 111-335121 |  342321 | ["TF-3556 "]                                  | ["50.00"]
    | ["789123@example-
isp.com","alexjohnson@example.com","monica@eng.example.com","sara@johnson.example.name",null]
(5 rows)
```

This example expands the `orderprices` column for a specified customer, in ascending order. The `custkey` and `email_addrs` columns are optional passthrough columns that are repeated for each array element.

```
=> SELECT EXPLODE(orderprices, custkey, email_addrs) OVER(PARTITION BEST) AS (position, orderprices,
custkey, email_addrs)
   FROM orders WHERE custkey='342845' ORDER BY orderprices;
 position | orderprices | custkey |         email_addrs
----------+-------------+---------+-----------------------------
        2 |             |  342845 | ["br92@cs.example.edu",null]
        3 |       12.00 |  342845 | ["br92@cs.example.edu",null]
        0 |       22.00 |  342845 | ["br92@cs.example.edu",null]
        1 |       35.00 |  342845 | ["br92@cs.example.edu",null]
(4 rows)
```

When NULL values are returned in a passthrough column, `null` is displayed. When you explode an array column that contains null values, the null values are displayed as empty.

You might store data of a primitive type in a set, a collection of unordered, unique elements. To explode a set column, you must explicitly cast the set column as an array column, or you receive an error. The following example explodes the `email_addrs` set column for a specified customer:

```
=> SELECT EXPLODE(email_addrs::ARRAY[VARCHAR], custkey) OVER(PARTITION BEST) AS (position, email_
addrs, custkey)
   FROM orders WHERE custkey='342321';
 position |        email_addrs         | custkey
----------+----------------------------+---------
        0 | 789123@example-isp.com     |  342321
        1 | alexjohnson@example.com    |  342321
        2 | monica@eng.example.com     |  342321
        3 | sara@johnson.example.name  |  342321
        4 |                            |  342321
(5 rows)
```

SET_UNION

Returns a SET containing all elements of two input sets.

Behavior Type

Immutable

Syntax

```
SET_UNION(set1,set2)
```

Null-Handling

- Null arguments are ignored. If one of the inputs is null, the function returns the non-null input. In other words, an argument of NULL is equivalent to SET[].
- If both inputs are null, the function returns null.

Example

```
=> SELECT SET_UNION(SET[1,2,4], SET[2,3,4,5.9]);
set_union
----------------------
["1.0","2.0","3.0","4.0","5.9"]
(1 row)
```

STRING_TO_ARRAY

Splits a string on a specified delimiter and returns an array. The input string must be bounded by brackets. The output does not include the "ARRAY" keyword.

This function returns array elements as strings by default. You can cast to other types, as in the following example:

```
=> SELECT STRING_TO_ARRAY('[1,2,3]',',')::ARRAY[INT];
```

This function returns an inlined array, not a native array (see ARRAY). To use the returned array as a native array in a query, such as a SELECT statement, you must cast the output to a native array type.

Behavior

Immutable

Syntax

```
STRING_TO_ARRAY(string,delimiter)
```

Supported Data Types

- STRING/VARCHAR

Examples

```
=> SELECT STRING_TO_ARRAY('[1,3,5]', ',');
 STRING_TO_ARRAY
-----------------
 ["1","3","5"]
(1 row)

=> SELECT STRING_TO_ARRAY('[t|t|f|t]','|');
 STRING_TO_ARRAY
-----------------
 ["t","t","f","t"]
(1 row)

=> SELECT STRING_TO_ARRAY('[]',',');
 STRING_TO_ARRAY
-----------------
 [null]
(1 row)

=> SELECT STRING_TO_ARRAY('[1::2::3::4]','::');
  STRING_TO_ARRAY
-------------------
 ["1","2","3","4"]
(1 row)
```

The following example demonstrates the required cast when using the function in a query:

```
=> CREATE TABLE records AS SELECT 1 one,
    STRING_TO_ARRAY('[1,2,3]', ',')::ARRAY[VARCHAR] nums;
```

Current Load Source

The current load source function returns the source file name.

CURRENT_LOAD_SOURCE

Returns the file name used during the COPY statement.

Behavior Type

Stable

Syntax

```
CURRENT_LOAD_SOURCE()
```

Behavior

- If the function is called outside of the context of a COPY statement, it returns NULL.
- If the function is called by a UDL that does not set the source, it returns the string <unknown>.
- This function is not supported for COPY LOCAL.

Examples

This example creates a table and populates column c3 with the names of the two separate files being loaded.

```
=> CREATE TABLE t (c1 integer, c2 varchar(50), c3 varchar(200));
CREATE TABLE
=> COPY t (c1, c2, c3 AS CURRENT_LOAD_SOURCE()) FROM '/home/load_file_1' ON exampledb_node02,
'/home/load_file_2' ON exampledb_node03 DELIMITER ',';
Rows Loaded
-------------
5
(1 row)
=> SELECT * FROM t;
c1  |      c2      |          c3
----+--------------+----------------------
2   |  dogs        | load_file_1
1   |  cats        | load_file_1
4   |  superheroes | load_file_2
3   |  birds       | load_file_1
5   |  whales      | load_file_2
(5 rows)
```

Date/Time Functions

Date and time functions perform conversion, extraction, or manipulation operations on date and time data types and can return date and time information.

Usage

Functions that take `TIME` or `TIMESTAMP` inputs come in two variants:

- `TIME WITH TIME ZONE` or `TIMESTAMP WITH TIME ZONE`
- `TIME WITHOUT TIME ZONE` or `TIMESTAMP WITHOUT TIME ZONE`

For brevity, these variants are not shown separately.

The + and * operators come in commutative pairs; for example, both `DATE + INTEGER` and `INTEGER + DATE`. We show only one of each such pair.

Daylight Savings Time Considerations

When adding an `INTERVAL` value to (or subtracting an `INTERVAL` value from) a `TIMESTAMP` WITH `TIME ZONE` value, the days component advances (or decrements) the date of the `TIMESTAMP WITH TIME ZONE` by the indicated number of days. Across daylight saving time changes (with the session time zone set to a time zone that recognizes DST), this means `INTERVAL '1 day'` does not necessarily equal `INTERVAL '24 hours'`.

For example, with the session time zone set to `CST7CDT`:

```
TIMESTAMP WITH TIME ZONE '2014-04-02 12:00-07' + INTERVAL '1 day'
```

produces

```
TIMESTAMP WITH TIME ZONE '2014-04-03 12:00-06'
```

Adding `INTERVAL '24 hours'` to the same initial `TIMESTAMP WITH TIME ZONE` produces

```
TIMESTAMP WITH TIME ZONE '2014-04-03 13:00-06',
```

This result occurs because there is a change in daylight saving time at `2014-04-03 02:00` in time zone `CST7CDT`.

Date/Time Functions in Transactions

Certain date/time functions such as `CURRENT_TIMESTAMP` and `NOW` return the start time of the current transaction; for the duration of that transaction, they return the same value. Other date/time functions such as `TIMEOFDAY` always return the current time.

Template Patterns for Date/Time Formatting

ADD_MONTHS

Adds the specified number of months to a date and returns the sum as a `DATE`. In general, ADD_MONTHS returns a date with the same day component as the start date. For example:

```
=> SELECT ADD_MONTHS ('2015-09-15'::date, -2) "2 Months Ago";
 2 Months Ago
--------------
 2015-07-15
(1 row)
```

Two exceptions apply:

- If the start date's day component is greater than the last day of the result month, ADD_MONTHS returns the last day of the result month. For example:

  ```
  => SELECT ADD_MONTHS ('31-Jan-2016'::TIMESTAMP, 1) "Leap Month";
   Leap Month
  ------------
   2016-02-29
  (1 row)
  ```

- If the start date's day component is the last day of that month, and the result month has more days than the start date month, ADD_MONTHS returns the last day of the result month. For example:

  ```
  => SELECT ADD_MONTHS ('2015-09-30'::date,-1) "1 Month Ago";
   1 Month Ago
  ```

```
-------------
 2015-08-31
(1 row)
```

Behavior Type

- **Immutable** if the *start-date* argument is a TIMESTAMP or DATE
- **Stable** if the *start-date* argument is a TIMESTAMPTZ

Syntax

```
ADD_MONTHS ( start-date, num-months );
```

Parameters

start-date	The date to process, an expression that evaluates to one of the following data types: • DATE • TIMESTAMP • TIMESTAMPTZ
num-months	An integer expression that specifies the number of months to add to or subtract from *start-date*.

Examples

Add one month to the current date:

```
=> SELECT CURRENT_DATE Today;
   Today
------------
 2016-05-05
(1 row)

VMart=> SELECT ADD_MONTHS(CURRENT_TIMESTAMP,1);
 ADD_MONTHS
------------
 2016-06-05
(1 row)
```

Subtract four months from the current date:

```
=> SELECT ADD_MONTHS(CURRENT_TIMESTAMP, -4);
 ADD_MONTHS
------------
 2016-01-05
(1 row)
```

Add one month to January 31 2016:

```
=> SELECT ADD_MONTHS('31-Jan-2016'::TIMESTAMP, 1) "Leap Month";
 Leap Month
------------
 2016-02-29
(1 row)
```

The following example sets the timezone to EST; it then adds 24 months to a TIMESTAMPTZ that specifies a PST time zone, so ADD_MONTHS takes into account the time change:

```
=> SET TIME ZONE 'America/New_York';
SET
VMart=> SELECT ADD_MONTHS('2008-02-29 23:30 PST'::TIMESTAMPTZ, 24);
 ADD_MONTHS
------------
 2010-03-01
(1 row)
```

AGE_IN_MONTHS

Returns the difference in months between two dates, expressed as an integer.

Behavior Type

- **Immutable** if both date arguments are of data type TIMESTAMP
- **Stable** if either date is a TIMESTAMPTZ or only one argument is supplied

Syntax

```
AGE_IN_MONTHS ( [ date1,] date2 )
```

Parameters

date1 *date2*	Specify the boundaries of the period to measure. If you supply only one argument, Vertica sets *date2* to the current date. Both parameters must

	evaluate to one of the following data types: • DATE • TIMESTAMP • TIMESTAMPTZ If *date1* < *date2*, AGE_IN_MONTHS returns a negative value.

Examples

Get the age in months of someone born March 2 1972, as of June 21 1990:

```
=> SELECT AGE_IN_MONTHS('1990-06-21'::TIMESTAMP, '1972-03-02'::TIMESTAMP);
  AGE_IN_MONTHS
---------------
            219
(1 row)
```

If the first date is less than the second date, AGE_IN_MONTHS returns a negative value

```
=> SELECT AGE_IN_MONTHS('1972-03-02'::TIMESTAMP, '1990-06-21'::TIMESTAMP);
AGE_IN_MONTHS
---------------
-220
(1 row)
```

Get the age in months of someone who was born November 21 1939, as of today:

```
=> SELECT AGE_IN_MONTHS ('1939-11-21'::DATE);
 AGE_IN_MONTHS
---------------
            930
(1 row)
```

AGE_IN_YEARS

Returns the difference in years between two dates, expressed as an integer.

Behavior Type

- **Immutable** if both date arguments are of data type TIMESTAMP
- **Stable** if either date is a TIMESTAMPTZ or only one argument is supplied

Syntax

```
AGE_IN_YEARS( [ date1,] date2 )
```

Parameters

date1 *date2*	Specify the boundaries of the period to measure. If you supply only one argument, Vertica sets *date1* to the current date. Both parameters must evaluate to one of the following data types: • DATE • TIMESTAMP • TIMESTAMPTZ If *date1* < *date2*, AGE_IN_YEARS returns a negative value.

Examples

Get the age of someone born March 2 1972, as of June 21 1990:

```
=> SELECT AGE_IN_YEARS('1990-06-21'::TIMESTAMP, '1972-03-02'::TIMESTAMP);
 AGE_IN_YEARS
--------------
           18
(1 row)
```

If the first date is earlier than the second date, AGE_IN_YEARS returns a negative number:

```
=> SELECT AGE_IN_YEARS('1972-03-02'::TIMESTAMP, '1990-06-21'::TIMESTAMP);
AGE_IN_YEARS
--------------
          -19
(1 row)
```

Get the age of someone who was born November 21 1939, as of today:

```
=> SELECT AGE_IN_YEARS('1939-11-21'::DATE);
 AGE_IN_YEARS
--------------
           77
(1 row)
```

CLOCK_TIMESTAMP

Returns a value of type TIMESTAMP WITH TIMEZONE that represents the current system-clock time.

CLOCK_TIMESTAMP uses the date and time supplied by the operating system on the server to which you are connected, which should be the same across all servers. The value changes each time you call it.

Behavior Type

Volatile

Syntax

```
CLOCK_TIMESTAMP()
```

Examples

The following command returns the current time on your system:

```
SELECT CLOCK_TIMESTAMP() "Current Time";
         Current Time
-------------------------------
 2010-09-23 11:41:23.33772-04
(1 row)
```

Each time you call the function, you get a different result. The difference in this example is in microseconds:

```
SELECT CLOCK_TIMESTAMP() "Time 1", CLOCK_TIMESTAMP() "Time 2";
            Time 1             |            Time 2
-------------------------------+-------------------------------
 2010-09-23 11:41:55.369201-04 | 2010-09-23 11:41:55.369202-04
(1 row)
```

See Also

- STATEMENT_TIMESTAMP
- TRANSACTION_TIMESTAMP

CURRENT_DATE

Returns the date (date-type value) on which the current transaction started.

Behavior Type

Stable

Syntax

```
CURRENT_DATE()
```

> **Note:**
> You can call this function without parentheses.

Examples

```
SELECT CURRENT_DATE;
  ?column?
------------
 2010-09-23
(1 row)
```

CURRENT_TIME

Returns a value of type `TIME WITH TIMEZONE` that represents the start of the current transaction.

The return value does not change during the transaction. Thus, multiple calls to CURRENT_TIME within the same transaction return the same timestamp.

Behavior Type

Stable

Syntax

```
CURRENT_TIME  [ ( precision ) ]
```

Note:
If you specify a column label without precision, you must also omit parentheses.

Parameters

precision	An integer value between 0-6, specifies to round the seconds fraction field result to the specified number of digits.

Examples

```
=> SELECT CURRENT_TIME(1) AS Time;
     Time
---------------
 06:51:45.2-07
(1 row)
=> SELECT CURRENT_TIME(5) AS Time;
       Time
-------------------
 06:51:45.18435-07
(1 row)
```

CURRENT_TIMESTAMP

Returns a value of type `TIME WITH TIMEZONE` that represents the start of the current transaction.

The return value does not change during the transaction. Thus, multiple calls to `CURRENT_TIMESTAMP` within the same transaction return the same timestamp.

Behavior Type

Stable

Syntax

```
CURRENT_TIMESTAMP ( precision )
```

Parameters

precision	An integer value between 0-6, specifies to round the seconds fraction field result to the specified number of digits.

Examples

```
=> SELECT CURRENT_TIMESTAMP(1) AS time;
           time
--------------------------
 2017-03-27 06:50:49.7-07
(1 row)
=> SELECT CURRENT_TIMESTAMP(5) AS time;
             time
-------------------------------
 2017-03-27 06:50:49.69967-07
(1 row)
```

DATE_PART

Extracts a sub-field such as year or hour from a date/time expression, equivalent to the the SQL-standard function EXTRACT.

Behavior Type

- **Immutable** if the specified date is a `TIMESTAMP`, `DATE`, or `INTERVAL`
- **Stable** if the specified date is a `TIMESTAMPTZ`

Syntax

```
DATE_PART ( 'field', date )
```

Parameters

field	A constant value that specifies the sub-field to extract from *date* (see Field Values below).
date	The date to process, an expression that evaluates to one of the following data types: • DATE (cast to TIMESTAMP) • TIMESTAMP/TIMESTAMPTZ • INTERVAL

Field Values

CENTURY	The century number. The first century starts at 0001-01-01 00:00:00 AD. This definition applies to all Gregorian calendar countries. There is no century number 0, you go from –1 to 1.
DAY	The day (of the month) field (1–31).
DECADE	The year field divided by 10.
DOQ	The day within the current quarter. DOQ recognizes leap year days.
DOW	Zero-based day of the week, where Sunday=0. **Note:** EXTRACT's day of week numbering differs from the function TO_CHAR .
DOY	The day of the year (1–365/366)
EPOCH	Specifies to return one of the following: • For DATE and TIMESTAMP values: the number of seconds before or since 1970-01-01 00:00:00-00 (if before, a negative number). • For INTERVAL values, the total number of seconds in the interval.

HOUR	The hour field (0–23).
ISODOW	The ISO day of the week, an integer between 1 and 7 where Monday is 1.
ISOWEEK	The ISO week of the year, an integer between 1 and 53.
ISOYEAR	The ISO year.
MICROSECONDS	The seconds field, including fractional parts, multiplied by 1,000,000. This includes full seconds.
MILLENNIUM	The millennium number, where the first millennium is 1 and each millenium starts on `01-01-`*`y`*`001`. For example, millennium 2 starts on 01-01-1001.
MILLISECONDS	The seconds field, including fractional parts, multiplied by 1000. This includes full seconds.
MINUTE	The minutes field (0 - 59).
MONTH	For `TIMESTAMP` values, the number of the month within the year (1 - 12) ; for `interval` values the number of months, modulo 12 (0 - 11).
QUARTER	The calendar quarter of the specified date as an integer, where the January-March quarter is 1, valid only for `TIMESTAMP` values.
SECOND	The seconds field, including fractional parts, 0–59, or 0-60 if the operating system implements leap seconds.
TIME ZONE	The time zone offset from UTC, in seconds. Positive values correspond to time zones east of UTC, negative values to zones west of UTC.
TIMEZONE_HOUR	The hour component of the time zone offset.
TIMEZONE_MINUTE	The minute component of the time zone offset.
WEEK	The number of the week of the calendar year that the day is in.
YEAR	The year field. There is no `0 AD`, so subtract `BC` years from `AD` years accordingly.

Notes

According to the ISO-8601 standard, the week starts on Monday, and the first week of a year contains January 4. Thus, an early January date can sometimes be in the week 52 or 53 of the previous calendar year. For example:

```
=> SELECT YEAR_ISO('01-01-2016'::DATE), WEEK_ISO('01-01-2016'), DAYOFWEEK_ISO('01-01-2016');
 YEAR_ISO | WEEK_ISO | DAYOFWEEK_ISO
----------+----------+---------------
     2015 |       53 |             5
(1 row)
```

Examples

Extract the day value:

```
SELECT DATE_PART('DAY', TIMESTAMP '2009-02-24 20:38:40') "Day";
  Day
-----
  24
(1 row)
```

Extract the month value:

```
SELECT DATE_PART('MONTH', '2009-02-24 20:38:40'::TIMESTAMP) "Month";
  Month
-------
     2
(1 row)
```

Extract the year value:

```
SELECT DATE_PART('YEAR', '2009-02-24 20:38:40'::TIMESTAMP) "Year";
  Year
------
 2009
(1 row)
```

Extract the hours:

```
SELECT DATE_PART('HOUR', '2009-02-24 20:38:40'::TIMESTAMP) "Hour";
  Hour
------
   20
(1 row)
```

Extract the minutes:

```
SELECT DATE_PART('MINUTES', '2009-02-24 20:38:40'::TIMESTAMP) "Minutes";
  Minutes
---------
       38
(1 row)
```

Extract the day of quarter (DOQ):

```
SELECT DATE_PART('DOQ', '2009-02-24 20:38:40'::TIMESTAMP) "DOQ";
 DOQ
-----
  55
(1 row)
```

See Also

TO_CHAR

DATE

Converts the input value to a DATE data type.

Behavior Type

- **Immutable** if the input value is a TIMESTAMP, DATE, VARCHAR, or integer
- **Stable** if the input value is a TIMESTAMPTZ

Syntax

```
DATE ( value )
```

Parameters

value	The value to convert, one of the following: • TIMESTAMP, TIMESTAMPTZ, VARCHAR, or another DATE. • Integer: Vertica treats the integer as the number of days since 01/01/0001 and returns the date.

Examples

```
=> SELECT DATE (1);
    DATE
------------
 0001-01-01
(1 row)

=> SELECT DATE (734260);
    DATE
------------
 2011-05-03
(1 row)

=> SELECT DATE('TODAY');
    DATE
------------
 2016-12-07
(1 row)
```

See Also

- TO_DATE
- TO_TIMESTAMP
- TO_TIMESTAMP_TZ

DATE_TRUNC

Truncates date and time values to the specified precision. The return value is the same data type as the input value. All fields that are less than the specified precision are set to 0, or to 1 for day and month.

Behavior Type

Stable

Syntax

DATE_TRUNC(*precision*, *trunc-target*)

Parameters

precision	A string constant that specifies precision for the truncated value. See Precision Field Values below. The precision must be valid for the *trunc-target* date or time.
trunc-target	Valid date/time expression.

Precision Field Values

MILLENNIUM	The millennium number.
CENTURY	The century number. The first century starts at 0001-01-01 00:00:00 AD. This definition applies to all Gregorian calendar countries.
DECADE	The year field divided by 10.
YEAR	The year field. Keep in mind there is no `0 AD`, so subtract BC years from AD years with care.
QUARTER	The calendar quarter of the specified date as an integer, where the January-March quarter is 1.
MONTH	For `timestamp` values, the number of the month within the year (1–12) ; for `interval` values the number of months, modulo 12 (0–11).

WEEK	The number of the week of the year that the day is in.
	According to the ISO-8601 standard, the week starts on Monday, and the first week of a year contains January 4. Thus, an early January date can sometimes be in the week 52 or 53 of the previous calendar year. For example:
	`=> SELECT YEAR_ISO('01-01-2016'::DATE), WEEK_ISO('01-01-2016'), DAYOFWEEK_ISO('01-01-2016');`
	`YEAR_ISO | WEEK_ISO | DAYOFWEEK_ISO`
	`----------+----------+---------------`
	`2015 | 53 | 5`
	`(1 row)`

DAY	The day (of the month) field (1–31).
HOUR	The hour field (0–23).
MINUTE	The minutes field (0–59).
SECOND	The seconds field, including fractional parts (0–59) (60 if leap seconds are implemented by the operating system).
MILLISECONDS	The seconds field, including fractional parts, multiplied by 1000. Note that this includes full seconds.
MICROSECONDS	The seconds field, including fractional parts, multiplied by 1,000,000. This includes full seconds.

Examples

The following example sets the field value as hour and returns the hour, truncating the minutes and seconds:

```
=> SELECT DATE_TRUNC('HOUR', TIMESTAMP '2012-02-24 13:38:40') AS HOUR;
        HOUR
---------------------
 2012-02-24 13:00:00
(1 row)
```

The following example returns the year from the input `timestamptz '2012-02-24 13:38:40'`. The function also defaults the month and day to January 1, truncates the hour:minute:second of the timestamp, and appends the time zone (`-05`):

```
=> SELECT DATE_TRUNC('YEAR', TIMESTAMPTZ '2012-02-24 13:38:40') AS YEAR;
         YEAR
------------------------
 2012-01-01 00:00:00-05
(1 row)
```

The following example returns the year and month and defaults day of month to 1, truncating the rest of the string:

```
=> SELECT DATE_TRUNC('MONTH', TIMESTAMP '2012-02-24 13:38:40') AS MONTH;
        MONTH
---------------------
 2012-02-01 00:00:00
(1 row)
```

DATEDIFF

Returns the time span between two dates, in the intervals specified. DATEDIFF excludes the start date in its calculation.

Behavior Type

- **Immutable** if start and end dates are TIMESTAMP , DATE, TIME, or INTERVAL
- **Stable** if start and end dates are TIMESTAMPTZ

Syntax

```
DATEDIFF ( datepart, start, end );
```

Parameters

datepart	Specifies the type of date or time intervals that DATEDIFF returns. If *datepart* is an expression, it must be enclosed in parentheses: `DATEDIFF((expression), start, end;` *datepart* must evaluate to one of the following string literals, either quoted or unquoted: • year | yy | yyyy • quarter | qq | q • month | mm | m • day | dayofyear | dd | d | dy | y • week | wk | ww • hour | hh • minute | mi | n • second | ss | s • millisecond | ms • microsecond | mcs | us
start, *end*	Specify the start and end dates, where *start* and *end* evaluate to one of the following data types: • TIMESTAMP/TIMESTAMPTZ

	• DATE • TIME/TIMETZ • INTERVAL If *end* < *start*, DATEDIFF returns a negative value. **Note:** TIME and INTERVAL data types are invalid for start and end dates if *datepart* is set to year, quarter, or month.

Compatible Start and End Date Data Types

The following table shows which data types can be matched as start and end dates:

	DATE	TIMESTAMP	TIMESTAMPTZ	TIME	INTERVAL
DATE	•	•	•		
TIMESTAMP	•	•	•		
TIMESTAMPTZ	•	•	•		
TIME				•	
INTERVAL					•

For example, if you set the start date to an INTERVAL data type, the end date must also be an INTERVAL, otherwise Vertica returns an error:

```
 SELECT DATEDIFF(day, INTERVAL '26 days', INTERVAL '1 month ');
 datediff
----------
        4
(1 row)
```

Date Part Intervals

DATEDIFF uses the *datepart* argument to calculate the number of intervals between two dates, rather than the actual amount of time between them. DATEDIFF uses the following

cutoff points to calculate those intervals:

- year: January 1
- quarter: January 1, April 1, July 1, October 1
- month: the first day of the month
- week: Sunday at midnight (24:00)

For example, if *datepart* is set to year, DATEDIFF uses January 01 to calculate the number of years between two dates. The following DATEDIFF statement sets *datepart* to year, and specifies a time span 01/01/2005 - 06/15/2008:

```
SELECT DATEDIFF(year, '01-01-2005'::date, '12-31-2008'::date);
 datediff
----------
        3
(1 row)
```

DATEDIFF always excludes the start date when it calculates intervals—in this case, 01/01//2005. DATEDIFF considers only calendar year starts in its calculation, so in this case it only counts years 2006, 2007, and 2008. The function returns 3, although the actual time span is nearly four years.

If you change the start and end dates to 12/31/2004 and 01/01/2009, respectively, DATEDIFF also counts years 2005 and 2009. This time, it returns 5, although the actual time span is just over four years:

```
=> SELECT DATEDIFF(year, '12-31-2004'::date, '01-01-2009'::date);
 datediff
----------
        5
(1 row)
```

Similarly, DATEDIFF uses month start dates when it calculates the number of months between two dates. Thus, given the following statement, DATEDIFF counts months February through September and returns 8:

```
=> SELECT DATEDIFF(month, '01-31-2005'::date, '09-30-2005'::date);
 datediff
----------
        8
(1 row)
```

See Also

TIMESTAMPDIFF

DAY

Returns as an integer the day of the month from the input value.

Behavior Type

- **Immutable** if the input value is a TIMESTAMP, DATE, VARCHAR, or INTEGER
- **Stable** if the specified date is a TIMESTAMPTZ

Syntax

```
DAY ( value )
```

Parameters

value	The value to convert, one of the following: TIMESTAMP, TIMESTAMPTZ, INTERVAL, VARCHAR, or INTEGER.

Examples

```
=> SELECT DAY (6);
 DAY
-----
   6
(1 row)

=> SELECT DAY(TIMESTAMP 'sep 22, 2011 12:34');
 DAY
-----
  22
(1 row)

=> SELECT DAY('sep 22, 2011 12:34');
 DAY
-----
  22
(1 row)

=> SELECT DAY(INTERVAL '35 12:34');
 DAY
-----
  35
```

```
(1 row)
```

DAYOFMONTH

Returns the day of the month as an integer.

Behavior Type

- **Immutable** if the target date is a TIMESTAMP, DATE, or VARCHAR
- **Stable** if the target date is aTIMESTAMPTZ

Syntax

```
DAYOFMONTH ( date )
```

Parameters

date	The date to process, one of the following data types: • VARCHAR • DATE • TIMESTAMP • TIMESTAMPTZ

Example

```
=> SELECT DAYOFMONTH (TIMESTAMP 'sep 22, 2011 12:34');
 DAYOFMONTH
------------
         22
(1 row)
```

DAYOFWEEK

Returns the day of the week as an integer, where Sunday is day 1.

Behavior Type

- **Immutable** if the target date is a TIMESTAMP, DATE, or VARCHAR
- **Stable** if the target date is aTIMESTAMPTZ

Syntax

```
DAYOFWEEK ( date )
```

Parameters

date	The date to process, one of the following data types: • VARCHAR • DATE • TIMESTAMP • TIMESTAMPTZ

Example

```
=> SELECT DAYOFWEEK (TIMESTAMP 'sep 17, 2011 12:34');
 DAYOFWEEK
-----------
         7
(1 row)
```

DAYOFWEEK_ISO

Returns the ISO 8061 day of the week as an integer, where Monday is day 1.

Behavior Type

- **Immutable** if the target date is a TIMESTAMP, DATE, or VARCHAR
- **Stable** if the target date is aTIMESTAMPTZ

Syntax

```
DAYOFWEEK_ISO ( date )
```

Parameters

date	The date to process, one of the following data types: • VARCHAR • DATE • TIMESTAMP • TIMESTAMPTZ

Examples

```
=> SELECT DAYOFWEEK_ISO(TIMESTAMP 'Sep 22, 2011 12:34');
 DAYOFWEEK_ISO
---------------
             4
(1 row)
```

The following example shows how to combine the DAYOFWEEK_ISO, WEEK_ISO, and YEAR_ISO functions to find the ISO day of the week, week, and year:

```
=> SELECT DAYOFWEEK_ISO('Jan 1, 2000'), WEEK_ISO('Jan 1, 2000'),YEAR_ISO('Jan1,2000');
 DAYOFWEEK_ISO | WEEK_ISO | YEAR_ISO
---------------+----------+----------
             6 |       52 |     1999
(1 row)
```

See Also

- WEEK_ISO
- DAYOFWEEK_ISO
- http://en.wikipedia.org/wiki/ISO_8601

DAYOFYEAR

Returns the day of the year as an integer, where January 1 is day 1.

Behavior Type

- **Immutable** if the specified date is a TIMESTAMP, DATE, or VARCHAR
- **Stable** if the specified date is aTIMESTAMPTZ

Syntax

```
DAYOFYEAR ( date )
```

Parameters

date	The date to process, one of the following data types: • VARCHAR • DATE • TIMESTAMP • TIMESTAMPTZ

Example

```
=> SELECT DAYOFYEAR (TIMESTAMP 'SEPT 22,2011 12:34');
 DAYOFYEAR
-----------
       265
(1 row)
```

DAYS

Returns the integer value of the specified date, where 1 AD is 1. If the date precedes 1 AD, DAYS returns a negative integer.

Behavior Type

- **Immutable** if the specified date is a TIMESTAMP, DATE, or VARCHAR
- **Stable** if the specified date is aTIMESTAMPTZ

Syntax

```
DAYS ( date )
```

Parameters

date	The date to process, one of the following data types: • VARCHAR • DATE • TIMESTAMP • TIMESTAMPTZ

Example

```
=> SELECT DAYS (DATE '2011-01-22');
  DAYS
--------
 734159
(1 row)

=> SELECT DAYS (DATE 'March 15, 0044 BC');
  DAYS
--------
 -15997
(1 row)
```

EXTRACT

Retrieves sub-fields such as year or hour from date/time values and returns values of type NUMERIC. EXTRACT is intended for computational processing, rather than for formatting date/time values for display.

Behavior Type

- **Immutable** if the specified date is a TIMESTAMP, DATE, or INTERVAL
- **Stable** if the specified date is aTIMESTAMPTZ

Syntax

```
EXTRACT ( field FROM date )
```

Parameters

field	A constant value that specifies the sub-field to extract from *date* (see Field Values below).
date	The date to process, an expression that evaluates to one of the following data types: • DATE (cast to TIMESTAMP) • TIMESTAMP/TIMESTAMPTZ • INTERVAL

Field Values

CENTURY	The century number. The first century starts at 0001-01-01 00:00:00 AD. This definition applies to all Gregorian calendar countries. There is no century number 0, you go from –1 to 1.
DAY	The day (of the month) field (1–31).
DECADE	The year field divided by 10.
DOQ	The day within the current quarter. DOQ recognizes leap year days.
DOW	Zero-based day of the week, where Sunday=0. **Note:** EXTRACT's day of week numbering differs from the function TO_CHAR .
DOY	The day of the year (1–365/366)
EPOCH	Specifies to return one of the following: • For DATE and TIMESTAMP values: the number of seconds

	before or since 1970-01-01 00:00:00-00 (if before, a negative number). • For INTERVAL values, the total number of seconds in the interval.
HOUR	The hour field (0–23).
ISODOW	The ISO day of the week, an integer between 1 and 7 where Monday is 1.
ISOWEEK	The ISO week of the year, an integer between 1 and 53.
ISOYEAR	The ISO year.
MICROSECONDS	The seconds field, including fractional parts, multiplied by 1,000,000. This includes full seconds.
MILLENNIUM	The millennium number, where the first millennium is 1 and each millenium starts on 01-01-*y*001. For example, millennium 2 starts on 01-01-1001.
MILLISECONDS	The seconds field, including fractional parts, multiplied by 1000. This includes full seconds.
MINUTE	The minutes field (0 - 59).
MONTH	For TIMESTAMP values, the number of the month within the year (1 - 12) ; for interval values the number of months, modulo 12 (0 - 11).
QUARTER	The calendar quarter of the specified date as an integer, where the January-March quarter is 1, valid only for TIMESTAMP values.
SECOND	The seconds field, including fractional parts, 0–59, or 0-60 if the operating system implements leap seconds.
TIME ZONE	The time zone offset from UTC, in seconds. Positive values correspond to time zones east of UTC, negative values to zones west of UTC.
TIMEZONE_HOUR	The hour component of the time zone offset.
TIMEZONE_MINUTE	The minute component of the time zone offset.
WEEK	The number of the week of the calendar year that the day is in.

YEAR	The year field. There is no `0` AD, so subtract BC years from AD years accordingly.

Examples

Extract the day of the week and day in quarter from the current TIMESTAMP:

```
=> SELECT CURRENT_TIMESTAMP AS NOW;
              NOW
-------------------------------
 2016-05-03 11:36:08.829004-04
(1 row)
=> SELECT EXTRACT (DAY FROM CURRENT_TIMESTAMP);
 date_part
-----------
         3
(1 row)
=> SELECT EXTRACT (DOQ FROM CURRENT_TIMESTAMP);
 date_part
-----------
        33
(1 row)
```

Extract the timezone hour from the current time:

```
=> SELECT CURRENT_TIMESTAMP;
           ?column?
-------------------------------
 2016-05-03 11:36:08.829004-04
(1 row)

=>  SELECT EXTRACT(TIMEZONE_HOUR FROM CURRENT_TIMESTAMP);
 date_part
-----------
        -4
(1 row)
```

Extract the number of seconds since 01-01-1970 00:00:

```
=> SELECT EXTRACT(EPOCH FROM '2001-02-16 20:38:40-08'::TIMESTAMPTZ);
    date_part
------------------
 982384720.000000
(1 row)
```

Extract the number of seconds between 01-01-1970 00:00 and 5 days 3 hours before:

```
=> SELECT EXTRACT(EPOCH FROM -'5 days 3 hours'::INTERVAL);
   date_part
----------------
 -442800.000000
```

```
(1 row)
```

Convert the results from the last example to a TIMESTAMP:

```
=> SELECT 'EPOCH'::TIMESTAMPTZ -442800  * '1 second'::INTERVAL;
        ?column?
------------------------
 1969-12-26 16:00:00-05
(1 row)
```

GETDATE

Returns the current statement's start date and time as a TIMESTAMP value. This function is identical to SYSDATE.

GETDATE uses the date and time supplied by the operating system on the server to which you are connected, which is the same across all servers. Internally, GETDATE converts STATEMENT_TIMESTAMP from TIMESTAMPTZ to TIMESTAMP.

Behavior Type

Stable

Syntax

```
GETDATE()
```

Example

```
=> SELECT GETDATE();
          GETDATE
----------------------------
 2011-03-07 13:21:29.497742
(1 row)
```

See Also

Date/Time Expressions

GETUTCDATE

Returns the current statement's start date and time as a TIMESTAMP value.

GETUTCDATE uses the date and time supplied by the operating system on the server to which you are connected, which is the same across all servers. Internally, GETUTCDATE converts STATEMENT_TIMESTAMP at TIME ZONE 'UTC'.

Behavior Type

Stable

Syntax

```
GETUTCDATE()
```

Example

```
=> SELECT GETUTCDATE();
         GETUTCDATE
----------------------------
 2011-03-07 20:20:26.193052
(1 row)
```

See Also

- Date/Time Expressions

HOUR

Returns the hour portion of the specified date as an integer, where 0 is 00:00 to 00:59.

Behavior Type

- **Immutable** if the specified date is a TIMESTAMP
- **Stable** if the specified date is aTIMESTAMPTZ

Syntax

```
HOUR( date )
```

Parameters

date	The date to process, one of the following data types: • VARCHAR • DATE • TIMESTAMP • TIMESTAMPTZ • INTERVAL

Examples

```
=> SELECT HOUR (TIMESTAMP 'sep 22, 2011 12:34');
 HOUR
------
   12
(1 row)
=> SELECT HOUR (INTERVAL '35 12:34');
 HOUR
------
   12
(1 row)
=> SELECT HOUR ('12:34');
 HOUR
------
   12
(1 row)
```

ISFINITE

Tests for the special TIMESTAMP constant INFINITY and returns a value of type BOOLEAN.

Behavior Type

Immutable

Syntax

```
ISFINITE ( timestamp )
```

Parameters

timestamp	Expression of type TIMESTAMP

Examples

```
SELECT ISFINITE(TIMESTAMP '2009-02-16 21:28:30');
 ISFINITE
----------
 t
(1 row)

SELECT ISFINITE(TIMESTAMP 'INFINITY');
 ISFINITE
----------
 f
(1 row)
```

JULIAN_DAY

Returns the integer value of the specified day according to the Julian calendar, where day 1 is the first day of the Julian period, January 1, 4713 BC (on the Gregorian calendar, November 24, 4714 BC).

Behavior Type

- **Immutable** if the specified date is a `TIMESTAMP`, `DATE`, or `VARCHAR`
- **Stable** if the specified date is a`TIMESTAMPTZ`

Syntax

```
JULIAN_DAY ( date )
```

Parameters

date	The date to process, one of the following data types: • VARCHAR • DATE • TIMESTAMP • TIMESTAMPTZ

Example

```
=> SELECT JULIAN_DAY (DATE 'MARCH 15, 0044 BC');
 JULIAN_DAY
------------
    1705428
(1 row)

=> SELECT JULIAN_DAY (DATE '2001-01-01');
 JULIAN_DAY
------------
    2451911
(1 row)
```

LAST_DAY

Returns the last day of the month in the specified date.

Behavior Type

- **Immutable** if the specified is a TIMESTAMP or DATE
- **Stable** if the specified date is a TIMESTAMPTZ

Syntax

```
LAST_DAY ( date )
```

Parameters

date	The date to process, one of the following data types: • DATE • TIMESTAMP • TIMESTAMPTZ

Examples

The following example returns the last day of February as 29 because 2016 is a leap year:

```
=> SELECT LAST_DAY('2016-02-28 23:30 PST') "Last Day";
  Last Day
------------
 2016-02-29
(1 row)
```

The following example returns the last day of February in a non-leap year:

```
> SELECT LAST_DAY('2017/02/03') "Last";
    Last
------------
 2017-02-28
(1 row)
```

The following example returns the last day of March, after converting the string value to the specified DATE type:

```
=> SELECT LAST_DAY('2003/03/15') "Last";
    Last
------------
 2012-03-31
(1 row)
```

LOCALTIME

Returns a value of type TIME that represents the start of the current transaction.

The return value does not change during the transaction. Thus, multiple calls to LOCALTIME within the same transaction return the same timestamp.

Behavior Type

Stable

Syntax

```
LOCALTIME [ ( precision ) ]
```

Parameters

precision	Rounds the result to the specified number of fractional digits in the seconds field.

Example

```
=> CREATE TABLE t1 (a int, b int);
CREATE TABLE

=> INSERT INTO t1 VALUES (1,2);
 OUTPUT
--------
      1
(1 row)

=> SELECT LOCALTIME time;
    time
-----------------
 15:03:14.595296
(1 row)

=> INSERT INTO t1 VALUES (3,4);
 OUTPUT
--------
      1
(1 row)

=> SELECT LOCALTIME;
    time
-----------------
 15:03:14.595296
(1 row)

=> COMMIT;
COMMIT
=> SELECT LOCALTIME;
    time
-----------------
```

```
 15:03:49.738032
(1 row)
```

LOCALTIMESTAMP

Returns a value of type `TIMESTAMP` that represents the start of the current transaction.

The return value does not change during the transaction. Thus, multiple calls to `LOCALTIMESTAMP` within the same transaction return the same timestamp.

Behavior Type

Stable

Syntax

```
LOCALTIMESTAMP [ ( precision ) ]
```

Parameters

precision	Rounds the result to the specified number of fractional digits in the seconds field.

Example

```
=> CREATE TABLE t1 (a int, b int);
CREATE TABLE

=> INSERT INTO t1 VALUES (1,2);
 OUTPUT
--------
      1
(1 row)

=> SELECT CURRENT_TIMESTAMP(2) timestamp;
         timestamp
---------------------------
 2016-12-07 15:19:12.34-05
(1 row)

=> INSERT INTO t1 VALUES (3,4);
```

```
 OUTPUT
--------
      1
(1 row)

=> SELECT CURRENT_TIMESTAMP(2) timestamp;
         timestamp
---------------------------
 2016-12-07 15:19:12.34-05
(1 row)

=> COMMIT;
COMMIT
=> SELECT CURRENT_TIMESTAMP(2) timestamp;
         timestamp
---------------------------
 2016-12-07 15:19:13.89-05
(1 row)
```

MICROSECOND

Returns the microsecond portion of the specified date as an integer.

Behavior Type

- **Immutable** if the specified date is a TIMESTAMP, INTERVAL, or VARCHAR
- **Stable** if the specified date is aTIMESTAMPTZ

Syntax

```
MICROSECOND ( date )
```

Parameters

date	The date to process, one of the following data types: • VARCHAR • TIMESTAMP • TIMESTAMPTZ • INTERVAL

Example

```
=> SELECT MICROSECOND (TIMESTAMP 'Sep 22, 2011 12:34:01.123456');
 MICROSECOND
-------------
      123456
(1 row)
```

MIDNIGHT_SECONDS

Within the specified date, returns the number of seconds between midnight and the date's time portion.

Behavior Type

- **Immutable** if the specified date is a TIMESTAMP, DATE, or VARCHAR
- **Stable** if the specified date is aTIMESTAMPTZ

Syntax

```
MIDNIGHT_SECONDS ( date )
```

Parameters

date	The date to process, one of the following data types: • VARCHAR • DATE • TIMESTAMP • TIMESTAMPTZ

Examples

Get the number of seconds since midnight:

```
=> SELECT MIDNIGHT_SECONDS(CURRENT_TIMESTAMP);
 MIDNIGHT_SECONDS
------------------
            36480
(1 row)
```

Get the number of seconds between midnight and noon on March 3 2016:

```
=> SELECT MIDNIGHT_SECONDS('3-3-2016 12:00'::TIMESTAMP);
 MIDNIGHT_SECONDS
------------------
            43200
(1 row)
```

MINUTE

Returns the minute portion of the specified date as an integer.

Behavior Type

- **Immutable** if the specified date is a TIMESTAMP, DATE, VARCHAR or INTERVAL
- **Stable** if the specified date is aTIMESTAMPTZ

Syntax

```
MINUTE ( date )
```

Parameters

date	The date to process, one of the following data types: • VARCHAR • DATE • TIMESTAMP • TIMESTAMPTZ • INTERVAL

Example

```
=> SELECT MINUTE('12:34:03.456789');
 MINUTE
--------
     34
(1 row)
=>SELECT MINUTE (TIMESTAMP 'sep 22, 2011 12:34');
 MINUTE
--------
     34
(1 row)
=> SELECT MINUTE(INTERVAL '35 12:34:03.456789');
 MINUTE
--------
     34
(1 row)
```

MONTH

Returns the month portion of the specified date as an integer.

Behavior Type

- **Immutable** if the specified date is a TIMESTAMP, DATE, VARCHAR or INTERVAL
- **Stable** if the specified date is aTIMESTAMPTZ

Syntax

```
MONTH ( date )
```

Parameters

date	The date to process, one of the following data types: • VARCHAR • DATE • TIMESTAMP • TIMESTAMPTZ • INTERVAL

Examples

In the following examples, Vertica returns the month portion of the specified string. For example, `'6-9'` represent September 6.

```
=> SELECT MONTH('6-9');
 MONTH
-------
     9
(1 row)
=> SELECT MONTH (TIMESTAMP 'sep 22, 2011 12:34');
 MONTH
-------
     9
(1 row)
=> SELECT MONTH(INTERVAL '2-35' year to month);
 MONTH
-------
    11
(1 row)
```

MONTHS_BETWEEN

Returns the number of months between two dates. `MONTHS_BETWEEN` can return an integer or a FLOAT:

- Integer: The day portions of *`date1`* and *`date2`* are the same, and neither date is the last day of the month. `MONTHS_BETWEEN` also returns an integer if both dates in *`date1`* and *`date2`* are the last days of their respective months. For example, `MONTHS_BETWEEN` calculates the difference between April 30 and March 31 as 1 month.
- FLOAT: The day portions of *`date1`* and *`date2`* are different and one or both dates are not the last day of their respective months. For example, the difference between April 2 and March 1 is `1.03225806451613`. To calculate month fractions, `MONTHS_BETWEEN` assumes all months contain 31 days.

`MONTHS_BETWEEN` disregards timestamp time portions.

Behavior Type

- **Immutable** if both date arguments are of data type `TIMESTAMP` or `DATE`
- **Stable** if either date is a `TIMESTAMPTZ`

Syntax

```
MONTHS_BETWEEN ( date1 , date2 );
```

Parameters

date1 *date2*	Specify the dates to evaluate where *date1* and *date2* evaluate to one of the following data types: • DATE • TIMESTAMP • TIMESTAMPTZ If *date1* < *date2*, MONTHS_BETWEEN returns a negative value.

Examples

Return the number of months between April 7 2016 and January 7 2015:

```
=> SELECT MONTHS_BETWEEN ('04-07-16'::TIMESTAMP, '01-07-15'::TIMESTAMP);
 MONTHS_BETWEEN
----------------
             15
(1 row)
```

Return the number of months between March 31 2016 and February 28 2016 (MONTHS_BETWEEN assumes both months contain 31 days):

```
=> SELECT MONTHS_BETWEEN ('03-31-16'::TIMESTAMP, '02-28-16'::TIMESTAMP);
  MONTHS_BETWEEN
------------------
 1.09677419354839
(1 row)
```

Return the number of months between March 31 2016 and February 29 2016:

```
=> SELECT MONTHS_BETWEEN ('03-31-16'::TIMESTAMP, '02-29-16'::TIMESTAMP);
 MONTHS_BETWEEN
----------------
              1
(1 row)
```

NEW_TIME

Converts a timestamp value from one time zone to another and returns a TIMESTAMP.

Behavior Type

Immutable

Syntax

```
NEW_TIME( 'timestamp' , 'timezone1' , 'timezone2')
```

Parameters

timestamp	The timestamp to convert, conforms to one of the following formats: • TIMESTAMP/TIMESTAMPTZ • DATE • Character string that can be converted to a TIMESTAMP—for example, May 24, 2012 10:00.
timezone1 *timezone2*	Specify the source and target timezones, one of the strings defined in /opt/vertica/share/timezonesets. For example: • GMT: Greenwich Mean Time • AST / ADT: Atlantic Standard/Daylight Time • EST / EDT: Eastern Standard/Daylight Time • CST / CDT: Central Standard/Daylight Time • MST / MDT: Mountain Standard/Daylight Time • PST / PDT: Pacific Standard/Daylight Time

Examples

Convert the specified time from Eastern Standard Time (EST) to Pacific Standard Time (PST):

```
=> SELECT NEW_TIME('05-24-12 13:48:00', 'EST', 'PST');
      NEW_TIME
```

```
---------------------
 2012-05-24 10:48:00
(1 row)
```

Convert 1:00 AM January 2012 from EST to PST:

```
=> SELECT NEW_TIME('01-01-12 01:00:00', 'EST', 'PST');
      NEW_TIME
---------------------
 2011-12-31 22:00:00
(1 row)
```

Convert the current time EST to PST:

```
=> SELECT NOW();
              NOW
-------------------------------
 2016-12-09 10:30:36.727307-05
(1 row)

=> SELECT NEW_TIME('NOW', 'EDT', 'CDT');
          NEW_TIME
----------------------------
 2016-12-09 09:30:36.727307
(1 row)
```

The following example returns the year 45 before the Common Era in Greenwich Mean Time and converts it to Newfoundland Standard Time:

```
=>  SELECT NEW_TIME('April 1, 45 BC', 'GMT', 'NST')::DATE;
   NEW_TIME
---------------
 0045-03-31 BC
(1 row)
```

NEXT_DAY

Returns the date of the first instance of a particular day of the week that follows the specified date.

Behavior Type

- **Immutable** if the specified date is a `TIMESTAMP`, `DATE`, or `VARCHAR`
- **Stable** if the specified date is a`TIMESTAMPTZ`

Syntax

```
NEXT_DAY( 'date', 'day-string')
```

Parameters

date	The date to process, one of the following data types: • VARCHAR • DATE • TIMESTAMP • TIMESTAMPTZ
day-string	The day of the week to process, a CHAR or VARCHAR string or character constant. Supply the full English name such as Tuesday, or any conventional abbreviation, such as Tue or Tues. *day-string* is not case sensitive and trailing spaces are ignored.

Examples

Get the date of the first Monday that follows April 29 2016:

```
=> SELECT NEXT_DAY('4-29-2016'::TIMESTAMP,'Monday') "NEXT DAY" ;
  NEXT DAY
------------
 2016-05-02
(1 row)
```

Get the first Tuesday that follows today:

```
SELECT NEXT_DAY(CURRENT_TIMESTAMP,'tues') "NEXT DAY" ;
  NEXT DAY
------------
 2016-05-03
(1 row)
```

NOW [Date/Time]

Returns a value of type TIMESTAMP WITH TIME ZONE representing the start of the current transaction. NOW is equivalent to CURRENT_TIMESTAMP except that it does not accept a

precision parameter.

The return value does not change during the transaction. Thus, multiple calls to CURRENT_TIMESTAMP within the same transaction return the same timestamp.

Behavior Type

Stable

Syntax

```
NOW()
```

Example

```
=> CREATE TABLE t1 (a int, b int);
CREATE TABLE
=> INSERT INTO t1 VALUES (1,2);
 OUTPUT
--------
      1
(1 row)

=> SELECT NOW();
              NOW
-------------------------------
 2016-12-09 13:00:08.74685-05
(1 row)

=> INSERT INTO t1 VALUES (3,4);
 OUTPUT
--------
      1
(1 row)

=> SELECT NOW();
              NOW
-------------------------------
 2016-12-09 13:00:08.74685-05
(1 row)

=> COMMIT;
COMMIT
dbadmin=> SELECT NOW();
               NOW
-------------------------------
 2016-12-09 13:01:31.420624-05
(1 row)
```

OVERLAPS

Evaluates two time periods and returns true when they overlap, false otherwise.

Behavior Type

- **Stable** when TIMESTAMP and TIMESTAMPTZ are both used, or when TIMESTAMPTZ is used with INTERVAL
- **Immutable** otherwise

Syntax

```
( start, end ) OVERLAPS ( start, end )
( start, interval) OVERLAPS ( start, interval )
```

Parameters

start	DATE, TIME, or TIMESTAMP/TIMESTAMPTZ value that specifies the beginning of a time period.
end	DATE, TIME, or TIMESTAMP/TIMESTAMPTZ value that specifies the end of a time period.
interval	Value that specifies the length of the time period.

Examples

Evaluate whether date ranges Feb 16 - Dec 21, 2016 and Oct 10 2008 - Oct 3 2016 overlap:

```
=> SELECT (DATE '2016-02-16', DATE '2016-12-21') OVERLAPS (DATE '2008-10-30', DATE '2016-10-30');
 overlaps
----------
 t
(1 row)
```

Evaluate whether date ranges Feb 16 - Dec 21, 2016 and Jan 01 - Oct 30 2008 - Oct 3, 2016 overlap:

```
=> SELECT (DATE '2016-02-16', DATE '2016-12-21') OVERLAPS (DATE '2008-01-30', DATE '2008-10-30');
 overlaps
----------
 f
(1 row)
```

Evaluate whether date range Feb 02 2016 + 1 week overlaps with date range Oct 16 2016 - 8 months:

```
=> SELECT (DATE '2016-02-16', INTERVAL '1 week') OVERLAPS (DATE '2016-10-16', INTERVAL '-8 months');
 overlaps
----------
 t
(1 row)
```

QUARTER

Returns calendar quarter of the specified date as an integer, where the January-March quarter is 1.

Syntax

```
QUARTER ( date )
```

Behavior Type

- **Immutable** if the specified date is a TIMESTAMP, DATE, or VARCHAR.
- **Stable** if the specified date is aTIMESTAMPTZ

Parameters

date	The date to process, one of the following data types: • VARCHAR • DATE • TIMESTAMP • TIMESTAMPTZ

Examples

```
=> SELECT QUARTER (TIMESTAMP 'sep 22, 2011 12:34');
 QUARTER
---------
       3
(1 row)
```

ROUND

Rounds the specified date or time. If you omit the precision argument, ROUND rounds to day (DD) precision.

Behavior Type

- **Immutable** if the target date is a TIMESTAMP or DATE
- **Stable** if the target date is aTIMESTAMPTZ

Syntax

```
ROUND( rounding-target[, 'precision'] )
```

Parameters

rounding-target	An expression that evaluates to one of the following data types: • DATE • TIMESTAMP/TIMESTAMPTZ • TIMESTAMPTZ
precision	A string constant that specifies precision for the rounded value, one of the following: • **Century**: CC | SCC • **Year**: SYYY | YYYY | YEAR | YYY | YY | Y • **ISO Year**: IYYY | IYY | IY | I • **Quarter**: Q

	• **Month**: MONTH | MON | MM | RM • **Same weekday as first day of year**: WW • **Same weekday as first day of ISO year**: IW • **Same weekday as first day of month**: W • **Day** (default): DDD | DD | J • **First weekday**: DAY | DY | D • **Hour**: HH | HH12 | HH24 • **Minute**: MI • **Second**: SS **Note:** Hour, minute, and second rounding is not supported by DATE expressions.

Examples

Round to the nearest hour:

```
=> SELECT ROUND(CURRENT_TIMESTAMP, 'HH');
        ROUND
---------------------
 2016-04-28 15:00:00
(1 row)
```

Round to the nearest month:

```
=> SELECT ROUND('9-22-2011 12:34:00'::TIMESTAMP, 'MM');
        ROUND
---------------------
 2011-10-01 00:00:00
(1 row)
```

See Also

TIMESTAMP_ROUND

SECOND

Returns the seconds portion of the specified date as an integer.

Syntax

```
SECOND ( date )
```

Behavior Type

Immutable, except for TIMESTAMPTZ arguments where it is **stable**.

Parameters

date	The date to process, one of the following data types: • VARCHAR • TIMESTAMP • TIMESTAMPTZ • INTERVAL

Examples

```
=> SELECT SECOND ('23:34:03.456789');
 SECOND
--------
      3
(1 row)
=> SELECT SECOND (TIMESTAMP 'sep 22, 2011 12:34');
 SECOND
--------
      0
(1 row)
=> SELECT SECOND (INTERVAL '35 12:34:03.456789');
 SECOND
--------
      3
(1 row)
```

STATEMENT_TIMESTAMP

Similar to TRANSACTION_TIMESTAMP, returns a value of type TIMESTAMP WITH TIME ZONE that represents the start of the current statement.

The return value does not change during statement execution. Thus, different stages of statement execution always have the same timestamp.

Behavior Type

Stable

Syntax

```
STATEMENT_TIMESTAMP()
```

Example

```
=> SELECT foo, bar FROM (SELECT STATEMENT_TIMESTAMP() AS foo)foo, (SELECT STATEMENT_TIMESTAMP() as
bar)bar;
              foo              |              bar
-------------------------------+-------------------------------
 2016-12-07 14:55:51.543988-05 | 2016-12-07 14:55:51.543988-05
(1 row)
```

See Also

- CLOCK_TIMESTAMP
- TRANSACTION_TIMESTAMP

SYSDATE

Returns the current statement's start date and time as a TIMESTAMP value. This function is identical to GETDATE.

SYSDATE uses the date and time supplied by the operating system on the server to which you are connected, which is the same across all servers. Internally, GETDATE converts STATEMENT_TIMESTAMP from TIMESTAMPTZ to TIMESTAMP.

Behavior Type

Stable

Syntax

```
SYSDATE()
```

> **Note:**
> You can call this function with no parentheses.

Example

```
=> SELECT SYSDATE;
          sysdate
----------------------------
 2016-12-12 06:11:10.699642
(1 row)
```

See Also

Date/Time Expressions

TIME_SLICE

Aggregates data by different fixed-time intervals and returns a rounded-up input `TIMESTAMP` value to a value that corresponds with the start or end of the time slice interval.

Given an input `TIMESTAMP` value such as `2000-10-28 00:00:01`, the start time of a 3-second time slice interval is `2000-10-28 00:00:00`, and the end time of the same time slice is `2000-10-28 00:00:03`.

Behavior Type

Immutable

Syntax

```
TIME_SLICE( expression, slice-length [, 'time-unit' [, 'start-or-end' ] ] )
```

Parameters

expression	One of the following: • Column of type TIMESTAMP • String constant that can be parsed into a TIMESTAMP value. For example: `'2004-10-19 10:23:54'` Vertica evaluates *expression* on each row.
slice-length	A positive integer that specifies the slice length.
time-unit	Time unit of the slice, one of the following: • HOUR • MINUTE • SECOND (default) • MILLISECOND • MICROSECOND
start-or-end	Specifies whether the returned value corresponds to the start or end time with one of the following strings: • START (default) • END **Note:** This parameter can be included only if you also supply a non-null *time-unit* argument.

Null Argument Handling

TIME_SLICE handles null arguments as follows:

- TIME_SLICE returns an error when any one of *slice-length*, *time-unit*, or *start-or-end* parameters is null.
- If *expression* is null and *slice-length, time-unit, or start-or-end* contain legal values, TIME_SLICE returns a NULL value instead of an error.

Usage

The following command returns the (default) start time of a 3-second time slice:

```
=> SELECT TIME_SLICE('2009-09-19 00:00:01', 3);
     TIME_SLICE
---------------------
 2009-09-19 00:00:00
(1 row)
```

The following command returns the end time of a 3-second time slice:

```
=> SELECT TIME_SLICE('2009-09-19 00:00:01', 3, 'SECOND', 'END');
     TIME_SLICE
---------------------
 2009-09-19 00:00:03
(1 row)
```

This command returns results in milliseconds, using a 3-second time slice:

```
=> SELECT TIME_SLICE('2009-09-19 00:00:01', 3, 'ms');
       TIME_SLICE
-------------------------
 2009-09-19 00:00:00.999

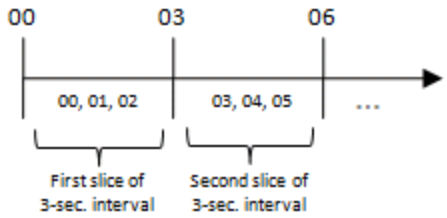
(1 row)
```

This command returns results in microseconds, using a 9-second time slice:

```
=> SELECT TIME_SLICE('2009-09-19 00:00:01', 3, 'us');
         TIME_SLICE
----------------------------
 2009-09-19 00:00:00.999999
(1 row)
```

The next example uses a 3-second interval with an input value of '00:00:01'. To focus specifically on seconds, the example omits date, though all values are implied as being part of the timestamp with a given input of `'00:00:01'`:

- '00:00:**00**' is the start of the 3-second time slice
- '00:00:**03**' is the end of the 3-second time slice.
- '00:00:03' is also the start of the *second* 3-second time slice. In time slice boundaries, the end value of a time slice does not belong to that time slice; it starts the next one.

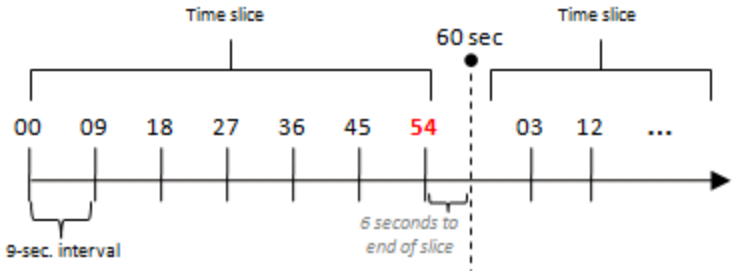


When the time slice interval is not a factor of 60 seconds, such as a given slice length of 9 in the following example, the slice does not always start or end on 00 seconds:

```
=> SELECT TIME_SLICE('2009-02-14 20:13:01', 9);
     TIME_SLICE
---------------------
 2009-02-14 20:12:54
(1 row)
```

This is expected behavior, as the following properties are true for all time slices:

- Equal in length
- Consecutive (no gaps between them)
- Non-overlapping



To force the above example ('2009-02-14 20:13:01') to start at '2009-02-14 20:13:00', adjust the output timestamp values so that the remainder of 54 counts up to 60:

```
=> SELECT TIME_SLICE('2009-02-14 20:13:01', 9 )+'6 seconds'::INTERVAL AS time;
        time
---------------------
 2009-02-14 20:13:00
(1 row)
```

Alternatively, you could use a different slice length, which is divisible by 60, such as 5:

```
=> SELECT TIME_SLICE('2009-02-14 20:13:01', 5);
     TIME_SLICE
---------------------
 2009-02-14 20:13:00
(1 row)
```

A TIMESTAMPTZ value is implicitly cast to TIMESTAMP. For example, the following two statements have the same effect.

```
=> SELECT TIME_SLICE('2009-09-23 11:12:01'::timestamptz, 3);
     TIME_SLICE
---------------------
 2009-09-23 11:12:00
(1 row)

=> SELECT TIME_SLICE('2009-09-23 11:12:01'::timestamptz::timestamp, 3);

     TIME_SLICE
---------------------
 2009-09-23 11:12:00
(1 row)
```

Examples

You can use the SQL analytic functions FIRST_VALUE and LAST_VALUE to find the first/last price within each time slice group (set of rows belonging to the same time slice). This structure can be useful if you want to sample input data by choosing one row from each time slice group.

```
=> SELECT date_key, transaction_time, sales_dollar_amount,TIME_SLICE(DATE '2000-01-01' + date_key +
transaction_time, 3),
FIRST_VALUE(sales_dollar_amount)
OVER (PARTITION BY TIME_SLICE(DATE '2000-01-01' + date_key + transaction_time, 3)
     ORDER BY DATE '2000-01-01' + date_key + transaction_time) AS first_value
FROM store.store_sales_fact
LIMIT 20;

 date_key | transaction_time | sales_dollar_amount |     time_slice      | first_value
----------+------------------+---------------------+---------------------+-------------
        1 | 00:41:16         |                 164 | 2000-01-02 00:41:15 |         164
        1 | 00:41:33         |                 310 | 2000-01-02 00:41:33 |         310
        1 | 15:32:51         |                 271 | 2000-01-02 15:32:51 |         271
        1 | 15:33:15         |                 419 | 2000-01-02 15:33:15 |         419
        1 | 15:33:44         |                 193 | 2000-01-02 15:33:42 |         193
        1 | 16:36:29         |                 466 | 2000-01-02 16:36:27 |         466
        1 | 16:36:44         |                 250 | 2000-01-02 16:36:42 |         250
        2 | 03:11:28         |                  39 | 2000-01-03 03:11:27 |          39
        3 | 03:55:15         |                 375 | 2000-01-04 03:55:15 |         375
        3 | 11:58:05         |                 369 | 2000-01-04 11:58:03 |         369
        3 | 11:58:24         |                 174 | 2000-01-04 11:58:24 |         174
        3 | 11:58:52         |                 449 | 2000-01-04 11:58:51 |         449
        3 | 19:01:21         |                 201 | 2000-01-04 19:01:21 |         201
        3 | 22:15:05         |                 156 | 2000-01-04 22:15:03 |         156
        4 | 13:36:57         |                -125 | 2000-01-05 13:36:57 |        -125
        4 | 13:37:24         |                -251 | 2000-01-05 13:37:24 |        -251
        4 | 13:37:54         |                 353 | 2000-01-05 13:37:54 |         353
        4 | 13:38:04         |                 426 | 2000-01-05 13:38:03 |         426
        4 | 13:38:31         |                 209 | 2000-01-05 13:38:30 |         209
        5 | 10:21:24         |                 488 | 2000-01-06 10:21:24 |         488
```

```
(20 rows)
```

TIME_SLICE rounds the transaction time to the 3-second slice length.

The following example uses the analytic (window) OVER clause to return the last trading price (the last row ordered by TickTime) in each 3-second time slice partition:

```
=> SELECT DISTINCT TIME_SLICE(TickTime, 3), LAST_VALUE(price)OVER (PARTITION BY TIME_SLICE(TickTime,
3)
ORDER BY TickTime ROWS BETWEEN UNBOUNDED PRECEDING AND UNBOUNDED FOLLOWING);
```

Note:
If you omit the windowing clause from an analytic clause, LAST_VALUE defaults to RANGE BETWEEN UNBOUNDED PRECEDING AND CURRENT ROW. Results can seem non-intuitive, because instead of returning the value from the bottom of the current partition, the function returns the bottom of the *window*, which continues to change along with the current input row that is being processed. For more information, see Time Series Analytics and SQL Analytics in Analyzing Data.

In the next example, FIRST_VALUE is evaluated once for each input record and the data is sorted by ascending values. Use SELECT DISTINCT to remove the duplicates and return only one output record per TIME_SLICE:

```
=> SELECT DISTINCT TIME_SLICE(TickTime, 3), FIRST_VALUE(price)OVER (PARTITION BY TIME_SLICE(TickTime,
3)
ORDER BY TickTime ASC)
FROM tick_store;
     TIME_SLICE      | ?column?
---------------------+----------
 2009-09-21 00:00:06 |    20.00
 2009-09-21 00:00:09 |    30.00
 2009-09-21 00:00:00 |    10.00
(3 rows)
```

The information output by the above query can also return MIN, MAX, and AVG of the trading prices within each time slice.

```
=> SELECT DISTINCT TIME_SLICE(TickTime, 3),FIRST_VALUE(Price) OVER (PARTITION BY TIME_SLICE(TickTime,
3)
ORDER BY TickTime ASC),
  MIN(price) OVER (PARTITION BY TIME_SLICE(TickTime, 3)),
  MAX(price) OVER (PARTITION BY TIME_SLICE(TickTime, 3)),
  AVG(price) OVER (PARTITION BY TIME_SLICE(TickTime, 3))
FROM tick_store;
```

- TS_LAST_VALUE
- Using Time Zones With Vertica

TIMEOFDAY

Returns the wall-clock time as a text string. Function results advance during transactions.

Behavior Type

Volatile

Syntax

```
TIMEOFDAY()
```

Example

```
=> SELECT TIMEOFDAY();
              TIMEOFDAY
-------------------------------------
 Mon Dec 12 08:18:01.022710 2016 EST
(1 row)
```

TIMESTAMPADD

Adds the specified number of intervals to a TIMESTAMP or TIMESTAMPTZ value and returns a result of the same data type.

Behavior Type

- **Immutable** if the input date is a TIMESTAMP
- **Stable** if the input date is a TIMESTAMPTZ

Syntax

```
TIMESTAMPADD ( datepart, count, start-date );
```

Parameters

datepart	Specifies the type of time intervals that TIMESTAMPADD adds to the specified start date. If *datepart* is an expression, it must be enclosed in parentheses: `TIMESTAMPADD((expression), interval, start;` *datepart* must evaluate to one of the following string literals, either quoted or unquoted: • year | yy | yyyy • quarter | qq | q • month | mm | m • day | dayofyear | dd | d | dy | y • week | wk | ww • hour | hh • minute | mi | n • second | ss | s • millisecond | ms • microsecond | mcs | us
count	Integer or integer expression that specifies the number of *datepart* intervals to add to *start-date*.
start-date	TIMESTAMP or TIMESTAMPTZ value.

Examples

Add two months to the current date:

```
=> SELECT CURRENT_TIMESTAMP AS Today;
           Today
-------------------------------
 2016-05-02 06:56:57.923045-04
(1 row)

=> SELECT TIMESTAMPADD (MONTH, 2, (CURRENT_TIMESTAMP)) AS TodayPlusTwoMonths;;
      TodayPlusTwoMonths
-------------------------------
 2016-07-02 06:56:57.923045-04
(1 row)
```

Add 14 days to the beginning of the current month:

```
=> SELECT TIMESTAMPADD (DD, 14, (SELECT TRUNC((CURRENT_TIMESTAMP), 'MM')));
    timestampadd
---------------------
 2016-05-15 00:00:00
(1 row)
```

TIMESTAMPDIFF

Returns the time span between two TIMESTAMP or TIMESTAMPTZ values, in the intervals specified. TIMESTAMPDIFF excludes the start date in its calculation.

Behavior Type

- **Immutable** if start and end dates are TIMESTAMP
- **Stable** if start and end dates are TIMESTAMPTZ

Syntax

```
TIMESTAMPDIFF ( datepart, start, end );
```

Parameters

datepart	Specifies the type of date or time intervals that TIMESTAMPDIFF returns. If *datepart* is an expression, it must be enclosed in parentheses: `TIMESTAMPDIFF((expression), start, end );` *datepart* must evaluate to one of the following string literals, either quoted or unquoted:

	• year | yy | yyyy • quarter | qq | q • month | mm | m • day | dayofyear | dd | d | dy | y • week | wk | ww • hour | hh • minute | mi | n • second | ss | s • millisecond | ms • microsecond | mcs | us
start, *end*	Specify the start and end dates, where *start* and *end* evaluate to one of the following data types: • TIMESTAMP/TIMESTAMPTZ • TIMESTAMPTZ If *end* < *start*, TIMESTAMPDIFF returns a negative value.

Date Part Intervals

TIMESTAMPDIFF uses the *datepart* argument to calculate the number of intervals between two dates, rather than the actual amount of time between them. For detailed information, see DATEDIFF.

Examples

```
=> SELECT TIMESTAMPDIFF (YEAR,'1-1-2006 12:34:00', '1-1-2008 12:34:00');
 timestampdiff
---------------
             2
(1 row)
```

See Also

DATEDIFF

TIMESTAMP_ROUND

Rounds the specified TIMESTAMP. If you omit the precision argument, TIMESTAMP_ROUND rounds to day (DD) precision.

Behavior Type

- **Immutable** if the target date is a TIMESTAMP
- **Stable** if the target date is a TIMESTAMPTZ

Syntax

```
TIMESTAMP_ROUND ( rounding-target[, 'precision'] )
```

Parameters

rounding-target	An expression that evaluates to one of the following data types: • TIMESTAMP/TIMESTAMPTZ • TIMESTAMPTZ
precision	A string constant that specifies precision for the rounded value, one of the following: • **Century**: CC | SCC • **Year**: SYYY | YYYY | YEAR | YYY | YY | Y • **ISO Year**: IYYY | IYY | IY | I • **Quarter**: Q • **Month**: MONTH | MON | MM | RM • **Same weekday as first day of year**: WW • **Same weekday as first day of ISO year**: IW • **Same weekday as first day of month**: W • **Day** (default): DDD | DD | J • **First weekday**: DAY | DY | D • **Hour**: HH | HH12 | HH24 • **Minute**: MI • **Second**: SS

	Note: Hour, minute, and second rounding is not supported by DATE expressions.

Examples

Round to the nearest hour:

```
=> SELECT TIMESTAMP_ROUND(CURRENT_TIMESTAMP, 'HH');
        ROUND
---------------------
 2016-04-28 15:00:00
(1 row)
```

Round to the nearest month:

```
=> SELECT TIMESTAMP_ROUND('9-22-2011 12:34:00'::TIMESTAMP, 'MM');
        ROUND
---------------------
 2011-10-01 00:00:00
(1 row)
```

See Also

ROUND

TIMESTAMP_TRUNC

Truncates the specified TIMESTAMP. If you omit the precision argument, TIMESTAMP_TRUNC truncates to day (DD) precision.

Behavior Type

- **Immutable** if the target date is a TIMESTAMP
- **Stable** if the target date is a TIMESTAMPTZ

Syntax

```
TIMESTAMP_TRUNC( trunc-target[, 'precision'] )
```

Parameters

trunc-target	An expression that evaluates to one of the following data types: • TIMESTAMP/TIMESTAMPTZ • TIMESTAMPTZ
precision	A string constant that specifies precision for the truncated value, one of the following: • **Century**: CC | SCC • **Year**: SYYY | YYYY | YEAR | YYY | YY | Y • **ISO Year**: IYYY | IYY | IY | I • **Quarter**: Q • **Month**: MONTH | MON | MM | RM • **Same weekday as first day of year**: WW • **Same weekday as first day of ISO year**: IW • **Same weekday as first day of month**: W • **Day**: DDD | DD | J • **First weekday**: DAY | DY | D • **Hour**: HH | HH12 | HH24 • **Minute**: MI • **Second**: SS **Note:** Hour, minute, and second truncating is not supported by DATE expressions.

Examples

Truncate to the current hour:

```
=> SELECT TIMESTAMP_TRUNC(CURRENT_TIMESTAMP, 'HH');
   TIMESTAMP_TRUNC
---------------------
 2016-04-29 08:00:00
(1 row)
```

Truncate to the month:

```
=> SELECT TIMESTAMP_TRUNC('9-22-2011 12:34:00'::TIMESTAMP, 'MM');
   TIMESTAMP_TRUNC
```

```
---------------------
 2011-09-01 00:00:00
(1 row)
```

See Also

TRUNC

TRANSACTION_TIMESTAMP

Returns a value of type `TIME WITH TIMEZONE` that represents the start of the current transaction.

The return value does not change during the transaction. Thus, multiple calls to `TRANSACTION_TIMESTAMP` within the same transaction return the same timestamp.

`TRANSACTION_TIMESTAMP` is equivalent to `CURRENT_TIMESTAMP`, except it does not accept a precision parameter.

Behavior Type

Stable

Syntax

```
TRANSACTION_TIMESTAMP()
```

Example

```
=> SELECT foo, bar FROM (SELECT TRANSACTION_TIMESTAMP() AS foo)foo, (SELECT TRANSACTION_TIMESTAMP()
as bar)bar;
              foo              |              bar
-------------------------------+-------------------------------
 2016-12-12 08:18:00.988528-05 | 2016-12-12 08:18:00.988528-05
(1 row)
```

See Also

- CLOCK_TIMESTAMP
- STATEMENT_TIMESTAMP

TRUNC

Truncates the specified date or time. If you omit the precision argument, TRUNC truncates to day (DD) precision.

Behavior Type

- **Immutable** if the target date is a TIMESTAMP or DATE
- **Stable** if the target date is aTIMESTAMPTZ

Syntax

```
TRUNC( trunc-target[, 'precision'] )
```

Parameters

trunc-target	An expression that evaluates to one of the following data types: • DATE • TIMESTAMP/TIMESTAMPTZ • TIMESTAMPTZ
precision	A string constant that specifies precision for the truncated value, one of the following: • **Century**: CC | SCC • **Year**: SYYY | YYYY | YEAR | YYY | YY | Y • **ISO Year**: IYYY | IYY | IY | I • **Quarter**: Q • **Month**: MONTH | MON | MM | RM • **Same weekday as first day of year**: WW

	• **Same weekday as first day of ISO year**: IW • **Same weekday as first day of month**: W • **Day** (default): DDD | DD | J • **First weekday**: DAY | DY | D • **Hour**: HH | HH12 | HH24 • **Minute**: MI • **Second**: SS **Note:** Hour, minute, and second truncating is not supported by DATE expressions.

Examples

Truncate to the current hour:

```
=> => SELECT TRUNC(CURRENT_TIMESTAMP, 'HH');
        TRUNC
---------------------
 2016-04-29 10:00:00
(1 row)
```

Truncate to the month:

```
=> SELECT TRUNC('9-22-2011 12:34:00'::TIMESTAMP, 'MM');
   TIMESTAMP_TRUNC
---------------------
 2011-09-01 00:00:00
(1 row)
```

See Also

TIMESTAMP_TRUNC

WEEK

Returns the week of the year for the specified date as an integer, where the first week begins on the first Sunday on or preceding January 1.

Syntax

```
WEEK ( date )
```

Behavior Type

- **Immutable** if the specified date is a TIMESTAMP, DATE, or VARCHAR
- **Stable** if the specified date is aTIMESTAMPTZ

Parameters

date	The date to process, one of the following data types: • VARCHAR • DATE • TIMESTAMP • TIMESTAMPTZ

Examples

January 2 is on Saturday, so WEEK returns 1:

```
=> SELECT WEEK ('1-2-2016'::DATE);
 WEEK
------
    1
(1 row)
```

January 3 is the second Sunday in 2016, so WEEK returns 2:

```
=> SELECT WEEK ('1-3-2016'::DATE);
 WEEK
------
    2
(1 row)
```

WEEK_ISO

Returns the week of the year for the specified date as an integer, where the first week starts on Monday and contains January 4. This function conforms with the ISO 8061 standard.

Syntax

```
WEEK_ISO ( date )
```

Behavior Type

- **Immutable** if the specified date is a TIMESTAMP, DATE, or VARCHAR
- **Stable** if the specified date is aTIMESTAMPTZ

Parameters

date	The date to process, one of the following data types: • VARCHAR • DATE • TIMESTAMP • TIMESTAMPTZ

Examples

The first week of 2016 begins on Monday January 4:

```
=> SELECT WEEK_ISO ('1-4-2016'::DATE);
 WEEK_ISO
----------
        1
(1 row)
```

January 3 2016 returns week 53 of the previous year (2015):

```
=> SELECT WEEK_ISO ('1-3-2016'::DATE);
 WEEK_ISO
```

```
----------
       53
(1 row)
```

In 2015, January 4 is on Sunday, so the first week of 2015 begins on the preceding Monday (December 29 2014):

```
=> SELECT WEEK_ISO ('12-29-2014'::DATE);
 WEEK_ISO
----------
        1
(1 row)
```

YEAR

Returns an integer that represents the year portion of the specified date.

Syntax

```
YEAR( date )
```

Behavior Type

- **Immutable** if the specified date is a TIMESTAMP, DATE, VARCHAR, or INTERVAL
- **Stable** if the specified date is aTIMESTAMPTZ

Parameters

date	The date to process, one of the following data types: • VARCHAR • DATE • TIMESTAMP • TIMESTAMPTZ • INTERVAL

Examples

```
=> SELECT YEAR(CURRENT_DATE::DATE);
 YEAR
------
 2016
(1 row)
```

See Also

YEAR_ISO

YEAR_ISO

Returns an integer that represents the year portion of the specified date. The return value is based on the ISO 8061 standard.

The first week of the ISO year is the week that contains January 4.

Syntax

```
YEAR_ISO ( date )
```

Behavior Type

- **Immutable** if the specified date is a TIMESTAMP, DATE, or VARCHAR
- **Stable** if the specified date is aTIMESTAMPTZ

Parameters

date	The date to process, one of the following data types: • VARCHAR • DATE • TIMESTAMP • TIMESTAMPTZ

Examples

```
> SELECT YEAR_ISO(CURRENT_DATE::DATE);
 YEAR_ISO
----------
     2016
(1 row)
```

See Also

YEAR

Error-handling Functions

Error-handling functions take a string and return the string when the query is executed.

THROW_ERROR

Returns a user-defined error message.

In a multi-node cluster, race conditions might cause the order of error messages to differ.

Syntax

```
THROW_ERROR ( message )
```

Parameters

message	The VARCHAR string to to return.

Examples

Return an error message when a CASE statement is met:

```
=> CREATE TABLE pitcher_err (some_text varchar);
CREATE TABLE
=> COPY pitcher_err FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> big foo value
>> bigger foo other value
>> bar another foo value
>> \.
=> SELECT (CASE WHEN true THEN THROW_ERROR('Failure!!!') ELSE some_text END) FROM pitcher_err;
ERROR 7137:  USER GENERATED ERROR: Failure!!!
```

Return an error message when a CASE statement using REGEXP_LIKE is met:

```
=> SELECT (CASE WHEN REGEXP_LIKE(some_text, 'other') THEN THROW_ERROR('Failure at "' || some_text ||
'"') END) FROM pitcher_err;
ERROR 4566:  USER GENERATED ERROR: Failure at "bar another foo value"
```

Formatting Functions

Formatting functions provide a powerful tool set for converting various data types (DATE/TIME, INTEGER, FLOATING POINT) to formatted strings and for converting from formatted strings to specific data types.

TO_BITSTRING

Returns a VARCHAR that represents the given VARBINARY value in bitstring format. This function is the inverse of BITSTRING_TO_BINARY.

Behavior Type

Immutable

Syntax

```
TO_BITSTRING ( expression )
```

Parameters

expression	The VARCHAR string to process.

Examples

```
=> SELECT TO_BITSTRING('ab'::BINARY(2));
   to_bitstring
------------------
 0110000101100010
(1 row)

=> SELECT TO_BITSTRING(HEX_TO_BINARY('0x10'));
 to_bitstring
--------------
00010000
(1 row)
```

```
=> SELECT TO_BITSTRING(HEX_TO_BINARY('0xF0'));
 to_bitstring
--------------
11110000
(1 row)
```

See Also

BITCOUNT

TO_CHAR

Converts various date/time and numeric values into text strings.

Behavior Type

Stable

Syntax

```
TO_CHAR ( expression [, pattern ] )
```

Parameters

expression	Specifies the value to convert, one of the following data types: • DOUBLE PRECISION • INTEGER • INTERVAL • TIME/TIMETZ • TIMESTAMP/TIMESTAMPTZ
pattern	A CHAR or VARCHAR that specifies an output pattern string. See: • Template Patterns for Date/Time Formatting • Template Patterns for Numeric Formatting

Notes

- TO_CHAR(any) casts any type, except BINARY/VARBINARY, to VARCHAR.

  The following example returns an error if you try to cast TO_CHAR to a binary data type:

```
=> SELECT TO_CHAR('abc'::VARBINARY);
   ERROR:  cannot cast type varbinary to varchar
```

- TO_CHAR accepts TIME and TIMETZ data types as inputs if you explicitly cast TIME to TIMESTAMP and TIMETZ to TIMESTAMPTZ.

```
=> SELECT TO_CHAR(TIME '14:34:06.4','HH12:MI am');
=> SELECT TO_CHAR(TIMETZ '14:34:06.4+6','HH12:MI am');
```

  You can extract the timezone hour from TIMETZ:

```
=> SELECT EXTRACT(timezone_hour FROM TIMETZ '10:30+13:30');
 date_part
-----------
        13
(1 row)
```

- Ordinary text is allowed in to_char templates and is output literally. You can put a substring in double quotes to force it to be interpreted as literal text even if it contains pattern key words. For example, in '"Hello Year "YYYY', the *YYYY* is replaced by the year data, but the single Y in Year is not.
- TO_CHAR's day-of-the-week numbering (see the 'D' template pattern) is different from that of the EXTRACT function.
- Given an INTERVAL type, TO_CHAR formats HH and HH12 as hours in a single day, while HH24 can output hours exceeding a single day, for example, >24.
- To use a double quote character in the output, precede it with a double backslash. This is necessary because the backslash already has a special meaning in a string constant. For example: '\\"YYYY Month\\"'
- TO_CHAR does not support the use of V combined with a decimal point. For example: 99.9V99 is not allowed.
- When rounding, the last digit of the rounded representation is selected to be even if the number is exactly half way between the two.

Examples

Expression	Result
SELECT TO_CHAR(CURRENT_TIMESTAMP, 'Day, DD HH12:MI:SS');	'Tuesday , 06 05:39:18'
SELECT TO_CHAR(CURRENT_TIMESTAMP, 'FMDay, FMDD HH12:MI:SS');	'Tuesday, 6 05:39:18'
SELECT TO_CHAR(TIMEtz '14:34:06.4+6','HH12:MI am'); TO_CHAR	04:34 am
SELECT TO_CHAR(-0.1, '99.99');	' -.10'
SELECT TO_CHAR(-0.1, 'FM9.99');	'-.1'
SELECT TO_CHAR(0.1, '0.9');	' 0.1'

SELECT TO_CHAR(485, '"Good number:"999');	'Good number: 485'
SELECT TO_CHAR(485.8, '"Pre:"999" Post:" .999');	'Pre: 485 Post: .800'
SELECT TO_CHAR(12, '99V999');	' 12000'
SELECT TO_CHAR(12.4, '99V999');	' 12400'
SELECT TO_CHAR(12.45, '99V9');	' 125'
SELECT TO_CHAR(-1234.567);	-1234.567
SELECT TO_CHAR('1999-12-25'::DATE);	1999-12-25
SELECT TO_CHAR('1999-12-25 11:31'::TIMESTAMP);	1999-12-25 11:31:00
SELECT TO_CHAR('1999-12-25 11:31 EST'::TIMESTAMPTZ);	1999-12-25 11:31:00-05
SELECT TO_CHAR('3 days 1000.333 secs'::INTERVAL);	3 days 00:16:40.333

See Also

- DATE_PART

TO_DATE

Converts a string value to a DATE type.

Behavior Type

Stable

Syntax

```
TO_DATE ( expression , pattern )
```

Parameters

expression	Specifies the string value to convert, either CHAR or VARCHAR.
pattern	A CHAR or VARCHAR that specifies an output pattern string. See: • Template Patterns for Date/Time Formatting • Template Patterns for Numeric Formatting

Input Value Considerations

TO_DATE requires a CHAR or VARCHAR expression. For other input types, use TO_CHAR to perform an explicit cast to a CHAR or VARCHAR before using this function.

Notes

- To use a double quote character in the output, precede it with a double backslash. This is necessary because the backslash already has a special meaning in a string constant. For example: `'\\"YYYY Month\\"'`
- TO_TIMESTAMP, TO_TIMESTAMP_TZ, and TO_DATE skip multiple blank spaces in the input string if the FX option is not used. FX must be specified as the first item in the template. For example:
  - `TO_TIMESTAMP('2000  JUN', 'YYYY MON')` is correct.
  - `TO_TIMESTAMP('2000  JUN', 'FXYYYY MON')` returns an error, because TO_TIMESTAMP expects one space only.
- The YYYY conversion from string to TIMESTAMP or DATE has a restriction if you use a year with more than four digits. You must use a non-digit character or template after YYYY, otherwise the year is always interpreted as four digits. For example, given the following arguments, TO_DATE interprets the five-digit year 20000 as a four-digit year:

```
=> SELECT TO_DATE('200001131','YYYYMMDD');
  TO_DATE
------------
 2000-01-13
(1 row)
```

Instead, use a non-digit separator after the year. For example:

```
=> SELECT TO_DATE('20000-1131', 'YYYY-MMDD');
   TO_DATE
-------------
 20000-12-01
(1 row)
```

- In conversions from string to `TIMESTAMP` or `DATE`, the CC field is ignored if there is a YYY, YYYY or Y,YYY field. If CC is used with YY or Y, then the year is computed as (CC–1)*100+YY.

Examples

```
=> SELECT TO_DATE('13 Feb 2000', 'DD Mon YYYY');
  to_date
------------
 2000-02-13
(1 row)
```

See Also

Date/Time Functions

TO_HEX

Returns a VARCHAR or VARBINARY representing the hexadecimal equivalent of a number. This function is the inverse of HEX_TO_BINARY.

Behavior Type

Immutable

Syntax

```
TO_HEX ( number )
```

Parameters

number	An INTEGER or VARBINARY value to convert to hexadecimal. If you supply a VARBINARY argument, the function's return value is not preceded by `0x`.

Examples

```
=> SELECT TO_HEX(123456789);
 TO_HEX
---------
 75bcd15
(1 row)
```

For VARBINARY inputs, the returned value is not preceded by `0x`. For example:

```
=> SELECT TO_HEX('ab'::binary(2));
 TO_HEX
--------
 6162
(1 row)
```

TO_TIMESTAMP

Converts a string value or a UNIX/POSIX epoch value to a `TIMESTAMP` type.

Behavior Type

Stable

Syntax

```
TO_TIMESTAMP ( { expression, pattern } | unix-epoch )
```

Parameters

expression	Specifies the string value to convert, of type CHAR or VARCHAR.
pattern	A CHAR or VARCHAR that specifies an output pattern string. See: • Template Patterns for Date/Time Formatting • Template Patterns for Numeric Formatting
unix-epoch	DOUBLE PRECISION value that specifies some number of seconds elapsed since midnight UTC of January 1, 1970, excluding leap seconds. INTEGER values are implicitly cast to DOUBLE PRECISION.

Notes

- Millisecond (MS) and microsecond (US) values in a conversion from string to `TIMESTAMP` are used as part of the seconds after the decimal point. For example `TO_TIMESTAMP('12:3', 'SS:MS')` is not 3 milliseconds, but 300, because the conversion counts it as 12 + 0.3 seconds. This means for the format `SS:MS`, the input values `12:3`, `12:30`, and `12:300` specify the same number of milliseconds. To get three milliseconds, use `12:003`, which the conversion counts as `12 + 0.003 = 12.003` seconds.

  Here is a more complex example: `TO_TIMESTAMP('15:12:02.020.001230', 'HH:MI:SS.MS.US')` is 15 hours, 12 minutes, and 2 seconds + 20 milliseconds + 1230 microseconds = 2.021230 seconds.

- To use a double quote character in the output, precede it with a double backslash. This is necessary because the backslash already has a special meaning in a string constant. For example: `'\\"YYYY Month\\"'`

- `TO_TIMESTAMP`, `TO_TIMESTAMP_TZ`, and `TO_DATE` skip multiple blank spaces in the input string if the FX option is not used. FX must be specified as the first item in the template. For example:

  - `TO_TIMESTAMP('2000  JUN', 'YYYY MON')` is correct.
  - `TO_TIMESTAMP('2000  JUN', 'FXYYYY MON')` returns an error, because `TO_TIMESTAMP` expects one space only.
- The `YYYY` conversion from string to `TIMESTAMP` or `DATE` has a restriction if you use a year with more than four digits. You must use a non-digit character or template after

YYYY, otherwise the year is always interpreted as four digits. For example, given the following arguments, TO_DATE interprets the five-digit year 20000 as a four-digit year:

```
=> SELECT TO_DATE('200001131','YYYYMMDD');
  TO_DATE
------------
 2000-01-13
(1 row)
```

Instead, use a non-digit separator after the year. For example:

```
=> SELECT TO_DATE('20000-1131', 'YYYY-MMDD');
   TO_DATE
-------------
 20000-12-01
(1 row)
```

- In conversions from string to TIMESTAMP or DATE, the CC field is ignored if there is a YYY, YYYY or Y,YYY field. If CC is used with YY or Y, then the year is computed as (CC–1)*100+YY.

Examples

```
=> SELECT TO_TIMESTAMP('13 Feb 2009', 'DD Mon YYYY');
    TO_TIMESTAMP
---------------------
 1200-02-13 00:00:00
(1 row)

=> SELECT TO_TIMESTAMP(200120400);
    TO_TIMESTAMP
---------------------
 1976-05-05 01:00:00
(1 row)
```

See Also

Date/Time Functions

TO_TIMESTAMP_TZ

Converts a string value or a UNIX/POSIX epoch value to a TIMESTAMP WITH TIME ZONE type.

Behavior Type

Immutable if single argument form, **Stable** otherwise.

Syntax

```
TO_TIMESTAMP_TZ ( { expression, pattern } | unix-epoch )
```

Parameters

expression	Specifies the string value to convert, of type CHAR or VARCHAR.
pattern	A CHAR or VARCHAR that specifies an output pattern string. See: • Template Patterns for Date/Time Formatting • Template Patterns for Numeric Formatting
unix-epoch	A DOUBLE PRECISION value that specifies some number of seconds elapsed since midnight UTC of January 1, 1970, excluding leap seconds. INTEGER values are implicitly cast to DOUBLE PRECISION.

Notes

- Millisecond (MS) and microsecond (US) values in a conversion from string to `TIMESTAMP` are used as part of the seconds after the decimal point. For example `TO_TIMESTAMP('12:3', 'SS:MS')` is not 3 milliseconds, but 300, because the conversion counts it as 12 + 0.3 seconds. This means for the format `SS:MS`, the input values `12:3`, `12:30`, and `12:300` specify the same number of milliseconds. To get three milliseconds, use `12:003`, which the conversion counts as `12 + 0.003 = 12.003` seconds.

  Here is a more complex example: `TO_TIMESTAMP('15:12:02.020.001230', 'HH:MI:SS.MS.US')` is 15 hours, 12 minutes, and 2 seconds + 20 milliseconds + 1230 microseconds = 2.021230 seconds.

- To use a double quote character in the output, precede it with a double backslash. This is necessary because the backslash already has a special meaning in a string constant. For example: `'\\"YYYY Month\\"'`

- TO_TIMESTAMP, TO_TIMESTAMP_TZ, and TO_DATE skip multiple blank spaces in the input string if the FX option is not used. FX must be specified as the first item in the template. For example:
  - TO_TIMESTAMP('2000 JUN', 'YYYY MON') is correct.
  - TO_TIMESTAMP('2000 JUN', 'FXYYYY MON') returns an error, because TO_TIMESTAMP expects one space only.
- The YYYY conversion from string to TIMESTAMP or DATE has a restriction if you use a year with more than four digits. You must use a non-digit character or template after YYYY, otherwise the year is always interpreted as four digits. For example, given the following arguments, TO_DATE interprets the five-digit year 20000 as a four-digit year:

```
=> SELECT TO_DATE('200001131','YYYYMMDD');
  TO_DATE
------------
 2000-01-13
(1 row)
```

  Instead, use a non-digit separator after the year. For example:

```
=> SELECT TO_DATE('20000-1131', 'YYYY-MMDD');
   TO_DATE
-------------
 20000-12-01
(1 row)
```

- In conversions from string to TIMESTAMP or DATE, the CC field is ignored if there is a YYY, YYYY or Y,YYY field. If CC is used with YY or Y, then the year is computed as (CC–1)*100+YY.

Examples

```
=> SELECT TO_TIMESTAMP_TZ('13 Feb 2009', 'DD Mon YYY');
    TO_TIMESTAMP_TZ
-----------------------
 1200-02-13 00:00:00-05
(1 row)
=> SELECT TO_TIMESTAMP_TZ(200120400);
    TO_TIMESTAMP_TZ
-----------------------
 1976-05-05 01:00:00-04
(1 row)
```

Date/Time Functions

TO_NUMBER

Converts a string value to DOUBLE PRECISION.

Behavior Type

Stable

Syntax

```
TO_NUMBER ( expression, [ pattern ] )
```

Parameters

expression	Specifies the string value to convert, either CHAR or VARCHAR.
pattern	A string value, either CHAR or VARCHAR, that specifies an output pattern string using one of the supported Template Patterns for Numeric Formatting. If you omit this parameter, TO_NUMBER returns a floating point.

Notes

To use a double quote character in the output, precede it with a double backslash. This is necessary because the backslash already has a special meaning in a string constant. For example: `'\\"YYYY Month\\"'`

Note:
To convert a date string to a numeric value, use the appropriate date/time function, such as EXTRACT.

Examples

```
=> SELECT TO_NUMBER('MCML', 'rn');
TO_NUMBER
-----------
1950
(1 row)
```

It the `pattern` parameter is omitted, the function returns a floating point. For example:

```
=> SELECT TO_NUMBER('-123.456e-01');
 TO_NUMBER
-----------
  -12.3456
```

Template Patterns for Date/Time Formatting

In an output template string (for TO_CHAR), certain patterns are recognized and replaced with appropriately formatted data from the value to format. Any text that is not a template pattern is copied verbatim. Similarly, in an input template string (for anything other than TO_CHAR), template patterns identify the parts of the input data string to look at and the values to find there.

Note:
Vertica uses the ISO 8601:2004 style for date/time fields in Vertica log files. For example:

```
2020-03-25 05:04:22.372 Init Session:0x7f8fcefec700-a000000013dcd4 [Txn] <INFO> Begin Txn:
a000000013dcd4 'read role info'
```

Certain modifiers can be applied to any template pattern to alter its behavior, as described in Template Pattern Modifiers for Date/Time Formatting.

Pattern	Description
HH	Hour of day (00-23)
HH12	Hour of day (01-12)
HH24	Hour of day (00-23)
MI	Minute (00-59)
SS	Second (00-59)
MS	Millisecond (000-999)
US	Microsecond (000000-999999)
SSSS	Seconds past midnight (0-86399)
AM A.M. PM P.M.	Meridian indicator (uppercase)
am a.m.	Meridian indicator (lowercase)

Pattern	Description
pm p.m.	
Y YYY	Year (4 and more digits) with comma
YYYY	Year (4 and more digits)
YYY	Last 3 digits of year
YY	Last 2 digits of year
Y	Last digit of year
IYYY	ISO year (4 and more digits)
IYY	Last 3 digits of ISO year
IY	Last 2 digits of ISO year
I	Last digits of ISO year
BC B.C. AD A.D.	Era indicator (uppercase)
bc b.c. ad a.d.	Era indicator (lowercase)
MONTH	Full uppercase month name (blank-padded to 9 chars)
Month	Full mixed-case month name (blank-padded to 9 chars)
month	Full lowercase month name (blank-padded to 9 chars)

Pattern	Description
MON	Abbreviated uppercase month name (3 chars)
Mon	Abbreviated mixed-case month name (3 chars)
mon	Abbreviated lowercase month name (3 chars)
MM	Month number (01-12)
DAY	Full uppercase day name (blank-padded to 9 chars)
Day	Full mixed-case day name (blank-padded to 9 chars)
day	full lowercase day name (blank-padded to 9 chars)
DY	Abbreviated uppercase day name (3 chars)
Dy	Abbreviated mixed-case day name (3 chars)
dy	Abbreviated lowercase day name (3 chars)
DDD	Day of year (001-366)
DD	Day of month (01-31) for TIMESTAMP **Note:** For INTERVAL, DD is day of year (001-366) because day of month is undefined.
D	Day of week (1-7; Sunday is 1)
W	Week of month (1-5) (The first week starts on the first day of the month.)
WW	Week number of year (1-53) (The first week starts on the first day of the year.)
IW	ISO week number of year (The first Thursday of the new year is in week 1.)
CC	Century (2 digits)
J	Julian Day (days since January 1, 4712 BC)
Q	Quarter

Pattern	Description
RM	Month in Roman numerals (I-XII; I=January) (uppercase)
rm	Month in Roman numerals (i-xii; i=January) (lowercase)
TZ	Time-zone name (uppercase)
tz	Time-zone name (lowercase)

Examples

Use TO_TIMESTAMP to convert an expression using the pattern `'YYY MON'`:

```
=> SELECT TO_TIMESTAMP('2017 JUN', 'YYYY MON');
    TO_TIMESTAMP
---------------------
 2017-06-01 00:00:00
(1 row)
```

Use TO_DATE to convert an expression using the pattern `'YYY-MMDD'`:

```
=> SELECT TO_DATE('2017-1231', 'YYYY-MMDD');
  TO_DATE
------------
 2017-12-31
(1 row)
```

Template Pattern Modifiers for Date/Time Formatting

Certain modifiers can be applied to any template pattern to alter its behavior. For example, `FMMonth` is the `Month` pattern with the `FM` modifier.

Modifier	Description
AM	Time is before 12:00
AT	Ignored
JULIAN, JD, J	Next field is Julian Day

Modifier	Description
FM prefix	Fill mode (suppress padding blanks and zeros) For example: FMMonth **Note:** The FM modifier suppresses leading zeros and trailing blanks that would otherwise be added to make the output of a pattern fixed width.
FX prefix	Fixed format global option For example: FX Month DD Day
ON	Ignored
PM	Time is on or after 12:00
T	Next field is time
TH suffix	Uppercase ordinal number suffix For example: DDTH
th suffix	Lowercase ordinal number suffix For example: DDth
TM prefix	Translation mode (print localized day and month names based on lc_ messages). For example: TMMonth

Template Patterns for Numeric Formatting

Pattern	Description
9	Value with the specified number of digits
0	Value with leading zeros
. (period)	Decimal point
, (comma)	Group (thousand) separator
PR	Negative value in angle brackets

Pattern	Description
S	Sign anchored to number (uses locale)
L	Currency symbol (uses locale)
D	Decimal point (uses locale)
G	Group separator (uses locale)
MI	Minus sign in specified position (if number < 0)
PL	Plus sign in specified position (if number > 0)
SG	Plus/minus sign in specified position
RN	Roman numeral (input between 1 and 3999)
TH or th	Ordinal number suffix
V	Shift specified number of digits (see notes)
EEEE	Scientific notation (not implemented yet)

Usage

- A sign formatted using SG, PL, or MI is not anchored to the number; for example:
  - TO_CHAR(-12, 'S9999') produces ' -12'
  - TO_CHAR(-12, 'MI9999') produces '- 12'
- 9 results in a value with the same number of digits as there are 9s. If a digit is not available it outputs a space.
- TH does not convert values less than zero and does not convert fractional numbers.
- V effectively multiplies the input values by 10^*n*, where *n* is the number of digits following V. TO_CHAR does not support the use of V combined with a decimal point. For example: 99.9V99 is not allowed.

Geospatial Functions

The following topics describe the Vertica geospatial functions.

Function-Naming Conventions

The geospatial functions use the following naming conventions:

- The ST_*function-name* functions are compliant with the latest Open Geospatial Consortium standard OGC SFA-SQL version 1.2.1 (reference. number is OGC 06-104r4, date: 2010-08-04). Currently, some ST_*function-name*> functions may not support all data types. Each function page contains details about the supported data types.

> **Note:**
> Some functions, such as ST_GeomFromText, are based on previous versions of the standard.

- The STV_*function-name*> functions are unique to Vertica and not compliant with OGC standards. Each function page explains its functionality in detail.

Verifying Spatial Objects Validity

Many spatial functions do not verify the validity of the parameters. If you pass an invalid spatial object to an ST_ or STV_ function, the function may return an error or produce incorrect results.

To avoid this issue, OpenText recommends that you first run ST_IsValid on all spatial objects to verify their validity. If your object is not valid, run STV_IsValidReason to get information about the location of the invalidity.

> **Note:**
> If you pass a valid polygon to STV_IsValidReason, it returns NULL.

ST_AsText

Creates the Well-Known Text (WKT) representation of a spatial object. Use this function when you need to specify a spatial object in ASCII form.

The Open Geospatial Consortium (OGC) defines the format of a WKT string in the Simple Feature Access Part 1 - Common Architecture specification.

Behavior Type

Immutable

Syntax

```
ST_AsText( g )
```

Arguments

g	Spatial object for which you want the WKT string, type GEOMETRY or GEOGRAPHY

Returns

LONG VARCHAR

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	Yes	Yes	Yes
Multipoint	Yes	Yes	Yes
Linestring	Yes	Yes	Yes
Multilinestring	Yes	Yes	Yes
Polygon	Yes	Yes	Yes
Multipolygon	Yes	Yes	Yes
GeometryCollection	Yes	No	No

Example

The following example shows how to use ST_AsText.

Retrieve WKB and WKT representations:

```
=> CREATE TABLE locations (id INTEGER, name VARCHAR(100), geom1 GEOMETRY(800),
   geom2 GEOGRAPHY);
CREATE TABLE
=> COPY locations
    (id, geom1x FILLER LONG VARCHAR(800), geom1 AS ST_GeomFromText(geom1x), geom2x FILLER LONG
VARCHAR (800),
     geom2 AS ST_GeographyFromText(geom2x))
    FROM stdin;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 1|POINT(2 3)|
>> 2|LINESTRING(2 4,1 5)|
>> 3||POLYGON((-70.96 43.27,-70.67 42.95,-66.90 44.74,-67.81 46.08,-67.81 47.20,-69.22 47.43,-71.09
45.25,-70.96 43.27))
>> \.
=> SELECT id, ST_AsText(geom1),ST_AsText(geom2) FROM locations ORDER BY id ASC;
 id |       ST_AsText       |                ST_AsText

----+-----------------------+-------------------------------------------
  1 | POINT (2 3)           |
  2 | LINESTRING (2 4, 1 5) |
  3 |                       | POLYGON ((-70.96 43.27, -70.67 42.95, -66.9 44.74, -67.81 46.08, -67.81
47.2, -69.22 47.43, -71.09 45.25, -70.96 43.27))
(3 rows)
```

Calculate the length of a WKT using the Vertica SQL function LENGTH:

```
=> SELECT LENGTH(ST_AsText(St_GeomFromText('POLYGON ((-1 2, 0 3, 1 2,
                                                     0 1, -1 2))')));
 LENGTH
--------
     37
(1 row)
```

See Also

- ST_AsBinary

ST_Area

Calculates the area of a spatial object.

The units are:

- GEOMETRY objects: spatial reference system identifier (SRID) units
- GEOGRAPHY objects: square meters

Behavior Type

Immutable

Syntax

```
ST_Area( g )
```

Arguments

g	Spatial object for which you want to calculate the area, type GEOMETRY or GEOGRAPHY

Returns

FLOAT

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)
Point	Yes	Yes
Multipoint	Yes	Yes
Linestring	Yes	Yes
Multilinestring	Yes	Yes
Polygon	Yes	Yes
Multipolygon	Yes	Yes
GeometryCollection	Yes	No

Examples

The following examples show how to use ST_Area.

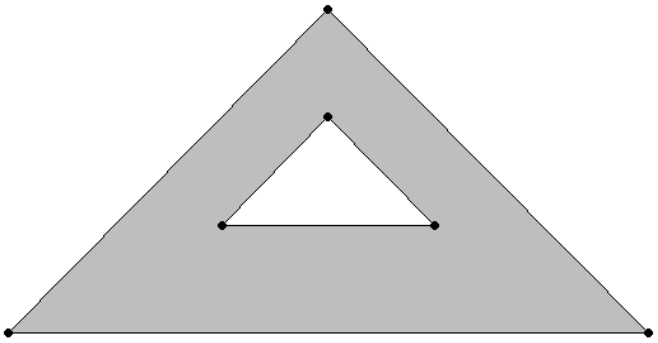
Calculate the area of a polygon:

```
=> SELECT ST_Area(ST_GeomFromText('POLYGON((0 0,1 0,1 1,0 1,0 0))'));
 ST_Area
---------
       1
(1 row)
```

Calculate the area of a multipolygon:

```
=> SELECT ST_Area(ST_GeomFromText('MultiPolygon(((0 0,1 0,1 1,0 1,0 0)),
   ((2 2,2 3,4 6,3 3,2 2)))'));
 ST_Area
---------
     3
(1 row)
```

Suppose the polygon has a hole, as in the following figure.



Calculate the area, excluding the area of the hole:

```
=> SELECT ST_Area(ST_GeomFromText('POLYGON((2 2,5 5,8 2,2 2),
   (4 3,5 4,6 3,4 3))'));
 ST_Area
---------
       8
(1 row)
```

Calculate the area of a geometry collection:

```
=> SELECT ST_Area(ST_GeomFromText('GEOMETRYCOLLECTION(POLYGON((20.5 20.45,
   20.51 20.52,20.69 20.32,20.5 20.45)),POLYGON((10 20,30 40,25 50,10 20)))'));
 ST_Area
----------
 150.0073
(1 row)
```

Calculate the area of a geography object:

```
=> SELECT ST_Area(ST_GeographyFromText('POLYGON((20.5 20.45,20.51 20.52,
   20.69 20.32,20.5 20.45))'));
     ST_Area
------------------
 84627437.116037
(1 row)
```

ST_AsBinary

Creates the Well-Known Binary (WKB) representation of a spatial object. Use this function when you need to convert an object to binary form for porting spatial data to or from other applications.

The Open Geospatial Consortium (OGC) defines the format of a WKB representation in the Simple Feature Access Part 1 - Common Architecture specification.

Behavior Type

Immutable

Syntax

```
ST_AsBinary( g )
```

Arguments

g	Spatial object for which you want the WKB, type GEOMETRY or GEOGRAPHY

Returns

LONG VARBINARY

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)

Point	Yes	Yes	Yes
Multipoint	Yes	Yes	Yes
Linestring	Yes	Yes	Yes
Multilinestring	Yes	Yes	Yes
Polygon	Yes	Yes	Yes
Multipolygon	Yes	Yes	Yes
GeometryCollection	Yes	No	No

Example

The following example shows how to use ST_AsBinary.

Retrieve WKB and WKT representations:

```
=> CREATE TABLE locations (id INTEGER, name VARCHAR(100), geom1 GEOMETRY(800), geom2 GEOGRAPHY);
CREATE TABLE
=> COPY locations
    (id, geom1x FILLER LONG VARCHAR(800), geom1 AS ST_GeomFromText(geom1x), geom2x FILLER LONG
VARCHAR (800),
     geom2 AS ST_GeographyFromText(geom2x))
   FROM stdin;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 1|POINT(2 3)|
>> 2|LINESTRING(2 4,1 5)|
>> 3||POLYGON((-70.96 43.27,-70.67 42.95,-66.90 44.74,-67.81 46.08,-67.81 47.20,-69.22 47.43,-71.09
45.25,-70.96 43.27))
>> \.
=> SELECT id, ST_AsText(geom1),ST_AsText(geom2) FROM locations ORDER BY id ASC;
 id |       ST_AsText       |                ST_AsText
----+-----------------------+-------------------------------------------
  1 | POINT (2 3)           |
  2 | LINESTRING (2 4, 1 5) |
  3 |                       | POLYGON ((-70.96 43.27, -70.67 42.95, -66.9 44.74, -67.81 46.08, -67.81
47.2, -69.22 47.43, -71.09 45.25, -70.96 43.27))
=> SELECT id, ST_AsBinary(geom1),ST_AsBinary(geom2) FROM locations ORDER BY id ASC;
.
.
.
(3 rows)
```

Calculate the length of a WKB using the Vertica SQL function LENGTH:

```
=> SELECT LENGTH(ST_AsBinary(St_GeomFromText('POLYGON ((-1 2, 0 3, 1 2,
                                                    0 1, -1 2))')));
 LENGTH
```

```
--------
     93
(1 row)
```

See Also

ST_AsText

ST_Boundary

Calculates the boundary of the specified GEOMETRY object. An object's boundary is the set of points that define the limit of the object.

For a linestring, the boundary is the start and end points. For a polygon, the boundary is a linestring that begins and ends at the same point.

Behavior Type

Immutable

Syntax

```
ST_Boundary( g )
```

Arguments

g	Spatial object for which you want the boundary, type GEOMETRY

Returns

GEOMETRY

Supported Data Types

Data Type	GEOMETRY
Point	Yes
Multipoint	Yes
Linestring	Yes
Multilinestring	Yes
Polygon	Yes
Multipolygon	Yes
GeometryCollection	No

Examples

The following examples show how to use ST_Boundary.

Returns a linestring that represents the boundary:

```
=> SELECT ST_AsText(ST_Boundary(ST_GeomFromText('POLYGON((-1 -1,2 2,
   0 1,-1 -1))')));
 ST_AsText
--------------
LINESTRING(-1 -1, 2 2, 0 1, -1 -1)
(1 row)
```

Returns a multilinestring that contains the boundaries of both polygons:

```
=> SELECT ST_AsText(ST_Boundary(ST_GeomFromText('POLYGON((2 2,5 5,8 2,2 2),
   (4 3,5 4,6 3,4 3))')));
                            ST_AsText
------------------------------------------------------------------
 MULTILINESTRING ((2 2, 5 5, 8 2, 2 2), (4 3, 5 4, 6 3, 4 3))
(1 row)
```

The boundary of a linestring is its start and end points:

```
=> SELECT ST_AsText(ST_Boundary(ST_GeomFromText(
   'LINESTRING(1 1,2 2,3 3,4 4)')));
       ST_AsText
-----------------------
```

```
 MULTIPOINT (1 1, 4 4)
(1 row)
```

A closed linestring has no boundary because it has no start and end points:

```
=> SELECT ST_AsText(ST_Boundary(ST_GeomFromText(
   'LINESTRING(1 1,2 2,3 3,4 4,1 1)')));
    ST_AsText
------------------
 MULTIPOINT EMPTY
(1 row)
```

ST_Buffer

Creates a GEOMETRY object greater than or equal to a specified distance from the boundary of a spatial object. The distance is measured in Cartesian coordinate units. ST_Buffer does not accept a distance size greater than +1e15 or less than –1e15.

Behavior Type

Immutable

Syntax

```
ST_Buffer( g, d )
```

Arguments

g	Spatial object for which you want to calculate the buffer, type GEOMETRY
d	Distance from the object in Cartesian coordinate units, type FLOAT

Returns

GEOMETRY

Supported Data Types

Data Type	GEOMETRY
Point	Yes
Multipoint	Yes
Linestring	Yes
Multilinestring	Yes
Polygon	Yes
Multipolygon	Yes
GeometryCollection	Yes

Usage Tips

- If you specify a positive distance, ST_Buffer returns a polygon that represents the points within or equal to the distance outside the object. If you specify a negative distance, ST_Buffer returns a polygon that represents the points within or equal to the distance inside the object.
- For points, multipoints, linestrings, and multilinestrings, if you specify a negative distance, ST_Buffer returns an empty polygon.
- The Vertica Place version of ST_Buffer returns the buffer as a polygon, so the buffer object has corners at its vertices. It does not contain rounded corners.

Example

The following example shows how to use ST_Buffer.

Returns a GEOMETRY object:

```
=> SELECT ST_AsText(ST_Buffer(ST_GeomFromText('POLYGON((0 1,1 4,4 3,0 1))'),1));
                                  ST_AsText
-------------------------------------------------------------------------------
POLYGON ((-0.188847498856 -0.159920845081, -1.12155598386 0.649012935089, 0.290814745534
4.76344136152,
 0.814758063466 5.02541302048, 4.95372324225 3.68665254814, 5.04124517538 2.45512549204, -
0.188847498856 -0.159920845081))
```

```
(1 row)
```

ST_Centroid

Calculates the geometric center—the centroid—of a spatial object. If points or linestrings or both are present in a geometry with polygons, only the polygons contribute to the calculation of the centroid. Similarly, if points are present with linestrings, the points do not contribute to the calculation of the centroid.

To calculate the centroid of a GEOGRAPHY object, see the examples for STV_Geometry and STV_Geography.

Behavior Type

Immutable

Syntax

```
ST_Centroid( g )
```

Arguments

g	Spatial object for which you want to calculate the centroid, type GEOMETRY

Returns

GEOMETRY (POINT only)

Supported Data Types

Data Type	**GEOMETRY**
Point	Yes

Multipoint	Yes
Linestring	Yes
Multilinestring	Yes
Polygon	Yes
Multipolygon	Yes
GeometryCollection	Yes

Examples

The following examples show how to use ST_Centroid.

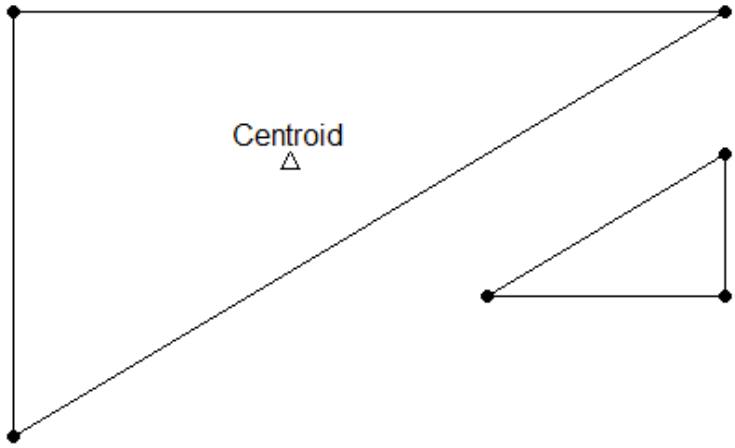
Calculate the centroid for a polygon:

```
=> SELECT ST_AsText(ST_Centroid(ST_GeomFromText('POLYGON((-1 -1,2 2,-1 2,
   -1 -1))')));
  ST_AsText
------------
 POINT (-0 1)
(1 row)
```

Calculate the centroid for a multipolygon:

```
=> SELECT ST_AsText(ST_Centroid(ST_GeomFromText('MULTIPOLYGON(((1 0,2 1,2 0,
   1 0)),((-1 -1,2 2,-1 2,-1 -1)))')));
              ST_AsText
--------------------------------------
 POINT (0.166666666667 0.933333333333)
(1 row)
```

This figure shows the centroid for the multipolygon.



ST_Contains

Determines if a spatial object is entirely inside another spatial object without existing only on its boundary. Both arguments must be the same spatial data type. Either specify two GEOMETRY objects or two GEOGRAPHY objects.

If an object such as a point or linestring only exists along a spatial object's boundary, then ST_Contains returns false. The interior of a linestring is all the points on the linestring except the start and end points.

ST_Contains(*g1*, *g2*) is functionally equivalent to ST_Within(*g2*, *g1*).

GEOGRAPHY Polygons with a vertex or border on the International Date Line (IDL) or the North or South pole are not supported.

Behavior Type

Immutable

Syntax

```
ST_Contains( g1, g2
                        [USING PARAMETERS spheroid={true | false}] )
```

Arguments

g1	Spatial object, type GEOMETRY or GEOGRAPHY
g2	Spatial object, type GEOMETRY or GEOGRAPHY

Parameters

`spheroid = {true | false}`	(Optional) BOOLEAN that specifies whether to use a perfect sphere or WGS84. **Default**: False

Returns

BOOLEAN

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	Yes	Yes	Yes
Multipoint	Yes	No	No
Linestring	Yes	Yes	No
Multilinestring	Yes	No	No
Polygon	Yes	Yes	Yes
Multipolygon	Yes	Yes	No
GeometryCollection	Yes	No	No

Compatible GEOGRAPHY pairs:

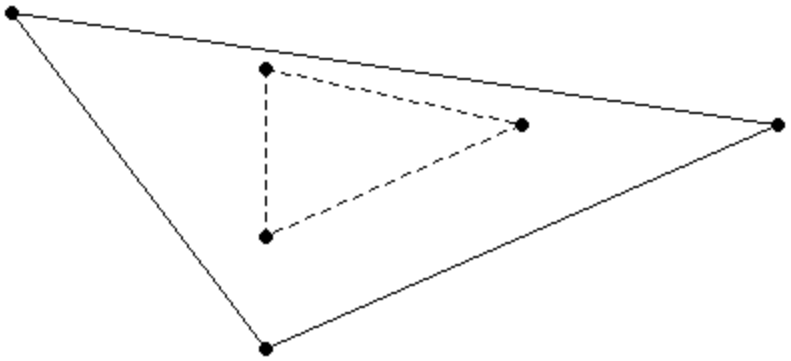
Data Type	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point-Point	Yes	No
Linestring-Point	Yes	No
Polygon-Point	Yes	Yes
Multipolygon-Point	Yes	No

Examples

The following examples show how to use ST_Contains.

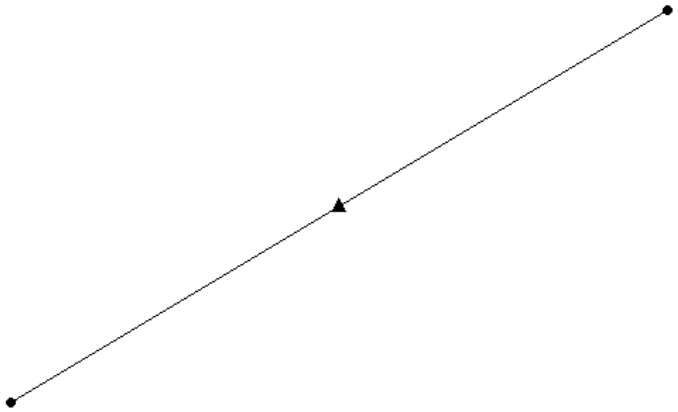
The first polygon does not completely contain the second polygon:

```
=> SELECT ST_Contains(ST_GeomFromText('POLYGON((0 2,1 1,0 -1,0 2))'),
   ST_GeomFromText('POLYGON((-1 3,2 1,0 -3,-1 3))'));
 ST_Contains
-------------
 f
(1 row)
```



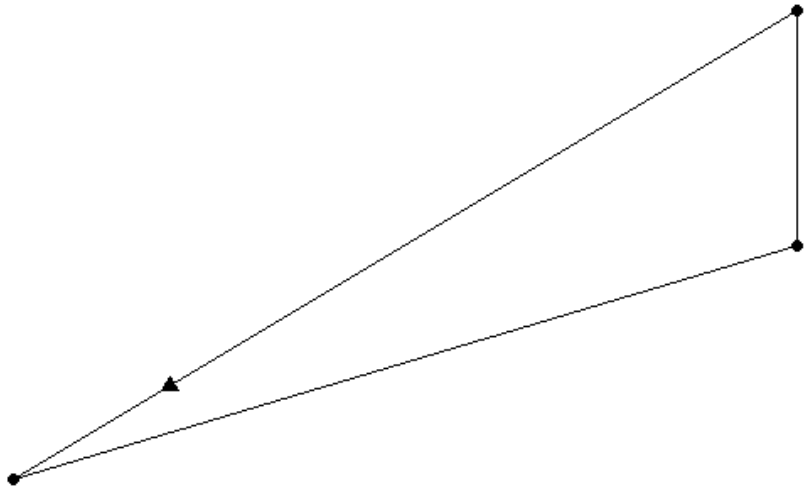
If a point is on a linestring, but not on an end point:

```
=> SELECT ST_Contains(ST_GeomFromText('LINESTRING(20 20,30 30)'),
   ST_GeomFromText('POINT(25 25)'));
 ST_Contains
--------------
 t
(1 row)
```



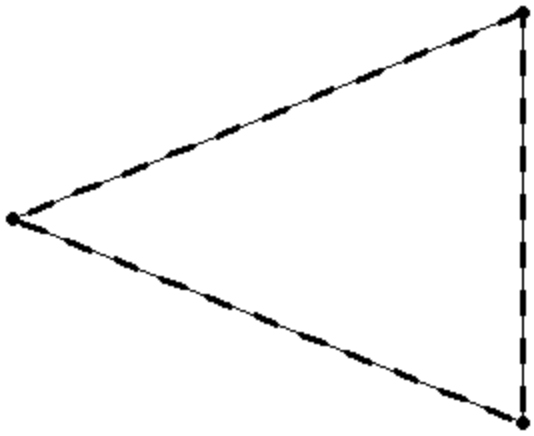
If a point is on the boundary of a polygon:

```
=> SELECT ST_Contains(ST_GeographyFromText('POLYGON((20 20,30 30,30 25,20 20))'),
   ST_GeographyFromText('POINT(20 20)'));
 ST_Contains
--------------
 f
(1 row)
```



Two spatially equivalent polygons:

```
=> SELECT ST_Contains (ST_GeomFromText('POLYGON((-1 2, 0 3, 0 1, -1 2))'),
   ST_GeomFromText('POLYGON((0 3, -1 2, 0 1, 0 3))'));
 ST_Contains
--------------
 t
(1 row)
```



See Also

- ST_Overlaps
- ST_Within

ST_ConvexHull

Calculates the smallest convex GEOMETRY object that contains a GEOMETRY object.

Behavior Type

Immutable

Syntax

```
ST_ConvexHull( g )
```

Arguments

g	Spatial object for which you want the convex hull, type GEOMETRY

Returns

GEOMETRY

Supported Data Types

Data Type	GEOMETRY
Point	Yes
Multipoint	Yes
Linestring	Yes
Multilinestring	Yes
Polygon	Yes
Multipolygon	Yes
GeometryCollection	Yes

Examples

The following examples show how to use ST_ConvexHull.

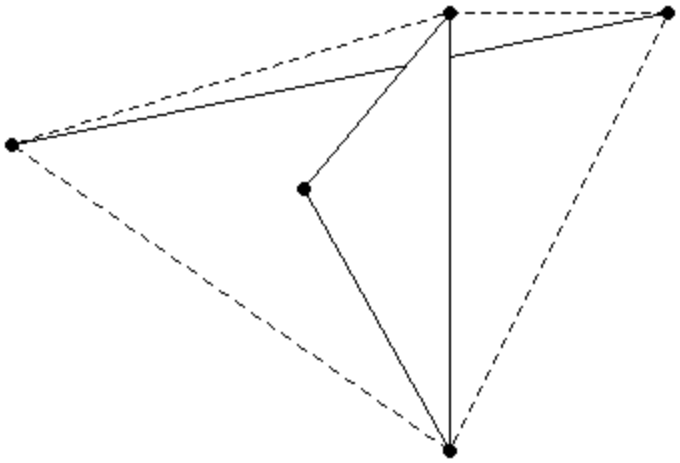
For a pair of points in a geometry collection:

```
=> SELECT ST_AsText(ST_ConvexHull(ST_GeomFromText('GEOMETRYCOLLECTION(
   POINT(1 1),POINT(0 0))')));
       ST_AsText
-----------------------
 LINESTRING (1 1, 0 0)
(1 row)
```

For a geometry collection:

```
=> SELECT ST_AsText(ST_ConvexHull(ST_GeomFromText('GEOMETRYCOLLECTION(
   LINESTRING(2.5 3,-2 1.5), POLYGON((0 1,1 3,1 -2,0 1)))')));
                 ST_AsText
-------------------------------------------
 POLYGON ((1 -2, -2 1.5, 1 3, 2.5 3, 1 -2))
(1 row)
```

The solid lines represent the original geometry collection and the dashed lines represent the convex hull.



ST_Crosses

Determines if one GEOMETRY object spatially crosses another GEOMETRY object. If two objects touch only at a border, ST_Crosses returns FALSE.

Two objects spatially cross when both of the following are true:

- The two objects have some, but not all, interior points in common.
- The dimension of the result of their intersection is less than the maximum dimension of the two objects.

Behavior Type

Immutable

Syntax

```
ST_Crosses( g1, g2 )
```

Arguments

g1	Spatial object, type GEOMETRY
g2	Spatial object, type GEOMETRY

Returns

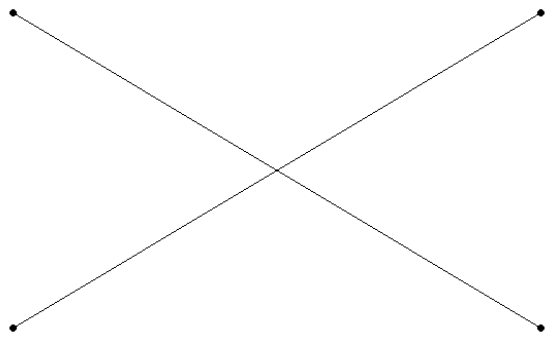
BOOLEAN

Supported Data Types

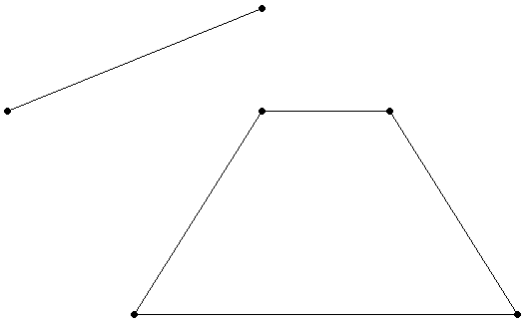
Data Type	GEOMETRY
Point	Yes
Multipoint	Yes
Linestring	Yes
Multilinestring	Yes
Polygon	Yes
Multipolygon	Yes
GeometryCollection	Yes

Examples

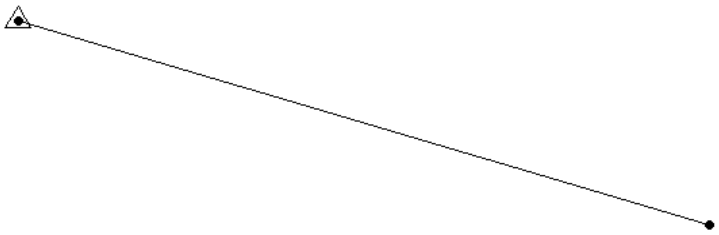
The following examples show how to use ST_Crosses.



```
=> SELECT ST_Crosses(ST_GeomFromText('LINESTRING(-1 3,1 4)'),
   ST_GeomFromText('LINESTRING(-1 4,1 3)'));
 ST_Crosses
------------
 t
(1 row)
```



```
=> SELECT ST_Crosses(ST_GeomFromText('LINESTRING(-1 1,1 2)'),
   ST_GeomFromText('POLYGON((1 1,0 -1,3 -1,2 1,1 1))'));
 ST_Crosses
------------
 f
(1 row)
```



```
=> SELECT ST_Crosses(ST_GeomFromText('POINT(-1 4)'),
   ST_GeomFromText('LINESTRING(-1 4,1 3)'));
ST_ Crosses
------------
 f
(1 row)
```

ST_Difference

Calculates the part of a spatial object that does not intersect with another spatial object.

Behavior Type

Immutable

Syntax

```
ST_Difference( g1, g2 )
```

Arguments

g1	Spatial object, type GEOMETRY
g2	Spatial object, type GEOMETRY

Returns

GEOMETRY

Supported Data Types

Data Type	GEOMETRY
Point	Yes
Multipoint	Yes
Linestring	Yes
Multilinestring	Yes
Polygon	Yes
Multipolygon	Yes
GeometryCollection	Yes

Examples

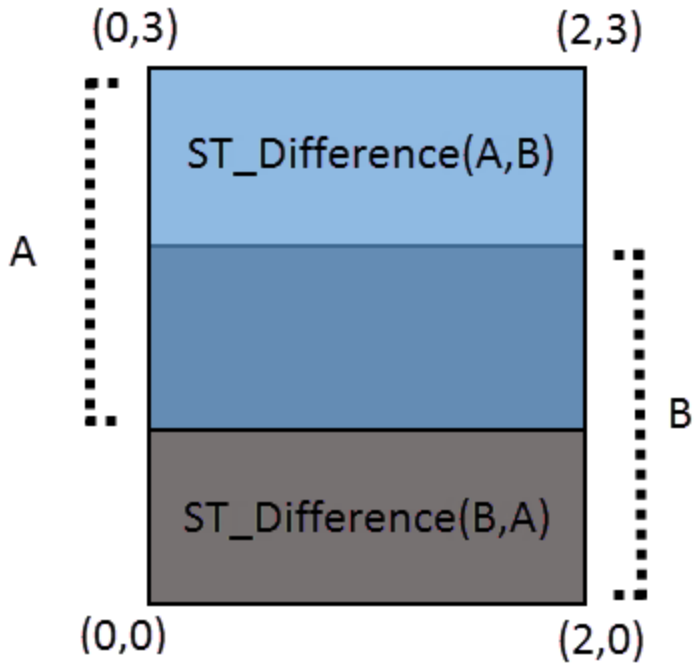
The following examples show how to use ST_Difference.

Two overlapping linestrings:

```
=> SELECT ST_AsText(ST_Difference(ST_GeomFromText('LINESTRING(0 0,0 2)'),
   ST_GeomFromText('LINESTRING(0 1,0 2)')));
       ST_AsText
-----------------------
 LINESTRING (0 0, 0 1)
(1 row)
=> SELECT ST_AsText(ST_Difference(ST_GeomFromText('LINESTRING(0 0,0 3)'),
```

```
   ST_GeomFromText('LINESTRING(0 1,0 2)')));
               ST_AsText
-----------------------------------------
 MULTILINESTRING ((0 0, 0 1), (0 2, 0 3))
(1 row)
```

Two overlapping polygons:



```
=> SELECT ST_AsText(ST_Difference(ST_GeomFromText('POLYGON((0 1,0 3,2 3,2 1,0 1))'),
   ST_GeomFromText('POLYGON((0 0,0 2,2 2,2 0,0 0))')));
           ST_AsText
-----------------------------------
 POLYGON ((0 2, 0 3, 2 3, 2 2, 0 2))
(1 row)
```

Two non-intersecting polygons:

```
=> SELECT ST_AsText(ST_Difference(ST_GeomFromText('POLYGON((1 1,1 3,3 3,3 1,
   1 1))'),ST_GeomFromText('POLYGON((1 5,1 7,-1 7,-1 5,1 5))')));
             ST_AsText
-----------------------------------
 POLYGON ((1 1, 1 3, 3 3, 3 1, 1 1))
(1 row)
```

ST_Disjoint

Determines if two GEOMETRY objects do not intersect or touch.

If ST_Disjoint returns TRUE for a pair of GEOMETRY objects, ST_Intersects returns FALSE for the same two objects.

GEOGRAPHY Polygons with a vertex or border on the International Date Line (IDL) or the North or South pole are not supported.

Behavior Type

Immutable

Syntax

```
ST_Disjoint( g1, g2
                        [USING PARAMETERS spheroid={true | false}] )
```

Arguments

g1	Spatial object, type GEOMETRY
g2	Spatial object, type GEOMETRY

Parameters

`spheroid = {true | false}`	(Optional) BOOLEAN that specifies whether to use a perfect sphere or WGS84. **Default**: False

Returns

BOOLEAN

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (WGS84)
Point	Yes	Yes

Multipoint	Yes	No
Linestring	Yes	No
Multilinestring	Yes	No
Polygon	Yes	Yes
Multipolygon	Yes	No
GeometryCollection	Yes	No

Compatible GEOGRAPHY pairs:

Data Type	**GEOGRAPHY (WGS84)**
Point-Point	No
Linestring-Point	No
Polygon-Point	Yes
Multipolygon-Point	No

Examples

The following examples show how to use ST_Disjoint.

Two non-intersecting or touching polygons:

```
=> SELECT ST_Disjoint (ST_GeomFromText('POLYGON((-1 2,0 3,0 1,-1 2))'),
   ST_GeomFromText('POLYGON((1 0, 1 1, 2 2, 1 0))'));
 ST_Disjoint
-------------
 t
(1 row)
```

Two intersecting linestrings:

```
=> SELECT ST_Disjoint(ST_GeomFromText('LINESTRING(-1 2,0 3)'),
   ST_GeomFromText('LINESTRING(0 2,-1 3)'));
 ST_Disjoint
-------------
 f
(1 row)
```

Two polygons touching at a single point:

```
=> SELECT ST_Disjoint (ST_GeomFromText('POLYGON((-1 2, 0 3, 0 1, -1 2))'),
   ST_GeomFromText('POLYGON((0 2, 1 1, 1 2, 0 2))'));
 ST_Disjoint
--------------
 f
(1 row)
```

See Also

- ST_Intersects

ST_Distance

Calculates the shortest distance between two spatial objects. For GEOMETRY objects, the distance is measured in Cartesian coordinate units. For GEOGRAPHY objects, the distance is measured in meters.

Parameters *g1* and *g2* must be both GEOMETRY objects or both GEOGRAPHY objects.

Behavior Type

Immutable

Syntax

```
ST_Distance( g1, g2
             [USING PARAMETERS spheroid={ true | false } ] )
```

Arguments

g1	Spatial object, type GEOMETRY or GEOGRAPHY
g2	Spatial object, type GEOMETRY or GEOGRAPHY

Parameters

`spheroid = { true |`	(Optional) BOOLEAN that specifies whether to use a perfect

`false }`	sphere or WGS84. **Default**: False

Returns

FLOAT

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	Yes	Yes	Yes
Multipoint	Yes	Yes	Yes
Linestring	Yes	Yes	Yes
Multilinestring	Yes	Yes	Yes
Polygon	Yes	Yes	No
Multipolygon	Yes	Yes	No
GeometryCollection	Yes	No	No

Compatible GEOGRAPHY pairs:

Data Type	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point-Point	Yes	Yes
Linestring-Point	Yes	Yes
Multilinestring-Point	Yes	Yes
Polygon-Point	Yes	No
Multipoint-Point	Yes	Yes
Multipoint-Multilinestring	Yes	No
Multipolygon-Point	Yes	No

Recommendations

Vertica recommends pruning invalid data before using ST_Distance. Invalid geography values could return non-guaranteed results.

Examples

The following examples show how to use ST_Distance.

Distance between two polygons:

```
=> SELECT ST_Distance(ST_GeomFromText('POLYGON((-1 -1,2 2,0 1,-1 -1))'),
                      ST_GeomFromText('POLYGON((5 2,7 4,5 5,5 2))'));
 ST_Distance
-------------
           3
(1 row)
```

Distance between a point and a linestring in meters:

```
=> SELECT ST_Distance(ST_GeographyFromText('POINT(31.75 31.25)'),
    ST_GeographyFromText('LINESTRING(32 32,32 35,40.5 35,32 35,32 32)'));
   ST_Distance
------------------
 86690.3950562969
(1 row)
```

ST_Envelope

Calculates the minimum bounding rectangle that contains the specified GEOMETRY object.

Behavior Type

Immutable

Syntax

```
ST_Envelope( g )
```

Arguments

g	Spatial object for which you want to find the minimum bounding rectangle, type GEOMETRY

Returns

GEOMETRY

Supported Data Types

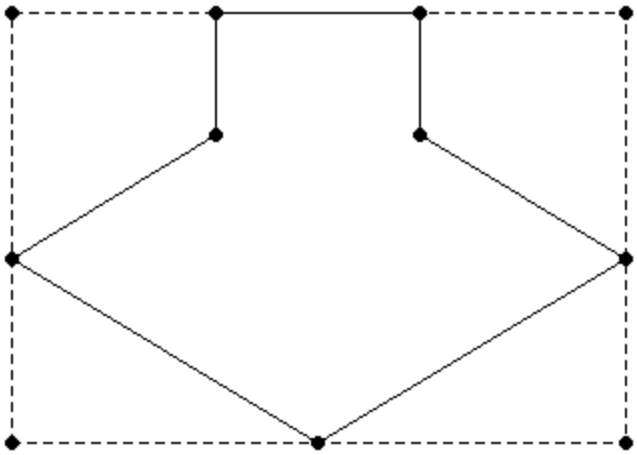
Data Type	GEOMETRY
Point	Yes
Multipoint	Yes
Linestring	Yes
Multilinestring	Yes
Polygon	Yes
Multipolygon	Yes
GeometryCollection	Yes

Example

The following example shows how to use ST_Envelope.

Returns the minimum bounding rectangle:

```
=> SELECT ST_AsText(ST_Envelope(ST_GeomFromText('POLYGON((0 0,1 1,1 2,2 2,
   2 1,3 0,1.5 -1.5,0 0))')));
                ST_AsText
-----------------------------------------
 POLYGON ((0 -1.5, 3 -1.5, 3 2, 0 2, 0 -1.5))
(1 row)
```



ST_Equals

Determines if two spatial objects are spatially equivalent. The coordinates of the two objects and their WKT/WKB representations must match exactly for ST_Equals to return TRUE.

The order of the points do not matter in determining spatial equivalence:

- LINESTRING(1 2, 4 3) equals LINESTRING(4 3, 1 2).
- POLYGON ((0 0, 1 1, 1 2, 2 2, 2 1, 3 0, 1.5 -1.5, 0 0)) equals POLYGON((1 1 , 1 2, 2 2, 2 1, 3 0, 1.5 -1.5, 0 0, 1 1)).
- MULTILINESTRING((1 2, 4 3),(0 0, -1 -4)) equals MULTILINESTRING((0 0, -1 -4),(1 2, 4 3)).

Coordinates are stored as FLOAT types. Thus, rounding errors are expected when importing Well-Known Text (WKT) values because the limitations of floating-point number representation.

g1 and *g2* must both be GEOMETRY objects or both be GEOGRAPHY objects. Also, *g1* and *g2* cannot both be of type GeometryCollection.

Behavior Type

Immutable

Syntax

```
ST_Equals( g1, g2 )
```

Arguments

g1	Spatial object to compare to *g2*, type GEOMETRY or GEOGRAPHY
g2	Spatial object to compare to *g1*, type GEOMETRY or GEOGRAPHY

Returns

BOOLEAN

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	Yes	Yes	Yes
Multipoint	Yes	Yes	Yes
Linestring	Yes	Yes	Yes
Multilinestring	Yes	Yes	Yes
Polygon	Yes	Yes	Yes
Multipolygon	Yes	Yes	Yes
GeometryCollection	No	No	No

Examples

The following examples show how to use ST_Equals.

Two linestrings:

```
=> SELECT ST_Equals (ST_GeomFromText('LINESTRING(-1 2, 0 3)'),
   ST_GeomFromText('LINESTRING(0 3, -1 2)'));
 ST_Equals
--------------
 t
```

```
(1 row)
```

Two polygons:

```
=> SELECT ST_Equals (ST_GeographyFromText('POLYGON((43.22 42.21,40.3 39.88,
   42.1 50.03,43.22 42.21))'),ST_GeographyFromText('POLYGON((43.22 42.21,
   40.3 39.88,42.1 50.31,43.22 42.21))'));
 ST_Equals
--------------
 f
(1 row)
```

ST_GeographyFromText

Converts a Well-Known Text (WKT) string into its corresponding GEOGRAPHY object. Use this function to convert a WKT string into the format expected by the Vertica Place functions.

A GEOGRAPHY object is a spatial object with coordinates (longitude, latitude) defined on the surface of the earth. Coordinates are expressed in degrees (longitude, latitude) from reference planes dividing the earth.

The maximum size of a GEOGRAPHY object is 10 MB. If you pass a WKT to ST_GeographyFromText, the result is a spatial object whose size is greater than 10 MB, ST_GeographyFromText returns an error.

The Open Geospatial Consortium (OGC) defines the format of a WKT string in Section 7 in the Simple Feature Access Part 1 - Common Architecture specification.

Behavior Type

Immutable

Syntax

```
ST_GeographyFromText( wkt [ USING PARAMETERS ignore_errors={'y'|'n'} ] )
```

Arguments

wkt	Well-Known Text (WKT) string of a GEOGRAPHY object, type LONG

	VARCHAR
ignore_errors	(Optional) ST_GeographyFromText returns the following, based on the parameters supplied: • NULL—If *wkt* is invalid and *ignore_errors*='y'. • Error—If *wkt* is invalid and *ignore_errors*='n' or is unspecified.

Returns

GEOGRAPHY

Supported Data Types

Data Type	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	Yes	Yes
Multipoint	Yes	Yes
Linestring	Yes	Yes
Multilinestring	Yes	Yes
Polygon	Yes	Yes
Multipolygon	Yes	Yes
GeometryCollection	No	No

Example

The following example shows how to use ST_GeographyFromText.

Convert WKT into a GEOGRAPHY object:

```
=> CREATE TABLE wkt_ex (g GEOGRAPHY);
 CREATE TABLE
=> INSERT INTO wkt_ex VALUES(ST_GeographyFromText('POLYGON((1 2,3 4,2 3,1 2))'));
 OUTPUT
--------
      1
(1 row)
```

ST_GeographyFromWKB

Converts a Well-Known Binary (WKB) value into its corresponding GEOGRAPHY object. Use this function to convert a WKB into the format expected by Vertica Place functions.

A GEOGRAPHY object is a spatial object defined on the surface of the earth. Coordinates are expressed in degrees (longitude, latitude) from reference planes dividing the earth. All calculations are in meters.

The maximum size of a GEOGRAPHY object is 10 MB. If you pass a WKB to ST_GeographyFromWKB that results in a spatial object whose size is greater than 10 MB, ST_GeographyFromWKB returns an error.

The Open Geospatial Consortium (OGC) defines the format of a WKB representation in Section 8 in the Simple Feature Access Part 1 - Common Architecture specification.

Behavior Type

Immutable

Syntax

```
ST_GeographyFromWKB( wkb [ USING PARAMETERS ignore_errors={'y'|'n'} ] )
```

Arguments

wkb	Well-Known Binary (WKB) value of a GEOGRAPHY object, type LONG VARBINARY
ignore_errors	(Optional) ST_GeographyFromWKB returns the following, based on the parameters supplied: • NULL—If *wkb* is invalid and *ignore_errors*='y'. • Error—If *wkb* is invalid and *ignore_errors*='n' or is unspecified.

Returns

GEOGRAPHY

Supported Data Types

Data Type	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	Yes	Yes
Multipoint	Yes	Yes
Linestring	Yes	Yes
Multilinestring	Yes	Yes
Polygon	Yes	Yes
Multipolygon	Yes	Yes
GeometryCollection	No	No

Example

The following example shows how to use ST_GeographyFromWKB.

Convert WKB into a GEOGRAPHY object:

```
=> CREATE TABLE wkb_ex (g GEOGRAPHY);
CREATE TABLE
=> INSERT INTO wkb_ex VALUES(ST_GeographyFromWKB(X'0103000000010000000 ... );
 OUTPUT
--------
      1
(1 row)
```

ST_GeoHash

Returns a GeoHash in the shape of the specified geometry.

Behavior Type

Immutable

Syntax

```
ST_GeoHash( SpatialObject [ USING PARAMETERS numchars=n] )
```

Arguments

Spatial object	A GEOMETRY or GEOGRAPHY spatial object. Inputs must be in polar coordinates (-180 <= x <= 180 and -90 <= y <= 90) for all points inside the given geometry.
n	Specifies the length, in characters, of the returned GeoHash.

Returns

GEOHASH

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	Yes	Yes	Yes
Multipoint	Yes	Yes	Yes
Linestring	Yes	Yes	Yes
Multilinestring	Yes	Yes	Yes
Polygon	Yes	Yes	Yes
Multipolygon	Yes	Yes	Yes
GeometryCollection	Yes	No	No

Examples

The following examples show how to use ST_PointFromGeoHash.

Generate a full precision GeoHash for the specified geometry:

```
=> SELECT ST_GeoHash(ST_GeographyFromText('POINT(3.14 -1.34)'));
ST_GeoHash
----------------------
kpf0rkn3zmcswks75010
(1 row)
```

Generate a GeoHash based on the first five characters of the specified geometry:

```
=>  select ST_GeoHash(ST_GeographyFromText('POINT(3.14 -1.34)')USING PARAMETERS numchars=5);
ST_GeoHash
------------
kpf0r
(1 row)
```

ST_GeometryN

Returns the n^{th} geometry within a geometry object.

If *n* is out of range of the index, then NULL is returned.

Behavior Type

Immutable

Syntax

```
ST_GeometryN( g , n )
```

Arguments

g	Spatial object of type GEOMETRY.
n	The geometry's index number, 1-based.

Returns

GEOMETRY

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	Yes	Yes	Yes
Multipoint	Yes	Yes	Yes
Linestring	Yes	Yes	Yes
Multilinestring	Yes	Yes	Yes
Polygon	Yes	Yes	Yes
Multipolygon	Yes	Yes	Yes
GeometryCollection	No	No	No

Examples

The following examples show how to use ST_GeometryN.

Return the second geometry in a multipolygon:

```
=> CREATE TABLE multipolygon_geom (gid int, geom GEOMETRY(1000));
CREATE TABLE
=> COPY multipolygon_geom(gid, gx FILLER LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM stdin
delimiter '|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>>9|MULTIPOLYGON(((2 6, 2 9, 6 9, 7 7, 4 6, 2 6)),((0 0, 0 5, 1 0, 0 0)),((0 2, 2 5, 4 5, 0 2)))
>>\.
=> SELECT gid, ST_AsText(ST_GeometryN(geom, 2)) FROM multipolygon_geom;
 gid |           ST_AsText
-----+--------------------------------
   9 | POLYGON ((0 0, 0 5, 1 0, 0 0))
(1 row)
```

Return all the geometries within a multipolygon:

```
=> CREATE TABLE multipolygon_geom (gid int, geom GEOMETRY(1000));
CREATE TABLE
=> COPY multipolygon_geom(gid, gx FILLER LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM stdin
delimiter '|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
```

```
>>9|MULTIPOLYGON(((2 6, 2 9, 6 9, 7 7, 4 6, 2 6)),((0 0, 0 5, 1 0, 0 0)),((0 2, 2 5, 4 5, 0 2)))
>>\.
=> CREATE TABLE series_numbers (numbs int);
CREATE TABLE
=> COPY series_numbers FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 1
>> 2
>> 3
>> 4
>> 5
>> \.
=> SELECT numbs, ST_AsText(ST_GeometryN(geom, numbs))
   FROM multipolygon_geom, series_numbers
   WHERE ST_AsText(ST_GeometryN(geom, numbs)) IS NOT NULL
   ORDER BY numbs ASC;
 numbs |               ST_AsText
-------+----------------------------------------
     1 | POLYGON ((2 6, 2 9, 6 9, 7 7, 4 6, 2 6))
     2 | POLYGON ((0 0, 0 5, 1 0, 0 0))
     3 | POLYGON ((0 2, 2 5, 4 5, 0 2))
(3 rows)
```

See Also

ST_NumGeometries

ST_GeometryType

Determines the class of a spatial object.

Behavior Type

Immutable

Syntax

```
ST_GeometryType( g )
```

Arguments

g	Spatial object for which you want the class, type GEOMETRY or GEOGRAPHY

Returns

VARCHAR

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)
Point	Yes	Yes
Multipoint	Yes	Yes
Linestring	Yes	Yes
Multilinestring	Yes	Yes
Polygon	Yes	Yes
Multipolygon	Yes	Yes
GeometryCollection	Yes	No

Example

The following example shows how to use ST_GeometryType.

Returns spatial class:

```
=> SELECT ST_GeometryType(ST_GeomFromText('GEOMETRYCOLLECTION(LINESTRING(1 1,
   2 2), POLYGON((1 3,4 5,2 2,1 3)))'));
    ST_GeometryType
-----------------------
 ST_GeometryCollection
(1 row)
```

ST_GeomFromGeoHash

Returns a polygon in the shape of the specified GeoHash.

Behavior Type

Immutable

Syntax

```
ST_GeomFromGeoHash(GeoHash)
```

Arguments

GeoHash	A valid GeoHash string of arbitrary length.

Returns

GEOGRAPHY

Examples

The following examples show how to use ST_GeomFromGeoHash.

Converts a GeoHash string to a Geography object and back to a GeoHash

```
=>  SELECT ST_GeoHash(ST_GeomFromGeoHash('vert1c9'));
ST_GeoHash
--------------------
vert1c9
(1 row)
```

Returns a polygon of the specified GeoHash and uses ST_AsText to convert the polygon, rectangle map tile, into Well-Known Text:

```
=>  SELECT ST_AsText(ST_GeomFromGeoHash('drt3jj9n4dpcbcdef'));
ST_AsText
------------------------------------------------------------------------------------------------------------
------------------------------------------------------------
POLYGON ((-71.1459699298 42.3945346513, -71.1459699297 42.3945346513, -71.1459699297 42.3945346513, -
71.1459699298 42.3945346513, -71.1459699298 42.3945346513))
(1 row)
```

Returns multiple polygons and their areas for the specified GeoHashes. The polygon for the high level GeoHash (1234) has a significant area, while the low level GeoHash (1234567890bcdefhjkmn) has an area of zero.

```
=>  SELECT ST_Area(short) short_area, ST_AsText(short) short_WKT, ST_Area(long) long_area, ST_AsText
(long) long_WKT from (SELECT ST_GeomFromGeoHash('1234') short, ST_GeomFromGeoHash
('1234567890bcdefhjkmn') long) as foo;
-[ RECORD 1 ]----------------------------------------------------------------------------------------
---------------------------------------------------------------------------
short_area | 24609762.8991076
short_WKT  | POLYGON ((-122.34375 -88.2421875, -121.9921875 -88.2421875, -121.9921875 -88.06640625, -
122.34375 -88.06640625, -122.34375 -88.2421875))
long_area  | 0
long_WKT   | POLYGON ((-122.196077187 -88.2297377551, -122.196077187 -88.2297377551, -122.196077187 -
88.2297377551, -122.196077187 -88.2297377551, -122.196077187 -88.2297377551))
```

ST_GeomFromText

Converts a Well-Known Text (WKT) string into its corresponding GEOMETRY object. Use this function to convert a WKT string into the format expected by the Vertica Place functions.

A GEOMETRY object is a spatial object defined by the coordinates of a plane. Coordinates are expressed as points on a Cartesian plane (*x*,*y*). SRID values of 0 to 2^{32-1} are valid. SRID values outside of this range will generate an error.

The maximum size of a GEOMETRY object is 10 MB. If you pass a WKT to ST_GeomFromText and the result is a spatial object whose size is greater than 10 MB, `ST_GeomFromText` returns an error.

The Open Geospatial Consortium (OGC) defines the format of a WKT representation. See section 7 in the Simple Feature Access Part 1 - Common Architecture specification.

Behavior Type

Immutable

Syntax

```
ST_GeomFromText( wkt [, srid] [ USING PARAMETERS ignore_errors={'y'|'n'} ])
```

Arguments

wkt	Well-Known Text (WKT) string of a GEOMETRY object, type LONG VARCHAR.
srid	(Optional when not performing operations) Spatial reference system identifier (SRID) of the GEOMETRY object, type INTEGER. The SRID is stored in the GEOMETRY object, but does not influence the results of spatial computations.
ignore_errors	(Optional) ST_GeomFromText returns the following, based on parameters supplied: • NULL—If *wkt* is invalid and *ignore_errors*='y'. • Error—If *wkt* is invalid and *ignore_errors*='n' or is unspecified.

Returns

GEOMETRY

Supported Data Types

Data Type	GEOMETRY
Point	Yes
Multipoint	Yes
Linestring	Yes
Multilinestring	Yes
Polygon	Yes
Multipolygon	Yes
GeometryCollection	No

Example

The following example shows how to use ST_GeomFromText.

Convert WKT into a GEOMETRY object:

```
=> SELECT ST_Area(ST_GeomFromText('POLYGON((1 1,2 3,3 5,0 5,1 -2,0 0,1 1))'));
 ST_Area
---------
       6
(1 row)
```

ST_GeomFromWKB

Converts the Well-Known Binary (WKB) value to its corresponding GEOMETRY object. Use this function to convert a WKB into the format expected by many of the Vertica Place functions.

A GEOMETRY object is a spatial object with coordinates (*x*,*y*) defined in the Cartesian plane.

The maximum size of a GEOMETRY object is 10 MB. If you pass a WKB to `ST_GeomFromWKB` and the result is a spatial object whose size is greater than 10 MB, `ST_GeomFromWKB` returns an error.

The Open Geospatial Consortium (OGC) defines the format of a WKB representation in section 8 in the Simple Feature Access Part 1 - Common Architecture specification.

Behavior Type

Immutable

Syntax

```
ST_GeomFromWKB( wkb[, srid] [ USING PARAMETERS ignore_errors={'y'|'n'} ])
```

Arguments

wkb	Well-Known Binary (WKB) value of a GEOMETRY object, type LONG VARBINARY

srid	(Optional) Spatial reference system identifier (SRID) of the GEOMETRY object, type INTEGER. The SRID is stored in the GEOMETRY object, but does not influence the results of spatial computations.
ignore_errors	(Optional) ST_GeomFromWKB returns the following, based on the parameters supplied: • NULL—If *wkb* is invalid and *ignore_errors*='y'. • Error—If *wkb* is invalid and *ignore_errors*='n' or is unspecified.

Returns

GEOMETRY

Supported Data Types

Data Type	GEOMETRY
Point	Yes
Multipoint	Yes
Linestring	Yes
Multilinestring	Yes
Polygon	Yes
Multipolygon	Yes
GeometryCollection	Yes

Example

The following example shows how to use ST_GeomFromWKB.

Convert GEOMETRY into WKT:

```
=> CREATE TABLE t(g GEOMETRY);
CREATE TABLE
=> INSERT INTO t VALUES(
ST_GeomFromWKB(X'0103000000010000000400000000000000000000000000000000000000000000000000000000000000000f

03f0000000000000000f64ae1c7022db54400000000000000f03f0000000000000000000000000000000000'));
 OUTPUT
--------
      1
(1 row)
=> SELECT ST_AsText(g) from t;
             ST_AsText
-----------------------------------
 POLYGON ((0 0, 1 0, 1e+23 1, 0 0))
(1 row)
```

ST_Intersection

Calculates the set of points shared by two GEOMETRY objects.

Behavior Type

Immutable

Syntax

```
ST_Intersection( g1, g2 )
```

Arguments

g1	Spatial object, type GEOMETRY
g2	Spatial object, type GEOMETRY

Returns

GEOMETRY

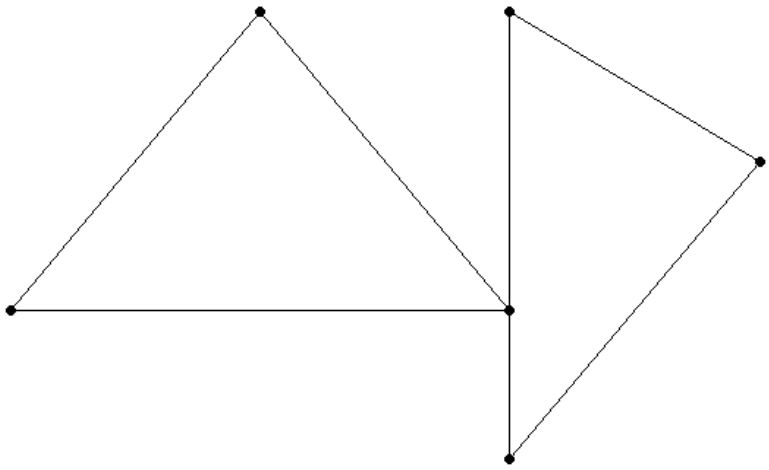
Supported Data Types

Data Type	GEOMETRY
Point	Yes
Multipoint	Yes
Linestring	Yes
Multilinestring	Yes
Polygon	Yes
Multipolygon	Yes
GeometryCollection	Yes

Examples

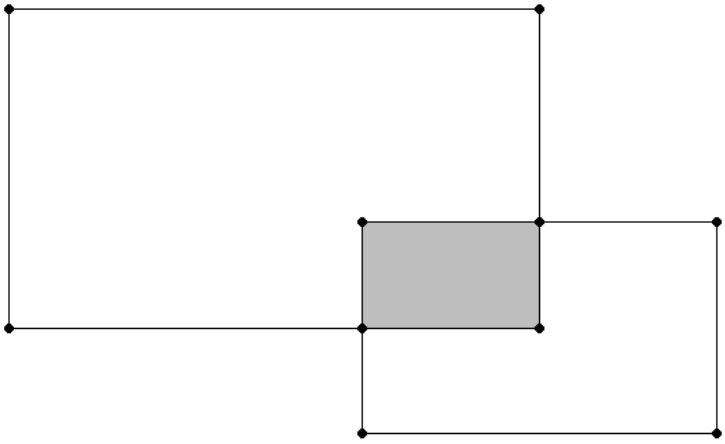
The following examples show how to use ST_Intersection.

Two polygons intersect at a single point:



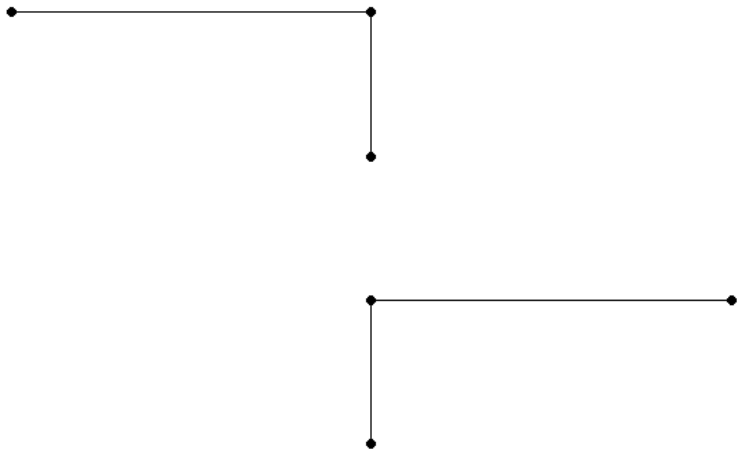
```
=> SELECT ST_AsText(ST_Intersection(ST_GeomFromText('POLYGON((0 2,1 1,0 -1,
   0 2))'),ST_GeomFromText('POLYGON((-1 2,0 0,-2 0,-1 2))')));
    ST_AsText
-----------------
 POINT(0 0)
(1 row)
```

Two polygons:



```
=> SELECT ST_AsText(ST_Intersection(ST_GeomFromText('POLYGON((1 2,1 5,4 5,
   4 2,1 2))'), ST_GeomFromText('POLYGON((3 1,3 3,5 3,5 1,3 1))')));
 ST_AsText
------------------
POLYGON ((4 3, 4 2, 3 2, 3 3, 4 3))
(1 row)
```

Two non-intersecting linestrings:



```
=> SELECT ST_AsText(ST_Intersection(ST_GeomFromText('LINESTRING(1 1,1 3,3 3)'),
   ST_GeomFromText('LINESTRING(1 5,1 7,-1 7)')));
       ST_AsText
-------------------------
 GEOMETRYCOLLECTION EMPTY
(1 row)
```

ST_Intersects

Determines if two GEOMETRY or GEOGRAPHY objects intersect or touch at a single point. If ST_Disjoint returns TRUE, ST_Intersects returns FALSE for the same GEOMETRY or GEOGRAPHY objects.

GEOGRAPHY Polygons with a vertex or border on the International Date Line (IDL) or the North or South pole are not supported.

Behavior Type

Immutable

Syntax

```
ST_Intersects( g1, g2
                [USING PARAMETERS bbox={true | false}, spheroid={true | false}])
```

Arguments

g1	Spatial object, type GEOMETRY
g2	Spatial object, type GEOMETRY

Parameters

`bbox = {true | false}`	Boolean. Intersects the bounding box of *g1* and *g2*. **Default**: False
`spheroid = {true | false}`	(Optional) BOOLEAN that specifies whether to use a perfect sphere or WGS84. **Default**: False

Returns

BOOLEAN

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (WGS84)
Point	Yes	Yes
Multipoint	Yes	No
Linestring	Yes	No
Multilinestring	Yes	No
Polygon	Yes	Yes
Multipolygon	Yes	No
GeometryCollection	Yes	No

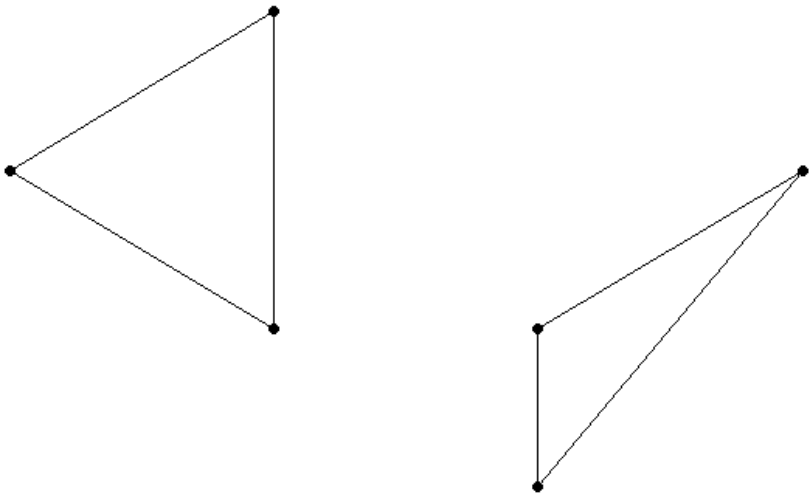
Compatible GEOGRAPHY pairs:

Data Type	GEOGRAPHY (WGS84)
Point-Point	No
Linestring-Point	No
Polygon-Point	Yes
Multipolygon-Point	No

Examples

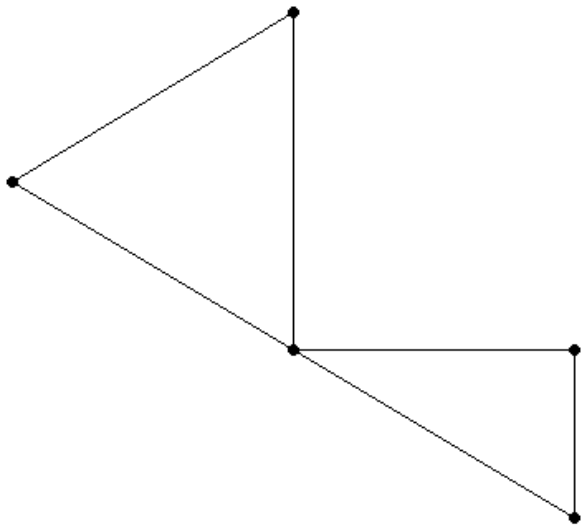
The following examples show how to use ST_Intersects.

Two polygons do not intersect or touch:



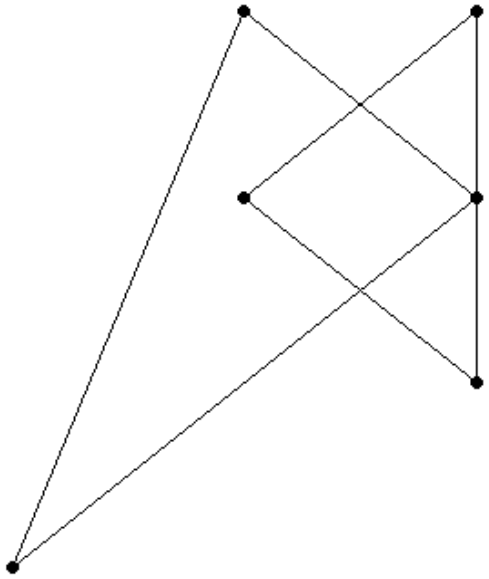
```
=> SELECT ST_Intersects (ST_GeomFromText('POLYGON((-1 2,0 3,0 1,-1 2))'),
   ST_GeomFromText('POLYGON((1 0,1 1,2 2,1 0))'));
 ST_Intersects
--------------
 f
(1 row)
```

Two polygons touch at a single point:



```
=> SELECT ST_Intersects (ST_GeomFromText('POLYGON((-1 2,0 3,0 1,-1 2))'),
   ST_GeomFromText('POLYGON((1 0,1 1,0 1,1 0))'));
 ST_Intersects
--------------
 t
(1 row)
```

Two polygons intersect:



```
=> SELECT ST_Intersects (ST_GeomFromText('POLYGON((-1 2, 0 3, 0 1, -1 2))'),
   ST_GeomFromText('POLYGON((0 2, -1 3, -2 0, 0 2))'));
 ST_Intersects
--------------
 t
(1 row)
```

See Also

ST_Disjoint

ST_IsEmpty

Determines if a spatial object represents the empty set. An empty object has no dimension.

Behavior Type

Immutable

Syntax

```
ST_IsEmpty( g )
```

Arguments

g	Spatial object, type GEOMETRY or GEOGRAPHY

Returns

BOOLEAN

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	Yes	Yes	Yes
Multipoint	Yes	Yes	Yes
Linestring	Yes	Yes	Yes
Multilinestring	Yes	Yes	Yes
Polygon	Yes	Yes	Yes
Multipolygon	Yes	Yes	Yes
GeometryCollection	Yes	No	No

Example

The following example shows how to use ST_IsEmpty.

An empty polygon:

```
=> SELECT ST_IsEmpty(ST_GeomFromText('GeometryCollection EMPTY'));
 ST_IsEmpty
------------
 t
(1 row)
```

ST_IsSimple

Determines if a spatial object does not intersect itself or touch its own boundary at any point.

Behavior Type

Immutable

Syntax

```
ST_IsSimple( g )
```

Arguments

g	Spatial object, type GEOMETRY or GEOGRAPHY

Returns

BOOLEAN

Supported Data Types

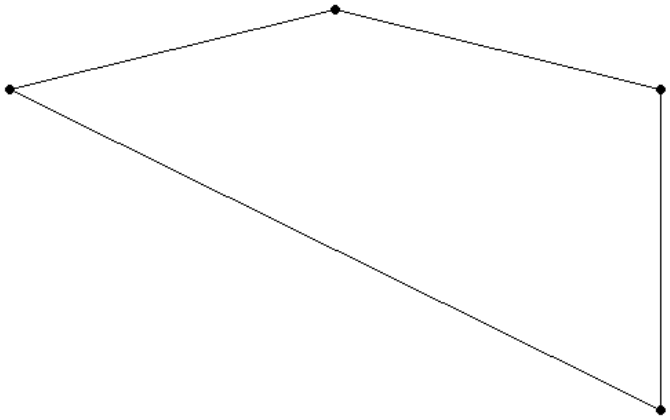
Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)
Point	Yes	Yes
Multipoint	Yes	No
Linestring	Yes	Yes
Multilinestring	Yes	No
Polygon	Yes	Yes
Multipolygon	Yes	No

GeometryCollection	No	No

Examples

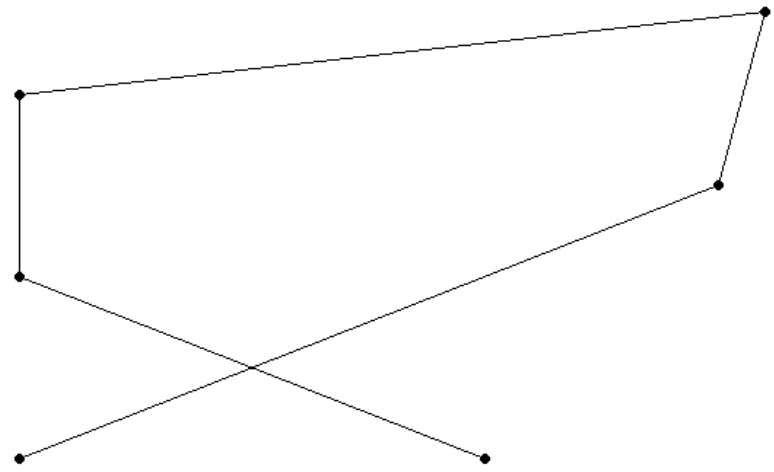
The following examples show how to use ST_IsSimple.

Polygon does not intersect itself:



```
=> SELECT ST_IsSimple(ST_GeomFromText('POLYGON((-1 2,0 3,1 2,1 -2,-1 2))'));
 ST_IsSimple
--------------
 t
(1 row)
```

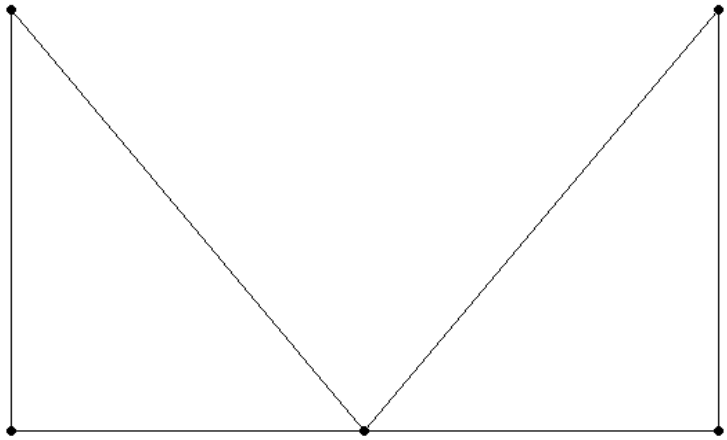
Linestring intersects itself.:



```
=> SELECT ST_IsSimple(ST_GeographyFromText('LINESTRING(10 10,25 25,26 34.5,
   10 30,10 20,20 10)'));
 St_IsSimple
```

```
-------------
 f
(1 row)
```

Linestring touches its interior at one or more locations:



```
=> SELECT ST_IsSimple(ST_GeomFromText('LINESTRING(0 0,0 1,1 0,2 1,2 0,0 0)'));
 ST_IsSimple
-------------
 f
(1 row)
```

ST_IsValid

Determines if a spatial object is well formed or valid. If the object is valid, ST_IsValid returns TRUE; otherwise, it returns FALSE. Use STV_IsValidReason to identify the location of the invalidity.

Spatial validity applies only to polygons and multipolygons. A polygon or multipolygon is valid if all of the following are true:

- The polygon is closed; its start point is the same as its end point.
- Its boundary is a set of linestrings.
- The boundary does not touch or cross itself.
- Any polygons in the interior do not touch the boundary of the exterior polygon except at a vertex.

The Open Geospatial Consortium (OGC) defines the validity of a polygon in section 6.1.11.1 of the Simple Feature Access Part 1 - Common Architecture specification.

If you are not sure if a polygon is valid, run ST_IsValid first. If you pass an invalid spatial object to a Vertica Place function, the function fails or returns incorrect results.

Behavior Type

Immutable

Syntax

```
ST_IsValid( g )
```

Arguments

g	Geospatial object to test for validity, value of type GEOMETRY or GEOGRAPHY (WGS84).

Returns

BOOLEAN

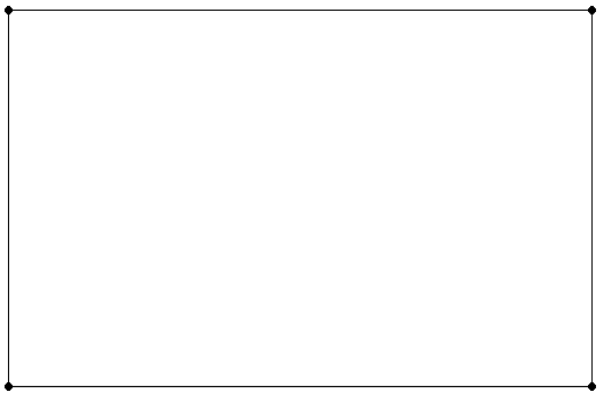
Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	Yes	No	No
Multipoint	Yes	No	No
Linestring	Yes	No	No
Multilinestring	Yes	No	No
Polygon	Yes	No	Yes
Multipolygon	Yes	No	No
GeometryCollection	Yes	No	No

Examples

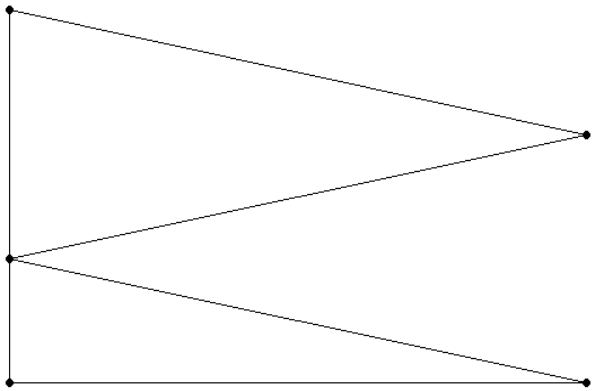
The following examples show how to use ST_IsValid.

Valid polygon:



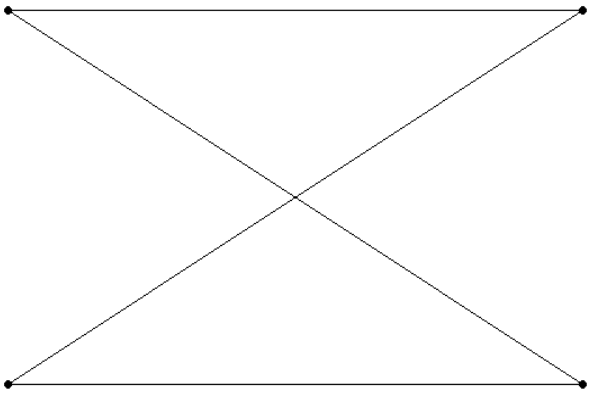
```
=> SELECT ST_IsValid(ST_GeomFromText('POLYGON((1 1,1 3,3 3,3 1,1 1))'));
 ST_IsValid
------------
 t
(1 row)
```

Invalid polygon:



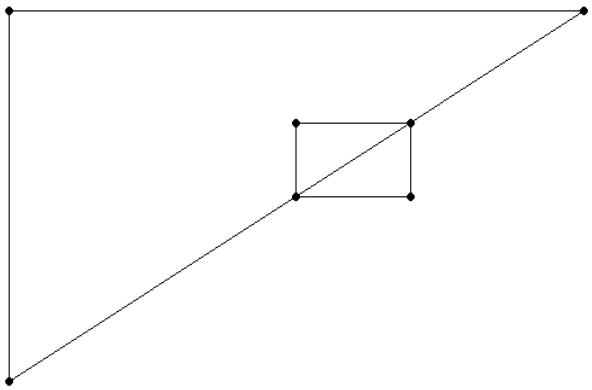
```
=> SELECT ST_IsValid(ST_GeomFromText('POLYGON((1 3,3 2,1 1,3 0,1 0,1 3))'));
 ST_IsValid
------------
 f
(1 row)
```

Invalid polygon:



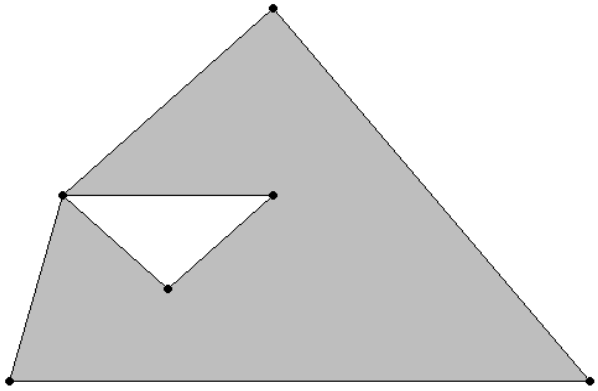
```
=> SELECT ST_IsValid(ST_GeomFromText('POLYGON((0 0,2 2,0 2,2 0,0 0))'));
 ST_IsValid
------------
 f
(1 row)
```

Invalid multipolygon:.



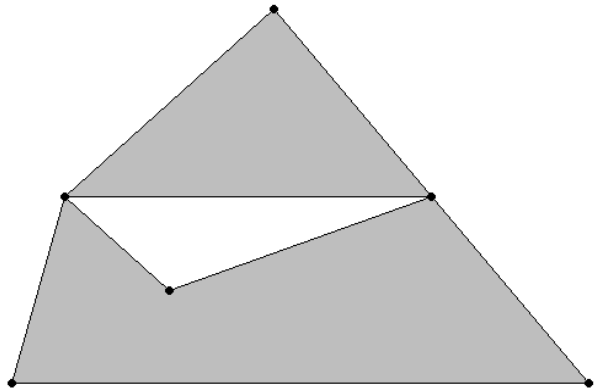
```
=> SELECT ST_IsValid(ST_GeomFromText('MULTIPOLYGON(((0 0, 0 1, 1 1, 0 0)),
   ((0.5 0.5, 0.7 0.5, 0.7 0.7, 0.5 0.7, 0.5 0.5)))'));
 ST_IsValid
------------
 f
(1 row)
```

Valid polygon with hole:



```
=> SELECT ST_IsValid(ST_GeomFromText('POLYGON((1 1,3 3,6 -1,0.5 -1,1 1),
   (1 1,3 1,2 0,1 1))'));
 ST_IsValid
------------
 t
(1 row)
```

Invalid polygon with hole:



```
=> SELECT ST_IsValid(ST_GeomFromText('POLYGON((1 1,3 3,6 -1,0.5 -1,1 1),
   (1 1,4.5 1,2 0,1 1))'));
 ST_IsValid
------------
 f
(1 row)
```

ST_Length

Calculates the length of a spatial object. For GEOMETRY objects, the length is measured in Cartesian coordinate units. For GEOGRAPHY objects, the length is measured in meters.

Calculates the length as follows:

- The length of a point or multipoint object is 0.
- The length of a linestring is the sum of the lengths of each line segment The length of a line segment is the distance from the start point to the end point.
- The length of a polygon is the sum of the lengths of the exterior boundary and any interior boundaries.
- The length of a multilinestring, multipolygon, or geometrycollection is the sum of the lengths of all the objects it contains.

Note:
ST_Length does not calculate the length of WKTs or WKBs. To calculate the lengths of those objects, use the Vertica LENGTH SQL function with ST_AsBinary or ST_AsText.

Behavior Type

Immutable

Syntax

```
ST_Length( g )
```

Arguments

g	Spatial object for which you want to calculate the length, type GEOMETRY or GEOGRAPHY

Returns

FLOAT

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)
Point	Yes	Yes

Multipoint	Yes	Yes
Linestring	Yes	Yes
Multilinestring	Yes	Yes
Polygon	Yes	Yes
Multipolygon	Yes	Yes
GeometryCollection	Yes	No

Examples

The following examples show how to use ST_Length.

Returns length in Cartesian coordinate units:

```
=> SELECT ST_Length(ST_GeomFromText('LINESTRING(-1 -1,2 2,4 5,6 7)'));
    ST_Length
------------------
 10.6766190873295
(1 row)
```

Returns length in meters:

```
=> SELECT ST_Length(ST_GeographyFromText('LINESTRING(-56.12 38.26,-57.51 39.78,
   -56.37 45.24)'));
    ST_Length
------------------
 821580.025733461
(1 row)
```

ST_NumGeometries

Returns the number of geometries contained within a spatial object. Single GEOMETRY or GEOGRAPHY objects return 1 and empty objects return NULL.

Behavior Type

Immutable

Syntax

```
ST_NumGeometries( g )
```

Arguments

g	Spatial object of type GEOMETRY or GEOGRAPHY

Returns

INTEGER

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	Yes	Yes	Yes
Multipoint	Yes	Yes	Yes
Linestring	Yes	Yes	Yes
Multilinestring	Yes	Yes	Yes
Polygon	Yes	Yes	Yes
Multipolygon	Yes	Yes	Yes
GeometryCollection	No	No	No

Examples

The following example shows how to use ST_NumGeometries.

Return the number of geometries:

```
=> SELECT ST_NumGeometries(ST_GeomFromText('MULTILINESTRING ((1 5, 2 4, 5 3, 6 6), (3 5, 3 7))'));
 ST_NumGeometries
------------------
                2
(1 row)
```

See Also

ST_GeometryN

ST_NumPoints

Calculates the number of vertices of a spatial object, empty objects return NULL.

The first and last vertex of polygons and multipolygons are counted separately.

Behavior Type

Immutable

Syntax

```
ST_NumPoints( g )
```

Arguments

g	Spatial object for which you want to count the vertices, type GEOMETRY or GEOGRAPHY

Returns

INTEGER

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	Yes	Yes	Yes
Multipoint	Yes	Yes	Yes
Linestring	Yes	Yes	Yes
Multilinestring	Yes	Yes	Yes
Polygon	Yes	Yes	Yes
Multipolygon	Yes	Yes	Yes
GeometryCollection	No	No	No

Examples

The following examples show how to use ST_NumPoints.

Returns the number of vertices in a linestring:

```
=> SELECT ST_NumPoints(ST_GeomFromText('LINESTRING(1.33 1.56,2.31 3.4,2.78 5.82,
   3.76 3.9,4.11 3.27,5.85 4.34,6.9 4.231,7.61 5.77)'));
 ST_NumPoints
--------------
            8
(1 row)
```

Use ST_Boundary and ST_NumPoints to return the number of vertices of a polygon:

```
=> SELECT ST_NumPoints(ST_Boundary(ST_GeomFromText('POLYGON((1 2,1 4,
   2 5,3 6,4 6,5 5,4 4,3 3,1 2))')));
 ST_NumPoints
--------------
            9
(1 row)
```

ST_Overlaps

Determines if a GEOMETRY object shares space with another GEOMETRY object, but is not completely contained within that object. They must overlap at their interiors. If two objects touch at a single point or intersect only along a boundary, they do not overlap. Both parameters must have the same dimension; otherwise, ST_Overlaps returns FALSE.

Behavior Type

Immutable

Syntax

```
ST_Overlaps ( g1, g2 )
```

Arguments

g1	Spatial object, type GEOMETRY
g2	Spatial object, type GEOMETRY

Returns

BOOLEAN

Supported Data Types

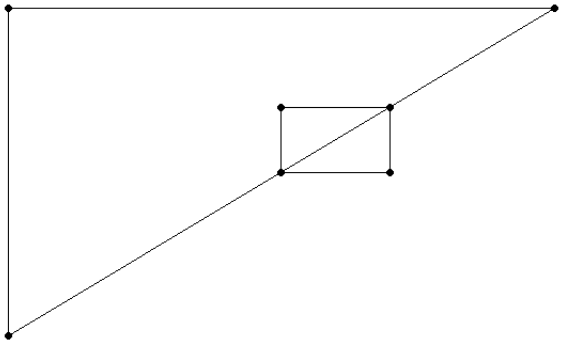
Data Type	GEOMETRY
Point	Yes
Multipoint	Yes
Linestring	Yes

Multilinestring	Yes
Polygon	Yes
Multipolygon	Yes
GeometryCollection	Yes

Examples

The following examples show how to use ST_Overlaps.

Polygon_1 overlaps but does not completely contain Polygon_2:



```
=> SELECT ST_Overlaps(ST_GeomFromText('POLYGON((0 0, 0 1, 1 1, 0 0))'),
   ST_GeomFromText('POLYGON((0.5 0.5, 0.7 0.5, 0.7 0.7, 0.5 0.7, 0.5 0.5))'));
 ST_Overlaps
-------------
 t
(1 row)
```

Two objects with different dimensions:

```
=> SELECT ST_Overlaps(ST_GeomFromText('LINESTRING(2 2,4 4)'),
   ST_GeomFromText('POINT(3 3)'));
 ST_Overlaps
-------------
 f
(1 row)
```

ST_PointFromGeoHash

Returns the center point of the specified GeoHash.

Behavior Type

Immutable

Syntax

```
ST_PointFromGeoHash(GeoHash)
```

Arguments

GeoHash	A valid GeoHash string of arbitrary length.

Returns

GEOGRAPHY POINT

Examples

The following examples show how to use ST_PointFromGeoHash.

Returns the geography point of a high-level GeoHash and uses ST_AsText to convert that point into Well-Known Text:

```
=>  SELECT ST_AsText(ST_PointFromGeoHash('dr'));
ST_AsText
-------------------------
POINT (-73.125 42.1875)
(1 row)
```

Returns the geography point of a detailed GeoHash and uses ST_AsText to convert that point into Well-Known Text:

```
=>  SELECT ST_AsText(ST_PointFromGeoHash('1234567890bcdefhjkmn'));
ST_AsText
--------------------------------------
POINT (-122.196077187 -88.2297377551)
(1 row)
```

ST_PointN

Finds the n^{th} point of a spatial object. If you pass a negative number, zero, or a number larger than the total number of points on the linestring, ST_PointN returns NULL.

The vertex order is based on the Well-Known Text (WKT) representation of the spatial object.

Behavior Type

Immutable

Syntax

```
ST_PointN( g, n )
```

Arguments

g	Spatial object to search, type GEOMETRY or GEOGRAPHY
n	Point in the spatial object to be returned. The index is one-based, type INTEGER

Returns

GEOMETRY or GEOGRAPHY

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	Yes	Yes	Yes
Multipoint	Yes	Yes	Yes

Linestring	Yes	Yes	Yes
Multilinestring	Yes	Yes	Yes
Polygon	Yes	Yes	Yes
Multipolygon	Yes	Yes	Yes
GeometryCollection	No	No	No

Examples

The following examples show how to use ST_PointN.

Returns the fifth point:

```
=> SELECT ST_AsText(ST_PointN(ST_GeomFromText('
          POLYGON(( 2 6, 2 9, 6 9, 7 7, 4 6, 2 6))'), 5));
  ST_AsText
-------------
 POINT (4 6)
(1 row)
```

Returns the second point:

```
=> SELECT ST_AsText(ST_PointN(ST_GeographyFromText('
          LINESTRING(23.41 24.93,34.2 32.98,40.7 41.19)'), 2));
     ST_AsText
--------------------
 POINT (34.2 32.98)
(1 row)
```

ST_Relate

Determines if a given GEOMETRY object is spatially related to another GEOMETRY object, based on the specified DE-9IM pattern matrix string.

The DE-9IM standard identifies how two objects are spatially related to each other.

Behavior Type

Immutable

Syntax

```
ST_Relate( g1, g2, matrix )
```

Arguments

g1	Spatial object, type GEOMETRY
g2	Spatial object, type GEOMETRY
matrix	DE-9IM pattern matrix string, type CHAR(9). This string represents a 3 x 3 matrix of restrictions on the dimensions of the respective intersections of the interior, boundary, and exterior of the two geometries. Must contain exactly 9 of the following characters: • T • F • 0 • 1 • 2 • *

Returns

BOOLEAN

Supported Data Types

Data Type	**GEOMETRY**
Point	Yes
Multipoint	Yes
Linestring	Yes
Multilinestring	Yes
Polygon	Yes

Multipolygon	Yes
GeometryCollection	Yes

Examples

The following examples show how to use ST_Relate.

The DE-9IM pattern for "equals" is `'T*F**FFF2'`:

```
=> SELECT ST_Relate(ST_GeomFromText('LINESTRING(0 1,2 2)'),
   ST_GeomFromText('LINESTRING(2 2,0 1)'), 'T*F**FFF2');
 ST_Relate
--------------
 t
(1 row)
```

The DE-9IM pattern for "overlaps" is `'T*T***T**'`:

```
=> SELECT ST_Relate(ST_GeomFromText('POLYGON((-1 -1,0 1,2 2,-1 -1))'),
   ST_GeomFromText('POLYGON((0 1,1 -1,1 1,0 1))'), 'T*T***T**');
 ST_Relate
-----------
 t
(1 row)
```

ST_SRID

Identifies the spatial reference system identifier (SRID) stored with a spatial object.

The SRID of a GEOMETRY object can only be determined when passing an SRID to either ST_GeomFromText or ST_GeomFromWKB. ST_SRID returns this stored value. SRID values of 0 to 2^{32-1} are valid.

Behavior Type

Immutable

Syntax

```
ST_SRID( g )
```

Arguments

g	Spatial object for which you want the SRID, type GEOMETRY or GEOGRAPHY

Returns

INTEGER

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	Yes	Yes	Yes
Multipoint	Yes	Yes	Yes
Linestring	Yes	Yes	Yes
Multilinestring	Yes	Yes	Yes
Polygon	Yes	Yes	Yes
Multipolygon	Yes	Yes	Yes
GeometryCollection	Yes	No	No

Examples

The following examples show how to use ST_SRID.

The default SRID of a GEOMETRY object is 0:

```
=> SELECT ST_SRID(ST_GeomFromText(
      'POLYGON((-1 -1,2 2,0 1,-1 -1))'));
 ST_SRID
---------
 0
(1 row)
```

The default SRID of a GEOGRAPHY object is 4326:

```
=> SELECT ST_SRID(ST_GeographyFromText(
      'POLYGON((22 35,24 35,26 32,22 35))'));
 ST_SRID
---------
 4326
(1 row)
```

ST_SymDifference

Calculates all the points in two GEOMETRY objects except for the points they have in common, but including the boundaries of both objects.

This result is called the symmetric difference and is represented mathematically as: Closure (*g1* – *g2*) ∪ Closure (*g2* – *g1*)

Behavior Type

Immutable

Syntax

```
ST_SymDifference( g1, g2 )
```

Arguments

g1	Spatial object, type GEOMETRY
g2	Spatial object, type GEOMETRY

Returns

GEOMETRY

Supported Data Types

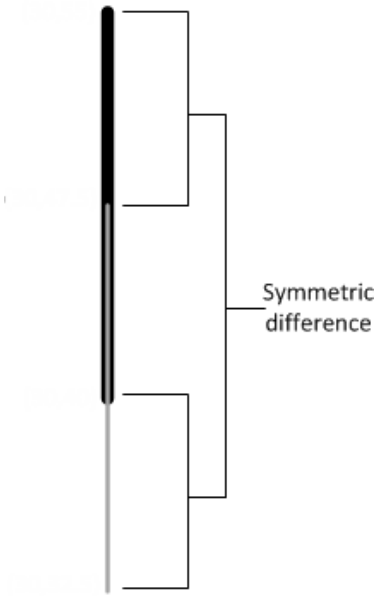
Data Type	**GEOMETRY**

Point	Yes
Multipoint	Yes
Linestring	Yes
Multilinestring	Yes
Polygon	Yes
Multipolygon	Yes
GeometryCollection	Yes

Examples

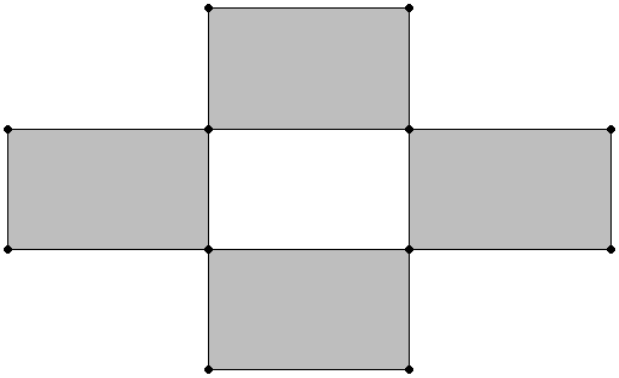
The following examples show how to use ST_SymDifference.

Returns the two linestrings:



```
=> SELECT ST_AsText(ST_SymDifference(ST_GeomFromText('LINESTRING(30 40,
   30 55)'),ST_GeomFromText('LINESTRING(30 32.5,30 47.5)')));
    ST_AsText
-----------------
MULTILINESTRING ((30 47.5, 30 55),(30 32.5,30 40))
(1 row)
```

Returns four squares:



```
=> SELECT ST_AsText(ST_SymDifference(ST_GeomFromText('POLYGON((2 1,2 4,3 4,
   3 1,2 1))'),ST_GeomFromText('POLYGON((1 2,1 3,4 3,4 2,1 2))')));
                              ST_AsText
-----------------------------------------------------------------------
 MULTIPOLYGON (((2 1, 2 2, 3 2, 3 1, 2 1)), ((1 2, 1 3, 2 3, 2 2, 1 2)),
 ((2 3, 2 4, 3 4, 3 3, 2 3)), ((3 2, 3 3, 4 3, 4 2, 3 2)))
(1 row)
```

ST_Touches

Determines if two GEOMETRY objects touch at a single point or along a boundary, but do not have interiors that intersect.

GEOGRAPHY Polygons with a vertex or border on the International Date Line (IDL) or the North or South pole are not supported.

Behavior Type

Immutable

Syntax

```
ST_Touches( g1, g2
                    [USING PARAMETERS spheroid={true | false}] )
```

Arguments

g1	Spatial object, value of type GEOMETRY
g2	Spatial object, value of type GEOMETRY

Parameters

`spheroid = {true | false}`	(Optional) BOOLEAN that specifies whether to use a perfect sphere or WGS84. **Default**: False

Returns

BOOLEAN

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (WGS84)
Point	Yes	Yes
Multipoint	Yes	No
Linestring	Yes	No
Multilinestring	Yes	No
Polygon	Yes	Yes
Multipolygon	Yes	No
GeometryCollection	Yes	No

Compatible GEOGRAPHY pairs:

Data Type	GEOGRAPHY (WGS84)
Point-Point	No
Linestring-Point	No
Polygon-Point	Yes
Multipolygon-Point	No

Examples

The following examples show how to use ST_Touches.

Two polygons touch at a single point:

```
=> SELECT ST_Touches(ST_GeomFromText('POLYGON((-1 2,0 3,0 1,-1 2))'),
   ST_GeomFromText('POLYGON((1 3,0 3,1 2,1 3))'));
 ST_Touches
------------
 t
(1 row)
```

Two polygons touch only along part of the boundary:

```
=> SELECT ST_Touches(ST_GeomFromText('POLYGON((-1 2,0 3,0 1,-1 2))'),
   ST_GeomFromText('POLYGON((1 2,0 3,0 1,1 2))'));
 ST_Touches
------------
 t
(1 row)
```

Two polygons do not touch at any point:

```
=> SELECT ST_Touches(ST_GeomFromText('POLYGON((-1 2,0 3,0 1,-1 2))'),
   ST_GeomFromText('POLYGON((0 2,-1 3,-2 0,0 2))'));
 ST_Touches
------------
 f
(1 row)
```

ST_Transform

Returns a new GEOMETRY with its coordinates converted to the spatial reference system identifier (SRID) used by the *srid* argument.

This function supports the following transformations:

- EPSG 4326 (WGS84) to EPSG 3857 (Web Mercator)
- EPSG 3857 (Web Mercator) to EPSG 4326 (WGS84)

For EPSG 4326 (WGS84), unless the coordinates fall within the following ranges, conversion results in failure:

- Longitude limits: -572 to +572
- Latitude limits: -89.9999999 to +89.9999999

Behavior Type

Immutable

Syntax

```
ST_Transform( g1, srid )
```

Arguments

g1	Spatial object of type GEOMETRY.
srid	Spatial reference system identifier (SRID) to which you want to convert your spatial object, of type INTEGER.

Returns

GEOMETRY

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	Yes	No	No
Multipoint	Yes	No	No
Linestring	Yes	No	No
Multilinestring	Yes	No	No
Polygon	Yes	No	No

Multipolygon	Yes	No	No
GeometryCollection	Yes	No	No

Examples

The following example shows how you can transform data from Web Mercator (3857) to WGS84 (4326):

```
=> SELECT ST_AsText(ST_Transform(STV_GeometryPoint(7910240.56433, 5215074.23966, 3857), 4326));
        ST_AsText
-------------------------
 POINT (71.0589 42.3601)
(1 row)
```

The following example shows how you can transform linestring data in a table from WGS84 (4326) to Web Mercator (3857):

```
=> CREATE TABLE transform_line_example (g GEOMETRY);
CREATE TABLE
=> COPY transform_line_example (gx FILLER LONG VARCHAR, g AS ST_GeomFromText(gx, 4326)) FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> LINESTRING(0 0, 1 1, 2 2, 3 4)
>> \.
=> SELECT ST_AsText(ST_Transform(g, 3857)) FROM transform_line_example;
                                                                                                    ST_AsText
-------------------------------------------------------------------------------------------------------------------
--------------------
 LINESTRING (0 -7.08115455161e-10, 111319.490793 111325.142866, 222638.981587 222684.208506,
333958.47238 445640.109656)
(1 row)
```

The following example shows how you can transform point data in a table from WGS84 (4326) to Web Mercator (3857):

```
=> CREATE TABLE transform_example (x FLOAT, y FLOAT, srid INT);
CREATE TABLE
=> COPY transform_example FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 42.3601|71.0589|4326
>> 122.4194|37.7749|4326
>> 94.5786|39.0997|4326
>> \.
=> SELECT ST_AsText(ST_Transform(STV_GeometryPoint(x, y, srid), 3857)) FROM transform_example;
              ST_AsText
-------------------------------------
 POINT (4715504.76195 11422441.5961)
 POINT (13627665.2712 4547675.35434)
 POINT (10528441.5919 4735962.8206)
```

```
(3 rows)
```

ST_Union

Calculates the union of all points in two spatial objects.

This result is represented mathematically by: *g1* ∪ *g2*

Behavior Type

Immutable

Syntax

```
ST_Union( g1, g2 )
```

Arguments

g1	Spatial object, type GEOMETRY
g2	Spatial object, type GEOMETRY

Returns

GEOMETRY

Supported Data Types

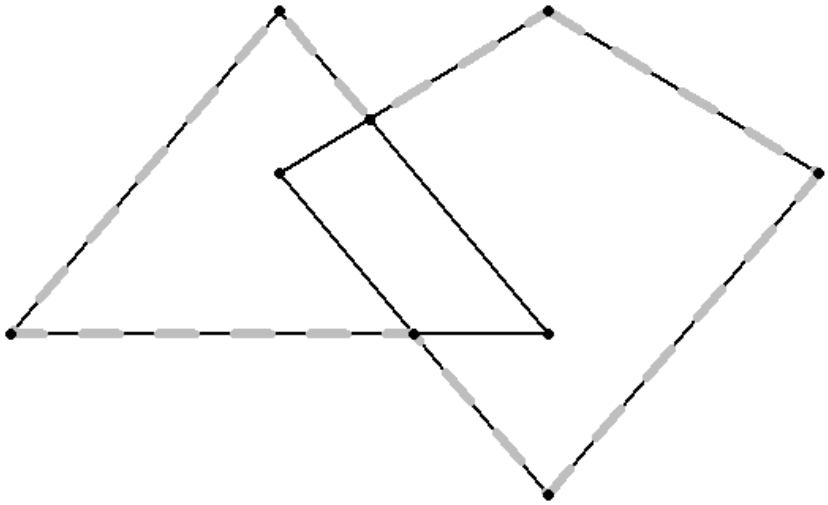
Data Type	**GEOMETRY**
Point	Yes
Multipoint	Yes
Linestring	Yes

Multilinestring	Yes
Polygon	Yes
Multipolygon	Yes
GeometryCollection	Yes

Example

The following example shows how to use ST_Union.

Returns a polygon that represents all the points contained in these two polygons:



```
=> SELECT ST_AsText(ST_Union(ST_GeomFromText('POLYGON((0 2,1 1,0 -1,-1 1,0 2))'),
   ST_GeomFromText('POLYGON((-1 2, 0 0, -2 0, -1 2))')));
                                    ST_AsText
-------------------------------------------------------------------------------
 POLYGON ((0 2, 1 1, 0 -1, -0.5 0, -2 0, -1 2, -0.666666666667 1.33333333333, 0 2))
(1 row)
```

ST_Within

If spatial object g1 is completely inside of spatial object g2, then ST_Within returns true. Both parameters must be the same spatial data type. Either specify two GEOMETRY objects or two GEOGRAPHY objects.

If an object such as a point or linestring only exists along a polygon's boundary, then ST_Within returns false. The interior of a linestring is all the points along the linestring except the start and end points.

ST_Within(*g1*,*g2*) is functionally equivalent to ST_Contains(*g2*,*g1*).

GEOGRAPHY Polygons with a vertex or border on the International Date Line (IDL) or the North or South pole are not supported.

Behavior Type

Immutable

Syntax

```
ST_Within( g1, g2
                    [USING PARAMETERS spheroid={true | false}] )
```

Arguments

g1	Spatial object, type GEOMETRY or GEOGRAPHY
g2	Spatial object, type GEOMETRY or GEOGRAPHY

Parameters

`spheroid = {true | false}`	(Optional) BOOLEAN that specifies whether to use a perfect sphere or WGS84. **Default**: False

Returns

BOOLEAN

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	Yes	Yes	Yes
Multipoint	Yes	No	No
Linestring	Yes	Yes	No
Multilinestring	Yes	No	No
Polygon	Yes	Yes	Yes
Multipolygon	Yes	Yes	No
GeometryCollection	Yes	No	No

Compatible GEOGRAPHY pairs:

Data Type	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point-Point	Yes	No
Point-Linestring	Yes	No
Point-Polygon	Yes	Yes
Point-Multipolygon	Yes	No

Examples

The following examples show how to use ST_Within.

The first polygon is completely contained within the second polygon:

```
=> SELECT ST_Within(ST_GeomFromText('POLYGON((0 2,1 1,0 -1,0 2))'),
   ST_GeomFromText('POLYGON((-1 3,2 1,0 -3,-1 3))'));
 ST_Within
-----------
 t
(1 row)
```

The point is on a vertex of the polygon, but not in its interior:

```
=> SELECT ST_Within (ST_GeographyFromText('POINT(30 25)'),
   ST_GeographyFromText('POLYGON((25 25,25 35,32.2 35,30 25,25 25))'));
 ST_Within
-----------
 f
(1 row)
```

Two polygons are spatially equivalent:

```
=> SELECT ST_Within (ST_GeomFromText('POLYGON((-1 2, 0 3, 0 1, -1 2))'),
   ST_GeomFromText('POLYGON((0 3, -1 2, 0 1, 0 3))'));
 ST_Within
-----------
 t
(1 row)
```

See Also

- ST_Contains
- ST_Overlaps

ST_X

Determines the *x*- coordinate for a GEOMETRY point or the longitude value for a GEOGRAPHY point.

Behavior Type

Immutable

Syntax

```
ST_X( g )
```

Arguments

g	Point of type GEOMETRY or GEOGRAPHY

Returns

FLOAT

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	Yes	Yes	Yes
Multipoint	No	No	No
Linestring	No	No	No
Multilinestring	No	No	No
Polygon	No	No	No
Multipolygon	No	No	No
GeometryCollection	No	No	No

Examples

The following examples show how to use ST_X.

Returns the *x*-coordinate:

```
=> SELECT ST_X(ST_GeomFromText('POINT(3.4 1.25)'));
 ST_X
-----
 3.4
(1 row)
```

Returns the longitude value:

```
=> SELECT ST_X(ST_GeographyFromText('POINT(25.34 45.67)'));
 ST_X
-------
 25.34
(1 row)
```

ST_XMax

Returns the maximum *x*-coordinate of the minimum bounding rectangle of the GEOMETRY or GEOGRAPHY object.

For GEOGRAPHY types, Vertica Place computes maximum coordinates by calculating the maximum longitude of the great circle arc from (MAX(longitude), ST_YMin(GEOGRAPHY)) to (MAX(longitude), ST_YMax(GEOGRAPHY)). In this case, MAX(longitude) is the maximum longitude value of the geography object.

If either latitude or longitude is out of range, ST_XMax returns the maximum plain value of the geography object.

Behavior Type

Immutable

Syntax

```
ST_XMax( g )
```

Arguments

g	Spatial object for which you want to find the maximum *x*-coordinate, type GEOMETRY or GEOGRAPHY.

Returns

FLOAT

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)
Point	Yes	Yes

Multipoint	Yes	Yes
Linestring	Yes	Yes
Multilinestring	Yes	Yes
Polygon	Yes	Yes
Multipolygon	Yes	Yes
GeometryCollection	Yes	No

Examples

The following examples show how to use ST_XMax.

Returns the maximum *x*-coordinate within a rectangle:

```
=> SELECT ST_XMax(ST_GeomFromText('POLYGON((0 1,0 2,1 2,1 1,0 1))'));
  ST_XMax
-----------
       1
(1 row)
```

Returns the maximum longitude value within a rectangle:

```
=> SELECT ST_XMax(ST_GeographyFromText(
    'POLYGON((-71.50 42.35, -71.00 42.35, -71.00 42.38, -71.50 42.38, -71.50 42.35))'));
  ST_XMax
---------
     -71
(1 row)
```

ST_XMin

Returns the minimum *x*-coordinate of the minimum bounding rectangle of the GEOMETRY or GEOGRAPHY object.

For GEOGRAPHY types, Vertica Place computes minimum coordinates by calculating the minimum longitude of the great circle arc from (MIN(longitude), ST_YMin(GEOGRAPHY)) to (MIN(longitude), ST_YMax(GEOGRAPHY)). In this case, MIN(latitude) represents the minimum longitude value of the geography object

If either latitude or longitude is out of range, ST_XMin returns the minimum plain value of the geography object.

Behavior Type

Immutable

Syntax

```
ST_XMin( g )
```

Arguments

g	Spatial object for which you want to find the minimum *x*-coordinate, type GEOMETRY or GEOGRAPHY.

Returns

FLOAT

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)
Point	Yes	Yes
Multipoint	Yes	Yes
Linestring	Yes	Yes
Multilinestring	Yes	Yes
Polygon	Yes	Yes
Multipolygon	Yes	Yes
GeometryCollection	Yes	No

Examples

The following examples show how to use ST_XMin.

Returns the minimum *x*-coordinate within a rectangle:

```
=> SELECT ST_XMin(ST_GeomFromText('POLYGON((0 1,0 2,1 2,1 1,0 1))'));
  ST_XMin
----------
       0
(1 row)
```

Returns the minimum longitude value within a rectangle:

```
=> SELECT ST_XMin(ST_GeographyFromText(
    'POLYGON((-71.50 42.35, -71.00 42.35, -71.00 42.38, -71.50 42.38, -71.50 42.35))'));
  ST_XMin
----------
    -71.5
(1 row)
```

ST_YMax

Returns the maximum *y*-coordinate of the minimum bounding rectangle of the GEOMETRY or GEOGRAPHY object.

For GEOGRAPHY types, Vertica Place computes maximum coordinates by calculating the maximum latitude of the great circle arc from (ST_XMin(GEOGRAPHY), MAX(latitude)) to (ST_XMax(GEOGRAPHY), MAX(latitude)). In this case, MAX(latitude) is the maximum latitude value of the geography object.

If either latitude or longitude is out of range, ST_YMax returns the maximum plain value of the geography object.

Behavior Type

Immutable

Syntax

```
ST_YMax( g )
```

Arguments

g	Spatial object for which you want to find the maximum *y*-coordinate, type GEOMETRY or GEOGRAPHY.

Returns

FLOAT

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)
Point	Yes	Yes
Multipoint	Yes	Yes
Linestring	Yes	Yes
Multilinestring	Yes	Yes
Polygon	Yes	Yes
Multipolygon	Yes	Yes
GeometryCollection	Yes	No

Examples

The following examples show how to use ST_YMax.

Returns the maximum *y*-coordinate within a rectangle:

```
=> SELECT ST_YMax(ST_GeomFromText('POLYGON((0 1,0 4,1 4,1 1,0 1))'));
  ST_YMax
-----------
       4
(1 row)
```

Returns the maximum latitude value within a rectangle:

```
=> SELECT ST_YMax(ST_GeographyFromText(
    'POLYGON((-71.50 42.35, -71.00 42.35, -71.00 42.38, -71.50 42.38, -71.50 42.35))'));
   ST_YMax
------------------
 42.3802715689979
(1 row)
```

ST_YMin

Returns the minimum *y*-coordinate of the minimum bounding rectangle of the GEOMETRY or GEOGRAPHY object.

For GEOGRAPHY types, Vertica Place computes minimum coordinates by calculating the minimum latitude of the great circle arc from (ST_XMin(GEOGRAPHY), MIN(latitude)) to (ST_XMax(GEOGRAPHY), MIN(latitude)). In this case, MIN(latitude) represents the minimum latitude value of the geography object.

If either latitude or longitude is out of range, ST_YMin returns the minimum plain value of the geography object.

Behavior Type

Immutable

Syntax

```
ST_YMin( g )
```

Arguments

g	Spatial object for which you want to find the minimum *y*-coordinate, type GEOMETRY or GEOGRAPHY.

Returns

FLOAT

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)
Point	Yes	Yes
Multipoint	Yes	Yes
Linestring	Yes	Yes
Multilinestring	Yes	Yes
Polygon	Yes	Yes
Multipolygon	Yes	Yes
GeometryCollection	Yes	No

Examples

The following examples show how to use ST_YMin.

Returns the minimum *y*-coordinate within a rectangle:

```
=> SELECT ST_YMin(ST_GeomFromText('POLYGON((0 1,0 4,1 4,1 1,0 1))'));
  ST_YMin
-----------
       1
(1 row)
```

Returns the minimum latitude value within a rectangle:

```
=> SELECT ST_YMin(ST_GeographyFromText(
    'POLYGON((-71.50 42.35, -71.00 42.35, -71.00 42.38, -71.50 42.38, -71.50 42.35))'));
  ST_YMin
------------------
 42.35
(1 row)
```

ST_Y

Determines the *y*-coordinate for a GEOMETRY point or the latitude value for a GEOGRAPHY point.

Behavior Type

Immutable

Syntax

```
ST_Y( g )
```

Arguments

g	Point of type GEOMETRY or GEOGRAPHY

Returns

FLOAT

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	Yes	Yes	Yes
Multipoint	No	No	No
Linestring	No	No	No
Multilinestring	No	No	No
Polygon	No	No	No
Multipolygon	No	No	No
GeometryCollection	No	No	No

Examples

The following examples show how to use ST_Y.

Returns the *y*-coordinate:

```
=> SELECT ST_Y(ST_GeomFromText('POINT(3 5.25)'));
 ST_Y
------
 5.25
(1 row)
```

Returns the latitude value:

```
=> SELECT ST_Y(ST_GeographyFromText('POINT(35.44 51.04)'));
 ST_Y
-------
 51.04
(1 row)
```

STV_AsGeoJSON

Returns the geometry or geography argument as a Geometry Javascript Object Notation (GeoJSON) object.

Behavior Type

Immutable

Syntax

```
STV_AsGeoJSON( g, [USING PARAMETERS maxdecimals=[dec_value]])
```

Arguments

g	Spatial object of type GEOMETRY or GEOGRAPHY
maxdecimals = *dec_value*	(Optional) Integer value. Determines the maximum number of digits to output after the decimal of floating point coordinates. Valid values: Between 0 and 15. Default value: 6

Returns

LONG VARCHAR

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	Yes	Yes	Yes
Multipoint	Yes	Yes	Yes
Linestring	Yes	Yes	Yes
Multilinestring	Yes	Yes	Yes
Polygon	Yes	Yes	Yes
Multipolygon	Yes	Yes	Yes
GeometryCollection	No	No	No

Examples

The following examples show how you can use STV_AsGeoJSON.

Convert a geometry polygon to GeoJSON:

```
=> SELECT STV_AsGeoJSON(ST_GeomFromText('POLYGON((3 2, 4 3, 5 1, 3 2), (3.5 2, 4 2.5, 4.5 1.5, 3.5
2))'));
                                                STV_AsGeoJSON
-------------------------------------------------------------------------------------------------------
 {"type":"Polygon","coordinates":[[[3,2],[4,3],[5,1],[3,2]],[[3.5,2],[4,2.5],[4.5,1.5],[3.5,2]]]}
(1 row)
```

Convert a geography point to GeoJSON:

```
=> SELECT STV_AsGeoJSON(ST_GeographyFromText('POINT(42.36011 71.05899)') USING PARAMETERS
maxdecimals=4);
                   STV_AsGeoJSON
-------------------------------------------------
 {"type":"Point","coordinates":[42.3601,71.059]}
(1 row)
```

STV_Create_Index

Creates a spatial index on a set of polygons to speed up spatial intersection with a set of points.

A spatial index is created from an input polygon set, which can be the result of a query. Spatial indexes are created in a global name space. Vertica uses a distributed plan whenever the input table or projection is segmented across nodes of the cluster.

The OVER() clause must be empty.

Important:
You cannot access spatial indexes on newly added nodes without rebalancing your cluster. For more information, see REBALANCE_CLUSTER.

Behavior Type

Immutable

Note:
Indexes are not connected to any specific table. Subsequent DML commands on the underlying table or tables of the input data source do not modify the index.

Syntax

```
STV_Create_Index( gid, g
                  USING PARAMETERS index='index_name'
                                   [, overwrite={ true | false } ]
                                   [, max_mem_mb=maxmem_value]
                                   [, skip_nonindexable_polygons={true | false } ] )
                OVER()
                   [ AS (polygons, srid, min_x, min_y, max_x, max_y, info) ]
```

Arguments

gid	Name of an integer column that uniquely identifies the polygon. The gid cannot be NULL.

g	Name of a geometry or geography (WGS84) column or expression that contains polygons and multipolygons. Only polygon and multipolygon can be indexed. Other shape types are excluded from the index.

Parameters

`index = 'index_name'`	Name of the index, type VARCHAR. Index names cannot exceed 110 characters. The slash, backslash, and tab characters are not allowed in index names.
`overwrite = [ true | false ]`	(Optional) BOOLEAN value that specifies whether to overwrite the index, if an index exists. This parameter cannot be NULL. Default: False
`max_mem_mb = maxmem_value`	A positive integer that assigns a limit to the amount of memory in megabytes that `STV_Create_Index` can allocate during index construction. On a multi-node database this is the memory limit per node. The default value is 256. Do not assign a value higher than the amount of memory in the GENERAL resource pool. For more information about this pool, see Querying Resource Pool Data. Setting a value for max_mem_mb that is at or near the maximum memory available on the node can negatively affect your system's performance. For example, it could cause other queries to time out waiting for memory resources during index construction.
`skip_nonindexable_polygons = [ true | false ]`	(Optional) BOOLEAN In rare cases, intricate polygons (for instance, with too high resolution or anomalous spikes) cannot be indexed. These polygons are considered non-indexable. When set to False, non-indexable polygons cause the index

	creation to fail. When set to True, index creation can succeed by excluding non-indexable polygons from the index. To review the polygons that were not able to be indexed, use STV_Describe_Index with the parameter list_polygon. Default: False

Returns

polygons	Number of polygons indexed.
SRID	Spatial reference system identifier.
min_x, min_y, max_x, max_y	Coordinates of the minimum bounding rectangle (MBR) of the indexed geometries. (*min_x*, *min_y*) are the south-west coordinates, and (*max_x*, *max_y*) are the north-east coordinates.
info	Lists the number of excluded spatial objects as well as their type that were excluded from the index.

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (WGS84)
Point	No	No
Multipoint	No	No
Linestring	No	No
Multilinestring	No	No
Polygon	Yes	Yes
Multipolygon	Yes	No
GeometryCollection	No	No

Privileges

Any user with access to the STV_*_Index functions can describe, rename, or drop indexes created by any other user.

Recommendations

- Segment large polygon tables across multiple nodes. Table segmentation causes index creation to run in parallel, leveraging the Massively Parallel Processing (MPP) architecture in Vertica. This significantly reduces execution time on large tables.

  Vertica recommends that you segment the table from which you are building the index when the total number of polygons is large.

- STV_Create_Index can consume large amounts of processing time and memory.

  Vertica recommends that when indexing new data for the first time, you monitor memory usage to be sure it stays within safe limits. Memory usage depends on number of polygons, number of vertices, and the amount of overlap among polygons.

- STV_Create_Index tries to allocate memory before it starts creating the index. If it cannot allocate enough memory, the function fails. If not enough memory is available, try the following:

  - Create the index at a time of less load on the system.
  - Avoid concurrent index creation.
  - Try segmenting the input table across the nodes of the cluster.
- Ensure that all of the polygons you plan to index are valid polygons. STV_Create_Index and STV_Refresh_Index do not check polygon validity when building an index.

  For more information, see Ensuring Polygon Validity Before Creating or Refreshing an Index.

Limitations

- Any indexes created prior to 10.0.x need to re-created.
- Index creation fails if there are WGS84 polygons with vertices on the International Date Line (IDL) or the North and South Poles.

- The backslash or tab characters are not allowed in index names.
- Indexes cannot have names greater than 110 characters.

- The following geometries are excluded from the index:
  - Non-polygons
  - Geometries with NULL identifiers
  - NULL (multi) polygon
  - EMPTY (multi) polygon
  - Invalid (multi) polygon
- The following geographies are excluded from the index:
  - Polygons with holes
  - Polygons crossing the International Date Line
  - Polygons covering the north or south pole
  - Antipodal polygons

Usage Tips

- To cancel an STV_Create_Index run, use **Ctrl** + **C**.
- If there are no valid polygons in the geom column, STV_Create_Index reports an error in vertica.log and stops index creation.
- If index creation uses a large amount of memory, consider segmenting your data to utilize parallel index creation.

Examples

The following examples show how to use STV_Create_Index.

Create an index with a single literal argument:

```
=> SELECT STV_Create_Index(1, ST_GeomFromText('POLYGON((0 0,0 15.2,3.9 15.2,3.9 0,0 0))')
     USING PARAMETERS index='my_polygon') OVER();
polygons  | SRID | min_x | min_y | max_x | max_y | info
----------+------+-------+-------+-------+-------+------
        1 |    0 |     0 |     0 |   3.9 |  15.2 |
(1 row)
```

Create an index from a table:

```
=> CREATE TABLE pols (gid INT, geom GEOMETRY(1000));
CREATE TABLE
=> COPY pols(gid, gx filler LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM stdin delimiter '|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 1|POLYGON((-31 74,8 70,8 50,-36 53,-31 74))
>> 2|POLYGON((-38 50,4 13,11 45,0 65,-38 50))
```

```
>> 3|POLYGON((10 20,15 60,20 45,46 15,10 20))
>> 4|POLYGON((5 20,9 30,20 45,36 35,5 20))
>> 5|POLYGON((12 23,9 30,20 45,36 35,37 67,45 80,50 20,12 23))
>> \.
=> SELECT STV_Create_Index(gid, geom USING PARAMETERS index='my_polygons_1', overwrite=true,
    max_mem_mb=256) OVER() FROM pols;
 polygons | SRID | min_x | min_y | max_x | max_y | info
----------+------+-------+-------+-------+-------+------
        5 |    0 |   -38 |    13 |    50 |    80 |
(1 row)
```

Create an index in parallel from a partitioned table:

```
=> CREATE TABLE pols (p INT, gid INT, geom GEOMETRY(1000)) SEGMENTED BY HASH(p) ALL NODES;
CREATE TABLE
=> COPY pols (p, gid, gx filler LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM stdin delimiter '|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 1|10|POLYGON((-31 74,8 70,8 50,-36 53,-31 74))
>> 1|11|POLYGON((-38 50,4 13,11 45,0 65,-38 50))
>> 3|12|POLYGON((-12 42,-12 42,27 48,14 26,-12 42))
>> \.
=> SELECT STV_Create_Index(gid, geom USING PARAMETERS index='my_polygons', overwrite=true,
    max_mem_mb=256) OVER() FROM pols;
 polygons | SRID | min_x | min_y | max_x | max_y | info
----------+------+-------+-------+-------+-------+------
        3 |    0 |   -38 |    13 |    27 |    74 |
(1 row)
```

STV_Describe_Index

Retrieves information about an index that contains a set of polygons. If you do not pass any parameters, STV_Describe_Index returns all of the defined indexes.

The OVER() clause must be empty.

Behavior Type

Immutable

Syntax

```
STV_Describe_Index ( [ USING PARAMETERS [index='index_name']
                                        [, list_polygons={true | false } ]] ) OVER ()
```

Arguments

index = *'index_name'*	Name of the index, type VARCHAR. Index names cannot exceed 110 characters. The slash, backslash, and tab characters are not allowed in index names.
list_polygon	(Optional) BOOLEAN that specifies whether to list the polygons in the index. The index argument must be used with this argument.

Returns

polygons	Number of polygons indexed.
SRID	Spatial reference system identifier.
min_x, min_y, max_x, max_y	Coordinates of the minimum bounding rectangle (MBR) of the indexed geometries. (*min_x*, *min_y*) are the south-west coordinates, and (*max_x*, *max_y*) are the north-east coordinates.
name	The name of the spatial index(es).
gid	Name of an integer column that uniquely identifies the polygon. The gid cannot be NULL.
state	The spatial object's state in the index. Possible values are: • INDEXED - The spatial object was successfully indexed. • SELF_INTERSECT - (WGS84 Only) The spatial object was not indexed because one of its edges intersects with

	another of its edges. • EDGE_CROSS_IDL - (WGS84 Only) The spatial object was not indexed because one of its edges crosses the International Date Line. • EDGE_HALF_CIRCLE - (WGS84 Only) The spatial object was not indexed because it contains two adjacent vertices that are antipodal. • NON_INDEXABLE - The spatial object was not able to be indexed.
geography	The Well-Known Binary (WKB) representation of the spatial object.
geometry	The Well-Known Binary (WKB) representation of the spatial object.

Privileges

Any user with access to the STV_*_Index functions can describe, rename, or drop indexes created by any other user.

Limitations

Some functionality will require the index to be rebuilt if the index was created with 10.0.x or earlier.

Examples

The following examples show how to use STV_Describe_Index.

Retrieve information about the index:

```
=> SELECT STV_Describe_Index (USING PARAMETERS index='my_polygons') OVER ();
   type    | polygons | SRID | min_x | min_y | max_x | max_y
-----------+----------+------+-------+-------+-------+-------
 GEOMETRY |        4 |    0 |    -1 |    -1 |    12 |    12
(1 row)
```

Return the names of all the defined indexes:

```
=> SELECT STV_Describe_Index() OVER ();
       name
------------------
MA_counties_index
my_polygons
NY_counties_index
US_States_Index
(4 rows)
```

Return the polygons included in an index:

```
=> SELECT STV_Describe_Index(USING PARAMETERS index='my_polygons', list_polygons=TRUE) OVER ();
 gid |     state     |            geometry
-----+---------------+--------------------------------
  12 | INDEXED       | \260\000\000\000\000\000\000\ ...
  14 | INDEXED       | \200\000\000\000\000\000\000\ ...
  10 | NON_INDEXABLE | \274\000\000\000\000\000\000\ ...
  11 | INDEXED       | \260\000\000\000\000\000\000\ ...
(4 rows)
```

- STV_Rename_Index

STV_Drop_Index

Deletes a spatial index. If STV_Drop_Index cannot find the specified spatial index, it returns an error.

The OVER clause must be empty.

Behavior Type

Immutable

Syntax

```
STV_Drop_Index( USING PARAMETERS index = 'index_name' ) OVER ()
```

Arguments

index = *'index_name'*	Name of the index, type VARCHAR. Index names cannot exceed 110 characters. The slash, backslash, and tab characters are not allowed in index names.

Example

The following example shows how to use STV_Drop_Index.

Drop an index:

```
=> SELECT STV_Drop_Index(USING PARAMETERS index ='my_polygons') OVER ();
 drop_index
------------
 Index dropped
(1 row)
```

See Also

- Spatial Joins with ST_Intersects and STV_Intersect

- STV_Describe_Index
- STV_Rename_Index

- STV_Intersect Scalar Function
- STV_Intersect Transform Function

STV_DWithin

Determines if the shortest distance from the boundary of one spatial object to the boundary of another object is within a specified distance.

Parameters *g1* and *g2* must be both GEOMETRY objects or both GEOGRAPHY objects.

Behavior Type

Immutable

Syntax

```
STV_DWithin( g1, g2, d )
```

Arguments

g1	Spatial object of type GEOMETRY or GEOGRAPHY
g2	Spatial object of type GEOMETRY or GEOGRAPHY
d	Value of type FLOAT indicating a distance. For GEOMETRY objects, the distance is measured in Cartesian coordinate units. For GEOGRAPHY objects, the distance is measured in meters.

Returns

BOOLEAN

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)
Point	Yes	Yes
Multipoint	Yes	Yes
Linestring	Yes	Yes
Multilinestring	Yes	Yes
Polygon	Yes	Yes
Multipolygon	Yes	Yes
GeometryCollection	Yes	No

Compatible GEOGRAPHY pairs:

Data Type	GEOGRAPHY (Perfect Sphere)

Point-Point	Yes
Point-Linestring	Yes
Point-Polygon	Yes
Point-Multilinestring	Yes
Point-Multipolygon	Yes

Examples

The following examples show how to use STV_DWithin.

Two geometries are one Cartesian coordinate unit from each other at their closest points:

```
=> SELECT STV_DWithin(ST_GeomFromText('POLYGON((-1 -1,2 2,0 1,-1 -1))'),
   ST_GeomFromText('POLYGON((4 3,2 3,4 5,4 3))'),1);
 STV_DWithin
-------------
 t
(1 row)
```

If you reduce the distance to 0.99 units:

```
=> SELECT STV_DWithin(ST_GeomFromText('POLYGON((-1 -1,2 2,0 1,-1 -1))'),
   ST_GeomFromText('POLYGON((4 3,2 3,4 5,4 3))'),0.99);
 STV_DWithin
-------------
 f
(1 row)
```

The first polygon touches the second polygon:

```
=> SELECT STV_DWithin(ST_GeomFromText('POLYGON((-1 -1,2 2,0 1,-1 -1))'),
   ST_GeomFromText('POLYGON((1 1,2 3,4 5,1 1))'),0.00001);
 STV_DWithin
-------------
 t
(1 row)
```

The first polygon is not within 1000 meters from the second polygon:

```
=> SELECT STV_DWithin(ST_GeomFromText('POLYGON((45.2 40,50.65 51.29,
   55.67 47.6,50 47.6,45.2 40))'),ST_GeomFromText('POLYGON((25 25,25 30,
   30 30,30 25,25 25))'), 1000);
 STV_DWithin
--------------
 t
```

```
(1 row)
```

STV_Export2Shapefile

Exports GEOGRAPHY or GEOMETRY data from a database table or a subquery to a shapefile. Writes the output to the directory specified using STV_SetExportShapefileDirectory.

Behavior Type

Immutable

Syntax

```
STV_Export2Shapefile( columns
                        USING PARAMETERS shapefile = 'name_of_shapefile'
                                        [, overwrite = { TRUE | FALSE } ]
                                        [, shape = ' { Point | Polygon | Linestring | Multipoint |
Multipolygon | Multilinestring } ' ] )
                        OVER()
```

Parameters

shapefile = '*name_of_shapefile*'	Prefix of the component names of the shapefile, type VARCHAR. Must end with the file extension .shp. Limited to 128 octets in length. For example, city-data.shp. If you want to save the shapefile to a sub-directory you can do so by concatenating the sub-directory to `name_of_shapefile`. For example, visualizations/city-

	data.shp. You can also export a shapefile to a mounted S3 directory where you have read and write permissions. Use the syntax '<bucketname>/path/file name'.
`overwrite = { TRUE | FALSE }`	(Optional) BOOLEAN value that specifies whether to overwrite the index, if an index exists. This parameter cannot be NULL. Default: False Overwriting may corrupt the existing files.
`shape = ' { Point | Polygon | Linestring | Multipoint | Multipolygon | Multilinestring } '`	Must be one of the following spatial classes: Point, Polygon, Linestring, Multipoint, Multipolygon, Multilinestring. Polygons and multipolygons always have a clockwise orientation. Default: Polygon

Arguments

columns	The columns to export to the shapefile. A value of asterisk (*) is the equivalent to listing all columns of the FROM clause.

Returns

Three files in the shapefile export directory with the extensions .shp, .shx, and .dbf.

Limitations

- If a multipolygon, multilinestring, or multipoint contains only one element, then it is written as a polygon, line, or point, respectively.
- Column names longer than 10 characters are truncated.
- Empty POINTS cannot be exported.
- All rows with NULL geometry or geography data are skipped.
- Unsupported or invalid dates are replaced with NULLs.
- Numeric values may lose precision when they are exported. This loss occurs because the target field in the .dbf file is a 64-bit FLOAT column, which can only represent about 15 significant digits.
- Shapefiles cannot exceed 4GB in size. If your shapefile is too large, try splitting the data and exporting to multiple shapefiles.

Examples

The following example shows how you can use STV_Export2Shapefile to export all columns from the table geo_data to a shapefile named city-data.shp:

```
=> SELECT STV_Export2Shapefile(*
            USING PARAMETERS shapefile = 'visualizations/city-data.shp',
                             overwrite = true, shape = 'Point')
            OVER()
            FROM geo_data
            WHERE REVENUE > 25000;
 Rows Exported |                          File Path
---------------+-------------------------------------------------------------
       6442892 | v_geo-db_node0001: /home/geo/temp/visualizations/city-data.shp
(1 row)
```

STV_Extent

Returns a bounding box containing all of the input data.

Use STV_Extent inside of a nested query for best results. The OVER clause must be empty.

Important:
STV_Extent does not return a valid polygon when the input is a single point.

Behavior Type

Immutable

Syntax

```
STV_Extent( g )
```

Arguments

g	Spatial object, type GEOMETRY.

Returns

GEOMETRY

Supported Data Types

Data Type	GEOMETRY
Point	Yes
Multipoint	Yes
Linestring	Yes
Multilinestring	Yes
Polygon	Yes
Multipolygon	Yes
GeometryCollection	Yes

Examples

The following examples show how you can use STV_Extent.

Return the bounding box of a linestring, and verify that it is a valid polygon:

```
=> SELECT ST_AsText(geom) AS bounding_box, ST_IsValid(geom)
   FROM (SELECT STV_Extent(ST_GeomFromText('LineString(0 0, 1 1)')) OVER() AS geom) AS g;
           bounding_box             | ST_IsValid
------------------------------------+------------
 POLYGON ((0 0, 1 0, 1 1, 0 1, 0 0)) | t
(1 row)
```

Return the bounding box of spatial objects in a table:

```
=> CREATE TABLE misc_geo_shapes (id IDENTITY, geom GEOMETRY);
CREATE TABLE
=> COPY misc_geo_shapes (gx FILLER LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> POINT(-71.03 42.37)
>> LINESTRING(-71.058849 42.367501, -71.062240 42.371276, -71.067938 42.371246)
>> POLYGON((-71.066030 42.380617, -71.055827 42.376734, -71.060811 42.376011, -71.066030 42.380617))
>> \.
=> SELECT ST_AsText(geom_col) AS bounding_box
   FROM (SELECT STV_Extent(geom) OVER() AS geom_col FROM misc_geo_shapes) AS g;
                                                bounding_box

-----------------------------------------------------------------------------------------------------
-------------
 POLYGON ((-71.067938 42.367501, -71.03 42.367501, -71.03 42.380617, -71.067938 42.380617, -71.067938
42.367501))
(1 row)
```

STV_ForceLHR

Alters the order of the vertices of a spatial object to follow the left-hand-rule.

Behavior Type

Immutable

Syntax

```
STV_ForceLHR( g, [USING PARAMETERS skip_nonreorientable_polygons={true | false} ])
```

Arguments

g	Spatial object, type GEOGRAPHY.
`skip_nonreorientable_polygons = { true | false }`	(Optional) Boolean When set to False, non-orientable polygons generate an error. For example, if you use STV_ForceLHR or STV_Reverse with `skip_nonorientable_polygons` set to False, a geography polygon containing a hole generates an error. When set to True, the result returned is the polygon, as passed to the API, without alteration. This argument can help you when you are creating an index from a table containing polygons that cannot be re-oriented. Vertica Place considers these polygons non-orientable: • Polygons with a hole • Multipolygons • Multipolygons with a hole **Default value**: False

Returns

GEOGRAPHY

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	No	No	No

Multipoint	No	No	No
Linestring	No	No	No
Multilinestring	No	No	No
Polygon	No	Yes	Yes
Multipolygon	No	Yes	Yes
GeometryCollection	No	No	No

Examples

The following example shows how you can use STV_ForceLHR.

Re-orient a geography polygon to left-hand orientation:

```
=> SELECT ST_AsText(STV_ForceLHR(ST_GeographyFromText('Polygon((1 1, 3 1, 2 2, 1 1))')));
            ST_AsText
-------------------------------
 POLYGON ((1 1, 3 1, 2 2, 1 1))
(1 row)
```

Reverse the orientation of a geography polygon by forcing left-hand orientation:

```
=> SELECT ST_AsText(STV_ForceLHR(ST_GeographyFromText('Polygon((1 1, 2 2, 3 1, 1 1))')));
           ST_AsText
-------------------------------
 POLYGON ((1 1, 3 1, 2 2, 1 1))
(1 row)
```

See Also

STV_Reverse

STV_Geography

Casts a GEOMETRY object into a GEOGRAPHY object. The SRID value does not affect the results of Vertica Place queries.

When STV_Geography converts a GEOMETRY object to a GEOGRAPHY object, it sets its SRID to 4326.

Behavior Type

Immutable

Syntax

```
STV_Geography( geom )
```

Arguments

geom	Spatial object that you want to cast into a GEOGRAPHY object, type GEOMETRY

Returns

GEOGRAPHY

Supported Data Types

Data Type	GEOMETRY
Point	Yes
Multipoint	Yes
Linestring	Yes
Multilinestring	Yes
Polygon	Yes
Multipolygon	Yes
GeometryCollection	No

Example

The following example shows how to use STV_Geography.

To calculate the centroid of the GEOGRAPHY object, convert it to a GEOMETRY object, then convert it back to a GEOGRAPHY object:

```
=> CREATE TABLE geogs(g GEOGRAPHY);
CREATE TABLE
=> COPY geogs(gx filler LONG VARCHAR, geog AS ST_GeographyFromText(gx)) FROM stdin delimiter '|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> MULTIPOINT(-108.619726 45.000284,-107.866813 45.00107,-106.363711 44.994223,-70.847746 41.205814)
>> \.
=> SELECT ST_AsText(STV_Geography(ST_Centroid(STV_Geometry(g)))) FROM geogs;
           ST_AsText
-------------------------------
 POINT (-98.424499 44.05034775)
(1 row)
```

STV_GeographyPoint

Returns a GEOGRAPHY point based on the input values.

This is the optimal way to convert raw coordinates to GEOGRAPHY points.

Behavior Type

Immutable

Syntax

```
STV_GeographyPoint( x, y )
```

Arguments

x	x-coordinate or longitude, FLOAT.
y	y-coordinate or latitude, FLOAT.

Returns

GEOGRAPHY

Examples

The following examples show how to use STV_GeographyPoint.

Return a GEOGRAPHY point:

```
=> SELECT ST_AsText(STV_GeographyPoint(-114.101588, 47.909677));
           ST_AsText
-------------------------------
 POINT (-114.101588 47.909677)
(1 row)
```

Return GEOGRAPHY points using two columns:

```
=> CREATE TABLE geog_data (id IDENTITY, x FLOAT, y FLOAT);
CREATE TABLE
=> COPY geog_data FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> -114.101588|47.909677
>> -111.532377|46.430753
>> \.
=> SELECT id, ST_AsText(STV_GeographyPoint(x, y)) FROM geog_data;
 id |           ST_AsText
----+-------------------------------
  1 | POINT (-114.101588 47.909677)
  2 | POINT (-111.532377 46.430753)
(2 rows)
```

Create GEOGRAPHY points by manipulating data source columns during load:

```
=> CREATE TABLE geog_data_load (id IDENTITY, geog GEOGRAPHY);
CREATE TABLE
=> COPY geog_data_load (lon FILLER FLOAT,
                        lat FILLER FLOAT,
                        geog AS STV_GeographyPoint(lon, lat))
   FROM 'test_coords.csv' DELIMITER ',';
 Rows Loaded
-------------
           2
(1 row)
=> SELECT id, ST_AsText(geog) FROM geog_data_load;
 id |             ST_AsText
----+-----------------------------------
  1 | POINT (-75.101654451 43.363830536)
  2 | POINT (-75.106444487 43.367093798)
(2 rows)
```

See Also

STV_GeometryPoint

STV_Geometry

Casts a GEOGRAPHY object into a GEOMETRY object.

The SRID value does not affect the results of Vertica Place queries.

Behavior Type

Immutable

Syntax

```
STV_Geometry( geog )
```

Arguments

geog	Spatial object that you want to cast into a GEOMETRY object, type GEOGRAPHY

Returns

GEOMETRY

Supported Data Types

Data Type	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	Yes	Yes
Multipoint	Yes	Yes
Linestring	Yes	Yes
Multilinestring	Yes	Yes
Polygon	Yes	Yes

Multipolygon	Yes	Yes
GeometryCollection	No	No

Example

The following example shows how to use STV_Geometry.

Convert the GEOGRAPHY values to GEOMETRY values, then convert the result back to a GEOGRAPHY type:

```
=> CREATE TABLE geogs(g GEOGRAPHY);
CREATE TABLE
=> COPY geogs(gx filler LONG VARCHAR, geog AS ST_GeographyFromText(gx)) FROM stdin delimiter '|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> MULTIPOINT(-108.619726 45.000284,-107.866813 45.00107,-106.363711 44.994223,-70.847746 41.205814)
>> \.
=> SELECT ST_AsText(STV_Geography(ST_Centroid(STV_Geometry(g)))) FROM geogs;
           ST_AsText
-------------------------------
 POINT (-98.424499 44.05034775)
```

STV_GeometryPoint

Returns a GEOMETRY point, based on the input values.

This approach is the most-optimal way to convert raw coordinates to GEOMETRY points.

Behavior Type

Immutable

Syntax

```
STV_GeometryPoint( x, y [, srid] )
```

Arguments

x	x-coordinate or longitude, FLOAT.

y	y-coordinate or latitude, FLOAT.
srid	(Optional) Spatial Reference Identifier (SRID) assigned to the point, INTEGER.

Returns

GEOMETRY

Examples

The following examples show how to use STV_GeometryPoint.

Return a GEOMETRY point with an SRID:

```
=> SELECT ST_AsText(STV_GeometryPoint(71.148562, 42.989374, 4326));
          ST_AsText
----------------------------
 POINT (-71.148562 42.989374)
(1 row)
```

Return GEOMETRY points using two columns:

```
=> CREATE TABLE geom_data (id IDENTITY, x FLOAT, y FLOAT, SRID int);
CREATE TABLE
=> COPY geom_data FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 42.36383053600048|-71.10165445099966|4326
>> 42.3670937980005|-71.10644448699964|4326
>> \.
=> SELECT id, ST_AsText(STV_GeometryPoint(x, y, SRID)) FROM geom_data;
 id |             ST_AsText
----+-----------------------------------
  1 | POINT (-71.101654451 42.363830536)
  2 | POINT (-71.106444487 42.367093798)
(2 rows)
```

Create GEOMETRY points by manipulating data source columns during load:

```
=> CREATE TABLE geom_data_load (id IDENTITY, geom GEOMETRY);
CREATE TABLE
=> COPY geom_data_load (lon FILLER FLOAT,
                        lat FILLER FLOAT,
                        geom AS STV_GeometryPoint(lon, lat))
   FROM 'test_coords.csv' DELIMITER ',';
 Rows Loaded
-------------
           2
(1 row)
```

```
=> SELECT id, ST_AsText(geom) FROM geom_data_load;
 id |             ST_AsText
----+-----------------------------------
  1 | POINT (-75.101654451 43.363830536)
  2 | POINT (-75.106444487 43.367093798)
(2 rows)
```

See Also

STV_GeographyPoint

STV_GetExportShapefileDirectory

Returns the path of the export directory.

Behavior Type

Immutable

Syntax

```
STV_GetExportShapefileDirectory( )
```

Returns

The path of the shapefile export directory.

Examples

The following example shows how you can use STV_GetExportShapefileDirectory to query the path of the shapefile export directory:

```
=> SELECT STV_GetExportShapefileDirectory();
        STV_GetExportShapefileDirectory
-----------------------------------------------
 Shapefile export directory: [/home/user/temp]
(1 row)
```

STV_Intersect Scalar Function

Spatially intersects a point or points with a set of polygons. The STV_Intersect scalar function returns the identifier associated with an intersecting polygon.

Behavior Type

Immutable

Syntax

```
STV_Intersect(  { g | x , y }
                  USING PARAMETERS index= 'index_name')
```

Arguments

g	A geometry or geography (WGS84) column that contains points. The *g* column can contain only point geometries or geographies. If the column contains a different geometry or geography type, STV_Intersect terminates with an error.
x	x-coordinate or longitude, FLOAT.
y	y-coordinate or latitude, FLOAT.

Parameters

index = '*index_name*'	Name of the spatial index, of type VARCHAR.

Returns

The identifier of a matching polygon. If the point does not intersect any of the index's polygons, then the STV_Intersect scalar function returns NULL.

Examples

The following examples show how you can use STV_Intersect scalar.

Using two floats, return the gid of a matching polygon or NULL:

```
=> CREATE TABLE pols (gid INT, geom GEOMETRY(1000));
CREATE TABLE
=> COPY pols(gid, gx filler LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 1|POLYGON((31 74,8 70,8 50,36 53,31 74))
>> \.
=> SELECT STV_Create_Index(gid, geom USING PARAMETERS index='my_polygons_1', overwrite=true,
                           max_mem_mb=256) OVER() FROM pols;
   type   | polygons | SRID | min_x | min_y | max_x | max_y | info
----------+----------+------+-------+-------+-------+-------+------
 GEOMETRY |        1 |    0 |     8 |    50 |    36 |    74 |
(1 row)

=> SELECT STV_Intersect(12.5683, 55.6761 USING PARAMETERS index = 'my_polygons_1');
 STV_Intersect
---------------
             1
(1 row)
```

Using a GEOMETRY column, return the gid of a matching polygon or NULL:

```
=> CREATE TABLE polygons (gid INT, geom GEOMETRY(700));
CREATE TABLE
=> COPY polygons (gid, gx filler LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM stdin delimiter '|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 1|POLYGON((-31 74,8 70,8 50,-36 53,-31 74))
>> 2|POLYGON((-38 50,4 13,11 45,0 65,-38 50))
>> 3|POLYGON((-18 42,-10 65,27 48,14 26,-18 42))
>> \.
=> SELECT STV_Create_Index(gid, geom USING PARAMETERS index='my_polygons', overwrite=true,
     max_mem_mb=256) OVER() FROM polygons;

STV_Intersect Transform Function

Spatially intersects points and polygons. The STV_Intersect transform function returns a tuple with matching point/polygon pairs. For every point, Vertica returns either one or many matching polygons.

You can improve performance when you parallelize the computation of the STV_Intersect transform function over multiple nodes. To parallelize the computation, use an OVER (PARTITION BEST) clause.

Behavior Type

Immutable

Syntax

```
STV_Intersect ( { gid | i }, { g | x , y }
        USING PARAMETERS index='index_name')
        OVER() AS (pt_gid, pol_gid)
```

Arguments

gid | *i*	An integer column or integer that uniquely identifies the spatial object(s) of *g* or *x* and *y*.
g	A geometry or geography (WGS84) column that contains points. The *g* column can contain only point geometries or geographies. If the column contains a different geometry or geography type, STV_Intersect terminates with an error.
x	x-coordinate or longitude, FLOAT.
y	y-coordinate or latitude, FLOAT.

Parameters

index = 'index_name'	Name of the spatial index, of type VARCHAR.

Returns

pt_gid	Unique identifier of the point geometry or geography, of type INTEGER.
pol_gid	Unique identifier of the polygon geometry or geography, of type INTEGER.

Examples

The following examples show how you can use STV_Intersect transform.

Using two floats, return the matching point-polygon pairs.

```
=> CREATE TABLE pols (gid INT, geom GEOMETRY(1000));
CREATE TABLE
=> COPY pols(gid, gx filler LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 1|POLYGON((31 74,8 70,8 50,36 53,31 74))
>> \.
=> SELECT STV_Create_Index(gid, geom USING PARAMETERS index='my_polygons_1', overwrite=true,
                           max_mem_mb=256) OVER() FROM pols;
   type   | polygons | SRID | min_x | min_y | max_x | max_y | info
----------+----------+------+-------+-------+-------+-------+------
```

```
 GEOMETRY |        1 |    0 |     8 |    50 |    36 |    74 |
(1 row)

=> SELECT STV_Intersect(56, 12.5683, 55.6761 USING PARAMETERS index = 'my_polygons_1') OVER();
 pt_gid | pol_gid
--------+---------
     56 |       1
(1 row)
```

Using a GEOMETRY column, return the matching point-polygon pairs.

```
=> CREATE TABLE polygons (gid int, geom GEOMETRY(700));
CREATE TABLE
=> COPY polygons (gid, gx filler LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM stdin;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 10|POLYGON((5 5, 5 10, 10 10, 10 5, 5 5))
>> 11|POLYGON((0 0, 0 2, 2 2, 2 0, 0 0))
>> 12|POLYGON((1 1, 1 3, 3 3, 3 1, 1 1))
>> 14|POLYGON((-1 -1, -1 12, 12 12, 12 -1, -1 -1))
>> \.
=> SELECT STV_Create_Index(gid, geom USING PARAMETERS index='my_polygons', overwrite=true, max_mem_
mb=256)
      OVER() FROM polygons;
   type   | polygons | SRID | min_x | min_y | max_x | max_y | info
----------+----------+------+-------+-------+-------+-------+------
 GEOMETRY |        4 |    0 |    -1 |    -1 |    12 |    12 |
(1 row)

=> CREATE TABLE points (gid INT, geom GEOMETRY(700));
CREATE TABLE
=> COPY points (gid, gx filler LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM stdin delimiter '|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 1|POINT(9 9)
>> 2|POINT(0 1)
>> 3|POINT(2.5 2.5)
>> 4|POINT(0 0)
>> 5|POINT(1 5)
>> 6|POINT(1.5 1.5)
>> \.
=> SELECT STV_Intersect(gid, geom USING PARAMETERS index='my_polygons') OVER (PARTITION BEST)
     AS (point_id, polygon_gid)
        FROM points;
 point_id | polygon_gid
----------+-------------
        5 |          14
        1 |          14
        1 |          10
        4 |          14
        4 |          11
        6 |          12
        6 |          14
        6 |          11
        2 |          14
        2 |          11
        3 |          12
        3 |          14
(12 rows)
```

You can improve query performance by using the STV_Intersect transform function in a WHERE clause. Performance improves because this syntax eliminates all points that do not intersect polygons in the index.

Return the count of points that intersect with the polygon, where gid = 14:

```
=> SELECT COUNT(pt_id) FROM
    (SELECT STV_Intersect(gid, geom USING PARAMETERS index='my_polygons')
     OVER (PARTITION BEST) AS (pt_id, pol_id) FROM points)
        AS T WHERE pol_id = 14;
 COUNT
-------
     6
(1 row)
```

- STV_Intersect Scalar Function

STV_IsValidReason

Determines if a spatial object is well formed or valid. If the object is not valid, STV_ IsValidReason returns a string that explains where the invalidity occurs.

A polygon or multipolygon is valid if all of the following are true:

- The polygon is closed; its start point is the same as its end point.
- Its boundary is a set of linestrings.
- The boundary does not touch or cross itself.
- Any polygons in the interior that do not have more than one point touching the boundary of the exterior polygon.

If you pass an invalid object to a Vertica Place function, the function fails or returns incorrect results. To determine if a polygon is valid, first run ST_IsValid. ST_IsValid returns TRUE if the polygon is valid, FALSE otherwise.

Important:
STV_IsValidReason supports only polygon and multipolygon GEOMETRY data types.

Behavior Type

Immutable

Syntax

```
STV_IsValidReason( g )
```

Arguments

g	Geospatial object to test for validity, value of type GEOMETRY or GEOGRAPHY (WGS84).

Returns

LONG VARCHAR

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	Yes	No	No
Multipoint	Yes	No	No
Linestring	Yes	No	No
Multilinestring	Yes	No	No
Polygon	Yes	No	Yes
Multipolygon	Yes	No	No
GeometryCollection	Yes	No	No

Example

The following example shows how to use STV_IsValidReason.

Returns a string describing where the polygon is invalid:

```
=> SELECT STV_IsValidReason(ST_GeomFromText('POLYGON((1 3,3 2,1 1,
   3 0,1 0,1 3))'));
               STV_IsValidReason
-----------------------------------------------
 Ring Self-intersection at or near POINT (1 1)
(1 row)
```

See Also

ST_IsValid

STV_LineStringPoint

Retrieves the vertices of a linestring or multilinestring. The values returned are points of either GEOMETRY or GEOGRAPHY type depending on the input object's type. GEOMETRY points inherit the SRID of the input object.

STV_LineStringPoint is an analytic function. For more information, see Analytic Functions.

Behavior Type

Immutable

Syntax

```
STV_LineStringPoint( g )
       OVER( [PARTITION NODES] ) AS
```

Arguments

g	Linestring or multilinestring, value of type GEOMETRY or GEOGRAPHY

Returns

GEOMETRY or GEOGRAPHY

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	No	No	No
Multipoint	No	No	No
Linestring	Yes	Yes	Yes
Multilinestring	Yes	Yes	Yes
Polygon	No	No	No
Multipolygon	No	No	No
GeometryCollection	No	No	No

Examples

The following examples show how to use STV_LineStringPoint.

Returns the vertices of the geometry linestring and their SRID:

```
=> SELECT ST_AsText(Point), ST_SRID(Point)
     FROM (SELECT STV_LineStringPoint(
           ST_GeomFromText('MULTILINESTRING((1 2, 2 3, 3 1, 4 2),
                  (10 20, 20 30, 30 10, 40 20))', 4269)) OVER () AS Point) AS foo;
    ST_AsText   | ST_SRID
 ---------------+---------
  POINT (1 2)   |    4269
  POINT (2 3)   |    4269
  POINT (3 1)   |    4269
  POINT (4 2)   |    4269
  POINT (10 20) |    4269
  POINT (20 30) |    4269
  POINT (30 10) |    4269
  POINT (40 20) |    4269
 (8 rows)
```

Returns the vertices of the geography linestring:

```
=> SELECT ST_AsText(g)
     FROM (SELECT STV_LineStringPoint(
       ST_GeographyFromText('MULTILINESTRING ((42.1 71.0, 41.4 70.0, 41.3 72.9),
           (42.99 71.46, 44.47 73.21)', 4269)) OVER () AS g) AS line_geog_points;
      ST_AsText
--------------------
 POINT (42.1 71.0)
 POINT (41.4 70.0)
 POINT (41.3 72.9)
 POINT (42.99 71.46)
 POINT (44.47 73.21)
(5 rows)
```

See Also

STV_PolygonPoint

STV_MemSize

Returns the length of the spatial object in bytes as an INTEGER.

Use this function to determine the optimal column width for your spatial data.

Behavior Type

Immutable

Syntax

```
STV_MemSize( g )
```

Arguments

g	Spatial object, value of type GEOMETRY or GEOGRAPHY

Returns

INTEGER

Examples

The following example shows how you can optimize your table by sizing the GEOMETRY or GEOGRAPHY column to the maximum value returned by STV_MemSize:

```
=> CREATE TABLE mem_size_table (id int, geom geometry(800));
CREATE TABLE
=> COPY mem_size_table (id, gx filler LONG VARCHAR, geom as ST_GeomFromText(gx)) FROM STDIN DELIMITER
'|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>>1|POINT(3 5)
>>2|MULTILINESTRING((1 5, 2 4, 5 3, 6 6),(3 5, 3 7))
>>3|MULTIPOLYGON(((2 6, 2 9, 6 9, 7 7, 4 6, 2 6)),((0 0, 0 5, 1 0, 0 0)),((0 2, 2 5, 4 5, 0 2)))
>>\.
=> SELECT max(STV_MemSize(geom)) FROM mem_size_table;
 max
-----
 336
(1 row)

=> CREATE TABLE production_table(id int, geom geometry(336));
CREATE TABLE
=> INSERT INTO production_table SELECT * FROM mem_size_table;
 OUTPUT
--------
      3
(1 row)
=> DROP mem_size_table;
DROP TABLE
```

STV_NN

Calculates the distance of spatial objects from a reference object and returns (object, distance) pairs in ascending order by distance from the reference object.

Parameters *g1* and *g2* must be both GEOMETRY objects or both GEOGRAPHY objects.

STV_NN is an analytic function. For more information, see Analytic Functions.

Behavior Type

Immutable

Syntax

```
STV_NN( g, ref_obj, k ) OVER()
```

Arguments

g	Spatial object, value of type GEOMETRY or GEOGRAPHY
ref_obj	Reference object, type GEOMETRY or GEOGRAPHY
k	Number of rows to return, type INTEGER

Returns

(Object, distance) pairs, in ascending order by distance. If a parameter is EMPTY or NULL, then 0 rows are returned.

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)
Point	Yes	Yes
Multipoint	Yes	Yes
Linestring	Yes	Yes
Multilinestring	Yes	Yes
Polygon	Yes	Yes
Multipolygon	Yes	Yes
GeometryCollection	Yes	No

Example

The following example shows how to use STV_NN.

Create a table and insert nine GEOGRAPHY points:

```
=> CREATE TABLE points (g geography);
CREATE TABLE
=> COPY points (gx filler LONG VARCHAR, g AS ST_GeographyFromText(gx)) FROM stdin delimiter '|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> POINT (21.5 18.4)
>> POINT (21.5 19.2)
>> POINT (21.5 20.7)
>> POINT (22.5 16.4)
>> POINT (22.5 17.15)
>> POINT (22.5 18.33)
>> POINT (23.5 13.68)
>> POINT (23.5 15.9)
>> POINT (23.5 18.4)
>> \.
```

Calculate the distances (in meters) of objects in table `points` from the GEOGRAPHY point (23.5, 20).

Returns the five objects that are closest to that point:

```
=> SELECT ST_AsText(nn), dist FROM (SELECT STV_NN(g,
   ST_GeographyFromText('POINT(23.5 20)'),5) OVER() AS (nn,dist) FROM points) AS example;
     ST_AsText      |       dist
--------------------+------------------
 POINT (23.5 18.4)  |  177912.12757541
 POINT (22.5 18.33) | 213339.210738322
 POINT (21.5 20.7)  |  222561.43679943
 POINT (21.5 19.2)  | 227604.371833335
 POINT (21.5 18.4)  | 275239.416790128
(5 rows)
```

STV_PolygonPoint

Retrieves the vertices of a polygon as individual points. The values returned are points of either GEOMETRY or GEOGRAPHY type depending on the input object's type. GEOMETRY points inherit the SRID of the input object.

STV_PolygonPoint is an analytic function. For more information, see Analytic Functions.

Behavior Type

Immutable

Syntax

```
STV_PolygonPoint( g )
       OVER( [PARTITION NODES] ) AS
```

Arguments

g	Polygon, value of type GEOMETRY or GEOGRAPHY

Returns

GEOMETRY or GEOGRAPHY

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	No	No	No
Multipoint	No	No	No
Linestring	No	No	No
Multilinestring	No	No	No
Polygon	Yes	Yes	Yes
Multipolygon	Yes	Yes	Yes
GeometryCollection	No	No	No

Examples

The following examples show how to use STV_PolygonPoint.

Returns the vertices of the geometry polygon:

```
=> SELECT ST_AsText(g) FROM (SELECT STV_PolygonPoint(ST_GeomFromText('POLYGON((1 2, 2 3, 3 1, 1
2))'))
     OVER (PARTITION NODES) AS g) AS poly_points;
  ST_AsText
-------------
 POINT (1 2)
 POINT (2 3)
 POINT (3 1)
 POINT (1 2)
(4 rows)
```

Returns the vertices of the geography polygon:

```
=> SELECT ST_AsText(g) FROM (SELECT STV_PolygonPoint(ST_GeographyFromText('
              POLYGON((25.5 28.76, 28.83 29.13, 27.2 30.99, 25.5 28.76))'))
   OVER (PARTITION NODES) AS g) AS poly_points;
      ST_AsText
---------------------
 POINT (25.5 28.76)
 POINT (28.83 29.13)
 POINT (27.2 30.99)
 POINT (25.5 28.76)
(4 rows)
```

See Also

STV_LineStringPoint

STV_Reverse

Reverses the order of the vertices of a spatial object.

Behavior Type

Immutable

Syntax

```
STV_Reverse( g, [USING PARAMETERS skip_nonreorientable_polygons={true | false} ])
```

Arguments

g	Spatial object, type GEOGRAPHY.
skip_nonreorientable_polygons = { true | false }	(Optional) Boolean When set to False, non-orientable polygons generate an error. For example, if you use STV_ForceLHR or STV_Reverse with skip_nonorientable_polygons set to False, a geography polygon containing a hole generates an error. When set to True, the result returned is the polygon, as passed to the API, without alteration. This argument can help you when you are creating an index from a table containing polygons that cannot be re-oriented. Vertica Place considers these polygons non-orientable: • Polygons with a hole • Multipolygons • Multipolygons with a hole **Default value**: False

Returns

GEOGRAPHY

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (Perfect Sphere)	GEOGRAPHY (WGS84)
Point	No	No	No

Multipoint	No	No	No
Linestring	No	No	No
Multilinestring	No	No	No
Polygon	No	Yes	Yes
Multipolygon	No	Yes	Yes
GeometryCollection	No	No	No

Examples

The following examples show how you can use STV_Reverse.

Reverse vertices of a geography polygon:

```
=> SELECT ST_AsText(STV_Reverse(ST_GeographyFromText('Polygon((1 1, 3 1, 2 2, 1 1))')));
            ST_AsText
-------------------------------
 POLYGON ((1 1, 2 2, 3 1, 1 1))
(1 row)
```

Force the polygon to reverse orientation:

```
=> SELECT ST_AsText(STV_Reverse(ST_GeographyFromText('Polygon((1 1, 2 2, 3 1, 1 1))')));
ST_AsText
-------------------------------
 POLYGON ((1 1, 3 1, 2 2, 1 1))
(1 row)
```

See Also

STV_ForceLHR

STV_Rename_Index

Renames a spatial index. If the index format is out of date, you cannot rename the index.

A spatial index is created from an input polygon set, which can be the result of a query. Spatial indexes are created in a global name space. Vertica uses a distributed plan whenever the input table or projection is segmented across nodes of the cluster.

The OVER() clause must be empty.

Behavior Type

Immutable

Syntax

```
STV_Rename_Index( USING PARAMETERS
                  source = 'old_index_name',
                  dest = 'new_index_name',
                  overwrite = [ 'true' | 'false' ]
                )
                 OVER ()
```

Arguments

`source = 'old_index_name'`	Current name of the spatial index, type VARCHAR.
`dest = 'new_index_name'`	New name of the spatial index, type VARCHAR.
`overwrite = [ 'true' | 'false' ]`	(Optional) BOOLEAN value that specifies whether to overwrite the index, if an index exists. This parameter cannot be NULL. Default: False

Privileges

Any user with access to the STV_*_Index functions can describe, rename, or drop indexes created by any other user.

Limitations

- Index names cannot exceed 110 characters.
- The backslash or tab characters are not allowed in index names.

Example

The following example shows how to use STV_Rename_Index.

Rename an index:

```
=> SELECT STV_Rename_Index (
       USING PARAMETERS
       source = 'my_polygons',
       dest = 'US_states',
       overwrite = 'false'
       )
       OVER ();
 rename_index
---------------
 Index renamed
(1 Row)
```

STV_Refresh_Index

Appends newly added or updated polygons and removes deleted polygons from an existing spatial index.

The OVER() clause must be empty.

Behavior Type

Mutable

Syntax

```
STV_Refresh_Index( gid, g
                   USING PARAMETERS index='index_name'
                                    [, skip_nonindexable_polygons={ true | false } ] )
                 OVER()
                    [ AS (type, polygons, srid, min_x, min_y, max_x, max_y, info,
                          indexed, appended, updated, deleted) ]
```

Arguments

gid	Name of an integer column that uniquely identifies the polygon. The gid cannot be NULL.
g	Name of a geometry or geography (WGS84) column or expression that contains polygons and multipolygons. Only polygon and multipolygon can be indexed. Other shape types are excluded from the index.

Parameters

`index = 'index_name'`	Name of the index, type VARCHAR. Index names cannot exceed 110 characters. The slash, backslash, and tab characters are not allowed in index names.
`skip_nonindexable_polygons = { true | false }`	(Optional) BOOLEAN In rare cases, intricate polygons (for instance, with too high resolution or anomalous spikes) cannot be indexed. These polygons are considered non-indexable. When set to False, non-indexable polygons cause the index creation to fail. When set to True, index creation can succeed by excluding non-indexable polygons from the index. To review the polygons that were not able to be indexed, use STV_Describe_Index with the parameter list_polygon. Default: False

Returns

type	Spatial object type of the index.
polygons	Number of polygons indexed.
SRID	Spatial reference system identifier.
min_x, min_y, max_x, max_y	Coordinates of the minimum bounding rectangle (MBR) of the indexed geometries. (*min_x*, *min_y*) are the south-west coordinates, and (*max_x*, *max_y*) are the north-east coordinates.
info	Lists the number of excluded spatial objects as well as their type that were excluded from the index.

indexed	Number of polygons indexed during the operation.
appended	Number of appended polygons.
updated	Number of updated polygons.
deleted	Number of deleted polygons.

Supported Data Types

Data Type	GEOMETRY	GEOGRAPHY (WGS84)
Point	No	No
Multipoint	No	No
Linestring	No	No
Multilinestring	No	No
Polygon	Yes	Yes
Multipolygon	Yes	No
GeometryCollection	No	No

Privileges

Any user with access to the STV_*_Index functions can describe, rename, or drop indexes created by any other user.

Limitations

- In rare cases, intricate polygons (such as those with too-high a resolution or anomalous spikes) cannot be indexed. See the parameter `skip_nonindexable_polygons`.
- If you replace a valid polygon in the source table with an invalid polygon, STV_Refresh_Index ignores the invalid polygon. As a result, the polygon originally indexed persists in the index.

- The following geometries cannot be indexed:
  - Non-polygons
  - NULL gid
  - NULL (multi) polygon
  - EMPTY (multi) polygon
  - Invalid (multi) polygon
- The following geographies are excluded from the index:
  - Polygons with holes
  - Polygons crossing the International Date Line
  - Polygons covering the north or south pole
  - Antipodal polygons

Usage Tips

- To cancel an STV_Refresh_Index run, use **Ctrl** + **C**.
- If you use source data not previously associated with the index, then the index will be overwritten.
- If STV_Refresh_Index has insufficient memory to process the query, then rebuild the index using STV_Create_Index.
- If there are no valid polygons in the geom column, STV_Refresh_Index reports an error in vertica.log and stops the index refresh.
- Ensure that all of the polygons you plan to index are valid polygons. STV_Create_Index and STV_Refresh_Index do not check polygon validity when building an index.

  For more information, see Ensuring Polygon Validity Before Creating or Refreshing an Index.

Examples

The following examples show how to use STV_Refresh_Index.

Refresh an index with a single literal argument:

```
=> SELECT STV_Create_Index(1, ST_GeomFromText('POLYGON((0 0,0 15.2,3.9 15.2,3.9 0,0 0))')
     USING PARAMETERS index='my_polygon') OVER();
   type    | polygons | SRID | min_x | min_y | max_x | max_y | info
-----------+----------+------+-------+-------+-------+-------+------
 GEOMETRY |        1 |    0 |     0 |     0 |   3.9 |  15.2 |
(1 row)
```

```
=> SELECT STV_Refresh_Index(2, ST_GeomFromText('POLYGON((0 0,0 13.2,3.9 18.2,3.9 0,0 0))')
     USING PARAMETERS index='my_polygon') OVER();
   type    | polygons | SRID | min_x | min_y | max_x | max_y | info | indexed | appended | updated |
deleted
----------+----------+------+-------+-------+-------+-------+------+---------+----------+---------+--
-------
 GEOMETRY |        1 |    0 |     0 |     0 |   3.9 |  18.2 |      |       1 |        1 |       0 |
    1
(1 row)
```

Refresh an index from a table:

```
=> CREATE TABLE pols (gid INT, geom GEOMETRY);
CREATE TABLE
=> COPY pols(gid, gx filler LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM stdin delimiter '|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 1|POLYGON((-31 74,8 70,8 50,-36 53,-31 74))
>> 2|POLYGON((5 20,9 30,20 45,36 35,5 20))
>> 3|POLYGON((12 23,9 30,20 45,36 35,37 67,45 80,50 20,12 23))
>> \.
=> SELECT STV_Create_Index(gid, geom USING PARAMETERS index='my_polygons_1', overwrite=true)
     OVER() FROM pols;
   type    | polygons | SRID | min_x | min_y | max_x | max_y | info
----------+----------+------+-------+-------+-------+-------+------
 GEOMETRY |        3 |    0 |   -36 |    20 |    50 |    80 |
(1 row)
=> COPY pols(gid, gx filler LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM stdin delimiter '|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 6|POLYGON((-32 74,8 70,8 50,-36 53,-32 74))
>> \.
=> SELECT STV_Refresh_Index(gid, geom USING PARAMETERS index='my_polygons_1') OVER() FROM pols;
   type    | polygons | SRID | min_x | min_y | max_x | max_y | info | indexed | appended | updated |
deleted
----------+----------+------+-------+-------+-------+-------+------+---------+----------+---------+--
-------

STV_SetExportShapefileDirectory

Specifies the directory to export GEOMETRY or GEOGRAPHY data to a shapefile. The validity of the path is not checked, and the path cannot be empty.

Behavior Type

Immutable

Syntax

```
STV_SetExportShapefileDirectory( USING PARAMETERS path='shapefile_path' )
```

Arguments

`path = ' shapefile_path '`	The path where you want the shapefile exported. For example, '/home/user/temp'. You can also export to a mounted S3 directory where you have read and write permissions using the convention '<bucketname>/path'.

Returns

The path of the shapefile export directory.

Privileges

Only a **superuser** can use this function.

Examples

The following example shows how you can use STV_SetExportShapefileDirectory to set the shapefile export directory to /home/user/temp:

```
=> SELECT STV_SetExportShapefileDirectory(USING PARAMETERS path = '/home/user/temp');
              STV_SetExportShapefileDirectory
-------------------------------------------------------------
 SUCCESS. Set shapefile export directory: [/home/user/temp]
(1 row)
```

STV_ShpSource and STV_ShpParser

These two functions work with COPY to parse and load geometries and attributes from a shapefile into a Vertica table, and convert them to the appropriate GEOMETRY data type. You must use these two functions together.

The following restrictions apply:

- An empty multipoint or an invalid multipolygon can not be loaded from a shapefile.
- If the `.dbf` component of a shapefile contains a numeric attribute, this field's values might lose precision when the Vertica Place shapefile loader loads it into a table. The target field is a 64-bit FLOAT column, which can only represent about 15 significant digits; in a `.dbf` file, Numeric fields can be up to 30 digits.

Rejected records are saved to `CopyErrorLogs` subdirectory, under the Vertica catalog directory.

Behavior Type

Immutable

Syntax

```
COPY table( columnslist )
     WITH SOURCE STV_ShpSource
          ( file = 'filename'[[, SRID=spatial-reference-identifier] [, flatten_2d={true | false }] ] )
     PARSER STV_ShpParser()
```

Arguments

table	Name of the table in which to load the geometry data.
columnslist	Comma-delimited list of column names in

	the table that match fields in the external file. Run the CREATE TABLE command that STV_ShpCreateTable creates. When you do so, these columns correspond to the second through the second-to-last columns.
`file = '`*`pathname`*`'`	Specifies the fully qualified path of a `.dbf`, `.shp`, or `.shx` file. You can also load from a shapefile that is stored on a mounted S3 directory where you have read and write permissions. In this case, use the following the syntax: *`bucketname/path/filename`*
`SRID=`*`spatial-reference-identifier`*	Specifies an integer spatial reference identifier (SRID) associated with the shape file.
`flatten_2d`	Specifies a BOOLEAN argument that excludes 3D or 4D coordinates during COPY commands: • `true`: Excludes geometries with 3D or 4D coordinates before a COPY command. • `false`: Causes the load to fail if a geometry with 3D or 4D coordinate is found. **Default:** `false`

Privileges

- Source shapefile: Read
- Shapefile directory: Execute

COPY Errors

The COPY command fails under one of the following conditions:

- The shapefile cannot be located or opened.
- The number of columns or the data types of the columns that STV_ShpParser creates do not match the columns in the destination table. Use STV_ShpCreateTable to generate the appropriate CREATE TABLE command.
- One of the mandatory files is missing or cannot be opened. When opening a shapefile, you must have three files: `.dbf`, `.shp`, and `.shx`.

STV_ShpSource File Corruption Handling

- If the `.shp` and `.shx` files are corrupt, STV_ShpSource returns an error.
- If the `.shp` and `.shx` files are valid, but the `.dbf` file is corrupt, STV_ShpSource ignores the `.dbf` file and does not create columns for that data.

Example

```
=> COPY tl_2010_us_state10 WITH SOURCE
STV_ShpSource(file='/shapefiles/tl_2010_us_state10.shp', SRID=4269) PARSER STV_ShpParser();
 Rows loaded
-------------
          52
```

STV_ShpCreateTable

Returns a CREATE TABLE statement with the columns and types of the attributes found in the specified shapefile.

The column types are sized according to the shapefile metadata. The size of the column is based on the largest geometry found in the shapefile. The first column in the table is `gid`, which is an auto-increment IDENTITY primary key column. The cache value is set to 64 by default. The last column is a GEOMETRY data type for storing the actual geometry data.

Behavior Type

Immutable

Syntax

```
STV_ShpCreateTable (USING PARAMETERS file='filename') OVER()
```

Arguments

`file = 'filename'`	Fully qualified path of the `.dbf`, `.shp`, or `.shx` file (file extension optional). You can also create a table using a shapefile stored on a mounted S3 directory where you have read and write permissions. Use the following syntax: *bucketname/path/filename*

Returns

CREATE TABLE statement that matches the specified shapefile

Usage Tips

- STV_ShpCreateTable returns a CREATE TABLE statement; but it does not create the table. Modify the CREATE TABLE statement as needed, and then create the table before loading the shapefile into the table.
- To create a table with characters other than alphanumeric and underscore (_) characters, you must specify the table name enclosed in double quotes, such as `"counties%NY"`.
- The name of the table is the same as the name of the shapefile, without the directory name or extension.
- The shapefile must be accessible from the initiator node.
- If the `.shp` and `.shx` files are corrupt, STV_ShpCreateTable returns an error. If the `.shp` and `.shx` files are valid, but the `.dbf` file is corrupt, STV_ShpCreateTable ignores the `.dbf` file and does not create columns for that data.
- All the mandatory files (`.dbf`, `.shp`, `.shx`) must be in the same directory. If not, STV_ShpCreateTable returns an error.
- If the `.dbf` component of a shapefile contains a Numeric attribute, this field's values may lose precision when the Vertica shapefile loader loads it into a table. The target field is a 64-bit FLOAT column, which can only represent about 15 significant digits. In

a `.dbf` file, numeric fields can be up to 30 digits.

Vertica records all instances of shapefile values that are too long in the `vertica.log` file.

Example

The following example shows how to use STV_ShpCreateTable.

Returns a CREATE TABLE statement:

```
=> SELECT STV_ShpCreateTable
      (USING PARAMETERS file='/shapefiles/tl_2010_us_state10.shp')
      OVER() as create_table_states;
      create_table_states
 ---------------------------------
CREATE TABLE tl_2010_us_state10(
   gid IDENTITY(64) PRIMARY KEY,
   REGION10 VARCHAR(2),
   DIVISION10 VARCHAR(2),
   STATEFP10 VARCHAR(2),
   STATENS10 VARCHAR(8),
   GEOID10 VARCHAR(2),
   STUSPS10 VARCHAR(2),
   NAME10 VARCHAR(100),
   LSAD10 VARCHAR(2),
   MTFCC10 VARCHAR(5),
   FUNCSTAT10 VARCHAR(1),
   ALAND10 INT8,
   AWATER10 INT8,
   INTPTLAT10 VARCHAR(11),
   INTPTLON10 VARCHAR(12),
   geom GEOMETRY(940845)
);
(18 rows)
```

IP Conversion Functions

IP functions perform conversion, calculation, and manipulation operations on IP, network, and subnet addresses.

INET_ATON

Returns an integer that represents the value of the address in host byte order, given the dotted-quad representation of a network address as a string.

Behavior Type

Immutable

Syntax

```
INET_ATON ( expression )
```

Parameters

expression	(VARCHAR) is the string to convert.

Notes

The following syntax converts an IPv4 address represented as the string A to an integer I. INET_ATON trims any spaces from the right of A, calls the Linux function inet_pton, and converts the result from network byte order to host byte order using ntohl.

```
=> INET_ATON(VARCHAR A) -> INT8 I
```

If A is NULL, too long, or inet_pton returns an error, the result is NULL.

Examples

The generated number is always in host byte order. In the following example, the number is calculated as 209×256^3 + 207×256^2 + 224×256 + 40.

```
=> SELECT INET_ATON('209.207.224.40');
 inet_aton
------------
 3520061480
(1 row)

=> SELECT INET_ATON('1.2.3.4');
 inet_aton
-----------
  16909060
(1 row)

=> SELECT TO_HEX(INET_ATON('1.2.3.4'));
 to_hex
---------
 1020304
(1 row)
```

See Also

- INET_NTOA

INET_NTOA

Returns the dotted-quad representation of the address as a VARCHAR, given a network address as an integer in network byte order.

Behavior Type

Immutable

Syntax

```
INET_NTOA ( expression )
```

Parameters

expression	(INTEGER) is the network address to convert.

Notes

The following syntax converts an IPv4 address represented as integer I to a string A.

INET_NTOA converts I from host byte order to network byte order using htonl, and calls the Linux function inet_ntop.

```
=> INET_NTOA(INT8 I) -> VARCHAR A
```

If I is NULL, greater than 2^32 or negative, the result is NULL.

Examples

```
=> SELECT INET_NTOA(16909060);
 inet_ntoa
-----------
 1.2.3.4
(1 row)

=> SELECT INET_NTOA(03021962);
 inet_ntoa
-------------
 0.46.28.138
(1 row)
```

See Also

- INET_ATON

V6_ATON

Converts an IPv6 address represented as a character string to a binary string.

Behavior Type

Immutable

Syntax

```
V6_ATON ( expression )
```

Parameters

expression	(VARCHAR) is the string to convert.

Notes

The following syntax converts an IPv6 address represented as the character string A to a binary string B.

V6_ATON trims any spaces from the right of A and calls the Linux function inet_pton.

```
=> V6_ATON(VARCHAR A) -> VARBINARY(16) B
```

If A has no colons it is prepended with '::ffff:'. If A is NULL, too long, or if inet_pton returns an error, the result is NULL.

Examples

```
=> SELECT V6_ATON('2001:DB8::8:800:200C:417A');
                      v6_aton
-----------------------------------------------------
  \001\015\270\000\000\000\000\000\010\010\000 \014Az
(1 row)

=> SELECT V6_ATON('1.2.3.4');
              v6_aton
----------------------------------------------------------------------
 \000\000\000\000\000\000\000\000\000\000\377\377\001\002\003\004
(1 row)
SELECT TO_HEX(V6_ATON('2001:DB8::8:800:200C:417A'));
              to_hex
---------------------------------
 20010db8000000000080800200c417a
(1 row)
```

```
=> SELECT V6_ATON('::1.2.3.4');
              v6_aton
------------------------------------------------------------------
 \000\000\000\000\000\000\000\000\000\000\000\000\001\002\003\004
(1 row)
```

See Also

- V6_NTOA

V6_NTOA

Converts an IPv6 address represented as varbinary to a character string.

Behavior Type

Immutable

Syntax

V6_NTOA (*expression*)

Parameters

expression	(VARBINARY) is the binary string to convert.

Notes

The following syntax converts an IPv6 address represented as VARBINARY B to a string A.

V6_NTOA right-pads B to 16 bytes with zeros, if necessary, and calls the Linux function inet_ntop.

```
=> V6_NTOA(VARBINARY B) -> VARCHAR A
```

If B is NULL or longer than 16 bytes, the result is NULL.

Vertica automatically converts the form '::ffff:1.2.3.4' to '1.2.3.4'.

Examples

```
=> SELECT V6_NTOA(' \001\015\270\000\000\000\000\000\010\010\000 \014Az');
          v6_ntoa
---------------------------
 2001:db8::8:800:200c:417a
(1 row)

=> SELECT V6_NTOA(V6_ATON('1.2.3.4'));
 v6_ntoa
---------
 1.2.3.4
(1 row)

=> SELECT V6_NTOA(V6_ATON('::1.2.3.4'));
  v6_ntoa
-----------
 ::1.2.3.4
(1 row)
```

See Also

- V6_ATON

V6_SUBNETA

Calculates a subnet address in CIDR (Classless Inter-Domain Routing) format from a binary or alphanumeric IPv6 address.

Behavior Type

Immutable

Syntax

V6_SUBNETA (*expression1*, *expression2*)

Parameters

expression1	(VARBINARY or VARCHAR) is the string to calculate.

expression2	(INTEGER) is the size of the subnet.

Notes

The following syntax calculates a subnet address in CIDR format from a binary or varchar IPv6 address.

V6_SUBNETA masks a binary IPv6 address B so that the N leftmost bits form a subnet address, while the remaining rightmost bits are cleared. It then converts to an alphanumeric IPv6 address, appending a slash and N.

```
=> V6_SUBNETA(BINARY B, INT8 N) -> VARCHAR C
```

The following syntax calculates a subnet address in CIDR format from an alphanumeric IPv6 address.

```
=> V6_SUBNETA(VARCHAR A, INT8 N) -> V6_SUBNETA(V6_ATON(A), N) -> VARCHAR C
```

Examples

```
=> SELECT V6_SUBNETA(V6_ATON('2001:db8::8:800:200c:417a'), 28);
  v6_subneta
---------------
 2001:db0::/28
(1 row)
```

See Also

- V6_SUBNETN

V6_SUBNETN

Calculates a subnet address in CIDR (Classless Inter-Domain Routing) format from a varbinary or alphanumeric IPv6 address.

Behavior Type

Immutable

Syntax

```
V6_SUBNETN ( expression1, expression2 )
```

Parameters

expression1	(VARBINARY or VARCHAR) is the string to calculate. **Notes:** • V6_SUBNETN(<VARBINARY>, <INTEGER>) returns VARBINARY. OR • V6_SUBNETN(<VARCHAR>, <INTEGER>) returns VARBINARY, after using V6_ATON to convert the <VARCHAR> string to <VARBINARY>.
expression2	(INTEGER) is the size of the subnet.

Notes

The following syntax masks a BINARY IPv6 address **B** so that the N left-most bits of **S** form a subnet address, while the remaining right-most bits are cleared.

V6_SUBNETN right-pads B to 16 bytes with zeros, if necessary and masks B, preserving its N-bit subnet prefix.

```
=> V6_SUBNETN(VARBINARY B, INT8 N) -> VARBINARY(16) S
```

If B is NULL or longer than 16 bytes, or if N is not between 0 and 128 inclusive, the result is NULL.

S = [B]/N in Classless Inter-Domain Routing notation (CIDR notation).

The following syntax masks an alphanumeric IPv6 address **A** so that the N leftmost bits form a subnet address, while the remaining rightmost bits are cleared.

```
=> V6_SUBNETN(VARCHAR A, INT8 N) -> V6_SUBNETN(V6_ATON(A), N) -> VARBINARY(16) S
```

Example

This example returns VARBINARY, after using V6_ATON to convert the VARCHAR string to VARBINARY:

```
=> SELECT V6_SUBNETN(V6_ATON('2001:db8::8:800:200c:417a'), 28);
                           v6_subnetn
-----------------------------------------------------------------
  \001\015\260\000\000\000\000\000\000\000\000\000\000\000\000\000
```

See Also

- V6_ATON
- V6_SUBNETA

V6_TYPE

Characterizes a binary or alphanumeric IPv6 address B as an integer type.

Behavior Type

Immutable

Syntax

V6_TYPE (*expression*)

Parameters

expression	(VARBINARY or VARCHAR) is the type to convert.

Notes

V6_TYPE(VARBINARY B) returns INT8 T.

```
=> V6_TYPE(VARCHAR A) -> V6_TYPE(V6_ATON(A)) -> INT8 T
```

The IPv6 types are defined in the Network Working Group's IP Version 6 Addressing Architecture memo.

```
  GLOBAL = 0       Global unicast addresses
  LINKLOCAL = 1    Link-Local unicast (and Private-Use) addresses
  LOOPBACK = 2     Loopback
  UNSPECIFIED = 3  Unspecified
  MULTICAST = 4    Multicast
```

IPv4-mapped and IPv4-compatible IPv6 addresses are also interpreted, as specified in IPv4 Global Unicast Address Assignments.

- For IPv4, Private-Use is grouped with Link-Local.
- If B is VARBINARY, it is right-padded to 16 bytes with zeros, if necessary.
- If B is NULL or longer than 16 bytes, the result is NULL.

Details

IPv4 (either kind):

```
    0.0.0.0/8        UNSPECIFIED    10.0.0.0/8    LINKLOCAL
    127.0.0.0/8      LOOPBACK
    169.254.0.0/16   LINKLOCAL
    172.16.0.0/12    LINKLOCAL
    192.168.0.0/16   LINKLOCAL
    224.0.0.0/4      MULTICAST
    others           GLOBAL
```

IPv6:

```
    ::0/128          UNSPECIFIED    ::1/128        LOOPBACK
    fe80::/10        LINKLOCAL
    ff00::/8         MULTICAST
    others           GLOBAL
```

Examples

```
=> SELECT V6_TYPE(V6_ATON('192.168.2.10'));
 v6_type
---------
       1
(1 row)

=> SELECT V6_TYPE(V6_ATON('2001:db8::8:800:200c:417a'));
 v6_type
```

```
---------
       0
(1 row)
```

- IPv4 Global Unicast Address Assignments

Machine Learning Functions

Machine learning functions let you work with your data set in different stages of the data analysis process:

- Preparing models
- Training models
- Evaluating models
- Applying models
- Managing models

Some Vertica machine learning functions are implemented as Vertica UDx functions, while others are implemented as meta-functions:

- A UDx function accepts an input relation name from a FROM clause. The SELECT statement that calls the functions is composable—it can be used as a sub-query in another SELECT statement.
- A meta-function accepts the input relation name as a single-quoted string passed to it as an argument or a named parameter. The data that the SELECT statement returns cannot be used in a sub-query. Machine learning meta-functions do not support temporary tables.

All machine learning functions automatically cast NUMERIC arguments to FLOAT.

Important:
Before using a machine learning function, be aware that any open transaction on the current session might be committed.

Data Preparation

Vertica supports machine learning functions that prepare data as needed before subjecting it to analysis.

BALANCE

Returns a view with an equal distribution of the input data based on the response_column.

Syntax

```
BALANCE ( 'output-view', 'input-relation', 'response-column', 'balance-method'
            [ USING PARAMETERS sampling_ratio=ratio ] )
```

Arguments

output-view	The name of the view where Vertica saves the balanced data from the input relation. **Note**: The view that results from this function employs a random function. Its content can differ each time it is used in a query. To make the operations on the view predictable, store it in a regular table.
input-relation	The table or view that contains the data the function uses to create a more balanced data set. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_SCHEMA to sync the hcatalog schema, and then run the machine learning function.
response-column	Name of the input column that represents the dependent variable, of type VARCHAR or INTEGER.
balance-method	Specifies a method to select data from the minority and majority classes, one of the following. • hybrid_sampling: Performs over-sampling and under-sampling on different classes so each class is equally

	represented. • `over_sampling`: Over-samples on all classes, with the exception of the most majority class, towards the most majority class's cardinality. • `under_sampling`: Under-samples on all classes, with the exception of the most minority class, towards the most minority class's cardinality. • `weighted_sampling`: An alias of `under_sampling`.

Parameter Settings

Parameter name	Set to...
`ratio`	The desired ratio between the majority class and the minority class. This value has no effect when used with balance method `hybrid_sampling`. **Default:** 1.0

Privileges

Non-superusers:

- SELECT privileges on the input relation
- CREATE privileges on the output view schema

Examples

```
=> CREATE TABLE backyard_bugs (id identity, bug_type int, finder varchar(20));
CREATE TABLE

=> COPY backyard_bugs FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 1|Ants
>> 1|Beetles
>> 3|Ladybugs
>> 3|Ants
>> 3|Beetles
>> 3|Caterpillars
>> 2|Ladybugs
>> 3|Ants
>> 3|Beetles
```

```
>> 1|Ladybugs
>> 3|Ladybugs
>> \.

=> SELECT bug_type, COUNT(bug_type) FROM backyard_bugs GROUP BY bug_type;
 bug_type | COUNT
----------+-------
        2 |     1
        1 |     3
        3 |     7
(3 rows)

=> SELECT BALANCE('backyard_bugs_balanced', 'backyard_bugs', 'bug_type', 'under_sampling');
         BALANCE
--------------------------
 Finished in 1 iteration

(1 row)

=> SELECT bug_type, COUNT(bug_type) FROM backyard_bugs_balanced GROUP BY bug_type;
----------+-------
        2 |     1
        1 |     2
        3 |     1
(3 rows)
```

- Balancing Imbalanced Data

CORR_MATRIX

Takes an input relation with numeric columns, and calculates the *Pearson Correlation Coefficient* between each pair of its input columns. The function is implemented as a Multi-Phase Transform function.

Syntax

```
CORR_MATRIX ( input_columns ) OVER()
```

Arguments

input_columns	A comma-separated list of the columns in the input table. The input columns can be of any numeric type or BOOL, but they will be converted

	internally to FLOAT. The number of input columns must be more than 1 and not more than 1600.

Return

CORR_MATRIX returns the correlation matrix in triplet format. That is, each pair-wise correlation is identified by three returned columns: name of the first variable, name of the second variable, and the correlation value of the pair. The function also returns two extra columns: number_of_ignored_input_rows and number_of_processed_input_rows. The value of the fourth/fifth column indicates the number of rows from the input which are ignored/used to calculate the corresponding correlation value. Any input pair with NULL, Inf, or NaN is ignored.

The correlation matrix is symmetric with a value of 1 on all diagonal elements; therefore, it could return only the value of elements above the diagonals—that is, the upper triangle. Nevertheless, the function returns the entire matrix to simplify any later operations. Then, the number of output rows is:

(#input-columns)^2

The first two output columns are of type VARCHAR(128), the third one is of type FLOAT, and the last two are of type INT.

Notes

The contents of the OVER clause must be empty.

The function returns no rows when the input table is empty.

When any of X_i and Y_i is NULL, Inf, or NaN, the pair will not be included in the calculation of CORR(X, Y). That is, any input pair with NULL, Inf, or NaN is ignored.

For the pair of (X,X), regardless of the contents of X: CORR(X,X) = 1, number_of_ignored_ input_rows = 0, and number_of_processed_input_rows = #input_rows.

When (N*SUMX2 == SUMX*SUMX) or (N*SUMY2 == SUMY*SUMY) then value of CORR(X, Y) will be NULL. In theory it can happen in case of a column with constant values; nevertheless, it may not be always observed because of rounding error.

In the special case where all pair values of (X_i,Y_i) contain NULL, inf, or NaN, and X != Y: CORR(X,Y)=NULL.

Example

This example uses the **iris** dataset*.

```
SELECT CORR_MATRIX("Sepal.Length", "Sepal.Width", "Petal.Length", "Petal.Width") OVER() FROM iris;
variable_name_1 | variable_name_2 | corr_value        | number_of_ignored_input_rows | number_of_
processed_input_rows
----------------+-----------------+-------------------+------------------------------+--------------
----------------
Sepal.Length    | Sepal.Width     |-0.117569784133002 | 0                            | 150

DETECT_OUTLIERS

Returns the outliers in a data set based on the outlier threshold. The output is a table that contains the outliers. `DETECT_OUTLIERS` uses the detection method `robust_szcore` to normalize each input column. The function then identifies as outliers all rows that contain a normalized value greater than the default or specified threshold.

Note:
You can calculate normalized column values with Vertica functions NORMALIZE and NORMALIZE_FIT.

Syntax

```
DETECT_OUTLIERS ( 'output-table', 'input-relation','input-columns', 'detection-method'
                  [ USING PARAMETERS [outlier_threshold=threshold]
                                     [, exclude_columns='excluded-columns']
                                     [, partition_columns='partition-columns'] ] )
```

Arguments

output-table	The name of the table where Vertica saves rows that are outliers along the chosen input_columns. All columns are present in this table.
input-relation	The table or view that contains outlier data. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_SCHEMA to sync the hcatalog schema, and then run the machine learning function.
input-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. Input columns must be of type numeric.
detection-method	The outlier detection method to use, set to robust_zscore.

Parameter Settings

Parameter name	Set to...
outlier_threshold	The minimum normalized value in a row that is used to identify that row as an outlier. **Default:** 3.0
exclude_columns	Comma-separated list of column names from *input-columns* to exclude from processing.
partition_	Comma-separated list of column names from the input table or view

Parameter name	Set to...
columns	that defines the partitions. DETECT_OUTLIERS detects outliers among each partition separately. **Default:** empty list

Privileges

Non-superusers:

- SELECT privileges on the input relation
- CREATE privileges on the output table

Examples

The following example shows how to use DETECT_OUTLIERS:

```
=> CREATE TABLE baseball_roster (id identity, last_name varchar(30), hr int, avg float);
CREATE TABLE

=> COPY baseball_roster FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> Polo|7|.233
>> Gloss|45|.170
>> Gus|12|.345
>> Gee|1|.125
>> Laus|3|.095
>> Hilltop|16|.222
>> Wicker|78|.333
>> Scooter|0|.121
>> Hank|999999|.8888
>> Popup|35|.378
>> \.

=> SELECT * FROM baseball_roster;
 id | last_name |   hr   |  avg
----+-----------+--------+--------
  3 | Gus       |     12 |  0.345
  4 | Gee       |      1 |  0.125
  6 | Hilltop   |     16 |  0.222
 10 | Popup     |     35 |  0.378
  1 | Polo      |      7 |  0.233
  7 | Wicker    |     78 |  0.333
  9 | Hank      | 999999 | 0.8888
  2 | Gloss     |     45 |   0.17
  5 | Laus      |      3 |  0.095
  8 | Scooter   |      0 |  0.121
(10 rows)
```

```
=> SELECT DETECT_OUTLIERS('baseball_outliers', 'baseball_roster', 'id, hr, avg', 'robust_zscore'
USING PARAMETERS
outlier_threshold=3.0);

     DETECT_OUTLIERS
--------------------------
 Detected 2 outliers

(1 row)

=> SELECT * FROM baseball_outliers;
 id | last_name | hr         | avg
----+-----------+------------+-------------
  7 | Wicker    |         78 |       0.333
  9 | Hank      |     999999 |      0.8888
(2 rows)
```

IMPUTE

Imputes missing values in a data set with either the mean or the mode, based on observed values for a variable in each column. This function supports numeric and categorical data types.

Syntax

```
IMPUTE( 'output-view', 'input-relation', 'input-columns', 'method'
            [ USING PARAMETERS [exclude_columns='excluded-columns']
                               [, partition_columns='partition-columns'] ] )
```

Arguments

output-view	Name of the view that shows the input table with imputed values in place of missing values. In this view, rows without missing values are kept intact while the rows with missing values are modified according to the specified method.
input-relation	The table or view that contains the data for missing-value imputation. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_SCHEMA to sync the hcatalog schema, and then run the machine learning function.
input-columns	Comma-separated list of input columns where missing values will be replaced, or asterisk (*) to specify all columns. All columns

	must be of type numeric or BOOLEAN.
method	The method to compute the missing value replacements, one of the following: • mean: The missing values in each column will be replaced by the mean of that column. This method can be used for numeric data only. • mode: The missing values in each column will be replaced by the most frequent value in that column. This method can be used for categorical data only.

Parameter Settings

Parameter name	Set to...
exclude_columns	Comma-separated list of column names from *input-columns* to exclude from processing.
partition_columns	Comma-separated list of column names from the input relation that defines the partitions.

Privileges

Non-superusers:

- SELECT privileges on the input relation
- CREATE privileges on the output view schema

Examples

Execute IMPUTE on the small_input_impute table, specifying the mean method:

```
=> SELECT impute('output_view','small_input_impute', 'pid, x1,x2,x3,x4','mean'
USING PARAMETERS exclude_columns='pid');
impute
-------------------------
Finished in 1 iteration
(1 row)
```

Execute IMPUTE, specifying the mode method:

```
=> SELECT impute('output_view3','small_input_impute', 'pid, x5,x6','mode' USING PARAMETERS exclude_
columns='pid');
impute
-------------------------
Finished in 1 iteration
(1 row)
```

See Also

Imputing Missing Values

NORMALIZE

Runs a normalization algorithm on an input relation. The output is a view with the normalized data.

> **Note**: This function differs from NORMALIZE_FIT, which creates and stores a model rather than creating a view definition. This can lead to different performance characteristics between the two functions.

Syntax

```
NORMALIZE ( 'output-view', 'input-relation', 'input-columns', 'normalization-method'
          [ USING PARAMETERS [exclude_columns='excluded-columns'] ] )
```

Arguments

output-view	The name of the view showing the input relation with normalized data replacing the specified input columns. .
input-relation	The table or view that contains the data to normalize. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_SCHEMA to sync the hcatalog schema, and then run the machine learning function.
input-columns	Comma-separated list of numeric input columns that contain the values to normalize, or asterisk (*) to select all

	columns.
normalization-method	The normalization method to use, one of the following: • `minmax` • `zscore` • `robust_zscore` If infinity values appear in the table, the method ignores those values.

Parameter Settings

Parameter name	Set to...
`exclude_columns`	Comma-separated list of column names from *`input-columns`* to exclude from processing.

Privileges

Non-superusers:

- SELECT privileges on the input relation
- CREATE privileges on the output view schema

Examples

These examples show how you can use the NORMALIZE function on the `wt` and `hp` columns in the mtcars table.

Execute the NORMALIZE function, and specify the `minmax` method:

```
=> SELECT NORMALIZE('mtcars_norm', 'mtcars',
                    'wt, hp', 'minmax');
        NORMALIZE
-------------------------
 Finished in 1 iteration

(1 row)
```

Execute the NORMALIZE function, and specify the `zscore` method:

```
=> SELECT NORMALIZE('mtcars_normz','mtcars',
                    'wt, hp', 'zscore');
        NORMALIZE
--------------------------
 Finished in 1 iteration

(1 row)
```

Execute the NORMALIZE function, and specify the `robust_zscore` method:

```
=> SELECT NORMALIZE('mtcars_normz', 'mtcars',
                    'wt, hp', 'robust_zscore');
        NORMALIZE
--------------------------
 Finished in 1 iteration

(1 row)
```

Normalizing Data

NORMALIZE_FIT

Note:
This function differs from NORMALIZE, which directly outputs a view with normalized results, rather than storing normalization parameters into a model for later operation.

`NORMALIZE_FIT` computes normalization parameters for each of the specified columns in an input relation. The resulting model stores the normalization parameters. For example, for `MinMax` normalization, the minimum and maximum value of each column are stored in the model. The generated model serves as input to functions APPLY_NORMALIZE and REVERSE_NORMALIZE.

Syntax

```
NORMALIZE_FIT ( 'model-name', 'input-relation', 'input-columns', 'normalization-method'
              [ USING PARAMETERS [exclude_columns='excluded-columns']
                                 [, output_view='output-view'] ] )
```

Arguments

model-name	Identifies the model to create, where *model-name* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
input-relation	The table or view that contains the data to normalize. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_SCHEMA to sync the hcatalog schema, and then run the machine learning function.
input-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. Input columns must be of data type numeric.
normalization-method	The normalization method to use, one of the following: • minmax • zscore • robust_zscore If you specify robust_zscore, NORMALIZE_FIT uses the function APPROXIMATE_MEDIAN [Aggregate]. All normalization methods ignore infinity, negative infinity, or NULL values in the input relation.

Parameter Settings

Parameter name	Set to...
exclude_columns	Comma-separated list of column names from *input-columns* to exclude from processing.
output_view	Name of the view that contains all columns from the input relation, with the specified input columns normalized.

Model Attributes

Attribute	Description
data	Normalization method set to minmax: • colNames: Model column names • mins: Minimum value of each column • maxes: Maximum value of each column
	Normalization method set to zscore: • colNames: Model column names • avgs: Average value of each column • stddev: Standard deviation of each column
	Normalization method set to robust_zscore: • colNames: Model column names • meds: Approximate median value of each column • mads: Median absolute deviation (MAD) from the median of each column

Privileges

Non-superusers:

- CREATE privileges on the schema where the model is created
- SELECT privileges on the input relation
- CREATE privileges on the output view schema

Examples

The following example creates a model with NORMALIZE_FIT using the wt and hp columns in table mtcars , and then uses this model in successive calls to APPLY_NORMALIZE and REVERSE_NORMALIZE.

```
=> SELECT NORMALIZE_FIT('mtcars_normfit', 'mtcars', 'wt,hp', 'minmax');
NORMALIZE_FIT
---------------
Success
```

```
(1 row)
```

The following call to APPLY_NORMALIZE specifies the hp and cyl columns in table mtcars, where hp is in the normalization model and cyl is not in the normalization model:

```
=> CREATE TABLE mtcars_normalized AS SELECT APPLY_NORMALIZE (hp, cyl USING PARAMETERS model_name =
'mtcars_normfit') FROM mtcars;
CREATE TABLE
=> SELECT * FROM mtcars_normalized;
          hp        | cyl

Normalizing Data

ONE_HOT_ENCODER_FIT

Generates a sorted list of each of the category levels for each feature to be encoded, and stores the model.

Syntax

```
ONE_HOT_ENCODER_FIT ( 'model-name', 'input-relation','input-columns'
                  [ USING PARAMETERS [exclude_columns='excluded-columns']
                                     [, output_view='output-view']
                                     [, extra_levels='category-levels'] ] )
```

Arguments

model-name	Identifies the model to create, where *model-name* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
input-relation	The table or view that contains the data for one hot encoding. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_SCHEMA to sync the hcatalog schema, and then run the machine learning function.
input-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. Input columns must be INTEGER, BOOLEAN, VARCHAR, or dates.

Parameter Settings

Parameter name	Set to...
exclude_columns	Comma-separated list of column names from *input-columns* to exclude from processing.
output_view	The name of the view that stores the input relation and the one hot encodings. Columns are returned in the order they appear in the input relation, with the one-hot encoded columns appended after the original columns.
extra_levels	Additional levels in each category that are not in the input relation. This parameter should be passed as a JSON string with category names as keys and lists of extra levels in each category as values. **Note:** Quote hyper parameter names and string values according to the JSON standard.

Model Attributes

Attribute	Description
call_string	The value of all input arguments that were specified at the time the function was called.
varchar_categories integer_categories boolean_categories date_categories	Settings for all: • category_name: Column name • category_level: Levels of the category, sorted for each category • category_level_index: Index of this categorical level in the sorted list of levels for the category.

Privileges

Non-superusers:

- CREATE privileges on the schema where the model is created
- SELECT privileges on the input relation
- CREATE privileges on the output view schema

Examples

```
=> SELECT ONE_HOT_ENCODER_FIT ('one_hot_encoder_model','mtcars','*'
USING PARAMETERS exclude_columns='mpg,disp,drat,wt,qsec,vs,am');
ONE_HOT_ENCODER_FIT
--------------------
Success
(1 row)
```

See Also

- APPLY_ONE_HOT_ENCODER
- Encoding Categorical Columns

PCA

Computes principal components from the input table/view. The results are saved in a PCA model. Internally, PCA finds the components by using SVD on the co-variance matrix built from the input date. The singular values of this decomposition are also saved as part of the PCA model. The signs of all elements of a principal component could be flipped all together on different runs.

Syntax

```
PCA ( 'model-name', 'input-relation', 'input-columns'
     [ USING PARAMETERS [exclude_columns='excluded-columns']
                        [, num_components=num-components]
                        [, scale=is-scaled]
                        [, method='method'] ] )
```

Arguments

model-name	Identifies the model to create, where *model-name* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
input-relation	The table or view that contains the input data for PCA.
input-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. All input columns must be a numeric data type.

Parameter Settings

Parameter name	Set to...
exclude_columns	Comma-separated list of column names from *input-columns* to exclude from processing.
num_components	The number of components to keep in the model. If this value is not provided, all components are kept. The maximum number of components is the number of non-zero singular values returned by the internal call to SVD. This number is less than or equal to SVD (number of columns, number of rows).
scale	A Boolean value that specifies whether to standardize the columns during the preparation step: • True: Use a correlation matrix instead of a covariance matrix. • False (default)
method	The method used to calculate PCA, can be set to LAPACK.

Model Attributes

Attribute	Description
columns	The information about columns from the input relation used for creating the PCA model: • index • name
singular_values	The information about singular values found. They are sorted in descending order: • index • value • explained_variance : percentage of the variance in data that can be attributed to this singular value • accumulated_explained_variance : percentage of the variance in data that can be retained if we drop all singular values after this current one
principal_components	The principal components corresponding to the singular values mentioned above: • index: indies of the elements in each component • PC1 • PC2 • ...

counters	The information collected during training the model, stored as name-value pairs:
	• counter_name
	  • accepted_row_count: number of valid rows in the data
	  • rejected_row_count: number of invalid rows (having NULL, INF or NaN) in the data
	  • iteration_count: number of iterations, always 1 for the current implementation of PCA
	• counter_value

call_string	The function call that created the model.

Privileges

Non-superusers:

- CREATE privileges on the schema where the model is created
- SELECT privileges on the input relation

Examples

```
=> SELECT PCA ('pcamodel',

SUMMARIZE_CATCOL

Returns a statistical summary of categorical data input, in three columns:

- CATEGORY: Categorical levels, of the same SQL data type as the summarized column
- COUNT: The number of category levels, of type INTEGER
- PERCENT: Represents category percentage, of type FLOAT

Syntax

```
SUMMARIZE_CATCOL (target-column
                  [ USING PARAMETERS [TOPK=topk-value]
                                     [, WITH_TOTALCOUNT=show-total] ] )
                 OVER()
```

Arguments

target-column	The name of the input column to summarize, one of the following data types: • BOOLEAN • FLOAT • INTEGER • DATE, • CHAR/VARCHAR

Parameter Settings

Parameter name	Set to…
TOPK	How many of the most frequent rows to include in the output.
WITH_ TOTALCOUNT	A Boolean value that specifies whether the table contains a heading row that displays the total number of rows displayed in the target column, and a percent equal to 100, by default set to `true`.

Examples

This example shows the categorical summary for the `current_salary` column in the `salary_data` table. The output of the query shows the column category, count, and percent. The first column gives the categorical levels, with the same SQL data type as the input column, the second column gives a count of that value, and the third column gives a percentage.

```
=> SELECT SUMMARIZE_CATCOL (current_salary USING PARAMETERS TOPK = 5) OVER() FROM salary_data;
CATEGORY | COUNT | PERCENT
---------+-------+---------
         |  1000 |     100
   39004 |     2 |     0.2
   35321 |     1 |     0.1
   36313 |     1 |     0.1
   36538 |     1 |     0.1
   36562 |     1 |     0.1
(6 rows)
```

SUMMARIZE_NUMCOL

Returns a statistical summary of columns in a Vertica table:

- Count
- Mean
- Standard deviation
- Min/max values
- Approximate percentile
- Median

All summary values are FLOAT data types, except INTEGER for count.

Syntax

```
SUMMARIZE_NUMCOL (input-columns
                  [ USING PARAMETERS exclude_columns='excluded-columns'] )
                 OVER()
```

Arguments

input-columns	Comma-separated list of columns to use from the input relation, or

	asterisk (*) to select all columns. All columns must be a numeric data type. If you select all columns, SUMMARIZE_NUMCOL normalizes all columns in the model

Parameter Settings

Parameter name	Set to...
exclude_columns	Comma-separated list of column names from *input-columns* to exclude from processing.

Examples

Show the statistical summary for the age and salary columns in the employee table:

```
=> SELECT SUMMARIZE_NUMCOL(* USING PARAMETERS exclude_columns='id,name,gender,title') OVER() FROM
employee;
COLUMN         | COUNT |    MEAN    |      STDDEV      |  MIN    | PERC25  | MEDIAN  |  PERC75   |
MAX
---------------+-------+------------+------------------+---------+---------+---------+-----------+---
-----
age            |     5 |    63.4    | 19.3209730603818 |      44 |      45 |      67 |      71   |
 90
salary         |     5 | 3456.76    | 1756.78754300285 | 1234.56 | 2345.67 | 3456.78 | 4567.89   |
5678.9
(2 rows)
```

SVD

Computes singular values (the diagonal of the S matrix) and right singular vectors (the V matrix) of an SVD decomposition of the input relation. The results are saved as an SVD model. The signs of all elements of a singular vector in SVD could be flipped all together on different runs.

Syntax

```
SVD ( 'model-name', 'input-relation', 'input-columns'
       [ USING PARAMETERS [exclude_columns='excluded-columns']
                          [, num_components=num-components]
                          [, method='method'] ] )
```

Arguments

model-name	Identifies the model to create, where *model-name* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
input-relation	The table or view that contains the input data for SVD.
input-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. Input columns must be a numeric data type.

Privileges

Non-superusers:

- CREATE privileges on the schema where the model is created
- SELECT privileges on the input relation

Parameter Settings

Parameter name	Set to...
exclude_columns	Comma-separated list of column names from *input-columns* to exclude from processing.
num_components	The number of components to keep in the model. The maximum number of components is the number of non-zero singular values computed, which is less than or equal to min (number of columns, number of rows). If you omit this parameter, all components are kept.
method	The method used to calculate SVD, can be set to LAPACK.

Model Attributes

Attribute	Description
columns	The information about columns from the input relation used for creating the SVD model: • index • name
singular_values	The information about singular values found. They are sorted in descending order: • index • value • explained_variance : percentage of the variance in data that can be attributed to this singular value • accumulated_explained_variance : percentage of the variance in data that can be retained if we drop all singular values after this current one
right_singular_vectors	The right singular vectors corresponding to the singular values mentioned above: • index: indices of the elements in each vector • vector1 • vector2 • ...

counters	The information collected during training the model, stored as name-value pairs:
	• counter_name
	  • accepted_row_count: number of valid rows in the data
	  • rejected_row_count: number of invalid rows (having NULL, INF or NaN) in the data
	  • iteration_count: number of iterations, always 1 for the current implementation of SVD
	• counter_value

call_string	The function call that created the model.

Examples

```
=> SELECT SVD ('svdmodel', 'small_svd', 'x1,x2,x3,x4');
SVD
---------------------------------------------------------------
Finished in 1 iterations.
Accepted Rows: 8  Rejected Rows: 0
(1 row)

=> CREATE TABLE transform_svd AS SELECT
     APPLY_SVD (id, x1, x2, x3, x4 USING PARAMETERS model_name='svdmodel', exclude_columns='id', key_
columns='id')
     OVER () FROM small_svd;
CREATE TABLE

=> SELECT * FROM transform_svd;

Machine Learning Algorithms

Vertica supports a full range of machine learning functions that train a model on a set of data, and return a model that can be saved for later execution.

These functions require the following privileges for non-superusers:

- CREATE privileges on the schema where the model is created
- SELECT privileges on the input relation

Note:
Machine learning algorithms contain a subset of four classification functions:

- LOGISTIC_REG
- NAIVE_BAYES
- RF_CLASSIFIER
- SVM_CLASSIFIER

APPLY_BISECTING_KMEANS

Applies a trained bisecting k-means model to an input relation, and assigns each new data point to the closest matching cluster in the trained model.

Syntax

```
SELECT APPLY_BISECTING_KMEANS('input-columns'
       [USING PARAMETERS model_name = 'model-name']
       [, num_clusters ='num-clusters']
       [, match_by_pos = '{true|false}'])
FROM 'input-relation'
```

Arguments

input-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. Input columns must be of data type numeric.

input-relation	The table or view that contains the input data for k-means. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_SCHEMA to sync the hcatalog schema, and then run the machine learning function.

Parameter Settings

Parameter name	Set to...
model-name	Name of the model (case-insensitive) used for prediction. Identifies the model to create, where *model-name*conforms to conventions described in Identifiers.It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.]
num-clusters	The number of clusters used for prediction, i.e., predict as if there were num_clusters_for_prediction of clusters. **Range**: [1, *k*], where *k* is the number of centers in the model. **Default**: The value specified for *k* in the model.
match_by_pos	Boolean value that specifies how input columns are matched to model features: • false (default): Match by name. • true: Match by the position of columns in the input columns list.

Examples

```
SELECT APPLY_BISECTING_KMEANS('input-columns'
       [USING PARAMETERS model_name = 'model-name']  -- name of the model for prediction
       [, num_clusters ='num-clusters']    -- predict as if there were num-clusters-for-prediction
                                              -- of clusters, by default the k in the model

       [, match_by_pos = '{true|false}'])  -- same as the match_by_pos in Vertica k-means
FROM 'input-relation';
```

BISECTING_KMEANS

Executes the bisecting k-means algorithm on an input relation. The result is a trained model with a hierarchy of cluster centers, with a range of *k* values, each of which can be used for prediction.

Syntax

```
BISECTING_KMEANS('model-name', 'input-relation', 'input-columns', 'num-clusters'
          [ USING PARAMETERS [exclude_columns = 'exclude-columns']
          [, bisection_iterations = bisection-iterations]
          [, split_method ='split-method']
          [, min_divisible_cluster_size = min-cluster-size]
          [, kmeans_max_iterations = kmeans-max-iterations]
          [, kmeans_epsilon = kmeans-epsilon]
          [, kmeans_center_init_method = 'kmeans-init-method']
          [, distance_method = 'distance-method']
          [, output_view = 'output-view']
          [, key_columns = 'key-columns']])
```

Arguments

model-name	Identifies the model to create, where *model-name* conforms to conventions described in Identifiers.It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
input-relation	The table or view that contains the input data for k-means. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_SCHEMA to sync the `hcatalog` schema, and then run the machine learning function.
input-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. Input columns must be of data type numeric.
num-clusters	The number of clusters to create, an integer ≤ 10,000. This argument represents the *k* in k-means.

Parameter Settings

Parameter name	Set to...
exclude_columns	Comma-separated list of column names from *input-columns* to exclude from processing.
bisection_iterations	The number of iterations the bisecting k-means algorithm performs for each bisection step. This corresponds to how many times a standalone k-means algorithm runs in each bisection step. Setting to more than 1 allows the algorithm to run and choose the best k-means run within each bisection step. Note that if you are using kmeanspp the bisection_iterations value is always 1, because kmeanspp is more costly to run but also better than the alternatives, so it does not require multiple runs. **Default value:** 1 **Value range:** 1 - 1,000,000
split_method	The method used to choose a cluster to bisect/split: **Valid values:** • 'size': Choose the largest cluster to bisect. • 'sum_squares': Choose the cluster with the largest withInSS to bisect. **Default value:** 'sum_squares'
min_divisible_cluster_size	The minimum number of points of a divisible cluster. Must be greater than or equal to 2. **Default value:** 2
kmeans_max_iterations	The maximum number of iterations the k-means algorithm performs. If you set this value to a number lower than the number of iterations needed for convergence, the algorithm may not converge. **Default value:** 10 **Value range:** 1 - 1,000,000

Parameter name	Set to...
kmeans_epsilon	Determines whether the k-means algorithm has converged. The algorithm is considered converged after no center has moved more than a distance of 'epsilon' from the previous iteration. **Default value:** 1e-4 **Value range:** 0 - 1,000,000
kmeans_center_init_method	The method used to find the initial cluster centers in k-means. **Valid values:** • kmeanspp (default): kmeans++ algorithm • pseudo: Uses "pseudo center" approach used by Spark, bisects given center without iterating over points
distance_method	The measure for distance between two data points. Only Euclidean distance is supported at this time. **Default value:** 'euclidean'
output_view	The name of the view where you save the assignment of each point to its cluster. You must have CREATE privileges on the schema where the view is saved.
key_columns	Comma-separated list of column names that identify the output rows. Columns must be in the *input-columns* argument list. To exclude these and other input columns from being used by the algorithm, list them in parameter exclude_columns.

Model Attributes

Attribute	Description
centers	A list of centers of the K centroids.
hierarchy	The hierarchy of the K clusters, including: • ParentCluster: the parent cluster centroid of each centroid. I.e., the centroid of the cluster from which a cluster is obtained by

Attribute	Description
	bisection. • LeftChildCluster: the left child cluster centroid of each centroid. I.e., the centroid of the first sub-cluster obtained by bisecting a cluster. • RightChildCluster: the right child cluster centroid of each centroid. I.e., the centroid of the second sub-cluster obtained by bisecting a cluster. • BisectionLevel: from which bisection step a cluster is obtained. • WithinSS: the withinSS for the current cluster • TotalWithinSS: the total withinSS of the leaf clusters obtained so far.
`metrics`	Several metrics related to the quality of the clustering, including: • Total SS. • WithinSS for each cluster. • Total withinSS. • Between-cluster SS. • Between-Cluster SS / Total SS.

Examples

```
SELECT BISECTING_KMEANS('myModel', 'iris1', '*', '5'
       USING PARAMETERS exclude_columns = 'Species,id', split_method ='sum_squares', output_view =
'myBKmeansView');
```

KMEANS

Executes the k-means algorithm on an input relation. The result is a model with a list of cluster centers.

You can export the resulting k-means model in VERTICA_MODELS or PMML format to apply it on data outside Vertica. You can also train a k-means model elsewhere, then import it to Vertica in PMML format to predict on data in Vertica.

Syntax

```
KMEANS ( 'model-name', 'input-relation', 'input-columns', 'num-clusters'
       [ USING PARAMETERS [exclude_columns='excluded-columns']
                          [, max_iterations=max-iterations]
                          [, epsilon=epsilon-value]
                          [, {init_method='init-method'} | {initial_centers_table='init-table'} ]
                          [, output_view='output-view']
                          [, key_columns='key-columns'] ] )
```

Arguments

model-name	Identifies the model to create, where *model-name* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
input-relation	The table or view that contains the input data for k-means. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_SCHEMA to sync the hcatalog schema, and then run the machine learning function.
input-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. Input columns must be of data type numeric.
num-clusters	The number of clusters to create, an integer ≤ 10,000. This argument represents the *k* in k-means.

Parameter Settings

Important:
Parameters `init_method` and `initial_centers_table` are mutually exclusive. If you set both, the function returns an error.

Parameter name	Set to...
`exclude_columns`	Comma-separated list of column names from *`input-columns`* to exclude from processing.
`max_iterations`	The maximum number of iterations the algorithm performs. If you set this value to a number lower than the number of iterations needed for convergence, the algorithm may not converge. **Default**: 10
`epsilon`	Determines whether the algorithm has converged. The algorithm is considered converged after no center has moved more than a distance of 'epsilon' from the previous iteration. **Default**: 1e-4
`init_method`	The method used to find the initial cluster centers, one of the following: • `random` • `kmeanspp` (default): kmeans++ algorithm This value can be memory intensive for high k. If the function returns an error that not enough memory is available, decrease the value of k or use the `random` method.
`initial_centers_table`	The table with the initial cluster centers to use. Supply this value if you know the initial centers to use and do not want Vertica to find the initial cluster centers for you.
`output_view`	The name of the view where you save the assignments of each point to its cluster. You must have CREATE privileges on the schema where the view is saved.

Parameter name	Set to...
key_columns	Comma-separated list of column names that identify the output rows. Columns must be in the *input-columns* argument list. To exclude these and other input columns from being used by the algorithm, list them in parameter exclude_columns.

Model Attributes

Attribute	Description
centers	A list that contains the center of each cluster.
metrics	A string summary of several metrics related to the quality of the clustering.

Examples

The following example creates k-means model myKmeansModel and applies it to input table iris1. The call to APPLY_KMEANS mixes column names and constants. When a constant is passed in place of a column name, the constant is substituted for the value of the column in all rows:

```
=> SELECT KMEANS('myKmeansModel', 'iris1', '*', 5
USING PARAMETERS max_iterations=20, output_view='myKmeansView', key_columns='id', exclude_
columns='Species, id');
           KMEANS
----------------------------
 Finished in 12 iterations

(1 row)
=> SELECT id, APPLY_KMEANS(Sepal_Length, 2.2, 1.3, Petal_Width
USING PARAMETERS model_name='myKmeansModel', match_by_pos='true') FROM iris2;
 id  | APPLY_KMEANS
-----+--------------
   5 |            1
  10 |            1
  14 |            1
  15 |            1
  21 |            1
  22 |            1
  24 |            1
  25 |            1
  32 |            1
  33 |            1
  34 |            1
  35 |            1
  38 |            1
```

```
  39 |           1
  42 |           1
…
 (60 rows)
```

LINEAR_REG

Executes linear regression on an input relation, and returns a linear regression model.

You can export the resulting linear regression model in VERTICA_MODELS or PMML format to apply it on data outside Vertica. You can also train a linear regression model elsewhere, then import it to Vertica in PMML format to predict on data in Vertica.

Syntax

```
LINEAR_REG ( 'model-name', 'input-relation', 'response-column', 'predictor-columns'
             [ USING PARAMETERS
                            [exclude_columns='excluded-columns']
                            [, optimizer='optimizer-method']
                            [, regularization='regularization-method']
                            [, epsilon=epsilon-value]
                            [, max_iterations=iterations]
                            [, lambda=lamda-value]
                            [, alpha=alpha-value] ] )
```

Arguments

model-name	Identifies the model to create, where *model-name* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
input-relation	The table or view that contains the training data for building

	the model. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_SCHEMA to sync the hcatalog schema, and then run the machine learning function.
response-column	Name of the input column that represents the dependent variable or outcome. All values in this column must be numeric, otherwise the model is invalid.
predictor-columns	Comma-separated list of columns in the input relation that represent independent variables for the model, or asterisk (*) to select all columns. If you select all columns, the argument list for parameter exclude_columns must include *response-column*, and any columns that are invalid as predictor columns. All predictor columns must be of type numeric or BOOLEAN; otherwise the model is invalid. **Note:** All BOOLEAN predictor values are converted to FLOAT values before training: 0 for false, 1 for true. No type checking occurs during prediction, so you can use a BOOLEAN predictor column in training, and during prediction provide a FLOAT column of the same name. In this case, all FLOAT values must be either 0 or 1.

Parameter Settings

Parameter name	Set to...
exclude_columns	Comma-separated list of columns from *predictor-columns* to exclude from processing.
optimizer	The optimizer method used to train the model, one of the following: • Newton • BFGS • CGD **Important:** If you select CGD, *regularization-method* must

Parameter name	Set to...
	be set to L1 or ENet, otherwise the function returns an error. **Default**: CGD if *regularization-method* is set to L1 or ENet, otherwise Newton.
regularization	Determines the method of regularization, one of the following: • None (default) • L1 • L2 • ENet
epsilon	Determines whether the algorithm has reached the specified accuracy result. **Default**: 1e-6
max_iterations	Determines the maximum number of iterations the algorithm performs before achieving the specified accuracy result. **Default**: 100
lambda	The regularization parameter value. The value must be zero or non-negative. **Default**: 1
alpha	ENet mixture parameter that defines how much L1 versus L2 regularization to provide. This argument sends a warning if used without ENet regularization. **Valid Values**: [0,1] A value of 1 is equivalent to L1 and a value of 0 is equivalent to L2.

Model Attributes

Attribute	Description
data	The data for the function, including:

Attribute	Description
	• coeffNames: Name of the coefficients. This starts with intercept and then follows with the names of the predictors in the same order specified in the call. • coeff: Vector of estimated coefficients, with the same order as coeffNames • stdErr: Vector of the standard error of the coefficients, with the same order as coeffNames • zValue (for logistic regression): Vector of z-values of the coefficients, in the same order as coeffNames • tValue (for linear regression): Vector of t-values of the coefficients, in the same order as coeffNames • pValue: Vector of p-values of the coefficients, in the same order as coeffNames
regularization	The type of regularization to use when training the model.
lambda	The regularization parameter. Higher values enforce stronger regularization. This value must be positive.
alpha	The elastic net mixture parameter.
iterations	The number of iterations that actually occur for the convergence before exceeding max_iteration.
skippedRows	The number of rows of input_relation that were skipped because they contained an invalid value.
processedRows	The total number of rows in input_relation minus the skippedRows.
callStr	The value of all input arguments that were specified at the time the function was called.

Examples

```
=> SELECT LINEAR_REG('myLinearRegModel', 'faithful', 'eruptions', 'waiting'
                     USING PARAMETERS optimizer='BFGS');
         LINEAR_REG
---------------------------
 Finished in 10 iterations

(1 row)
```

LOGISTIC_REG

Executes logistic regression on an input relation. The result is a logistic regression model.

You can export the resulting logistic regression model in VERTICA_MODELS orPMML format to apply it on data outside Vertica. You can also train a logistic regression model elsewhere, then import it to Vertica in PMML format to predict on data in Vertica.

Syntax

```
LOGISTIC_REG ( 'model-name', 'input-relation', 'response-column', 'predictor-columns'
                [ USING PARAMETERS [exclude_columns='excluded-columns']
                                   [, optimizer='optimizer-method']
                                   [, regularization='regularization-method']
                                   [, epsilon=epsilon-value]
                                   [, max_iterations=iterations]
                                   [, lambda=lamda-value]
                                   [, alpha=alpha-value] ] )
```

Arguments

model-name	Identifies the model to create, where *model-name* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
input-relation	The table or view that contains the training data for building the model. If the input relation is defined in Hive, use SYNC_

	WITH_HCATALOG_SCHEMA to sync the hcatalog schema, and then run the machine learning function.
response-column	The input column that represents the dependent variable or outcome. The column value must be 0 or 1, and of type numeric or BOOLEAN. The function automatically skips all other values.
predictor-columns	Comma-separated list of columns in the input relation that represent independent variables for the model, or asterisk (*) to select all columns. If you select all columns, the argument list for parameter exclude_columns must include *response-column*, and any columns that are invalid as predictor columns. All predictor columns must be of type numeric or BOOLEAN; otherwise the model is invalid. **Note:** All BOOLEAN predictor values are converted to FLOAT values before training: 0 for false, 1 for true. No type checking occurs during prediction, so you can use a BOOLEAN predictor column in training, and during prediction provide a FLOAT column of the same name. In this case, all FLOAT values must be either 0 or 1.

Parameter Settings

Parameter name	Set to...
exclude_columns	Comma-separated list of columns from *predictor-columns* to exclude from processing.
optimizer	The optimizer method used to train the model, one of the following: • Newton • BFGS • CGD **Important:** If you select CGD, *regularization-method* must

Parameter name	Set to...
	be set to `L1` or `ENet`, otherwise the function returns an error. **Default**: `CGD` if *`regularization-method`* is set to `L1` or `ENet`, otherwise `Newton`.
`regularization`	Determines the method of regularization, one of the following: • `None` (default) • `L1` • `L2` • `ENet`
`epsilon`	Determines whether the algorithm has reached the specified accuracy result. **Default**: 1 e-6
`max_iterations`	Determines the maximum number of iterations the algorithm performs before achieving the specified accuracy result. **Default**: 100
`lambda`	The regularization parameter value, an integer ≥ 0. **Default**: 1
`alpha`	ENet mixture parameter that defines how much L1 versus L2 regularization to provide, one of the following: • `0`: L2 • `1`: L1 This argument returns a warning if it is used without ENet regularization.

Model Attributes

Attribute	Description
`data`	The data for the function, including:

Attribute	Description
	• coeffNames: Name of the coefficients. This starts with intercept and then follows with the names of the predictors in the same order specified in the call. • coeff: Vector of estimated coefficients, with the same order as coeffNames • stdErr: Vector of the standard error of the coefficients, with the same order as coeffNames • zValue (for logistic regression): Vector of z-values of the coefficients, in the same order as coeffNames • tValue (for linear regression): Vector of t-values of the coefficients, in the same order as coeffNames • pValue: Vector of p-values of the coefficients, in the same order as coeffNames
regularization	The type of regularization to use when training the model.
lambda	The regularization parameter. Higher values enforce stronger regularization. This value must be positive.
alpha	The elastic net mixture parameter.
iterations	The number of iterations that actually occur for the convergence before exceeding max_iteration.
skippedRows	The number of rows of input_relation that were skipped because they contained an invalid value.
processedRows	The total number of rows in input_relation minus the skippedRows.
callStr	The value of all input arguments that were specified at the time the function was called.

Privileges

Superuser, or SELECT privileges on the input relation

Examples

```
=> SELECT LOGISTIC_REG('myLogisticRegModel', 'mtcars', 'am',
                       'mpg, cyl, disp, hp, drat, wt, qsec, vs, gear, carb'
                        USING PARAMETERS exclude_columns='hp', optimizer='BFGS');
        LOGISTIC_REG
----------------------------
 Finished in 20 iterations

(1 row)
```

NAIVE_BAYES

Executes the Naive Bayes algorithm on an input relation. The result is a Naive Bayes model.

Columns are treated according to data type:

- FLOAT: Values are assumed to follow some Gaussian distribution.
- INTEGER: Values are assumed to belong to one multinomial distribution.
- CHAR/VARCHAR: Values are assumed to follow some categorical distribution. The string values stored in these columns must not be greater than 128 characters.
- BOOLEAN: Values are treated as categorical with two values.

Syntax

```
NAIVE_BAYES ( 'model-name', 'input-relation', 'response-column', 'predictor-columns'
            [ USING PARAMETERS[exclude_columns='excluded-columns']
                              [, alpha=alpha-value] ] )
```

Arguments

model-name	Identifies the model to create, where *model-name* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
input-relation	The table or view that contains the training data for building the model. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_SCHEMA to sync the hcatalog schema, and then run the machine learning function.
response-column	Name of the input column that represents the dependent variable, or outcome. This column must contain discrete labels that represent different class labels. The response column must be of type numeric, CHAR/VARCHAR, or BOOLEAN; otherwise the model is invalid. **Note:** Vertica automatically casts numeric response column values to VARCHAR.
predictor-columns	Comma-separated list of columns in the input relation that represent independent variables for the model, or asterisk (*) to select all columns. If you select all columns, the argument list for parameter exclude_columns must include *response-column*, and any columns that are invalid as predictor columns. All predictor columns must be of type numeric, CHAR/VARCHAR, or BOOLEAN; otherwise the model is invalid. BOOLEAN column values are converted to FLOAT values before training: 0 for false, 1 for true.

Parameter Settings

Parameter name	Set to...
exclude_	Comma-separated list of columns from *predictor-columns* to

Parameter name	Set to...
columns	exclude from processing.
alpha	A FLOAT that specifies use of Laplace smoothing if the event model is categorical, multinomial, or Bernoulli. **Default:** 1.0

Model Attributes

Attribute	Description
colsInfo	The information from the response and predictor columns used in training: • index: The index (starting at 0) of the column as provided in training. Index 0 is used for the response column. • name: The column name. • type: The label used for response with a value of Gaussian, Multinominal, Categorical, or Bernoulli.
alpha	The smooth parameter value.
prior	The percentage of each class among all training samples: • label: The class label. • value: The percentage of each class.
nRowsTotal	The number of samples accepted for training from the data set.
nRowsRejected	The number of samples rejected for training.
callStr	The SQL statement used to replicate the training.
Gaussian	The Gaussian model conditioned on the class indicated by the class_name: • index: The index of the predictor column. • mu: The mean value of the model. • sigmaSq: The squared standard deviation of the model.
Multinominal	The Multinomial model conditioned on the class indicated by the class_name:

Attribute	Description
	• index: The index of the predictor column. • prob: The probability conditioned on the class indicated by the class_name.
`Bernoulli`	The Bernoulli model conditioned on the class indicated by the class_name: • index: The index of the predictor column. • probTrue: The probability of having the value TRUE in this predictor column.
`Categorical`	The Gaussian model conditioned on the class indicated by the class_name: • category: The value in the predictor name. • <class_name>: The probability of having that value conditioned on the class indicated by the class_name.

Privileges

Superuser, or SELECT privileges on the input relation.

Examples

```
=> SELECT NAIVE_BAYES('naive_house84_model', 'house84_train', 'party', '*'
                      USING PARAMETERS exclude_columns='party, id');
                              NAIVE_BAYES
-------------------------------------------------
 Finished. Accepted Rows: 324  Rejected Rows: 0
(1 row)
```

RF_CLASSIFIER

Trains a random forest model for classification on an input relation.

Syntax

```
RF_CLASSIFIER ( 'model-name', input-relation, 'response-column', 'predictor-columns'

            [ USING PARAMETERS [exclude_columns='excluded-columns']
                               [, ntree=num-trees]
                               [, mtry=num-features]
                               [, sampling_size=sampling-size]
                               [, max_depth=depth]
                               [, max_breadth=breadth]
                               [, min_leaf_size=leaf_size]
                               [, min_info_gain=threshold]
                               [, nbins=num-bins] ] )
```

Arguments

model-name	Identifies the model stored as a result of the training, where *model-name* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
input-relation	The table or view that contains the training samples. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_SCHEMA to sync the hcatalog schema, and then run the machine learning function.
response-column	An input column of type numeric, CHAR/VARCHAR, or BOOLEAN that represents the dependent variable. **Note:** Vertica automatically casts numeric response column values to VARCHAR.
predictor-columns	Comma-separated list of columns in the input relation that represent independent variables for the model, or asterisk (*) to select all columns. If you select all columns, the argument list for parameter exclude_columns must include

	response-column, and any columns that are invalid as predictor columns. All predictor columns must be of type numeric, CHAR/VARCHAR, or BOOLEAN; otherwise the model is invalid. BOOLEAN column values are converted to FLOAT values before training: 0 for false, 1 for true.

Parameter Settings

Parameter name	Set to...
exclude_columns	Comma-separated list of column names from *input-columns* to exclude from processing.
ntree	The number of trees in the forest, an integer between 0 and 1000, inclusive. **Default:** 20
mtry	The number of randomly chosen features from which to pick the best feature to split on a given tree node, an integer ≤ *number-predictors*. **Default:** Square root of the total number of predictors
sampling_size	The portion of the input data set that is randomly picked for training each tree, a FLOAT between 0.0 and 1.0, inclusive. **Default:** 0.632
max_depth	The maximum depth for growing each tree, an integer between 1 and 100, inclusive. **Default:** 5
max_breadth	The maximum number of leaf nodes a tree in the forest can have, an integer between 1 and 1e9, inclusive. **Default:** 32
min_leaf_size	The minimum number of samples each branch must have after splitting a node, an integer between 1 and 1e6, inclusive. A split that causes fewer remaining samples is discarded.

Parameter name	Set to...
	Default: 1
min_info_gain	The minimum threshold for including a split, a FLOAT between 0.0 and 1.0, inclusive. A split with information gain less than this threshold is discarded. **Default:** 0.0
nbins	The number of bins to use for continuous features, an integer between 2 and 1000, inclusive. **Default:** 32

Model Attributes

Attribute	Description
data	Data for the function, including: • predictorNames: The name of the predictors in the same order they were specified for training the model. • predictorTypes: The type of the predictors in the same order as their names in predictorNames.
ntree	Number of trees in the model.
skippedRows	Number of rows in input_relation that were skipped because they contained an invalid value.
processedRows	Total number of rows in input_relation minus skippedRows.
callStr	Value of all input arguments that were specified at the time the function was called.

Examples

```
=> SELECT RF_CLASSIFIER ('myRFModel', 'iris', 'Species', 'Sepal_Length, Sepal_Width,
Petal_Length, Petal_Width' USING PARAMETERS ntree=100, sampling_size=0.3);

RF_CLASSIFIER

RF_REGRESSOR

Trains a random forest model for regression on an input relation.

Syntax

```
RF_REGRESSOR ( 'model-name', input-relation, 'response-column', 'predictor-columns'

             [ USING PARAMETERS [exclude_columns='excluded-columns']
                                [, ntree=num-trees]
                                [, mtry=num-features]
                                [, sampling_size=sampling-size]
                                [, max_depth=depth]
                                [, max_breadth=breadth]
                                [, min_leaf_size=leaf_size]
                                [, min_info_gain=threshold]
                                [, nbins=num-bins] ] )
```

Arguments

model-name	The model that is stored as a result of training, where *model-name* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
input-relation	The table or view that contains the training samples. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_SCHEMA to sync the hcatalog schema, and then run the machine learning function.
response-column	A numeric input column that represents the dependent variable.

predictor-columns	Comma-separated list of columns in the input relation that represent independent variables for the model, or asterisk (*) to select all columns. If you select all columns, the argument list for parameter `exclude_columns` must include *response-column*, and any columns that are invalid as predictor columns. All predictor columns must be of type numeric, CHAR/VARCHAR, or BOOLEAN; otherwise the model is invalid. BOOLEAN column values are converted to FLOAT values before training: 0 for false, 1 for true.

Parameter Settings

Parameter name	Set to...
exclude_columns	Comma-separated list of columns from *predictor-columns* to exclude from processing.
ntree	The number of trees in the forest, an integer between 0 and 1000, inclusive. **Default:** 20
mtry	The number of features to consider at the split of a tree node, an integer ≤ *number-predictors*. **Default:** one-third the total number of predictors
sampling_size	The portion of the input data set that is randomly picked for training each tree, a FLOAT between 0.0 and 1.0, inclusive. **Default:** 0.632
max_depth	The maximum depth for growing each tree, an integer between 1 and 100, inclusive. **Default:** 5
max_breadth	The maximum number of leaf nodes a tree in the forest can have, an integer between 1 and 1e9, inclusive. **Default:** 32

Parameter name	Set to...
min_leaf_size	The minimum number of samples each branch must have after splitting a node, an integer between 1 and 1e6, inclusive. A split that causes fewer remaining samples is discarded. **Default:** 5
min_info_gain	The minimum threshold for including a split, a FLOAT between 0.0 and 1.0, inclusive. A split with information gain less than this threshold is discarded. **Default:** 0.0
nbins	The number of bins to use for continuous features, an integer between 2 and 1000, inclusive. **Default:** 32

Model Attributes

Attribute	Description
data	Data for the function, including: • predictorNames: The name of the predictors in the same order they were specified for training the model. • predictorTypes: The type of the predictors in the same order as their names in predictorNames.
ntree	Number of trees in the model.
skippedRows	Number of rows in input_relation that were skipped because they contained an invalid value.
processedRows	Total number of rows in input_relation minus skippedRows.
callStr	Value of all input arguments that were specified at the time the function was called.

Examples

```
=> SELECT RF_REGRESSOR ('myRFRegressorModel', 'mtcars', 'carb', 'mpg, cyl, hp, drat, wt' USING
PARAMETERS
ntree=100, sampling_size=0.3);
RF_REGRESSOR

SVM_CLASSIFIER

Trains the SVM model on an input relation.

Syntax

```
SVM_CLASSIFIER ( 'model-name', input-relation, 'response-column', 'predictor-columns'
                 [ USING PARAMETERS [exclude_columns='excluded-columns']
                                    [, C='cost']
                                    [, epsilon='epsilon-value']
                                    [, max_iterations='max-iterations']
                                    [, class_weights='weight']
                                    [, intercept_mode='intercept-mode']
                                    [, intercept_scaling='scale'] ] )
```

Arguments

model-name	Identifies the model to create, where *model-name* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
input-relation	The table or view that contains the training data. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_

	SCHEMA to sync the `hcatalog` schema, and then run the machine learning function.
response-column	The input column that represents the dependent variable or outcome. The column value must be 0 or 1, and of type numeric or BOOLEAN, otherwise the function returns with an error.
predictor-columns	Comma-separated list of columns in the input relation that represent independent variables for the model, or asterisk (*) to select all columns. If you select all columns, the argument list for parameter `exclude_columns` must include *response-column*, and any columns that are invalid as predictor columns. All predictor columns must be of type numeric or BOOLEAN; otherwise the model is invalid. **Note:** All BOOLEAN predictor values are converted to FLOAT values before training: 0 for false, 1 for true. No type checking occurs during prediction, so you can use a BOOLEAN predictor column in training, and during prediction provide a FLOAT column of the same name. In this case, all FLOAT values must be either 0 or 1.

Parameter Settings

Parameter name	Set to...
`exclude_columns`	Comma-separated list of columns from *predictor-columns* to exclude from processing.
`C`	The weight for misclassification cost. The algorithm minimizes the regularization cost and the misclassification cost. **Default**: 1.0
`epsilon`	Used to control accuracy. **Default**: 1e-3

Parameter name	Set to...
max_iterations	The maximum number of iterations that the algorithm performs. **Default**: 100
class_weights	A string that specifies how to determine weights of the two classes, one of the following: • None (default): No weights are used • *value0*, *value1*: Two comma-delimited strings that specify two positive FLOAT values, where *value0* assigns a weight to class 0, and *value1* assigns a weight to class 1. • auto: Weights each class according to the number of samples.
intercept_mode	A string that specifies how to treat the intercept, one of the following • regularized (default): Fits the intercept and applies a regularization on it. • unregularized: Fits the intercept but does not include it in regularization.
intercept_scaling	A FLOAT value, serves as the value of a dummy feature whose coefficient Vertica uses to calculate the model intercept. Because the dummy feature is not in the training data, its values are set to a constant, by default set to 1.

Model Attributes

Attribute	Description
coeff	Coefficients in the model: • colNames: Intercept, or predictor column name • coefficients: Coefficient value
nAccepted	Number of samples accepted for training from the data set
nRejected	Number of samples rejected when training
nIteration	Number of iterations used in training
callStr	SQL statement used to replicate the training

Examples

The following example uses SVM_CLASSIFIER on the mtcars table:

```
=> SELECT SVM_CLASSIFIER(
       'mySvmClassModel', 'mtcars', 'am', 'mpg,cyl,disp,hp,drat,wt,qsec,vs,gear,carb'
       USING PARAMETERS exclude_columns = 'hp,drat');
SVM_CLASSIFIER
---------------------------------------------------------------
Finished in 15 iterations.
Accepted Rows: 32  Rejected Rows: 0
(1 row)
```

SVM_REGRESSOR

Trains the SVM model on an input relation.

Syntax

```
SVM_REGRESSOR ( 'model-name', input-relation, 'response-column', 'predictor-columns'
                [ USING PARAMETERS [exclude_columns='excluded-columns']
                                   [, error_tolerance=error-tolerance]
                                   [, C=cost]
                                   [, epsilon=epsilon-value]
                                   [, max_iterations=max-iterations]
                                   [, intercept_mode='mode']
                                   [, intercept_scaling='scale'] ] )
```

Arguments

model-name	Identifies the model to create, where *model-name* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.

input-relation	The table or view that contains the training data. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_SCHEMA to sync the hcatalog schema, and then run the machine learning function.
response-column	An input column that represents the dependent variable or outcome. The column must be a numeric data type.
predictor-columns	Comma-separated list of columns in the input relation that represent independent variables for the model, or asterisk (*) to select all columns. If you select all columns, the argument list for parameter exclude_columns must include *response-column*, and any columns that are invalid as predictor columns. All predictor columns must be of type numeric or BOOLEAN; otherwise the model is invalid. **Note:** All BOOLEAN predictor values are converted to FLOAT values before training: 0 for false, 1 for true. No type checking occurs during prediction, so you can use a BOOLEAN predictor column in training, and during prediction provide a FLOAT column of the same name. In this case, all FLOAT values must be either 0 or 1.

Parameter Settings

Parameter name	Set to…
exclude_columns	Comma-separated list of columns from *predictor-columns* to exclude from processing.
error_tolerance	Defines the acceptable error margin. Any data points outside this region add a penalty to the cost function. **Default**: 0.1
C	The weight for misclassification cost. The algorithm minimizes the regularization cost and the misclassification cost. **Default**: 1.0

Parameter name	Set to...
epsilon	Used to control accuracy. **Default**: 1e-3
max_iterations	The maximum number of iterations that the algorithm performs. **Default**: 100
intercept_mode	A string that specifies how to treat the intercept, one of the following • regularized (default): Fits the intercept and applies a regularization on it. • unregularized: Fits the intercept but does not include it in regularization.
intercept_ scaling	A FLOAT value, serves as the value of a dummy feature whose coefficient Vertica uses to calculate the model intercept. Because the dummy feature is not in the training data, its values are set to a constant, by default set to 1.

Model Attributes

Attribute	Description
coeff	Coefficients in the model: • colNames: Intercept, or predictor column name • coefficients: Coefficient value
nAccepted	Number of samples accepted for training from the data set
nRejected	Number of samples rejected when training
nIteration	Number of iterations used in training
callStr	SQL statement used to replicate the training

Examples

```
=> SELECT SVM_REGRESSOR('mySvmRegModel', 'faithful', 'eruptions', 'waiting'
                        USING PARAMETERS error_tolerance=0.1, max_iterations=100);
SVM_REGRESSOR
---------------------------------------------------------------
Finished in 5 iterations.
Accepted Rows: 272  Rejected Rows: 0
(1 row)
```

Transformation Functions

The machine learning API includes a set of UDx functions that transform the columns of each input row to one or more corresponding output columns. These transformations follow rules that are defined in models that were created earlier. For example, APPLY_SVD uses an SVD model to transform input data.

Unless otherwise indicated, these functions require the following privileges for non-superusers:

- USAGE privileges on the model
- SELECT privileges on the input relation

In general, given an invalid input row, the return value for these functions is NULL.

APPLY_INVERSE_PCA

Inverts the APPLY_PCA-generated transform back to the original coordinate system.

Syntax

```
APPLY_INVERSE_PCA ( input-columns
                    USING PARAMETERS model_name='model-name'
                                     [, exclude_columns='excluded-columns']
                                     [, key_columns='key-columns'] )
```

Arguments

input-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. The following requirements apply: • All columns must be a numeric data type. • Enclose the column name in double quotes if it contains special characters.

Parameter Settings

Parameter name	Set to...
model_name	Name of the model (case-insensitive).
exclude_columns	Comma-separated list of column names from *input-columns* to exclude from processing.
key_columns	Comma-separated list of column names from *input-columns* that identify its data rows. These columns are included in the output table.

Examples

The following example shows how to use the APPLY_INVERSE_PCA function. It shows the output for the first record.

```
=> SELECT PCA ('pcamodel',
'world','country,HDI,em1970,em1971,em1972,em1973,em1974,em1975,em1976,em1977,

APPLY_INVERSE_SVD

Transforms the data back to the original domain. This essentially computes the approximated version of the original data by multiplying three matrices: matrix U (input to this function), matrices S and V (stored in the model).

Syntax

```
APPLY_INVERSE_SVD ( 'input-columns'
                  USING PARAMETERS model_name='model-name'
                                   [, match_by_pos=match-by-position]
                                   [, exclude_columns='excluded-columns']
                                   [, key_columns='key-columns'] )
```

Arguments

input-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. The following requirements apply: • All columns must be a numeric data type. • Enclose the column name in double quotes if it contains special characters.

Parameter Settings

Parameter name	Set to...
model_name	Name of the model (case-insensitive).
match_by_pos	Boolean value that specifies how input columns are matched to model features: • false (default): Match by name. • true: Match by the position of columns in the input columns list.
exclude_columns	Comma-separated list of column names from *input-columns* to exclude from processing.
key_columns	Comma-separated list of column names from *input-columns* that identify its data rows. These columns are included in the output table.

Examples

```
=> SELECT SVD ('svdmodel', 'small_svd', 'x1,x2,x3,x4');
SVD
-------------------------------------------------------------
Finished in 1 iterations.
Accepted Rows: 8  Rejected Rows: 0
(1 row)

=> CREATE TABLE transform_svd AS SELECT
     APPLY_SVD (id, x1, x2, x3, x4 USING PARAMETERS model_name='svdmodel', exclude_columns='id', key_
```

```
columns='id')
     OVER () FROM small_svd;
CREATE TABLE

APPLY_KMEANS

Assigns each row of an input relation to a cluster center from an existing k-means model.

Syntax

```
APPLY_KMEANS ( input-columns
               USING PARAMETERS model_name='model-name'
                                [, match_by_pos=match-by-position] )
```

Arguments

input-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns.

Parameter Settings

Parameter name	Set to...
model_name	Name of the model (case-insensitive).
match_by_pos	Boolean value that specifies how input columns are matched to model features: • false (default): Match by name. • true: Match by the position of columns in the input columns list.

Privileges

Non-superusers: model owner, or USAGE privileges on the model

Examples

The following example creates k-means model myKmeansModel and applies it to input table iris1. The call to APPLY_KMEANS mixes column names and constants. When a constant is passed in place of a column name, the constant is substituted for the value of the column in all rows:

```
=> SELECT KMEANS('myKmeansModel', 'iris1', '*', 5
USING PARAMETERS max_iterations=20, output_view='myKmeansView', key_columns='id', exclude_
columns='Species, id');
           KMEANS
----------------------------
 Finished in 12 iterations

(1 row)
=> SELECT id, APPLY_KMEANS(Sepal_Length, 2.2, 1.3, Petal_Width
USING PARAMETERS model_name='myKmeansModel', match_by_pos='true') FROM iris2;
```

```
 id  | APPLY_KMEANS
-----+--------------
   5 |            1

APPLY_NORMALIZE

A UDTF function that applies the normalization parameters saved in a model to a set of specified input columns. If any column specified in the function is not in the model, its data passes through unchanged to APPLY_NORMALIZE.

Note: If a column contains only one distinct value, APPLY_NORMALIZE returns NaN for values in that column.

Syntax

```
APPLY_NORMALIZE ( input-columns
                  USING PARAMETERS model_name='model-name');
```

Arguments

input-columns	Comma-separated list of columns to use from the input relation, or

	asterisk (*) to select all columns. If you supply an asterisk, APPLY_NORMALIZE normalizes all columns in the model.

Parameter Settings

Parameter name	Set to...
model_name	Name of the model (case-insensitive).

Examples

The following example creates a model with NORMALIZE_FIT using the wt and hp columns in table mtcars , and then uses this model in successive calls to APPLY_NORMALIZE and REVERSE_NORMALIZE.

```
=> SELECT NORMALIZE_FIT('mtcars_normfit', 'mtcars', 'wt,hp', 'minmax');
NORMALIZE_FIT
---------------
Success
(1 row)
```

The following call to APPLY_NORMALIZE specifies the hp and cyl columns in table mtcars, where hp is in the normalization model and cyl is not in the normalization model:

```
=> CREATE TABLE mtcars_normalized AS SELECT APPLY_NORMALIZE (hp, cyl USING PARAMETERS model_name =
'mtcars_normfit') FROM mtcars;
CREATE TABLE
=> SELECT * FROM mtcars_normalized;
          hp        | cyl

APPLY_ONE_HOT_ENCODER

A user-defined transform function (UDTF) that loads the one hot encoder model and writes out a table that contains the encoded columns.

Syntax

```
APPLY_ONE_HOT_ENCODER( input-columns
                    USING PARAMETERS model_name='model-name'
                                     [, drop_first='is-first']
                                     [, ignore_null='ignore']
                                     [, separator='separator-character']
                                     [, column_naming='name-output']
                                     [, null_column_name='null-column-name'] )
```

Arguments

input-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns.

Parameter Settings

Parameter name	Set to...
model_name	Name of the model (case-insensitive). , stores the categories and their corresponding levels.
drop_first	Boolean value, one of the following: • true (default): Treat the first level of the categorical variable as the reference level. • false: Every level of the categorical variable has a corresponding column in the output view
ignore_null	Boolean value, one of the following: • true (default): Null values set all corresponding one-hot binary columns to null. • false: Null values in *input-columns* are treated as a categorical level
separator	The character that separates the input variable name and the indicator variable level in the output table.To avoid using any separator, set this parameter to null value. **Default**: Underscore (_)

Parameter name	Set to…
column_naming	Appends categorical levels to column names according to the specified method: • indices (default): Uses integer indices to represent categorical levels. • values/values_relaxed: Both methods use categorical level names. If duplicate column names occur, the function attempts to disambiguate them by appending _*n*, where *n* is a zero-based integer index (_0, _1,…). If the function cannot produce unique column names , it handles this according to the chosen method: • values returns an error. • values_relaxed reverts to using indices. **Important:** The following column naming rules apply if column_naming is set to values or values_relaxed: • Input column names with more than 128 characters are truncated. • Column names can contain special characters. • If parameter ignore_null is set to true, APPLY_ONE_HOT_ENCODER constructs the column name from the value set in parameter null_column_name. If this parameter is omitted, the string null is used.
null_column_name	The string used in naming the indicator column for null values, used only if ignore_null is set to false and column_naming is set to values or values_relaxed. **Default**: null

Note: If an input row contains a level not stored in the model, the output row columns corresponding to that categorical level are returned as null values.

Examples

```
=> SELECT APPLY_ONE_HOT_ENCODER(cyl USING PARAMETERS model_name='one_hot_encoder_model',
drop_first='true', ignore_null='false') FROM mtcars;
cyl | cyl_1 | cyl_2

APPLY_PCA

Transforms the data using a PCA model. This returns new coordinates of each data point.

Syntax

```
APPLY_PCA ( input-columns
                  USING PARAMETERS model_name='model-name'
                                   [, num_components=num-components]
                                   [, cutoff=cutoff-value]
                                   [, match_by_pos=match-by-position]
                                   [, exclude_columns='excluded-columns']
                                   [, key_columns='key-columns'] )
```

Arguments

input-columns	Comma-separated list of columns that contain the data matrix, or asterisk (*) to select all columns. The following requirements apply: • All columns must be a numeric data type. • Enclose the column name in double quotes if it contains special characters.

Parameter Settings

Parameter name	Set to…
model_name	Name of the model (case-insensitive).
num_components	The number of components to keep in the model. This is the number of output columns that will be generated. If you omit this parameter and the cutoff parameter, all model components are kept.
cutoff	Set to 1, specifies the minimum accumulated explained variance. Components are taken until the accumulated explained variance reaches this value.
match_by_pos	Boolean value that specifies how input columns are matched to model features: • false (default): Match by name. • true: Match by the position of columns in the input columns list.

Parameter name	Set to...
exclude_columns	Comma-separated list of column names from *input-columns* to exclude from processing.
key_columns	Comma-separated list of column names from *input-columns* that identify its data rows. These columns are included in the output table.

Examples

```

APPLY_SVD

Transforms the data using an SVD model. This computes the matrix U of the SVD decomposition.

Syntax

```
APPLY_SVD ( input-columns
                  USING PARAMETERS model_name='model-name'
                                   [, num_components=num-components]
                                   [, cutoff=cutoff-value]
                                   [, match_by_pos=match-by-position]
                                   [, exclude_columns='excluded-columns']
                                   [, key_columns='key-columns'] )
```

Arguments

input-columns	Comma-separated list of columns that contain the data matrix, or asterisk (*) to select all columns. The following requirements apply: • All columns must be a numeric data type. • Enclose the column name in double quotes if it contains special characters.

Parameter Settings

Parameter name	Set to...
model_name	Name of the model (case-insensitive).
num_components	The number of components to keep in the model. This is the number of output columns that will be generated. If neither this parameter nor the cutoff parameter is provided, all components from the model are kept.
cutoff	Set to 1, specifies the minimum accumulated explained variance. Components are taken until the accumulated explained variance reaches this value. If you omit this parameter and the num_components parameter, all model components are kept.

Parameter name	Set to...
match_by_pos	Boolean value that specifies how input columns are matched. • false (default): Match input columns to model columns by name. • true: Match input columns to model columns by the order in which they are listed.
exclude_columns	Comma-separated list of column names from *input-columns* to exclude from processing.
key_columns	Comma-separated list of column names from *input-columns* that identify its data rows. These columns are included in the output table.

Examples

```
=> SELECT SVD ('svdmodel', 'small_svd', 'x1,x2,x3,x4');

PREDICT_LINEAR_REG

Applies a linear regression model on an input relation and returns the predicted value as a FLOAT.

Syntax

```
PREDICT_LINEAR_REG ( input-columns
                     USING PARAMETERS model_name='model-name'
                                      [, match_by_pos=match-by-position] )
```

Arguments

input-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns.

Parameter Settings

Parameter name	Set to...
model_name	Name of the model (case-insensitive).

Parameter name	Set to…
`match_by_pos`	Boolean value that specifies how input columns are matched to model features: • `false` (default): Match by name. • `true`: Match by the position of columns in the input columns list.

Examples

```
=> SELECT PREDICT_LINEAR_REG(waiting USING PARAMETERS model_name='myLinearRegModel')FROM
faithful ORDER BY id;

 PREDICT_LINEAR_REG

.
 (272 rows)
```

PREDICT_LOGISTIC_REG

Applies a logistic regression model on an input relation.

Syntax

```
PREDICT_LOGISTIC_REG ( input-columns
                       USING PARAMETERS model_name='model-name'
                                        [, type='prediction-type']
                                        [, cutoff=probability-cutoff]
                                        [, match_by_pos=match-by-position] )
```

Arguments

input-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns.

Parameter Settings

Parameter name	Set to...
model_name	Name of the model (case-insensitive).
type	Type of prediction for logistic regression, one of the following: • response (default): Predicted values are 0 or 1. • probability: Output is the probability of the predicted category to be 1.
cutoff	Used in conjunction with the type parameter, a FLOAT between 0 and 1, exclusive. When type is set to response, the returned value of prediction is 1 if its corresponding probability is greater than or equal to the value of cutoff; otherwise, it is 0. **Default**: 0.5
match_by_pos	Boolean value that specifies how input columns are matched to model features: • false (default): Match by name.

Parameter name	Set to...
	• `true`: Match by the position of columns in the input columns list.

Returns

Returns as a FLOAT the predicted class or the probability of the predicted class, depending on how the `type` parameter is set. You can cast the return value to INTEGER or another numeric type when the return is in the probability of the predicted class.

Examples

```
=> SELECT car_model,
            PREDICT_LOGISTIC_REG(mpg, cyl, disp, drat, wt, qsec, vs, gear, carb
                                 USING PARAMETERS model_name='myLogisticRegModel')
          FROM mtcars;
      car_model      | PREDICT_LOGISTIC_REG
---------------------+----------------------
 Camaro Z28          |                    0

 Maserati Bora       |                    1
 Mazda RX4           |                    1
 Mazda RX4 Wag       |                    1
 Merc 240D           |                    0
 Volvo 142E          |                    1
```

```
(32 rows)
```

The following example shows how to use PREDICT_LOGISTIC_REG on an input table, using the match_by_pos parameter. Note that you can replace any of the column inputs with a constant that does not match an input column. In this example, column mpg was replaced with the constant 20:

```
=> SELECT car_model,
            PREDICT_LOGISTIC_REG(20, cyl, disp, drat, wt, qsec, vs, gear, carb
                                 USING PARAMETERS model_name='myLogisticRegModel', match_by_
pos='true')
           FROM mtcars;
      car_model     | PREDICT_LOGISTIC_REG
--------------------+----------------------
AMC Javelin         |                    0
Cadillac Fleetwood  |                    0
Camaro Z28          |                    0
Chrysler Imperial   |                    0
Datsun 710          |                    1
Dodge Challenger    |                    0
Duster 360          |                    0
Ferrari Dino        |                    1
Fiat 128            |                    1
Fiat X1-9           |                    1
Ford Pantera L      |                    1
Honda Civic         |                    1
Hornet 4 Drive      |                    0
Hornet Sportabout   |                    0
Lincoln Continental |                    0

PREDICT_NAIVE_BAYES

Applies a Naive Bayes model on an input relation.

Syntax

```
PREDICT_NAIVE_BAYES ( input-columns
                      USING PARAMETERS model_name='model-name'
                                       [, type=' return-type ']
                                       [, class='user-input-class']
                                       [, match_by_pos=match-by-position] )
```

Arguments

input-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns.

Parameter Settings

Parameter name	Set to...
model_name	Name of the model (case-insensitive).
type	One of the following: • response (default): Returns the class with the highest probability. • probability: Valid only if class parameter is set, returns the probability of belonging to the specified class argument.
class	Required if type parameter is set to probability. If you omit this parameter, PREDICT_NAIVE_BAYES returns the class that it predicts as having the highest probability.
match_by_pos	Boolean value that specifies how input columns are matched to model features: • false (default): Match by name. • true: Match by the position of columns in the input columns list.

Returns

Depending on how the `type` parameter is set, a VARCHAR that specifies either the predicted class or probability of the predicted class. If the function returns probability, you can cast the return value to an INTEGER or another numeric data type.

Examples

```
=> SELECT party, PREDICT_NAIVE_BAYES (vote1, vote2, vote3
                                      USING PARAMETERS model_name='naive_house84_model',
                                                       type='response')
                                      AS Predicted_Party
                                      FROM house84_test;

PREDICT_NAIVE_BAYES_CLASSES

Applies a Naive Bayes model on an input relation and returns the probabilities of classes.

Syntax

```
PREDICT_NAIVE_BAYES_CLASSES ( predictor-columns
               USING PARAMETERS model_name='model-name'
                                [, key_columns='key-columns']
                                [, exclude_columns='excluded-columns]
                                [, classes='classes']
                                [, match_by_pos=match-by-position] )
                OVER( [window-partition-clause] )
```

Arguments

predictor-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns.

Parameter Settings

Parameter name	Set to...
model_name	Name of the model (case-insensitive).
key_columns	Comma-separated list of predictor column names that identify the output rows. To exclude these and other predictor columns from being used for prediction, include them in the argument list for parameter exclude_columns.
exclude_columns	Comma-separated list of columns from *predictor-columns* to exclude from processing.
classes	Comma-separated list of class labels in the model. The probability of belonging to this given class as predicted by the classifier. The values are case sensitive.
match_by_pos	Boolean value that specifies how predictor columns are matched to model features: • false (default): Match by name. • true: Match by the position of columns in the predictor columns list.

Returns

- VARCHAR `predicted` column contains the class label with the highest probability.
- Multiple FLOAT columns, where the first `probability` column contains the probability for the class specified in the predicted column. Other columns contain the probability of belonging to each class specified in the `classes` parameter.

Examples

```
=> SELECT PREDICT_NAIVE_BAYES_CLASSES (id, vote1, vote2 USING PARAMETERS
model_name='naive_house84_model',key_columns='id',exclude_columns='id',
classes='democrat, republican', match_by_pos='false')
        OVER() FROM house84_test;

PREDICT_RF_CLASSIFIER_CLASSES

Applies a random forest model on an input relation and returns the probabilities of classes. The predicted class is selected only based on the popular vote of the decision trees in the forest. Therefore, in special cases the calculated probability of the predicted class may not be the highest.

Syntax

```
PREDICT_RF_CLASSIFIER_CLASSES ( predictor-columns
                  USING PARAMETERS model_name='model-name'
                                  [, key_columns='key-columns'']
                                  [, exclude_columns='excluded-columns']
                                  [, classes='classes']
                                  [, match_by_pos=match-by-position] )
                   OVER( [window-partition-clause] )
```

Arguments

predictor-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns.

Parameter Settings

Parameter name	Set to...
model_name	Name of the model (case-insensitive).
key_columns	Comma-separated list of predictor column names that identify the output rows. To exclude these and other predictor columns from being used for prediction, include them in the argument list for parameter exclude_columns.
exclude_columns	Comma-separated list of columns from *predictor-columns* to exclude from processing.
classes	Comma-separated list of class labels in the model. The probability of belonging to this given class is predicted by the classifier. Values are case sensitive.
match_by_pos	Boolean value that specifies how predictor columns are matched to model features: • false (default): Match by name. • true: Match by the position of columns in the predictor columns list.

Returns

- VARCHAR `predicted` column contains the class label with the highest vote (popular vote).
- Multiple FLOAT columns, where the first `probability` column contains the probability for the class reported in the predicted column. Other columns contain the probability of each class specified in the `classes` parameter.
- Key columns with the same value and data type as matching input columns specified in parameter `key_columns`.

Examples

```
=> SELECT PREDICT_RF_CLASSIFIER_CLASSES(Sepal_Length, Sepal_Width, Petal_Length, Petal_Width
                              USING PARAMETERS model_name='myRFModel') OVER () FROM iris;
predicted  |    probability
-----------+-------------------
setosa     |                1
setosa     |             0.99
setosa     |                1
setosa     |                1
setosa     |                1
setosa     |             0.97
setosa     |                1
setosa     |                1
setosa     |                1
setosa     |                1
setosa     |             0.99
…
(150 rows)
```

This example shows how to use function `PREDICT_RF_CLASSIFIER_CLASSES`, using the `match_by_pos` parameter:

```
=> SELECT PREDICT_RF_CLASSIFIER_CLASSES(Sepal_Length, Sepal_Width, Petal_Length, Petal_Width
                          USING PARAMETERS model_name='myRFModel', match_by_pos='true') OVER () FROM
iris;
predicted  |    probability
-----------+-------------------
setosa     |                1
setosa     |                1
setosa     |                1
setosa     |                1
setosa     |                1
setosa     |                1
setosa     |                1
setosa     |                1
setosa     |                1
setosa     |                1
setosa     |                1
```

```
…
(150 rows)s
```

PREDICT_PMML

Applies an imported PMML model on an input relation.

Syntax

```
PREDICT_PMML ( input-columns
                     USING PARAMETERS model_name='model-name'
                                      [, match_by_pos=match_by_position])
```

Arguments

input-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns.

Parameters

Parameter	Description
model_name	Name of the model (case-insensitive). The function supports PMML models that encode the following model types: • K-means • Linear regression • Logistic regression
match_by_	Boolean value that specifies how input columns are matched to model

`position`	features: • `false` (default): Match by name. • `true`: Match by the position of columns in the input columns list.

Returns

The function returns the result that would be expected for the model type encoded in the PMML model.

Examples

In this example, the function call uses all the columns from the table as predictors and predicts the value using the '`my_kmeans`' model in PMML format:

```
SELECT PREDICT_PMML(* USING PARAMETERS model_name='my_kmeans') AS predicted_label FROM table;
```

In this example, the function call takes only columns `col1, col2` as predictors, and predicts the value for each row using the '`my_kmeans`' model from schema '`my_schema`':

```
SELECT PREDICT_PMML(col1, col2 USING PARAMETERS model_name='my_schema.my_kmeans') AS predicted_label
FROM table;
```

In this example, the function call returns an error as neither *`schema`* nor *`model-name`* can accept * as a value:

```
SELECT PREDICT_PMML(* USING PARAMETERS model_name='*.*') AS predicted_label FROM table;
SELECT PREDICT_PMML(* USING PARAMETERS model_name='*') AS predicted_label FROM table;
SELECT PREDICT_PMML(* USING PARAMETERS model_name='models.*') AS predicted_label FROM table;
```

See Also

- IMPORT_MODELS
- EXPORT_MODELS

PREDICT_RF_CLASSIFIER

Applies a random forest model on an input relation. The predicted class is selected only based on the popular vote of the decision trees in the forest. Therefore, in special cases the calculated probability of the predicted class may not be the highest.

Syntax

```
PREDICT_RF_CLASSIFIER ( input-columns
                      USING PARAMETERS model_name='model-name'
                                      [, type='prediction-type']
                                      [, class='user-input-class']
                                      [, match_by_pos=match-by-position] )
```

Arguments

input-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns.

Parameter Settings

Parameter name	Set to…
model_name	Name of the model (case-insensitive).
type	Type of prediction to return, one of the following: • response (default): The class with the highest probability among all possible classes. • probability: Valid only if the class parameter is set, returns the probability of the specified class.
class	Class to use when the type parameter is set to probability. If you omit this parameter, the function uses the predicted class—the one with popular vote. Thus, the predict function returns the probability that the input instance belongs to its predicted class. **Default**: Auto

Parameter name	Set to...
match_by_pos	Boolean value that specifies how input columns are matched to model features: • false (default): Match by name. • true: Match by the position of columns in the input columns list.

Returns

VARCHAR data type that specifies one of the following, as determined by how the type parameter is set:

- The predicted class (based on popular votes)
- Probability of a class for each input instance.

Examples

```
=> SELECT PREDICT_RF_CLASSIFIER (Sepal_Length, Sepal_Width, Petal_Length, Petal_Width
                                 USING PARAMETERS model_name='myRFModel') FROM iris;
PREDICT_RF_CLASSIFIER
----------------------
setosa
setosa
setosa
…
versicolor
versicolor
versicolor
…
virginica
virginica
virginica
…
(150 rows)
```

This example shows how you can use the PREDICT_RF_CLASSIFIER function, using the match_by_pos parameter:

```
=> SELECT PREDICT_RF_CLASSIFIER (Sepal_Length, Sepal_Width, Petal_Length, Petal_Width
                                USING PARAMETERS model_name='myRFModel', match_by_pos='true') FROM
iris;
PREDICT_RF_CLASSIFIER
----------------------

PREDICT_RF_REGRESSOR

Applies a random forest model on an input relation.

Syntax

```
PREDICT_RF_REGRESSOR ( input-columns
                       USING PARAMETERS model_name='model-name'
                                        [, match_by_pos=match-by-position] )
```

Arguments

input-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns.

Parameter Settings

Parameter name	Set to…
model_name	Name of the model (case-insensitive).

Parameter name	Set to...
`match_by_pos`	Boolean value that specifies how input columns are matched to model features: • `false` (default): Match by name. • `true`: Match by the position of columns in the input columns list.

Returns

A FLOAT data type that specifies the predicted value of the random forest model—the average of the prediction of the trees in the forest.

Examples

```
=> SELECT PREDICT_RF_REGRESSOR (mpg,cyl,hp,drat,wt
USING PARAMETERS model_name='myRFRegressorModel')FROM mtcars;

PREDICT_SVM_CLASSIFIER

Uses an SVM model to predict class labels for samples in an input relation, and returns the predicted value as a FLOAT data type.

Syntax

```
PREDICT_SVM_CLASSIFIER (input-columns
             USING PARAMETERS model_name='model-name'
                              [, match_by_pos=match-by-position]
                              [, type='return-type']
                              [, cutoff='cutoff-value'] ] )
```

Arguments

input-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns.

Parameter Settings

Parameter name	Set to...
model_name	Name of the model (case-insensitive).
match_by_pos	Boolean value that specifies how input columns are matched to model features:

Parameter name	Set to...
	• `false` (default): Match by name. • `true`: Match by the position of columns in the input columns list.
`type`	A string that specifies the output to return for each input row, one of the following: • `response`: Outputs the predicted class of 0 or 1. • `probability`: Outputs a value in the range (0,1), the prediction score transformed using the logistic function.
`cutoff`	Valid only if the `type` parameter is set to `probability`, a FLOAT value that is compared to the transformed prediction score to determine the predicted class. **Default**: 0

Examples

```
=> SELECT PREDICT_SVM_CLASSIFIER (mpg,cyl,disp,wt,qsec,vs,gear,carb
USING PARAMETERS model_name='mySvmClassModel') FROM mtcars;
PREDICT_SVM_CLASSIFIER

PREDICT_SVM_REGRESSOR

Use an SVM model to perform regression on samples in an input relation, and returns the predicted value as a FLOAT data type.

Syntax

```
PREDICT_SVM_REGRESSOR(input-columns
            USING PARAMETERS model_name='model-name'
                             [, match_by_pos=match-by-position] )
```

Arguments

input-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns.

Parameter Settings

Parameter name	Set to...
model_name	Name of the model (case-insensitive).
match_by_pos	Boolean value that specifies how input columns are matched to model features: • false (default): Match by name. • true: Match by the position of columns in the input columns list.

Examples

```
=> SELECT PREDICT_SVM_REGRESSOR(waiting USING PARAMETERS model_name='mySvmRegModel')
           FROM faithful ORDER BY id;
 PREDICT_SVM_REGRESSOR
--------------------
   4.06488248694445

PREDICT_TENSORFLOW

Applies a TensorFlow model on an input relation.

Syntax

```
PREDICT_TENSORFLOW ( input-columns
                  USING PARAMETERS model_name='model-name',
                                   [, num_passthru_cols='n-first-columns-to-ignore''] )
                  OVER( [window-partition-clause] ) FROM 'table'
```

Arguments

input-columns	Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns.

Parameter Settings

Parameter name	Set to...
model_name	Name of the model (case-insensitive).
num_passthru_cols	Number of input columns to skip. Integer. The PREDICT_TENSORFLOW function is different from the other predict functions in that it does not accept any parameters that affect the input columns such as "exclude_columns" or "id_column". The function will therefore always predict on all the input columns provided, but does accept a num_passthru_cols parameter which allows the user to "skip" some number of input columns.
window-partition-clause	Clause that groups input rows before the function processes them. Specify PARTITION BEST to cause Vertica to use parallelism to improve performance across multiple nodes. For additional information, see Window Partitioning.
table	Name of the table in Vertica from which to read the input data.

Returns

The function returns the result that would be expected for the model type encoded in the TensorFlow model.

Examples

This example shows how you can use PREDICT_TENSORFLOW with num_passthru_cols to skip some input columns.

```
select PREDICT_TENSORFLOW ( pid,label,x1,x2
                  USING PARAMETERS model_name='spiral_demo', num_passthru_cols=2)
                  OVER(PARTITION BEST) as predicted_class FROM points;

--example output, the skipped columns are displayed as the first columns of the output
  pid  | label |         col0         |         col1
-------+-------+----------------------+----------------------
     0 |     0 |    0.990638732910156 |  0.00936129689216614
     1 |     0 |    0.999036073684692 | 0.000963933940511197
     2 |     1 |   0.0103802494704723 | 0.989619791507721
```

- PREDICT_NAIVE_BAYES_CLASSES

REVERSE_NORMALIZE

Reverses the normalization transformation on normalized data, thereby de-normalizing the normalized data. If you specify a column that is not in the specified model, REVERSE_NORMALIZE returns that column unchanged.

Syntax

```
REVERSE_NORMALIZE ( input-columns
                  USING PARAMETERS model_name='model-name');
```

Arguments

input-columns	The columns to use from the input relation, or asterisk (*) to select all columns.

Parameter Settings

Parameter name	Set to...
model_name	Name of the model (case-insensitive).

Examples

Use REVERSE_NORMALIZE on the hp and cyl columns in table mtcars, where hp is in normalization model mtcars_normfit, and cyl is not in the normalization model.

```
=> SELECT REVERSE_NORMALIZE (hp, cyl USING PARAMETERS model_name='mtcars_normfit') FROM mtcars;
hp    | cyl

Model Evaluation

A set of Vertica machine learning functions evaluate the prediction data that is generated by trained models, or return information about the models themselves.

CONFUSION_MATRIX

Computes the confusion matrix of a table with observed and predicted values of a response variable. CONFUSION_MATRIX produces a table with the following dimensions:

- Rows: Number of classes
- Columns: Number of classes + 2

Syntax

```
CONFUSION_MATRIX ( targets, predictions
                   [ USING PARAMETERS num_classes=num-classes ] )
                 OVER()
```

Arguments

targets	An input column that contains the true values of the response variable.
predictions	An input column that contains the predicted class labels.

Arguments *targets* and *predictions* must be set to input columns of the same data type, one of the following: INTEGER, BOOLEAN, or CHAR/VARCHAR. Depending on their data type, these columns identify classes as follows:

- INTEGER: Zero-based consecutive integers between 0 and (*num-classes*-1) inclusive, where *num-classes* is the number of classes. For example, given the following input column values— `{0, 1, 2, 3, 4}`—Vertica assumes five classes.

  Note:
  If input column values are not consecutive, Vertica interpolates the missing values. Thus, given the following input values— `{0, 1, 3, 5, 6,}`— Vertica assumes seven classes.

- BOOLEAN: Yes or No
- CHAR/VARCHAR: Class names. If the input columns are of type CHAR/VARCHAR columns, you must also set parameter `num_classes` to the number of classes.

  Note:
  Vertica computes the number of classes as the union of values in both input columns. For example, given the following sets of values in the *targets* and *predictions* input columns, Vertica counts four classes:

  ```
  {'milk', 'soy milk', 'cream'}
  {'soy milk', 'almond milk'}
  ```

Parameter Settings

Parameter name	Set to...
num_classes	An integer > 1, specifies the number of classes to pass to the function.

Parameter name	Set to…
	You must set this parameter if the specified input columns are of type CHAR/VARCHAR. Otherwise, the function processes this parameter according to the column data types: • INTEGER: By default set to 2, you must set this parameter correctly if the number of classes is any other value. • BOOLEAN: By default set to 2, cannot be set to any other value.

Examples

This example computes the confusion matrix for a logistic regression model that classifies cars in the `mtcars` data set as automatic or manual transmission. Observed values are in input column `obs`, while predicted values are in input column `pred`. Because this is a binary classification problem, all values are either 0 or 1.

In the table returned, all 19 cars with a value of 0 in column `am` are correctly predicted by `PREDICT_LOGISTIC_REGRESSION` as having a value of 0. Of the 13 cars with a value of 1 in column `am`, 12 are correctly predicted to have a value of 1, while 1 car is incorrectly classified as having a value of 0:

```
=> SELECT CONFUSION_MATRIX(obs::int, pred::int USING PARAMETERS num_classes=2) OVER()
       FROM (SELECT am AS obs, PREDICT_LOGISTIC_REG(mpg, cyl, disp,drat, wt, qsec, vs, gear, carb
             USING PARAMETERS model_name='myLogisticRegModel')AS PRED
             FROM mtcars) AS prediction_output;

actual_class | predicted_0 | predicted_1 |        comment
-------------+-------------+-------------+----------------------------------------
0            |          19 |           0 |
1            |           0 |          13 | Of 32 rows, 32 were used and 0 were ignored
(2 rows)
```

CROSS_VALIDATE

Performs k-fold cross validation on a learning algorithm using an input relation, and grid search for hyper parameters. The output is an average performance indicator of the selected algorithm. This function supports SVM classification, naive bayes, and logistic regression.

Syntax

```
CROSS_VALIDATE ( 'algorithm', 'input-relation', 'response-column', 'predictor-columns'
             [ USING PARAMETERS [exclude_columns='excluded-columns']
                                [, cv_model_name='model']
                                [, cv_metrics='metrics']
                                [, cv_fold_count=num-folds]
                                [, cv_hyperparams='hyperparams']
                                [, cv_prediction_cutoff=prediction-cutoff] ] )
```

Arguments

algorithm	Name of the algorithm training function, one of the following: • LINEAR_REG • LOGISTIC_REG • NAIVE_BAYES • SVM_CLASSIFIER • SVM_REGRESSOR
input-relation	The table or view that contains data used for training and testing. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_SCHEMA to sync the hcatalog schema, and then run the machine learning function.
response-column	Name of the input column that contains the response.
predictor-columns	Comma-separated list of columns in the input relation that represent independent variables for the model, or asterisk (*) to select all columns. If you select all columns, the argument list for parameter exclude_columns must include *response-column*, and any columns that are invalid as predictor columns.

Parameter Settings

Parameter name	Set to...
exclude_columns	Comma-separated list of columns from *predictor-columns* to exclude from processing.

Parameter name	Set to…
cv_model_name	The name of a model that lets you retrieve results of the cross validation process. If you omit this parameter, results are displayed but not saved. If you set this parameter to a model name, you can retrieve the results with summary functions GET_MODEL_ATTRIBUTE and GET_MODEL_SUMMARY
cv_metrics	The metrics used to assess the algorithm, specified either as a comma-separated list of metric names or in a JSON array. In both cases, you specify one or more of the following metric names: • accuracy (default) • error_rate • TP: True positive, the number of cases of class 1 predicted as class 1 • FP: False positive, the number of cases of class 0 predicted as class 1 • TN: True negative, the number of cases of class 0 predicted as class 0 • FN: False negative, the number of cases of class 1 predicted as class 0 • TPR or recall: True positive rate, the correct predictions among class 1 • FPR: False positive rate, the wrong predictions among class 0 • TNR: True negative rate, the correct predictions among class 0 • FNR: False negative rate, the wrong predictions among class 1 • PPV or precision: The positive predictive value, the correct predictions among cases predicted as class 1 • NPV: Negative predictive value, the correct predictions among cases predicted as class 0 • MSE: Mean squared error

Parameter name	Set to…

	$$\mathrm{MSE}(y, \hat{y}) = \frac{1}{n_{\text{samples}}} \sum_{i=0}^{n_{\text{samples}}-1} (y_i - \hat{y}_i)^2.$$
	• MAE: Mean absolute error
	$$\mathrm{MAE}(y, \hat{y}) = \frac{1}{n_{\text{samples}}} \sum_{i=0}^{n_{\text{samples}}-1} \left|y_i - \hat{y}_i\right|.$$
	• rsquared: coefficient of determination
	$$R^2(y, \hat{y}) = 1 - \frac{\sum_{i=0}^{n_{\text{samples}}-1} (y_i - \hat{y}_i)^2}{\sum_{i=0}^{n_{\text{samples}}-1} (y_i - \bar{y})^2}$$
	• explained_variance
	$$\texttt{explained\_variance}\ (y, \hat{y}) = 1 - \frac{Var\{y - \hat{y}\}}{Var\{y\}}$$
	• fscore
	`(1 + beta^2) * precison * recall / (beta^2 * precision + recall)`
	beta equals 1 by default
	• auc_roc: AUC of ROC using the specified number of bins, by default 100
	• auc_prc: AUC of PRC using the specified number of bins, by default 100
	• counts: Shortcut that resolves to four other metrics: TP, FP, TN, and FN
	• count: Valid only in JSON syntax, counts the number of cases labeled by one class (*case-class-label*) but predicted as another class (*predicted-class-label*):
	`cv_metrics='[{"count":[case-class-label, predicted-class-label]}]'`

cv_fold_count	The number of folds to split the data. **Default**: 5
cv_hyperparam	A JSON string that describes the combination of parameters for use in grid search of hyper parameters. The JSON string contains pairs of the

Parameter name	Set to...
s	hyper parameter name. The value of each hyper parameter can be specified as an array or sequence. For example: `{"param1":[value1,value2,…], "param2":{"first":first_value, "step":step_size, "count":number_of_values} }` Hyper parameter names and string values should be quoted using the JSON standard. These parameters are passed to the training function.
cv_prediction_cutoff	The cutoff threshold that is passed to the prediction stage of logistic regression, a FLOAT between 0 and 1, exclusive **Default**: 0.5

Model Attributes

Attribute	Description
call_string	The value of all input arguments that were specified at the time CROSS_VALIDATE was called.
run_average	The average across all folds of all metrics specified in parameter cv_metrics, if specified; otherwise, average accuracy.
fold_info	The number of rows in each fold: • fold_id: The index of the fold. • row_count: The number of rows held out for testing in the fold.
counters	All counters for the function, including: • accepted_row_count: The total number of rows in the input_relation, minus the number of rejected rows. • rejected_row_count: The number of rows of the input_relation that were skipped because they contained an invalid value. • feature_count: The number of features input to the machine learning model.
run_	Information about each run, where a run means training a single model,

Attribute	Description
details	and then testing that model on the one held-out fold: • fold_id: The index of the fold held out for testing. • iteration_count: The number of iterations used in model training on non-held-out folds. • accuracy: All metrics specified in parameter cv_metrics, or accuracy if cv_metrics is not provided. • error_rate: All metrics specified in parameter cv_metrics, or accuracy if the parameter is omitted.

Privileges

Non-superusers:

- SELECT privileges on the input relation
- CREATE and USAGE privileges on the default schema where machine learning algorithms generate models. If cv_model_name is provided, the cross validation results are saved as a model in the same schema.

Specifying Metrics in JSON

Parameter cv_metrics can specify metrics as an array of JSON objects, where each object specifies a metric name . For example, the following expression sets cv_metrics to two metrics specified as JSON objects, accuracy and error_rate:

```
cv_metrics='["accuracy", "error_rate"]'
```

In the next example, cv_metrics is set to two metrics, accuracy and TPR (true positive rate). Here, the TPR metric is specified as a JSON object that takes an array of two class label arguments, 2 and 3:

```
cv_metrics='[ "accuracy", {"TPR":[2,3] } ]'
```

Metrics specified as JSON objects can accept parameters. In the following example, the fscore metric specifies parameter beta, which is set to 0.5:

```
cv_metrics='[ {"fscore":{"beta":0.5} } ]'
```

Parameter support can be especially useful for certain metrics. For example, metrics auc_roc and auc_prc build a curve, and then compute the area under that curve. For ROC, the curve is formed by plotting metrics TPR against FPR; for PRC, PPV (precision) against TPR (recall). The accuracy of such curves can be increased by setting parameter num_

bins to a value greater than the default value of 100. For example, the following expression computes AUC for an ROC curve built with 1000 bins:

```
cv_metrics='[{"auc_roc":{"num_bins":1000}}]'
```

Using Metrics with Multi-class Classifier Functions

All supported metrics are defined for binary classifier functions LOGISTIC_REG and SVM_CLASSIFIER. For multi-class classifier functions such as NAIVE_BAYES, these metrics can be calculated for each *one-versus-the-rest* binary classifier. Use arguments to request the metrics for each classifier. For example, if training data has integer class labels, you can set cv_metrics with the precision (PPV) metric as follows:

```
cv_metrics='[{"precision":[0,4]}]'
```

This setting specifies to return two columns with precision computed for two classifiers:

- Column 1: classifies 0 versus not 0
- Collumn 2: classifies 4 versus not 4

If you omit class label arguments, the class with index 1 is used. Instead of computing metrics for individual *one-versus-the-rest* classifiers, the average is computed in one of the following styles: macro, micro, or weighted (default). For example, the following cv_metrics setting returns the average weighted by class sizes:

```
cv_metrics='[{"precision":{"avg":"weighted"}}]'
```

AUC-type metrics can be similarly defined for multi-class classifiers. For example, the following cv_metrics setting computes the area under the ROC curve for each *one-versus-the-rest* classifier, and then returns the average weighted by class sizes.

```
cv_metrics='[{"auc_roc":{"avg":"weighted", "num_bins":1000}}]'
```

Examples

```
=> SELECT CROSS_VALIDATE('svm_classifier', 'mtcars', 'am', 'mpg'
      USING PARAMETERS cv_fold_count= 6,
                       cv_hyperparams='{"C":[1,5]}',
                       cv_model_name='cv_svm',
                       cv_metrics='accuracy, error_rate');
         CROSS_VALIDATE
----------------------------
 Finished

===========
```

```
run_average
===========
C  |accuracy      |error_rate
---+--------------+----------
1 | 0.75556       |  0.24444
5 | 0.78333       |  0.21667
(1 row)
```

ERROR_RATE

Using an input table, returns a table that calculates the rate of incorrect classifications and displays them as FLOAT values. ERROR_RATE returns a table with the following dimensions:

- Rows: Number of classes plus one row that contains the total error rate across classes
- Columns: 2

Syntax

```
ERROR_RATE ( targets, predictions
             [ USING PARAMETERS num_classes=num-classes ] )
           OVER()
```

Arguments

targets	An input column that contains the true values of the response variable.
predictions	An input column that contains the predicted class labels.

Arguments *targets* and *predictions* must be set to input columns of the same data type, one of the following: INTEGER, BOOLEAN, or CHAR/VARCHAR. Depending on their data type, these columns identify classes as follows:

- INTEGER: Zero-based consecutive integers between 0 and (*num-classes*-1) inclusive, where *num-classes* is the number of classes. For example, given the following input column values— {0, 1, 2, 3, 4}—Vertica assumes five classes.

  Note:
  If input column values are not consecutive, Vertica interpolates the missing values. Thus, given the following input values— {0, 1, 3, 5, 6,}— Vertica assumes seven classes.

- BOOLEAN: Yes or No
- CHAR/VARCHAR: Class names. If the input columns are of type CHAR/VARCHAR columns, you must also set parameter `num_classes` to the number of classes.

Note:
Vertica computes the number of classes as the union of values in both input columns. For example, given the following sets of values in the *`targets`* and *`predictions`* input columns, Vertica counts four classes:

```
{'milk', 'soy milk', 'cream'}
{'soy milk', 'almond milk'}
```

Parameter Settings

Parameter name	Set to...
`num_classes`	An integer > 1, specifies the number of classes to pass to the function. You must set this parameter if the specified input columns are of type CHAR/VARCHAR. Otherwise, the function processes this parameter according to the column data types: • INTEGER: By default set to 2, you must set this parameter correctly if the number of classes is any other value. • BOOLEAN: By default set to 2, cannot be set to any other value.

Privileges

Non-superusers: model owner, or USAGE privileges on the model

Examples

This example shows how to execute the ERROR_RATE function on an input table named `mtcars`. The response variables appear in the column `obs`, while the prediction variables appear in the column `pred`. Because this example is a classification problem, all response variable values and prediction variable values are either 0 or 1, indicating binary classification.

In the table returned by the function, the first column displays the class id column. The second column displays the corresponding error rate for the class id. The third column indicates how many rows were successfully used by the function and whether any rows were ignored.

```
=> SELECT ERROR_RATE(obs::int, pred::int USING PARAMETERS num_classes=2) OVER()
       FROM (SELECT am AS obs, PREDICT_LOGISTIC_REG (mpg, cyl, disp, drat, wt, qsec, vs, gear, carb
                USING PARAMETERS model_name='myLogisticRegModel', type='response') AS pred
             FROM mtcars) AS prediction_output;
 class |     error_rate     |                   comment
-------+--------------------+---------------------------------------------
     0 |                  0 |
     1 | 0.0769230797886848 |
       |            0.03125 | Of 32 rows, 32 were used and 0 were ignored
(3 rows)
```

LIFT_TABLE

Returns a table that compares the predictive quality of a machine learning model. This function is also known as a *lift chart*.

Syntax

```
LIFT_TABLE ( targets, probabilities
             [ USING PARAMETERS [num_bins=num-bins]
                                [, main_class=class-name ] ] )
          OVER()
```

Arguments

targets	An input column that contains the true values of the response variable, one of the following data types: INTEGER, BOOLEAN, or CHAR/VARCHAR. Depending on the column data type, the function processes column data as follows: • INTEGER: Uses the input column as containing the true value of the response variable. • BOOLEAN: Resolves Yes to 1, 0 to No. • CHAR/VARCHAR: Resolves the value specified by parameter `main_class` to 1, all other values to 0. **Note:** If the input column is of data type INTEGER or BOOLEAN,

	the function ignores parameter `main_class`.
probabilities	A FLOAT input column that contains the predicted probability of response being the main class, set to 1 if *targets* is of type INTEGER.

Parameter Settings

Parameter name	Set to...
num_bins	An integer value that determines the number of decision boundaries. Decision boundaries are set at equally spaced intervals between 0 and 1, inclusive. The function computes the table at each *num-bin* + 1 point. **Default**: 100
main_class	Used only if *target* is of type CHAR/VARCHAR, specifies the class to associate with the *probabilities* argument.

Examples

Execute LIFT_TABLE on an input table mtcars.

```
=> SELECT LIFT_TABLE(obs::int, prob::float USING PARAMETERS num_bins=2) OVER()
       FROM (SELECT am AS obs, PREDICT_LOGISTIC_REG(mpg, cyl, disp, drat, wt, qsec, vs, gear, carb
                                                    USING PARAMETERS model_name='myLogisticRegModel',
                                                    type='probability') AS prob
             FROM mtcars) AS prediction_output;
 decision_boundary | positive_prediction_ratio |       lift       |                   comment
-------------------+---------------------------+------------------+-----------------------------------
-----------
                 1 |                         0 |              NaN |
               0.5 |                   0.40625 | 2.46153846153846 |
                 0 |                         1 |                1 | Of 32 rows, 32 were used and 0
were ignored
(3 rows)
```

The first column, decision_boundary, indicates the cut-off point for whether to classify a response as 0 or 1. For instance, for each row, if prob is greater than or equal to decision_boundary, the response is classified as 1. If prob is less than decision_boundary, the response is classified as 0.

The second column, positive_prediction_ratio, shows the percentage of samples in class 1 that the function classified correctly using the corresponding decision_boundary value.

For the third column, lift, the function divides the positive_prediction_ratio by the percentage of rows correctly or incorrectly classified as class 1.

MSE

Returns a table that displays the mean squared error of the prediction and response columns in a machine learning model.

Syntax

```
MSE ( targets, predictions)
     OVER()
```

Arguments

targets	The model response variable, of type FLOAT.
predictions	A FLOAT input column that contains predicted values for the response variable.

Examples

Execute the MSE function on input table faithful_testing. The response variables appear in the column obs, while the prediction variables appear in the column prediction.

```
=> SELECT MSE(obs, prediction) OVER()
   FROM (SELECT eruptions AS obs,
                PREDICT_LINEAR_REG (waiting USING PARAMETERS model_name='myLinearRegModel') AS
prediction
         FROM faithful_testing) AS prediction_output;
        mse        |                   Comments
-------------------+-----------------------------------------------
 0.252925741352641 | Of 110 rows, 110 were used and 0 were ignored
(1 row)
```

PRC

Returns a table that displays the points on a receiver precision recall (PR) curve.

Syntax

```
PRC ( targets, probabilities
      [ USING PARAMETERS [num_bins=num-bins]
                         [, f1_score=return-score ]
                         [, main_class=class-name ] )
      OVER()
```

Arguments

targets	An input column that contains the true values of the response variable, one of the following data types: INTEGER, BOOLEAN, or CHAR/VARCHAR. Depending on the column data type, the function processes column data as follows: • INTEGER: Uses the input column as containing the true value of the response variable. • BOOLEAN: Resolves Yes to 1, 0 to No. • CHAR/VARCHAR: Resolves the value specified by parameter `main_class` to 1, all other values to 0. **Note:** If the input column is of data type INTEGER or BOOLEAN, the function ignores parameter `main_class`.
probabilities	A FLOAT input column that contains the predicted probability of response being the main class, set to 1 if *targets* is of type INTEGER.

Parameter Settings

Parameter name	Set to...
num_bins	An integer value that determines the number of decision

Parameter name	Set to...
	boundaries. Decision boundaries are set at equally spaced intervals between 0 and 1, inclusive. The function computes the table at each *num-bin* + 1 point. **Default**: 100
f1_score	A Boolean that specifies whether to return a column that contains the f1 score—the harmonic average of the precision and recall measures, where an F1 score reaches its best value at 1 (perfect precision and recall) and worst at 0. **Default**: false
main_class	Used only if *target* is of type CHAR/VARCHAR, specifies the class to associate with the *probabilities* argument.

Examples

Execute the PRC function on an input table named mtcars. The response variables appear in the column obs, while the prediction variables appear in column pred.

```
=> SELECT PRC(obs::int, prob::float USING PARAMETERS num_bins=2, f1_score=true) OVER()
       FROM (SELECT am AS obs,
                    PREDICT_LOGISTIC_REG (mpg, cyl, disp, drat, wt, qsec, vs, gear, carb
                          USING PARAMETERS model_name='myLogisticRegModel',
                                           type='probability') AS prob
             FROM mtcars) AS prediction_output;
decision_boundary | recall | precision |     f1_score      |     comment
------------------+--------+-----------+-------------------+-----------------------------------------
---
0                 |      1 |   0.40625 | 0.577777777777778 |
0.5               |      1 |         1 |                 1 | Of 32 rows, 32 were used and 0 were
ignored
(2 rows)
```

The first column, decision_boundary, indicates the cut-off point for whether to classify a response as 0 or 1. For example, in each row, if the probability is equal to or greater than decision_boundary, the response is classified as 1. If the probability is less than decision_boundary, the response is classified as 0.

READ_TREE

Reads the contents of each individual tree within the forest of the random forest model.

Syntax

```
READ_TREE ( USING PARAMETERS model_name='model-name'
            [, tree_id=tree-id]
            [, format='format'] )
```

Parameter Settings

Parameter name	Set to...
`model_name`	Identifies the model that is stored as a result of training, where *model-name* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
`tree_id`	The tree identifier, an integer between 0 and *n*-1, where *n* is the number of trees in the forest. If you omit this parameter, all trees are returned.
`format`	Output format of the returned tree, one of the following: • `tabular`: Returns a table with the twelve output columns. • `graphviz`: Returns DOT language source that can be passed to a graphviz tool and render a graphic visualization of the tree.

Privileges

Non-superusers: USAGE privileges on the model

Examples

This example shows how you can use the READ_TREE function with the tabular format.

```
=> SELECT READ_TREE ( USING PARAMETERS model_name='myRFModel', tree_id=1 ,
format= 'tabular')LIMIT 2;
-[ RECORD 1 ]-------------+-------------------
tree_id                   | 1
node_id                   | 1
node_depth                | 0
```

```

See Also

- RF_CLASSIFIER
- RF_REGRESSOR

RF_PREDICTOR_IMPORTANCE

Measures the importance of the predictors in a random forest model using the Mean Decrease Impurity (MDI) approach. The importance vector is normalized to sum to 1.

Syntax

```
RF_PREDICTOR_IMPORTANCE ( USING PARAMETERS model_name='model-name'
                                          [, tree_id=tree-id] )
```

Parameter Settings

Parameter name	Set to...
`model_name`	Identifies the model that is stored as a result of the training, where *`model-name`* must be of type `rf_classifier` or `rf_regressor`.
`tree-id`	Identifies the tree to process, an integer between 0 and *n*-1, where *n* is the number of trees in the forest. If you omit this parameter, the function uses all trees to measure importance values.

Privileges

Non-superusers: USAGE privileges on the model

Examples

This example shows how you can use the RF_PREDICTOR_IMPORTANCE function.

```
=> SELECT RF_PREDICTOR_IMPORTANCE ( USING PARAMETERS model_name = 'myRFModel');
 predictor_index | predictor_name | importance_value
-----------------+----------------+--------------------
               0 | sepal.length   | 0.106763318092655
               1 | sepal.width    | 0.0279536658041994
               2 | petal.length   | 0.499198722346586
               3 | petal.width    | 0.366084293756561
(4 rows)
```

See Also

- RF_CLASSIFIER
- RF_REGRESSOR

ROC

Returns a table that displays the points on a receiver operating characteristic curve. The ROC function tells you the accuracy of a classification model as you raise the discrimination threshold for the model.

Syntax

```
ROC ( targets, probabilities
    [ USING PARAMETERS [num_bins=num-bins]
                       [, AUC=output]
                       [, main_class=class-name ] ) ] )
    OVER()
```

Arguments

targets	An input column that contains the true values of the response variable, one of the following data types: INTEGER, BOOLEAN, or CHAR/VARCHAR. Depending on the column data type, the function processes column data as follows: • INTEGER: Uses the input column as containing the true value of the response variable. • BOOLEAN: Resolves Yes to 1, 0 to No. • CHAR/VARCHAR: Resolves the value specified by parameter `main_class` to 1, all other values to 0. **Note:** If the input column is of data type INTEGER or BOOLEAN, the function ignores parameter `main_class`.
probabilities	A FLOAT input column that contains the predicted probability of response being the main class, set to 1 if *targets* is of type INTEGER.

Parameter Settings

Parameter name	Set to...
num_bins	An integer value that determines the number of decision boundaries. Decision boundaries are set at equally spaced intervals between 0 and 1, inclusive. The function computes the table at each *num-bin* + 1 point. **Default**: 100 Greater values result in more precise approximations of the AUC.
AUC	A Boolean value that specifies whether to output the area under the curve (AUC) value. **Default**: True
main_class	Used only if *target* is of type CHAR/VARCHAR, specifies the class to associate with the *probabilities* argument.

Examples

Execute ROC on input table mtcars. Observed class labels are in column obs, predicted class labels are in column prob:

```
=> SELECT ROC(obs::int, prob::float USING PARAMETERS num_bins=5, AUC = True) OVER()
       FROM (SELECT am AS obs,
                    PREDICT_LOGISTIC_REG (mpg, cyl, disp, drat, wt,
                                          qsec, vs, gear, carb
                                          USING PARAMETERS model_name='myLogisticRegModel',
                                                           type='probability') AS prob
             FROM mtcars) AS prediction_output;
 decision_boundary | false_positive_rate | true_positive_rate | AUC |comment
-------------------+---------------------+--------------------+-----+--------------------------------
---
0                 |                   1 |                  1 |     |
0.5               |                   0 |                  1 |     |
1                 |                   0 |                  0 |   1 | Of 32 rows,32 were used and 0
were ignoreded
(3 rows)
```

The function returns a table with the following results:

- decision_boundary indicates the cut-off point for whether to classify a response as 0 or 1. In each row, if prob is equal to or greater than decision_boundary, the

response is classified as 1. If prob is less than decision_boundary, the response is classified as 0.
- false_positive_rate shows the percentage of false positives (when 0 is classified as 1) in the corresponding decision_boundary.
- true_positive_rate shows the percentage of rows that were classified as 1 and also belong to class 1.

RSQUARED

Returns a table with the R-squared value of the predictions in a regression model.

Syntax

```
RSQUARED ( targets, predictions )
     OVER()
```

Important:
The OVER( ) clause must be empty.

Arguments

targets	A FLOAT response variable for the model.
predictions	A FLOAT input column that contains the predicted values for the response variable.

Examples

This example shows how to execute the RSQUARED function on an input table named faithful_testing. The observed values of the response variable appear in the column, obs, while the predicted values of the response variable appear in the column, pred.

```
=> SELECT RSQUARED(obs, prediction) OVER()
     FROM (SELECT eruptions AS obs,
                  PREDICT_LINEAR_REG (waiting
                                      USING PARAMETERS model_name='myLinearRegModel') AS prediction
             FROM faithful_testing) AS prediction_output;
        rsq        |                    comment
-------------------+-----------------------------------------------
 0.801392981147911 | Of 110 rows, 110 were used and 0 were ignored
```

```
(1 row)
```

Model Management

Vertica provides several functions for managing models.

EXPORT_MODELS

Exports models in native Vertica (VERTICA_MODELS) or PMML format.

Syntax

```
EXPORT_MODELS ('destination', 'scope' [USING PARAMETERS category='model-category'])
```

Arguments

destination	Specifies the absolute path of an output directory in which to store the exported models.
scope	Specifies the machine learning models to export in the format '*model-name*'. • To export all models in a schema, set the argument to '*schema.**'. • If the input schema is not provided, then the function uses the default schema as the input schema. • When all models of a schema are exported, failure in exporting one model does not stop the function from processing other models in the schema. In case of any failure, the function returns the message "Has failure. Please check export_log.json file". The 'destination/export_log.json' file contains the log of the export function for all models.

Parameter Settings

Parameter name	Set to...

category	Specifies the output category of the model to be exported. When it is not specified, each model will be exported without category conversion. You may export models only in the formats listed below. Each model is exported as a directory containing several files.
	
	A schema may contain many models with different categories. When all the models of that schema are exported and the category parameter is not specified, each model is exported without any category change.
	
	Valid values:
	
	• VERTICA_MODELS ; Exports the model as a directory that contains several binary files (their number depends on the model type), a CRC file, and a metadata.json file.
	• PMML ; Exports the model as a directory with the same name as the model, containing an XML file with the same name as the model and complying with PMML standard; and a JSON metadata file named metadata.json to contain general information about the model; namely, model name, its category, its type, and the Vertica version from which it was exported.
	• TENSORFLOW ; Exports the model as a directory of the same name as the model, which contains the following files:
	  • *model_name*.pb - Contains the TensorFlow model, saved in 'frozen graph' format.
	  • crc.json - Keeps track of files in this directory and their sizes, for use on import.
	  • metadata.json - Contains the Vertica version, model type, and other details.
	  • tf_model_desc.json - Contains a summary of the model description.
	  • model.json - Contains a more verbose version of tf_model_desc.json.
	
	EXPORT_MODELS returns a warning:

Parameter name	Set to...
	• If when exporting all models of a schema, one or more models are of PMML or TENSORFLOW type and the output model category is set to VERTICA_MODELS. EXPORT_MODELS returns an error in the following cases: • If the model is of PMML or TENSORFLOW type and the output model category is set to VERTICA_MODELS. • If the model is of PMML or VERTICA_MODELS category and the output model category is set to TENSORFLOW. • If the model is of TENSORFLOW category and the output model category is set to PMML.

Privileges

Superuser

Examples

This series of examples shows different ways you can export a model.

Export model `myschema.mykmeansmodel` without changing its category:

```
=> SELECT EXPORT_MODELS ('/home/dbadmin', 'myschema.mykmeansmodel')
EXPORT_MODELS
----------------
Success
(1 row)
```

Export all models in schema `myschema` without changing their categories:

```
=> SELECT EXPORT_MODELS ('/home/dbadmin', 'myschema.*')
EXPORT_MODELS
----------------
Success
(1 row)
```

Export the model in PMML format and store it in the '/tmp' directory (the category of `my_kmeans` might be PMML or VERTICA_MODELS):

```
SELECT EXPORT_MODELS ('/tmp/', 'my_kmeans' USING PARAMETERS category='PMML')
```

Export the model as a native Vertica model and store it in the '/tmp/' directory (the category of `public.my_kmeans` must be VERTICA_MODELS):

```
SELECT EXPORT_MODELS ('/tmp/', 'public.my_kmeans' USING PARAMETERS category='VERTICA_MODELS')
```

Export a TensorFlow model (the category of tf_minst_keras must be TENSORFLOW):

```
SELECT EXPORT_MODELS ('/path/to/export/to', 'tf_mnist_keras');
 export_models
---------------
 Success
(1 row)
```

View the files in the resulting TensorFlow model directory:

```
$ ls tf_mnist_keras/
crc.json  metadata.json  mnist_keras.pb  model.json  tf_model_desc.json
```

GET_MODEL_ATTRIBUTE

Extracts either a specific attribute from a model or all attributes from a model. Use this function to view a list of attributes and row counts or view detailed information about a single attribute. The output of GET_MODEL_ATTRIBUTE is a table format where users can select particular columns or rows.

Syntax

```
GET_MODEL_ATTRIBUTE ( USING PARAMETERS model_name='model-name'
                                    [, attr_name='attribute'] )
```

Parameter Settings

Parameter name	Set to...
`model_name`	Name of the model (case-insensitive).
`attr_name`	Name of the model attribute to extract. If omitted, the function shows all available attributes. Attribute names are case-sensitive.

Privileges

Non-superusers: model owner, or USAGE privileges on the model

Examples

This example returns a summary of all model attributes.

```
=> SELECT GET_MODEL_ATTRIBUTE ( USING PARAMETERS model_name='myLinearRegModel');
attr_name          |               attr_fields                          | #_of_rows
-------------------+----------------------------------------------------+-----------
details            | predictor, coefficient, std_err, t_value, p_value |         2
regularization     | type, lambda                                       |         1
iteration_count    | iteration_count                                    |         1
rejected_row_count | rejected_row_count                                 |         1
accepted_row_count | accepted_row_count                                 |         1
call_string        | call_string                                        |         1
(6 rows)
```

This example extracts the `details` attribute from the `myLinearRegModel` model.

```
=> SELECT GET_MODEL_ATTRIBUTE ( USING PARAMETERS model_name='myLinearRegModel', attr_
name='details');
coeffNames |       coeff        |       stdErr        |      zValue       |        pValue
-----------+--------------------+---------------------+-------------------+----------------------
-
Intercept  |  -1.87401598641074 |   0.160143331525544 | -11.7021169008952 |   7.3592939615234e-26
waiting    | 0.0756279479518627 | 0.00221854185633525 |  34.0890336307608 | 8.13028381124448e-100
(2 rows)
```

GET_MODEL_SUMMARY

Returns summary information of a model.

Syntax

```
GET_MODEL_SUMMARY ( USING PARAMETERS model_name='model-name')
```

Parameter Settings

Parameter name	Set to...
`model_name`	Name of the model (case-insensitive).

Privileges

Non-superusers: model owner, or USAGE privileges on the model

Examples

This example shows how you can view the summary of a linear regression model.

```
=> SELECT GET_MODEL_SUMMARY( USING PARAMETERS model_name='myLinearRegModel');

--------------------------------------------------------------------------------
=======
details
=======
predictor|coefficient|std_err |t_value |p_value
---------+-----------+--------+--------+--------
Intercept| -2.06795  | 0.21063|-9.81782| 0.00000
waiting  |  0.07876  | 0.00292|26.96925| 0.00000

(1 row)
```

IMPORT_MODELS

Imports models to Vertica. The models can be either Vertica models that were exported with EXPORT_MODELS, or models in Predictive Model Markup Language (PMML) or

TensorFlow format. You can use this function to move models between Vertica clusters, or to import PMML and TensorFlow models trained elsewhere.

If you export a model, then import it again, the export and import model directory names must match. If naming conflicts occur, import the model to a different schema by using the new_schema parameter, and then rename the model.

The machine learning configuration parameter MaxModelSizeKB sets the maximum size of a model that can be imported into Vertica.

All model management functionality works for the imported models, including GET_MODEL_SUMMARY and GET_MODEL_ATTRIBUTE.

Some PMML features and attributes are not currently supported. See Supported and Unsupported PMML Features and Attributes for details.

Caution:
Changing the exported model files causes the import functionality to fail on attempted re-import.

Syntax

```
IMPORT_MODELS ( 'source'
                [ USING PARAMETERS [new_schema='schema-name'    ]
                                   [, category='model-category'] ] )
```

Arguments

source	Specifies the absolute path of the location from which to import the model. **Valid Inputs:** • The absolute path of a model directory. • The absolute path of a parent directory followed by "/*" to import all the models in that directory.

Parameter Settings

Parameter name	Set to...
new_schema	Name of an existing schema to which the machine learning models

Parameter name	Set to…
	are imported. If omitted, models are imported to the default schema. The function extracts the name of the resulting model from the metadata.json file, if the directory includes the file. If the metadata.json file is absent, the function uses the name of the model directory.
`category`	Specifies the category of the model that will be imported. When the category is not specified, the model is imported without converting its category. An external model is treated as a PMML model if it has an XML file with the same name as its directory. If the category specified in the function call does not match the real category of the model, then the function returns an error. Optional if the model directory includes a metadata.json file. Required if the model directory has no metadata.json, which is the case for new TensorFlow models. If the metadata.json file and the category are both missing, the function returns an error. You may import models only in the categories listed below. **Valid Values:** • VERTICA_MODELS • PMML • TENSORFLOW **Note:** When `category` is TENSORFLOW, IMPORT_MODELS imports the following files from the model directory: Required: *`model-name`*.pb *`model-name`*.json Optional: *`model-name`*.pbtxt

Parameter name	Set to...
	 All other files found in the model directory are ignored. The checkpoint files are not imported.

Privileges

Superuser

Examples

This example shows how you could import the `mykmeansmodel` model into the `newschema` schema:

```
=> SELECT IMPORT_MODELS ('/home/dbadmin/myschema/mykmeansmodel' USING PARAMETERS new_
schema='newschema')
IMPORT_MODELS
---------------
Success
(1 row)
```

This example demonstrates how you would import all models in the `myschema` directory into the 'newschema' schema:

```
=> SELECT IMPORT_MODELS ('/home/dbadmin/myschema/*' USING PARAMETERS new_schema='newschema')
IMPORT_MODELS
---------------
Success
(1 row)
```

This example shows how to import the `my_kmeans` model and store it inside the schema '`my_models`'. If it is a PMML model, it is imported as a model with PMML category. If it is a native Vertica model, it is imported as a model with VERTICA_MODELS category. Similarly, if it is a TensorFlow model, it is imported as a model with TENSORFLOW category:

```
SELECT IMPORT_MODELS ('my_kmeans' USING PARAMETERS new_schema='my_models')
```

In this example, the `kmeans_pmml` model is imported successfully provided it is a PMML model; otherwise, the function returns an error due to a mismatch between the specified `category` and the real model category:

```
SELECT IMPORT_MODELS ('/root/user/kmeans_pmml' USING PARAMETERS category='PMML')
```

This example shows how you can import a single TensorFlow model:

```
select IMPORT_MODELS ( '/path/tf_models/tf_mnist_estimator' USING PARAMETERS category='TENSORFLOW');
 import_models
---------------
 Success
(1 row)
```

If you specify * instead of <model_name>, you can import all the TensorFlow models in the specified directory:

```
select IMPORT_MODELS ( '/path/tf_models/*' USING PARAMETERS category='TENSORFLOW');
 import_models
---------------
 Success
(1 row)
```

UPGRADE_MODEL

Upgrades a model from a previous Vertica version. Vertica automatically runs this function during an upgrade of the database and if you run the IMPORT_MODELS function. Manually call this function to upgrade models after a backup or restore.

Syntax

```
UPGRADE_MODEL ( [ USING PARAMETERS [model_name='model-name'] ] )
```

Parameter Settings

Parameter name	Set to...
`model_name`	Name of the model to upgrade. If you omit this parameter, Vertica upgrades all models on which you have privileges.

Privileges

Non-superuser: Upgrades only models that the user owns.

Examples

Upgrade model `myLogisticRegModel`:

```
=> SELECT UPGRADE_MODEL( USING PARAMETERS model_name = 'myLogisticRegModel');
        UPGRADE_MODEL
----------------------------
 1 model(s) upgrade

(1 row)
```

Upgrade all models that the user owns:

```
=> SELECT UPGRADE_MODEL();
        UPGRADE_MODEL
----------------------------
 20 model(s) upgrade

(1 row)
```

Mathematical Functions

Some of these functions are provided in multiple forms with different argument types. Except where noted, any given form of a function returns the same data type as its argument. The functions working with DOUBLE PRECISION data could vary in accuracy and behavior in boundary cases depending on the host system.

ABS

Returns the absolute value of the argument. The return value has the same data type as the argument..

Behavior Type

Immutable

Syntax

```
ABS ( expression )
```

Parameters

expression	Is a value of type INTEGER or DOUBLE PRECISION

Examples

```
SELECT ABS(-28.7);
 abs
------
 28.7
(1 row)
```

ACOS

Returns a DOUBLE PRECISION value representing the trigonometric inverse cosine of the argument.

Behavior Type

Immutable

Syntax

```
ACOS ( expression )
```

Parameters

expression	Is a value of type DOUBLE PRECISION

Example

```
SELECT ACOS (1);
 acos
------
    0
(1 row)
```

ASIN

Returns a DOUBLE PRECISION value representing the trigonometric inverse sine of the argument.

Behavior Type

Immutable

Syntax

```
ASIN ( expression )
```

Parameters

expression	Is a value of type DOUBLE PRECISION

Example

```
SELECT ASIN(1);
      asin
-----------------
 1.5707963267949
(1 row)
```

ATAN

Returns a DOUBLE PRECISION value representing the trigonometric inverse tangent of the argument.

Behavior Type

Immutable

Syntax

```
ATAN ( expression )
```

Parameters

expression	Is a value of type DOUBLE PRECISION

Example

```
SELECT ATAN(1);
       atan
-------------------
 0.785398163397448
(1 row)
```

ATAN2

Returns a DOUBLE PRECISION value representing the trigonometric inverse tangent of the arithmetic dividend of the arguments.

Behavior Type

Immutable

Syntax

ATAN2 (*quotient, divisor*)

Parameters

quotient	Is an expression of type DOUBLE PRECISION representing the quotient
divisor	Is an expression of type DOUBLE PRECISION representing the divisor

Example

```
SELECT ATAN2(2,1);
      ATAN2
------------------
 1.10714871779409
(1 row)
```

CBRT

Returns the cube root of the argument. The return value has the type DOUBLE PRECISION.

Behavior Type

Immutable

Syntax

```
CBRT ( expression )
```

Parameters

expression	Value of type DOUBLE PRECISION

Examples

```
SELECT CBRT(27.0);
 cbrt
------
    3
(1 row)
```

CEILING

Rounds up the returned value up to the next whole number. For example, given arguments of 5.01 and 5.99, CEILING returns 6.

Note:
CEILING is the opposite of FLOOR, which rounds down the returned value.

Behavior Type

Immutable

Syntax

```
CEIL[ING] ( expression )
```

Parameters

expression	Resolves to an INTEGER or DOUBLE PRECISION value.

Examples

```
=> SELECT CEIL(-42.8);
 CEIL
------
  -42
(1 row)

SELECT CEIL(48.01);
 CEIL
------
   49
(1 row)
```

COS

Returns a DOUBLE PRECISION value tat represents the trigonometric cosine of the passed parameter.

Behavior Type

Immutable

Syntax

```
COS ( expression )
```

Parameters

expression	An expression of type DOUBLE PRECISION

Example

```
SELECT COS(-1);
       COS
------------------
 0.54030230586814
(1 row)
```

COSH

Returns a DOUBLE PRECISION value that represents the hyperbolic cosine of the passed parameter.

Behavior Type

Immutable

Syntax

COSH (*expression*)

Parameters

expression	An expression of type DOUBLE PRECISION

Example

```
=> SELECT COSH(-1);
       COSH
------------------
 1.54308063481524
```

COT

Returns a DOUBLE PRECISION value representing the trigonometric cotangent of the argument.

Behavior Type

Immutable

Syntax

```
COT ( expression )
```

Parameters

expression	Is a value of type DOUBLE PRECISION

Example

```
SELECT COT(1);
        cot
-------------------
 0.642092615934331
(1 row)
```

DEGREES

Converts an expression from radians to fractional degrees, or from degrees, minutes, and seconds to fractional degrees. The return value has the type DOUBLE PRECISION.

Behavior Type

Immutable

Syntax

```
DEGREES ( { radians | degrees, minutes, seconds } )
```

Parameters

radians	Unit of angular measure. 2π radians is equal to a full rotation.
degrees	Unit of angular measure, equal to 1/360 of a full rotation.
minutes	Unit of angular measurement, representing 1/60 of a degree.
seconds	Unit of angular measurement, representing 1/60 of a minute.

Examples

```
SELECT DEGREES(0.5);
     DEGREES
------------------
 28.6478897565412
(1 row)

SELECT DEGREES(1,2,3);
     DEGREES
------------------
 1.03416666666667
(1 row)
```

DISTANCE

Returns the distance (in kilometers) between two points. You specify the latitude and longitude of the starting point and the ending point. You can also specify the radius of curvature for greater accuracy when using an ellipsoidal model.

Behavior Type

Immutable

Syntax

```
DISTANCE ( lat0, lon0, lat1, lon1 [, radius-of-curvature ] )
```

Parameters

lat0	Starting point latitude.
lon0	Starting point longitude.
lat1	Ending point latitude
lon1	Ending point longitude.
radius-of-curvature	Specifies the radius of the curvature of the earth at the midpoint between the starting and ending points. This parameter allows for greater accuracy when using an ellipsoidal earth model. If you omit this parameter, DISTANCE uses the WGS-84 average r1 radius, about 6371.009 km.

Example

This example finds the distance in kilometers for 1 degree of longitude at latitude 45 degrees, assuming earth is spherical.

```
SELECT DISTANCE(45,0,45,1);
      DISTANCE
---------------------
 78.6262959272162
(1 row)
```

DISTANCEV

Returns the distance (in kilometers) between two points using the Vincenty formula. Because the Vincenty formula includes the parameters of the WGS-84 ellipsoid model, you need not specify a radius of curvature. You specify the latitude and longitude of both the starting point and the ending point. This function is more accurate, but will be slower, than the DISTANCE function.

Behavior Type

Immutable

Syntax

```
DISTANCEV (lat0, lon0, lat1, lon1);
```

Parameters

lat0	Specifies the latitude of the starting point.
lon0	Specifies the longitude of the starting point.
lat1	Specifies the latitude of the ending point.
lon1	Specifies the longitude of the ending point.

Example

This example finds the distance in kilometers for 1 degree of longitude at latitude 45 degrees, assuming earth is ellipsoidal.

```
SELECT DISTANCEV(45,0, 45,1);
    distanceV
------------------
 78.8463347095916
(1 row)
```

EXP

Returns the exponential function, e to the power of a number. The return value has the same data type as the argument.

Behavior Type

Immutable

Syntax

```
EXP ( exponent )
```

Parameters

exponent	Is an expression of type INTEGER or DOUBLE PRECISION

Example

```
SELECT EXP(1.0);
       exp
------------------
 2.71828182845905
(1 row)
```

FLOOR

Rounds down the returned value to the next whole number. For example, given arguments of 5.01 and 5.99, FLOOR returns 5.

Note:
FLOOR is the opposite of CEILING, which rounds up the returned value.

Behavior Type

Immutable

Syntax

```
FLOOR ( expression )
```

Parameters

expression	Resolves to an INTEGER or DOUBLE PRECISION value.

Examples

```
=> SELECT FLOOR((TIMESTAMP '2005-01-17 10:00' - TIMESTAMP '2005-01-01') / INTERVAL '7');
 FLOOR
-------
     2
(1 row)

=> SELECT FLOOR(-42.8);
 FLOOR
-------
   -43
(1 row)

=> SELECT FLOOR(42.8);
 FLOOR
-------
    42
(1 row)
```

Although the following example looks like an INTEGER, the number on the left is 2^49 as an INTEGER, while the number on the right is a FLOAT:

```
=> SELECT 1<<49, FLOOR(1 << 49);
    ?column?     |      floor
-----------------+-----------------
 562949953421312 | 562949953421312
(1 row)
```

Compare the previous example to:

```
=> SELECT 1<<50, FLOOR(1 << 50);
     ?column?     |        floor
------------------+----------------------
 1125899906842624 | 1.12589990684262e+15
(1 row)
```

HASH

Calculates a hash value over the function arguments, producing a value in the range $0 <= x < 2^{63}$.

The HASH function is typically used to segment a projection over a set of cluster nodes. The function selects a specific node for each row based on the values of the row columns. The HASH function distributes data evenly across the cluster, which facilitates optimal query execution.

Behavior Type

Immutable

Syntax

```
HASH ( expression-arg[,… ] )
```

Parameters

expression-arg	An expression of any data type. Functions that are included in *expression* must be deterministic. If specified in a projection's hash segmentation clause, each expression typically resolves to a column reference.

Examples

```
=> SELECT HASH(product_price, product_cost) FROM product_dimension
     WHERE product_price = '11';
        hash

Hash Segmentation Clause

LN

Returns the natural logarithm of the argument. The return data type is the same as the argument.

Behavior Type

Immutable

Syntax

```
LN ( expression )
```

Parameters

expression	Is an expression of type INTEGER or DOUBLE PRECISION

Example

```
SELECT LN(2);
        ln
-------------------
 0.693147180559945
(1 row)
```

LOG

Returns the logarithm to the specified base of the argument. The data type of the return value is the same data type as the passed parameter.

Behavior Type

Immutable

Syntax

```
LOG ( [ base, ] expression )
```

Parameters

base	Specifies the base (default is base 10)
expression	An expression of type INTEGER or DOUBLE PRECISION

Examples

```
=> SELECT LOG(2.0, 64);
 LOG
-----
   6
(1 row)

SELECT LOG(100);
 LOG
-----
   2
(1 row)
```

LOG10

Returns the base 10 logarithm of the argument, also known as the *common logarithm*. The data type of the return value is the same as the data type of the passed parameter.

Behavior Type

Immutable

Syntax

```
LOG10 ( expression )
```

Parameters

expression	An expression of type INTEGER or DOUBLE PRECISION

Examples

```
=> SELECT LOG10(30);
       LOG10
------------------
 1.47712125471966
(1 row)
```

MOD

Returns the remainder of a division operation.

Behavior Type

Immutable

Syntax

```
MOD( expression1, expression2 )
```

Parameters

expression1	A numeric data type that specifies the dividend.
expression2	A numeric data type that specifies the divisor.

Computation Rules

When computing MOD(*expression1*, *expression2*), the following rules apply:

- If either *expression1* or *expression2* is the null value, then the result is the null value.
- If *expression2* is zero, then an exception condition is raised: data exception — division by zero.
- Otherwise, the result is the unique exact numeric value *R* with scale 0 (zero) such that all of the following are true:

- *R* has the same sign as *expression2*.
- The absolute value of *R* is less than the absolute value of *expression1*.
- *expression2* = *expression1* * *K* + *R* for some exact numeric value *K* with scale 0 (zero).

Examples

```
SELECT MOD(9,4);
 mod
-----
   1
(1 row)

SELECT MOD(10,3);
 mod
-----
   1
(1 row)

SELECT MOD(-10,3);
 mod
-----
  -1
(1 row)

SELECT MOD(-10,-3);
 mod
-----
  -1
(1 row)

SELECT MOD(10,-3);
 mod
-----
   1
(1 row)

=> SELECT MOD(6.2,0);
ERROR 3117:  Division by zero
```

PI

Returns the constant pi (Π), the ratio of any circle's circumference to its diameter in Euclidean geometry The return type is DOUBLE PRECISION.

Behavior Type

Immutable

Syntax

```
PI()
```

Examples

```
SELECT PI();
        pi
------------------
 3.14159265358979
(1 row)
```

POWER

Returns a DOUBLE PRECISION value representing one number raised to the power of another number.

Behavior Type

Immutable

Syntax

```
POW[ER] ( expression1, expression2 )
```

Parameters

expression1	DOUBLE PRECISION value that represents the base.
expression2	DOUBLE PRECISION value that represents the exponent.

Examples

```
SELECT POWER(9.0, 3.0);
 power
-------
```

```
   729
(1 row)
```

RADIANS

Returns a DOUBLE PRECISION value representing an angle expressed in radians. You can express the input angle in DEGREES, and optionally include minutes and seconds.

Behavior Type

Immutable

Syntax

```
RADIANS (degrees [, minutes, seconds])
```

Parameters

degrees	A unit of angular measurement, representing 1/360 of a full rotation.
minutes	A unit of angular measurement, representing 1/60 of a degree.
seconds	A unit of angular measurement, representing 1/60 of a minute.

Examples

```
SELECT RADIANS(45);
      RADIANS
-------------------
 0.785398163397448
(1 row)

SELECT RADIANS (1,2,3);
      RADIANS
-------------------
 0.018049613347708
(1 row)
```

RANDOM

Returns a uniformly-distributed random DOUBLE PRECISION value *x*, where `0 <= x < 1`.

Typical pseudo-random generators accept a seed, which is set to generate a reproducible pseudo-random sequence. Vertica, however, distributes SQL processing over a cluster of nodes, where each node generates its own independent random sequence.

Results depending on RANDOM are not reproducible because the work might be divided differently across nodes. Therefore, Vertica automatically generates truly random seeds for each node each time a request is executed and does not provide a mechanism for forcing a specific seed.

Behavior Type

Volatile

Syntax

```
RANDOM()
```

Examples

In the following example, RANDOM returns a float ≥ 0 and < 1.0:

```
SELECT RANDOM();
      random
-------------------
 0.211625560652465
(1 row)
```

RANDOMINT

Accepts and returns an `INTEGER` value. `RANDOMINT(n)` returns one of the *n* integers from `0` through `n - 1`.

Typical pseudo-random generators accept a seed, which is set to generate a reproducible pseudo-random sequence. Vertica, however, distributes SQL processing over a cluster of nodes, where each node generates its own independent random sequence.

Results depending on RANDOM are not reproducible because the work might be divided differently across nodes. Therefore, Vertica automatically generates truly random seeds for each node each time a request is executed and does not provide a mechanism for forcing a specific seed.

Behavior Type

Volatile

Syntax

```
RANDOMINT ( n )
```

Parameters

The value accepted is any positive integer (*n*) between the values 1 and 9,223,372,036,854,775,807.

For general information on integer data types, refer to the section, INTEGER.

Restrictions

If you provide a negative value, or if you exceed the maximum value, Vertica returns an error.

Example

In the following example, the result is an INTEGER, which is >= `0` and < *n*, randomly chosen from the set {0,1,2,3,4}.

```
=> SELECT RANDOMINT(5);
RANDOMINT
----------
        3
(1 row)
```

RANDOMINT_CRYPTO

Accepts and returns an INTEGER value from a set of values between 0 and the specified function argument -1. For this cryptographic random number generator, Vertica uses RAND_bytes to provide the random value.

Behavior Type

Volatile

Syntax

```
RANDOMINT_CRYPTO ( integer-expression )
```

Parameters

integer-expression	Resolves to a positive integer between 1 and $2^{63} - 1$, inclusive.

Examples

In the following example, RANDOMINT_CRYPTO returns an INTEGER >= `0` and less than the specified argument `5`, randomly chosen from the set `{0,1,2,3,4}`.

```
=> SELECT RANDOMINT_crypto(5);
RANDOMINT_crypto
----------------
               3
(1 row)
```

ROUND

Rounds a value to a specified number of decimal places, retaining the original precision and scale. Fractions greater than or equal to .5 are rounded up. Fractions less than .5 are rounded down (truncated).

Behavior Type

Immutable

Syntax

```
ROUND ( expression [ , places ] )
```

Parameters

expression	Is an expression of type NUMERIC or DOUBLE PRECISION (FLOAT).
places	An INTEGER value. When *places* is a positive integer, Vertica rounds the value to the right of the decimal point using the specified number of places. When *places* is a negative integer, Vertica rounds the value on the left side of the decimal point using the specified number of places.

Notes

Using ROUND with a NUMERIC datatype returns NUMERIC, retaining the original precision and scale.

```
=> SELECT ROUND(3.5);
 ROUND
-------
   4.0
(1 row)
```

Examples

```
=> SELECT ROUND(2.0, 1.0) FROM dual;
 ROUND
-------
   2.0
(1 row)

=> SELECT ROUND(12.345, 2.0);
 ROUND
--------
 12.350
(1 row)
```

```
=> SELECT ROUND(3.444444444444444);
       ROUND
-------------------
 3.000000000000000
(1 row)

=> SELECT ROUND(3.14159, 3);
  ROUND
---------
 3.14200
(1 row)

=> SELECT ROUND(1234567, -3);
  ROUND
---------
 1235000
(1 row)

=> SELECT ROUND(3.4999, -1);
 ROUND
--------
 0.0000
(1 row)
```

The following example creates a table with two columns, adds one row of values, and shows sample rounding to the left and right of a decimal point.

```
=> CREATE TABLE sampleround (roundcol1 NUMERIC, roundcol2 NUMERIC);
CREATE TABLE

=> INSERT INTO sampleround VALUES (1234567, .1234567);
 OUTPUT
--------
      1
(1 row)

=> SELECT ROUND(roundcol1,-3) AS pn3, ROUND(roundcol1,-4) AS pn4, ROUND(roundcol1,-5) AS pn5 FROM
sampleround;

           pn3           |           pn4           |           pn5
-------------------------+-------------------------+-------------------------
 1235000.000000000000000 | 1230000.000000000000000 | 1200000.000000000000000
(1 row)

=> SELECT ROUND(roundcol2,3) AS p3, ROUND(roundcol2,4) AS p4, ROUND(roundcol2,5) AS p5 FROM
sampleround;

        p3         |        p4         |        p5
-------------------+-------------------+-------------------
 0.123000000000000 | 0.123500000000000 | 0.123460000000000
(1 row)
```

SIGN

Returns a DOUBLE PRECISION value of -1, 0, or 1 representing the arithmetic sign of the argument.

Behavior Type

Immutable

Syntax

```
SIGN ( expression )
```

Parameters

expression	Is an expression of type DOUBLE PRECISION

Examples

```
SELECT SIGN(-8.4);
 sign
------
   -1
(1 row)
```

SIN

Returns a DOUBLE PRECISION value that represents the trigonometric sine of the passed parameter.

Behavior Type

Immutable

Syntax

```
SIN ( expression )
```

Parameters

expression	An expression of type DOUBLE PRECISION

Example

```
SELECT SIN(30 * 2 * 3.14159 / 360);
        SIN
--------------------
 0.499999616987256
(1 row)
```

SINH

Returns a DOUBLE PRECISION value that represents the hyperbolic sine of the passed parameter.

Behavior Type

Immutable

Syntax

```
SINH ( expression )
```

Parameters

expression	An expression of type DOUBLE PRECISION

Example

```
=> SELECT SINH(30 * 2 * 3.14159 / 360);
        SINH
-------------------
 0.547852969600632
```

SQRT

Returns a DOUBLE PRECISION value representing the arithmetic square root of the argument.

Behavior Type

Immutable

Syntax

SQRT (*expression*)

Parameters

expression	Is an expression of type DOUBLE PRECISION

Examples

```
SELECT SQRT(2);
      sqrt
-----------------
 1.4142135623731
(1 row)
```

TAN

Returns a DOUBLE PRECISION value that represents the trigonometric tangent of the passed parameter.

Behavior Type

Immutable

Syntax

```
TAN ( expression )
```

Parameters

expression	An expression of type DOUBLE PRECISION

Example

```
=> SELECT TAN(30);
        TAN
-------------------
 -6.40533119664628
(1 row)
```

TANH

Returns a DOUBLE PRECISION value that represents the hyperbolic tangent of the passed parameter.

Behavior Type

Immutable

Syntax

```
TANH ( expression )
```

Parameters

expression	An expression of type DOUBLE PRECISION

Example

```
=> SELECT TANH(-1);
        TANH
-------------------
  -0.761594155955765
```

TRUNC

Returns the *expression* value fully truncated (toward zero). Supplying a *places* argument truncates the expression to the number of decimal places you indicate.

Behavior Type

Immutable

Syntax

```
TRUNC ( expression [ , places ] )
```

Parameters

expression	Is an expression of type NUMERIC or DOUBLE PRECISION (FLOAT).
places	An INTEGER value. When places is a positive integer, Vertica truncates the value to the right of the decimal point. When places is a negative integer, Vertica truncates the value on the left side of the decimal point.

Notes

Using TRUNC with a NUMERIC datatype returns NUMERIC, retaining the original precision and scale.

```
=> SELECT TRUNC(3.5);
 TRUNC
-------
   3.0
(1 row)
```

Examples

```
=> SELECT TRUNC(42.8);
 TRUNC
-------
  42.0
(1 row)
=> SELECT TRUNC(42.4382, 2);
  TRUNC
---------
 42.4300
(1 row)
```

The following example creates a table with two columns, adds one row of values, and shows sample truncating to the left and right of a decimal point.

```
=> CREATE TABLE sampletrunc (truncol1 NUMERIC, truncol2 NUMERIC);
CREATE TABLE

=> INSERT INTO sampletrunc VALUES (1234567, .1234567);
 OUTPUT
--------
      1
(1 row)

=> SELECT TRUNC(truncol1,-3) AS p3, TRUNC(truncol1,-4) AS p4, TRUNC(truncol1,-5) AS p5 FROM
sampletrunc;

           p3            |           p4            |           p5
-------------------------+-------------------------+-------------------------
 1234000.000000000000000 | 1230000.000000000000000 | 1200000.000000000000000
(1 row)

=> SELECT TRUNC(truncol2,3) AS p3, TRUNC(truncol2,4) AS p4, TRUNC(truncol2,5) AS p5 FROM sampletrunc;

        p3         |        p4         |        p5
-------------------+-------------------+-------------------
 0.123000000000000 | 0.123400000000000 | 0.123450000000000
(1 row)
```

WIDTH_BUCKET

Constructs equiwidth histograms, in which the histogram range is divided into intervals (buckets) of identical sizes. In addition, values below the low bucket return 0, and values above the high bucket return bucket_count +1. Returns an integer value.

Behavior Type

Immutable

Syntax

```
WIDTH_BUCKET ( expression, hist_min, hist_max, bucket_count )
```

Parameters

expression	The expression for which the histogram is created. This expression must evaluate to a numeric or datetime value or to a value that can be implicitly converted to a numeric or datetime value. If *expression* evaluates to null, then the *expression* returns null.
hist_min	An expression that resolves to the low boundary of bucket 1. Must also evaluate to numeric or datetime values and cannot evaluate to null.
hist_max	An expression that resolves to the high boundary of bucket bucket_count. Must also evaluate to a numeric or datetime value and cannot evaluate to null.
bucket_count	An expression that resolves to a constant, indicating the number of buckets. This expression always evaluates to a positive INTEGER.

Notes

- WIDTH_BUCKET divides a data set into buckets of equal width. For example, Age = 0–20, 20–40, 40–60, 60–80. This is known as an equiwidth histogram.
- When using WIDTH_BUCKET pay attention to the minimum and maximum boundary values. Each bucket contains values equal to or greater than the base value of that

bucket, so that age ranges of 0–20, 20–40, and so on, are actually 0–19.99 and 20–39.999.

- WIDTH_BUCKET accepts the following data types: (FLOAT and/or INTEGER), (TIMESTAMP and/or DATE and/or TIMESTAMPTZ), or (INTERVAL and/or TIME).

Examples

The following example returns five possible values and has three buckets: 0 [Up to 100), 1 [100–300), 2 [300–500), 3 [500–700), and 4 [700 and up):

```
SELECT product_description, product_cost, WIDTH_BUCKET(product_cost, 100, 700, 3);
```

The following example creates a nine-bucket histogram on the annual_income column for customers in Connecticut who are female doctors. The results return the bucket number to an “Income” column, divided into eleven buckets, including an underflow and an overflow. Note that if customers had an annual incomes greater than the maximum value, they would be assigned to an overflow bucket, 10:

```
SELECT customer_name, annual_income, WIDTH_BUCKET (annual_income, 100000, 1000000, 9) AS "Income"
FROM public.customer_dimension WHERE customer_state='CT'
AND title='Dr.' AND customer_gender='Female' AND household_id < '1000'
ORDER BY "Income";
```

In the following result set, the reason there is a bucket 0 is because buckets are numbered from 1 to `bucket_count`. Anything less than the given value of `hist_min` goes in bucket 0, and anything greater than the given value of `hist_max` goes in the bucket `bucket_count+1`. In this example, bucket 9 is empty, and there is no overflow. The value 12,283 is less than 100,000, so it goes into the underflow bucket.

```
   customer_name    | annual_income | Income
--------------------+---------------+--------
 Joanna A. Nguyen   |         12283 |      0
 Amy I. Nguyen      |        109806 |      1
 Juanita L. Taylor  |        219002 |      2
 Carla E. Brown     |        240872 |      2
 Kim U. Overstreet  |        284011 |      2
 Tiffany N. Reyes   |        323213 |      3
 Rebecca V. Martin  |        324493 |      3
 Betty . Roy        |        476055 |      4
 Midori B. Young    |        462587 |      4
 Martha T. Brown    |        687810 |      6
 Julie D. Miller    |        616509 |      6
 Julie Y. Nielson   |        894910 |      8
 Sarah B. Weaver    |        896260 |      8
 Jessica C. Nielson |        861066 |      8
(14 rows)
```

NULL-handling Functions

NULL-handling functions take arguments of any type, and their return type is based on their argument types.

COALESCE

Returns the value of the first non-null expression in the list. If all expressions evaluate to null, then COALESCE returns null.

COALESCE conforms to the ANSI SQL-92 standard.

Behavior Type

Immutable

Syntax

```
COALESCE ( expression[,…] );
```

Example

```
=> SELECT product_description, COALESCE(
     lowest_competitor_price, highest_competitor_price, average_competitor_price) AS price
     FROM product_dimension LIMIT 10;
     product_description     | price
-----------------------------+-------
 Brand #313 corn muffins     |   565
 Brand #591 hot dogs         |   323
 Brand #1247 american cheese |   263
 Brand #1510 whole milk      |   183
 Brand #2549 vegatable soup  |   491
 Brand #4520 catfish         |   113
 Brand #4684 onions          |    56
 Brand #6078 salmon          |   195
 Brand #6924 bananas         |    80
 Brand #7912 green peppers   |   180
(10 rows)
```

- CASE Expressions
- ISNULL

IFNULL

Returns the value of the first non-null expression in the list.

IFNULL is an alias of NVL.

Behavior Type

Immutable

Syntax

```
IFNULL ( expression1 , expression2 );
```

Parameters

- If *expression1* is null, then IFNULL returns *expression2*.
- If *expression1* is not null, then IFNULL returns *expression1*.

Notes

- COALESCE is the more standard, more general function.
- IFNULL is equivalent to ISNULL.
- IFNULL is equivalent to COALESCE except that IFNULL is called with only two arguments.
- `ISNULL(a,b)` is different from `x IS NULL`.
- The arguments can have any data type supported by Vertica.
- Implementation is equivalent to the CASE expression. For example:

```
CASE WHEN expression1 IS NULL THEN expression2
ELSE expression1 END;
```

- The following statement returns the value 140:

```
SELECT IFNULL(NULL, 140) FROM employee_dimension;
```

- The following statement returns the value 60:

```
SELECT IFNULL(60, 90) FROM employee_dimension;
```

Examples

```
=> SELECT IFNULL (SCORE, 0.0) FROM TESTING;
 IFNULL
--------
  100.0
   87.0
     .0
     .0
     .0
(5 rows)
```

- ISNULL

ISNULL

Returns the value of the first non-null expression in the list.

ISNULL is an alias of NVL.

Behavior Type

Immutable

Syntax

```
ISNULL ( expression1 , expression2 );
```

Parameters

- If *expression1* is null, then ISNULL returns *expression2*.
- If *expression1* is not null, then ISNULL returns *expression1*.

Notes

- COALESCE is the more standard, more general function.
- ISNULL is equivalent to COALESCE except that ISNULL is called with only two arguments.
- `ISNULL(a,b)` is different from `x IS NULL`.
- The arguments can have any data type supported by Vertica.
- Implementation is equivalent to the CASE expression. For example:

```
CASE WHEN expression1 IS NULL THEN expression2
ELSE expression1 END;
```

- The following statement returns the value 140:

```
SELECT ISNULL(NULL, 140) FROM employee_dimension;
```

- The following statement returns the value 60:

```
SELECT ISNULL(60, 90) FROM employee_dimension;
```

Examples

```
SELECT product_description, product_price,
ISNULL(product_cost, 0.0) AS cost
FROM product_dimension;
      product_description       | product_price | cost
--------------------------------+---------------+------
 Brand #59957 wheat bread       |           405 |  207
 Brand #59052 blueberry muffins |           211 |  140
 Brand #59004 english muffins   |           399 |  240
 Brand #53222 wheat bread       |           323 |   94
 Brand #52951 croissants        |           367 |  121
 Brand #50658 croissants        |           100 |   94
 Brand #49398 white bread       |           318 |   25
 Brand #46099 wheat bread       |           242 |    3
 Brand #45283 wheat bread       |           111 |  105
 Brand #43503 jelly donuts      |           259 |   19
(10 rows)
```

NULLIF

Compares two expressions. If the expressions are not equal, the function returns the first expression (expression1). If the expressions are equal, the function returns null.

Behavior Type

Immutable

Syntax

```
NULLIF( expression1, expression2 )
```

Parameters

expression1	Is a value of any data type.
expression2	Must have the same data type as *expr1* or a type that can be implicitly cast to match *expression1*. The result has the same type as *expression1*.

Examples

The following series of statements illustrates one simple use of the NULLIF function.

Creates a single-column table `t and insert some values`:

```
CREATE TABLE t (x TIMESTAMPTZ);
INSERT INTO t VALUES('2009-09-04 09:14:00-04');
INSERT INTO t VALUES('2010-09-04 09:14:00-04');
```

Issue a select statement:

```
SELECT x, NULLIF(x, '2009-09-04 09:14:00 EDT') FROM t;
           x            |         nullif
------------------------+------------------------
 2009-09-04 09:14:00-04 |
 2010-09-04 09:14:00-04 | 2010-09-04 09:14:00-04
SELECT NULLIF(1, 2);
 NULLIF
--------
      1
(1 row)
SELECT NULLIF(1, 1);
 NULLIF
--------
(1 row)
SELECT NULLIF(20.45, 50.80);
 NULLIF
--------
  20.45
(1 row)
```

NULLIFZERO

Evaluates to NULL if the value in the column is 0.

Syntax

NULLIFZERO(*expression*)

Parameters

expression	(INTEGER, DOUBLE PRECISION, INTERVAL, or NUMERIC) Is the string to evaluate for 0 values.

Example

The TESTING table below shows the test scores for 5 students. Note that test scores are missing for S. Robinson and K. Johnson (NULL values appear in the Score column.)

```
=> SELECT * FROM TESTING;
    Name     | Score
-------------+-------
 J. Doe      |   100
 R. Smith    |    87
 L. White    |     0
 S. Robinson |
 K. Johnson  |
(5 rows)
```

The SELECT statement below specifies that Vertica should return any 0 values in the Score column as Null. In the results, you can see that Vertica returns L. White's 0 score as Null.

```
=> SELECT Name, NULLIFZERO(Score) FROM TESTING;
    Name     | NULLIFZERO
-------------+------------
 J. Doe      |        100
 R. Smith    |         87
 L. White    |
 S. Robinson |
 K. Johnson  |
(5 rows)
```

NVL

Returns the value of the first non-null expression in the list.

Behavior Type

Immutable

Syntax

```
NVL ( expression1 , expression2 );
```

Parameters

- If *expression1* is null, then NVL returns *expression2*.
- If *expression1* is not null, then NVL returns *expression1*.

Notes

- COALESCE is the more standard, more general function.
- NVL is equivalent to COALESCE except that NVL is called with only two arguments.
- The arguments can have any data type supported by Vertica.
- Implementation is equivalent to the CASE expression:

```
CASE WHEN expression1 IS NULL THEN expression2
ELSE expression1 END;
```

Examples

expression1 is not null, so NVL returns expression1:

```
SELECT NVL('fast', 'database');
nvl
------
 fast
(1 row)
```

expression1 is null, so NVL returns expression2:

```
SELECT NVL(null, 'database');
nvl
----------
 database
(1 row)
```

expression2 is null, so NVL returns expression1:

```
SELECT NVL('fast', null);
nvl
------
 fast
(1 row)
```

In the following example, expression1 (title) contains nulls, so NVL returns expression2 and substitutes 'Withheld' for the unknown values:

```
SELECT customer_name, NVL(title, 'Withheld') as title
FROM customer_dimension
ORDER BY title;
     customer_name      | title
------------------------+-------
 Alexander I. Lang      | Dr.
 Steve S. Harris        | Dr.
```

```
 Daniel R. King         | Dr.
 Luigi I. Sanchez       | Dr.
 Duncan U. Carcetti     | Dr.
 Meghan K. Li           | Dr.
 Laura B. Perkins       | Dr.
 Samantha V. Robinson   | Dr.
 Joseph P. Wilson       | Mr.
 Kevin R. Miller        | Mr.
 Lauren D. Nguyen       | Mrs.
 Emily E. Goldberg      | Mrs.
 Darlene K. Harris      | Ms.
 Meghan J. Farmer       | Ms.
 Bettercare             | Withheld
 Ameristar              | Withheld
 Initech                | Withheld
(17 rows)
```

See Also

- CASE Expressions
- COALESCE
- ISNULL
- NVL2

NVL2

Takes three arguments. If the first argument is not NULL, it returns the second argument, otherwise it returns the third argument. The data types of the second and third arguments are implicitly cast to a common type if they don't agree, similar to COALESCE.

Behavior Type

Immutable

Syntax

```
NVL2 ( expression1 , expression2 , expression3 );
```

Parameters

- If *expression1* is not null, then NVL2 returns *expression2*.
- If *expression1* is null, then NVL2 returns *expression3*.

Notes

Arguments two and three can have any data type supported by Vertica.

Implementation is equivalent to the CASE expression:

```
 CASE WHEN expression1 IS NOT NULL THEN expression2 ELSE expression3
END;
```

Examples

In this example, expression1 is not null, so NVL2 returns expression2:

```
SELECT NVL2('very', 'fast', 'database');
nvl2
------
 fast
(1 row)
```

In this example, expression1 is null, so NVL2 returns expression3:

```
SELECT NVL2(null, 'fast', 'database');
nvl2
----------
 database
(1 row)
```

In the following example, expression1 (title) contains nulls, so NVL2 returns expression3 ('Withheld') and also substitutes the non-null values with the expression 'Known':

```
SELECT customer_name, NVL2(title, 'Known', 'Withheld')
as title
FROM customer_dimension
ORDER BY title;
     customer_name      | title
------------------------+-------
 Alexander I. Lang      | Known
 Steve S. Harris        | Known
 Daniel R. King         | Known
 Luigi I. Sanchez       | Known
 Duncan U. Carcetti     | Known
```

```

- COALESCE

ZEROIFNULL

Evaluates to 0 if the column is NULL.

Syntax

```
ZEROIFNULL(expression)
```

Parameters

expression	String to evaluate for NULL values, one of the following data types: • INTEGER • DOUBLE PRECISION • INTERVAL • NUMERIC

Examples

The following query returns scores for five students from table `test_results`, where `Score` is set to 0 for L. White, and null for S. Robinson and K. Johnson:

```
=> SELECT Name, Score FROM test_results;
    Name     | Score
-------------+-------
 J. Doe      |   100
 R. Smith    |    87
 L. White    |     0
 S. Robinson |
 K. Johnson  |
(5 rows)
```

The next query invokes ZEROIFNULL on column `Score`, so Vertica returns 0 for for S. Robinson and K. Johnson:

```
=> SELECT Name, ZEROIFNULL (Score) FROM test_results;
    Name     | ZEROIFNULL
-------------+------------
 J. Doe      |        100
 R. Smith    |         87
 L. White    |          0
 S. Robinson |          0
 K. Johnson  |          0
(5 rows)
```

You can also use ZEROIFNULL in `PARTITION BY` expressions, which must always resolve to a non-null value. For example:

```
CREATE TABLE t1 (a int, b int) PARTITION BY (ZEROIFNULL(a));
CREATE TABLE
```

Vertica invokes this function when it partitions table `t1`, typically during a load operation. During the load, the function checks the data of the `PARTITION BY` expression—in this case, column `a`—for null values. If encounters a null value in a given row, it sets the partition key to 0, instead of returning with an error.

Pattern Matching Functions

Used with the MATCH Clause, the Vertica pattern matching functions return additional data about the patterns found/output. For example, you can use these functions to return values representing the name of the event or pattern that matched the input row, the sequential number of the match, or a partition-wide unique identifier for the instance of the pattern that matched.

Pattern matching is particularly useful for clickstream analysis where you might want to identify users' actions based on their Web browsing behavior (page clicks). A typical online clickstream funnel is:

Company home page -> product home page -> search -> results -> purchase online

Using the above clickstream funnel, you can search for a match on the user's sequence of web clicks and identify that the user:

- Landed on the company home page.
- Navigated to the product page.
- Ran a search.
- Clicked a link from the search results.
- Made a purchase.

For examples that use this clickstream model, see Event Series Pattern Matching.

Note:
GROUP BY and PARTITION BY expressions do not support window functions.

See Also

- MATCH Clause
- Event Series Pattern Matching

EVENT_NAME

Returns a VARCHAR value representing the name of the event that matched the row.

Syntax

```
EVENT_NAME()
```

Notes

Pattern matching functions must be used in MATCH Clause syntax; for example, if you call EVENT_NAME() on its own, Vertica returns the following error message:

```
=> SELECT event_name();
ERROR:  query with pattern matching function event_name must include a MATCH clause
```

Example

Note:
This example uses the schema defined in Event Series Pattern Matching.

The following statement analyzes users' browsing history on `website2.com` and identifies patterns where the user landed on `website2.com` from another Web site (Entry) and browsed to any number of other pages (Onsite) before making a purchase (Purchase). The query also outputs the values for EVENT_NAME(), which is the name of the event that matched the row.

```
SELECT uid,
       sid,
       ts,
       refurl,
       pageurl,
       action,
       event_name()
FROM clickstream_log
MATCH
  (PARTITION BY uid, sid ORDER BY ts
   DEFINE
     Entry    AS RefURL  NOT ILIKE '%website2.com%' AND PageURL ILIKE '%website2.com%',
     Onsite   AS PageURL ILIKE     '%website2.com%' AND Action='V',
     Purchase AS PageURL ILIKE     '%website2.com%' AND Action = 'P'
   PATTERN
     P AS (Entry Onsite* Purchase)
   ROWS MATCH FIRST EVENT);
 uid | sid |    ts    |        refurl        |       pageurl        | action | event_name
-----+-----+----------+----------------------+----------------------+--------+------------
   1 | 100 | 12:00:00 | website1.com         | website2.com/home    | V      | Entry
   1 | 100 | 12:01:00 | website2.com/home    | website2.com/floby   | V      | Onsite
   1 | 100 | 12:02:00 | website2.com/floby   | website2.com/shamwow | V      | Onsite
   1 | 100 | 12:03:00 | website2.com/shamwow | website2.com/buy     | P      | Purchase
```

```
   2 | 100 | 12:10:00 | website1.com         | website2.com/home    | V      | Entry
   2 | 100 | 12:11:00 | website2.com/home    | website2.com/forks   | V      | Onsite
   2 | 100 | 12:13:00 | website2.com/forks   | website2.com/buy     | P      | Purchase
(7 rows)
```

See Also

- MATCH Clause
- MATCH_ID
- PATTERN_ID
- Event Series Pattern Matching

MATCH_ID

Returns a successful pattern match as an INTEGER value. The returned value is the ordinal position of a match within a partition.

Syntax

```
MATCH_ID()
```

Notes

Pattern matching functions must be used in MATCH Clause syntax; for example, if you call MATCH_ID() on its own, Vertica returns the following error message:

```
=> SELECT match_id();
ERROR:  query with pattern matching function match_id must include a MATCH clause
```

Example

Note:
This example uses the schema defined in Event Series Pattern Matching.

The following statement analyzes users' browsing history on a site called `website2.com` and identifies patterns where the user reached `website2.com` from another Web site (`Entry` in the `MATCH` clause) and browsed to any number of other pages (`Onsite`) before

making a purchase (Purchase). The query also outputs values for the MATCH_ID(), which represents a sequential number of the match.

```
SELECT uid,
       sid,
       ts,
       refurl,
       pageurl,
       action,
       match_id()
FROM clickstream_log
MATCH
  (PARTITION BY uid, sid ORDER BY ts
   DEFINE
     Entry    AS RefURL  NOT ILIKE '%website2.com%' AND PageURL ILIKE '%website2.com%',
     Onsite   AS PageURL ILIKE     '%website2.com%' AND Action='V',
     Purchase AS PageURL ILIKE     '%website2.com%' AND Action = 'P'
   PATTERN
     P AS (Entry Onsite* Purchase)
   ROWS MATCH FIRST EVENT);

uid | sid |    ts    |        refurl        |       pageurl        | action | match_id
----+-----+----------+----------------------+----------------------+--------+----------
1   | 100 | 12:00:00 | website1.com         | website2.com/home    | V      |          1
1   | 100 | 12:01:00 | website2.com/home    | website2.com/floby   | V      |          2
1   | 100 | 12:02:00 | website2.com/floby   | website2.com/shamwow | V      |          3
1   | 100 | 12:03:00 | website2.com/shamwow | website2.com/buy     | P      |          4
2   | 100 | 12:10:00 | website1.com         | website2.com/home    | V      |          1
2   | 100 | 12:11:00 | website2.com/home    | website2.com/forks   | V      |          2
2   | 100 | 12:13:00 | website2.com/forks   | website2.com/buy     | P      |          3
(7 rows)
```

See Also

- MATCH Clause
- EVENT_NAME
- PATTERN_ID
- Event Series Pattern Matching

PATTERN_ID

Returns an integer value that is a partition-wide unique identifier for the instance of the pattern that matched.

Syntax

```
PATTERN_ID()
```

Notes

Pattern matching functions must be used in MATCH Clause syntax; for example, if call PATTERN_ID() on its own, Vertica returns the following error message:

```
=> SELECT pattern_id();
ERROR:  query with pattern matching function pattern_id must include a MATCH clause
```

Example

Note:
This example uses the schema defined in Event Series Pattern Matching.

The following statement analyzes users' browsing history on website2.com and identifies patterns where the user landed on website2.com from another Web site (Entry) and browsed to any number of other pages (Onsite) before making a purchase (Purchase). The query also outputs values for PATTERN_ID(), which represents the partition-wide identifier for the instance of the pattern that matched.

```
SELECT uid,
       sid,
       ts,
       refurl,
       pageurl,
       action,
       pattern_id()
FROM clickstream_log
MATCH
  (PARTITION BY uid, sid ORDER BY ts
   DEFINE
     Entry    AS RefURL  NOT ILIKE '%website2.com%' AND PageURL ILIKE '%website2.com%',
     Onsite   AS PageURL ILIKE     '%website2.com%' AND Action='V',
     Purchase AS PageURL ILIKE     '%website2.com%' AND Action = 'P'
   PATTERN
     P AS (Entry Onsite* Purchase)
   ROWS MATCH FIRST EVENT);

uid | sid |    ts    |        refurl        |       pageurl        | action | pattern_id
----+-----+----------+----------------------+----------------------+--------+------------
1   | 100 | 12:00:00 | website1.com         | website2.com/home    | V      |          1
1   | 100 | 12:01:00 | website2.com/home    | website2.com/floby   | V      |          1
1   | 100 | 12:02:00 | website2.com/floby   | website2.com/shamwow | V      |          1
1   | 100 | 12:03:00 | website2.com/shamwow | website2.com/buy     | P      |          1
2   | 100 | 12:10:00 | website1.com         | website2.com/home    | V      |          1

Regular Expression Functions

A regular expression lets you perform pattern matching on strings of characters. The regular expression syntax allows you to precisely define the pattern used to match strings, giving you much greater control than wildcard matching used in the LIKE predicate. The Vertica regular expression functions let you perform tasks such as determining if a string value matches a pattern, extracting a portion of a string that matches a pattern, or counting the number of times a pattern occurs within a string.

Vertica uses the Perl Compatible Regular Expression (PCRE) library to evaluate regular expressions. As its name implies, PCRE's regular expression syntax is compatible with the syntax used by the Perl 5 programming language. You can read PCRE's documentation about its library. However, if you are unfamiliar with using regular expressions, the Perl Regular Expressions Documentation is a good introduction.

Note:
The regular expression functions only operate on valid UTF-8 strings. If you try using a regular expression function on a string that is not valid UTF-8, the query fails with an error. To prevent an error from occurring, use the ISUTF8 function as an initial clause to ensure the strings you pass to the regular expression functions are valid UTF-8 strings. Alternatively, or you can use the 'b' argument to treat the strings as binary octets, rather than UTF-8 encoded strings.

ISUTF8

Tests whether a string is a valid UTF-8 string. Returns true if the string conforms to UTF-8 standards, and false otherwise. This function is useful to test strings for UTF-8 compliance before passing them to one of the regular expression functions, such as REGEXP_LIKE, which expect UTF-8 characters by default.

ISUTF8 checks for invalid UTF8 byte sequences, according to UTF-8 rules:

- invalid bytes
- an unexpected continuation byte
- a start byte not followed by enough continuation bytes
- an Overload Encoding

The presence of an invalid UTF8 byte sequence results in a return value of false.

Syntax

```
ISUTF8( string );
```

Parameters

string	The string to test for UTF-8 compliance.

Examples

```
=> SELECT ISUTF8(E'\xC2\xBF'); -- UTF-8 INVERTED QUESTION MARK ISUTF8
--------
 t
(1 row)

=> SELECT ISUTF8(E'\xC2\xC0'); -- UNDEFINED UTF-8 CHARACTER
 ISUTF8
--------
 f
(1 row)
```

REGEXP_COUNT

Returns the number times a regular expression matches a string. This function operates on UTF-8 strings using the default locale, even if the locale has been set to something else. If you are porting a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

Syntax

```
REGEXP_COUNT( string, pattern[, position[, regexp-modifier ]… ] )
```

Parameters

string	The VARCHAR or LONG VARCHAR string to search for a regular expression pattern match. If string exists in a __raw__ column of

	a flex or columnar table, cast string to a `LONG VARCHAR` before searching for *`pattern`*.
`pattern`	The regular expression to search for within `string`. The syntax of the regular expression is compatible with the Perl 5 regular expression syntax. See the Perl Regular Expressions Documentation for details.
`position`	The number of characters from the start of the string where the function should start searching for matches. By default, the function begins searching for a match at the first (leftmost) character. Setting this parameter to a value greater than 1 begins searching for a match at the *n*th character you specify. **Default value:** 1
`regexp-modifier`	One or more single-character flags that modify how the regular expression finds matches in *`string`*: • `b`: Treat strings as binary octets, rather than UTF-8 characters. • `c`: Force the match to be case sensitive (the default). • `i`: Force the match to be case insensitive. • `m`: Treat the string to match as multiple lines. Using this modifier, the start of line (`^`) and end of line (`$`) regular expression operators match line breaks (`\n`) within the string. Without the `m` modifier, the start and end of line operators match only the start and end of the string. • `n`: Allow the single character regular expression operator (`.`) to match a newline (`\n`). Without the `n` modifier, the `.` operator matches any character except a newline. • `x`: Add comments to your regular expressions. Using the `x` modifier causes the function to ignore all unescaped space characters and comments in the regular expression. Comments start with a hash (#) character and end with a newline (`\n`). All spaces in the regular expression that you want to be matched in strings must be escaped with a backslash (`\`) character.

Examples

Count the number of occurrences of the substring *an* in the string "a man, a plan, a canal, Panama."

```
=> SELECT REGEXP_COUNT('a man, a plan, a canal: Panama', 'an');
 REGEXP_COUNT
--------------
            4
(1 row)
```

Find the number of occurrences of the substring *an* in the string "a man, a plan, a canal: Panama" starting with the fifth character.

```
=> SELECT REGEXP_COUNT('a man, a plan, a canal: Panama', 'an',5);
 REGEXP_COUNT
--------------
            3
(1 row)
```

Find the number of occurrences of a substring containing a lower-case character followed by *an*. In the first example, do not use a modifier. In the second example, use the `i` modifier to force the regular expression to ignore case.

```
=> SELECT REGEXP_COUNT('a man, a plan, a canal: Panama', '[a-z]an');
 REGEXP_COUNT
--------------
            3
(1 row)
=> SELECT REGEXP_COUNT('a man, a plan, a canal: Panama', '[a-z]an', 1, 'i');

 REGEXP_COUNT
--------------
            4
```

REGEXP_ILIKE

Returns true if the string contains a match for the regular expression. This function is similar to the LIKE predicate, except that it uses a case insensitive regular expression, rather than simple wildcard character matching. This function operates on UTF-8 strings using the default locale, even if the locale has been set to something else.
If you are porting a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

Syntax

```
REGEXP_ILIKE( string, pattern )
```

Parameters

pattern	The VARCHAR or LONG VARCHAR string to search for a regular expression pattern match. If string exists in a __raw__ column of a flex or columnar table, cast string to a LONG VARCHAR before searching for *pattern*.
pattern	A string containing the regular expression to match against the string. The syntax of the regular expression is compatible with the Perl 5 regular expression syntax. See the Perl Regular Expressions Documentation for details.

Examples

This example creates a table containing several strings to demonstrate regular expressions.

1. Create a table (longvc) with a single, long varchar column (body) and insert data with some distinct characters:

```
=> CREATE table longvc(body long varchar (1048576));
CREATE TABLE
=> insert into longvc values ('На берегу пустынных волн');
=> insert into longvc values ('Voin syödä lasia, se ei vahingoita minua');
=> insert into longvc values ('私はガラスを食べられます。それは私を傷つけません。');
=> insert into longvc values ('Je peux manger du verre, ça ne me fait pas mal.');
=> insert into longvc values ('zésbaésbaa');
=> SELECT * FROM longvc;
                       body
-----------------------------------------------
 На берегу пустынных волн
 Voin syödä lasia, se ei vahingoita minua
 私はガラスを食べられます。それは私を傷つけません。
 Je peux manger du verre, ça ne me fait pas mal.
 zésbaésbaa
(5 rows)
```

2. Pattern match table rows containing a specific character ('ç'), added as part of Step 1:

```
=> SELECT * FROM longvc where regexp_ilike(body, 'ç');
                       body
```

```
------------------------------------------------
 Je peux manger du verre, ça ne me fait pas mal.
(1 row)
```

3. Select all rows that contain the substring `'a'`:

```
=> SELECT * FROM longvc where regexp_ilike(body, 'a');
                      body
------------------------------------------------
 Je peux manger du verre, ça ne me fait pas mal.
 Voin syödä lasia, se ei vahingoita minua
 zésbaésbaa
(3 rows)
```

REGEXP_INSTR

Returns the starting or ending position in a string where a regular expression matches. This function returns 0 if no match for the regular expression is found in the string. This function operates on UTF-8 strings using the default locale, even if the locale has been set to something else.
If you are porting a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

Syntax

```
REGEXP_INSTR( string, pattern [, position[, occurrence[, return-position[, regexp-modifier ]… [,
captured-subexp ]]]] )
```

Parameters

string	The VARCHAR or LONG VARCHAR string to search for a regular expression pattern match. If string exists in a __raw__ column of a flex or columnar table, cast string to a LONG VARCHAR before searching for *pattern*.
pattern	The regular expression to search for within the string. The syntax of the regular expression is compatible with the Perl 5 regular expression syntax. See Perl Regular Expressions Documentation for details.
position	The number of characters from the start of the string where the

	function should start searching for matches. By default, the function begins searching for a match at the first (leftmost) character. Setting this parameter to a value greater than 1 begins searching for a match at the *n*th character you specify. **Default value:** 1
occurrence	Controls which occurrence of a pattern match in the string to return. By default, the function returns the position of the first matching substring. Use this parameter to find the position of subsequent matching substrings. For example, setting this parameter to 3 returns the position of the third substring that matches the pattern. **Default value:** 1
return-position	Sets the position within the string to return. Using the default position (0), the function returns the string position of the first character of the substring that matches the pattern. If you set *return-position* to 1, the function returns the position of the first character after the end of the matching substring. **Default value:** 0
regexp-modifier	One or more single-character flags that modify how the regular expression finds matches in *string*: • `b`: Treat strings as binary octets, rather than UTF-8 characters. • `c`: Force the match to be case sensitive (the default). • `i`: Force the match to be case insensitive. • `m`: Treat the string to match as multiple lines. Using this modifier, the start of line (`^`) and end of line (`$`) regular expression operators match line breaks (`\n`) within the string. Without the `m` modifier, the start and end of line operators match only the start and end of the string. • `n`: Allow the single character regular expression operator (`.`) to match a newline (`\n`). Without the `n` modifier, the `.` operator matches any character except a newline. • `x`: Add comments to your regular expressions. Using the `x` modifier causes the function to ignore all unescaped space characters and comments in the regular expression. Comments start with a hash (#) character and end with a

	newline (\n). All spaces in the regular expression that you want to be matched in strings must be escaped with a backslash (\) character.
captured-subexp	The captured subexpression whose position to return. By default, the function returns the position of the first character in *string* that matches the regular expression. If you set this value from 1 – 9, the function returns the subexpression captured by the corresponding set of parentheses in the regular expression. For example, setting this value to 3 returns the substring captured by the third set of parentheses in the regular expression. **Default value:** 0 **Note:** The subexpressions are numbered left to right, based on the appearance of opening parenthesis, so nested regular expressions . For example, in the regular expression \s*(\w+\s+(\w+)), subexpression 1 is the one that captures everything but any leading whitespaces.

Examples

Find the first occurrence of a sequence of letters starting with the letter e and ending with the letter y in the phrase "easy come, easy go."

```
=> SELECT REGEXP_INSTR('easy come, easy go','e\w*y');
 REGEXP_INSTR
--------------
            1
(1 row)
```

Find the first sequence of letters starting with the letter e and ending with the letter y in the string "easy come, easy go" starting at the second character (2) ."

```
=> SELECT REGEXP_INSTR('easy come, easy go','e\w*y',2);
 REGEXP_INSTR
--------------
           12
(1 row)
```

Find the second sequence of letters starting with the letter e and ending with the letter y in the string "easy come, easy go" starting at the first character.

```
=> SELECT REGEXP_INSTR('easy come, easy go','e\w*y',1,2);
 REGEXP_INSTR
--------------
           12
(1 row)
```

Find the position of the first character after the first whitespace in the string "easy come, easy go."

```
=> SELECT REGEXP_INSTR('easy come, easy go','\s',1,1,1);
 REGEXP_INSTR
--------------
            6
(1 row)
```

Find the position of the start of the third word in a string by capturing each word as a subexpression, and returning the third subexpression's start position.

```
=> SELECT REGEXP_INSTR('one two three','(\w+)\s+(\w+)\s+(\w+)', 1,1,0,'',3);
REGEXP_INSTR
--------------
            9
(1 row)
```

REGEXP_LIKE

Returns true if the string matches the regular expression. This function is similar to the LIKE predicate, except that it uses regular expressions rather than simple wildcard character matching. This function operates on UTF-8 strings using the default locale, even if the locale has been set to something else.
If you are porting a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

Syntax

```
REGEXP_LIKE( string, pattern[, regexp-modifier ]… )
```

Parameters

string	The VARCHAR or LONG VARCHAR string to search for a regular expression pattern match. If string exists in a __raw__ column of a flex or columnar table, cast string to a LONG VARCHAR before

	searching for *pattern*.
pattern	A string containing the regular expression to match against the string. The syntax of the regular expression is compatible with the Perl 5 regular expression syntax. See the Perl Regular Expressions Documentation for details.
regexp-modifier	One or more single-character flags that modify how the regular expression finds matches in *string*: • `b`: Treat strings as binary octets, rather than UTF-8 characters. • `c`: Force the match to be case sensitive (the default). • `i`: Force the match to be case insensitive. • `m`: Treat the string to match as multiple lines. Using this modifier, the start of line (`^`) and end of line (`$`) regular expression operators match line breaks (`\n`) within the string. Without the `m` modifier, the start and end of line operators match only the start and end of the string. • `n`: Allow the single character regular expression operator (`.`) to match a newline (`\n`). Without the `n` modifier, the `.` operator matches any character except a newline. • `x`: Add comments to your regular expressions. Using the `x` modifier causes the function to ignore all unescaped space characters and comments in the regular expression. Comments start with a hash (#) character and end with a newline (`\n`). All spaces in the regular expression that you want to be matched in strings must be escaped with a backslash (`\`) character.

Examples

This example creates a table containing several strings to demonstrate regular expressions.

```
=> CREATE TABLE t (v VARCHAR);
CREATE TABLE
=> CREATE PROJECTION t1 AS SELECT * FROM t;
CREATE PROJECTION
=> COPY t FROM stdin;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> aaa
>> Aaa
>> abc
```

```
>> abc1
>> 123
>> \.
=> SELECT * FROM t;
   v
-------
 aaa
 Aaa
 abc
 abc1
 123
(5 rows)
```

Select all records in the table that contain the letter "a."

```
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'a');
  v
------
 Aaa
 aaa
 abc
 abc1
(4 rows)
```

Select all of the rows in the table that start with the letter "a."

```
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'^a');
  v
------
 aaa
 abc
 abc1
(3 rows)
```

Select all rows that contain the substring "aa."

```
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'aa');
  v
-----
 Aaa
 aaa
(2 rows)
```

Select all rows that contain a digit.

```
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'\d');
  v
------
 123
 abc1
(2 rows)
```

Select all rows that contain the substring "aaa."

```
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'aaa');
  v
-----
 aaa
(1 row)
```

Select all rows that contain the substring "aaa" using case insensitive matching.

```
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'aaa', 'i');
  v
-----
 Aaa
 aaa
(2 rows)
```

Select rows that contain the substring "a b c."

```
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'a b c');
 v
---
(0 rows)
```

Select rows that contain the substring "a b c" ignoring space within the regular expression.

```
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'a b c','x');
  v
------
 abc
 abc1
(2 rows)
```

Add multi-line rows to demonstrate using the "m" modifier.

```
=> COPY t FROM stdin RECORD TERMINATOR '!';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> Record 1 line 1
>> Record 1 line 2
>> Record 1 line 3!
>> Record 2 line 1
>> Record 2 line 2
>> Record 2 line 3!
>> \.
```

Select rows that start with the substring "Record" and end with the substring "line 2."

```
=> SELECT v from t WHERE REGEXP_LIKE(v,'^Record.*line 2$');
 v
---
(0 rows)
```

Select rows that start with the substring "Record" and end with the substring "line 2," treating multiple lines as separate strings.

```
=> SELECT v from t WHERE REGEXP_LIKE(v,'^Record.*line 2$','m');
                        v
-------------------------------------------------

Record 2 line 1
Record 2 line 2
Record 2 line 3
Record 1 line 1
Record 1 line 2
Record 1 line 3
(2 rows)
```

REGEXP_NOT_ILIKE

Returns true if the string does not match the case-insensitive regular expression. This function operates on UTF-8 strings using the default locale, even if the locale has been set to something else.
If you are porting a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

Syntax

```
REGEXP_NOT_ILIKE( string, pattern )
```

Parameters

string	The VARCHAR or LONG VARCHAR string to search for a regular expression pattern match. If string exists in a __raw__ column of a flex or columnar table, cast string to a LONG VARCHAR before searching for *pattern*.
pattern	A string containing the regular expression to match against the string. The syntax of the regular expression is compatible with the Perl 5 regular expression syntax. See the Perl Regular Expressions Documentation for details.

Examples

This example creates a table containing strings to demonstrate regular expressions.

1. Create a table (longvc) with a single, long varchar column (body). Then, insert data with some distinct characters, and query the table contents:

```
=> CREATE table longvc(body long varchar (1048576));
CREATE TABLE
=> insert into longvc values ('На берегу пустынных волн');
=> insert into longvc values ('Voin syödä lasia, se ei vahingoita minua');
=> insert into longvc values ('私はガラスを食べられます。それは私を傷つけません。');
=> insert into longvc values ('Je peux manger du verre, ça ne me fait pas mal.');
=> insert into longvc values ('zésbaésbaa');
=> SELECT * FROM longvc;
                      body
-----------------------------------------------
 На берегу пустынных волн
 Voin syödä lasia, se ei vahingoita minua
 私はガラスを食べられます。それは私を傷つけません。
 Je peux manger du verre, ça ne me fait pas mal.
 zésbaésbaa
(5 rows)
```

2. Use REGEXP_NOT_ILIKE to return rows that do not contain a specific character ('ç'):

```
=> SELECT * FROM longvc where regexp_not_ilike(body, 'ç');
                        body
-----------------------------------------------------
 Voin syödä lasia, se ei vahingoita minua
 zésbaésbaa
 На берегу пустынных волн
 私はガラスを食べられます。それは私を傷つけません。
(4 rows)
```

3. Pattern match all rows that do not contain the substring 'a':

```
=> SELECT * FROM longvc where regexp_not_ilike(body, 'a');
                        body
-----------------------------------------------------
 На берегу пустынных волн
 私はガラスを食べられます。それは私を傷つけません。
(2 rows)
```

REGEXP_NOT_LIKE

Returns true if the string does not contain a match for the regular expression. This function is a case sensitive regular expression. This function operates on UTF-8 strings using the default locale, even if the locale has been set to something else.
If you are porting a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

Syntax

```
REGEXP_NOT_LIKE( string, pattern )
```

Parameters

string	The VARCHAR or LONG VARCHAR string to search for a regular expression pattern match. If string exists in a __raw__ column of a flex or columnar table, cast string to a LONG VARCHAR before searching for *pattern*.
pattern	A string containing the regular expression to match against the string. The syntax of the regular expression is compatible with the Perl 5 regular expression syntax. See the Perl Regular Expressions Documentation for details.

Examples

These examples demonstrate the REGEXP_NOT_LIKE regular expression function.

1. Create a table (longvc) with a single, long varchar column (body). Then, insert data with some distinct characters, and query the table contents:

```
=> CREATE table longvc(body long varchar (1048576));
CREATE TABLE

=> insert into longvc values ('На берегу пустынных волн');
=> insert into longvc values ('Voin syödä lasia, se ei vahingoita minua');
=> insert into longvc values ('私はガラスを食べられます。それは私を傷つけません。');
=> insert into longvc values ('Je peux manger du verre, ça ne me fait pas mal.');
=> insert into longvc values ('zésbaésbaa');

=> SELECT * FROM longvc;
                      body
-----------------------------------------------
 На берегу пустынных волн
 Voin syödä lasia, se ei vahingoita minua
 私はガラスを食べられます。それは私を傷つけません。
 Je peux manger du verre, ça ne me fait pas mal.
 zésbaésbaa
(5 rows)
```

2. Use REGEXP_NOT_LIKE to return rows that do not contain a specific character ('ç'):

```
=> SELECT * FROM longvc where regexp_not_like(body, 'ç');
                       body
-----------------------------------------------------
```

```
 Voin syödä lasia, se ei vahingoita minua
 zésbaésbaa
 На берегу пустынных волн
 私はガラスを食べられます。それは私を傷つけません。
(4 rows)
```

3. Return all rows that do not contain these characters (`'.*ö.*ä'`):

```
=> SELECT * FROM longvc where regexp_not_like(body, '.*ö.*ä');
                        body
-----------------------------------------------------
 Je peux manger du verre, ça ne me fait pas mal.
 zésbaésbaa
 На берегу пустынных волн
 私はガラスを食べられます。それは私を傷つけません。
(4 rows)
```

4. Pattern match all rows that do not contain these specific characters (`'z.*eśbaa'`):

```
=> SELECT * FROM longvc where regexp_not_like(body, 'z.*eśbaa');
                        body
-----------------------------------------------------
 Je peux manger du verre, ça ne me fait pas mal.
 Voin syödä lasia, se ei vahingoita minua
 zésbaésbaa
 На берегу пустынных волн
 私はガラスを食べられます。それは私を傷つけません。
(5 rows)
```

REGEXP_REPLACE

Replace all occurrences of a substring that match a regular expression with another substring. It is similar to the REPLACE function, except it uses a regular expression to select the substring to be replaced. This function operates on UTF-8 strings using the default locale, even if the locale has been set to something else.
If you are porting a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

Syntax

REGEXP_REPLACE(*string*, *target* [, *replacement*[, *position*[, *occurrence*[…] [, *regexp-modifier*]]]])

Parameters

string	The VARCHAR or LONG VARCHAR string to search for a regular expression pattern match. If string exists in a __raw__ column of

	a flex or columnar table, cast string to a `LONG VARCHAR` before searching for *`pattern`*.
`target`	The regular expression to search for within the string. The syntax of the regular expression is compatible with the Perl 5 regular expression syntax. See the Perl Regular Expressions Documentation for details.
`replacement`	The string to replace matched substrings. If you do not supply a *`replacement`*, the function deletes matched substrings. The replacement string can contain backreferences for substrings captured by the regular expression. The first captured substring is inserted into the replacement string using `\1`, the second `\2`, and so on.
`position`	The number of characters from the start of the string where the function should start searching for matches. By default, the function begins searching for a match at the first (leftmost) character. Setting this parameter to a value greater than 1 begins searching for a match at the *n*th character you specify. **Default value:** 1
`occurrence`	Controls which occurrence of a pattern match in the string to return. By default, the function returns the position of the first matching substring. Use this parameter to find the position of subsequent matching substrings. For example, setting this parameter to 3 returns the position of the third substring that matches the pattern. **Default value:** 1
`regexp-modifier`	One or more single-character flags that modify how the regular expression finds matches in *`string`*: • `b`: Treat strings as binary octets, rather than UTF-8 characters. • `c`: Force the match to be case sensitive (the default). • `i`: Force the match to be case insensitive. • `m`: Treat the string to match as multiple lines. Using this modifier, the start of line (`^`) and end of line (`$`) regular expression operators match line breaks (`\n`) within the string. Without the `m` modifier, the start and end of line

	operators match only the start and end of the string. • n: Allow the single character regular expression operator (.) to match a newline (\n). Without the n modifier, the . operator matches any character except a newline. • x: Add comments to your regular expressions. Using the x modifier causes the function to ignore all unescaped space characters and comments in the regular expression. Comments start with a hash (#) character and end with a newline (\n). All spaces in the regular expression that you want to be matched in strings must be escaped with a backslash (\) character.

Another key difference between Oracle and Vertica is that Vertica can handle an unlimited number of captured subexpressions, while Oracle is limited to nine.

In Vertica, you can use `\10` in the replacement pattern to access the substring captured by the tenth set of parentheses in the regular expression. In Oracle, `\10` is treated as the substring captured by the first set of parentheses, followed by a zero. To force this Oracle behavior in Vertica, use the `\g` back reference and enclose the number of the captured subexpression in curly braces. For example, `\g{1}0` is the substring captured by the first set of parentheses followed by a zero.

You can also name captured subexpressions to make your regular expressions less ambiguous. See the PCRE documentation for details.

Examples

Find groups of "word characters" (letters, numbers and underscore) ending with "thy" in the string "healthy, wealthy, and wise" and replace them with nothing.

```
=> SELECT REGEXP_REPLACE('healthy, wealthy, and wise','\w+thy');
 REGEXP_REPLACE
----------------
 , , and wise
(1 row)
```

Find groups of word characters ending with "thy" and replace with the string "something."

```
=> SELECT REGEXP_REPLACE('healthy, wealthy, and wise','\w+thy', 'something');
         REGEXP_REPLACE
--------------------------------
 something, something, and wise
(1 row)
```

Find groups of word characters ending with "thy" and replace with the string "something" starting at the third character in the string.

```
=> SELECT REGEXP_REPLACE('healthy, wealthy, and wise','\w+thy', 'something', 3);
          REGEXP_REPLACE
---------------------------------
 hesomething, something, and wise
(1 row)
```

Replace the second group of word characters ending with "thy" with the string "something."

```
=> SELECT REGEXP_REPLACE('healthy, wealthy, and wise','\w+thy', 'something', 1, 2);
        REGEXP_REPLACE
------------------------------
 healthy, something, and wise
(1 row)
```

Find groups of word characters ending with "thy" capturing the letters before the "thy", and replace with the captured letters plus the letters "ish."

```
=> SELECT REGEXP_REPLACE('healthy, wealthy, and wise','(\w+)thy', '\1ish');
       REGEXP_REPLACE
---------------------------
 healish, wealish, and wise
(1 row)
```

Create a table to demonstrate replacing strings in a query.

```
=> CREATE TABLE customers (name varchar(50), phone varchar(11));
CREATE TABLE
=> CREATE PROJECTION customers1 AS SELECT * FROM customers;
CREATE PROJECTION
=> COPY customers FROM stdin;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> Able, Adam|17815551234
>> Baker,Bob|18005551111
>> Chu,Cindy|16175559876
>> Dodd,Dinara|15083452121
>> \.
```

Query the customers, using REGEXP_REPLACE to format the phone numbers.

```
=> SELECT name, REGEXP_REPLACE(phone, '(\d)(\d{3})(\d{3})(\d{4})',
'\1-(\2) \3-\4') as phone FROM customers;
    name     |      phone
-------------+------------------
 Able, Adam  | 1-(781) 555-1234
 Baker,Bob   | 1-(800) 555-1111
 Chu,Cindy   | 1-(617) 555-9876
 Dodd,Dinara | 1-(508) 345-2121
(4 rows)
```

REGEXP_SUBSTR

Returns the substring that matches a regular expression within a string. If no matches are found, this function returns NULL. This is different from an empty string, which the function can return if the regular expression matches a zero-length string. This function operates on UTF-8 strings using the default locale, even if the locale has been set to something else. If you are porting a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

Syntax

```
REGEXP_SUBSTR( string, pattern [, position[,  occurrence[, regexp-modifier[, captured-subexp ]]… ]] )
```

Parameters

string	The VARCHAR or LONG VARCHAR string to search for a regular expression pattern match. If string exists in a __raw__ column of a flex or columnar table, cast string to a LONG VARCHAR before searching for *pattern*.
pattern	The regular expression to find a substring to extract. The syntax of the regular expression is compatible with the Perl 5 regular expression syntax. See the Perl Regular Expressions Documentation for details.
position	The number of characters from the start of the string where the function should start searching for matches. By default, the function begins searching for a match at the first (leftmost) character. Setting this parameter to a value greater than 1 begins searching for a match at the *n*th character you specify. **Default value:** 1
occurrence	Controls which occurrence of a pattern match in the string to return. By default, the function returns the position of the first matching substring. Use this parameter to find the position of subsequent matching substrings. For example, setting this parameter to 3 returns the position of the third substring that

	matches the pattern. **Default value:** 1
regexp-modifier	One or more single-character flags that modify how the regular expression finds matches in *string*: • b: Treat strings as binary octets, rather than UTF-8 characters. • c: Force the match to be case sensitive (the default). • i: Force the match to be case insensitive. • m: Treat the string to match as multiple lines. Using this modifier, the start of line (^) and end of line ($) regular expression operators match line breaks (\n) within the string. Without the m modifier, the start and end of line operators match only the start and end of the string. • n: Allow the single character regular expression operator (.) to match a newline (\n). Without the n modifier, the . operator matches any character except a newline. • x: Add comments to your regular expressions. Using the x modifier causes the function to ignore all unescaped space characters and comments in the regular expression. Comments start with a hash (#) character and end with a newline (\n). All spaces in the regular expression that you want to be matched in strings must be escaped with a backslash (\) character.
captured-subexp	The captured subexpression whose position to return. By default, the function returns the position of the first character in *string* that matches the regular expression. If you set this value from 1 – 9, the function returns the subexpression captured by the corresponding set of parentheses in the regular expression. For example, setting this value to 3 returns the substring captured by the third set of parentheses in the regular expression. **Default value:** 0 **Note:** The subexpressions are numbered left to right, based on the appearance of opening parenthesis, so nested regular expressions . For example, in the regular expression \s*(\w+\s+(\w+)), subexpression 1 is the one that captures everything but any leading

	 whitespaces.

Examples

Select the first substring of letters that end with "thy."

```
=> SELECT REGEXP_SUBSTR('healthy, wealthy, and wise','\w+thy');
 REGEXP_SUBSTR
---------------
 healthy
(1 row)
```

Select the first substring of letters that ends with "thy" starting at the second character in the string.

```
=> SELECT REGEXP_SUBSTR('healthy, wealthy, and wise','\w+thy',2);
 REGEXP_SUBSTR
---------------
 ealthy
(1 row)
```

Select the second substring of letters that ends with "thy."

```
=> SELECT REGEXP_SUBSTR('healthy, wealthy, and wise','\w+thy',1,2);
 REGEXP_SUBSTR
---------------
 wealthy
(1 row)
```

Return the contents of the third captured subexpression, which captures the third word in the string.

```
=> SELECT REGEXP_SUBSTR('one two three', '(\w+)\s+(\w+)\s+(\w+)', 1, 1, '', 3);
 REGEXP_SUBSTR
---------------
 three
(1 row)
```

Sequence Functions

The sequence functions provide simple, multiuser-safe methods for obtaining successive sequence values from sequence objects.

CURRVAL

Returns the last value across all nodes that was set by NEXTVALon this sequence in the current session. If NEXTVAL was never called on this sequence since its creation, Vertica returns an error.

Behavior Type

Volatile

Syntax

```
CURRVAL('[[database.]schema.]sequence-name')
```

Parameters

[*database*.]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
sequence-name	The target sequence

Privileges

- SELECT privilege on sequence
- USAGE privilege on sequence schema

Restrictions

You cannot invoke CURRVAL in a SELECT statement, in the following contexts:

- WHERE clause
- GROUP BY clause
- ORDER BY clause
- DISTINCT clause
- UNION
- Subquery

You also cannot invoke CURRVAL to act on a sequence in:

- UPDATE or DELETE subqueries
- Views

Examples

See Creating and Using Named Sequences in the Administrator's Guide

LAST_INSERT_ID

Returns the last value of an AUTO_INCREMENT/IDENTITY column. If multiple sessions concurrently load the same table with an AUTO_INCREMENT/IDENTITY column, the function returns the last value generated for that column.

Note:
This function works only with AUTO_INCREMENT/IDENTITY columns. It does not work with named sequences.

Behavior Type

Volatile

Syntax

```
LAST_INSERT_ID()
```

Privileges

- Table owner
- USAGE privileges on the table schema

Examples

See AUTO_INCREMENT and IDENTITY Sequences in the Administrator's Guide.

NEXTVAL

Returns the next value in a sequence. Call NEXTVAL after creating a sequence to initialize the sequence with its default value. Thereafter, call NEXTVAL to increment the sequence value for ascending sequences, or decrement its value for descending sequences.

Behavior Type

Volatile

Syntax

```
NEXTVAL('[[database.]schema.]sequence')
```

Parameters

[*database* .]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.

sequence	Identifies the target sequence.

Privileges

- SELECT privilege on sequence
- USAGE privilege on sequence schema

Restrictions

You cannot invoke NEXTVAL in a SELECT statement, in the following contexts:

- WHERE clause
- GROUP BY clause
- ORDER BY clause
- DISTINCT clause
- UNION
- Subquery

You also cannot invoke NEXTVAL to act on a sequence in:

- UPDATE or DELETE subqueries
- Views

You can use subqueries to work around some of these restrictions. For example, to use sequences with a DISTINCT clause:

```
=> SELECT t.col1, shift_allocation_seq.NEXTVAL FROM (
     SELECT DISTINCT col1 FROM av_temp1) t;
```

Examples

See Creating and Using Named Sequences in the Administrator's Guide

CURRVAL

String Functions

String functions perform conversion, extraction, or manipulation operations on strings, or return information about strings.

This section describes functions and operators for examining and manipulating string values. Strings in this context include values of the types CHAR, VARCHAR, BINARY, and VARBINARY.

Unless otherwise noted, all of the functions listed in this section work on all four data types. As opposed to some other SQL implementations, Vertica keeps CHAR strings unpadded internally, padding them only on final output. So converting a CHAR(3) 'ab' to VARCHAR(5) results in a VARCHAR of length 2, not one with length 3 including a trailing space.

Some of the functions described here also work on data of non-string types by converting that data to a string representation first. Some functions work only on character strings, while others work only on binary strings. Many work for both. BINARY and VARBINARY functions ignore multibyte UTF-8 character boundaries.

Non-binary character string functions handle normalized multibyte UTF-8 characters, as specified by the Unicode Consortium. Unless otherwise specified, those character string functions for which it matters can optionally specify whether VARCHAR arguments should be interpreted as octet (byte) sequences, or as (locale-aware) sequences of UTF-8 characters. This is accomplished by adding "USING OCTETS" or "USING CHARACTERS" (default) as a parameter to the function.

Some character string functions are **stable** because in general UTF-8 case-conversion, searching and sorting can be locale dependent. Thus, LOWER is stable, while LOWERB is **immutable**. The USING OCTETS clause converts these functions into their "B" forms, so they become immutable. If the locale is set to collation=binary, which is the default, all string functions—except CHAR_LENGTH/CHARACTER_LENGTH, LENGTH, SUBSTR, and OVERLAY—are converted to their "B" forms and so are immutable.

BINARY implicitly converts to VARBINARY, so functions that take VARBINARY arguments work with BINARY.

ASCII

Converts the first character of a VARCHAR datatype to an INTEGER.

Behavior Type

Immutable

Syntax

```
ASCII ( expression )
```

Parameters

expression	(VARCHAR) is the string to convert.

Notes

- ASCII is the opposite of the CHR function.
- ASCII operates on UTF-8 characters, not only on single-byte ASCII characters. It continues to get the same results for the ASCII subset of UTF-8.

Examples

This example returns employees whose last name begins with M. The ASCII equivalent of M is 77:

```
=> SELECT employee_last_name FROM employee_dimension
      WHERE ASCII(SUBSTR(employee_last_name, 1, 1)) = 76
       LIMIT 5;
 employee_last_name
--------------------
 Lewis
 Lewis
 Lampert
 Lampert
 Li
(5 rows)
```

BIT_LENGTH

Returns the length of the string expression in bits (bytes * 8) as an INTEGER.

Behavior Type

Immutable

Syntax

```
BIT_LENGTH ( expression )
```

Parameters

expression	(CHAR or VARCHAR or BINARY or VARBINARY) is the string to convert.

Notes

BIT_LENGTH applies to the contents of VARCHAR and VARBINARY fields.

Examples

Expression	Result
`SELECT BIT_LENGTH('abc'::varbinary);`	24
`SELECT BIT_LENGTH('abc'::binary);`	8
`SELECT BIT_LENGTH(''::varbinary);`	0
`SELECT BIT_LENGTH(''::binary);`	8
`SELECT BIT_LENGTH(null::varbinary);`	
`SELECT BIT_LENGTH(null::binary);`	
`SELECT BIT_LENGTH(VARCHAR 'abc');`	24

SELECT BIT_LENGTH(CHAR 'abc');	24
SELECT BIT_LENGTH(CHAR(6) 'abc');	48
SELECT BIT_LENGTH(VARCHAR(6) 'abc');	24
SELECT BIT_LENGTH(BINARY(6) 'abc');	48
SELECT BIT_LENGTH(BINARY 'abc');	24
SELECT BIT_LENGTH(VARBINARY 'abc');	24
SELECT BIT_LENGTH(VARBINARY(6) 'abc');	24

See Also

- CHARACTER_LENGTH
- LENGTH
- OCTET_LENGTH

BITCOUNT

Returns the number of one-bits (sometimes referred to as set-bits) in the given VARBINARY value. This is also referred to as the population count.

Behavior Type

Immutable

Syntax

```
BITCOUNT ( expression )
```

Parameters

expression	(BINARY or VARBINARY) is the string to return.

Examples

```
=> SELECT BITCOUNT(HEX_TO_BINARY('0x10'));
 BITCOUNT
----------
        1
(1 row)
=> SELECT BITCOUNT(HEX_TO_BINARY('0xF0'));
 BITCOUNT
----------
        4
(1 row)
=> SELECT BITCOUNT(HEX_TO_BINARY('0xAB'));
 BITCOUNT
----------
        5
(1 row)
```

BITSTRING_TO_BINARY

Translates the given VARCHAR bitstring representation into a VARBINARY value. This function is the inverse of TO_BITSTRING.

Behavior Type

Immutable

Syntax

```
BITSTRING_TO_BINARY ( expression )
```

Parameters

expression	The VARCHAR string to process.

Examples

If there are an odd number of characters in the hex value, the first character is treated as the low nibble of the first (furthest to the left) byte.

```
=> SELECT BITSTRING_TO_BINARY('0110000101100010');
 BITSTRING_TO_BINARY
---------------------
 ab
(1 row)
```

BTRIM

Removes the longest string consisting only of specified characters from the start and end of a string.

Behavior Type

Immutable

Syntax

```
BTRIM ( expression [ , characters-to-remove ] )
```

Parameters

expression	(CHAR or VARCHAR) is the string to modify
characters-to-remove	(CHAR or VARCHAR) specifies the characters to remove. The default is the space character.

Example

```
=> SELECT BTRIM('xyxtrimyyx', 'xy');
 BTRIM
-------
 trim
```

```
(1 row)
```

See Also

- LTRIM
- RTRIM
- TRIM

CHARACTER_LENGTH

The CHARACTER_LENGTH() function:

- Returns the string length in UTF-8 characters for CHAR and VARCHAR columns
- Returns the string length in bytes (octets) for BINARY and VARBINARY columns
- Strips the padding from CHAR expressions but not from VARCHAR expressions
- Is identical to LENGTH() for CHAR and VARCHAR. For binary types, CHARACTER_LENGTH() is identical to OCTET_LENGTH().

Behavior Type

Immutable if `USING OCTETS`, **stable** otherwise.

Syntax

```
[ CHAR_LENGTH | CHARACTER_LENGTH ] ( expression ... [ USING { CHARACTERS | OCTETS } ] )
```

Parameters

expression	(CHAR or VARCHAR) is the string to measure
`USING CHARACTERS | OCTETS`	Determines whether the character length is expressed in characters (the default) or octets.

Examples

```
=> SELECT CHAR_LENGTH('1234  '::CHAR(10) USING OCTETS);
 octet_length
--------------
            4
(1 row)

=> SELECT CHAR_LENGTH('1234  '::VARCHAR(10));
 char_length
-------------
           6
(1 row)

=> SELECT CHAR_LENGTH(NULL::CHAR(10)) IS NULL;
 ?column?
----------
 t
(1 row)
```

See Also

- BIT_LENGTH

CHR

Converts the first character of an INTEGER datatype to a VARCHAR.

Behavior Type

Immutable

Syntax

CHR (*expression*)

Parameters

expression	(INTEGER) is the string to convert and is masked to a single character.

Notes

- CHR is the opposite of the ASCII function.
- CHR operates on UTF-8 characters, not only on single-byte ASCII characters. It continues to get the same results for the ASCII subset of UTF-8.

Examples

This example returns the VARCHAR datatype of the CHR expressions 65 and 97 from the employee table:

```
=> SELECT CHR(65), CHR(97) FROM employee;
 CHR | CHR
-----+-----
 A   | a
 A   | a
 A   | a
 A   | a
 A   | a
 A   | a
 A   | a
 A   | a
 A   | a
 A   | a
 A   | a
 A   | a
(12 rows)
```

COLLATION

Applies a collation to two or more strings. Use `COLLATION` with `ORDER BY`, `GROUP BY`, and equality clauses.

Syntax

```
COLLATION ( 'expression' [ , 'locale_or_collation_name' ] )
```

Parameters

'expression'	Any expression that evaluates to a column name or to two or

	more values of type CHAR or VARCHAR.

'locale_or_collation_name'	The ICU (International Components for Unicode) locale or collation name to use when collating the string. If you omit this parameter, COLLATION uses the collation associated with the session locale.
	
	To determine the current session locale, enter the vsql meta-command \locale:
	
	`=> \locale`
	`en_US@collation=binary`
	
	To set the locale and collation, use \locale as follows:
	
	`=> \locale en_US@collation=binary`
	`INFO 2567:  Canonical locale: 'en_US'`
	`Standard collation: 'LEN_KBINARY'`
	`English (United States)`

Locales

The locale used for COLLATION can be one of the following:

- The default locale
- A session locale
- A locale that you specify when you call COLLATION. If you specify the locale, Vertica applies the collation associated with that locale to the data. COLLATION does not modify the collation for any other columns in the table.

For a list of valid ICU locales, go to Locale Explorer (ICU).

Binary and Non-Binary Collations

The Vertica default locale is en_US@collation=binary, which uses *binary collation*. Binary collation compares binary representations of strings. Binary collation is fast, but it can result in a sort order where K precedes c because the binary representation of K is lower than c.

For non-binary collation, Vertica transforms the data according to the rules of the locale or the specified collation, and then applies the sorting rules. Suppose the locale collation is

non-binary and you request a GROUP BY on string data. In this case,Vertica calls COLLATION, whether or not you specify the function in your query.

For information about collation naming, see Collator Naming Scheme.

Examples

Collating GROUP BY Results

The following examples are based on a Premium_Customer table that contains the following data:

```
=> SELECT * FROM Premium_Customer;
 ID | LName   | FName
----+--------+---------
  1 | Mc Coy | Bob
  2 | Mc Coy | Janice
  3 | McCoy  | Jody
  4 | McCoy  | Peter
  5 | McCoy  | Brendon
  6 | Mccoy  | Cameron
  7 | Mccoy  | Lisa
```

The first statement shows how COLLATION applies the collation for the EN_US locale to the LName column for the locale EN_US. Vertica sorts the GROUP BY output as follows:

- Last names with spaces
- Last names where "coy" starts with a lowercase letter
- Last names where "Coy" starts with an uppercase letter

```
=> SELECT * FROM Premium_Customer ORDER BY COLLATION(LName, 'EN_US'), FName;
 ID | LName   | FName
----+--------+---------
  1 | Mc Coy | Bob
  2 | Mc Coy | Janice
  6 | Mccoy  | Cameron
  7 | Mccoy  | Lisa
  5 | McCoy  | Brendon
  3 | McCoy  | Jody
  4 | McCoy  | Peter
```

The next statement shows how COLLATION collates the LName column for the locale LEN_AS:

- LEN indicates the language (L) is English (EN).
- AS (Alternate Shifted) instructs COLLATION that lowercase letters come before uppercase (shifted) letters.

In the results, the last names in which "coy" starts with a lowercase letter precede the last names where "Coy" starts with an uppercase letter.

```
=> SELECT * FROM Premium_Customer ORDER BY COLLATION(LName, 'LEN_AS'), FName;
 ID | LName  | FName
----+--------+---------
  6 | Mccoy  | Cameron
  7 | Mccoy  | Lisa
  1 | Mc Coy | Bob
  5 | McCoy  | Brendon
  2 | Mc Coy | Janice
  3 | McCoy  | Jody
  4 | McCoy  | Peter
```

Comparing Strings with an Equality Clause

In the following query, `COLLATION` removes spaces and punctuation when comparing two strings in English. It then determines whether the two strings still have the same value after the punctuation has been removed:

```
=> SELECT COLLATION ('U.S.A', 'LEN_AS') = COLLATION('USA', 'LEN_AS');
?column?
----------
 t
```

Sorting Strings in Non-English Languages

The following table contains data that uses the German character eszett, ß:

```
=> SELECT * FROM t1;
     a      | b | c
------------+---+----
 ßstringß   | 1 | 10
 SSstringSS | 2 | 20
 random1    | 3 | 30
 random1    | 4 | 40
 random2    | 5 | 50
```

When you specify the collation `LDE_S1`:

- `LDE` indicates the language (`L`) is German (`DE`).
- `S1` indicates the strength (`S`) of 1 (primary). This value indicates that the collation does not need to consider accents and case.

The query returns the data in the following order:

```
=> SELECT a FROM t1 ORDER BY COLLATION(a, 'LDE_S1'));
     a
------------
 random1
 random1
 random2
```

```
SSstringSS
ßstringß
```

CONCAT

Used to concatenate two strings.

Syntax

```
CONCAT ('string1','string2')
```

Behavior Type

Immutable

Parameters

'string1'	Can be any datatype.
'string2'	

Restrictions

Varbinary and long varbinary types cannot be mixed with other types. These types return varbinary and long varbinary, respectively.

Similarly, long varchar types return long varchar.

Otherwise, the result is varchar.

Note:
If either argument is null, concat returns null.

Example

The following simple examples use a sample table named `alphabet`, which contains two rows, `letter1` and `letter2`. The contents are as follows.

```
=> CREATE TABLE alphabet (letter1 varchar(2), letter2 varchar(2));
CREATE TABLE
=> COPY alphabet FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> A|B
>> C|D
>> \.
=> SELECT * FROM alphabet;
 letter1 | letter2
---------+---------
 C       | D
 A       | B
(2 rows)
```

The following example concatenates the contents of the first column with a character string.

```
=> SELECT CONCAT(letter1, ' is a letter') FROM alphabet;
    CONCAT
---------------
 A is a letter
 C is a letter
(2 rows)
```

The following example nests the CONCAT function.

```
=> SELECT CONCAT(CONCAT(letter1, ' and '), CONCAT(letter2, ' are both letters')) FROM alphabet;
          CONCAT
--------------------------
 C and D are both letters
 A and B are both letters
(2 rows)
```

DECODE

Compares *expression* to each search value one by one. If *expression* is equal to a search, the function returns the corresponding result. If no match is found, the function returns default. If default is omitted, the function returns null.

DECODE is similar to the IF-THEN-ELSE and CASE expressions:

```
CASE expression
[WHEN search THEN result]
[WHEN search THEN result]

...
[ELSE default];
```

The arguments can have any data type supported by Vertica. The result types of individual results are promoted to the least common type that can be used to represent all of them. This leads to a character string type, an exact numeric type, an approximate numeric type, or a DATETIME type, where all the various result arguments must be of the same type grouping.

Behavior Type

Immutable

Syntax

DECODE (*expression, search, result* [, *search, result*]...[, *default*])

Parameters

expression	The value to compare.
search	The value compared against *expression*.
result	The value returned, if *expression* is equal to search.
default	Optional. If no matches are found, DECODE returns default. If default is omitted, then DECODE returns NULL (if no matches are found).

Example

The following example converts numeric values in the weight column from the product_ dimension table to descriptive values in the output.

```
=> SELECT product_description, DECODE(weight,
      2, 'Light',
     50, 'Medium',
     71, 'Heavy',
     99, 'Call for help',
         'N/A')
  FROM product_dimension
  WHERE category_description = 'Food'
  AND department_description = 'Canned Goods'
  AND sku_number BETWEEN 'SKU-#49750' AND 'SKU-#49999'
  LIMIT 15;
       product_description        |     case
----------------------------------+---------------
```

```
 Brand #499 canned corn            | N/A
 Brand #49900 fruit cocktail       | Medium
 Brand #49837 canned tomatoes      | Heavy
 Brand #49782 canned peaches       | N/A
 Brand #49805 chicken noodle soup  | N/A
 Brand #49944 canned chicken broth | N/A
 Brand #49819 canned chili         | N/A
 Brand #49848 baked beans          | N/A
 Brand #49989 minestrone soup      | N/A
 Brand #49778 canned peaches       | N/A
 Brand #49770 canned peaches       | N/A
 Brand #4977 fruit cocktail        | N/A
 Brand #49933 canned olives        | N/A
 Brand #49750 canned olives        | Call for help
 Brand #49777 canned tomatoes      | N/A
(15 rows)
```

GREATEST

Returns the largest value in a list of expressions.

Behavior Type

Stable

Syntax

`GREATEST ( expression1, expression2, ... expression-n )`

Parameters

expression1, *expression2*, and *expression-n* are the expressions to be evaluated.

Notes

- Works for all data types, and implicitly casts similar types. See Examples.
- A NULL value in any one of the expressions returns NULL.
- Depends on the collation setting of the locale.

Examples

This example returns 9 as the greatest in the list of expressions:

```
 => SELECT GREATEST(7, 5, 9);
  GREATEST
 ----------
         9
 (1 row)
```

Note that putting quotes around the integer expressions returns the same result as the first example:

```
=> SELECT GREATEST('7', '5', '9');
 GREATEST
----------
 9
(1 row)
```

The next example returns FLOAT 1.5 as the greatest because the integer is implicitly cast to float:

```
=> SELECT GREATEST(1, 1.5);
 GREATEST
----------
      1.5
(1 row)
```

The following example returns 'vertica' as the greatest:

```
=> SELECT GREATEST('vertica', 'analytic', 'database');
 GREATEST
----------
 vertica
(1 row)
```

Notice this next command returns NULL:

```
=> SELECT GREATEST('vertica', 'analytic', 'database', null);
 GREATEST
----------

(1 row)
```

And one more:

```
=> SELECT GREATEST('sit', 'site', 'sight');
 GREATEST
----------
 site
(1 row)
```

See Also

- LEAST

GREATESTB

Returns its greatest argument, using binary ordering, not UTF-8 character ordering.

Behavior Type

Immutable

Syntax

```
GREATESTB ( expression1, expression2, ... expression-n )
```

Parameters

expression1, *expression2*, and *expression-n* are the expressions to be evaluated.

Notes

- Works for all data types, and implicitly casts similar types. See Examples.
- A NULL value in any one of the expressions returns NULL.
- Depends on the collation setting of the locale.

Examples

The following command selects straße as the greatest in the series of inputs:

```
=> SELECT GREATESTB('straße', 'strasse');
 GREATESTB
-----------
 straße
(1 row)
```

This example returns 9 as the greatest in the list of expressions:

```
=> SELECT GREATESTB(7, 5, 9);
 GREATESTB
-----------
         9
(1 row)
```

Note that putting quotes around the integer expressions returns the same result as the first example:

```
=> SELECT GREATESTB('7', '5', '9');
 GREATESTB
-----------
 9
(1 row)
```

The next example returns FLOAT 1.5 as the greatest because the integer is implicitly cast to float:

```
=> SELECT GREATESTB(1, 1.5);
 GREATESTB
-----------
       1.5
(1 row)
```

The following example returns `vertica` as the greatest:

```
=> SELECT GREATESTB('vertica', 'analytic', 'database');
  GREATESTB
-----------
 vertica
(1 row)
```

Notice this next command returns NULL:

```
=> SELECT GREATESTB('vertica', 'analytic', 'database', null);
 GREATESTB
-----------
(1 row)
```

And one more:

```
=> SELECT GREATESTB('sit', 'site', 'sight');
 GREATESTB
-----------
 site
(1 row)
```

See Also

- LEASTB

HEX_TO_BINARY

Translates the given VARCHAR hexadecimal representation into a VARBINARY value.

Behavior Type

Immutable

Syntax

```
HEX_TO_BINARY ( [ 0x ] expression )
```

Parameters

expression	(BINARY or VARBINARY) String to translate.
0x	Optional prefix.

Notes

VARBINARY HEX_TO_BINARY(VARCHAR) converts data from character type in hexadecimal format to binary type. This function is the inverse of TO_HEX.

```
HEX_TO_BINARY(TO_HEX(x)) = x)
TO_HEX(HEX_TO_BINARY(x)) = x)
```

If there are an odd number of characters in the hexadecimal value, the first character is treated as the low nibble of the first (furthest to the left) byte.

Examples

If the given string begins with "0x" the prefix is ignored. For example:

```
=> SELECT HEX_TO_BINARY('0x6162') AS hex1, HEX_TO_BINARY('6162') AS hex2;
 hex1 | hex2
------+------
 ab   | ab
(1 row)
```

If an invalid hex value is given, Vertica returns an “invalid binary representation" error; for example:

```
=> SELECT HEX_TO_BINARY('0xffgf');
ERROR:  invalid hex string "0xffgf"
```

See Also

- TO_HEX

HEX_TO_INTEGER

Translates the given VARCHAR hexadecimal representation into an INTEGER value.

Vertica completes this conversion as follows:

- Adds the 0x prefix if it is not specified in the input
- Casts the VARCHAR string to a NUMERIC
- Casts the NUMERIC to an INTEGER

Behavior Type

Immutable

Syntax

`HEX_TO_INTEGER ( [ 0x ] expression )`

Parameters

expression	VARCHAR is the string to translate.
0x	Is the optional prefix.

Examples

You can enter the string with or without the Ox prefix. For example:

```
=> SELECT HEX_TO_INTEGER ('0aedc')
         AS hex1,HEX_TO_INTEGER ('aedc') AS hex2;
 hex1  | hex2
-------+-------
 44764 | 44764
(1 row)
```

If you pass the function an invalid hex value, Vertica returns an `invalid input syntax` error; for example:

```
=> SELECT HEX_TO_INTEGER ('0xffgf');
ERROR 3691:  Invalid input syntax for numeric: "0xffgf"
```

See Also

- TO_HEX
- HEX_TO_BINARY

INET_ATON

Returns an integer that represents the value of the address in host byte order, given the dotted-quad representation of a network address as a string.

Behavior Type

Immutable

Syntax

`INET_ATON ( expression )`

Parameters

expression	(VARCHAR) is the string to convert.

Notes

The following syntax converts an IPv4 address represented as the string A to an integer I. INET_ATON trims any spaces from the right of A, calls the Linux function inet_pton, and converts the result from network byte order to host byte order using ntohl.

```
=> INET_ATON(VARCHAR A) -> INT8 I
```

If A is NULL, too long, or inet_pton returns an error, the result is NULL.

Examples

The generated number is always in host byte order. In the following example, the number is calculated as 209×256^3 + 207×256^2 + 224×256 + 40.

```
=> SELECT INET_ATON('209.207.224.40');
 inet_aton
------------
 3520061480
(1 row)

=> SELECT INET_ATON('1.2.3.4');
 inet_aton
-----------
  16909060
(1 row)

=> SELECT TO_HEX(INET_ATON('1.2.3.4'));
 to_hex
---------
 1020304
(1 row)
```

See Also

- INET_NTOA

INET_NTOA

Returns the dotted-quad representation of the address as a VARCHAR, given a network address as an integer in network byte order.

Behavior Type

Immutable

Syntax

```
INET_NTOA ( expression )
```

Parameters

expression	(INTEGER) is the network address to convert.

Notes

The following syntax converts an IPv4 address represented as integer I to a string A.

INET_NTOA converts I from host byte order to network byte order using htonl, and calls the Linux function inet_ntop.

```
=> INET_NTOA(INT8 I) -> VARCHAR A
```

If I is NULL, greater than 2^32 or negative, the result is NULL.

Examples

```
=> SELECT INET_NTOA(16909060);
 inet_ntoa
-----------
 1.2.3.4
(1 row)

=> SELECT INET_NTOA(03021962);
 inet_ntoa
-------------
 0.46.28.138
(1 row)
```

See Also

- INET_ATON

INITCAP

Capitalizes first letter of each alphanumeric word and puts the rest in lowercase.

Behavior Type

Immutable

Syntax

```
INITCAP ( expression )
```

Parameters

expression	(VARCHAR) is the string to format.

Notes

- Depends on collation setting of the locale.
- INITCAP is restricted to 32750 octet inputs, since it is possible for the UTF-8 representation of result to double in size.

Examples

Expression	Result
`SELECT INITCAP('high speed database');`	`High Speed Database`
`SELECT INITCAP('LINUX TUTORIAL');`	`Linux Tutorial`

`SELECT INITCAP('abc DEF 123aVC 124Btd,lAsT');`	`Abc Def 123Avc 124Btd,Last`
`SELECT INITCAP('');`	
`SELECT INITCAP(null);`	

INITCAPB

Capitalizes first letter of each alphanumeric word and puts the rest in lowercase. Multibyte characters are not converted and are skipped.

Behavior Type

Immutable

Syntax

`INITCAPB ( expression )`

Parameters

expression	(VARCHAR) is the string to format.

Notes

Depends on collation setting of the locale.

Examples

Expression	Result
`SELECT INITCAPB('étudiant');`	`éTudiant`
`SELECT INITCAPB('high speed database');`	`High Speed Database`
`SELECT INITCAPB('LINUX TUTORIAL');`	`Linux Tutorial`

`SELECT INITCAPB('abc DEF 123aVC 124Btd,lAsT');`	`Abc Def 123Avc 124Btd,Last`
`SELECT INITCAPB('');`	
`SELECT INITCAPB(null);`	

INSERT

Inserts a character string into a specified location in another character string.

Syntax

```
INSERT( 'string1', n, m, 'string2' )
```

Behavior Type

Immutable

Parameters

string1	(VARCHAR) Is the string in which to insert the new string.
n	A character of type INTEGER that represents the starting point for the insertion within *string1*. You specify the number of characters from the first character in string1 as the starting point for the insertion. For example, to insert characters before "c", in the string "abcdef," enter 3.
m	A character of type INTEGER that represents the number of characters in *string1* (if any) that should be replaced by the insertion. For example,if you want the insertion to replace the letters "cd" in the string "abcdef, " enter 2.
string2	(VARCHAR) Is the string to be inserted.

Example

The following example changes the string Warehouse to Storehouse using the INSERT function:

```
=> SELECT INSERT ('Warehouse',1,3,'Stor');
   INSERT
------------
 Storehouse
(1 row)
```

INSTR

Searches *string* for *substring* and returns an integer indicating the position of the character in *string* that is the first character of this *occurrence*. The return value is based on the character position of the identified character.

Behavior Type

Immutable

Syntax

```
INSTR ( string , substring [, position [, occurrence ] ] )
```

Parameters

string	(CHAR or VARCHAR, or BINARY or VARBINARY) Text expression to search.
substring	(CHAR or VARCHAR, or BINARY or VARBINARY) String to search for.
position	Nonzero integer indicating the character of string where Vertica begins the search. If position is negative, then Vertica counts backward from the end of string and then searches backward from the resulting position. The first character of string occupies the default position 1, and position cannot be 0.
occurrence	Integer indicating which occurrence of string Vertica searches. The value of occurrence must be positive (greater than 0), and the default is 1.

Notes

Both *position* and *occurrence* must be of types that can resolve to an integer. The default values of both parameters are 1, meaning Vertica begins searching at the first character of string for the first occurrence of substring. The return value is relative to the beginning of string, regardless of the value of position, and is expressed in characters.

If the search is unsuccessful (that is, if substring does not appear *occurrence* times after the *position* character of *string*, the return value is 0.

Examples

The first example searches forward in string 'abc' for substring 'b'. The search returns the position in 'abc' where 'b' occurs, or position 2. Because no position parameters are given, the default search starts at 'a', position 1.

```
=> SELECT INSTR('abc', 'b');
 INSTR
-------
     2
(1 row)
```

The following three examples use character position to search backward to find the position of a substring.

Note:
Although it might seem intuitive that the function returns a negative integer, the position of *n* occurrence is read left to right in the sting, even though the search happens in reverse (from the end—or right side—of the string).

In the first example, the function counts backward one character from the end of the string, starting with character 'c'. The function then searches backward for the first occurrence of 'a', which it finds it in the first position in the search string.

```
=> SELECT INSTR('abc', 'a', -1);
 INSTR
-------
     1
(1 row)
```

In the second example, the function counts backward one byte from the end of the string, starting with character ‘c’. The function then searches backward for the first occurrence of ‘a’, which it finds it in the first position in the search string.

```
=> SELECT INSTR(VARBINARY 'abc', VARBINARY 'a', -1);
 INSTR
-------
     1
(1 row)
```

In the third example, the function counts backward one character from the end of the string, starting with character ‘b’, and searches backward for substring ‘bc’, which it finds in the second position of the search string.

```
=> SELECT INSTR('abcb', 'bc', -1);
 INSTR
-------
     2
(1 row)
```

In the fourth example, the function counts backward one character from the end of the string, starting with character ‘b’, and searches backward for substring ‘bcef’, which it does not find. The result is 0.

```
=> SELECT INSTR('abcb', 'bcef', -1);
INSTR
-------
     0
(1 row)
```

In the fifth example, the function counts backward one byte from the end of the string, starting with character ‘b’, and searches backward for substring ‘bcef’, which it does not find. The result is 0.

```
=> SELECT INSTR(VARBINARY 'abcb', VARBINARY 'bcef', -1);
INSTR
-------
     0
(1 row)
```

Multibyte characters are treated as a single character:

```
=> SELECT INSTR('aébc', 'b');
 INSTR
-------
     3
(1 row)
```

Use INSTRB to treat multibyte characters as binary:

```
=> SELECT INSTRB('aébc', 'b');
  INSTRB
--------
       4
(1 row)
```

INSTRB

Searches *string* for *substring* and returns an integer indicating the octet position within string that is the first *occurrence*. The return value is based on the octet position of the identified byte.

Behavior Type

Immutable

Syntax

```
INSTRB ( string , substring [, position [, occurrence ] ] )
```

Parameters

string	Is the text expression to search.
substring	Is the string to search for.
position	Is a nonzero integer indicating the character of string where Vertica begins the search. If position is negative, then Vertica counts backward from the end of string and then searches backward from the resulting position. The first byte of string occupies the default position 1, and position cannot be 0.
occurrence	Is an integer indicating which occurrence of string Vertica searches. The value of occurrence must be positive (greater than 0), and the default is 1.

Notes

Both *position* and *occurrence* must be of types that can resolve to an integer. The default values of both parameters are 1, meaning Vertica begins searching at the first byte of string for the first occurrence of substring. The return value is relative to the beginning of string, regardless of the value of position, and is expressed in octets.

If the search is unsuccessful (that is, if substring does not appear *occurrence* times after the *position* character of *string*, then the return value is 0.

Example

```
=> SELECT INSTRB('straße', 'ß');
 INSTRB
--------
      5
(1 row)
```

See Also

- INSTR

ISUTF8

Tests whether a string is a valid UTF-8 string. Returns true if the string conforms to UTF-8 standards, and false otherwise. This function is useful to test strings for UTF-8 compliance before passing them to one of the regular expression functions, such as REGEXP_LIKE, which expect UTF-8 characters by default.

ISUTF8 checks for invalid UTF8 byte sequences, according to UTF-8 rules:

- invalid bytes
- an unexpected continuation byte
- a start byte not followed by enough continuation bytes
- an Overload Encoding

The presence of an invalid UTF8 byte sequence results in a return value of false.

Syntax

```
ISUTF8( string );
```

Parameters

string	The string to test for UTF-8 compliance.

Examples

```
=> SELECT ISUTF8(E'\xC2\xBF'); -- UTF-8 INVERTED QUESTION MARK ISUTF8
--------
 t
(1 row)
=> SELECT ISUTF8(E'\xC2\xC0'); -- UNDEFINED UTF-8 CHARACTER
 ISUTF8
--------
 f
(1 row)
```

LEAST

Returns the smallest value in a list of expressions.

Behavior Type

Stable

Syntax

```
LEAST ( expression1, expression2, ... expression-n )
```

Parameters

expression1, *expression2*, and *expression-n* are the expressions to be evaluated.

Notes

- Works for all data types, and implicitly casts similar types. See Examples below.
- A NULL value in any one of the expressions returns NULL.

Examples

This example returns 5 as the least:

```
=> SELECT LEAST(7, 5, 9);
 LEAST
-------
     5
(1 row)
```

Putting quotes around the integer expressions returns the same result as the first example:

```
=> SELECT LEAST('7', '5', '9');
 LEAST
-------
 5
(1 row)
```

In the above example, the values are being compared as strings, so '10' would be less than '2'.

The next example returns 1.5, as INTEGER 2 is implicitly cast to FLOAT:

```
=> SELECT LEAST(2, 1.5);
 LEAST
-------
   1.5
(1 row)
```

The following example returns 'analytic' as the least:

```
=> SELECT LEAST('vertica', 'analytic', 'database');
  LEAST
----------
 analytic
(1 row)
```

Notice this next command returns NULL:

```
=> SELECT LEAST('vertica', 'analytic', 'database', null);
 LEAST
-------
```

```
(1 row)
```

And one more:

```
=> SELECT LEAST('sit', 'site', 'sight');
 LEAST
-------
 sight
(1 row)
```

See Also

- GREATEST

LEASTB

Returns the function's least argument, using binary ordering, not UTF-8 character ordering.

Behavior Type

Immutable

Syntax

LEASTB (*expression1*, *expression2*, ... *expression-n*)

Parameters

expression1, *expression2*, and *expression-n* are the expressions to be evaluated.

Notes

- Works for all data types, and implicitly casts similar types. See Examples below.
- A NULL value in any one of the expressions returns NULL.

Examples

The following command selects strasse as the least in the series of inputs:

```
=> SELECT LEASTB('straße', 'strasse');
 LEASTB
---------
 strasse
(1 row)
```

This example returns 5 as the least:

```
==> SELECT LEASTB(7, 5, 9);
 LEASTB
--------
      5
(1 row)
```

Putting quotes around the integer expressions returns the same result as the first example:

```
=> SELECT LEASTB('7', '5', '9');
 LEASTB
--------
 5
(1 row)
```

In the above example, the values are being compared as strings, so '10' would be less than '2'.

The next example returns 1.5, as INTEGER 2 is implicitly cast to FLOAT:

```
=> SELECT LEASTB(2, 1.5);
 LEASTB
--------
    1.5
(1 row)
```

The following example returns 'analytic' as the least in the series of inputs:

```
=> SELECT LEASTB('vertica', 'analytic', 'database');
  LEASTB
----------
 analytic
(1 row)
```

Notice this next command returns NULL:

```
=> SELECT LEASTB('vertica', 'analytic', 'database', null);
 LEASTB
```

```
--------

(1 row)
```

- GREATESTB

LEFT

Returns the specified characters from the left side of a string.

Behavior Type

Immutable

Syntax

```
LEFT ( string-expr, length )
```

Parameters

string-expr	The string expression to return.
length	An integer value that specifies how many characters to return.

Examples

```
=> SELECT LEFT('vertica', 3);
 LEFT
------
 ver
(1 row)
```

```
 SELECT DISTINCT(
   LEFT (customer_name, 4)) FnameTruncated
   FROM customer_dimension ORDER BY FnameTruncated LIMIT 10;
 FnameTruncated
```

```
---------------
 Alex
 Amer
 Amy
 Anna
 Barb
 Ben
 Bett
 Bria
 Carl
 Crai
(10 rows)
```

See Also

SUBSTR

LENGTH

Returns the length of a string. The behavior of LENGTH varies according to the input data type:

- CHAR and VARCHAR: Identical to CHARACTER_LENGTH, returns the string length in UTF-8 characters, .
- CHAR: Strips padding.
- BINARY and VARBINARY: Identical to OCTET_LENGTH, returns the string length in bytes (octets).

Behavior Type

Immutable

Syntax

```
LENGTH ( expression )
```

Parameters

expression	String to evaluate, one of the following: CHAR, VARCHAR, BINARY or VARBINARY.

Examples

Statement	Returns
SELECT LENGTH('1234 '::CHAR(10));	4
SELECT LENGTH('1234 '::VARCHAR(10));	6
SELECT LENGTH('1234 '::BINARY(10));	10
SELECT LENGTH('1234 '::VARBINARY(10));	6
SELECT LENGTH(NULL::CHAR(10)) IS NULL;	t

See Also

BIT_LENGTH

LOWER

Takes a string value and returns a VARCHAR value converted to lowercase.

Behavior Type

stable

Syntax

```
LOWER ( expression )
```

Arguments

expression	CHAR or VARCHAR string to convert, where the string width is ≤ 65000 octets. **Important:** In practice, *expression* should not exceed 32,500 octets. LOWER does not use the locale's collation setting—for example,

	`collation=binary`—to identify its encoding; rather, it treats the input argument as a UTF-8 encoded string. The UTF-8 representation of the input value might be double its original width. As a result, LOWER returns an error if the input value exceeds 32,500 octets. Note also that if *`expression`* is a table column, LOWER calculates its size from the column's defined width, and not from the column data. If the column width is greater than VARCHAR(32500), Vertica returns an error.

Examples

```
=> SELECT LOWER('AbCdEfG');
  LOWER
---------
 abcdefg
(1 row)

=> SELECT LOWER('The Bat In The Hat');
       LOWER
--------------------
 the bat in the hat
(1 row)

=> SELECT LOWER('ÉTUDIANT');
  LOWER
----------
 étudiant
(1 row)
```

LOWERB

Returns a character string with each ASCII character converted to lowercase. Multi-byte characters are skipped and not converted.

Behavior Type

Immutable

Syntax

`LOWERB ( expression )`

Parameters

expression	CHAR or VARCHAR string to convert

Examples

In the following example, the multi-byte UTF-8 character É is not converted to lowercase:

```
=> SELECT LOWERB('ÉTUDIANT');
  LOWERB
----------
 Étudiant
(1 row)

=> SELECT LOWER('ÉTUDIANT');
  LOWER
----------
 étudiant
(1 row)

=> SELECT LOWERB('AbCdEfG');
 LOWERB
---------
 abcdefg
(1 row)

=> SELECT LOWERB('The Vertica Database');
        LOWERB
----------------------
 the vertica database
(1 row)
```

LPAD

Returns a VARCHAR value representing a string of a specific length filled on the left with specific characters.

Behavior Type

Immutable

Syntax

```
LPAD ( expression , length [ , fill ] )
```

Parameters

expression	(CHAR OR VARCHAR) specifies the string to fill
length	(INTEGER) specifies the number of characters to return
fill	(CHAR OR VARCHAR) specifies the repeating string of characters with which to fill the output string. The default is the space character.

Examples

```
=> SELECT LPAD('database', 15, 'xzy');
      LPAD
-----------------
 xzyxzyxdatabase
(1 row)
```

If the string is already longer than the specified length it is truncated on the right:

```
=> SELECT LPAD('establishment', 10, 'abc');
    LPAD
------------
 establishm
(1 row)
```

LTRIM

Returns a VARCHAR value representing a string with leading blanks removed from the left side (beginning).

Behavior Type

Immutable

Syntax

```
LTRIM ( expression [ , characters ] )
```

Parameters

expression	(CHAR or VARCHAR) is the string to trim
characters	(CHAR or VARCHAR) specifies the characters to remove from the left side of *expression*. The default is the space character.

Examples

```
=> SELECT LTRIM('zzzyyyyyyyxxxxxxxxtrim', 'xyz');
 LTRIM
-------
 trim
(1 row)
```

See Also

- BTRIM
- RTRIM
- TRIM

MD5

Calculates the MD5 hash of string, returning the result as a VARCHAR string in hexadecimal.

Behavior Type

Immutable

Syntax

```
MD5 ( string )
```

Parameters

string	Is the argument string.

Examples

```
=> SELECT MD5('123');
               MD5
----------------------------------
 202cb962ac59075b964b07152d234b70
(1 row)
=> SELECT MD5('Vertica'::bytea);
               MD5
----------------------------------
 fc45b815747d8236f9f6fdb9c2c3f676
(1 row)
```

See Also

- SHA1
- SHA224
- SHA256
- SHA384
- SHA512

OCTET_LENGTH

Takes one argument as an input and returns the string length in octets for all string types.

Behavior Type

Immutable

Syntax

```
OCTET_LENGTH ( expression )
```

Parameters

expression	(CHAR or VARCHAR or BINARY or VARBINARY) is the string to measure.

Notes

- If the data type of *expression* is a CHAR, VARCHAR or VARBINARY, the result is the same as the actual length of *expression* in octets. For CHAR, the length does not include any trailing spaces.
- If the data type of *expression* is BINARY, the result is the same as the fixed-length of *expression*.
- If the value of *expression* is NULL, the result is NULL.

Examples

Expression	Result
SELECT OCTET_LENGTH(CHAR(10) '1234 ');	4
SELECT OCTET_LENGTH(CHAR(10) '1234');	4
SELECT OCTET_LENGTH(CHAR(10) ' 1234');	6
SELECT OCTET_LENGTH(VARCHAR(10) '1234 ');	6
SELECT OCTET_LENGTH(VARCHAR(10) '1234 ');	5
SELECT OCTET_LENGTH(VARCHAR(10) '1234');	4
SELECT OCTET_LENGTH(VARCHAR(10) ' 1234');	7
SELECT OCTET_LENGTH('abc'::VARBINARY);	3
SELECT OCTET_LENGTH(VARBINARY 'abc');	3
SELECT OCTET_LENGTH(VARBINARY 'abc ');	5
SELECT OCTET_LENGTH(BINARY(6) 'abc');	6
SELECT OCTET_LENGTH(VARBINARY '');	0
SELECT OCTET_LENGTH(''::BINARY);	1
SELECT OCTET_LENGTH(null::VARBINARY);	
SELECT OCTET_LENGTH(null::BINARY);	

See Also

- BIT_LENGTH
- CHARACTER_LENGTH
- LENGTH

OVERLAY

Replaces part of a string with another string and returns the new string value as a VARCHAR.

Behavior Type

Immutable if using OCTETS, **Stable** otherwise

Syntax

```
OVERLAY ( input-string PLACING replace-string FROM position [ FOR extent ] [ USING { CHARACTERS | OCTETS } ] )
```

Parameters

input-string	The string to process, of type CHAR or VARCHAR.
replace-string	The string to replace the specified substring of *input-string*, of type CHAR or VARCHAR.
position	Integer ≥1 that specifies the first character or octet of *input-string* to overlay *replace-string*.
extent	Integer that specifies how many characters or octets of *input-string* to overlay with *replace-string*. If omitted, OVERLAY uses the length of *replace-string*. For example, compare the following calls to OVERLAY:

	• OVERLAY omits FOR clause. The number of characters replaced in the input string equals the number of characters in replacement string ABC:
	`dbadmin=> SELECT OVERLAY ('123456789' PLACING 'ABC' FROM 5);`
	`  overlay`
	`-----------`
	` 1234ABC89`
	`(1 row)`
	• OVERLAY includes a FOR clause that specifies to replace four characters in the input string with the replacement string. The replacement string is three characters long, so OVERLAY returns a string that is one character shorter than the input string:
	`=> SELECT OVERLAY ('123456789' PLACING 'ABC' FROM 5 FOR 4);`
	` overlay`
	`----------`
	` 1234ABC9`
	`(1 row)`
	• OVERLAY includes a FOR clause that specifies to replace -2 characters in the input string with the replacement string. The function returns a string that is two characters longer than the input string:
	`=> SELECT OVERLAY ('123456789' PLACING 'ABC' FROM 5 FOR -2);`
	`    overlay`
	`----------------`
	` 1234ABC3456789`
	`(1 row)`

`USING CHARACTERS | OCTETS`	Specifies whether OVERLAY uses characters (default) or octets. **Note:** If you specify `USING OCTETS`, Vertica calls the OVERLAYB function.

Examples

```
=> SELECT OVERLAY('123456789' PLACING 'xxx' FROM 2);
  overlay
-----------
 1xxx56789
(1 row)

=> SELECT OVERLAY('123456789' PLACING 'XXX' FROM 2 USING OCTETS);
 overlayb
-----------
 1XXX56789
(1 row)

=> SELECT OVERLAY('123456789' PLACING 'xxx' FROM 2 FOR 4);
 overlay
----------
 1xxx6789
(1 row)

=> SELECT OVERLAY('123456789' PLACING 'xxx' FROM 2 FOR 5);
 overlay
---------
 1xxx789
(1 row)

=> SELECT OVERLAY('123456789' PLACING 'xxx' FROM 2 FOR 6);
 overlay
---------
 1xxx89
(1 row)
```

OVERLAYB

Replaces part of a string with another string and returns the new string as an octet value.

The OVERLAYB function treats the multibyte character string as a string of octets (bytes) and use octet numbers as incoming and outgoing position specifiers and lengths. The strings themselves are type VARCHAR, but they treated as if each byte was a separate character.

Behavior Type

Immutable

Syntax

OVERLAYB (*input-string*, *replace-string*, *position* [, *extent*])

Parameters

input-string	The string to process, of type CHAR or VARCHAR.
replace-string	The string to replace the specified substring of *input-string*, of type CHAR or VARCHAR.
position	Integer ≥1 that specifies the first octet of*input-string* to overlay *replace-string*.
extent	Integer that specifies how many octets of *input-string* to overlay with *replace-string*. If omitted, OVERLAY uses the length of *replace-string*.

Examples

```
=> SELECT OVERLAYB('123456789', 'ééé', 2);
 OVERLAYB
----------
 1ééé89
(1 row)

=> SELECT OVERLAYB('123456789', 'ßßß', 2);
 OVERLAYB
----------
 1ßßß89
(1 row)

=> SELECT OVERLAYB('123456789', 'xxx', 2);
 OVERLAYB
-----------
 1xxx56789
(1 row)

=> SELECT OVERLAYB('123456789', 'xxx', 2, 4);
 OVERLAYB
----------
 1xxx6789
(1 row)

=> SELECT OVERLAYB('123456789', 'xxx', 2, 5);
 OVERLAYB
----------
 1xxx789
(1 row)

=> SELECT OVERLAYB('123456789', 'xxx', 2, 6);
 OVERLAYB
----------
 1xxx89
(1 row)
```

POSITION

Returns an INTEGER value representing the character location of a specified substring with a string (counting from one).

Behavior Type

Immutable

Syntax 1

```
POSITION ( substring IN string [ USING { CHARACTERS | OCTETS } ] )
```

Parameters

substring	(CHAR or VARCHAR) is the substring to locate
string	(CHAR or VARCHAR) is the string in which to locate the substring
USING CHARACTERS | OCTETS	Determines whether the position is reported by using characters (the default) or octets.

Syntax 2

```
POSITION ( substring IN string )
```

Parameters

substring	(VARBINARY) is the substring to locate
string	(VARBINARY) is the string in which to locate the substring

Notes

- When the string and substring are CHAR or VARCHAR, the return value is based on either the character or octet position of the substring.
- When the string and substring are VARBINARY, the return value is always based on the octet position of the substring.
- The string and substring must be consistent. Do not mix VARBINARY with CHAR or VARCHAR.
- POSITION is similar to STRPOS although POSITION allows finding by characters and by octet.
- If the string is not found, the return value is zero.

Examples

```
=> SELECT POSITION('é' IN 'étudiant' USING CHARACTERS);
 position
----------
        1
(1 row)

=> SELECT POSITION('ß' IN 'straße' USING OCTETS);
 positionb
-----------
         5
(1 row)

=> SELECT POSITION('c' IN 'abcd' USING CHARACTERS);
 position
----------
        3
(1 row)

=> SELECT POSITION(VARBINARY '456' IN VARBINARY '123456789');
 position
----------
        4
(1 row)

SELECT POSITION('n' in 'León') as 'default',
       POSITIONB('León', 'n') as 'POSITIONB',
       POSITION('n' in 'León' USING CHARACTERS) as 'pos_chars',
       POSITION('n' in 'León' USING OCTETS) as 'pos_oct',INSTR('León','n'),
       INSTRB('León','n'), REGEXP_INSTR('León','n');
 default | POSITIONB | pos_chars | pos_oct | INSTR | INSTRB | REGEXP_INSTR
---------+-----------+-----------+---------+-------+--------+--------------
       4 |         5 |         4 |       5 |     4 |      5 |            4
(1 row)
```

POSITIONB

Returns an INTEGER value representing the octet location of a specified substring with a string (counting from one).

Behavior Type

Immutable

Syntax

```
POSITIONB ( string, substring )
```

Parameters

string	(CHAR or VARCHAR) is the string in which to locate the substring
substring	(CHAR or VARCHAR) is the substring to locate

Examples

```
=> SELECT POSITIONB('straße', 'ße');
 POSITIONB
-----------
         5
(1 row)
=> SELECT POSITIONB('étudiant', 'é');
 POSITIONB
-----------
         1
(1 row)
```

QUOTE_IDENT

Returns the specified string argument in the format that is required in order to use that string as an identifier in an SQL statement. Quotes are added as needed—for example, if the string contains non-identifier characters or is an SQL or Vertica-reserved keyword:

- `1time`
- `Next week`
- `SELECT`

Embedded double quotes are doubled.

- SQL identifiers such as table and column names are stored as created, and references to them are resolved using case-insensitive compares. Thus, you do not need to double-quote mixed-case identifiers.
- Vertica quotes all reserved keywords, even if they are unused.

Behavior Type

Immutable

Syntax

```
QUOTE_IDENT( 'string' )
```

Parameters

string	String to quote

Examples

Quoted identifiers are case-insensitive, and Vertica does not supply the quotes:

```
=> SELECT QUOTE_IDENT('VErtIcA');
 QUOTE_IDENT
-------------
 VErtIcA
(1 row)

=> SELECT QUOTE_IDENT('Vertica database');
    QUOTE_IDENT
--------------------
 "Vertica database"
(1 row)
```

Embedded double quotes are doubled:

```
=> SELECT QUOTE_IDENT('Vertica "!" database');
       QUOTE_IDENT
--------------------------
 "Vertica ""!"" database"
(1 row)
```

The following example uses the SQL keyword SELECT, so results are double quoted:

```
=> SELECT QUOTE_IDENT('select');
 QUOTE_IDENT
-------------
 "select"
(1 row)
```

QUOTE_LITERAL

Returns the given string, suitably quoted, to be used as a string literal in a SQL statement string. Embedded single quotes and backslashes are doubled.

Behavior Type

Immutable

Syntax

```
QUOTE_LITERAL ( string )
```

Parameters

string	String to convert to a string literal.

Notes

Vertica recognizes two consecutive single quotes within a string literal as one single quote character. For example, `'You''re here!'`. This is the SQL standard representation and is preferred over the form, `'You\'re here!'`, as backslashes are not parsed as before.

Examples

```
=> SELECT QUOTE_LITERAL('You''re here!');
  QUOTE_LITERAL
-----------------
 'You''re here!'
(1 row)
```

See Also

- Character String Literals

REPEAT

Replicates a string the specified number of times and concatenates the replicated values as a single string. The return value takes on the data type of the string argument. Return values for non-LONG data types and LONG data types can be up to 65000 and 32000000 bytes in length, respectively. If the length of *string* * *count* exceeds these limits, Vertica silently truncates the results.

Behavior Type

Immutable

Syntax

```
REPEAT ( 'string', count )
```

Parameters

string	The string to repeat, one of the following: • CHAR • VARCHAR • BINARY • VARBINARY

	• LONG VARCHAR • LONG VARBINARY
count	An integer expression that specifies how many times to repeat *string*.

Examples

The following example repeats `vmart` three times:

```
=> SELECT REPEAT ('vmart', 3);
     REPEAT
-----------------
 vmartvmartvmart
(1 row)
```

REPLACE

Replaces all occurrences of characters in a string with another set of characters.

Behavior Type

Immutable

Syntax

```
REPLACE ('string', 'target', 'replacement' )
```

Parameters

string	The string to modify.
target	The characters in *string* to replace.
replacement	The characters to replace *target*.

Examples

```
=> SELECT REPLACE('Documentation%20Library', '%20', ' ');
        REPLACE
-----------------------
 Documentation Library
(1 row)

=> SELECT REPLACE('This &amp; That', '&amp;', 'and');
    REPLACE
---------------
 This and That
(1 row)

=> SELECT REPLACE('straße', 'ß', 'ss');
 REPLACE
---------
 strasse
(1 row)
```

RIGHT

Returns the specified characters from the right side of a string.

Behavior Type

Immutable

Syntax

```
RIGHT ( string-expr, length )
```

Parameters

string-expr	The string expression to return.
length	An integer value that specifies how many characters to return.

Examples

The following query returns the last three characters of the string 'vertica':

```
=> SELECT RIGHT('vertica', 3);
 RIGHT
-------
 ica
(1 row)
```

The following query queries date column `date_ordered` from table `store.store_orders_fact`. It coerces the dates to strings and extracts the last five characters from each string. It then returns all distinct strings:

```
SELECT DISTINCT(
  RIGHT(date_ordered::varchar, 5)) MonthDays
  FROM store.store_orders_fact ORDER BY MonthDays;
 MonthDays
-----------
 01-01
 01-02
 01-03
 01-04
 01-05
 01-06
 01-07
 01-08
 01-09
 01-10
 02-01
 02-02
 02-03
 ...
 11-08
 11-09
 11-10
 12-01
 12-02
 12-03
 12-04
 12-05
 12-06
 12-07
 12-08
 12-09
 12-10
(120 rows)
```

See Also

SUBSTR

RPAD

Returns a VARCHAR value representing a string of a specific length filled on the right with specific characters.

Behavior Type

Immutable

Syntax

```
RPAD ( expression , length [ , fill ] )
```

Parameters

expression	(CHAR OR VARCHAR) specifies the string to fill
length	(INTEGER) specifies the number of characters to return
fill	(CHAR OR VARCHAR) specifies the repeating string of characters with which to fill the output string. The default is the space character.

Examples

```
=> SELECT RPAD('database', 15, 'xzy');
      RPAD
-----------------
 databasexzyxzyx
(1 row)
```

If the string is already longer than the specified length it is truncated on the right:

```
=> SELECT RPAD('database', 6, 'xzy');
  RPAD
--------
 databa
(1 row)
```

RTRIM

Returns a VARCHAR value representing a string with trailing blanks removed from the right side (end).

Behavior Type

Immutable

Syntax

```
RTRIM ( expression [ , characters ] )
```

Parameters

expression	(CHAR or VARCHAR) is the string to trim
characters	(CHAR or VARCHAR) specifies the characters to remove from the right side of *expression*. The default is the space character.

Examples

```
=> SELECT RTRIM('trimzzzyyyyyyxxxxxxx', 'xyz');
 RTRIM
-------
 trim
(1 row)
```

See Also

- BTRIM
- LTRIM
- TRIM

SHA1

Uses the US Secure Hash Algorithm 1 to calculate the SHA1 hash of string. Returns the result as a VARCHAR string in hexadecimal.

Behavior Type

Immutable

Syntax

```
SHA1 ( string )
```

Parameters

string	The VARCHAR or VARBINARY string to be calculated.

Examples

The following examples calculate the SHA1 hash of the provided strings:

```
=> SELECT SHA1('123');
                   SHA1
-----------------------------------------
 40bd001563085fc35165329ea1ff5c5ecbdbbeef
(1 row)
```

```
=> SELECT SHA1('Vertica'::bytea);
                   SHA1
-----------------------------------------
 ee2cff8d3444995c6c301546c4fc5ee152d77c11
(1 row)
```

See Also

- SHA512

SHA224

Uses the US Secure Hash Algorithm 2 to calculate the SHA224 hash of string. Returns the result as a VARCHAR string in hexadecimal.

Behavior Type

Immutable

Syntax

```
SHA224 ( string )
```

Parameters

string	The VARCHAR or VARBINARY string to be calculated.

Examples

The following examples calculate the SHA224 hash of the provided strings:

```
=> SELECT SHA224('abc');
                       SHA224
----------------------------------------------------------
78d8045d684abd2eece923758f3cd781489df3a48e1278982466017f
(1 row)
```

```
=> SELECT SHA224('Vertica'::bytea);
                       SHA224
----------------------------------------------------------
 135ac268f64ff3124aeeebc3cc0af0a29fd600a3be8e29ed97e45e25
(1 row)
```

```
=> SELECT sha224(''::varbinary) = 'd14a028c2a3a2bc9476102bb288234c415a2b01f828ea62ac5b3e42f' AS
"TRUE";
 TRUE
------
```

```
t
(1 row)
```

SHA256

Uses the US Secure Hash Algorithm 2 to calculate the SHA256 hash of string. Returns the result as a VARCHAR string in hexadecimal.

Behavior Type

Immutable

Syntax

```
SHA256 ( string )
```

Parameters

string	The VARCHAR or VARBINARY string to be calculated.

Examples

The following examples calculate the SHA256 hash of the provided strings:

```
=> SELECT SHA256('abc');
                                SHA256
------------------------------------------------------------------
 a665a45920422f9d417e4867efdc4fb8a04a1f3fff1fa07e998e86f7f7a27ae3
(1 row)
```

```
=> SELECT SHA256('Vertica'::bytea);
                              SHA256
------------------------------------------------------------------
 9981b0b7df9f5be06e9e1a7f4ae2336a7868d9ab522b9a6ca6a87cd9ed95ba53
(1 row)
```

```
=> SELECT sha256('') = 'e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855' AS "TRUE";
 TRUE
------
t
(1 row)
```

SHA384

Uses the US Secure Hash Algorithm 2 to calculate the SHA384 hash of string. Returns the result as a VARCHAR string in hexadecimal.

Behavior Type

Immutable

Syntax

```
SHA384 ( string )
```

Parameters

string	The VARCHAR or VARBINARY string to be calculated.

Examples

The following examples calculate the SHA384 hash of the provided strings:

```
=> SELECT SHA384('123');
                                                SHA384
-------------------------------------------------------------------------------------------------
 9a0a82f0c0cf31470d7affede3406cc9aa8410671520b727044eda15b4c25532a9b5cd8aaf9cec4919d76255b6bfb00f
(1 row)
```

```
=> SELECT SHA384('Vertica'::bytea);
                                                SHA384
-------------------------------------------------------------------------------------------------
 3431a717dc3289862bbd636a064d26980b47ebe4684b800cff4756f0c24985866ef97763eafd548fedb0ce28722c96bb
(1 row)
```

SHA512

Uses the US Secure Hash Algorithm 2 to calculate the SHA512 hash of string. Returns the result as a VARCHAR string in hexadecimal.

Behavior Type

Immutable

Syntax

```
SHA512 ( string )
```

Parameters

string	The VARCHAR or VARBINARY string to be calculated.

Examples

The following examples calculate the SHA512 hash of the provided strings:

```
=> SELECT SHA512('123');
                                                                SHA512
-------------------------------------------------------------------------------------------------------------------
----------------------------

3c9909afec25354d551dae21590bb26e38d53f2173b8d3dc3eee4c047e7ab1c1eb8b85103e3be7ba613b31bb5c9c36214dc9f
14a42fd7a2fdb84856bca5c44c2

(1 row)
```

```
=> SELECT SHA512('Vertica'::bytea);
                                                                SHA512
-------------------------------------------------------------------------------------------------------------------
----------------------------

c4ee2b2d17759226a3897c9c30d7c6df1145c4582849bb5191ee140bce05b83d3d869890cc3619b534fea6f97ff28a739d8b5

- SHA384

SPACE

Returns the specified number of blank spaces, typically for insertion into a character string.

Behavior Type

Immutable

Syntax

```
SPACE(n)
```

Parameters

n	An integer argument that specifies how many spaces to insert.

Example

The following example concatenates strings x and y with 10 spaces inserted between them:

```
=> SELECT 'x' || SPACE(10) || 'y' AS Ten_spaces;
  Ten_spaces
--------------
 x          y
(1 row)
```

SPLIT_PART

Splits string on the delimiter and returns the string at the location of the beginning of the specified field (counting from 1).

Behavior Type

Immutable

Syntax

```
SPLIT_PART ( string , delimiter , field )
```

Parameters

string	Argument string
delimiter	Delimiter
field	(INTEGER) Number of the part to return

Notes

Use this with the character form of the subfield.

Examples

The specified integer of 2 returns the second string, or `def`.

```
=> SELECT SPLIT_PART('abc~@~def~@~ghi', '~@~', 2);
 SPLIT_PART
------------
 def
(1 row)
```

In the next example, specify 3, which returns the third string, or `789`.

```
=> SELECT SPLIT_PART('123~|~456~|~789', '~|~', 3);
 SPLIT_PART
------------
 789
(1 row)
```

The tildes are for readability only. Omitting them returns the same results:

```
=> SELECT SPLIT_PART('123|456|789', '|', 3);
 SPLIT_PART
------------
 789
(1 row)
```

See what happens if you specify an integer that exceeds the number of strings: The result is not null, it is an empty string.

```
=> SELECT SPLIT_PART('123|456|789', '|', 4);
 SPLIT_PART
```

```
------------

(1 row)
=> SELECT SPLIT_PART('123|456|789', '|', 4) IS NULL;
 ?column?
----------
 f
(1 row)
```

If SPLIT_PART had returned NULL, LENGTH would have returned 0.

```
=> SELECT LENGTH (SPLIT_PART('123|456|789', '|', 4));
 LENGTH
--------
      0
(1 row)
```

If the locale of your database is BINARY, SPLIT_PART calls SPLIT_PARTB:

```
=> SHOW LOCALE;
  name  |               setting
--------+--------------------------------------
 locale | en_US@collation=binary (LEN_KBINARY)
(1 row)
=> SELECT SPLIT_PART('123456789', '5', 1);
 split_partb
-------------
 1234
(1 row)
=> SET LOCALE TO 'en_US@collation=standard';
INFO 2567:  Canonical locale: 'en_US@collation=standard'
Standard collation: 'LEN'
English (United States, collation=standard)
SET
=> SELECT SPLIT_PART('123456789', '5', 1);
 split_part
------------
 1234
(1 row)
```

See Also

- SPLIT_PARTB

SPLIT_PARTB

Splits string on the delimiter and rreturns the string at the location of the beginning of the specified field (counting from 1). The VARCHAR arguments are treated as octets rather than UTF-8 characters.

Behavior Type

Immutable

Syntax

```
SPLIT_PARTB ( string , delimiter , field )
```

Parameters

string	(VARCHAR) Is the argument string.
delimiter	(VARCHAR) Is the given delimiter.
field	(INTEGER) is the number of the part to return.

Notes

Use this function with the character form of the subfield.

Examples

The specified integer of 3 returns the third string, or soupçon.

```
=> SELECT SPLIT_PARTB('straße~@~café~@~soupçon', '~@~', 3);
 SPLIT_PARTB
-------------
 soupçon
(1 row)
```

The tildes are for readability only. Omitting them returns the same results:

```
=> SELECT SPLIT_PARTB('straße @ café @ soupçon', '@', 3);
 SPLIT_PARTB
-------------
  soupçon
(1 row)
```

See what happens if you specify an integer that exceeds the number of strings: The result is not null, it is an empty string.

```
=> SELECT SPLIT_PARTB('straße @ café @ soupçon', '@', 4);
 SPLIT_PARTB
-------------
(1 row)

=> SELECT SPLIT_PARTB('straße @ café @ soupçon', '@', 4) IS NULL;
 ?column?
----------
 f
(1 row)
```

If the locale of your database is BINARY, SPLIT_PART calls SPLIT_PARTB:

```
=> SHOW LOCALE;
  name  |               setting
--------+-------------------------------------
 locale | en_US@collation=binary (LEN_KBINARY)
(1 row)
=> SELECT SPLIT_PART('123456789', '5', 1);
 split_partb
-------------
 1234
(1 row)

=> SET LOCALE TO 'en_US@collation=standard';
INFO 2567:  Canonical locale: 'en_US@collation=standard'
Standard collation: 'LEN'
English (United States, collation=standard)
SET

=> SELECT SPLIT_PART('123456789', '5', 1);
 split_part
------------
 1234
(1 row)
```

See Also

- SPLIT_PART

STRPOS

Returns an INTEGER value representing the character location of a specified substring within a string (counting from one).

Behavior Type

Immutable

Syntax

```
STRPOS ( string , substring )
```

Parameters

string	(CHAR or VARCHAR) is the string in which to locate the substring
substring	(CHAR or VARCHAR) is the substring to locate

Notes

STRPOS is similar to POSITION although POSITION allows finding by characters and by octet.

If the string is not found, the return value is zero.

Examples

```
=> SELECT STRPOS('abcd', 'c');
 STRPOS
--------
      3
(1 row)
```

STRPOSB

Returns an INTEGER value representing the location of a specified substring within a string, counting from one, where each octet in the string is counted (as opposed to characters).

Behavior Type

Immutable

Syntax

```
STRPOSB ( string , substring )
```

Parameters

string	(CHAR or VARCHAR) is the string in which to locate the substring
substring	(CHAR or VARCHAR) is the substring to locate

Notes

STRPOSB is identical to POSITIONB except for the order of the arguments.

Examples

```
=> SELECT STRPOSB('straße', 'e');
 STRPOSB
---------
       7
(1 row)

=> SELECT STRPOSB('étudiant', 'tud');
 STRPOSB
---------
       3
(1 row)
```

SUBSTR

Returns VARCHAR or VARBINARY value representing a substring of a specified string.

Behavior Type

Immutable

Syntax

```
SUBSTR ( string , position [ , extent ] )
```

Parameters

string	(CHAR/VARCHAR or BINARY/VARBINARY) is the string from which to extract a substring. If null, Vertica returns no results.
position	(INTEGER or DOUBLE PRECISION) is the starting position of the substring (counting from one by characters). If 0 or negative, Vertica returns no results.
extent	(INTEGER or DOUBLE PRECISION) is the length of the substring to extract (in characters). The default is the end of the string.

Notes

SUBSTR truncates DOUBLE PRECISION input values.

Examples

```
=> SELECT SUBSTR('abc'::binary(3),1);
 substr
--------
 abc
(1 row)

=> SELECT SUBSTR('123456789', 3, 2);
 substr
--------
```

```
 34
(1 row)
=> SELECT SUBSTR('123456789', 3);
 substr
---------
 3456789
(1 row)
=> SELECT SUBSTR(TO_BITSTRING(HEX_TO_BINARY('0x10')), 2, 2);
 substr
--------
 00
(1 row)
=> SELECT SUBSTR(TO_HEX(10010), 2, 2);
 substr
--------
 71
(1 row)
```

SUBSTRB

Returns an octet value representing the substring of a specified string.

Behavior Type

Immutable

Syntax

SUBSTRB (*string* , *position* [, *extent*])

Parameters

string	(CHAR/VARCHAR) is the string from which to extract a substring.
position	(INTEGER or DOUBLE PRECISION) is the starting position of the substring (counting from one in octets).
extent	(INTEGER or DOUBLE PRECISION) is the length of the substring to extract (in octets). The default is the end of the string

Notes

- This function treats the multibyte character string as a string of octets (bytes) and uses octet numbers as incoming and outgoing position specifiers and lengths. The strings themselves are type VARCHAR, but they treated as if each octet were a separate character.
- SUBSTRB truncates DOUBLE PRECISION input values.

Examples

```
=> SELECT SUBSTRB('soupçon', 5);
 SUBSTRB
---------
 çon
(1 row)

=> SELECT SUBSTRB('soupçon', 5, 2);
 SUBSTRB
---------
 ç
(1 row)
```

Vertica returns the following error message if you use BINARY/VARBINARY:

```
=>SELECT SUBSTRB('abc'::binary(3),1);
ERROR: function substrb(binary, int) does not exist, or permission is denied for substrb(binary, int)
HINT: No function matches the given name and argument types. You may need to add explicit type casts.
```

SUBSTRING

Returns a value representing a substring of the specified string at the given position, given a value, a position, and an optional length. SUBSTRING truncates DOUBLE PRECISION input values.

Behavior Type

Immutable if USING OCTETS, **stable** otherwise.

Syntax

```
SUBSTRING ( string, position[, length ]
    [USING {CHARACTERS | OCTETS } ] )
SUBSTRING ( string FROM position [ FOR length ]
    [USING { CHARACTERS | OCTETS } ] )
```

Parameters

string	(CHAR/VARCHAR or BINARY/VARBINARY) is the string from which to extract a substring
position	(INTEGER or DOUBLE PRECISION) is the starting position of the substring (counting from one by either characters or octets). (The default is characters.) If position is greater than the length of the given value, an empty value is returned.
length	(INTEGER or DOUBLE PRECISION) is the length of the substring to extract in either characters or octets. (The default is characters.) The default is the end of the string.If a length is given the result is at most that many bytes. The maximum length is the length of the given value less the given position. If no length is given or if the given length is greater than the maximum length then the length is set to the maximum length.
USING CHARACTERS | OCTETS	Determines whether the value is expressed in characters (the default) or octets.

Examples

```
=> SELECT SUBSTRING('abc'::binary(3),1);
 substring
-----------
 abc
(1 row)

=> SELECT SUBSTRING('soupçon', 5, 2 USING CHARACTERS);
 substring
```

```
-----------
 ço
(1 row)

=> SELECT SUBSTRING('soupçon', 5, 2 USING OCTETS);
 substring
-----------
 ç
(1 row)
```

If you use a negative position, then the functions starts at a non-existent position. In this example, that means counting eight characters starting at position -4. So the function starts at the empty position -4 and counts five characters, including a position for zero which is also empty. This returns three characters.

```
=> SELECT SUBSTRING('1234567890', -4, 8);
 substring
 -----------
 123
(1 row)
```

TO_BITSTRING

Returns a VARCHAR that represents the given VARBINARY value in bitstring format. This function is the inverse of BITSTRING_TO_BINARY.

Behavior Type

Immutable

Syntax

```
TO_BITSTRING ( expression )
```

Parameters

expression	The VARCHAR string to process.

Examples

```
=> SELECT TO_BITSTRING('ab'::BINARY(2));
   to_bitstring
------------------
 0110000101100010
(1 row)

=> SELECT TO_BITSTRING(HEX_TO_BINARY('0x10'));
 to_bitstring
--------------
00010000
(1 row)

=> SELECT TO_BITSTRING(HEX_TO_BINARY('0xF0'));
 to_bitstring
--------------
11110000
(1 row)
```

See Also

BITCOUNT

TO_HEX

Returns a VARCHAR or VARBINARY representing the hexadecimal equivalent of a number. This function is the inverse of HEX_TO_BINARY.

Behavior Type

Immutable

Syntax

```
TO_HEX ( number )
```

Parameters

number	An INTEGER or VARBINARY value to convert to hexadecimal. If you supply a

	VARBINARY argument, the function's return value is not preceded by `0x`.

Examples

```
=> SELECT TO_HEX(123456789);
 TO_HEX
---------
 75bcd15
(1 row)
```

For VARBINARY inputs, the returned value is not preceded by `0x`. For example:

```
=> SELECT TO_HEX('ab'::binary(2));
 TO_HEX
--------
 6162
(1 row)
```

TRANSLATE

Replaces individual characters in *`string_to_replace`* with other characters.

Behavior Type

Immutable

Syntax

```
TRANSLATE ( string_to_replace , from_string , to_string );
```

Parameters

string_to_replace	String to be translated.
from_string	Contains characters that should be replaced in string_to_replace.
to_string	Any character in string_to_replace that matches a character in from_string is replaced by the corresponding character in to_string.

Example

```
=> SELECT TRANSLATE('straße', 'ß', 'ss');
 TRANSLATE
-----------
 strase
(1 row)
```

TRIM

Combines the BTRIM, LTRIM, and RTRIM functions into a single function.

Behavior Type

Immutable

Syntax

`TRIM ( [ [ LEADING | TRAILING | BOTH ] characters FROM ] expression )`

Parameters

`LEADING`	Removes the specified characters from the left side of the string
`TRAILING`	Removes the specified characters from the right side of the string
`BOTH`	Removes the specified characters from both sides of the string (default)
characters	(CHAR or VARCHAR) specifies the characters to remove from *expression*. The default is the space character.
expression	(CHAR or VARCHAR) is the string to trim

Examples

```
=> SELECT '-' || TRIM(LEADING 'x' FROM 'xxdatabasexx') || '-';
   ?column?
--------------
 -databasexx-
(1 row)

=> SELECT '-' || TRIM(TRAILING 'x' FROM 'xxdatabasexx') || '-';
   ?column?
--------------
 -xxdatabase-
(1 row)

=> SELECT '-' || TRIM(BOTH 'x' FROM 'xxdatabasexx') || '-';
  ?column?
------------
 -database-
(1 row)

=> SELECT '-' || TRIM('x' FROM 'xxdatabasexx') || '-';
  ?column?
------------
 -database-
(1 row)

=> SELECT '-' || TRIM(LEADING FROM '  database  ') || '-';
   ?column?
--------------
 -database  -
(1 row)

=> SELECT '-' || TRIM('  database  ') || '-';  ?column?
------------
 -database-
(1 row)
```

See Also

- BTRIM
- LTRIM
- RTRIM

UPPER

Returns a VARCHAR value containing the argument converted to uppercase letters.

Starting in Release 5.1, this function treats the `string` argument as a UTF-8 encoded string, rather than depending on the collation setting of the locale (for example, collation=binary) to identify the encoding.

Behavior Type

stable

Syntax

```
UPPER ( expression )
```

Parameters

expression	CHAR or VARCHAR containing the string to convert

Notes

UPPER is restricted to 32500 octet inputs, since it is possible for the UTF-8 representation of result to double in size.

Examples

```
=> SELECT UPPER('AbCdEfG');
  UPPER
----------
 ABCDEFG
(1 row)
=> SELECT UPPER('étudiant');
  UPPER
----------
 ÉTUDIANT
(1 row)
```

UPPERB

Returns a character string with each ASCII character converted to uppercase. Multibyte characters are not converted and are skipped.

Behavior Type

Immutable

Syntax

```
UPPERB ( expression )
```

Parameters

expression	(CHAR or VARCHAR) is the string to convert

Examples

In the following example, the multibyte UTF-8 character é is not converted to uppercase:

```
=> SELECT UPPERB('étudiant');
  UPPERB
----------
 éTUDIANT
(1 row)

=> SELECT UPPERB('AbCdEfG');
 UPPERB
---------
 ABCDEFG
(1 row)

=> SELECT UPPERB('The Vertica Database');
        UPPERB
----------------------
 THE VERTICA DATABASE
(1 row)
```

V6_ATON

Converts an IPv6 address represented as a character string to a binary string.

Behavior Type

Immutable

Syntax

```
V6_ATON ( expression )
```

Parameters

expression	(VARCHAR) is the string to convert.

Notes

The following syntax converts an IPv6 address represented as the character string A to a binary string B.

V6_ATON trims any spaces from the right of A and calls the Linux function inet_pton.

```
=> V6_ATON(VARCHAR A) -> VARBINARY(16) B
```

If A has no colons it is prepended with '::ffff:'. If A is NULL, too long, or if inet_pton returns an error, the result is NULL.

Examples

```
=> SELECT V6_ATON('2001:DB8::8:800:200C:417A');
                      v6_aton
-----------------------------------------------------
  \001\015\270\000\000\000\000\000\010\010\000 \014Az
(1 row)

=> SELECT V6_ATON('1.2.3.4');
              v6_aton
----------------------------------------------------------------------
 \000\000\000\000\000\000\000\000\000\000\377\377\001\002\003\004
(1 row)
SELECT TO_HEX(V6_ATON('2001:DB8::8:800:200C:417A'));
              to_hex
---------------------------------
 20010db8000000000000800200c417a
(1 row)

=> SELECT V6_ATON('::1.2.3.4');
              v6_aton
----------------------------------------------------------------------
 \000\000\000\000\000\000\000\000\000\000\000\000\001\002\003\004
(1 row)
```

See Also

- V6_NTOA

V6_NTOA

Converts an IPv6 address represented as varbinary to a character string.

Behavior Type

Immutable

Syntax

```
V6_NTOA ( expression )
```

Parameters

expression	(VARBINARY) is the binary string to convert.

Notes

The following syntax converts an IPv6 address represented as VARBINARY B to a string A.

V6_NTOA right-pads B to 16 bytes with zeros, if necessary, and calls the Linux function inet_ntop.

```
=> V6_NTOA(VARBINARY B) -> VARCHAR A
```

If B is NULL or longer than 16 bytes, the result is NULL.

Vertica automatically converts the form '::ffff:1.2.3.4' to '1.2.3.4'.

Examples

```
=> SELECT V6_NTOA(' \001\015\270\000\000\000\000\000\010\010\000 \014Az');
          v6_ntoa
---------------------------
 2001:db8::8:800:200c:417a
(1 row)

=> SELECT V6_NTOA(V6_ATON('1.2.3.4'));
 v6_ntoa
---------
 1.2.3.4
(1 row)

=> SELECT V6_NTOA(V6_ATON('::1.2.3.4'));
  v6_ntoa
-----------
 ::1.2.3.4
(1 row)
```

See Also

- V6_ATON

V6_SUBNETA

Calculates a subnet address in CIDR (Classless Inter-Domain Routing) format from a binary or alphanumeric IPv6 address.

Behavior Type

Immutable

Syntax

V6_SUBNETA (*expression1*, *expression2*)

Parameters

expression1	(VARBINARY or VARCHAR) is the string to calculate.

expression2	(INTEGER) is the size of the subnet.

Notes

The following syntax calculates a subnet address in CIDR format from a binary or varchar IPv6 address.

V6_SUBNETA masks a binary IPv6 address B so that the N leftmost bits form a subnet address, while the remaining rightmost bits are cleared. It then converts to an alphanumeric IPv6 address, appending a slash and N.

```
=> V6_SUBNETA(BINARY B, INT8 N) -> VARCHAR C
```

The following syntax calculates a subnet address in CIDR format from an alphanumeric IPv6 address.

```
=> V6_SUBNETA(VARCHAR A, INT8 N) -> V6_SUBNETA(V6_ATON(A), N) -> VARCHAR C
```

Examples

```
=> SELECT V6_SUBNETA(V6_ATON('2001:db8::8:800:200c:417a'), 28);
  v6_subneta
---------------
 2001:db0::/28
(1 row)
```

See Also

- V6_SUBNETN

V6_SUBNETN

Calculates a subnet address in CIDR (Classless Inter-Domain Routing) format from a varbinary or alphanumeric IPv6 address.

Behavior Type

Immutable

Syntax

```
V6_SUBNETN ( expression1, expression2 )
```

Parameters

expression1	(VARBINARY or VARCHAR) is the string to calculate. **Notes:** • V6_SUBNETN(<VARBINARY>, <INTEGER>) returns VARBINARY. OR • V6_SUBNETN(<VARCHAR>, <INTEGER>) returns VARBINARY, after using V6_ATON to convert the <VARCHAR> string to <VARBINARY>.
expression2	(INTEGER) is the size of the subnet.

Notes

The following syntax masks a BINARY IPv6 address **B** so that the N left-most bits of **S** form a subnet address, while the remaining right-most bits are cleared.

V6_SUBNETN right-pads B to 16 bytes with zeros, if necessary and masks B, preserving its N-bit subnet prefix.

```
=> V6_SUBNETN(VARBINARY B, INT8 N) -> VARBINARY(16) S
```

If B is NULL or longer than 16 bytes, or if N is not between 0 and 128 inclusive, the result is NULL.

S = [B]/N in Classless Inter-Domain Routing notation (CIDR notation).

The following syntax masks an alphanumeric IPv6 address **A** so that the N leftmost bits form a subnet address, while the remaining rightmost bits are cleared.

```
=> V6_SUBNETN(VARCHAR A, INT8 N) -> V6_SUBNETN(V6_ATON(A), N) -> VARBINARY(16) S
```

Example

This example returns VARBINARY, after using V6_ATON to convert the VARCHAR string to VARBINARY:

```
=> SELECT V6_SUBNETN(V6_ATON('2001:db8::8:800:200c:417a'), 28);
                          v6_subnetn
-------------------------------------------------------------
  \001\015\260\000\000\000\000\000\000\000\000\000\000\000\000
```

See Also

- V6_ATON
- V6_SUBNETA

V6_TYPE

Characterizes a binary or alphanumeric IPv6 address B as an integer type.

Behavior Type

Immutable

Syntax

V6_TYPE (*expression*)

Parameters

expression	(VARBINARY or VARCHAR) is the type to convert.

Notes

V6_TYPE(VARBINARY B) returns INT8 T.

```
=> V6_TYPE(VARCHAR A) -> V6_TYPE(V6_ATON(A)) -> INT8 T
```

The IPv6 types are defined in the Network Working Group's IP Version 6 Addressing Architecture memo.

```
  GLOBAL = 0       Global unicast addresses
  LINKLOCAL = 1    Link-Local unicast (and Private-Use) addresses
  LOOPBACK = 2     Loopback
  UNSPECIFIED = 3  Unspecified
  MULTICAST = 4    Multicast
```

IPv4-mapped and IPv4-compatible IPv6 addresses are also interpreted, as specified in IPv4 Global Unicast Address Assignments.

- For IPv4, Private-Use is grouped with Link-Local.
- If B is VARBINARY, it is right-padded to 16 bytes with zeros, if necessary.
- If B is NULL or longer than 16 bytes, the result is NULL.

Details

IPv4 (either kind):

```
    0.0.0.0/8        UNSPECIFIED    10.0.0.0/8    LINKLOCAL
    127.0.0.0/8      LOOPBACK
    169.254.0.0/16   LINKLOCAL
    172.16.0.0/12    LINKLOCAL
    192.168.0.0/16   LINKLOCAL
    224.0.0.0/4      MULTICAST
    others           GLOBAL
```

IPv6:

```
    ::0/128          UNSPECIFIED    ::1/128        LOOPBACK
    fe80::/10        LINKLOCAL
    ff00::/8         MULTICAST
    others           GLOBAL
```

Examples

```
=> SELECT V6_TYPE(V6_ATON('192.168.2.10'));
 v6_type
---------
       1
(1 row)

=> SELECT V6_TYPE(V6_ATON('2001:db8::8:800:200c:417a'));
 v6_type
```

```
---------
       0
(1 row)
```

System Information Functions

These functions provide system information regarding user sessions. A superuser has unrestricted access to all system information, but users can view only information about their own, current sessions.

CURRENT_DATABASE

Returns the name of the current database, equivalent to DBNAME.

Behavior Type

Stable

Syntax

> **Note:**
> Parentheses are optional.

```
CURRENT_DATABASE()
```

Examples

```
=> SELECT CURRENT_DATABASE;
 CURRENT_DATABASE
------------------
 VMart
(1 row)
```

CURRENT_SCHEMA

Returns the name of the current schema.

Behavior Type

Stable

Syntax

```
CURRENT_SCHEMA()
```

> **Note:**
> You can call this function without parentheses.

Privileges

None

Examples

The following command returns the name of the current schema:

```
=> SELECT CURRENT_SCHEMA();
 current_schema
----------------
 public
(1 row)
```

The following command returns the same results without the parentheses:

```
=> SELECT CURRENT_SCHEMA;
 current_schema
----------------
 public
(1 row)
```

The following command shows the current schema, listed after the current user, in the search path:

```
=> SHOW SEARCH_PATH;
    name     |                       setting
-------------+-------------------------------------------------
 search_path | "$user", public, v_catalog, v_monitor, v_internal
(1 row)
```

See Also

- SET SEARCH_PATH

CURRENT_USER

Returns a VARCHAR containing the name of the user who initiated the current database connection.

Behavior Type

Stable

Syntax

```
CURRENT_USER()
```

Notes

- The CURRENT_USER function does not require parentheses.
- This function is useful for permission checking.
- CURRENT_USER is equivalent to SESSION_USER, USER, and USERNAME.

Examples

```
=> SELECT CURRENT_USER();
 CURRENT_USER
--------------
 dbadmin
(1 row)
```

The following command returns the same results without the parentheses:

```
=> SELECT CURRENT_USER;
 CURRENT_USER
--------------
 dbadmin
(1 row)
```

DBNAME (function)

Returns the name of the current database, equivalent to CURRENT_DATABASE.

Behavior Type

Immutable

Syntax

```
DBNAME()
```

Examples

```
=> SELECT DBNAME();
      dbname
------------------
 VMart
(1 row)
```

HAS_TABLE_PRIVILEGE

Returns true or false to verify whether a user has the specified privilege on a table.

Behavior Type

Stable

Syntax

```
HAS_TABLE_PRIVILEGE ( [ user, ] '[[database.]schema.]table', 'privilege' )
```

Parameters

user	Name or OID of a database user. If omitted, Vertica checks privileges for the current user.
[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table	Name or OID of the table to check.

privilege	A table privilege, one of the following:
	• SELECT: Query tables. SELECT privileges are granted by default to the PUBLIC role.
	• INSERT: Insert table rows with INSERT, and load data with COPY.
	Note: `COPY FROM STDIN` is allowed for users with INSERT privileges, while `COPY FROM file` requires admin privileges.
	• UPDATE: Update table rows.
	• DELETE: Delete table rows.
	• REFERENCES: Create foreign key constraints on this table. This privilege must be set on both referencing and referenced tables.
	• TRUNCATE: Truncate table contents. Non-owners of tables can also execute the following partition operations on them:
	  • DROP_PARTITIONS
	  • SWAP_PARTITIONS_BETWEEN_TABLES
	  • MOVE_PARTITIONS_TO_TABLE
	• ALTER: Modify a table's DDL with ALTER TABLE.
	• DROP: Drop a table.

Privileges

Non-superuser, one of the following:

- Table owner
- USAGE privilege on the table schema and one or more privileges on the table

Examples

```
=> SELECT HAS_TABLE_PRIVILEGE('store.store_dimension', 'SELECT');
 HAS_TABLE_PRIVILEGE
---------------------
 t
(1 row)

=> SELECT HAS_TABLE_PRIVILEGE('release', 'store.store_dimension', 'INSERT');
 HAS_TABLE_PRIVILEGE
---------------------
 t
(1 row)

=> SELECT HAS_TABLE_PRIVILEGE(45035996273711159, 45035996273711160, 'select');
 HAS_TABLE_PRIVILEGE
---------------------
t
(1 row)
```

LIST_ENABLED_CIPHERS

Returns a list of enabled cipher suites, which are sets of algorithms used to secure TLS/SSL connections.

By default, Vertica uses OpenSSL's default cipher suites. For more information, see the OpenSSL man page.

Syntax

LIST_ENABLED_CIPHERS()

Example

```
=> SELECT LIST_ENABLED_CIPHERS();
SSL_RSA_WITH_RC4_128_MD5
SSL_RSA_WITH_RC4_128_SHA
TLS_RSA_WITH_AES_128_CBC_SHA
```

See Also

- TLS Protocol
- Security Parameters

SESSION_USER

Returns a VARCHAR containing the name of the user who initiated the current database session.

Behavior Type

Stable

Syntax

```
SESSION_USER()
```

Notes

- The SESSION_USER function does not require parentheses.
- SESSION_USER is equivalent to CURRENT_USER, USER, and USERNAME.

Examples

```
=> SELECT SESSION_USER();
 session_user
--------------
 dbadmin
```

```
(1 row)
```

The following command returns the same results without the parentheses:

```
=> SELECT SESSION_USER;
 session_user
--------------
 dbadmin
(1 row)
```

USER

Returns a VARCHAR containing the name of the user who initiated the current database connection.

Behavior Type

Stable

Syntax

```
USER()
```

Notes

- The USER function does not require parentheses.
- USER is equivalent to CURRENT_USER, SESSION_USER, and USERNAME.

Examples

```
=> SELECT USER();
 current_user
--------------
 dbadmin
(1 row)
```

The following command returns the same results without the parentheses:

```
=> SELECT USER;
 current_user
```

```
--------------
 dbadmin
(1 row)
```

USERNAME

Returns a VARCHAR containing the name of the user who initiated the current database connection.

Behavior Type

Stable

Syntax

```
USERNAME()
```

Notes

- This function is useful for permission checking.
- USERNAME is equivalent to CURRENT_USER, SESSION_USER and USER.

Examples

```
=> SELECT USERNAME();
 username
--------------
 dbadmin
(1 row)
```

VERSION

Returns a VARCHAR containing a Vertica node's version information.

Behavior Type

Stable

Syntax

```
VERSION()
```

> **Note:**
> The parentheses are required.

Examples

```
=> SELECT VERSION();
                    VERSION
-----------------------------------------
Vertica Analytic Database v10.0.0-0
(1 row)
```

Timeseries Functions

Timeseries aggregate functions evaluate the values of a given set of variables over time and group those values into a window for analysis and aggregation.

One output row is produced per time slice—or per partition per time slice—if partition expressions are present.

TS_FIRST_VALUE

Processes the data that belongs to each time slice. A time series aggregate (TSA) function, TS_FIRST_VALUE returns the value at the start of the time slice, where an interpolation scheme is applied if the timeslice is missing, in which case the value is determined by the values corresponding to the previous (and next) timeslices based on the interpolation scheme of const (linear).

TS_FIRST_VALUE returns one output row per time slice, or one output row per partition per time slice if partition expressions are specified

Behavior Type

Immutable

Syntax

```
TS_FIRST_VALUE ( expression [ IGNORE NULLS ] [, { 'CONST' | 'LINEAR' } ] )
```

Parameters

expression	An INTEGER or FLOAT expression on which to aggregate and interpolate.
IGNORE NULLS	The IGNORE NULLS behavior changes depending on a CONST or LINEAR interpolation scheme. See When Time

	Series Data Contains Nulls in Analyzing Data for details.
'CONST' | 'LINEAR'	Specifies the interpolation value as constant or linear: • CONST (default): New value is interpolated based on previous input records. • LINEAR: Values are interpolated in a linear slope based on the specified time slice.

Requirements

You must use an ORDER BY clause with a TIMESTAMP column.

Multiple Time Series Aggregate Functions

The same query can call multiple time series aggregate functions. They share the same gap-filling policy as defined by the TIMESERIES Clause; however, each time series aggregate function can specify its own interpolation policy. For example:

```
=> SELECT slice_time, symbol,
TS_FIRST_VALUE(bid, 'const') fv_c,
       TS_FIRST_VALUE(bid, 'linear') fv_l,
       TS_LAST_VALUE(bid, 'const') lv_c
FROM TickStore
TIMESERIES slice_time AS '3 seconds'
OVER(PARTITION BY symbol ORDER BY ts);
```

Examples

See Gap Filling and Interpolation in Analyzing Data.

See Also

- TS_LAST_VALUE
- Time Series Analytics

TS_LAST_VALUE

Processes the data that belongs to each time slice. A time series aggregate (TSA) function, TS_LAST_VALUE returns the value at the end of the time slice, where an interpolation scheme is applied if the timeslice is missing. In this case the value is determined by the values corresponding to the previous (and next) timeslices based on the interpolation scheme of const (linear).

TS_LAST_VALUE returns one output row per time slice, or one output row per partition per time slice if partition expressions are specified.

Behavior Type

Immutable

Syntax

```
TS_LAST_VALUE ( expression [ IGNORE NULLS ] [, { 'CONST' | 'LINEAR' } ] )
```

Parameters

expression	An INTEGER or FLOAT expression on which to aggregate and interpolate.
IGNORE NULLS	The IGNORE NULLS behavior changes depending on a CONST or LINEAR interpolation scheme. See When Time Series Data Contains Nulls in Analyzing Data for details.
'CONST' | 'LINEAR'	Specifies the interpolation value as constant or linear: • CONST (default): New value is interpolated based on previous input records. • LINEAR: Values are interpolated in a linear slope based on the specified time slice.

Requirements

You must use the ORDER BY clause with a TIMESTAMP column.

Multiple Time Series Aggregate Functions

The same query can call multiple time series aggregate functions. They share the same gap-filling policy as defined by the TIMESERIES Clause; however, each time series aggregate function can specify its own interpolation policy. For example:

```
=> SELECT slice_time, symbol,
TS_FIRST_VALUE(bid, 'const') fv_c,
       TS_FIRST_VALUE(bid, 'linear') fv_l,
       TS_LAST_VALUE(bid, 'const') lv_c
FROM TickStore
TIMESERIES slice_time AS '3 seconds'
OVER(PARTITION BY symbol ORDER BY ts);
```

Examples

See Gap Filling and Interpolation in Analyzing Data.

URI Encode/Decode Functions

The functions in this section follow the RFC 3986 standard for percent-encoding a Universal Resource Identifier (URI).

URI_PERCENT_DECODE

Decodes a percent-encoded Universal Resource Identifier (URI) according to the RFC 3986 standard.

Syntax

```
URI_PERCENT_DECODE (expression)
```

Behavior Type

Immutable

Parameters

expression	(VARCHAR) is the string to convert.

Examples

The following example invokes uri_percent_decode on the Websites column of the URI table and returns a decoded URI:

```
=> SELECT URI_PERCENT_DECODE(Websites) from URI;
              URI_PERCENT_DECODE
-----------------------------------------------
 http://www.faqs.org/rfcs/rfc3986.html x xj%a%
(1 row)
```

The following example returns the original URI in the Websites column and its decoded version:

```
=> SELECT Websites, URI_PERCENT_DECODE (Websites) from URI;

                     Websites                      |              URI_PERCENT_DECODE
---------------------------------------------------+-----------------------------------------
 http://www.faqs.org/rfcs/rfc3986.html+x%20x%6a%a% | http://www.faqs.org/rfcs/rfc3986.html x xj%a%

(1 row)
```

URI_PERCENT_ENCODE

Encodes a Universal Resource Identifier (URI) according to the RFC 3986 standard for percent encoding. For compatibility with older encoders, this function converts + to space; space is converted to `%20`.

Syntax

`URI_PERCENT_ENCODE (`*`expression`*`)`

Behavior Type

Immutable

Parameters

expression	(VARCHAR) is the string to convert.

Examples

The following example shows how the `uri_percent_encode` function is invoked on a the Websites column of the URI table and returns an encoded URI:

```
=> SELECT URI_PERCENT_ENCODE(Websites) from URI;
            URI_PERCENT_ENCODE
-----------------------------------------
 http%3A%2F%2Fexample.com%2F%3F%3D11%2F15
(1 row)
```

The following example returns the original URI in the Websites column and it's encoded form:

```
=> SELECT Websites, URI_PERCENT_ENCODE(Websites) from URI;          Websites          |
URI_PERCENT_ENCODE
---------------------------+------------------------------------------
 http://example.com/?=11/15 | http%3A%2F%2Fexample.com%2F%3F%3D11%2F15
(1 row)
```

UUID Functions

Currently, Vertica provides one function to support UUID data types, UUID_GENERATE.

UUID_GENERATE

Returns a new universally unique identifier (UUID) that is generated based on high-quality randomness from /dev/urandom.

Behavior Type

Volatile

Syntax

```
UUID_GENERATE()
```

Example

```
=> CREATE TABLE Customers(
     cust_id UUID DEFAULT UUID_GENERATE(),
   lname VARCHAR(36),
   fname VARCHAR(24));
CREATE TABLE
=> INSERT INTO Customers VALUES (DEFAULT, 'Kearney', 'Thomas');
 OUTPUT
--------
      1
(1 row)

=> COPY Customers (lname, fname) FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> Pham|Duc
>> Garcia|Mary
```

```
>> \.
=> SELECT * FROM Customers;
               cust_id                |  lname  | fname
--------------------------------------+---------+--------
 03fe0794-ac5d-42d4-8246-54f7ec81ed0c | Pham    | Duc
 6950313d-c77e-4c11-a86e-0a54aa3ec114 | Kearney | Thomas
 9c9653ce-c2e4-4441-b0f7-0137b54cc28c | Garcia  | Mary
(3 rows)
```

Vertica Meta-Functions

Vertica built-in (meta) functions access the internal state of Vertica and are used in SELECT queries with the function name and an argument (where required). These functions are not part of the SQL standard and take the following form:

```
SELECT <meta-function-name>(<args>);
```

Note:
The query cannot contain other clauses, such as FROM or WHERE.

The behavior type of Vertica meta-functions is **immutable**.

Alphabetical List of Vertica Meta-Functions

The following list shows all Vertica meta-functions in alphabetical order.

Jump to letter: A - B - C - D - E - F - G - H - I - K - L - M - N - P - R - S - V

Collects and aggregates data samples and storage information for a range of partitions in the specified table.

ANALYZE_WORKLOAD

Runs Workload Analyzer, a utility that analyzes system information held in system tables.

AUDIT

Returns the raw data size (in bytes) of a database, schema, or table as it is counted in an audit of the database size.

AUDIT_FLEX

Returns the estimated ROS size of __raw__ columns, equivalent to the export size of the flex data in the audited objects.

AUDIT_LICENSE_SIZE

Triggers an immediate audit of the database size to determine if it is in compliance with the raw data storage allowance included in your Vertica licenses.

AUDIT_LICENSE_TERM

Triggers an immediate audit to determine if the Vertica license has expired.

AWS_GET_CONFIG

Returns the current Amazon Web Services (AWS) credentials set by AWS_SET_CONFIG or ALTER SESSION.

AWS_SET_CONFIG

Sets the values of AWS Library User-Defined Session Parameters for the current session.

BACKGROUND_DEPOT_WARMING

, .

BUILD_FLEXTABLE_VIEW

Creates, or re-creates, a view for a default or user-defined _keys table, ignoring any empty keys.

CALENDAR_HIERARCHY_DAY

Specifies to group DATE partition keys into a hierarchy of years, months, and days.

CANCEL_DEPOT_WARMING

Eon Mode only.

CANCEL_REBALANCE_CLUSTER

Stops any rebalance task that is currently in progress or is waiting to execute.

CANCEL_REFRESH

Cancels refresh-related internal operations initiated by START_REFRESH and REFRESH.

CHANGE_CURRENT_STATEMENT_RUNTIME_PRIORITY

Changes the run-time priority of an active query.

CHANGE_RUNTIME_PRIORITY

Changes the run-time priority of a query that is actively running.

CLEAN_COMMUNAL_STORAGE

Eon Mode only.

CLEAR_CACHES

Clears the Vertica internal cache files.

CLEAR_DATA_COLLECTOR

Clears all memory and disk records from Data Collector tables and logs, and resets collection statistics in system table DATA_COLLECTOR.

CLEAR_DATA_DEPOT
: Eon Mode only.

CLEAR_DEPOT_PIN_POLICY
: Eon Mode only.

CLEAR_DEPOT_PIN_POLICY_PARTITION
: Eon Mode only.

CLEAR_DEPOT_PIN_POLICY_TABLE
: Eon Mode only.

CLEAR_FETCH_QUEUE
: Eon Mode only.

CLEAR_HDFS_CACHES
: Clears the configuration information copied from HDFS and any cached connections.

CLEAR_OBJECT_STORAGE_POLICY
: Removes a user-defined storage policy from the specified database, schema or table.

CLEAR_PROFILING
: Clears from memory data for the specified profiling type.

CLEAR_PROJECTION_REFRESHES
: Clears information in system table PROJECTION_REFRESHES of projection refresh history.

CLEAR_RESOURCE_REJECTIONS
: Clears the content of the RESOURCE_REJECTIONS and DISK_RESOURCE_REJECTIONS system tables.

CLOSE_ALL_RESULTSETS
: Closes all result set sessions within Multiple Active Result Sets (MARS) and frees the MARS storage for other result sets.

CLOSE_ALL_SESSIONS
: Closes all external sessions except the one that issues this function.

CLOSE_RESULTSET
: Closes a specific result set within Multiple Active Result Sets (MARS) and frees the MARS storage for other result sets.

CLOSE_SESSION
: Interrupts the specified external session, rolls back the current transaction if any, and closes the socket.

CLOSE_USER_SESSIONS
: Stops the session for a user, rolls back any transaction currently running, and closes the connection.

COMPACT_STORAGE
: Bundles existing data (.fdb) and index (.pidx) files into the .gt file format.

COMPUTE_FLEXTABLE_KEYS
: Computes the virtual columns (keys and values) from the flex table VMap data.

COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW

Combines the functionality of BUILD_FLEXTABLE_VIEW and COMPUTE_FLEXTABLE_KEYS to compute virtual columns (keys) from the VMap data of a flex table and construct a view.

COPY_PARTITIONS_TO_TABLE

Copies partitions from one table to another.

COPY_TABLE

Copies one table to another.

CURRENT_SCHEMA

Returns the name of the current schema.

DATA_COLLECTOR_HELP

Returns online usage instructions about the Data Collector, the V_MONITOR.DATA_ COLLECTOR system table, and the Data Collector control functions.

DELETE_TOKENIZER_CONFIG_FILE

Deletes a tokenizer configuration file.

DEMOTE_SUBCLUSTER_TO_SECONDARY

Eon Mode only.

DESCRIBE_LOAD_BALANCE_DECISION

Evaluates if any load balancing routing rules apply to a given IP address and describes how the client connection would be handled.

DESIGNER_ADD_DESIGN_QUERIES

Reads and evaluates queries from an input file, and adds the queries that it accepts to the specified design.

DESIGNER_ADD_DESIGN_QUERIES_FROM_RESULTS

Executes the specified query and evaluates results in the following columns:.

DESIGNER_ADD_DESIGN_QUERY

Reads and parses the specified query, and if accepted, adds it to the design.

DESIGNER_ADD_DESIGN_TABLES

Adds the specified tables to a design.

DESIGNER_CANCEL_POPULATE_DESIGN

Cancels population or deployment operation for the specified design if it is currently running.

DESIGNER_CREATE_DESIGN

Creates a design with the specified name.

DESIGNER_DESIGN_PROJECTION_ENCODINGS

Analyzes encoding in the specified projections, creates a script to implement encoding recommendations, and optionally deploys the recommendations.

DESIGNER_DROP_ALL_DESIGNS

Removes all Database Designer-related schemas associated with the current user.

DESIGNER_DROP_DESIGN

Removes the schema associated with the specified design and all its contents.

DESIGNER_OUTPUT_ALL_DESIGN_PROJECTIONS

Displays the DDL statements that define the design projections to standard output.

DESIGNER_OUTPUT_DEPLOYMENT_SCRIPT
: Displays the deployment script for the specified design to standard output.

DESIGNER_RESET_DESIGN
: Discards all run-specific information of the previous Database Designer build or deployment of the specified design but keeps its configuration.

DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY
: Populates the design and creates the design and deployment scripts.

DESIGNER_SET_DESIGN_KSAFETY
: Sets K-safety for a comprehensive design and stores the K-safety value in the DESIGNS table.

DESIGNER_SET_DESIGN_TYPE
: Specifies whether Database Designer creates a comprehensive or incremental design.

DESIGNER_SET_OPTIMIZATION_OBJECTIVE
: Valid only for comprehensive database designs, specifies the optimization objective Database Designer uses.

DESIGNER_SET_PROPOSE_UNSEGMENTED_PROJECTIONS
: Specifies whether a design can include unsegmented projections.

DESIGNER_SINGLE_RUN
: Evaluates all queries that completed execution within the specified timespan, and returns with a design that is ready for deployment.

DESIGNER_WAIT_FOR_DESIGN
: Waits for completion of operations that are populating and deploying the design.

DISABLE_DUPLICATE_KEY_ERROR
: Disables error messaging when Vertica finds duplicate primary or unique key values at run time (for use with key constraints that are not automatically enabled).

DISABLE_LOCAL_SEGMENTS
: Disables local data segmentation, which breaks projections segments on nodes into containers that can be easily moved to other nodes.

DISABLE_PROFILING
: Disables for the current session collection of profiling data of the specified type.

DISPLAY_LICENSE
: Returns the terms of your Vertica license.

DO_TM_TASK
: Runs a Tuple Mover operation on the specified table or projection and commits current transactions.

DROP_EXTERNAL_ROW_COUNT
: Removes external table row count statistics compiled by ANALYZE_EXTERNAL_ROW_COUNT.

DROP_LICENSE
: Drops a license key from the global catalog.

DROP_LOCATION
: Removes the specified storage location.

DROP_PARTITIONS
: Drops the specified table partition keys.

DROP_STATISTICS
: Removes statistical data on database projections previously generated by ANALYZE_STATISTICS.

DROP_STATISTICS_PARTITION
: Removes statistical data on database projections previously generated by ANALYZE_STATISTICS_PARTITION.

DUMP_CATALOG
: Returns an internal representation of the Vertica catalog.

DUMP_LOCKTABLE
: Returns information about deadlocked clients and the resources they are waiting for.

DUMP_PARTITION_KEYS
: Dumps the partition keys of all projections in the system.

DUMP_PROJECTION_PARTITION_KEYS
: Dumps the partition keys of the specified projection.

DUMP_TABLE_PARTITION_KEYS
: Dumps the partition keys of all projections for the specified table.

EMPTYMAP
: Constructs a new VMap with one row but without keys or data.

ENABLED_ROLE
: Checks whether a Vertica user role is enabled, and returns true or false.

ENABLE_ELASTIC_CLUSTER
: Enables elastic cluster scaling, which makes enlarging or reducing the size of your database cluster more efficient by segmenting a node's data into chunks that can be easily moved to other hosts.

ENABLE_LOCAL_SEGMENTS
: Enables local storage segmentation, which breaks projections segments on nodes into containers that can be easily moved to other nodes.

ENABLE_PROFILING
: Enables collection of profiling data of the specified type for the current session.

ENFORCE_OBJECT_STORAGE_POLICY
: Applies storage policies of the specified object immediately.

EVALUATE_DELETE_PERFORMANCE
: Evaluates projections for potential DELETE and UPDATE performance issues.

EXPORT_CATALOG
: Generates a SQL script for recreating a physical schema design on another cluster.

EXPORT_DIRECTED_QUERIES
: Generates SQL for creating directed queries from a set of input queries, and writes the SQL to the specified file or to standard output.

EXPORT_OBJECTS

Generates a SQL script you can use to recreate non-virtual catalog objects on another cluster.

EXPORT_STATISTICS
: Generates statistics in XML format from data previously collected by ANALYZE_STATISTICS.

EXPORT_STATISTICS_PARTITION
: Generates partition-level statistics in XML format from data previously collected by ANALYZE_STATISTICS_PARTITION.

EXPORT_TABLES
: Generates a SQL script that can be used to recreate a logical schema—schemas, tables, constraints, and views—on another cluster.

EXTERNAL_CONFIG_CHECK
: Tests the Hadoop configuration of a Vertica cluster.

FINISH_FETCHING_FILES
: Eon Mode only.

FLUSH_DATA_COLLECTOR
: Waits until memory logs are moved to disk and then flushes the Data Collector, synchronizing the log with disk storage.

FLUSH_REAPER_QUEUE
: Eon Mode only.

GET_AHM_EPOCH
: Returns the number of the epoch in which the Ancient History Mark is located.

GET_AHM_TIME
: Returns a TIMESTAMP value representing the Ancient History Mark.

GET_AUDIT_TIME
: Reports the time when the automatic audit of database size occurs.

GET_CLIENT_LABEL
: Returns the client connection label for the current session.

GET_COMPLIANCE_STATUS
: Displays whether your database is in compliance with your Vertica license agreement.

GET_CONFIG_PARAMETER
: Gets the value of a configuration parameter at the database level or for a specific node.

GET_CURRENT_EPOCH
: The epoch into which data (COPY, INSERT, UPDATE, and DELETE operations) is currently being written.

GET_DATA_COLLECTOR_NOTIFY_POLICY
: Lists any notification policies set on a Data Collector component.

GET_DATA_COLLECTOR_POLICY
: Retrieves a brief statement about the retention policy for the specified component.

GET_LAST_GOOD_EPOCH
: Returns the last good epoch number.

GET_METADATA

Returns the metadata of a Parquet file.

GET_NUM_ACCEPTED_ROWS

Returns the number of rows loaded into the database for the last completed load for the current session.

GET_NUM_REJECTED_ROWS

Returns the number of rows that were rejected during the last completed load for the current session.

GET_PRIVILEGES_DESCRIPTION

Returns the effective privileges the current user has on an object, including explicit, implicit, inherited, and role-based privileges.

GET_PROJECTIONS

Returns the following information about projections of the specified anchor table:.

GET_PROJECTION_SORT_ORDER

Returns the order of columns in a projection's ORDER BY clause.

GET_PROJECTION_STATUS

Returns information relevant to the status of a projection:.

GET_TOKENIZER_PARAMETER

Returns the configuration parameter for a given tokenizer.

HADOOP_IMPERSONATION_CONFIG_CHECK

Reports the delegation tokens Vertica will use when accessing Kerberized data in HDFS.

HASH_EXTERNAL_TOKEN

Returns a hash of a string token, for use with HADOOP_IMPERSONATION_CONFIG_CHECK.

HAS_ROLE

Checks whether a Vertica user role is granted to the specified user or role, and returns true or false.

HCATALOGCONNECTOR_CONFIG_CHECK

Tests the configuration of a Vertica cluster that uses the HCatalog Connector to access Hive data.

HDFS_CLUSTER_CONFIG_CHECK

Tests the configuration of a Vertica cluster that uses HDFS.

IMPORT_DIRECTED_QUERIES

Imports to the database catalog directed queries from a SQL file that was generated by EXPORT_DIRECTED_QUERIES.

IMPORT_STATISTICS

Imports statistics from the XML file that was generated by EXPORT_STATISTICS.

INFER_EXTERNAL_TABLE_DDL

Inspects a file in Parquet format and returns a CREATE EXTERNAL TABLE AS COPY statement that can be used to read the file.

INSTALL_LICENSE

Installs the license key in the global catalog.

INTERRUPT_STATEMENT

Interrupts the specified statement in a user session, rolls back the current transaction, and writes a success or failure message to the log file.

KERBEROS_CONFIG_CHECK

Tests the Kerberos configuration of a Vertica cluster.

KERBEROS_HDFS_CONFIG_CHECK

Tests the Kerberos configuration of a Vertica cluster that uses HDFS.

LAST_INSERT_ID

Returns the last value of an AUTO_INCREMENT/IDENTITY column.

LDAP_LINK_DRYRUN_CONNECT

Takes a set of LDAP Link connection parameters as arguments and begins a dry run connection between the LDAP server and Vertica.

LDAP_LINK_DRYRUN_SEARCH

Takes a set of LDAP Link connection and search parameters as arguments and begins a dry run search for users and groups that would get imported from the LDAP server.

LDAP_LINK_DRYRUN_SYNC

Takes a set of LDAP Link connection and search parameters as arguments and begins a dry run synchronization between the database and the LDAP server, which maps and synchronizes the LDAP server's users and groups with their equivalents in Vertica.

LDAP_LINK_SYNC_START

Begins the synchronization between the LDAP server and Vertica immediately rather than waiting for the interval set in LDAPLinkInterval.

MAKE_AHM_NOW

Sets the Ancient History Mark (AHM) to the greatest allowable value.

MAPAGGREGATE

Returns a LONG VARBINARY VMap with keys and value pairs supplied from two VARCHAR input columns of an existing columnar table.

MAPCONTAINSKEY

Determines whether a VMap contains a virtual column (key).

MAPCONTAINSVALUE

Determines whether a VMap contains a specific value.

MAPDELIMITEDEXTRACTOR

Extracts data with a delimiter character, and other optional arguments, returning a single VMap value.

MAPITEMS

Returns information about items in a VMap.

MAPJSONEXTRACTOR

Extracts content of repeated JSON data objects, including nested maps, or data with an outer list of JSON elements.

MAPKEYS

Returns the virtual columns (and values) present in any VMap data.

MAPKEYSINFO

Returns virtual column information from a given map.

MAPLOOKUP
: Returns single-key values from VMAP data.

MAPPUT
: Accepts a VMap and one or more key/value pairs and returns a new VMap with the key/value pairs added.

MAPREGEXEXTRACTOR
: Extracts data from a regular expression and returns the results as a VMap.

MAPSIZE
: Returns the number of virtual columns present in any VMap data.

MAPTOSTRING
: Recursively builds a string representation VMap data, including nested JSON maps.

MAPVALUES
: Returns a string representation of the top-level values from a VMap.

MAPVERSION
: Returns the version or invalidity of any map data.

MARK_DESIGN_KSAFE
: Enables or disables high availability in your environment, in case of a failure.

MATERIALIZE_FLEXTABLE_COLUMNS
: Materializes virtual columns listed as key_names in the flextable_keys table you compute using either COMPUTE_FLEXTABLE_KEYS or COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW.

MEASURE_LOCATION_PERFORMANCE
: Measures a storage location's disk performance.

MEMORY_TRIM
: Calls glibc function malloc_trim() to reclaim free memory from malloc and return it to the operating system.

MIGRATE_ENTERPRISE_TO_EON
: Enterprise Mode only.

MOVE_PARTITIONS_TO_TABLE
: Moves partitions from one table to another.

MOVE_RETIRED_LOCATION_DATA
: Moves all data from the specified retired storage location or from all retired storage locations in the database.

MOVE_STATEMENT_TO_RESOURCE_POOL
: Attempts to move the specified query to the specified target pool.

NOTIFY
: Specifies the text message to include with a notification.

PARTITION_PROJECTION
: Splits ROS containers for a specified projection.

PARTITION_TABLE
: Invokes the Tuple Mover to reorganize ROS storage containers as needed to conform with the current partitioning policy.

PROMOTE_SUBCLUSTER_TO_PRIMARY
: Eon Mode only.

PURGE
: Permanently removes delete vectors from ROS storage containers so disk space can be reused.

PURGE_PARTITION
: Purges a table partition of deleted rows.

PURGE_PROJECTION
: Permanently removes deleted data from physical storage so disk space can be reused.

PURGE_TABLE
: Permanently removes deleted data from physical storage so disk space can be reused.

READ_CONFIG_FILE
: Reads and returns the key-value pairs of all the parameters of a given tokenizer.

REALIGN_CONTROL_NODES
: Causes Vertica to re-evaluate which nodes in the cluster or subcluster are control nodes and which nodes are assigned to them as dependents when large cluster is enabled.

REBALANCE_CLUSTER
: Rebalances the database cluster synchronously as a session foreground task.

REBALANCE_SHARDS
: Eon Mode only.

REBALANCE_TABLE
: Synchronously rebalances data in the specified table.

REENABLE_DUPLICATE_KEY_ERROR
: Restores the default behavior of error reporting by reversing the effects of DISABLE_DUPLICATE_KEY_ERROR.

REFRESH
: Synchronously refreshes one or more table projections in the foreground, and updates system table PROJECTION_REFRESHES.

REFRESH_COLUMNS
: Refreshes table columns that are defined with the constraint SET USING or DEFAULT USING.

RELEASE_ALL_JVM_MEMORY
: Forces all sessions to release the memory consumed by their Java Virtual Machines (JVM).

RELEASE_JVM_MEMORY
: Terminates a Java Virtual Machine (JVM), making available the memory the JVM was using.

RELEASE_SYSTEM_TABLES_ACCESS
: Enables non-superuser access to all system tables.

RELOAD_SPREAD
: Updates cluster changes to the catalog's Spread configuration file.

RESERVE_SESSION_RESOURCE

Reserves memory resources from the general resource pool for the exclusive use of the Vertica backup and restore process.

RESET_LOAD_BALANCE_POLICY

Resets the counter each host in the cluster maintains, to track which host it will refer a client to when the native connection load balancing scheme is set to ROUNDROBIN.

RESET_SESSION

Applies your default connection string configuration settings to your current session.

RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW

Restores the _keys table and the _view.

RESTORE_LOCATION

Restores a storage location that was previously retired with RETIRE_LOCATION.

RESTRICT_SYSTEM_TABLES_ACCESS

Checks system table SYSTEM_TABLES to determine which system tables non-superusers can access.

RETIRE_LOCATION

Inactivates the specified storage location.

RUN_INDEX_TOOL

Runs the Index tool on a Vertica database to perform one of these tasks:.

S3EXPORT

Exports data to an Amazon S3 bucket from the Vertica cluster.

S3EXPORT_PARTITION

The S3EXPORT_PARTITION function allows Vertica output to be used by the Amazon Elastic MapReduce (EMR) feature.

SECURITY_CONFIG_CHECK

Returns the status of various security-related parameters.

SET_CONFIG_PARAMETER

Sets the value of a configuration parameter at the database level or for a specific node.

SET_AHM_EPOCH

Sets the Ancient History Mark (AHM) to the specified epoch.

SET_AHM_TIME

Sets the Ancient History Mark (AHM) to the epoch corresponding to the specified time on the initiator node.

SET_AUDIT_TIME

Sets the time that Vertica performs automatic database size audit to determine if the size of the database is compliant with the raw data allowance in your Vertica license.

SET_CLIENT_LABEL

Assigns a label to a client connection for the current session.

SET_CONTROL_SET_SIZE

Sets the number of control nodes that participate in the spread service when large cluster is enabled.

SET_DATA_COLLECTOR_NOTIFY_POLICY

Enables or disables automatic notification of Data Collector component changes.

SET_DATA_COLLECTOR_POLICY
: Updates the following retention policy properties for the specified component: .

SET_DATA_COLLECTOR_TIME_POLICY
: Updates the retention policy property INTERVAL_TIME for the specified component.

SET_DEPOT_PIN_POLICY
: Eon Mode only.

SET_DEPOT_PIN_POLICY_PARTITION
: Eon Mode only.

SET_DEPOT_PIN_POLICY_TABLE
: Eon Mode only.

SET_LOAD_BALANCE_POLICY
: Sets how native connection load balancing chooses a host to handle a client connection.

SET_LOCATION_PERFORMANCE
: Sets disk performance for a storage location.

SET_OBJECT_STORAGE_POLICY
: Creates or changes the storage policy of a database object by assigning it a labeled storage location.

SET_SCALING_FACTOR
: Sets the scaling factor that determines the number of storage containers used when rebalancing the database and when using local data segmentation is enabled.

SET_SPREAD_OPTION
: Changes spread daemon settings.

SET_TOKENIZER_PARAMETER
: Configures the tokenizer parameters.

SHOW_PROFILING_CONFIG
: Shows whether profiling is enabled.

SHUTDOWN
: Shuts down a Vertica database.

SHUTDOWN_SUBCLUSTER
: Eon Mode only.

SLEEP
: Waits a specified number of seconds before executing another statement or command.

START_REAPING_FILES
: Eon Mode only.

START_REBALANCE_CLUSTER
: Asynchronously rebalances the database cluster as a background task.

START_REFRESH
: Refreshes projections in the current schema with the latest data of their respective anchor tables.

SWAP_PARTITIONS_BETWEEN_TABLES
: Swaps partitions between two tables.

SYNC_CATALOG

Eon Mode only.

SYNC_WITH_HCATALOG_SCHEMA
: Copies the structure of a Hive database schema available through the HCatalog Connector to a Vertica schema.

SYNC_WITH_HCATALOG_SCHEMA_TABLE
: Copies the structure of a single table in a Hive database schema available through the HCatalog Connector to a Vertica table.

VALIDATE_STATISTICS
: Validates statistics in the XML file generated by EXPORT_STATISTICS.

VERIFY_HADOOP_CONF_DIR
: Verifies that the Hadoop configuration that is used to access HDFS is valid on all Vertica nodes.

AWS Library Functions

This section contains the functions associated with the Vertica library for Amazon Web Services (AWS).

AWS_GET_CONFIG

Returns the current Amazon Web Services (AWS) credentials set by AWS_SET_CONFIG or ALTER SESSION.

Syntax

```
AWS_GET_CONFIG( 'parameter' )
```

parameter

```
aws_id
aws_secret
aws_session_token
aws_region
aws_ca_path
aws_ca_bundle
aws_proxy
aws_verbose
aws_max_send_speed
aws_max_recv_speed
```

Parameters

`aws_id`	Retrieves the value for the 20-character AWS access key used to authenticate your account
`aws_secret`	Retrieves the value for the 40-character AWS secret access key used to authenticate your account
`aws_session_token`	The AWS temporary security token generated by running the AWS STS command `get-session-token`. This AWS STS command generates temporary credentials you can use to implement multi-factor authentication for security purposes. For more information on get-session-token see the AWS documentation.
`aws_region`	Retrieves the region where your AWS bucket is located. See the AWS Documentation for the full list of values. **Default value**: `us-east-1`
`aws_ca_path`	Retrieves the path Vertica uses to look up SSL server certificates..
`aws_ca_bundle`	Retrieves the path Vertica uses to look up an SSL server certificate bundle.
`aws_proxy`	A string value that lets you set an HTTP/HTTPS proxy for the AWS library.
`aws_verbose`	When enabled, logs libcurl debug messages to dbLog.
`aws_max_send_speed`	Retrieves the value for the maximum transfer speed when sending data to AWS S3, in bytes per second.
`aws_max_recv_speed`	Retrieves the value for the maximum transfer speed for receiving data to AWS S3, in bytes per second.

Examples

This example retrieves a stored AWS access key in a session.

```
=> SELECT AWS_GET_CONFIG('aws_id');
   aws_get_config
----------------------
 AKABCOEXAMPLEPKPXYZQ
(1 row)
```

See Also

- AWS Library Parameters
- Vertica AWS Library

AWS_SET_CONFIG

Sets the values of AWS Library S3-Compatible User-Defined Session Parameters for the current session. This function is designed to be used with a table that contains those values, rather than by setting values explicitly in the function call.

Syntax

```
AWS_SET_CONFIG( 'parameter' , 'value')
```

Parameters

`aws_id`	The 20-character AWS access key used to authenticate your account.
`aws_secret`	The 40-character AWS secret access key used to authenticate your account.
`aws_session_token`	The AWS temporary security token generated by running the AWS STS command `get-session-token`. This AWS STS command generates temporary credentials you can use to implement multi-factor authentication for security purposes. For more information on get-session-token see the AWS documentation.
`aws_region`	Specifies the region where your AWS bucket is located. See the AWS Documentation for the full list of values.

	You can configure aws_region with only one region. To access buckets in multiple regions, reset the parameter each time you change regions. **Default value**: us-east-1
aws_ca_path	The path Vertica uses to look up SSL server certificates. **Default value:** System-dependent
aws_ca_bundle	The path Vertica uses to look up an SSL server certificate bundle. **Default value:** System-dependent
aws_proxy	A string value that lets you set an HTTP/HTTPS proxy for the AWS library.
aws_verbose	When enabled, logs libcurl debug messages to dbLog. **Default value:** false
aws_max_send_speed	The maximum transfer speed for sending data to AWS S3, in bytes per second. **Default value:** unlimited
aws_max_recv_speed	The maximum transfer speed when receiving data to AWS S3, in bytes per second. **Default value:** unlimited

Examples

Configure session parameters for an AWS access key and secret access key with credentials in the keychain table:

```
=> SELECT AWS_SET_CONFIG('aws_id', accesskey),
          AWS_SET_CONFIG('aws_secret', secretaccesskey)
   FROM keychain;
 AWS_SET_CONFIG | AWS_SET_CONFIG
----------------+----------------
 aws_id         | aws_secret
(1 row)
```

See Also

- AWS_GET_CONFIG
- AWS Library Parameters
- Vertica AWS Library

S3EXPORT

Exports data to an Amazon S3 bucket from the Vertica cluster.

> **Important:**
> If the S3 bucket name contains a period (`.`) in its path, set `prepend_hash` to true, or specify a file extension in the export syntax.

Syntax

```
S3EXPORT( source-data USING PARAMETERS parameter=setting[,…])
```

Arguments

source-data	Specifies the source of the export operation.

Parameter Settings

Parameter name	Set to…
`url`	String value ≤ 236 characters that specifies the URL of the S3 bucket and object base name, one of the following: • HTTPS URL • S3 URL

* `from_charset` and `to_charset` values are system-dependent. See your operating system documentation for more details.

Parameter name	Set to...
	URLs can contain only ASCII characters, 0x01 to 0x7F.
chunksize	Specifies in bytes the size of the buffer that stores each chunk of exported data, between 5 MB and 5 GB. You might need to increase this value from the default if you export data from a very wide table, or a table with LONG VARBINARY or LONG VARCHAR columns. If the width of a single column's data is exceeds the buffer width, Vertica returns an error like this: `The specified buffer of 10485760 bytesRead is too small.` See Adjusting the Export Chunk Size for Wide Tables for more information. **Note:** The maximum number of chunks allowed in an export is `10000`. **Default**:`10485760`
compression	Uses the specified filter to compress exported data. Valid settings are one of the following: • `bzip` • `none` **Default**:none
delimiter	Specifies the column delimiter character. **Default**: | (vertical bar)
enclosed_by	The character used to enclose string and date/time data. If you omit this parameter, no character encloses these data types. **Default**: `''` (empty string)
escape_as	The character used to escape values in exported data that must be escaped, including the `enclosed_by` value.

* from_charset and to_charset values are system-dependent. See your operating system documentation for more details., continued

Parameter name	Set to...
	Default: \ (backslash)
from_charset*	The character set in which data is currently encoded.
to_charset*	The character set in which to encode the export.
null_as '*null-string*'	Specifies a string to represent null values in the source data. If this parameter is included, S3EXPORT exports all null values as *null-string*. Otherwise, S3EXPORT exports null values as zero-length strings.
prepend_hash	Boolean, specifies whether to prepend unique hash values assigned to exported objects instead of the standard values. **Important:** If the S3 bucket name contains a period (.) in its path, set prepend_hash to true, or specify a file extension in the export syntax. **Default:** false
record_terminator	Specifies what character marks the end of a record. **Default**:\n

* from_charset and to_charset values are system-dependent. See your operating system documentation for more details., continued

Examples

Export column1 data from exampleTable:

```
=> SELECT s3export(column1 USING PARAMETERS
    url='s3://exampleBucket/object',
    delimiter=',',
    chunksize='10485760',
    record_terminator='\n',
    from_charset='ASCII',
    to_charset='UTF-8',
    prepend_hash='true')
OVER () FROM exampleTable;
```

See Also

- AWS_SET_CONFIG
- AWS Library S3-Compatible User-Defined Session Parameters
- Export Data From Amazon S3 Using the AWS Library

S3EXPORT_PARTITION

Deprecated:
The AWS library is deprecated. To export delimited data to S3 or any other destination, use EXPORT TO DELIMITED.

The S3EXPORT_PARTITION function allows Vertica output to be used by the Amazon Elastic MapReduce (EMR) feature. Since EMR stores and consumes data from S3 using the partition key included in the key of the S3 file, S3EXPORT_PARTITION exports data by adding the partition key in the url/filename.

Syntax

```
S3EXPORT_PARTITION ( expression USING PARAMETERS { parameter=setting} [,...] )
```

Parameters

expression	Specifies the source of the export operation.
url	The URL of the S3 bucket and object base name. Also include the partition key as part of the URL to export data so it is usable by EMR. The URL can be either the HTTPS URL or the S3 URL. URL length is limited to a maximum of 236 characters. URLs should contain only ASCII characters, 0x01 to 0x7F.
delimiter	Specifies the column delimiter character. **Default**: | (vertical bar)
chunksize	Determines the buffer size used to send bytes to S3. Valid settings can

	range between 5 MB and 5 GB. The maximum number of chunks allowed in an export is 10000. **Default**: 10485760
record_terminator	Specifies what character marks the end of a record. **Default**: \n
from_charset	Specifies the character set in which your data is currently encoded.
to_charset	Specifies the character set in which you want to encode your export.
prepend_hash	Prepends the unique hash values assigned to exported objects instead of the standard appendation. If your S3 bucket contains a period in its path, set the prepend_hash parameter to true. **Default**: false

from_charset and to_charset values are system-dependent. Refer to your operating system documentation for more details.

Examples

In the following example, st and yr are the partition keys:

```
=> SELECT s3EXPORT_PARTITION(* USING PARAMETERS url='s3://db001/bystate.date')
   OVER (PARTITION by st, yr) from T;
 rows   | url
--------+-------------------------------------------------------------------------
 184647 | https://db001/st=MA/yr=2005/bystate.77fcab9836b93a04.dat
 282633 | https://db001/st=VA/yr=2007/bystate.77fcab9836b93a05.dat
 282633 | https://db001/st=VA/yr=2009/bystate.77fcab9836b93a05.dat
(3 rows)
```

Catalog Management Functions

This section contains catalog management functions specific to Vertica.

DROP_LICENSE

Drops a license key from the global catalog. Dropping expired keys is optional. Vertica automatically ignores expired license keys if a valid, alternative license key is installed.

Syntax

```
DROP_LICENSE( 'license-name' )
```

Parameters

license-name	The name of the license to drop. Use the name (or long license key) in the NAME column of system table LICENSES.

Privileges

Superuser

Examples

```
=> SELECT DROP_LICENSE('9b2d81e2-aab1-4cfb-bc07-fa9a696e8f5e');
```

See Also

Managing Licenses

DUMP_CATALOG

Returns an internal representation of the Vertica catalog. This function is used for diagnostic purposes.

DUMP_CATALOG returns only the objects that are visible to the user.

Syntax

```
DUMP_CATALOG()
```

Privileges

None

Examples

The following query obtains an internal representation of the Vertica catalog:

```
=> SELECT DUMP_CATALOG();
```

The output is written to the specified file:

```
\o /tmp/catalog.txt
SELECT DUMP_CATALOG();
\o
```

EXPORT_CATALOG

Generates a SQL script for recreating a physical schema design on another cluster. This function always attempts to recreate projection statements with KSAFE clauses, if they exist in the original definitions, or OFFSET clauses if they do not.

Syntax

```
EXPORT_CATALOG ( '[destination]' [, 'scope' ] )
```

Parameters

If you omit all parameters, EXPORT_CATALOG exports to standard output all schemas, tables, constraints, views, and projections to which you have access.

destination	Specifies where to send output, one of the following: • An empty string (' ') writes the script to standard output. • The path and name of a SQL output file. This option is valid only for **superusers**. If you specify a file that does not exist, the function creates one. If you specify only a file name, Vertica creates it in the catalog directory. If the file already exists, the function silently overwrites its contents.
scope	Determines what to export: • DESIGN (default): Exports schemas, tables, constraints, views, projections, and SQL macros to which you have access. See also EXPORT_OBJECTS. • DESIGN_ALL: Exports all design objects plus system objects created in Database Designer—for example, design contexts and their tables. Exported objects are those to which you have access. • TABLES: Exports all tables and constraints to which you have access. See also EXPORT_TABLES. • DIRECTED_QUERIES: Exports all directed queries that are stored in the database. For more information, see Managing Directed Queries.

Privileges

None

Example

See Exporting the Catalog.

See Also

- EXPORT_OBJECTS
- EXPORT_TABLES
- Exporting the Catalog

EXPORT_OBJECTS

Generates a SQL script you can use to recreate non-virtual catalog objects on another cluster. The following requirements apply:

- EXPORT_OBJECTS only exports objects to which the user has access.
- EXPORT_OBJECTS exports objects in order dependency for correct recreation. When you run the script on another cluster, Vertica creates all referenced objects before their dependent objects.
- EXPORT_OBJECTS always tries to recreate projection statements with their KSAFE clause, if any, otherwise with their OFFSET clause.

Syntax

```
EXPORT_OBJECTS( '[destination]' [, 'scope' ] [, 'ksafe' ] )
```

Parameters

destination	Specifies where to send output, one of the following: • An empty string (' ') writes the script to standard output. • The path and name of a SQL output file. This option is valid only for **superusers**. If you specify a file that does not exist, the function creates one. If you specify only a file name, Vertica creates it in the catalog directory. If the file already exists, the function silently overwrites its contents.
scope	Specifies one or more objects to export, as follows: `[database.]schema[.object][,…]` If set to an empty string, Vertica exports all objects to which the user

	has access, including constraints. If you specify a schema, Vertica exports all objects in that schema. If you specify a database, it must be the current database.
ksafe	Specifies whether to include a MARK_DESIGN_KSAFE statement in the generated script with the correct K-safe value for the database: • true (default): Include the MARK_DESIGN_KSAFE statement at the end of the output script. • false: Omit the MARK_DESIGN_KSAFE statement from the script.

Privileges

None

Example

See Exporting Objects.

See Also

- EXPORT_CATALOG
- EXPORT_TABLES

EXPORT_TABLES

Generates a SQL script that can be used to recreate a logical schema—schemas, tables, constraints, and views—on another cluster. EXPORT_OBJECTS only exports objects to which the user has access.

Syntax

```
EXPORT_TABLES(  '[destination]' [, 'scope' ] )
```

Parameters

destination	Specifies where to send output, one of the following: • An empty string (' ') writes the script to standard output. • The path and name of a SQL output file. This option is valid only for **superusers**. If you specify a file that does not exist, the function creates one. If you specify only a file name, Vertica creates it in the catalog directory. If the file already exists, the function silently overwrites its contents.
scope	Specifies one or more tables to export, as follows: [*database*.]*schema*[.*table*][,…] If set to an empty string, Vertica exports all non-virtual table objects to which you have access, including table schemas, sequences, and constraints. If you specify a schema, Vertica exports all non-virtual table objects in that schema. If you specify a database, it must be the current database.

Privileges

None

Example

See Exporting Tables.

The following example exports to standard output all tables in the `store` schema:

```
=> SELECT EXPORT_TABLES('','store');
                                                EXPORT_TABLES
-----------------------------------------------------------------------------------------------------
CREATE SCHEMA store;
CREATE TABLE store.store_dimension
(
    store_key int NOT NULL,
    store_name varchar(64),
    store_number int,
    store_address varchar(256),
```

```
    store_city varchar(64),
    store_state char(2),
    store_region varchar(64),
    floor_plan_type varchar(32),
    photo_processing_type varchar(32),
    financial_service_type varchar(32),
    selling_square_footage int,
    total_square_footage int,
    first_open_date date,
    last_remodel_date date,
    number_of_employees int,
    annual_shrinkage int,
    foot_traffic int,
    monthly_rent_cost int,
    CONSTRAINT C_PRIMARY PRIMARY KEY (store_key) DISABLED
);

CREATE TABLE store.store_sales_fact
(
    date_key int NOT NULL,
    product_key int NOT NULL,
    product_version int NOT NULL,
    store_key int NOT NULL,
    promotion_key int NOT NULL,
    customer_key int NOT NULL,
    employee_key int NOT NULL,

INSTALL_LICENSE

Installs the license key in the global catalog.

Syntax

```
INSTALL_LICENSE( 'filename' )
```

Parameters

filename	The absolute path name of a valid license file.

Privileges

Superuser

Examples

```
=> SELECT INSTALL_LICENSE('/tmp/vlicense.dat');
```

See Also

Managing Licenses

MARK_DESIGN_KSAFE

Enables or disables high availability in your environment, in case of a failure. Before enabling recovery, MARK_DESIGN_KSAFE queries the catalog to determine whether a cluster's physical schema design meets the following requirements:

- Small, unsegmented tables are replicated on all nodes.
- Large table **superprojections** are segmented with each segment on a different node.
- Each large table projection has at least one **buddy projection** for K-safety=1 (or two buddy projections for K-safety=2).

  Buddy projections are also segmented across database nodes, but the distribution is modified so segments that contain the same data are distributed to different nodes. See High Availability With Projections in Vertica Concepts.

MARK_DESIGN_KSAFE does not change the physical schema.

Syntax

```
MARK_DESIGN_KSAFE ( k )
```

Parameters

k	Specifies the level of K-safety, one of the following:

	• 2: Enables high availability if the schema design meets requirements for K-safety=2 • 1: Enables high availability if the schema design meets requirements for K-safety=1 • 0: Disables high availability

Return Messages

If you specify a *k* value of 1 or 2, Vertica returns one of the following messages.

Success:

```
Marked design n-safe
```

Failure:

```
The schema does not meet requirements for K=n.
Fact table projection projection-name
has insufficient "buddy" projections.
```

where *n* is a K-safety setting.

Privileges

Superuser

Notes

- The database's internal recovery state persists across database restarts but it is not checked at startup time.
- When one node fails on a system marked K-safe=1, the remaining nodes are available for DML operations.

Examples

```
=> SELECT MARK_DESIGN_KSAFE(1);
  mark_design_ksafe
----------------------
 Marked design 1-safe
(1 row)
```

If the physical schema design is not K-safe, messages indicate which projections do not have a buddy:

```
=> SELECT MARK_DESIGN_KSAFE(1);
The given K value is not correct;
the schema is 0-safe
Projection pp1 has 0 buddies,
which is smaller that the given K of 1
Projection pp2 has 0 buddies,
which is smaller that the given K of 1
.
.
.
(1 row)
```

Client Connection Management Functions

This section contains client connection management functions specific to Vertica.

DESCRIBE_LOAD_BALANCE_DECISION

Evaluates if any load balancing routing rules apply to a given IP address and describes how the client connection would be handled. This function is useful when you are evaluating connection load balancing policies you have created, to ensure they work the way you expect them to.

You pass this function an IP address of a client connection, and it uses the load balancing routing rules to determine how the connection will be handled. The logic this function uses is the same logic used when Vertica load balances client connections, including determining which nodes are available to handle the client connection.

This function assumes the client connection has opted into being load balanced. If actual clients have not opted into load balancing, the connections will not be redirected. See Enabling Native Connection Load Balancing in ADO.NET, Enabling Native Connection Load Balancing in JDBC, and Enabling Native Connection Load Balancing in ODBC, for information

on enabling load balancing on the client. For vsql, use the `-C` command-line option to enable load balancing.

Syntax

```
DESSCRIBE_LOAD_BALANCE_DECISION('ip_address')
```

Arguments

'ip_address'	An IP address of a client connection to be tested against the load balancing rules. This can be either an IPv4 or IPv6 address.

Return Value

A step-by-step description of how the load balancing rules are being evaluated, including the final decision of which node in the database has been chosen to service the connection.

Privileges

None.

Examples

The following example demonstrates calling DESCRIBE_LOAD_BALANCE_DECISION with three different IP addresses, two of which are handled by different routing rules, and one which is not handled by any rule.

```
=> SELECT describe_load_balance_decision('192.168.1.25');
                        describe_load_balance_decision
--------------------------------------------------------------------------------
 Describing load balance decision for address [192.168.1.25]
Load balance cache internal version id (node-local): [2]
Considered rule [etl_rule] source ip filter [10.20.100.0/24]... input address
does not match source ip filter for this rule.
Considered rule [internal_clients] source ip filter [192.168.1.0/24]... input
address matches this rule
Matched to load balance group [group_1] the group has policy [ROUNDROBIN]
number of addresses [2]
(0) LB Address: [10.20.100.247]:5433
(1) LB Address: [10.20.100.248]:5433
Chose address at position [1]
Routing table decision: Success. Load balance redirect to: [10.20.100.248] port [5433]
```

```
(1 row)

=> SELECT describe_load_balance_decision('192.168.2.25');
                        describe_load_balance_decision
--------------------------------------------------------------------------------
 Describing load balance decision for address [192.168.2.25]
Load balance cache internal version id (node-local): [2]
Considered rule [etl_rule] source ip filter [10.20.100.0/24]... input address
does not match source ip filter for this rule.
Considered rule [internal_clients] source ip filter [192.168.1.0/24]... input
address does not match source ip filter for this rule.
Considered rule [subnet_192] source ip filter [192.0.0.0/8]... input address
matches this rule
Matched to load balance group [group_all] the group has policy [ROUNDROBIN]
number of addresses [3]
(0) LB Address: [10.20.100.247]:5433
(1) LB Address: [10.20.100.248]:5433
(2) LB Address: [10.20.100.249]:5433
Chose address at position [1]
Routing table decision: Success. Load balance redirect to: [10.20.100.248] port [5433]

(1 row)

=> SELECT describe_load_balance_decision('1.2.3.4');
                         describe_load_balance_decision
--------------------------------------------------------------------------------
 Describing load balance decision for address [1.2.3.4]
Load balance cache internal version id (node-local): [2]
Considered rule [etl_rule] source ip filter [10.20.100.0/24]... input address
does not match source ip filter for this rule.
Considered rule [internal_clients] source ip filter [192.168.1.0/24]... input
address does not match source ip filter for this rule.
Considered rule [subnet_192] source ip filter [192.0.0.0/8]... input address
does not match source ip filter for this rule.
Routing table decision: No matching routing rules: input address does not match
any routing rule source filters. Details: [Tried some rules but no matching]
No rules matched. Falling back to classic load balancing.
Classic load balance decision: Classic load balancing considered, but either
the policy was NONE or no target was available. Details: [NONE or invalid]

(1 row)
```

The following example demonstrates calling DESCRIBE_LOAD_BALANCE_DECISION repeatedly with the same IP address. You can see that the load balance group's ROUNDROBIN load balance policy has it switch between the two nodes in the load balance group:

```
=> SELECT describe_load_balance_decision('192.168.1.25');
                        describe_load_balance_decision
--------------------------------------------------------------------------------
 Describing load balance decision for address [192.168.1.25]
Load balance cache internal version id (node-local): [1]
Considered rule [etl_rule] source ip filter [10.20.100.0/24]... input address
does not match source ip filter for this rule.
Considered rule [internal_clients] source ip filter [192.168.1.0/24]... input
address matches this rule
```

```
Matched to load balance group [group_1] the group has policy [ROUNDROBIN]
number of addresses [2]
(0) LB Address: [10.20.100.247]:5433
(1) LB Address: [10.20.100.248]:5433
Chose address at position [1]
Routing table decision: Success. Load balance redirect to: [10.20.100.248]
port [5433]

(1 row)

=> SELECT describe_load_balance_decision('192.168.1.25');
                        describe_load_balance_decision
--------------------------------------------------------------------------------
 Describing load balance decision for address [192.168.1.25]
Load balance cache internal version id (node-local): [1]
Considered rule [etl_rule] source ip filter [10.20.100.0/24]... input address
does not match source ip filter for this rule.
Considered rule [internal_clients] source ip filter [192.168.1.0/24]... input
address matches this rule
Matched to load balance group [group_1] the group has policy [ROUNDROBIN]
number of addresses [2]
(0) LB Address: [10.20.100.247]:5433
(1) LB Address: [10.20.100.248]:5433
Chose address at position [0]
Routing table decision: Success. Load balance redirect to: [10.20.100.247]
port [5433]

(1 row)

=> SELECT describe_load_balance_decision('192.168.1.25');
                         describe_load_balance_decision
--------------------------------------------------------------------------------
 Describing load balance decision for address [192.168.1.25]
Load balance cache internal version id (node-local): [1]
Considered rule [etl_rule] source ip filter [10.20.100.0/24]... input address
does not match source ip filter for this rule.

port [5433]

(1 row)
```

See Also

GET_CLIENT_LABEL

Returns the client connection label for the current session.

Syntax

```
GET_CLIENT_LABEL()
```

Privileges

None

Examples

Return the current client connection label:

```
=> SELECT GET_CLIENT_LABEL();
   GET_CLIENT_LABEL
-----------------------
 data_load_application
(1 row)
```

See Also

Setting a Client Connection Label

RESET_LOAD_BALANCE_POLICY

Resets the counter each host in the cluster maintains, to track which host it will refer a client to when the native connection load balancing scheme is set to `ROUNDROBIN`. To reset the counter, run this function on all cluster nodes.

Syntax

```
RESET_LOAD_BALANCE_POLICY()
```

Privileges

Superuser

Example

```
=> SELECT RESET_LOAD_BALANCE_POLICY();
                        RESET_LOAD_BALANCE_POLICY
-------------------------------------------------------------------------
Successfully reset stateful client load balance policies: "roundrobin".
(1 row)
```

SET_CLIENT_LABEL

Assigns a label to a client connection for the current session. You can use this label to distinguish client connections.

Labels appear in the v_monitor.sessions table. However, only certain **Data Collector** tables show new client labels set by SET_CLIENT_LABEL. For example, DC_REQUESTS_ISSUED reflects changes by SET_CLIENT_LABEL, while DC_SESSION_STARTS, which collects login data before SET_CLIENT_LABEL can be run, does not.

Syntax

```
SET_CLIENT_LABEL('label-name')
```

Parameters

label-name	VARCHAR name assigned to the client connection label.

Privileges

None

Examples

Assign label `data_load_application` to the current client connection:

```
=> SELECT SET_CLIENT_LABEL('data_load_application');
            SET_CLIENT_LABEL
-----------------------------------------
 client_label set to data_load_application
(1 row)
```

See Also

Setting a Client Connection Label

SET_LOAD_BALANCE_POLICY

Sets how native connection load balancing chooses a host to handle a client connection.

Syntax

```
SET_LOAD_BALANCE_POLICY('policy')
```

Parameters

policy	The name of the load balancing policy to use, one of the following: • NONE (default): Disables native connection load balancing. • ROUNDROBIN: Chooses the next host from a circular list of hosts in the cluster that are up—for example, in a three-node cluster, iterates over node1, node2, and node3, then wraps back to node1. Each host in the cluster maintains its own pointer to the next host in the circular list, rather than there being a single cluster-wide state. • RANDOM: Randomly chooses a host from among all hosts in the cluster that are up.

	Note: Even if the load balancing policy is set on the server to something other than NONE, clients must indicate they want their connections to be load balanced by setting a connection property.

Privileges

Superuser

Example

The following example demonstrates enabling native connection load balancing on the server by setting the load balancing scheme to ROUNDROBIN:

```
=> SELECT SET_LOAD_BALANCE_POLICY('ROUNDROBIN');
                  SET_LOAD_BALANCE_POLICY
-------------------------------------------------------------------------------
Successfully changed the client initiator load balancing policy to: roundrobin
(1 row)
```

See Also

About Native Connection Load Balancing

Cluster Management Functions

This section contains functions that manage **spread** deployment on large, distributed database clusters.

REALIGN_CONTROL_NODES

Causes Vertica to re-evaluate which nodes in the cluster or subcluster are **control nodes** and which nodes are assigned to them as dependents when large cluster is enabled. Call this function after altering fault groups in an Enterprise Mode database, or changing the number of control nodes in either database mode. After calling this function, query the V_CATALOG.CLUSTER_LAYOUT system table to see the proposed new layout for nodes in the

cluster. You must also take additional steps before the new control node assignments take effect. See Changing the Number of Control Nodes and Realigning for details.

Note:
In Vertica versions prior to 10.0.1, control node assignments weren't restricted to be within the same Eon Mode subcluster. If you attempt to realign control nodes in a subcluster whose control nodes have dependents in other subclusters, this function returns an error. In this case, you must realign the control nodes in those other subclusters first. Realigning the other subclusters fixes the cross-subcluster dependencies, allowing you to realign the control nodes in the original subcluster you attempted to realign.

Syntax

In Enterprise Mode:

```
REALIGN_CONTROL_NODES()
```

In Eon Mode:

```
REALIGN_CONTROL_NODES('subcluster_name')
```

Parameters

subcluster_name	The name of the subcluster where you want to realign control nodes. Only the nodes in this subcluster are affected. Other subclusters are unaffected. Only allowed when the database is running in Eon Mode.

Privileges

Superuser

Example

In an Enterprise Mode database, choose control nodes from all nodes and assign the remaining nodes to a control node:

```
=> SELECT REALIGN_CONTROL_NODES();
```

In an Eon Mode database, re-evaluate the control node assignments in the subcluster named analytics:

```
=> SELECT REALIGN_CONTROL_NODES('analytics');
```

See Also

- Changing the Number of Control Nodes and Realigning
- Fault Groups

REBALANCE_CLUSTER

Rebalances the database cluster synchronously as a session foreground task. REBALANCE_CLUSTER returns only after the rebalance operation is complete. If the current session ends, the operation immediately aborts. To rebalance the cluster as a background task, call START_REBALANCE_CLUSTER.

On large cluster arrangements, you typically call REBALANCE_CLUSTER in a flow (see Changing the Number of Control Nodes and Realigning). After you change the number and distribution of control nodes (spread hosts), run REBALANCE_CLUSTER to achieve fault tolerance.

For detailed information about rebalancing tasks, see Rebalancing Data Across Nodes.

Tip:
By default, before performing a rebalance, Vertica queries system tables to compute the size of all projections involved in the rebalance task. This query can add significant overhead to the rebalance operation. To disable this query, set projection configuration parameter RebalanceQueryStorageContainers to 0.

Syntax

```
REBALANCE_CLUSTER()
```

Privileges

Superuser

Example

```
=> SELECT REBALANCE_CLUSTER();
REBALANCE_CLUSTER
-------------------
 REBALANCED
(1 row)
```

RELOAD_SPREAD

Updates cluster changes to the catalog's Spread configuration file. These changes include:

- New or realigned control nodes
- New Spread hosts or fault group
- New or dropped cluster nodes

This function is often used in a multi-step process for large and elastic cluster arrangements. Calling it might require you to restart the database. You must then rebalance the cluster to realize fault tolerance. For details, see Defining and Realigning Control Nodes in the Administrator's Guide.

Caution:
In an Eon Mode database, using this function could result in a database shutdown. Nodes may become disconnected after you call this function. If the database no longer has full shard coverage without these nodes, it shuts down to maintain data integrity. You can safely restart a database that shuts down after calling this function, as the disconnected nodes will rejoin the database on startup.

Syntax

```
RELOAD_SPREAD( true )
```

Parameters

true	Updates cluster changes related to control message responsibilities to the Spread configuration file.

Privileges

Superuser

Example

Update the cluster with changes to control messaging:

```
=> SELECT reload_spread(true);
 reload_spread
---------------
 reloaded
(1 row)
```

See Also

REBALANCE_CLUSTER

SET_CONTROL_SET_SIZE

Sets the number of **control nodes** that participate in the spread service when large cluster is enabled. If the database is running in Enterprise Mode, this function sets the number of control nodes for the entire database cluster. If the database is running in Eon Mode, this function sets the number of control nodes in the subcluster you specify. See Large Cluster for more information.

Syntax

In Enterprise Mode:

```
SET_CONTROL_SET_SIZE( control_nodes )
```

In Eon Mode:

```
SET_CONTROL_SET_SIZE('subcluster_name', control_nodes )
```

Parameters

subcluster_name	The name of the subcluster where you want to set the number of control nodes. Only allowed when the database is running in Eon Mode.
control_nodes	The number of control nodes to assign to the cluster (when in Enterprise Mode) or subcluster (when in Eon Mode). Value can be one of the following: • Positive integer value: Vertica assigns the number of control nodes you specify to the cluster or subcluster. This value can be larger than the current node count. This value cannot be larger than 120 (the maximum number of control nodes for a database). In Eon Mode, the total of this value plus the number of control nodes set for all other subclusters cannot be more than 120. • `-1`: Makes every node in the cluster or subcluster into control nodes. This value effectively disables large cluster for the cluster or subcluster.

Privileges

Superuser

Example

In an Enterprise Mode database, set the number of control nodes for the entire cluster to 5:

```
=> SELECT set_control_set_size(5);
 SET_CONTROL_SET_SIZE
----------------------
 Control size set
(1 row)
```

See Also

- Changing the Number of Control Nodes and Realigning

Cluster Scaling Functions

This section contains functions that control how the cluster organizes data for rebalancing.

CANCEL_REBALANCE_CLUSTER

Stops any rebalance task that is currently in progress or is waiting to execute.

Syntax

```
CANCEL_REBALANCE_CLUSTER()
```

Privileges

Superuser

Example

```
=> SELECT CANCEL_REBALANCE_CLUSTER();
 CANCEL_REBALANCE_CLUSTER
--------------------------
 CANCELED
(1 row)
```

See Also

- START_REBALANCE_CLUSTER
- REBALANCE_CLUSTER

DISABLE_LOCAL_SEGMENTS

Disables local data segmentation, which breaks projections segments on nodes into containers that can be easily moved to other nodes. See Local Data Segmentation in the Administrator's Guide for details.

Syntax

```
DISABLE_LOCAL_SEGMENTS()
```

Privileges

Superuser

Example

```
=> SELECT DISABLE_LOCAL_SEGMENTS();
 DISABLE_LOCAL_SEGMENTS
------------------------
 DISABLED
(1 row)
```

ENABLE_ELASTIC_CLUSTER

Enables elastic cluster scaling, which makes enlarging or reducing the size of your database cluster more efficient by segmenting a node's data into chunks that can be easily moved to other hosts.

Syntax

```
ENABLE_ELASTIC_CLUSTER()
```

Privileges

Superuser

Example

```
=> SELECT ENABLE_ELASTIC_CLUSTER();
 ENABLE_ELASTIC_CLUSTER
------------------------
 ENABLED
(1 row)
```

ENABLE_LOCAL_SEGMENTS

Enables local storage segmentation, which breaks projections segments on nodes into containers that can be easily moved to other nodes. See Local Data Segmentation in the Administrator's Guide for more information.

Syntax

```
ENABLE_LOCAL_SEGMENTS()
```

Privileges

Superuser

Example

```
=> SELECT ENABLE_LOCAL_SEGMENTS();
 ENABLE_LOCAL_SEGMENTS
-----------------------
 ENABLED
(1 row)
```

SET_SCALING_FACTOR

Sets the scaling factor that determines the number of storage containers used when rebalancing the database and when using local data segmentation is enabled. See Cluster Scaling for details.

Syntax

```
SET_SCALING_FACTOR( factor )
```

Parameters

factor	An integer value between 1 and 32. Vertica uses this value to calculate the

	number of storage containers each projection is broken into when rebalancing or when local data segmentation is enabled.

Privileges

Superuser

Best Practices

The scaling factor determines the number of storage containers that Vertica uses to store each projection across the database during rebalancing when local segmentation is enabled. When setting the scaling factor, follow these guidelines:

- The number of storage containers should be greater than or equal to the number of partitions multiplied by the number of local segments:

  num-storage-containers >= (*num-partitions* * *num-local-segments*)

- Set the scaling factor high enough so rebalance can transfer local segments to satisfy the skew threshold, but small enough so the number of storage containers does not result in too many ROS containers, and cause ROS pushback. The maximum number of ROS containers (by default 1024) is set by configuration parameter ContainersPerProjectionLimit.

Example

```
=> SELECT SET_SCALING_FACTOR(12);
 SET_SCALING_FACTOR
--------------------
 SET
(1 row)
```

START_REBALANCE_CLUSTER

Asynchronously rebalances the database cluster as a background task. This function returns immediately after the rebalancing operation is complete. Rebalancing persists until the operation is complete, even if you close the current session or the database shuts down. In

the case of shutdown, rebalancing resumes after the cluster restarts. To stop the rebalance operation, call CANCEL_REBALANCE_CLUSTER.

For detailed information about rebalancing tasks, see Rebalancing Data Across Nodes.

Syntax

```
START_REBALANCE_CLUSTER()
```

Privileges

Superuser

Example

```
=> SELECT START_REBALANCE_CLUSTER();
 START_REBALANCE_CLUSTER
-------------------------
 REBALANCING
(1 row)
```

See Also

REBALANCE_CLUSTER

Communications Functions

This section contains communication functions specific to Vertica.

NOTIFY

Specifies the text message to include with a notification.

Syntax

```
NOTIFY ( 'message', 'notifier', 'target-topic' )
```

Parameters

message	The message to send to the end point.
notifier	The name of the notifier used to deliver the message.
target-topic	The name of the destination Kafka topic for the message.

Privileges

Superuser

Examples

Send a message to confirm that an ETL job is complete:

```
=> SELECT NOTIFY('ETL Done!', 'my_notifier', 'DB_activity_topic');
```

Constraint Management Functions

This section contains constraint management functions specific to Vertica.

See also SQL system table V_CATALOG.TABLE_CONSTRAINTS.

ANALYZE_CONSTRAINTS

Analyzes and reports on constraint violations within the specified scope

You can enable automatic enforcement of primary key, unique key, and check constraints when `INSERT`, `UPDATE`, `MERGE`, or `COPY` statements execute. Alternatively, you can use `ANALYZE_CONSTRAINTS` to validate constraints after issuing these statements. Refer to Constraint Enforcement for more information.

`ANALYZE_CONSTRAINTS` performs a lock in the same way that `SELECT * FROM t1` holds a lock on table `t1`. See LOCKS for additional information.

Syntax

```
ANALYZE_CONSTRAINTS ('[[[database.]schema.]table ]' [, 'column[,…]'] )
```

Parameters

[*database*.]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table	Identifies the table to analyze. If you omit specifying a schema, Vertica uses the current schema search path. If set to an empty string, Vertica analyzes all tables in the current schema.
column	The column in *table* to analyze. You can specify multiple comma-delimited columns. Vertica narrows the scope of the analysis to the

	specified columns. If you omit specifying a column, Vertica analyzes all columns in *table*.

Privileges

- Schema: USAGE
- Table: SELECT

Detecting Constraint Violations During a Load Process

Vertica checks for constraint violations when queries are run, not when data is loaded. To detect constraint violations as part of the load process, use a COPY statement with the NO COMMIT option. By loading data without committing it, you can run a post-load check of your data using the ANALYZE_CONSTRAINTS function. If the function finds constraint violations, you can roll back the load because you have not committed it.

If ANALYZE_CONSTRAINTS finds violations, such as when you insert a duplicate value into a primary key, you can correct errors using the following functions. Effects last until the end of the session only:

- DISABLE_DUPLICATE_KEY_ERROR
- REENABLE_DUPLICATE_KEY_ERROR

Important:
If a check constraint SQL expression evaluates to an unknown for a given row because a column within the expression contains a null, the row passes the constraint condition.

Return Values

ANALYZE_CONSTRAINTS returns results in a structured set (see table below) that lists the schema name, table name, column name, constraint name, constraint type, and the column values that caused the violation.

If the result set is empty, then no constraint violations exist; for example:

```
> SELECT ANALYZE_CONSTRAINTS ('public.product_dimension', 'product_key');
Schema Name | Table Name | Column Names | Constraint Name | Constraint Type | Column Values
------------+------------+--------------+-----------------+-----------------+---------------
```

```
(0 rows)
```

The following result set shows a primary key violation, along with the value that caused the violation (`'10'`):

```
=> SELECT ANALYZE_CONSTRAINTS ('');
Schema Name | Table Name | Column Names | Constraint Name | Constraint Type | Column Values
------------+------------+--------------+-----------------+-----------------+---------------
store         t1           c1             pk_t1             PRIMARY           ('10')
(1 row)
```

The result set columns are described in further detail in the following table:

Column Name	Data Type	Description
`Schema Name`	VARCHAR	The name of the schema.
`Table Name`	VARCHAR	The name of the table, if specified.
`Column Names`	VARCHAR	A list of comma-delimited columns that contain constraints.
`Constraint Name`	VARCHAR	The given name of the primary key, foreign key, unique, check, or not null constraint, if specified.
`Constraint Type`	VARCHAR	Identified by one of the following strings: • `PRIMARY KEY` • `FOREIGN KEY` • `UNIQUE` • `CHECK` • `NOT NULL`
`Column Values`	VARCHAR	Value of the constraint column, in the same order in which `Column Names` contains the value of that column in the violating row. When interpreted as SQL, the value of this column forms a list of values of the same type as the columns in `Column Names`; for example: `('1'), ('1', 'z')`

Examples

See Detecting Constraint Violations in the Administrator's Guide.

ANALYZE_CORRELATIONS

Deprecated

Analyzes the specified tables for pairs of columns that are strongly correlated. ANALYZE_CORRELATIONS stores the 20 pairs with the strongest correlation. ANALYZE_CORRELATIONS also analyzes statistics.

ANALYZE_CORRELATIONS analyzes only pairwise single-column correlations.

For example, state name and country name columns are strongly correlated because the city name usually, but perhaps not always, identifies the state name. The city of Conshohoken is uniquely associated with Pennsylvania, while the city of Boston exists in Georgia, Indiana, Kentucky, New York, Virginia, and Massachusetts. In this case, city name is strongly correlated with state name.

Behavior Type

Immutable

Syntax

```
ANALYZE_CORRELATIONS ('[[[database.]schema.]table ]' [, 'recalculate'] )
```

Parameters

[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.

table-name	Identifies the table to analyze. If you omit specifying a schema, Vertica uses the current schema search path. If set to an empty string, Vertica analyzes all tables in the current schema.
recalculate	Boolean that specifies whether to analyze correlated columns that were previously analyzed. **Note:** Column correlation analysis typically needs to be done only once. **Default**: `false`

Privileges

One of the following:

- **Superuser**
- User with USAGE privilege on the design schema

Example

In the following example, `ANALYZE_CORRELATIONS` analyzes column correlations for all tables in the `public` schema, even if they currently exist:

```
=> SELECT ANALYZE_CORRELATIONS ('public.*', 'true');
 ANALYZE_CORRELATIONS
----------------------
                    0
(1 row)
```

DISABLE_DUPLICATE_KEY_ERROR

Disables error messaging when Vertica finds duplicate primary or unique key values at run time (for use with key constraints that are not automatically enabled). Queries execute as though no constraints are defined on the schema. Effects are session scoped.

Syntax

```
DISABLE_DUPLICATE_KEY_ERROR();
```

Privileges

Superuser

Examples

When you call DISABLE_DUPLICATE_KEY_ERROR, Vertica issues warnings letting you know that duplicate values will be ignored, and incorrect results are possible. DISABLE_DUPLICATE_KEY_ERROR is for use only for key constraints that are not automatically enabled.

```
=> select DISABLE_DUPLICATE_KEY_ERROR();
WARNING 3152:  Duplicate values in columns marked as UNIQUE will now be ignored for the remainder of
your session or until reenable_duplicate_key_error() is called
WARNING 3539:  Incorrect results are possible. Please contact Vertica Support if unsure
 disable_duplicate_key_error
-----------------------------
 Duplicate key error disabled
(1 row)
```

See Also

ANALYZE_CONSTRAINTS

LAST_INSERT_ID

Returns the last value of an AUTO_INCREMENT/IDENTITY column. If multiple sessions concurrently load the same table with an AUTO_INCREMENT/IDENTITY column, the function returns the last value generated for that column.

Note:
This function works only with AUTO_INCREMENT/IDENTITY columns. It does not work with named sequences.

Behavior Type

Volatile

Syntax

```
LAST_INSERT_ID()
```

Privileges

- Table owner
- USAGE privileges on the table schema

Examples

See AUTO_INCREMENT and IDENTITY Sequences in the Administrator's Guide.

REENABLE_DUPLICATE_KEY_ERROR

Restores the default behavior of error reporting by reversing the effects of DISABLE_DUPLICATE_KEY_ERROR. Effects are session-scoped.

Syntax

```
REENABLE_DUPLICATE_KEY_ERROR();
```

Privileges

Superuser

Examples

```
=> SELECT REENABLE_DUPLICATE_KEY_ERROR();
 REENABLE_DUPLICATE_KEY_ERROR
------------------------------
 Duplicate key error enabled
(1 row)
```

See Also

ANALYZE_CONSTRAINTS

Data Collector Functions

The Vertica Data Collector is a utility that extends system table functionality by providing a framework for recording events. It gathers and retains monitoring information about your database cluster and makes that information available in system tables, requiring few configuration parameter tweaks, and having negligible impact on performance.

Collected data is stored on disk in the `DataCollector` directory under the Vertica /catalog path. You can use the information the Data Collector retains to query the past state of system tables and extract aggregate information, as well as do the following:

- See what actions users have taken
- Locate performance bottlenecks
- Identify potential improvements to Vertica configuration

Data Collector works in conjunction with an advisor tool called Workload Analyzer, which intelligently monitors the performance of SQL queries and workloads and recommends tuning actions based on observations of the actual workload history.

By default, Data Collector is on and retains information for all sessions. If performance issues arise, a superuser can disable Data Collector by setting set configuration parameter EnableDataCollector to 0.

CLEAR_DATA_COLLECTOR

Clears all memory and disk records from Data Collector tables and logs, and resets collection statistics in system table DATA_COLLECTOR.

Syntax

```
CLEAR_DATA_COLLECTOR( [ 'component' ] )
```

Parameters

component	Clears memory and disk records for the specified component. If you provide no argument, the function clears memory and disk records for all

	components. Query system table DATA_COLLECTOR for component names. For example: `=> SELECT DISTINCT component, description FROM data_collector WHERE component ilike '%Depot%' ORDER BY component;` ` component	description` `----------------+------------------------------` ` DepotEvictions	Files evicted from the Depot` ` DepotFetches	Files fetched to the Depot` ` DepotUploads	Files Uploaded from the Depot` `(3 rows)`

Privileges

Superuser

Examples

The following command clears memory and disk records for the ResourceAcquisitions component:

```
=> SELECT clear_data_collector('ResourceAcquisitions');
 clear_data_collector
----------------------
 CLEAR
(1 row)
```

The following command clears data collection for all components:

```
=> SELECT clear_data_collector();
 clear_data_collector
----------------------
 CLEAR
(1 row)
```

See Also

Data Collector Utility

DATA_COLLECTOR_HELP

Returns online usage instructions about the Data Collector, the DATA_COLLECTOR system table, and the Data Collector control functions.

Syntax

```
DATA_COLLECTOR_HELP()
```

Privileges

None

Returns

The DATA_COLLECTOR_HELP() function returns the following information:

```
=> SELECT DATA_COLLECTOR_HELP();

-------------------------------------------------------------------------------
Usage Data Collector
The data collector retains history of important system activities.
   This data can be used as a reference of what actions have been taken
      by users, but it can also be used to locate performance bottlenecks,
      or identify potential improvements to the Vertica configuration.
   This data is queryable via Vertica system tables.

Acccess a list of data collector components, and some statistics, by running:
   SELECT * FROM v_monitor.data_collector;

The amount of data retained by size and time can be controlled with several
functions.
   To just set the size amount:
      set_data_collector_policy(<component>,
                                <memory retention (KB)>,
                                <disk retention (KB)>);

   To set both the size and time amounts (the smaller one will dominate):
      set_data_collector_policy(<component>,
                                <memory retention (KB)>,
                                <disk retention (KB)>,
                                <interval>);

   To set just the time amount:
      set_data_collector_time_policy(<component>,
                                     <interval>);
```

```
   To set the time amount for all tables:
      set_data_collector_time_policy(<interval>);

The current retention policy for a component can be queried with:
   get_data_collector_policy(<component>);

Data on disk is kept in the "DataCollector" directory under the Vertica
\catalog path. This directory also contains instructions on how to load
the monitoring data into another Vertica database.

To move the data collector logs and instructions to other storage locations,
create labeled storage locations using add_location and then use:

   set_data_collector_storage_location(<storage_label>);

Additional commands can be used to configure the data collection logs.

The log can be cleared with:

clear_data_collector([<optional component>]);

The log can be synchronized with the disk storage using:

flush_data_collector([<optional component>]);
```

See Also

- DATA_COLLECTOR
- TUNING_RECOMMENDATIONS
- Analyzing Workloads
- Data Collector Utility

FLUSH_DATA_COLLECTOR

Waits until memory logs are moved to disk and then flushes the Data Collector, synchronizing the log with disk storage.

Syntax

```
FLUSH_DATA_COLLECTOR( [ 'component' ] )
```

Parameters

component	Flushes data for the specified component. If you omit this argument, the

	function flushes data for all components. Query system table DATA_COLLECTOR for component names. For example: `=> SELECT DISTINCT component, description FROM data_collector WHERE component ilike '%Depot%' ORDER BY component;` ` component	description` `----------------+------------------------------` ` DepotEvictions	Files evicted from the Depot` ` DepotFetches	Files fetched to the Depot` ` DepotUploads	Files Uploaded from the Depot` `(3 rows)`

Privileges

Superuser

Examples

The following command flushes the Data Collector for the ResourceAcquisitions component:

```
=> SELECT flush_data_collector('ResourceAcquisitions');
 flush_data_collector
----------------------
 FLUSH
(1 row)
```

The following command flushes data collection for all components:

```
=> SELECT flush_data_collector();
 flush_data_collector
----------------------
 FLUSH
(1 row)
```

See Also

Data Collector Utility

GET_DATA_COLLECTOR_NOTIFY_POLICY

Lists any notification policies set on a **Data Collector** component.

Syntax

```
GET_DATA_COLLECTOR_NOTIFY_POLICY('component')
```

component	Name of the Data Collector component to check for notification policies. Query system table DATA_COLLECTOR for component names. For example: `=> SELECT DISTINCT component, description FROM data_collector WHERE component ilike '%Depot%' ORDER BY component;` ` component	description` `----------------+------------------------------` ` DepotEvictions	Files evicted from the Depot` ` DepotFetches	Files fetched to the Depot` ` DepotUploads	Files Uploaded from the Depot` `(3 rows)`

Example

```
=> SELECT GET_DATA_COLLECTOR_NOTIFY_POLICY('LoginFailures');
                  GET_DATA_COLLECTOR_NOTIFY_POLICY
-------------------------------------------------------------------------
 Notifiable;  Notifier: vertica_stats; Channel: vertica_notifications
(1 row)
```

The following example shows the output from the function when there is no notification policy for the component:

```
=> SELECT GET_DATA_COLLECTOR_NOTIFY_POLICY('LoginFailures');
 GET_DATA_COLLECTOR_NOTIFY_POLICY
---------------------------------
 Not notifiable;
(1 row)
```

See Also

- SET_DATA_COLLECTOR_NOTIFY_POLICY
- Producing Kafka Messages Using Notifiers

GET_DATA_COLLECTOR_POLICY

Retrieves a brief statement about the retention policy for the specified component.

Syntax

```
GET_DATA_COLLECTOR_POLICY( 'component' )
```

Parameters

component	Returns the retention policy of the specified component. Query system table DATA_COLLECTOR for component names. For example: `=> SELECT DISTINCT component, description FROM data_collector WHERE component ilike '%Depot%' ORDER BY component;` ` component	description` `----------------+------------------------------` ` DepotEvictions	Files evicted from the Depot` ` DepotFetches	Files fetched to the Depot` ` DepotUploads	Files Uploaded from the Depot` `(3 rows)`

Privileges

None

Example

The following query returns the history of all resource acquisitions by specifying the `ResourceAcquisitions` component:

```
=> SELECT get_data_collector_policy('ResourceAcquisitions');
          get_data_collector_policy
-----------------------------------------------
 1000KB kept in memory, 10000KB kept on disk.
(1 row)
```

See Also

- DATA_COLLECTOR
- Data Collector Utility

SET_DATA_COLLECTOR_NOTIFY_POLICY

Enables or disables automatic notification of **Data Collector** component changes.

Syntax

```
SET_DATA_COLLECTOR_NOTIFY_POLICY('component','notifier', 'topic', enabled)
```

component	Name of the component whose change will be reported via the notifier. Query system table DATA_COLLECTOR for component names. For example: `=> SELECT DISTINCT component, description FROM data_collector WHERE component ilike '%Depot%' ORDER BY component;` ` component	description` `----------------+------------------------------` ` DepotEvictions	Files evicted from the Depot` ` DepotFetches	Files fetched to the Depot` ` DepotUploads	Files Uploaded from the Depot` `(3 rows)`
notifier	Name of the notifier that will send the message.
topic	Name of the Kafka topic that will receive the notification message.
enabled	Boolean value that specifies whether this policy is enabled. Set to TRUE to enable reporting component changes. Set to FALSE to disable the notifier.

Examples

The following example demonstrates creating a notifier, then sends it notifications each time the LoginFailures component updates. This component updates every time there is a failed attempt to log into the Vertica database.

```
=> CREATE NOTIFIER vertica_stats ACTION 'kafka://kafka01.example.com:9092' MAXMEMORYSIZE '10M';
CREATE NOTIFIER
=> SELECT SET_DATA_COLLECTOR_NOTIFY_POLICY('LoginFailures','vertica_stats', 'vertica_notifications',
true);
SET_DATA_COLLECTOR_NOTIFY_POLICY
---------------------------------
 SET
(1 row)
```

The following example shows how to disable the policy created in the previous example:

```
=> SELECT SET_DATA_COLLECTOR_NOTIFY_POLICY('LoginFailures','vertica_stats', 'vertica_notifications',
false);
 SET_DATA_COLLECTOR_NOTIFY_POLICY
---------------------------------
 SET
(1 row)

=> SELECT GET_DATA_COLLECTOR_NOTIFY_POLICY('LoginFailures');
 GET_DATA_COLLECTOR_NOTIFY_POLICY
---------------------------------
 Not notifiable;
(1 row)
```

See Also

- GET_DATA_COLLECTOR_NOTIFY_POLICY
- Producing Kafka Messages Using Notifiers

SET_DATA_COLLECTOR_POLICY

Updates the following retention policy properties for the specified component:

- MEMORY_BUFFER_SIZE_KB
- DISK_SIZE_KB
- INTERVAL_TIME

Before you change a retention policy, you can view its current settings by querying system table DATA_COLLECTOR or by calling meta-function GET_DATA_COLLECTOR_POLICY.

Syntax

```
SET_DATA_COLLECTOR_POLICY('component', 'memory-buffer-size', 'disk-size' ['interval-time']  )
```

Parameters

component	Specifies the retention policy to update. Query system table DATA_COLLECTOR for component names. For example: `=> SELECT DISTINCT component, description FROM data_collector WHERE component ilike '%Depot%' ORDER BY component;` ` component	description` `----------------+-----------------------------` ` DepotEvictions	Files evicted from the Depot` ` DepotFetches	Files fetched to the Depot` ` DepotUploads	Files Uploaded from the Depot` `(3 rows)`
memory-buffer-size	Specifies in kilobytes the maximum amount of data that is buffered in memory before moving it to disk. The policy retention policy property MEMORY_BUFFER_SIZE_KB is set from this value. **Caution:** If you set this parameter to 0, the function returns with a warning that the Data Collector cannot retain any data for this component in memory or on disk. Consider setting this parameter to a high value in the following cases: • Unusually high levels of data collection. If *memory-buffer-size* is set too low, the Data Collector might be unable to flush buffered data to disk fast enough to keep up with the activity level, which can lead to loss of in-memory data. • Very large data collector records—for example, records with very long query strings. The Data

	Collector uses double-buffering, so it cannot retain in memory records that are more than 50 percent larger than *memory-buffer-size*.
disk-size	Specifies in kilobytes the maximum disk space allocated for this component's Data Collector table. The policy retention policy property DISK_SIZE_KB is set from this value. If set to 0, the Data Collector retains only as much component data as it can buffer in memory, as specified by *memory-buffer-size*.
interval-time	INTERVAL data type that specifies how long data of a given component is retained in that component's Data Collector table. The retention policy property INTERVAL_TIME is set from this value. If you set this parameter to a positive value, it also changes the policy property INTERVAL_SET to t (true). For example, if you specify component TupleMoverEvents and set interval-time to an interval of two days (`'2 days'::interval`), the Data Collector table `dc_tuple_mover_events` retains records of Tuple Mover activity over the last 48 hours. Older Tuple Mover data are automatically dropped from this table. **Note:** Setting a component's policy's INTERVAL_TIME property has no effect on how much data storage the Data Collector retains on disk for that component. Maximum disk storage capacity is determined by the DISK_SIZE_KB property. Setting the INTERVAL_TIME property only affects how long data is retained by the component's Data Collector table. For details, see Configuring Data Retention Policies. To disable the INTERVAL_TIME policy property, set this parameter to a negative integer. Doing so reverts two retention policy properties to their default settings: • INTERVAL_SET: f • INTERVAL_TIME: 0

	With these two properties thus set, the component's Data Collector table retains data on all component events until it reaches its maximum limit, as set by retention policy property DISK_SIZE_KB.

Privileges

Superuser

Examples

See Configuring Data Retention Policies.

SET_DATA_COLLECTOR_TIME_POLICY

Updates the retention policy property INTERVAL_TIME for the specified component. Calling this function has no effect on other properties of the same component. You can use this function to update the INTERVAL_TIME property of all component retention policies.

To set other retention policy properties, call SET_DATA_COLLECTOR_POLICY.

Syntax

```
SET_DATA_COLLECTOR_TIME_POLICY( ['component',] 'interval-time' )
```

Parameters

component	Specifies the retention policy to update. If you omit this argument, Vertica updates the retention policy of all Data Collector components.
	
	Query system table DATA_COLLECTOR for component names. For example:
	
	`=> SELECT DISTINCT component, description FROM data_collector WHERE component ilike '%Depot%' ORDER BY component;`
	`component | description`

| | ```
----------------+------------------------------
 DepotEvictions | Files evicted from the Depot
 DepotFetches   | Files fetched to the Depot
 DepotUploads   | Files Uploaded from the Depot
(3 rows)
``` |
| *interval-time* | INTERVAL data type that specifies how long data of a given component is retained in that component's Data Collector table. The retention policy property INTERVAL_TIME is set from this value. If you set this parameter to a positive value, it also changes the policy property INTERVAL_SET to t (true).

For example, if you specify component TupleMoverEvents and set interval-time to an interval of two days (`'2 days'::interval`), the Data Collector table `dc_tuple_mover_events` retains records of Tuple Mover activity over the last 48 hours. Older Tuple Mover data are automatically dropped from this table.

Note:
Setting a component's policy's INTERVAL_TIME property has no effect on how much data storage the Data Collector retains on disk for that component. Maximum disk storage capacity is determined by the DISK_SIZE_KB property. Setting the INTERVAL_TIME property only affects how long data is retained by the component's Data Collector table. For details, see Configuring Data Retention Policies.

To disable the INTERVAL_TIME policy property, set this parameter to a negative integer. Doing so reverts two retention policy properties to their default settings:

• INTERVAL_SET: f
• INTERVAL_TIME: 0

With these two properties thus set, the component's Data Collector table retains data on all component events until it reaches its maximum limit, as set by retention policy property DISK_SIZE_KB. |

Privileges

Superuser
```

Examples

See Configuring Data Retention Policies.

Database Designer Functions

Database Designer functions perform the following operations, generally performed in the following order:

1. Create a design.
2. Set design properties.
3. Populate a design.
4. Create design and deployment scripts.
5. Get design data.
6. Clean up.

Important:
You can also use meta-function DESIGNER_SINGLE_RUN, which encapsulates all of these steps with a single call. The meta-function iterates over all queries within a specified timespan, and returns with a design ready for deployment.

For detailed information, see Workflow for Running Database Designer Programmatically. For information on required privileges, see Privileges for Running Database Designer Functions

Caution:
Before running Database Designer functions on an existing schema, back up the current design by calling EXPORT_CATALOG.

Create a design

DESIGNER_CREATE_DESIGN directs Database Designer to create a design.

Set design properties

The following functions let you specify design properties:

DESIGNER_SET_DESIGN_TYPE	Specifies whether the design is comprehensive or incremental.

DESIGNER_DESIGN_PROJECTION_ENCODINGS	Analyzes encoding in the specified projections and creates a script that implements encoding recommendations.
DESIGNER_SET_DESIGN_KSAFETY	Sets the **K-safety** value for a comprehensive design.
DESIGNER_SET_OPTIMIZATION_OBJECTIVE	Specifies whether the design optimizes for query or load performance.
DESIGNER_SET_PROPOSE_UNSEGMENTED_PROJECTIONS	Enables inclusion of unsegmented projections in the design.

Populate a design

The following functions let you add tables and queries to your Database Designer design:

DESIGNER_ADD_DESIGN_TABLES	Adds the specified tables to a design.
DESIGNER_ADD_DESIGN_QUERY	Adds queries to the design and weights them.
DESIGNER_ADD_DESIGN_QUERIES	
DESIGNER_ADD_DESIGN_QUERIES_FROM_RESULTS	

Create design and deployment scripts

The following functions populate the Database Designer workspace and create design and deployment scripts. You can also analyze statistics, deploy the design automatically, and drop the workspace after the deployment:

DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY	Populates the design and creates design and deployment scripts.
DESIGNER_WAIT_FOR_DESIGN	Waits for a currently running design to complete.

Reset a design

DESIGNER_RESET_DESIGN discards all the run-specific information of the previous Database Designer build or deployment of the specified design but retains its configuration.

Get design data

The following functions display information about projections and scripts that the Database Designer created:

DESIGNER_OUTPUT_ALL_DESIGN_PROJECTIONS	Sends to standard output DDL statements that define design projections.
DESIGNER_OUTPUT_DEPLOYMENT_SCRIPT	Sends to standard output a design's deployment script.

Clean up

The following functions cancel any running Database Designer operation or drop a Database Designer design and all its contents:

DESIGNER_CANCEL_POPULATE_DESIGN	Cancels population or deployment operation for the specified design if it is currently running.
DESIGNER_DROP_DESIGN	Removes the schema associated with the specified design and all its contents.
DESIGNER_DROP_ALL_DESIGNS	Removes all Database Designer-related schemas associated with the current user.

DESIGNER_ADD_DESIGN_QUERIES

Reads and evaluates queries from an input file, and adds the queries that it accepts to the specified design. All accepted queries are assigned a weight of 1 (see DESIGNER_ADD_DESIGN_QUERIES).

The following requirements apply:

- All queried tables must previously be added to the design with DESIGNER_ADD_DESIGN_TABLES.
- If the design type is incremental, the Database Designer reads only the first 100 queries in the input file, and ignores all queries beyond that number.

All accepted queries are added to the system table DESIGN_QUERIES.

Behavior Type

Immutable

Syntax

```
DESIGNER_ADD_DESIGN_QUERIES ( 'design-name', 'input-file' [, return-results] )
```

Parameters

design-name	Name of the target design.
input-file	Absolute path to the queries file.
return-results	Boolean, optionally specifies whether to return results of the add operation to standard output. If set to `true`, Database Designer returns the following results: • Number of accepted queries • Number of queries referencing non-design tables • Number of unsupported queries • Number of illegal queries

Privileges

Superuser, or design creator with all privileges required to execute the queries in *input-file*.

Errors

Database Designer returns an error in the following cases:

- The query contains illegal syntax.
- The query references:
  - External or system tables only
  - Local temporary or other non-design tables
- DELETE or UPDATE query has one or more subqueries.
- INSERT query does not include a SELECT clause.
- Database Designer cannot optimize the query.

Examples

The following example adds queries from vmart_queries.sql to the VMART_DESIGN design. This file contains nine queries. The statement includes a third argument of true, so Database Designer returns results of the add operation:

```
=> SELECT DESIGNER_ADD_DESIGN_QUERIES ('VMART_DESIGN', '/tmp/examples/vmart_queries.sql', 'true');
...
 DESIGNER_ADD_DESIGN_QUERIES
-----------------------------------------------------
 Number of accepted queries                      =9
 Number of queries referencing non-design tables =0
 Number of unsupported queries                   =0
 Number of illegal queries                       =0
(1 row)
```

See Also

Running Database Designer Programmatically

DESIGNER_ADD_DESIGN_QUERIES_FROM_RESULTS

Executes the specified query and evaluates results in the following columns:

- QUERY_TEXT (required): Text of potential design queries.
- QUERY_WEIGHT (optional): The weight assigned to each query that indicates its importance relative to other queries, a real number >0 and ≤ 1. Database Designer uses this setting when creating the design to prioritize the query. If DESIGNER_ADD_DESIGN_QUERIES_FROM_RESULTS returns any results that omit this value, Database Designer sets their weight to 1.

After evaluating the queries in QUERY_TEXT, DESIGNER_ADD_DESIGN_QUERIES_FROM_RESULTS adds all accepted queries to the design. An unlimited number of queries can be added to the design.

Before you add queries to a design, you must add the queried tables with DESIGNER_ADD_DESIGN_TABLES.

Behavior Type

Immutable

Syntax

```
DESIGNER_ADD_DESIGN_QUERIES_FROM_RESULTS ( 'design-name', 'query' )
```

Parameters

design-name	Name of the target design.
query	A valid SQL query whose results contain columns named QUERY_TEXT and, optionally, QUERY_WEIGHT.

Privileges

Superuser, or design creator with all privileges required to execute the specified query, and all queries returned by this function

Errors

Database Designer returns an error in the following cases:

- The query contains illegal syntax.
- The query references:
  - External or system tables only
  - Local temporary or other non-design tables
- DELETE or UPDATE query has one or more subqueries.
- INSERT query does not include a SELECT clause.
- Database Designer cannot optimize the query.

Example

The following example queries the system table QUERY_REQUESTS for all long-running queries (> 1 million microseconds) and adds them to the VMART_DESIGN design. The query returns no information on query weights, so all queries are assigned a weight of 1:

```
=> SELECT DESIGNER_ADD_DESIGN_QUERIES_FROM_RESULTS ('VMART_DESIGN',
   'SELECT request as query_text FROM query_requests where request_duration_ms > 1000000 AND request_
type =
   ''QUERY'';');
```

See Also

Running Database Designer Programmatically

DESIGNER_ADD_DESIGN_QUERY

Reads and parses the specified query, and if accepted, adds it to the design. Before you add queries to a design, you must add the queried tables with DESIGNER_ADD_DESIGN_TABLES.

All accepted queries are added to the system table DESIGN_QUERIES.

Behavior Type

Immutable

Syntax

```
DESIGNER_ADD_DESIGN_QUERY ( 'design-name', 'design-query' [, query-weight] )
```

Parameters

design-name	Name of the target design.
design-query	Executable SQL query.
query-weight	Optionally assigns a weight to each query that indicates its importance relative to other queries, a real number >0 and ≤ 1. Database Designer uses this setting to prioritize queries in the design . If you omit this parameter, Database Designer assigns a weight of 1.

Privileges

Superuser, or design creator with all privileges required to execute the specified query

Errors

Database Designer returns an error in the following cases:

- The query contains illegal syntax.
- The query references:
  - External or system tables only
  - Local temporary or other non-design tables
- `DELETE` or `UPDATE` query has one or more subqueries.
- `INSERT` query does not include a `SELECT` clause.
- Database Designer cannot optimize the query.

Examples

The following example adds the specified query to the `VMART_DESIGN` design and assigns that query a weight of 0.5:

```
=> SELECT DESIGNER_ADD_DESIGN_QUERY (
   'VMART_DESIGN',
   'SELECT customer_name, customer_type FROM customer_dimension ORDER BY customer_name ASC;', 0.5
   );
```

Running Database Designer Programmatically

DESIGNER_ADD_DESIGN_TABLES

Adds the specified tables to a design. You must run DESIGNER_ADD_DESIGN_TABLES before adding design queries to the design. If no tables are added to the design, Vertica does not accept design queries.

Behavior Type

Immutable

Syntax

```
DESIGNER_ADD_DESIGN_TABLES ( 'design-name', '[ table-spec[,…] ]' [, 'analyze-statistics'] )
```

Parameters

design-name	Name of the Database Designer design.
table-spec[,…]	One or more comma-delimited arguments that specify which tables to add to the design, where each *table-spec* argument can specify tables as follows: • [*schema*.]*table* Add *table* to the design. • *schema*.* Add all tables in *schema*. If set to an empty string, Vertica adds all tables in the database to which the user has access.
analyze-statistics	Boolean that optionally specifies whether to run ANALYZE_STATISTICS after adding the specified tables to the design, by default set to false.

	Accurate statistics help Database Designer optimize compression and query performance. Updating statistics takes time and resources.

Privileges

Superuser, or design creator with USAGE privilege on the design table schema and owner of the design table

Examples

The following example adds to design `VMART_DESIGN` all tables from schemas `online_sales` and `store`, and analyzes statistics for those tables:

```
=> SELECT DESIGNER_ADD_DESIGN_TABLES('VMART_DESIGN', 'online_sales.*, store.*','true');
 DESIGNER_ADD_DESIGN_TABLES
----------------------------
                          7
(1 row)
```

See Also

Running Database Designer Programmatically

DESIGNER_CANCEL_POPULATE_DESIGN

Cancels population or deployment operation for the specified design if it is currently running. When you cancel a deployment, the Database Designer cancels the projection refresh operation. It does not roll back projections that it already deployed and refreshed.

Behavior Type

Immutable

Syntax

```
DESIGNER_CANCEL_POPULATE_DESIGN ( 'design-name' )
```

Parameters

design-name	Name of the design operation to cancel.

Privileges

Superuser, or design creator

Examples

The following example cancels a currently running design for VMART_DESIGN and then drops the design:

```
=> SELECT DESIGNER_CANCEL_POPULATE_DESIGN ('VMART_DESIGN');
=> SELECT DESIGNER_DROP_DESIGN ('VMART_DESIGN', 'true');
```

See Also

Running Database Designer Programmatically

DESIGNER_CREATE_DESIGN

Creates a design with the specified name.

Behavior Type

Immutable

Syntax

```
DESIGNER_CREATE_DESIGN ( 'design-name' )
```

Parameters

design-name	Name of the design to create, can contain only alphanumeric and underscore (_) characters. Two users cannot have designs with the same name at the same time.

Privileges

- Superuser
- DBDUSER with WRITE privileges on storage location of *design-name*.

Database Designer System Views

If any of the following V_MONITOR tables do not already exist from previous designs, DESIGNER_CREATE_DESIGN creates them:

- DESIGNS
- DESIGN_TABLES
- DEPLOYMENT_PROJECTIONS
- DEPLOYMENT_PROJECTION_STATEMENTS
- DESIGN_QUERIES
- OUTPUT_DEPLOYMENT_STATUS
- OUTPUT_EVENT_HISTORY

Examples

The following example creates the design VMART_DESIGN:

```
=> SELECT DESIGNER_CREATE_DESIGN('VMART_DESIGN');
 DESIGNER_CREATE_DESIGN
------------------------
                      0
(1 row)
```

See Also

Running Database Designer Programmatically

DESIGNER_DESIGN_PROJECTION_ENCODINGS

Analyzes encoding in the specified projections, creates a script to implement encoding recommendations, and optionally deploys the recommendations.

Behavior Type

Immutable

Syntax

```
DESIGNER_DESIGN_PROJECTION_ENCODINGS ( '[ proj-spec[,… ] ]', '[destination]' [, 'deploy'] [, 'reanalyze-encodings'] )
```

Parameters

proj-spec[,…]	One or more comma-delimited projections to add to the design. Each projection can be specified in one of the following ways: • [[*schema.*]*table.*]*projection* Specifies to analyze *projection*. • *schema.** Specifies to analyze all projections in the named schema. • [*schema.*]*table* Specifies to analyze all projections of the named table. If set to an empty string, Vertica analyzes all projections in the database to which the user has access. For example, the following statement specifies to analyze all projections in schema `private`, and send the results to the file `encodings.sql`: `=> SELECT DESIGNER_DESIGN_PROJECTION_ENCODINGS ('mydb.private.*','encodings.sql');`
destination	Specifies where to send output, one of the following:

	• Empty string (' ') writes the script to standard output. • Pathname of a SQL output file. If you specify a file that does not exist, the function creates one. If you specify only a file name, Vertica creates it in the catalog directory. If the file already exists, the function silently overwrites its contents.
deploy	Boolean that specifies whether to deploy encoding changes. **Default:** false
reanalyze-encodings	Boolean that specifies whether DESIGNER_DESIGN_PROJECTION_ENCODINGS analyzes encodings in a projection where all columns are already encoded: • false: Analyzes no columns and generates no recommendations if all columns are encoded. • true: Ignores existing encodings and generates recommendations. **Default:** false

Privileges

Superuser, or DBDUSER with the following privileges:

- OWNER of all projections to analyze
- USAGE privilege on the schema for the specified projections

Examples

The following example requests that Database Designer analyze encodings of all projections in the schema online_sales, as follows:

- The second parameter *destination* is set to an empty string, so the script is sent to standard output (shown truncated below).
- The last two parameters *deploy* and *reanalyze-encodings* are omitted, so Database Designer does not execute the script or reanalyze existing encodings:

```
=> SELECT DESIGNER_DESIGN_PROJECTION_ENCODINGS ('online_sales.*','');

CREATE PROJECTION online_page_dimension_DBD_1_seg_EncodingDesign /*+createtype(D)*/
```

```
(
 online_page_key ENCODING COMMONDELTA_COMP,
 start_date ENCODING DELTAVAL,
 end_date ENCODING DELTAVAL,
 page_number ENCODING DELTAVAL,
 page_description,
 page_type
)
AS
 SELECT online_page_dimension.online_page_key,
        online_page_dimension.start_date,
        online_page_dimension.end_date,
        online_page_dimension.page_number,
        online_page_dimension.page_description,
        online_page_dimension.page_type
 FROM online_sales.online_page_dimension
 ORDER BY online_page_dimension.online_page_key
SEGMENTED BY hash(online_page_dimension.online_page_key) ALL NODES KSAFE 1;

select refresh('online_sales.online_page_dimension');

select make_ahm_now();

DROP PROJECTION online_sales.online_page_dimension CASCADE;

ALTER PROJECTION online_sales.online_page_dimension_DBD_1_seg_EncodingDesign RENAME TO online_page_
dimension;

...
(1 row)
```

See Also

Running Database Designer Programmatically

DESIGNER_DROP_ALL_DESIGNS

Removes all Database Designer-related schemas associated with the current user. Use this function to remove database objects after one or more Database Designer sessions complete execution.

Behavior Type

Immutable

Syntax

```
DESIGNER_DROP_ALL_DESIGNS()
```

Parameters

None.

Privileges

Superuser, or design creator

Example

The following example removes all schema and their contents associated with the current user. DESIGNER_DROP_ALL_DESIGNS returns the number of designs dropped:

```
=> SELECT DESIGNER_DROP_ALL_DESIGNS();
 DESIGNER_DROP_ALL_DESIGNS
---------------------------
                         2
(1 row)
```

See Also

- DESIGNER_CANCEL_POPULATE_DESIGN
- DESIGNER_DROP_DESIGN

DESIGNER_DROP_DESIGN

Removes the schema associated with the specified design and all its contents. Use DESIGNER_DROP_DESIGN after a Database Designer design or deployment completes successfully. You must also use it to drop a design before creating another one under the same name.

To drop all designs that you created, use DESIGNER_DROP_ALL_DESIGNS.

Behavior Type

Immutable

Syntax

```
DESIGNER_DROP_DESIGN ( 'design-name' [, force-drop ] )
```

Parameters

design-name	Name of the design to drop.
force-drop	Boolean that overrides any dependencies that otherwise prevent Vertica from executing this function—for example, the design is in use or is currently being deployed. If you omit this parameter, Vertica sets it to `false`.

Privileges

Superuser, or design creator

Example

The following example deletes the Database Designer design `VMART_DESIGN` and all its contents:

```
=> SELECT DESIGNER_DROP_DESIGN ('VMART_DESIGN');
```

See Also

Running Database Designer Programmatically

DESIGNER_OUTPUT_ALL_DESIGN_PROJECTIONS

Displays the DDL statements that define the design projections to standard output.

Behavior Type

Immutable

Syntax

```
DESIGNER_OUTPUT_ALL_DESIGN_PROJECTIONS ( 'design-name' )
```

Parameters

design-name	Name of the target design.

Privileges

Superuser or DBDUSER

Examples

The following example returns the design projection DDL statements for `vmart_design`:

```
=> SELECT DESIGNER_OUTPUT_ALL_DESIGN_PROJECTIONS('vmart_design');
CREATE PROJECTION customer_dimension_DBD_1_rep_VMART_DESIGN /*+createtype(D)*/
(
 customer_key ENCODING DELTAVAL,
 customer_type ENCODING AUTO,
 customer_name ENCODING AUTO,
 customer_gender ENCODING REL,
 title ENCODING AUTO,
 household_id ENCODING DELTAVAL,
 customer_address ENCODING AUTO,
 customer_city ENCODING AUTO,
 customer_state ENCODING AUTO,
 customer_region ENCODING AUTO,
 marital_status ENCODING AUTO,
 customer_age ENCODING DELTAVAL,
 number_of_children ENCODING BLOCKDICT_COMP,
 annual_income ENCODING DELTARANGE_COMP,
 occupation ENCODING AUTO,
 largest_bill_amount ENCODING DELTAVAL,
 store_membership_card ENCODING BLOCKDICT_COMP,
 customer_since ENCODING DELTAVAL,
 deal_stage ENCODING AUTO,
 deal_size ENCODING DELTARANGE_COMP,
 last_deal_update ENCODING DELTARANGE_COMP
```

```
)
AS
 SELECT customer_key,
        customer_type,
        customer_name,
        customer_gender,
        title,
        household_id,
        customer_address,
        customer_city,
        customer_state,
        customer_region,
        marital_status,
        customer_age,
        number_of_children,
        annual_income,
        occupation,
        largest_bill_amount,
        store_membership_card,
        customer_since,
        deal_stage,
        deal_size,
        last_deal_update
 FROM public.customer_dimension
 ORDER BY customer_gender,
          annual_income
UNSEGMENTED ALL NODES;
CREATE PROJECTION product_dimension_DBD_2_rep_VMART_DESIGN /*+createtype(D)*/
(
...
```

See Also

DESIGNER_OUTPUT_DEPLOYMENT_SCRIPT

DESIGNER_OUTPUT_DEPLOYMENT_SCRIPT

Displays the deployment script for the specified design to standard output. If the design is already deployed, Vertica ignores this function.

To output only the `CREATE PROJECTION` commands in a design script, use DESIGNER_OUTPUT_ALL_DESIGN_PROJECTIONS.

Behavior Type

Immutable

Syntax

```
DESIGNER_OUTPUT_DEPLOYMENT_SCRIPT ( 'design-name' )
```

Parameters

design-name	Name of the target design.

Privileges

Superuser, or design creator

Examples

The following example displays the deployment script for VMART_DESIGN:

```
=> SELECT DESIGNER_OUTPUT_DEPLOYMENT_SCRIPT('VMART_DESIGN');
CREATE PROJECTION customer_dimension_DBD_1_rep_VMART_DESIGN /*+createtype(D)*/
...
CREATE PROJECTION product_dimension_DBD_2_rep_VMART_DESIGN /*+createtype(D)*/
...
select refresh('public.customer_dimension,
                public.product_dimension,
                public.promotion.dimension,
                public.date_dimension');
select make_ahm_now();
DROP PROJECTION public.customer_dimension_super CASCADE;
DROP PROJECTION public.product_dimension_super CASCADE;
...
```

See Also

DESIGNER_OUTPUT_ALL_DESIGN_PROJECTIONS

DESIGNER_RESET_DESIGN

Discards all run-specific information of the previous Database Designer build or deployment of the specified design but keeps its configuration. You can make changes to the design as needed, for example, by changing parameters or adding additional tables and/or queries, before running the design again.

Behavior Type

Immutable

Syntax

```
DESIGNER_RESET_DESIGN ( 'design-name' )
```

Parameters

design-name	Name of the design to reset.

Privileges

Superuser, or design creator

Example

The following example resets the Database Designer design VMART_DESIGN:

```
=> SELECT DESIGNER_RESET_DESIGN ('VMART_DESIGN');
```

DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY

Populates the design and creates the design and deployment scripts. DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY can also analyze statistics, deploy the design, and drop the workspace after the deployment.

The files output by this function have the permissions 666 or rw-rw-rw-, which allows any Linux user on the node to read or write to them. It is highly recommended that you keep the files in a secure directory.

Caution:
DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY does not create a backup copy of the current design before deploying the new design. Before

running this function, back up the existing schema design with EXPORT_CATALOG.

Behavior Type

Immutable

Syntax

```
DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY (
    'design-name',
    'output-design-file',
    'output-deployment-file'
    [ , 'analyze-statistics']
    [ , 'deploy']
    [ , 'drop-design-workspace']
    [ , 'continue-after-error']
    )
```

Parameters

design-name	Name of the design to populate and deploy.
output-design-filename	The file to contain DDL statements that create design projections, where *output-design-filename* includes the full path on the node where the session is connected.
output-deployment-filename	The file to contain the deployment script, where *output-deployment-filename* includes the full path on the node where the session is connected.
analyze-statistics	Specifies whether to collect or refresh statistics for the tables before populating the design. If set to true, Vertica Invokes ANALYZE_STATISTICS. Accurate statistics help Database Designer optimize compression and query performance. However, updating statistics requires time and resources. **Default:** false
deploy	Specifies whether to deploy the Database Designer

	design using the deployment script created by this function. **Default:** true
drop-design-workspace	Specifies whether to drop the design workspace after the design is deployed. **Default:** true
continue-after-error	Specifies whether DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY continues to run after an error occurs. By default, an error causes this function to terminate. **Default:** false

Privileges

- Superuser
- Design creator with WRITE privileges on storage locations of design and deployment scripts

Requirements

Before calling this function, you must:

- Create a design, a logical schema with tables.
- Associate tables with the design.
- Load queries to the design.
- Set design properties (K-safety level, mode, and policy).

Examples

The following example creates projections for and deploys the VMART_DESIGN design, and analyzes statistics about the design tables.

```
=> SELECT DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY (
   'VMART_DESIGN',
   '/tmp/examples/vmart_design_files/design_projections.sql',
   '/tmp/examples/vmart_design_files/design_deploy.sql',
   'true',
```

```
    'true',
    'false',
    'false'
    );
```

See Also

Running Database Designer Programmatically

DESIGNER_SET_DESIGN_KSAFETY

Sets K-safety for a comprehensive design and stores the K-safety value in the DESIGNS table. Database Designer ignores this function for incremental designs.

Behavior Type

Immutable

Syntax

```
DESIGNER_SET_DESIGN_KSAFETY ( 'design-name' [, k-level ] )
```

Parameters

design-name	Name of the design for which you want to set the K-safety value, type VARCHAR.
k-level	An integer between 0 and 2 that specifies the level of K-safety for the target design. This value must be compatible with the number of nodes in the database cluster: • *k-level* = 0: ≥ 1 nodes • *k-level* = 1: ≥ 3 nodes • *k-level* = 2: ≥ 5 nodes If you omit this parameter, Vertica sets K-safety for this design to 0 or 1, according to the number of nodes: 1 if the cluster contains ≥ 3 nodes, otherwise 0.

	If you are a DBADMIN user and *k-Level* differs from system K-safety, Vertica changes system K-safety as follows: • If *k-Level* is less than system K-safety, Vertica changes system K-safety to the lower level after the design is deployed. • If *k-Level* is greater than system K-safety and is valid for the database cluster, Vertica creates the required number of buddy projections for the tables in this design. If the design applies to all database tables, or all tables in the database have the required number of buddy projections, Database Designer changes system K-safety to *k-Level*. If the design excludes some database tables and the number of their buddy projections is less than *k-Level*, Database Designer leaves system K-safety unchanged. Instead, it returns a warning and indicates which tables need new buddy projections in order to adjust system K-safety. If you are a DBDUSER, Vertica ignores this parameter.

Privileges

Superuser, or design creator

Examples

The following example set K-safety for the VMART_DESIGN design to 1:

```
=> SELECT DESIGNER_SET_DESIGN_KSAFETY('VMART_DESIGN', 1);
```

See Also

Running Database Designer Programmatically

DESIGNER_SET_DESIGN_TYPE

Specifies whether Database Designer creates a comprehensive or incremental design. DESIGNER_SET_DESIGN_TYPE stores the design mode in the DESIGNS table.

Important:
If you do not explicitly set a design mode with this function, Database Designer creates a comprehensive design.

Behavior Type

Immutable

Syntax

```
DESIGNER_SET_DESIGN_TYPE ( 'design-name', 'mode' )
```

Parameters

design-name	Name of the target design.
mode	Name of the mode that Database Designer should use when designing the database, one of the following: • COMPREHENSIVE: Creates an initial or replacement design for all tables in the specified schemas. You typically create a comprehensive design for a new database. • INCREMENTAL: Modifies an existing design with additional projection that are optimized for new or modified queries. **Note:** Incremental designs always inherit the K-safety value of the database. For more information, see Design Types.

Privileges

Superuser, or design creator

Examples

The following examples show the two design mode options for the VMART_DESIGN design:

```
=> SELECT DESIGNER_SET_DESIGN_TYPE(
    'VMART_DESIGN',
    'COMPREHENSIVE');
DESIGNER_SET_DESIGN_TYPE
-------------------------
                        0
(1 row)
=> SELECT DESIGNER_SET_DESIGN_TYPE(
    'VMART_DESIGN',
    'INCREMENTAL');
 DESIGNER_SET_DESIGN_TYPE
-------------------------
                        0
(1 row)
```

See Also

Running Database Designer Programmatically

DESIGNER_SET_OPTIMIZATION_OBJECTIVE

Valid only for comprehensive database designs, specifies the optimization objective Database Designer uses. Database Designer ignores this function for incremental designs.

DESIGNER_SET_OPTIMIZATION_OBJECTIVE stores the optimization objective in the DESIGNS table.

Behavior Type

Immutable

Syntax

```
DESIGNER_SET_OPTIMIZATION_OBJECTIVE ( 'design-name', 'policy' )
```

Parameters

design-name	Name of the target design.
policy	Specifies the design's optimization policy, one of the following:

	• QUERY: Optimize for query performance. This can result in a larger database storage footprint because additional projections might be created. • LOAD: Optimize for load performance so database size is minimized. This can result in slower query performance. • BALANCED: Balance the design between query performance and database size.

Privileges

Superuser, or design creator

Examples

The following example sets the optimization objective option for the VMART_DESIGN design: to QUERY:

```
=> SELECT DESIGNER_SET_OPTIMIZATION_OBJECTIVE(  'VMART_DESIGN', 'QUERY');
 DESIGNER_SET_OPTIMIZATION_OBJECTIVE
-------------------------------------
                                   0
(1 row)
```

See Also

Running Database Designer Programmatically

DESIGNER_SET_PROPOSE_UNSEGMENTED_PROJECTIONS

Specifies whether a design can include unsegmented projections. Vertica ignores this function on a one-node cluster, where all projections must be unsegmented.

Behavior Type

Immutable

Syntax

```
DESIGNER_SET_PROPOSE_UNSEGMENTED_PROJECTIONS ( 'design-name', unsegmented )
```

Parameters

design-name	Name of the target design.
unsegmented	Boolean that specifies whether Database Designer can propose unsegmented projections for tables in this design. When you create a design, the `propose_unsegmented_projections` value in system table DESIGNS for this design is set to true. If DESIGNER_SET_PROPOSE_UNSEGMENTED_PROJECTIONS sets this value to false, Database Designer proposes only segmented projections.

Privileges

Superuser, or design creator

Example

The following example specifies that Database Designer can propose only segmented projections for tables in the design `VMART_DESIGN`:

```
=> SELECT DESIGNER_SET_PROPOSE_UNSEGMENTED_PROJECTIONS('VMART_DESIGN', false);
```

See Also

Running Database Designer Programmatically

DESIGNER_SINGLE_RUN

Evaluates all queries that completed execution within the specified timespan, and returns with a design that is ready for deployment. This design includes projections that are

recommended for optimizing the evaluated queries. Unless you redirect output, DESIGNER_SINGLE_RUN returns the design to stdout.

Tip:
Before running DESIGNER_SINGLE_RUN, collect statistics on the queried data by calling ANALYZE_STATISTICS and ANALYZE_STATISTICS_PARTITION.

Syntax

```
DESIGNER_SINGLE_RUN ('interval')
```

interval	Specifies an interval of time that precedes the meta-function call. Database Designer evaluates all queries that ran to completion over the specified interval.

Privileges

Superuser or DBUSER

Examples

```
-------------------------------------------------------------------------
-- SSBM dataset test
-------------------------------------------------------------------------
-- create ssbm schema
\! $TARGET/bin/vsql -f 'sql/SSBM/SSBM_schema.sql' > /dev/null 2>&1

DESIGNER_WAIT_FOR_DESIGN

Waits for completion of operations that are populating and deploying the design. Ctrl+C cancels this operation and returns control to the user.

Behavior Type

Immutable

Syntax

```
DESIGNER_WAIT_FOR_DESIGN ( 'design-name' )
```

Parameters

design-name	Name of the running design.

Privileges

Superuser, or DBDUSER with USAGE privilege on the design schema

Examples

The following example requests to wait for the currently running design of VMART_DESIGN to complete:

```
=> SELECT DESIGNER_WAIT_FOR_DESIGN ('VMART_DESIGN');
```

See Also

- DESIGNER_CANCEL_POPULATE_DESIGN
- DESIGNER_DROP_ALL_DESIGNS
- DESIGNER_DROP_DESIGN

Database Management Functions

This section contains the database management functions specific to Vertica.

CLEAR_RESOURCE_REJECTIONS

Clears the content of the RESOURCE_REJECTIONS and DISK_RESOURCE_REJECTIONS system tables. Normally, these tables are only cleared during a node restart. This function lets you clear the tables whenever you need. For example, you might want to clear the system tables after you resolved a disk space issue that was causing disk resource rejections.

Syntax

```
CLEAR_RESOURCE_REJECTIONS();
```

Privileges

Superuser

Example

The following command clears the content of the RESOURCE_REJECTIONS and DISK_RESOURCE_REJECTIONS system tables:

```
=> SELECT clear_resource_rejections();
clear_resource_rejections
--------------------------
 OK
(1 row)
```

See Also

- DISK_RESOURCE_REJECTIONS
- RESOURCE_REJECTIONS

COMPACT_STORAGE

Bundles existing data (`.fdb`) and index (`.pidx`) files into the `.gt` file format. The `.gt` format is enabled by default for data files created version 7.2 or later. If you upgrade a database from an earlier version, use `COMPACT_STORAGE` to bundle storage files into the `.gt` format. Your database can continue to operate with a mix of file storage formats.

If the settings you specify for `COMPACT_STORAGE` vary from the limit specified in configuration parameter `MaxBundleableROSSizeKB`, Vertica does not change the size of the automatically created bundles.

Note:
Run this function during periods of low demand.

Syntax

```
SELECT COMPACT_STORAGE ('[[[database.]schema.]object-name]', min-ros-filesize-kb, 'small-or-all-files',
'simulate');
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
object-name	Specifies the table or projection to bundle. If set to an empty string, COMPACT_STORAGE evaluates the data of all projections in the database for bundling.
min-ros-filesize-kb	Integer ≥ 1, specifies in kilobytes the minimum size of an independent ROS file. COMPACT_STORAGE bundles storage container ROS files below this size into a single file.
small-or-all-files	One of the following:

	• `small`: Bundles only files smaller than the limit specified in *`min-ros-filesize-kb`* • `all`: Bundles files smaller than the limit specified in *`min-ros-filesize-kb`* and bundles the `.fdb` and `.pidx` files for larger storage containers.
`simulate`	Specifies whether to simulate the storage settings and produce a report describing the impact of those settings. • `true`: Produces a report on the impact of the specified bundle settings without actually bundling storage files. • `false`: Performs the bundling as specified.

Privileges

Superuser

Storage and Performance Impact

Bundling reduces the number of files in your file system by at least fifty percent and improves the performance of file-intensive operations. Improved operations include backups, restores, and mergeout.

Vertica creates small files for the following reasons:

- Tables contain hundreds of columns.
- Partition ranges are small (partition by minute).
- Local segmentation is enabled and your factor is set to a high value.

Example

The following example describes the impact of bundling the table `EMPLOYEES`:

```
=> SELECT COMPACT_STORAGE('employees', 1024,'small','true');
Task: compact_storage

On node v_vmart_node0001:
Projection Name :public.employees_b0 | selected_storage_containers :0 |
selected_files_to_compact :0 | files_after_compact : 0 | modified_storage_KB :0

On node v_vmart_node0002:
```

```
Projection Name :public.employees_b0 | selected_storage_containers :1 |
selected_files_to_compact :6 | files_after_compact : 1 | modified_storage_KB :0

On node v_vmart_node0003:
Projection Name :public.employees_b0 | selected_storage_containers :2 |
selected_files_to_compact :12 | files_after_compact : 2 | modified_storage_KB :0

On node v_vmart_node0001:
Projection Name :public.employees_b1 | selected_storage_containers :2 |
selected_files_to_compact :12 | files_after_compact : 2 | modified_storage_KB :0

On node v_vmart_node0002:
Projection Name :public.employees_b1 | selected_storage_containers :0 |
selected_files_to_compact :0 | files_after_compact : 0 | modified_storage_KB :0

On node v_vmart_node0003:
Projection Name :public.employees_b1 | selected_storage_containers :1 |
selected_files_to_compact :6 | files_after_compact : 1 | modified_storage_KB :0

Success

(1 row)
```

CURRENT_SCHEMA

Returns the name of the current schema.

Behavior Type

Stable

Syntax

```
CURRENT_SCHEMA()
```

Note:
You can call this function without parentheses.

Privileges

None

Examples

The following command returns the name of the current schema:

```
=> SELECT CURRENT_SCHEMA();
 current_schema
----------------
 public
(1 row)
```

The following command returns the same results without the parentheses:

```
=> SELECT CURRENT_SCHEMA;
 current_schema
----------------
 public
(1 row)
```

The following command shows the current schema, listed after the current user, in the search path:

```
=> SHOW SEARCH_PATH;
    name     |                       setting
-------------+-------------------------------------------------
 search_path | "$user", public, v_catalog, v_monitor, v_internal
(1 row)
```

See Also

- SET SEARCH_PATH

DUMP_LOCKTABLE

Returns information about deadlocked clients and the resources they are waiting for.

Syntax

```
DUMP_LOCKTABLE()
```

Privileges

None

Notes

Use DUMP_LOCKTABLE if Vertica becomes unresponsive:

1. Open an additional vsql connection.
2. Execute the query:

```
=> SELECT DUMP_LOCKTABLE();
```

   The output is written to vsql. See Monitoring the Log Files.

You can also see who is connected using the following command:

```
=> SELECT * FROM SESSIONS;
```

Close all sessions using the following command:

```
=> SELECT CLOSE_ALL_SESSIONS();
```

Close a single session using the following command:

```
=> SELECT CLOSE_SESSION('session_id');
```

You get the session_id value from the V_MONITOR.SESSIONS system table.

See Also

- CLOSE_ALL_SESSIONS
- CLOSE_SESSION
- LOCKS
- SESSIONS

DUMP_PARTITION_KEYS

Dumps the partition keys of all projections in the system.

Syntax

```
DUMP_PARTITION_KEYS( )
```

Note:
The **ROS** objects of partitioned tables without partition keys are ignored by the tuple mover and are not merged during automatic tuple mover operations.

Privileges

User must have select privileges on the table or usage privileges on the schema.

Example

```
=> SELECT DUMP_PARTITION_KEYS( );
Partition keys on node v_vmart_node0001
  Projection 'states_b0'
   Storage [ROS container]
     No of partition keys: 1
     Partition keys: NH
   Storage [ROS container]
     No of partition keys: 1
     Partition keys: MA
  Projection 'states_b1'
   Storage [ROS container]
     No of partition keys: 1
     Partition keys: VT
   Storage [ROS container]
     No of partition keys: 1
     Partition keys: ME
   Storage [ROS container]
     No of partition keys: 1
     Partition keys: CT
```

- DUMP_TABLE_PARTITION_KEYS
- PARTITION_PROJECTION
- PARTITION_TABLE
- PARTITIONS
- Partitioning Tables in the Administrator's Guide

GET_CONFIG_PARAMETER

Gets the value of a configuration parameter at the database level or for a specific node.

Syntax

```
GET_CONFIG_PARAMETER( 'parameter-name', ['level'])
```

Parameters

parameter-name	The parameter value to get. See Configuration Parameters in the Administrator's Guide for a list of supported parameters, their purposes, and usage examples.
level	The level at which the configuration parameter was set. This parameter can be the literal string 'session' to get the session-level setting, It can also be the name of a node whose parameter value you wish to get. If you omit this parameter or set it to NULL, this function returns the value set at the database level.

Privileges

None

Examples

Get the AnalyzeRowCountInterval parameter at the database level:

```
=> SELECT GET_CONFIG_PARAMETER ('AnalyzeRowCountInterval');
 GET_CONFIG_PARAMETER
----------------------
 3600
```

Get the MaxSessionUDParameterSize parameter at the session level:

```
=> SELECT GET_CONFIG_PARAMETER ('MaxSessionUDParameterSize','session');
 GET_CONFIG_PARAMETER
----------------------
 2000
(1 row)
```

See Also

- SET_CONFIG_PARAMETER
- Managing Configuration Parameters: VSQL
- CONFIGURATION_PARAMETERS

KERBEROS_CONFIG_CHECK

Tests the Kerberos configuration of a Vertica cluster. The function succeeds if it can kinit with both the keytab file and the current user's credential, and reports errors otherwise.

Syntax

```
KERBEROS_CONFIG_CHECK( )
```

Parameters

This function has no parameters.

Privileges

This function does not require privileges.

Examples

The following example shows the results when the Kerberos configuration is valid.

```
=> SELECT KERBEROS_CONFIG_CHECK();
    kerberos_config_check
------------------------------------------------------------------------------
 ok: krb5 exists at [/etc/krb5.conf]
 ok: Vertica Keytab file is set to [/etc/vertica.keytab]
 ok: Vertica Keytab file exists at [/etc/vertica.keytab]
[INFO] KerberosCredentialCache [/tmp/vertica_D4/vertica450676899262134963.cc]
 Kerberos configuration parameters set in the database
        KerberosServiceName : [vertica]
        KerberosHostname : [data.hadoop.com]
        KerberosRealm : [EXAMPLE.COM]
        KerberosKeytabFile : [/etc/vertica.keytab]
 Vertica Principal: [vertica/data.hadoop.com@EXAMPLE.COM]
```

```
 [OK] Vertica can kinit using keytab file
 [OK] User [bob] has valid client authentication for kerberos principal [bob@EXAMPLE.COM]]

(1 row)
```

MEMORY_TRIM

Calls glibc function `malloc_trim()` to reclaim free memory from malloc and return it to the operating system. Details on the trim operation are written to system table MEMORY_EVENTS.

Unless you turn off memory polling, Vertica automatically detects when glibc accumulates an excessive amount of free memory in its allocation arena. When this occurs, Vertica consolidates much of this memory and returns it to the operating system. Call this function if you disable memory polling and wish to reduce glibc-allocated memory manually.

For more information, see Memory Trimming.

Syntax

```
MEMORY_TRIM()
```

Privileges

Superuser

Examples

```
=> SELECT memory_trim();
                           memory_trim
-----------------------------------------------------------------
 Pre-RSS: [378822656] Post-RSS: [372129792] Benefit: [0.0176675]
(1 row)
```

RUN_INDEX_TOOL

Runs the Index tool on a Vertica database to perform one of these tasks:

- Run a per-block cyclic redundancy check (CRC) on data storage to verify data integrity.
- Check that the sort order in ROS containers is correct.

The function writes summary information about its operation to standard output; detailed information on results is logged in `vertica.log` on the current node. For more about evaluating tool output, see:

- Evaluating CRC Errors
- Evaluating Sort Order Errors

You can also run the Index tool on a database that is down, from the Linux command line. For details, see CRC and Sort Order Check.

Caution:
Use this function only under guidance from Vertica Support.

Syntax

```
RUN_INDEX_TOOL ( 'taskType', global, '[projFilter]' [, numThreads ] );
```

Parameters

taskType	Specifies the operation to run, one of the following: • `checkcrc`: Run a cyclic redundancy check (CRC) on each block of existing data storage to check the data integrity of ROS data blocks. • `checksort`: Evaluate each ROS row to determine whether it is sorted correctly. If ROS data is not sorted correctly in the projection's order, query results that rely on sorted data will be incorrect.
global	Boolean, specifies whether to run the specified task on all nodes (true), or the current one (false).

projFilter	Specifies the scope of the operation:
	• Empty string (' '): Run the check on all projections.
	• A string that specifies one or more projections as follows:
	  • *projection-name*: Run the check on this projection
	  • *projection-prefix**: Run the check on all projections

	that begin with the string *projection-prefix*.
numThreads	An unsigned (positive) or signed (negative) integer that specifies the number of threads used to run this operation: • *n*: Number of threads, ≥ 1 • *-n*: Negative integer, denotes a fraction of all CPU cores as follows: *num-cores / n* Thus, -1 specifies all cores, -2, half the cores, -3, a third of all cores, and so on. **Default**: 1

Privileges

Superuser

Optimizing Performance

You can optimize meta-function performance by setting two parameters:

- *projFilter*: Narrows the scope of the operation to one or more projections.
- *numThreads*: Specifies the number of threads used to execute the function.

SECURITY_CONFIG_CHECK

Returns the status of various security-related parameters. Use this function to verify completeness of your TLS configuration.

Syntax

```
SECURITY_CONFIG_CHECK( 'db-component' )
```

Parameters

db-component	Components to check: NETWORK: Returns the status of the parameters for spread encryption, internode TLS, and client-server TLS.

Example

In the following example, a call to SECURITY_CONFIG_CHECK returns with confirmation that parameters SSLCertificate and SSLPrivateKey are set, but other parameters such as EncryptSpreadComm and DataSSLParams are not:

```
=> SELECT SECURITY_CONFIG_CHECK('NETWORK');
                              security_config_check

--------------------------------------------------------------------------------
Spread security details:
* EncryptSpreadComm = []
Spread encryption is disabled
It is NOT safe to set/change other security config parameters while spread is not encrypted!
Please set EncryptSpreadComm to enable spread encryption first

Data Channel security details:
* DataSSLParams is unset
SSL on the data channel is disabled
Please set EncryptSpreadComm and DataSSLParams to enable SSL on the data channel

Client-Server network security details:
* EnableSSL is unset
* SSLCertificate is set
* SSLPrivateKey is set
Client-Server SSL is disabled
Please set EnableSSL, SSLCertificate and SSLPrivateKey to enable Client-Server SSL

(1 row)
```

See Also

- Internode TLS
- TLS Protocol

SET_CONFIG_PARAMETER

Sets the value of a configuration parameter at the database level or for a specific node.

Important:
Vertica encourages use of ALTER NODE, ALTER DATABASE, and ALTER SESSION to set and clear configuration parameters.

Caution:
Vertica is designed to operate with minimal configuration changes, so use this capability sparingly. Carefully follow documented guidelines for the parameter you wish to configure.

Syntax

```
SET_CONFIG_PARAMETER( 'parameter-name', value, ['level'])
```

Parameters

parameter-name	The parameter value to set. See Configuration Parameters in the Administrator's Guide for a list of supported parameters, their purposes, and usage examples.
value	The value to set for *parameter-name*. Syntax for this argument varies depending upon the parameter and its expected data type. For strings, enclose the argument in single quotes; integer arguments can be unquoted. If `value` is specified as `NULL`, the parameter is cleared.
level	The level at which the value should be set. This can be the name of a node to set the value specifically for a node. Pr it can be the literal string session to set the value at the session level. If you omit this parameter or set it to `NULL`, the parameter is set at the database level. If a parameter is set at the session level, the value overrides the value set at the database level. If set for a node, the node setting supersedes the session and database-level

	setting.

Note:
Some parameters require restart for the value to take effect.

Privileges

Superuser

Examples

Set the AnalyzeRowCountInterval parameter to 3600 at the database level:

```
=> SELECT SET_CONFIG_PARAMETER('AnalyzeRowCountInterval',3600);
    SET_CONFIG_PARAMETER
----------------------------
 Parameter set successfully
(1 row)
```

Note:
You can achieve the same result with ALTER DATABASE:

```
ALTER DATABASE DEFAULT SET PARAMETER AnalyzeRowCountInterval = 3600;
```

Set the MaxSessionUDParameterSize parameter to 2000 at the session level.

```
=> SELECT SET_CONFIG_PARAMETER('MaxSessionUDParameterSize',2000,'SESSION');
    SET_CONFIG_PARAMETER
----------------------------
 Parameter set successfully
(1 row)
```

See Also

- GET_CONFIG_PARAMETER
- Managing Configuration Parameters: VSQL
- CONFIGURATION_PARAMETERS

SET_SPREAD_OPTION

Changes **spread** daemon settings. This function is mainly used to set the timeout before spread assumes a node has gone down.

> **Important:**
> Changing spread settings with SET_SPREAD_OPTION has minor impact on your cluster as it pauses while the new settings are propagated across the entire cluster.

Syntax

```
SET_SPREAD_OPTION( option-name, option-value )
```

Parameters

option-name	String containing the spread daemon setting to change. Currently, this function supports only one option: TokenTimeout. This setting controls how long spread waits for a node to respond to a message before assuming it is lost. See Adjusting Spread Daemon Timeouts For Virtual Environments for more information.
option-value	The new setting for *option-name*.

Example

```
=> SELECT SET_SPREAD_OPTION( 'TokenTimeout', '35000');
NOTICE 9003:  Spread has been notified about the change
                  SET_SPREAD_OPTION
-----------------------------------------------------------
 Spread option 'TokenTimeout' has been set to '35000'.

(1 row)

=> SELECT * FROM V_MONITOR.SPREAD_STATE;
    node_name     | token_timeout
------------------+---------------
 v_vmart_node0001 |         35000
 v_vmart_node0002 |         35000
 v_vmart_node0003 |         35000
```

```
(3 rows);
```

See Also

SHUTDOWN

Shuts down a Vertica database. By default, the shutdown fails if any users are connected. You can check the status of the shutdown operation in the `vertica.log` file.

Tip:
Before calling SHUTDOWN, you can close all current user connections and prevent further connection attempts as follows:

1. Temporarily set configuration parameter MaxClientSessions to 0.
2. Call CLOSE_ALL_SESSIONS to close all non-dbamin connections.

Syntax

```
SHUTDOWN ( [ 'false' | 'true' ] )
```

Parameters

false	Default, returns a message if users are connected and aborts the shutdown.
true	Forces the database to shut down, disallowing further connections.

Privileges

Superuser

Examples

The following command attempts to shut down the database. Because users are connected, the command fails:

```
=> SELECT SHUTDOWN('false');
NOTICE:  Cannot shut down while users are connected
          SHUTDOWN
----------------------------
 Shutdown: aborting shutdown
(1 row)
```

SESSIONS

Directed Queries Functions

The following meta-functions let you batch export query plans as directed queries from one Vertica database, and import those directed queries to another database.

EXPORT_DIRECTED_QUERIES

Generates SQL for creating directed queries from a set of input queries, and writes the SQL to the specified file or to standard output.

Syntax

```
EXPORT_DIRECTED_QUERIES('input-file', '[output-file]')
```

Parameters

input-file	A SQL file that contains one or more input queries. See Input Format below for details on format requirements.
output-file	Specifies where to write the generated SQL for creating directed queries. If the file name already exists, EXPORT_DIRECTED_QUERIES returns with an error. If you supply an empty string, Vertica writes the SQL to standard output. See Output Format below for details.

Privileges

Superuser

Input Format

The input file that you supply to EXPORT_DIRECTED_QUERIES contains one or more input queries. For each input query, you can optionally specify two fields that are used in the generated directed query:

- DirQueryName provides the directed query's unique identifier, a string that conforms to conventions described in Identifiers.
- DirQueryComment specifies a quote-delimited string, up to 128 characters.

You format each input query as follows:

```
--DirQueryName=query-name
--DirQueryComment='comment'
input-query
```

Output Format

EXPORT_DIRECTED_QUERIES generates SQL for creating directed queries, and writes the SQL to the specified file or to standard output. In both cases, output conforms to the following format:

```
/* Query: directed-query-name */
/* Comment: directed-query-comment */
SAVE QUERY input-query;
CREATE DIRECTED QUERY CUSTOM 'directed-query-name'
COMMENT 'directed-query-comment'
OPTVER 'vertica-release-num'
PSDATE 'timestamp'
annotated-query
```

Error Handling

If any errors or warnings occur during EXPORT_DIRECTED_QUERIES execution, it returns with a message like this one:

```
1 queries successfully exported.
1 warning message was generated.
Queries exported to /home/dbadmin/outputQueries.
See error report, /home/dbadmin/outputQueries.err for details.
```

EXPORT_DIRECTED_QUERIES writes all errors and warnings to a file that it creates on the same path as the output file, and uses the output file's base name.

For example:

```
-----------------------------------------------------------------------------------------------
WARNING: Name field not supplied. Using auto-generated name: 'Autoname:2016-04-25 15:03:32.115317.0'
Input Query: SELECT employee_dimension.employee_first_name, employee_dimension.employee_last_name,
employee_dimension.job_title FROM public.employee_dimension WHERE (employee_dimension.employee_city =
'Boston'::varchar(6)) ORDER BY employee_dimension.job_title;
END WARNING
```

Examples

See Batch Query Plan Export in the Administrator's Guide.

See Also

- Batch Query Plan Export
- IMPORT_DIRECTED_QUERIES

IMPORT_DIRECTED_QUERIES

Imports to the database catalog directed queries from a SQL file that was generated by EXPORT_DIRECTED_QUERIES. If no directed queries are specified, Vertica lists all directed queries in the SQL file.

Syntax

```
IMPORT_DIRECTED_QUERIES( 'export-file'[, 'directed-query-name'[,...] ] )
```

Parameters

export-file	A SQL file generated by EXPORT_DIRECTED_QUERIES. When

	you run this file, Vertica creates the specified directed queries in the current database catalog.
directed-query-name	The name of a directed query that is defined in *export-file*. You can specify multiple comma-delimited directed query names. If you omit this parameter, Vertica lists the names of all directed queries in *export-file*.

Privileges

Superuser

Examples

See Importing Directed Queries.

See Also

Batch Query Plan Export

Eon Mode Functions

The following functions are meant to be used in Eon Mode.

ALTER_LOCATION_SIZE

Eon Mode only

Resizes **the depot** on one node, all nodes in a subcluster, or all nodes in the database.

> **Important:**
> If you reduce the size of the depot, Vertica may be forced to evict data from the depot often to make room for more recently-requested data. This behavior leads to more accesses to communal storage causing slower performance and higher costs due to access charges.

Syntax

```
ALTER_LOCATION_SIZE( 'location', '[target]', 'size')
```

Parameters

location	The location to resize. Valid options are: • The literal string `depot`. This argument applies to the node's current depot, no matter what its path. This is usually the argument you want to use, even if you are altering just a single node's depot. • The absolute path of the depot in the Linux filesystem. If you change the depot size on multiple nodes and specify a path, the path must be identical on all affected nodes . By default, this is not the case, as the node's name is typically this path. For example, the default depot path for node 1 in a database named verticadb is `/vertica/data/verticadb/v_verticadb_node0001_depot`.
target	The node or nodes on which to change the depot, one of the following: • Name of an individual node. • Name of a subcluster. The function resizes depots on all nodes of the specified subcluster. • Empty string. The function resizes all depots in the database.
size	Valid only if the storage location usage type is set to DEPOT, specifies the maximum amount of disk space that the depot can allocate from the storage location's file system. You can specify *size* in two ways: • *integer*%: Percentage of storage location disk size. • *integer*{K|M|G|T}: Amount of storage location disk size in kilobytes, megabytes, gigabytes, or terabytes. **Important:** However you specify this value, the depot size cannot be more than 80 percent of disk space of the file system where the depot is stored. If you specify a value that is too large, Vertica warns you of this limitation and automatically changes the value to 80% of the size of the file system.

Privileges

Superuser

Examples

On all database nodes, increase the depot's size to 80 percent of file system.

```
=> SELECT node_name, location_label, location_path, max_size
   FROM storage_locations WHERE location_usage = 'DEPOT' ORDER BY 1;
      node_name       | location_label  |                   location_path                    |  max_
size
----------------------+-----------------+----------------------------------------------------+-------
------
 v_verticadb_node0001 | auto-data-depot | /vertica/data/verticadb/v_verticadb_node0001_depot |
4982631424
 v_verticadb_node0002 | auto-data-depot | /vertica/data/verticadb/v_verticadb_node0002_depot |
4982631424
 v_verticadb_node0003 | auto-data-depot | /vertica/data/verticadb/v_verticadb_node0003_depot |
4982631424

=> SELECT alter_location_size('depot', '','80%');
 alter_location_size
---------------------
 depotSize changed.
(1 row)

=> SELECT node_name, location_label, location_path, max_size
   FROM storage_locations WHERE location_usage = 'DEPOT' ORDER BY 1;
      node_name       | location_label  |                   location_path                    |  max_
size
----------------------+-----------------+----------------------------------------------------+-------
------
 v_verticadb_node0001 | auto-data-depot | /vertica/data/verticadb/v_verticadb_node0001_depot |
6643508224
 v_verticadb_node0002 | auto-data-depot | /vertica/data/verticadb/v_verticadb_node0002_depot |
6643508224
 v_verticadb_node0003 | auto-data-depot | /vertica/data/verticadb/v_verticadb_node0003_depot |
6643508224
```

Change the depot size to 75% of the filesystem size for all nodes in the analytics subcluster.

```
=> SELECT subcluster_name,subclusters.node_name,storage_locations.max_size
       FROM subclusters INNER JOIN storage_locations
       ON subclusters.node_name = storage_locations.node_name
       WHERE storage_locations.location_usage='DEPOT';

BACKGROUND_DEPOT_WARMING

Eon Mode only, Deprecated

Note:
Vertica version 10.0.0 removes support for foreground depot warming. When enabled, depot warming always happens in the background. Because foreground depot warming no longer exists, this function serves no purpose and has been deprecated. Calling it has no effect.

Forces a node that is warming its depot to start processing queries while continuing to warm its depot in the background. Depot warming only occurs when a node is joining the database and is activating its subscriptions. This function only has an effect if:

- The database is running in Eon Mode.
- The node is currently warming its depot.
- The node is warming its depot from communal storage. This is the case when the UseCommunalStorageForBatchDepotWarming configuration parameter is set to the default value of 1. See Eon Mode Parameters for more information about this parameter.

After calling this function, the node warms its depot in the background while taking part in queries.

This function has no effect on a node that is not warming its depot.

Syntax

```
BACKGROUND_DEPOT_WARMING('node-name' [, 'subscription-name'])
```

Arguments

node-name	The name of the node that you want to warm its depot in the background.
subscription-name	The name of a shard that the node subscribes to that you want the node to warm in the background. You can find the names of the shards a node subscribes to in the SHARD_NAME column of the NODE_SUBSCRIPTIONS system table. **Note:** When you supply the name of a specific shard subscription to warm in the background, the node may not immediately begin processing queries. It continues to warm any other shard subscriptions in the foreground if they are not yet warm. The node does not begin taking part in queries until it finishes warming the other subscriptions.

Return Value

A message indicating that the node's warming will continue in the background.

Privileges

The user must be a **superuser** .

Examples

The following example demonstrates having node 6 of the verticadb database warm its depot in the background:

```
=> SELECT BACKGROUND_DEPOT_WARMING('v_verticadb_node0006');
                           BACKGROUND_DEPOT_WARMING
-------------------------------------------------------------------------------
 Depot warming running in background. Check monitoring tables for progress.
(1 row)
```

See Also

CANCEL_DEPOT_WARMING

Eon Mode only

Cancels depot warming on a node. Depot warming only occurs when a node is joining the database and is activating its subscriptions. You can choose to cancel all warming on the node, or cancel the warming of a specific shard's subscription. The node finishes whatever data transfers it is currently carrying out to warm its depot and removes pending warming-related transfers from its queue. It keeps any data it has already loaded into its depot. If you cancel warming for a specific subscription, it stops warming its depot if all of its other subscriptions are warmed. If they aren't warmed, the node continues to warm those other subscriptions.

This function only has an effect if:

- The database is running in Eon Mode.
- The node is currently warming its depot.

Syntax

```
CANCEL_DEPOT_WARMING('node-name' [, 'subscription-name'])
```

Arguments

'*node-name*'	The name of the node that you want to warm its depot in the background.
'*subscription-name*'	The name of a shard that the node subscribes to that you want the node to stop warming. You can find the names of the shards a node subscribes to in the SHARD_NAME column of the NODE_SUBSCRIPTIONS system table.

Return Value

Returns a message indicating warming has been canceled.

Privileges

The user must be a **superuser**.

Usage Considerations

Canceling depot warming can negatively impact the performance of your queries. A node with a cold depot may have to retrieve much of its data from communal storage, which is slower than accessing the depot.

Examples

The following demonstrates canceling the depot warming taking place on node 7:

```
=> SELECT CANCEL_DEPOT_WARMING('v_verticadb_node0007');
   CANCEL_DEPOT_WARMING
-------------------------
 Depot warming cancelled.
(1 row)
```

See Also

CLEAN_COMMUNAL_STORAGE

Eon Mode only

Marks for deletion invalid data in communal storage, often data that leaked due to an event where Vertica cleanup mechanisms failed. Events that require calling this function include:

- Node failure
- Interrupted migration of an Enterprise database to Eon
- Restoring objects from backup

Tip:
It is generally good practice to call CLEAN_COMMUNAL_STORAGE soon after completing an Enterprise-to-Eon migration, and reviving the migrated Eon database.

Syntax

```
CLEAN_COMMUNAL_STORAGE ( ['actually-delete'] )
```

Parameters

actually-delete	BOOLEAN, specifies whether to queue data files for deletion: • `true` (default): Add files to the reaper queue and return immediately. The queued files are removed automatically by the reaper service, or can be removed manually by calling FLUSH_REAPER_QUEUE. • `false`: Report information about extra files but do not queue them for deletion.

Privileges

Superuser

Examples

```
=> SELECT CLEAN_COMMUNAL_STORAGE('true')
CLEAN_COMMUNAL_STORAGE
-----------------------------------------------------------------
CLEAN COMMUNAL STORAGE
Task was canceled.
Total leaked files: 9265
Total size: 4236501526
Files have been queued for deletion.
Check communal_cleanup_records for more information.
(1 row)
```

CLEAR_DATA_DEPOT

Eon Mode only

Deletes the specified depot data. You can clear the data of a single table or all data, from the depot of one subcluster or all subclusters. Clearing depot data has no effect on communal storage.

Note:
Clearing depot data can incur extra processing time for any subsequent queries that require that data and must now fetch it from communal storage.

Syntax

```
CLEAR_DATA_DEPOT( ['[table-name]' [, '[subcluster-name]']] )
```

Parameters

table-name	Name of the table to delete from the target depots. If you omit a table name or supply an empty string, data of all tables is deleted from the target depots.
subcluster-name	Specifies to clear data from the depot of the named subcluster. This parameter optionally qualifies the argument for *table-name*. If you omit this parameter or supply an empty

	string, Vertica clears data from the depots of all database subclusters.

Privileges

Superuser

Examples

Clear all data from all database depots:

```
=> SELECT CLEAR_DATA_DEPOT();
```

Clear data of table `t1` from all depots:

```
=> SELECT CLEAR_DATA_DEPOT('t1');
```

Clear data of table `t22` table from the depot of subcluster `subcluster_1`:

```
=> SELECT CLEAR_DATA_DEPOT('t22', 'subcluster_1');
```

Clear all data from the depot of subcluster `subcluster_1`

```
=> SELECT CLEAR_DATA_DEPOT('', 'subcluster_1');
```

CLEAR_DEPOT_PIN_POLICY

Eon Mode only

Deprecated, superseded by CLEAR_DEPOT_PIN_POLICY_TABLE and CLEAR_DEPOT_PIN_POLICY_PARTITION.

CLEAR_DEPOT_PIN_POLICY_PARTITION

Eon Mode only

Clears a depot pinning policy from the specified table partitions. After the object is unpinned, it can be evicted from the depot by any unpinned or pinned object.

Syntax

```
CLEAR_DEPOT_PIN_POLICY_PARTITION( '[[database.]schema.]table', 'min-range-value', 'max-range-value' [, subcluster ] )
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table	The table with a pinning policy to clear.
min-range-value *max-range-value*	Clears a pinning policy from a range of partition keys in *table*, where *min-range-value* must be ≤ *max-range-value*. If the policy applies to a single partition, *min-range-value* and *max-range-value* must be equal.
subcluster	Clears the specified pinning policy only from the depot in *subcluster*. If you omit this parameter, the policy is cleared from all database depots.

Privileges

Superuser

See Also

- Managing Depot Caching
- CLEAR_DEPOT_PIN_POLICY_TABLE
- SET_DEPOT_PIN_POLICY_PARTITION

CLEAR_DEPOT_PIN_POLICY_TABLE

Eon Mode only

Clears a depot pinning policy from the specified table. After the object is unpinned, it can be evicted from the depot by any unpinned or pinned object.

Syntax

```
CLEAR_DEPOT_PIN_POLICY_TABLE( '[[database.]schema.]table' [, 'subcluster' ] )
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
`table`	Table with a pinning policy to clear.
`subcluster`	Clears the specified pinning policy only from the depot in *`subcluster`*. If you omit this parameter, the policy is cleared from all database depots.

Privileges

Superuser

See Also

CLEAR_FETCH_QUEUE

Eon Mode only

Removes all entries or entries for a specific transaction from the queue of fetch requests of data from the communal storage. You can view the fetch queue by querying the DEPOT_FETCH_QUEUE system table. This function removes all of the queued requests synchronously. It returns after all the fetches have been removed from the queue.

Syntax

```
CLEAR_FETCH_QUEUE([transaction_id])
```

Parameters

transaction_id	The id of the transaction whose fetches will be cleared from the queue. If this value is not specified, all fetches are removed from the fetch queue.

Example

This example clears all of the queued fetches for all transactions.

```
=> SELECT CLEAR_FETCH_QUEUE();

    CLEAR_FETCH_QUEUE

--------------------------

Cleared the fetch queue.

(1 row)
```

This example clears the fetch queue for a specific transaction.

```
=> SELECT node_name,transaction_id FROM depot_fetch_queue;
      node_name       |  transaction_id
----------------------+-------------------
 v_verticadb_node0001 | 45035996273719510
 v_verticadb_node0003 | 45035996273719510
 v_verticadb_node0002 | 45035996273719510
 v_verticadb_node0001 | 45035996273719777
 v_verticadb_node0003 | 45035996273719777
```

```
 v_verticadb_node0002 | 45035996273719777

(6 rows)

=> SELECT clear_fetch_queue(45035996273719510);
    clear_fetch_queue
--------------------------
 Cleared the fetch queue.
(1 row)

=> SELECT node_name,transaction_id from depot_fetch_queue;
      node_name       |  transaction_id
----------------------+-------------------
 v_verticadb_node0001 | 45035996273719777
 v_verticadb_node0003 | 45035996273719777
 v_verticadb_node0002 | 45035996273719777

(3 rows)
```

DEMOTE_SUBCLUSTER_TO_SECONDARY

Eon Mode only

Converts a **primary subcluster** to a **secondary subcluster**.

Vertica will not allow you to demote a primary subcluster if any of the following are true:

- The subcluster contains a **critical node**.
- The subcluster is the only primary subcluster in the database. You must have at least one primary subcluster.
- The **initiator node** is a member of the subcluster you are trying to demote. You must call DEMOTE_SUBCLUSTER_TO_SECONDARY from another subcluster.

Important:
This function call can take a long time to complete because all of the nodes in the subcluster you are demoting will take a global catalog lock, write a checkpoint, and then commit. This global catalog lock can cause other database tasks to fail with errors.

Schedule calls to this function to occur when other database activity is low.

Syntax

```
DEMOTE_SUBCLUSTER_TO_SECONDARY('subcluster-name')
```

Parameters

subcluster-name	The name of the primary subcluster to demote to a secondary subcluster.

Privileges

Superuser

Examples

The following example demotes the subcluster `analytics_cluster` to a secondary subcluster:

```
=> SELECT DISTINCT subcluster_name, is_primary from subclusters;
  subcluster_name  | is_primary
-------------------+------------
 analytics_cluster | t
 load_subcluster   | t
(2 rows)

=> SELECT DEMOTE_SUBCLUSTER_TO_SECONDARY('analytics_cluster');
 DEMOTE_SUBCLUSTER_TO_SECONDARY
--------------------------------
 DEMOTE SUBCLUSTER TO SECONDARY
(1 row)

=> SELECT DISTINCT subcluster_name, is_primary from subclusters;
  subcluster_name  | is_primary
-------------------+------------
 analytics_cluster | f
 load_subcluster   | t
(2 rows)
```

Attempting to demote the subcluster that contains the initiator node results in an error:

```
=> SELECT node_name FROM sessions WHERE user_name = 'dbadmin'
   AND client_type = 'vsql';
      node_name
----------------------
 v_verticadb_node0004
(1 row)

=> SELECT node_name, is_primary FROM subclusters WHERE subcluster_name = 'analytics';
      node_name       | is_primary
----------------------+------------
```

```
 v_verticadb_node0004 | t
 v_verticadb_node0005 | t
 v_verticadb_node0006 | t
(3 rows)

=> SELECT DEMOTE_SUBCLUSTER_TO_SECONDARY('analytics');
ERROR 9204:  Cannot promote or demote subcluster including the initiator node
HINT:  Run this command on another subcluster
```

See Also

FINISH_FETCHING_FILES

Eon Mode only

Fetches all the files that are queued for fetching from the communal storage.

Syntax

```
FINISH_FETCHING_FILES()
```

Privileges

Superuser

Examples

Get all the files queued from communal storage:

```
=> SELECT FINISH_FETCHING_FILES();
      FINISH_FETCHING_FILES
--------------------------------
 Finished fetching all the files
(1 row)
```

See Also

- Eon Mode Concepts

FLUSH_REAPER_QUEUE

Eon Mode only

Deletes all data marked for deletion in the database. Use this function to remove all data marked for deletion before the reaper service deletes disk files.

Syntax

```
FLUSH_REAPER_QUEUE( [sync-catalog] )
```

Parameters

sync-catalog	Specifies to sync metadata in the database catalog on all nodes before the function executes: • `true` (default): Sync the database catalog • `false`: Run without syncing.

Privileges

Superuser

Examples

Remove all files that are marked for deletion:

```
=> SELECT FLUSH_REAPER_QUEUE();
                 FLUSH_REAPER_QUEUE
-----------------------------------------------------
 Sync'd catalog and deleted all files in the reaper queue.
(1 row)
```

See Also

CLEAN_COMMUNAL_STORAGE

MIGRATE_ENTERPRISE_TO_EON

Enterprise Mode only

Migrates an Enterprise database to an Eon Mode database. MIGRATE_ENTERPRISE_TO_EON runs in the foreground; until it returns—either with success or an error—it blocks all operations in the same session on the source Enterprise database. If successful, MIGRATE_ENTERPRISE_TO_EON returns with a list of nodes in the migrated database.

If migration is interrupted before the meta-function returns—for example, the client disconnects, or a network outage occurs—the migration returns an error. In this case, call MIGRATE_ENTERPRISE_TO_EON again to restart migration. For details, see Handling Interrupted Migration.

You can repeat migration multiple times to the same communal storage location—for example, to capture changes that occurred in the source database during the previous migration. For details, see Repeating Migration.

Syntax

```
MIGRATE_ENTERPRISE_TO_EON ( 'communal-storage-location', 'depot-location' [, is-dry-run] )
```

communal-storage-location	URI of communal storage whose scheme conforms to one of the following: • `s3://`: AWS, PureStorage, MinIO • `gs://`: GCP • `webhdfs://`: Communal storage on HDFS
depot-location	Full path of Eon depot location
is-dry-run	Boolean. If set to true, MIGRATE_ENTERPRISE_TO_EON only checks whether the Enterprise source database complies with all migration prerequisites. If the meta-function discovers any compliance issues, it writes these to the migration error log `migrate_enterprise_to_eon_error.log` in the database directory. **Default:** false

Privileges

Superuser

Examples

Migrate an Enterprise database to Eon Mode on AWS:

```
=> SELECT MIGRATE_ENTERPRISE_TO_EON ('s3://verticadbbucket', '/data/depot');
                      migrate_enterprise_to_eon
-----------------------------------------------------------------------
 v_vmart_node0001,v_vmart_node0002,v_vmart_node0003,v_vmart_node0004
(1 row)
```

See Also

Migrating an Enterprise Database to Eon Mode

PROMOTE_SUBCLUSTER_TO_PRIMARY

Eon Mode only

Converts a secondary subcluster to a **primary subcluster**. You cannot use this function to promote the subcluster that contains the **initiator node**. You must call it while connected to a node in another subcluster.

Important:
This function call can take a long time to complete because all of the nodes in the subcluster you are promoting will take a global catalog lock, write a checkpoint, and then commit. This global catalog lock can cause other database tasks to fail with errors.

Schedule calls to this function to occur when other database activity is low.

Syntax

```
PROMOTE_SUBCLUSTER_TO_PRIMARY('subcluster-name')
```

Parameters

subcluster-name	The name of the secondary cluster to promote to a primary subcluster.

Privileges

Superuser

Examples

The following example promotes the subcluster named analytics_cluster to a primary cluster:

```
=> SELECT DISTINCT subcluster_name, is_primary from subclusters;
  subcluster_name  | is_primary
-------------------+------------
 analytics_cluster | f
 load_subcluster   | t
(2 rows)

=> SELECT PROMOTE_SUBCLUSTER_TO_PRIMARY('analytics_cluster');
 PROMOTE_SUBCLUSTER_TO_PRIMARY
-------------------------------
 PROMOTE SUBCLUSTER TO PRIMARY
(1 row)

=> SELECT DISTINCT subcluster_name, is_primary from subclusters;
  subcluster_name  | is_primary
-------------------+------------
 analytics_cluster | t
 load_subcluster   | t
(2 rows)
```

See Also

REBALANCE_SHARDS

Eon Mode only

Rebalances shard assignments in a subcluster or across the entire cluster in Eon Mode. If the current session ends, the operation immediately aborts. The amount of time required to rebalance shards scales in a roughly linear fashion based on the number of objects in your database.

Run REBALANCE_SHARDS after you modify your cluster using ALTER NODE or when you add nodes to a subcluster.

Note:
Vertica automatically rebalances shards in a subcluster when you remove a node. You do not need to run REBALANCE_SHARDS manually in this case.

After you rebalance shards, you will no longer be able to restore objects from a backup taken before the rebalancing. (Full backups are always possible.) After you rebalance, make another full backup so you will be able to restore objects from it in the future.

Syntax

```
REBALANCE_SHARDS(['subcluster-name'])
```

Parameters

subcluster-name	The name of the subcluster where shards will be rebalanced. If you do not supply this parameter, all subclusters in the database rebalance their shards.

Privileges

Superuser

Examples

The following shows that the nodes in the in the newly-added analytics subcluster do not yet have shard subscriptions. It then calls REBALANCE_SHARDS to update the node's subscriptions:

```
=> SELECT subcluster_name, n.node_name, shard_name, subscription_state FROM
   v_catalog.nodes n LEFT JOIN v_catalog.node_subscriptions ns ON (n.node_name
```

```
   = ns.node_name) ORDER BY 1,2,3;

   subcluster_name    |      node_name       | shard_name  | subscription_state
----------------------+----------------------+-------------+--------------------
 analytics_subcluster | v_verticadb_node0004 |             |
 analytics_subcluster | v_verticadb_node0005 |             |
 analytics_subcluster | v_verticadb_node0006 |             |
 default_subcluster   | v_verticadb_node0001 | replica     | ACTIVE
 default_subcluster   | v_verticadb_node0001 | segment0001 | ACTIVE
 default_subcluster   | v_verticadb_node0001 | segment0003 | ACTIVE
 default_subcluster   | v_verticadb_node0002 | replica     | ACTIVE
 default_subcluster   | v_verticadb_node0002 | segment0001 | ACTIVE
 default_subcluster   | v_verticadb_node0002 | segment0002 | ACTIVE
 default_subcluster   | v_verticadb_node0003 | replica     | ACTIVE
 default_subcluster   | v_verticadb_node0003 | segment0002 | ACTIVE
 default_subcluster   | v_verticadb_node0003 | segment0003 | ACTIVE
(12 rows)

=> SELECT REBALANCE_SHARDS('analytics_subcluster');
 REBALANCE_SHARDS
-------------------
 REBALANCED SHARDS
(1 row)

=> SELECT subcluster_name, n.node_name, shard_name, subscription_state FROM
   v_catalog.nodes n LEFT JOIN v_catalog.node_subscriptions ns ON (n.node_name
   = ns.node_name) ORDER BY 1,2,3;

   subcluster_name    |      node_name       | shard_name  | subscription_state
----------------------+----------------------+-------------+--------------------
 analytics_subcluster | v_verticadb_node0004 | replica     | ACTIVE
 analytics_subcluster | v_verticadb_node0004 | segment0001 | ACTIVE
 analytics_subcluster | v_verticadb_node0004 | segment0003 | ACTIVE

SET_DEPOT_PIN_POLICY

Eon Mode only

Deprecated, superseded by SET_DEPOT_PIN_POLICY_TABLE and SET_DEPOT_PIN_POLICY_PARTITION

SET_DEPOT_PIN_POLICY_PARTITION

Eon Mode only

Pins table partitions to a subcluster depot, or all database depots, to reduce its exposure to depot eviction. As a best practice, consider only pinning objects that are most active in DML operations and queries.

Caution:
If too much depot space is claimed by pinned objects, the depot might be unable to handle load operations on unpinned objects. In this case, set configuration parameter UseDepotForWrites to 0, so load operations are routed directly to communal storage for processing. Otherwise, load operations are liable to return with an error.

Syntax

```
SET_DEPOT_PIN_POLICY_PARTITION ( '[[database.]schema.]table', 'min-range-value', 'max-range-value' [,
'subcluster' ] )  )
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table	Table to pin.

min-range-value *max-range-value*	Minimum and maximum value of partition keys in *table* to pin, where *min-range-value* must be ≤ *max-range-value*. To specify a single partition, *min-range-value* and *max-range-value* must be equal. **Note:** If partition pinning policies on the same table specify overlapping key ranges, Vertica collates the partition ranges. For example, if you create two partition policies with key ranges of 1-3 and 2-4, Vertica creates a single pinning policy with a key range of 1-4.
subcluster	Sets this pinning policy only on the depot in *subcluster*. If you omit this parameter, the policy is set on all depots in the database.

Privileges

Superuser

Requirements

The following requirements apply to partition pinning:

- You can pin partitions of a table on a subcluster only if the table itself is not already pinned on the same subcluster.
- Partition groups can be pinned only if all partitions within the group are pinned individually.
- If you alter or remove table partitioning, Vertica drops all partition pin policies for that table. The table's pin policy, if any, is unaffected.

Precedence of Pin Policies

In general, partition management functions that involve two partitioned tables give precedence to the pin policy of the target table, as follows:

Function	Application of pin policy
COPY_PARTITIONS_TO_TABLE	Partition-level pinning is reliable if the source

Function	Application of pin policy
	and target tables have pin policies on the same partition keys. If the two tables have different pin policies, then the partition pin policies of the target table apply.
MOVE_PARTITIONS_TO_TABLE	Partition-level pin policies of the target table apply.
SWAP_PARTITIONS_BETWEEN_TABLES	Partition-level pin policies of the target table apply.

For example, the following statement copies partitions from table `foo` to table `bar`:

```
=> SELECT COPY_PARTITIONS_TO_TABLE('foo', '1', '5', 'bar');
```

In this case, the following logic applies:

- If the two tables have different partition pin policies, then the pin policy of target table `bar` for partition keys 1-5 applies.
- If table `bar` does not exist, then Vertica creates it from table `foo`, and copies `foo`'s policy on partition keys 1-5. Subsequently, if you clear the partition pin policy from either table, it is also cleared from the other.

- CLEAR_DEPOT_PIN_POLICY_PARTITION
- Managing Depot Caching

SET_DEPOT_PIN_POLICY_TABLE

Eon Mode only

Pins a table to a subcluster depot, or all database depots, to reduce its exposure to depot eviction. As a best practice, consider only pinning objects that are most active in DML operations and queries.

Caution:
If too much depot space is claimed by pinned objects, the depot might be unable to handle load operations on unpinned objects. In this case, set

configuration parameter UseDepotForWrites to 0, so load operations are routed directly to communal storage for processing. Otherwise, load operations are liable to return with an error.

Syntax

```
SET_DEPOT_PIN_POLICY_TABLE ( '[[database.]schema.]table' [, 'subcluster' ] )
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
`table`	Table to pin. **Note:** You can pin this table on a subcluster only if partitions of the table are not already pinned on the same subcluster.
`subcluster`	Sets this pinning policy only on the depot in *`subcluster`*. If you omit this parameter, the policy is set on all depots in the database.

Privileges

Superuser

See Also

- CLEAR_DEPOT_PIN_POLICY_TABLE
- Managing Depot Caching

SHUTDOWN_SUBCLUSTER

Eon Mode only

Shuts down a subcluster. This function shuts down the subcluster synchronously, returning when shutdown is complete with the message *Subcluster shutdown*. If the subcluster is already down, the function returns with no error.

Caution:
This function does not test whether the target subcluster is critical (a subcluster whose loss would cause the database to shut down). Using this function to shut down a critical subcluster results in the database shutting down. Always verify that the subcluster you want to shut down is not critical by querying the CRITICAL_SUBCLUSTERS system table before calling this function.

Important:
Stopping a subcluster does not warn you if there are active user sessions connected to the subcluster. This behavior is same as stopping an individual node. Before stopping a subcluster, verify that no users are connected to it.

Syntax

```
SHUTDOWN_SUBCLUSTER('subcluster-name')
```

Arguments

subcluster-name	Name of the subcluster to shut down.

Privileges

Superuser

Examples

The following example demonstrates shutting down the subcluster `analytics`:

```
=> SELECT subcluster_name, node_name, node_state FROM nodes order by 1,2;
  subcluster_name   |      node_name       | node_state
--------------------+----------------------+------------
 analytics          | v_verticadb_node0004 | UP
 analytics          | v_verticadb_node0005 | UP
 analytics          | v_verticadb_node0006 | UP
 default_subcluster | v_verticadb_node0001 | UP
 default_subcluster | v_verticadb_node0002 | UP
 default_subcluster | v_verticadb_node0003 | UP
(6 rows)

=> SELECT SHUTDOWN_SUBCLUSTER('analytics');
WARNING 4539:  Received no response from v_verticadb_node0004 in stop subcluster
WARNING 4539:  Received no response from v_verticadb_node0005 in stop subcluster
WARNING 4539:  Received no response from v_verticadb_node0006 in stop subcluster
 SHUTDOWN_SUBCLUSTER
---------------------
 Subcluster shutdown
(1 row)

=> SELECT subcluster_name, node_name, node_state FROM nodes order by 1,2;
  subcluster_name   |      node_name       | node_state
--------------------+----------------------+------------
 analytics          | v_verticadb_node0004 | DOWN
 analytics          | v_verticadb_node0005 | DOWN
 analytics          | v_verticadb_node0006 | DOWN
 default_subcluster | v_verticadb_node0001 | UP
 default_subcluster | v_verticadb_node0002 | UP
 default_subcluster | v_verticadb_node0003 | UP
(6 rows)
```

Note:
The "WARNING 4539" messages after calling SHUTDOWN_SUBCLUSTER occur because the nodes are in the process of shutting down. They are expected.

See Also

START_REAPING_FILES

Eon Mode only

Starts the disk file deletion in the background as an asynchronous function. By default, this meta-function syncs the catalog before beginning deletion. Disk file deletion is handled in the foreground by FLUSH_REAPER_QUEUE.

Syntax

```
START_REAPING_FILES()
```

Parameters

false	When set to false, the reaper skips the catalog sync before starting the service.

Privileges

Superuser

Examples

Start the reaper service:

```
=> SELECT START_REAPING_FILES();
```

Starts the reaper service and skips the initial catalog sync:

```
=> SELECT START_REAPING_FILES(false);
```

SYNC_CATALOG

Eon Mode only

Synchronizes the catalog to communal storage to enable reviving the current catalog version in the case of an imminent crash. Vertica synchronizes all pending checkpoint and transaction logs to communal storage.

Syntax

```
SYNC_CATALOG( [ 'node-name' ] )
```

Parameters

node-name	The node to synchronize. If you omit this argument, Vertica synchronizes the catalog on all nodes.

Privileges

Superuser

Examples

Synchronize the catalog on all nodes:

```
=> SELECT SYNC_CATALOG();
```

Synchronize the catalog on one node:

```
=> SELECT SYNC_CATALOG( 'node001' );
```

Epoch Management Functions

This section contains the epoch management functions specific to Vertica.

ADVANCE_EPOCH

Manually closes the current epoch and begins a new epoch.

Syntax

```
ADVANCE_EPOCH ( [ integer ] )
```

Parameters

integer	Specifies the number of epochs to advance.

Privileges

Superuser

Notes

This function is primarily maintained for backward compatibility with earlier versions of Vertica.

Example

The following command increments the epoch number by 1:

```
=> SELECT ADVANCE_EPOCH(1);
```

GET_AHM_EPOCH

Returns the number of the **epoch** in which the **Ancient History Mark** is located. Data deleted up to and including the AHM epoch can be purged from physical storage.

Syntax

```
GET_AHM_EPOCH()
```

> **Note:**
> The AHM epoch is 0 (zero) by default (purge is disabled).

Privileges

None

Examples

```
=> SELECT GET_AHM_EPOCH();
    GET_AHM_EPOCH
----------------------
 Current AHM epoch: 0
(1 row)
```

GET_AHM_TIME

Returns a TIMESTAMP value representing the **Ancient History Mark**. Data deleted up to and including the AHM epoch can be purged from physical storage.

Syntax

```
GET_AHM_TIME()
```

Privileges

None

Examples

```
=> SELECT GET_AHM_TIME();
                  GET_AHM_TIME
-------------------------------------------------
 Current AHM Time: 2010-05-13 12:48:10.532332-04
(1 row)
```

GET_CURRENT_EPOCH

The epoch into which data (COPY, INSERT, UPDATE, and DELETE operations) is currently being written.

Returns the number of the current epoch.

Syntax

```
GET_CURRENT_EPOCH()
```

Privileges

None

Examples

```
=> SELECT GET_CURRENT_EPOCH();
 GET_CURRENT_EPOCH
-------------------
               683
(1 row)
```

GET_LAST_GOOD_EPOCH

Returns the **last good epoch** number. If the database has no projections, the function returns an error.

Syntax

```
GET_LAST_GOOD_EPOCH()
```

Privileges

None

Examples

```
=> SELECT GET_LAST_GOOD_EPOCH();
 GET_LAST_GOOD_EPOCH
---------------------
                 682
(1 row)
```

MAKE_AHM_NOW

Sets the **Ancient History Mark** (AHM) to the greatest allowable value. This lets you purge all deleted data.

Caution:
After running this function, you cannot query historical data that precedes the current epoch. Only database administrators should use this function.

MAKE_AHM_NOW performs the following operations:

- Advances the epoch.
- Sets the AHM to the **last good epoch** (LGE) — at least to the epoch that is current when you execute MAKE_AHM_NOW.

Syntax

```
MAKE_AHM_NOW ( [ true ] )
```

Parameters

true	Allows AHM to advance when one of the following conditions is true: • One or more nodes are down. • One projection is being refreshed from another (retentive refresh). In both cases , you must supply this argument to MAKE_AHM_NOW, otherwise Vertica returns an error. If you execute MAKE_AHM_NOW(true) during retentive refresh, Vertica rolls back the refresh operation and advances the AHM. **Caution:** If the function advances AHM beyond the last good epoch of the down nodes, those nodes must recover all data from scratch.

Privileges

Superuser

Setting AHM When Nodes Are Down

If any node in the cluster is down, you must call MAKE_AHM_NOW with an argument of true; otherwise, the function returns an error.

Note:
This requirement applies only to Enterprise mode; in Eon mode, it is ignored.

In the following example, MAKE_AHM_NOW advances the AHM even though a node is down:

```
=> SELECT MAKE_AHM_NOW(true);
WARNING:  Received no response from v_vmartdb_node0002 in get cluster LGE
WARNING:  Received no response from v_vmartdb_node0002 in get cluster LGE
WARNING:  Received no response from v_vmartdb_node0002 in set AHM
         MAKE_AHM_NOW
------------------------------
 AHM set (New AHM Epoch: 684)
(1 row)
```

See Also

- SET_AHM_EPOCH
- SET_AHM_TIME

SET_AHM_EPOCH

Sets the **Ancient History Mark** (AHM) to the specified epoch. This function allows deleted data up to and including the AHM epoch to be purged from physical storage.

SET_AHM_EPOCH is normally used for testing purposes. Instead, consider using SET_AHM_TIME which is easier to use.

Syntax

```
SET_AHM_EPOCH ( epoch, [ true ] )
```

Parameters

epoch	Specifies one of the following: • The number of the epoch in which to set the AHM • Zero (0) (the default) disables PURGE **Important:** The number of the specified epoch must be: • Greater than the current AHM epoch • Less than the current epoch Query the SYSTEM table to view current epoch values relative to the AHM.
true	Allows the AHM to advance when nodes are down. **Caution:** If you advance AHM beyond the **last good**

	epoch of the down nodes, those nodes must recover all data from scratch.

Privileges

Superuser

Setting AHM When Nodes Are Down

If any node in the cluster is down, you must call SET_AHM_EPOCH with an argument of true; otherwise, the function returns an error.

Note:
This requirement applies only to Enterprise mode; in Eon mode, it is ignored.

Examples

The following command sets the AHM to a specified epoch of 12:

```
=> SELECT SET_AHM_EPOCH(12);
```

The following command sets the AHM to a specified epoch of 2 and allows the AHM to advance despite a failed node:

```
=> SELECT SET_AHM_EPOCH(2, true);
```

See Also

- MAKE_AHM_NOW
- SET_AHM_TIME

SET_AHM_TIME

Sets the **Ancient History Mark** (AHM) to the epoch corresponding to the specified time on the initiator node. This function allows historical data up to and including the AHM epoch

to be purged from physical storage. SET_AHM_TIME returns a TIMESTAMPTZ that represents the end point of the AHM epoch.

Syntax

```
SET_AHM_TIME ( time, [ true ] )
```

Parameters

time	A TIMESTAMP/TIMESTAMPTZ value that is automatically converted to the appropriate epoch number.
true	Allows the AHM to advance when nodes are down. **Caution:** If you advance AHM beyond the **last good epoch** of the down nodes, those nodes must recover all data from scratch.

Privileges

Superuser

Setting AHM When Nodes Are Down

If any node in the cluster is down, you must call SET_AHM_TIME with an argument of true; otherwise, the function returns an error.

Note:
This requirement applies only to Enterprise mode; in Eon mode, it is ignored.

Examples

Epochs depend on a configured epoch advancement interval. If an epoch includes a three-minute range of time, the purge operation is accurate only to within minus three minutes of the specified timestamp:

```
=> SELECT SET_AHM_TIME('2008-02-27 18:13');
           set_ahm_time
-----------------------------------
 AHM set to '2008-02-27 18:11:50-05'
(1 row)
```

Note:
The –05 part of the output string is a time zone value, an offset in hours from UTC (Universal Coordinated Time, traditionally known as Greenwich Mean Time, or GMT).

In the previous example, the actual AHM epoch ends at 18:11:50, roughly one minute before the specified timestamp. This is because SET_AHM_TIME selects the epoch that ends at or before the specified timestamp. It does not select the epoch that ends after the specified timestamp because that would purge data deleted as much as three minutes after the AHM.

For example, using only hours and minutes, suppose that epoch 9000 runs from 08:50 to 11:50 and epoch 9001 runs from 11:50 to 15:50. `SET_AHM_TIME('11:51')` chooses epoch 9000 because it ends roughly one minute before the specified timestamp.

In the next example, suppose that a node went down at 11:00:00 AM on January 1st 2017. At noon, you want to advance the AHM to 11:15:00, but the node is still down.

Suppose you try to set the AHM using this command:

```
=> SELECT SET_AHM_TIME('2017-01-01 11:15:00');
```

Then you will receive an error message. Vertica prevents you from moving the AHM past the point where a node went down. Vertica returns this error to prevent the AHM from advancing past the down node's last good epoch. You can force the AHM to advance by supplying the optional second parameter:

```
=> SELECT SET_AHM_TIME('2017-01-01 11:15:00', true);
```

However, if you force the AHM past the last good epoch, the failed node will have to recover from scratch.

Flex Table Functions

This section contains helper functions for use in working with flex tables and flexible columns for complex types. You can use these functions with flex tables, their associated *flex_table*_keys tables and *flex_table*_view views, and flexible columns in external tables. These functions do not apply to other tables.

For more information about flex tables, see Using Flex Tables. For more information about flexible columns for complex types, see Using Flexible Complex Types.

BUILD_FLEXTABLE_VIEW

Creates, or re-creates, a view for a default or user-defined _keys table, ignoring any empty keys.

> **Note:**
> If the length of a key exceeds 65,000, Vertica truncates the key.

Syntax

```
BUILD_FLEXTABLE_VIEW('[[database.]schema.]flex-table' [ [,'view-name'] [,'user-keys-table'] ])
```

Arguments

[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
flex-table	The flex table name. By default, this function builds or rebuilds a

	view for the input table with the current contents of the associated `flex_table_keys` table.
view-name	A custom view name. Use this option to build a new view for *flex-table* with the name you specify.
user-keys-table	Specifies a keys table from which to create the view. Use this option if you created a custom `user_keys` table from the flex table map data, rather than from the default `flex_table_keys` table. The function builds a view from the keys in `user_keys` table, rather than from the `flex_table_keys` table.

Examples

The following examples show how to call `build_flextable_view` with 1, 2, or 3 arguments.

Creating a Default View

To create, or re-create, a default view:

1. Call the function with an input flex table, `darkdata`:

```
=> SELECT BUILD_FLEXTABLE_VIEW('darkdata');
                  build_flextable_view
-----------------------------------------------------
 The view public.darkdata_view is ready for querying
(1 row)
```

   The function creates a view with the default name (`darkdata_view`) from the `darkdata_keys` table.

2. Query a key name (`user.id`) from the new or updated view:

```
=> SELECT "user.id" FROM darkdata_view;
  user.id
-----------
 340857907
 727774963
 390498773
 288187825
 164464905
 125434448
 601328899
 352494946
(12 rows)
```

Creating a Custom Name View

To create, or re-create, a view with a custom name:

1. Call the function with two arguments, an input flex table, `darkdata`, and the name of the view to create, `dd_view`:

```
=> SELECT BUILD_FLEXTABLE_VIEW('darkdata', 'dd_view');
            build_flextable_view
-----------------------------------------------
 The view public.dd_view is ready for querying
(1 row)
```

2. Query a key name (`user.lang`) from the new or updated view (`dd_view`):

```
=> SELECT "user.lang" FROM dd_view;
 user.lang
-----------
 tr
 en
 es
 en
 en
 it
 es
 en
(12 rows)
```

Creating a View from a Custom Keys Table

To create a view from a custom `_keys` table with `build_flextable_view`, the custom table must have the same schema and table definition as the default table (`darkdata_keys`). Create a custom keys table, using any of these three approaches:

1. Create a columnar table with all keys from the default keys table for a flex table (`darkdata_keys`):

```
=> CREATE TABLE new_darkdata_keys AS SELECT * FROMdarkdata_keys;
CREATE TABLE
```

2. Create a columnar table without content (`LIMIT 0`) from the default keys table for a flex table (`darkdata_keys`):

```
=> CREATE TABLE new_darkdata_keys AS SELECT * FROM darkdata_keys LIMIT 0;
CREATE TABLE
kdb=> SELECT * FROM new_darkdata_keys;
 key_name | frequency | data_type_guess
----------+-----------+-----------------
(0 rows)
```

3. Create a columnar table without content (`LIMIT 0`) from the default keys table, and insert two values ('`user.lang`', '`user.name`') into the `key_name` column:

```
=> CREATE TABLE dd_keys AS SELECT * FROM darkdata_keys limit 0;
CREATE TABLE
=> INSERT INTO dd_keys (key_name) values ('user.lang');
 OUTPUT
--------
      1
(1 row)
=> INSERT INTO dd_keys (key_name) values ('user.name');
 OUTPUT
--------
      1
(1 row)
=> SELECT * FROM dd_keys;
 key_name  | frequency | data_type_guess
-----------+-----------+-----------------
 user.lang |           |
 user.name |           |
(2 rows)
```

4. After creating a custom keys table, call `build_flextable_view` with all arguments (an input flex table, the new view name, the custom keys table):

```
=> SELECT BUILD_FLEXTABLE_VIEW('darkdata', 'dd_view', 'dd_keys');
            build_flextable_view
-----------------------------------------------
 The view public.dd_view is ready for querying
(1 row)
```

5. Query the new view:

```
=> SELECT * FROM dd_view;
```

See Also

- COMPUTE_FLEXTABLE_KEYS
- COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW
- MATERIALIZE_FLEXTABLE_COLUMNS
- RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW

COMPUTE_FLEXTABLE_KEYS

Computes the virtual columns (keys and values) from the flex table VMap data. Use this function to compute keys without creating an associated table view. To also build a view, use COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW.

Note:
If the length of a key exceeds 65,000, Vertica truncates the key.

The function stores its results in the associated flex `_keys` table, which has the following columns:

- `key_name`
- `frequency`
- `data_type_guess`

For more information, see Computing Flex Table Keys.

Syntax

```
COMPUTE_FLEXTABLE_KEYS('[[database.]schema.]flex-table')
```

Arguments

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
flex-table	Name of a flex table.

Using Data Type Guessing

The results of the flex _keys table `data_type_guess` column depend on the `EnableBetterFlexTypeGuessing` configuration parameter. By default, the parameter is 1 (ON). This setting results in the function returning all non-string keys in the `data_type_guess` column as one of the following types (and others listed in SQL Data Types):

- BOOLEAN
- INTEGER
- FLOAT
- TIMESTAMP
- DATE

Setting the configuration parameter to 0 (OFF), results in the function returning only string types ([LONG]VARCHAR) or ([LONG] VARBINARY) for all values in the data_type_guess column of the flex _keys table .

Assigning Flex Key Data Types

Use the sample CSV data in this section to compare the results of using or not using the EnableBetterFlexTypeGuessing configuration parameter. When the parameter is ON, the function determines key non-string data types in your map data more accurately. The default for the parameter is 1 (ON).

```
Year,Quarter,Region,Species,Grade,Pond Value,Number of Quotes,Available
2015,1,2 - Northwest Oregon & Willamette,Douglas-fir,1P,$615.12 ,12,No
2015,1,2 - Northwest Oregon & Willamette,Douglas-fir,SM,$610.78 ,12,Yes
2015,1,2 - Northwest Oregon & Willamette,Douglas-fir,2S,$596.00 ,20,Yes
2015,1,2 - Northwest Oregon & Willamette,Hemlock,P,$520.00 ,6,Yes
2015,1,2 - Northwest Oregon & Willamette,Hemlock,SM,$510.00 ,6,No
2015,1,2 - Northwest Oregon & Willamette,Hemlock,2S,$490.00 ,14,No
```

To compare the data type assignment results, complete the following steps:

1. Save the CSV data file (here, as trees.csv).
2. Create a flex table (trees) and load trees.csv using the fcsvparser:

```
=> CREATE FLEX TABLE trees();
=> COPY trees FROM '/home/dbadmin/tempdat/trees.csv' PARSER fcsvparser();
```

3. Use COMPUTE_FLEXTABLE_KEYS with the trees flex table.

```
=> SELECT COMPUTE_FLEXTABLE_KEYS('trees');
            COMPUTE_FLEXTABLE_KEYS
-----------------------------------------------
 Please see public.trees_keys for updated keys
(1 row)
```

4. Query the trees_keys table output.:

```
=> SELECT * FROM trees_keys;
     key_name     | frequency | data_type_guess
------------------+-----------+-----------------
 Year             |         6 | Integer
 Quarter          |         6 | Integer
 Region           |         6 | Varchar(66)
 Available        |         6 | Boolean
 Number of Quotes |         6 | Integer
 Grade            |         6 | Varchar(20)
 Species          |         6 | Varchar(22)
 Pond Value       |         6 | Numeric(8,3)
(8 rows)
```

5. Set the EnableBetterFlexTypeGuessing parameter to 0 (OFF).
6. Call COMPUTE_FLEXTABLE_KEYS with the trees flex table again.
7. Query the trees_keys table to compare the data_type_guess values with the previous results. Without the configuration parameter set, all of the non-string data types are VARCHARS of various lengths:

```
=> SELECT * FROM trees_keys;
    key_name     | frequency | data_type_guess
-----------------+-----------+-----------------
 Year            |         6 | varchar(20)
 Quarter         |         6 | varchar(20)
 Region          |         6 | varchar(66)
 Available       |         6 | varchar(20)
 Grade           |         6 | varchar(20)
 Number of Quotes |         6 | varchar(20)
 Pond Value      |         6 | varchar(20)
 Species         |         6 | varchar(22)
(8 rows)
```

8. To maintain accurate results for non-string data types, set the EnableBetterFlexTypeGuessing parameter back to 1 (ON).

For more information about setting the EnableBetterFlexTypeGuessing configuration parameter, see Setting Flex Table Configuration Parameters.

- COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW
- MATERIALIZE_FLEXTABLE_COLUMNS
- RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW

COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW

Combines the functionality of BUILD_FLEXTABLE_VIEW and COMPUTE_FLEXTABLE_KEYS to compute virtual columns (keys) from the VMap data of a flex table and construct a view. Creating a view with this function ignores empty keys. If you do not need to perform both operations together, use one of the single-operation functions instead.

Note:
If the length of a key exceeds 65,000, Vertica truncates the key.

Syntax

```
COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW('flex-table')
```

Arguments

flex-table	Name of a flex table

Examples

This example shows how to call the function for the darkdata flex table.

```
=> SELECT COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW('darkdata');
               compute_flextable_keys_and_build_view
-------------------------------------------------------------------------
 Please see public.darkdata_keys for updated keys
The view public.darkdata_view is ready for querying
(1 row)
```

See Also

- BUILD_FLEXTABLE_VIEW
- COMPUTE_FLEXTABLE_KEYS
- MATERIALIZE_FLEXTABLE_COLUMNS
- RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW

EMPTYMAP

Constructs a new VMap with one row but without keys or data. Use this transform function to populate a map without using a flex parser. Instead, you use either from SQL queries or from map data present elsewhere in the database.

Syntax

```
EMPTYMAP()
```

Arguments

None

Examples

Create an Empty Map

```
=> SELECT EMPTYMAP();
                              emptymap
-------------------------------------------------------------------
 \001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000
(1 row)
```

Create an Empty Map from an Existing Flex Table

If you create an empty map from an existing flex table, the new map has the same number of rows as the table from which it was created.

This example shows the result if you create an empty map from the `darkdata` table, which has 12 rows of JSON data:

```
=> SELECT EMPTYMAP() FROM darkdata;
                              emptymap
-------------------------------------------------------------------
 \001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000
 \001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000
 \001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000
 \001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000
 \001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000
 \001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000
 \001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000
 \001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000
 \001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000
 \001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000
 \001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000
 \001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000
(12 rows)
```

MAPAGGREGATE

Returns a `LONG VARBINARY VMap` with keys and value pairs supplied from two VARCHAR input columns of an existing columnar table. Using this function requires specifying an `over()` clause for the source table.

Syntax

`MAPAGGREGATE(`*`source_column1, source_column2`*`)`

Arguments

`source_column1`	Table column with values to use as the keys of the key/value pair of the returned `VMap` data.
`source_column2`	Table column with values to use as the values in the key/value pair of the returned `VMap` data.

Examples

This example creates a columnar table `btest`, with two `VARCHAR` columns, named `keys` and `values`, and adds three sets of values:

```
=> CREATE TABLE btest(keys varchar(10), values varchar(10));
CREATE TABLE
=>  COPY btest FROM stdin;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> one|1
>> two|2
>> three|3
```

```
>> \.
```

After populating the `btest` table, call `mapaggregate()`, using the the `over (PARTITION BEST)` clause. This call returns the `raw_map` data:

```
=> SELECT MAPAGGREGATE(keys, values) OVER(PARTITION BEST) FROM btest;
                raw_map
-----------------------------------------------------------------------------------------------------------
-----------------------------------------------------------------------------
 \001\000\000\000\023\000\000\000\003\000\000\000\020\000\000\000\021\000\000\000\022\000\000\000132
\003\000\000\000\020\000\000\000\023\000\000\000\030\000\000\000onethreetwo
(1 row)
```

The next example illustrates using MAPTOSTRING() with the returned `raw_map` from `mapaggregate()` to see the values:

```
=> SELECT MAPTOSTRING(raw_map) FROM (SELECT MAPAGGREGATE(keys, values) OVER(PARTITION BEST) FROM
btest) bit;
                maptostring
-------------------------------------------
 {
        "one":  "1",
        "three":        "3",
        "two":  "2"
 }
(1 row)
```

- MAPVERSION

MAPCONTAINSKEY

Determines whether a VMap contains a virtual column (key). This scalar function returns true (`t`), if the virtual column exists, or false (`f`) if it does not. Determining that a key exists before calling `maplookup()` lets you distinguish between NULL returns. The `maplookup()` function uses for both a non-existent key and an existing key with a NULL value.

Syntax

`MAPCONTAINSKEY(`*`VMap_data`*`, 'virtual_column_name')`

Arguments

`VMap_data`	Any VMap data. The VMap can exist as: • The `__raw__` column of a flex table • Data returned from a map function such as `maplookup()` • Other database content
`virtual_column_name`	The name of the key to check.

Examples

This example shows how to use the `mapcontainskey()` functions with `maplookup()`. View the results returned from both functions. Check whether the empty fields that `maplookup()` returns indicate a `NULL` value for the row (t) or no value (`f`):

You can use mapcontainskey( ) to determine that a key exists before calling maplookup(). The maplookup() function uses both NULL returns and existing keys with NULL values to indicate a non-existent key.

```
=> SELECT MAPLOOKUP(__raw__, 'user.location'), MAPCONTAINSKEY(__raw__, 'user.location')
FROM darkdata ORDER BY 1;
 maplookup | mapcontainskey
-----------+----------------
           | t
           | t
           | t
```

```
          | t
 Chile    | t
 Narnia   | t
 Uptown.. | t
 chicago  | t
          | f
          | f
          | f
          | f
(12 rows)
```

- MAPVERSION

MAPCONTAINSVALUE

Determines whether a VMap contains a specific value. Use this scalar function to return true (`t`), if the value exists, or false (`f`), if it does not.

Syntax

`MAPCONTAINSVALUE(`*`VMap_data`*`, 'virtual_column_value')`

Arguments

`VMap_data`	Any VMap data. The VMap can exist as: • The `__raw__` column of a flex table • Data returned from a map function such as

	`maplookup()` • Other database content
`virtual_column_value`	The value whose existence you want to confirm.

Examples

This example shows how to use `mapcontainsvalue()` to determine whether or not a virtual column contains a particular value. Create a flex table (`ftest`), and populate it with some virtual columns and values. Name both virtual columns `one`:

```
=> CREATE FLEX TABLE ftest();
CREATE TABLE
=> copy ftest from stdin parser fjsonparser();
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> {"one":1, "two":2}
>> {"one":"one","2":"2"}
>> \.
```

Call `mapcontainsvalue()` on the `ftest` map data. The query returns false (`f`) for the first virtual column, and true (`t`) for the second , which contains the value `one`:

```
=> SELECT MAPCONTAINSVALUE(__raw__, 'one') FROM ftest;
mapcontainsvalue
------------------
f
t
(2 rows)
```

MAPDELIMITEDEXTRACTOR

Extracts data with a delimiter character, and other optional arguments, returning a single VMap value. The `USING PARAMETERS` phrase specifies optional parameters for the function.

Syntax

```
MAPDELIMITEDEXTRACTOR (record_value USING PARAMETERS delimiter=character
                      [,header_names= value,]
                      [trim= value,]
                      [treat_empty_val_as_null = value,])
```

Arguments

`record_value`	VARCHAR	String containing a JSON or delimited format record on which the expression will be applied.

Parameters

`delimiter`	VARCHAR	Single delimiter character. Default value: |
`header_names`	VARCHAR	[Optional] Specifies header names for columns. Default value: `ucol`*`n`* Where *n* is the column offset number, starting with `0` for the first column. The function uses default values if you do not specify values for the `header_names` parameter.
`trim`	BOOLEAN	[Optional] Trims white space from header names and field values. Default value: `true`

treat_empty_val_as_null	BOOLEAN	[Optional] Specifies that empty fields become NULLs, rather than empty strings (''). **Default value:** true

Examples

These examples use a short set of delimited data:

```
Name|CITY|New city|State|zip
Tom|BOSTON|boston|MA|01
Eric|Burlington|BURLINGTON|MA|02
Jamie|cambridge|CAMBRIDGE|MA|08
```

To begin, save this data as delim.dat.

1. Create a flex table, dflex:

```
=> CREATE FLEX TABLE dflex();
CREATE TABLE
```

2. Use COPY to load the delim.dat file. Use the flex tables fdelimitedparser with the header='false' option:

```
=> COPY dflex FROM '/home/release/kmm/flextables/delim.dat' parser fdelimitedparser
(header='false');
 Rows Loaded
-------------
           4
(1 row)
```

3. Create a columnar table, dtab, with an identity id column, a delim column, and a column to hold a VMap, named vmap:

```
=> CREATE TABLE dtab (id IDENTITY(1,1), delim varchar(128), vmap long varbinary(512));
CREATE TABLE
```

4. Use COPY to load the delim.dat file into the dtab table. For the mapdelimitedextractor function, add a header row with USING PARAMETERS header_names= option to specify the header row for the sample data, along with delimiter '!' :

```
=> COPY dtab(delim, vmap AS MAPDELIMITEDEXTRACTOR (delim
   USING PARAMETERS header_names='Name|CITY|New City|State|Zip')) FROM
'/home/dbadmin/data/delim.dat'
DELIMITER '!';
```

```
 Rows Loaded
-------------
           4
(1 row)
```

5. Use `maptostring` for the flex table `dflex` to view the `__raw__` column contents. Notice the default header names in use (`ucol0` – `ucol4`), since you specified `header='false'` when you loaded the flex table:

```
=> SELECT MAPTOSTRING(__raw__) FROM dflex limit 10;
                               maptostring
-------------------------------------------------------------------------------------
 {
   "ucol0" : "Jamie",
   "ucol1" : "cambridge",
   "ucol2" : "CAMBRIDGE",
   "ucol3" : "MA",
   "ucol4" : "08"
}

 {
   "ucol0" : "Name",
   "ucol1" : "CITY",
   "ucol2" : "New city",
   "ucol3" : "State",
   "ucol4" : "zip"
}

 {
   "ucol0" : "Tom",
   "ucol1" : "BOSTON",
   "ucol2" : "boston",
   "ucol3" : "MA",
   "ucol4" : "01"
}

 {
   "ucol0" : "Eric",
   "ucol1" : "Burlington",
   "ucol2" : "BURLINGTON",
   "ucol3" : "MA",
   "ucol4" : "02"
}

(4 rows)
```

6. Use `maptostring` again, this time with the `dtab` table's `vmap` column. Compare the results of this output to those for the flex table. Note that `maptostring` returns the `header_name` parameter values you specified when you loaded the data:

```
=> SELECT MAPTOSTRING(vmap) FROM dtab;
                                                          maptostring
-------------------------------------------------------------------------------------------------
-----------------------------
 {
```

```
   "CITY" : "CITY",
   "Name" : "Name",
   "New City" : "New city",
   "State" : "State",
   "Zip" : "zip"
}

 {
   "CITY" : "BOSTON",
   "Name" : "Tom",
   "New City" : "boston",
   "State" : "MA",
   "Zip" : "02121"
}

 {
   "CITY" : "Burlington",
   "Name" : "Eric",
   "New City" : "BURLINGTON",
   "State" : "MA",
   "Zip" : "02482"
}

 {
   "CITY" : "cambridge",
   "Name" : "Jamie",
   "New City" : "CAMBRIDGE",
   "State" : "MA",
   "Zip" : "02811"
}

(4 rows)
```

7. Query the `delim` column to view the contents differently:

```
=> SELECT delim FROM dtab;
                delim
-------------------------------------
 Name|CITY|New city|State|zip
 Tom|BOSTON|boston|MA|02121
 Eric|Burlington|BURLINGTON|MA|02482
 Jamie|cambridge|CAMBRIDGE|MA|02811
(4 rows)
```

- MAPREGEXEXTRACTOR

MAPITEMS

Returns information about items in a VMap. Use this transform function with one or more optional arguments to access polystructured values within the VMap data. This function requires an `OVER()` clause.

Syntax

`MAPITEMS(`*`VMap_data`* `[, passthrough_arg [,…] ])`

Arguments

VMap_data	Any VMap data. The VMap can exist as: • The `__raw__` column of a flex table • Data returned from a map function such as `maplookup()` • Other database content
max_key_length	In a `__raw__` column, determines the maximum length of keys that the function can return. Keys that are longer than *max_key_length* cause the query to fail. Defaults to the smaller of VMap column length and 65K.
max_value_length	In a `__raw__` column, determines the maximum length of values the function can return. Values that are larger than *max_value_length* cause the query to fail. Defaults to the smaller of VMap column length and 65K.
passthrough_arg	[Optional] One or more arguments indicating keys within the map data in `VMap_data`.

Examples

The following examples illustrate using `MAPITEMS()`with the `over(PARTITION BEST)` clause.

This example determines the number of virtual columns in the map data using a flex table, labeled `darkmountain`. Query using the `count()` function to return the number of virtual columns in the map data:

```
=> SELECT COUNT(keys) FROM (SELECT MAPITEMS(darkmountain.__raw__) OVER(PARTITION BEST) FROM
 darkmountain) AS a;
 count
-------
    19
(1 row)
```

The next example determines what items exist in the map data:

```
=> SELECT * FROM (SELECT MAPITEMS(darkmountain.__raw__) OVER(PARTITION BEST) FRPM darkmountain) AS a;
    keys     |    values
-------------+---------------
 hike_safety | 50.6
 name        | Mt Washington
 type        | mountain
 height      | 17000
 hike_safety | 12.2
 name        | Denali
 type        | mountain
 height      | 29029
 hike_safety | 34.1
 name        | Everest
 type        | mountain
 height      | 14000
 hike_safety | 22.8
 name        | Kilimanjaro
 type        | mountain
 height      | 29029
 hike_safety | 15.4
 name        | Mt St Helens
 type        | volcano
(19 rows)
```

The following example shows how to restrict the length of returned values to 100000:

```
=> SELECT LENGTH(keys), LENGTH(values) FROM (SELECT MAPITEMS(__raw__ USING PARAMETERS max_value_
length=100000) OVER() FROM t1) x;
 LENGTH | LENGTH
--------+--------
      9 | 98899
(1 row)
```

Directly Query a Key Value in a VMap

Review the following JSON input file, `simple.json`. In particular, notice the array called `three_Array`, and its four values:

```
{
  "one": "one",
  "two": 2,
```

```
  "three_Array":
  [
    "three_One",
    "three_Two",
    3,
    "three_Four"
  ],
  "four": 4,
  "five_Map":
  {
    "five_One": 51,
    "five_Two": "Fifty-two",
    "five_Three": "fifty three",
    "five_Four": 54,
    "five_Five": "5 x 5"
  },
  "six": 6
}
```

1. Create a flex table, mapper:

```
=> CREATE FLEX TABLE mapper();
CREATE TABLE
```

1. Load `simple.json` into the flex table mapper:

```
=> COPY mapper FROM '/home/dbadmin/data/simple.json' parser fjsonparser (flatten_
arrays=false,
flatten_maps=false);
 Rows Loaded
-------------
           1
(1 row)
```

2. Call MAPKEYS on the flex table's `__raw__` column to see the flex table's keys, but not the key submaps. The return values indicate `three_Array` as one of the virtual columns:

```
=> SELECT MAPKEYS(__raw__) OVER() FROM mapper;
    keys
-------------
 five_Map
 four
 one
 six
 three_Array
 two
(6 rows)
```

3. Call `mapitems` on flex table `mapper` with `three_Array` as a pass-through argument to the function. The call returns these array values:

```
=> SELECT __identity__, MAPTIEMS(three_Array) OVER(PARTITION BY __identity__) FROM mapper;
 __identity__ | keys |   values
--------------+------+------------
```

```
            1 | 0    | three_One
            1 | 1    | three_Two
            1 | 2    | 3
            1 | 3    | three_Four
(4 rows)
```

MAPJSONEXTRACTOR

Extracts content of repeated JSON data objects, including nested maps, or data with an outer list of JSON elements. The `USING PARAMETERS` phrase specifies optional parameters for the function. Empty input does not generate a Warning or Error.

Note: The function fails if the output size of the function is greater than 65000.

Syntax

```
MAPJSONEXTRACTOR (record_value [USING PARAMETERS [flatten_maps=value]
                      [,flatten_arrays = value,]
                      [reject_on_duplicate = value,]
                      [reject_on_empty_key = value,]
                      [omit_empty_keys = value,]
                      [start_point = value]])
```

Arguments

record_value	VARCHAR	String containing a JSON or delimited format record on which the expression will be applied.

Parameters

flatten_maps	BOOLEAN	[Optional] Flattens sub-maps within the JSON data, separating map levels with a period (.). **Default value:** true
flatten_arrays	BOOLEAN	[Optional] Converts lists to sub-maps with integer keys. Lists are not flattened by default. **Default value:** false
reject_on_duplicate	BOOLEAN	[Optional] Specifies whether to ignore duplicate records (false), or to reject duplicates (true). In either case, the load continues. **Default value:** false
reject_on_empty_key	BOOLEAN	[Optional] Rejects any row containing a key without a value (reject_on_empty_key=true). **Default value:** false
omit_empty_keys	BOOLEAN	[Optional] Omits any key from the load data that does not have a value (omit_empty_keys=true). **Default value:** false
start_point	CHAR	[Optional] Specifies the name of a key in the JSON load data at which to begin parsing. The parser ignores all data before the start_point value.The parser processes data after the first instance, and up to the second, ignoring any remaining data. **Default value:** none

Examples

These examples use the following sample JSON data:

```
{ "id": "5001", "type": "None" }
{ "id": "5002", "type": "Glazed" }
{ "id": "5005", "type": "Sugar" }
{ "id": "5007", "type": "Powdered Sugar" }
{ "id": "5004", "type": "Maple" }
```

Save this example data as `bake_single.json`, and load that file.

1. Create a flex table, `flexjson`:

   ```
   => CREATE FLEX TABLE flexjson();
   CREATE TABLE
   ```

2. Use COPY to load the `bake_single.json` file with the `fjsonparser` parser:

   ```
   => COPY flexjson FROM '/home/dbadmin/data/bake_single.json' parser fjsonparser();
    Rows Loaded
   -------------
              5
   (1 row)
   ```

3. Create a columnar table, `coljson`, with an identity column (`id`), a `json` column, and a column to hold a VMap, called `vmap`:

   ```
   => CREATE TABLE coljson(id IDENTITY(1,1), json varchar(128), vmap long varbinary(10000));
   CREATE TABLE
   ```

4. Use COPY to load the `bake_single.json` file into the `coljson` table, using the `mapjsonextractor` function:

   ```
   => COPY coljson (json, vmap AS MapJSONExtractor(json)) FROM '/home/dbadmin/data/bake_
   single.json';
    Rows Loaded
   -------------
              5
   (1 row)
   ```

5. Use the `maptostring` function for the flex table `flexjson` to output the `__raw__` column contents as strings:

   ```
   => SELECT MAPTOSTRING(__raw__) FROM flexjson limit 5;
                       maptostring
   ------------------------------------------------------
    {
   ```

```
   "id" : "5001",
   "type" : "None"
}

 {
   "id" : "5002",
   "type" : "Glazed"
}

 {
   "id" : "5005",
   "type" : "Sugar"
}

 {
   "id" : "5007",
   "type" : "Powdered Sugar"
}

 {
   "id" : "5004",
   "type" : "Maple"
}

(5 rows)
```

6. Use the `maptostring` function again, this time with the `coljson` table's `vmap` column and compare the results. The element order differs:

```
=> SELECT MAPTOSTRING(vmap) FROM coljson limit 5;
                     maptostring
-----------------------------------------------------
 {
   "id" : "5001",
   "type" : "None"
}

 {
   "id" : "5002",
   "type" : "Glazed"
}

 {
   "id" : "5004",
   "type" : "Maple"
}

 {
   "id" : "5005",
   "type" : "Sugar"
}

 {
   "id" : "5007",
   "type" : "Powdered Sugar"
}

(5 rows)
```

- MAPDELIMITEDEXTRACTOR
- MAPREGEXEXTRACTOR

MAPKEYS

Returns the virtual columns (and values) present in any VMap data. This transform function requires an `over(PARTITION BEST)` clause.

Syntax

`MAPKEYS(`*`VMap_data`*`)`

Arguments

`VMap_data`	Any VMap data. The VMap can exist as: • The `__raw__` column of a flex table • Data returned from a map function such as `maplookup()` • Other database content
`max_key_length`	In a `__raw__` column, specifies the maximum length of keys that the function can return. Keys that are longer than *`max_key_length`* cause the query to fail. Defaults to the smaller of VMap column length and 65K.

Examples

Determine Number of Virtual Columns in Map Data

This example shows how to create a query, using an `over(PARTITION BEST)` clause with a flex table, `darkdata` to find the number of virtual column in the map data. The table is populated with JSON tweet data.

```
=> SELECT COUNT(keys) FROM (SELECT MAPKEYS(darkdata.__raw__) OVER(PARTITION BEST) FROM darkdata) AS
a;
```

```
 count
-------
   550
(1 row)
```

Query Ordered List of All Virtual Columns in the Map

This example shows a snippet of the return data when you query an ordered list of all virtual columns in the map data:

```
=> SELECT * FROM (SELECT MAPKEYS(darkdata.__raw__) OVER(PARTITION BEST) FROM darkdata) AS a;
    keys
-------------------------------------
 contributors
 coordinates
 created_ at

MAPKEYSINFO

Returns virtual column information from a given map. This transform function requires an `over(PARTITION BEST)` clause.

Syntax

`MAPKEYSINFO(`*`VMap_data`*`)`

Arguments

`VMap_data`	Any VMap data. The VMap can exist as: • The `__raw__` column of a flex table • Data returned from a map function such as `maplookup()` • Other database content
`max_key_length`	In a `__raw__` column, determines the maximum length of keys that the function can return. Keys that are longer than *`max_key_length`* cause the query to fail. Defaults to the smaller of VMap column length and 65K.

Returns

This function is a superset of the MAPKEYS() function. It returns the following information about each virtual column:

Column	Description
keys	The virtual column names in the raw data.
length	The data length of the key name, which can differ from the actual string length.
type_oid	The OID type into which the value should be converted. Currently, the type is always 116 for a LONG VARCHAR, or 199 for a nested map that is stored as a LONG VARBINARY.
row_num	The number of rows in which the key was found.
field_num	The field number in which the key exists.

Examples

This example shows a snippet of the return data you receive if you query an ordered list of all virtual columns in the map data:

```
=> SELECT * FROM (SELECT MAPKEYSINFO(darkdata.__raw__) OVER(PARTITION BEST) FROM darkdata) AS a;
                          keys                          | length | type_oid | row_num | field_num
--------------------------------------------------------+--------+----------+---------+-----------
 contributors                                           |      0 |      116 |       1 |         0
 coordinates                                            |      0 |      116 |       1 |         1
 created_at                                             |     30 |      116 |       1 |         2
 entities.hashtags                                      |     93 |      199 |       1 |         3
 entities.media                                         |    772 |      199 |       1 |         4
 entities.urls                                          |     16 |      199 |       1 |         5
 entities.user_mentions                                 |     16 |      199 |       1 |         6

MAPLOOKUP

Returns single-key values from VMAP data. This scalar function returns a `LONG VARCHAR`, with values, or `NULL` if the virtual column does not have a value.

Using `maplookup` is case insensitive to virtual column names. To avoid loading same-name values, set the `fjsonparser` parser `reject_on_duplicate` parameter to `true` when data loading.

You can control the behavior for non-scalar values in a VMAP (like arrays), when loading data with the `fjsonparser` or `favroparser` parsers and its `flatten-arrays` argument. See Loading JSON Data and the FJSONPARSER reference.

For information about using maplookup() to access nested JSON data, see Querying Nested Data.

Syntax

```
MAPLOOKUP(VMap_data, 'virtual_column_name' [USING PARAMETERS [case_
sensitive={false | true}] [, buffer_size=n] ] )
```

Parameters

VMap_data	Any VMap data. The VMap can exist as: • The __raw__ column of a flex table • Data returned from a map function such as maplookup() • Other database content
virtual_column_name	The name of the virtual column whose values this function returns.
buffer_size	[Optional parameter] Specifies the maximum length (in bytes) of each value returned for *virtual_column_name*. To return all values for virtual_column_name, specify a buffer_size equal to or greater than (=>) the number of bytes for any returned value. Any returned values greater in length than buffer_size are rejected. Default value: 0 (No limit on buffer_size)
case_sensitive	[Optional parameter] Specifies whether to return values for *virtual_column_name* if keys with different cases exist. Example: (... USING PARAMETERS case_sensitive=true) Default value: false

Examples

This example returns the values of one virtual column, user.location:

```
=> SELECT MAPLOOKUP(__raw__, 'user.location') FROM darkdata ORDER BY 1;
 maplookup
-----------
 Chile
 Nesnia
 Uptown
 .
 .
 chicago
(12 rows)
```

Using maplookup buffer_size

Use the `buffer_size=` parameter to indicate the maximum length of any value that maplookup returns for the virtual column you specify. If none of the returned key values can be greater than `n` bytes, use this parameter to allocate `n` bytes as the `buffer_size`.

For the next example, save this JSON data to a file, `simple_name.json`:

```
{
  "name": "sierra",
  "age": "63",
  "eyes": "brown",
  "weapon": "doggie"
}
{
  "name": "janis",
  "age": "10",
  "eyes": "blue",
  "weapon": "humor"
}
{
  "name": "ben",
  "age": "43",
  "eyes": "blue",
  "weapon": "sword"
}
{
  "name": "jen",
  "age": "38",
  "eyes": "green",
  "weapon": "shopping"
}
```

1. Create a flex table, `logs`.
2. Load the `simple_name.json` data into `logs`, using the `fjsonparser`. Specify the `flatten_arrays` option as `True`:

   ```
   => COPY logs FROM '/home/dbadmin/data/simple_name.json'
     PARSER fjsonparser(flatten_arrays=True);
   ```

3. Use `maplookup` with `buffer_size=0` for the `logs` table `name` key. This query returns all of the values:

```
=> SELECT MAPLOOKUP(__raw__, 'name' USING PARAMETERS buffer_size=0) FROM logs;
 MapLookup
-----------
 sierra
 ben
 janis
 jen
(4 rows)
```

4. Next, call `maplookup()` three times, specifying the `buffer_size` parameter as `3`, `5`, and `6`, respectively. Now, `maplookup()` returns values with a byte length less than or equal to (<=) `buffer_size`:

```
=> SELECT MAPLOOKUP(__raw__, 'name' USING PARAMETERS buffer_size=3) FROM logs;
 MapLookup
-----------

 ben

 jen
(4 rows)
=> SELECT MAPLOOKUP(__raw__, 'name' USING PARAMETERS buffer_size=5) FROM logs;
 MapLookup
-----------

 janis
 jen
 ben
(4 rows)
=> SELECT MAPLOOKUP(__raw__, 'name' USING PARAMETERS buffer_size=6) FROM logs;
 MapLookup
-----------
 sierra
 janis
 jen
 ben
(4 rows)
```

Disambiguate Empty Output Rows

This example shows how to interpret empty rows. Using `maplookup` without first checking whether a key exists can be ambiguous. When you review the following output, 12 empty rows, you cannot determine whether a `user.location` key has:

- A non-NULL value
- A `NULL` value
- No value

```
=> SELECT MAPLOOKUP(__raw__, 'user.location') FROM darkdata;
 maplookup
-----------
```

```
(12 rows)
```

To disambiguate empty output rows, use the `mapcontainskey()` function in conjunction with `maplookup()`. When `maplookup` returns an empty field, the corresponding value from `mapcontainskey` indicates `t` for a `NULL` or other value, or `f`for no value.

The following example output using both functions lists rows with NULL or a name value as `t`, and rows with no value as `f`:

```
=> SELECT MAPLOOKUP(__raw__, 'user.location'), MAPCONTAINSKEY(__raw__, 'user.location')
FROM darkdata ORDER BY 1;
 maplookup | mapcontainskey
-----------+----------------
           | t
           | t
           | t
           | t
 Chile     | t
 Nesnia    | t
 Uptown    | t
 chicago   | t
           | f >>>>>>>>>>No value
           | f >>>>>>>>>>No value
           | f >>>>>>>>>>No value
           | f >>>>>>>>>>No value
(12 rows)
```

Check for Case-Sensitive Virtual Columns

You can use `maplookup()` with the `case_sensitive` parameter to return results when key names with different cases exist.

1. Save the following sample content as a JSON file. This example saves the file as `repeated_key_name.json`:

   ```
   {
     "test": "lower1"
   }
   {
     "TEST": "upper1"
   }
   {
     "TEst": "half1"
   }
   ```

```
{
  "test": "lower2",
  "TEst": "half2"
}
{
  "TEST": "upper2",
  "TEst": "half3"
}
{
  "test": "lower3",
  "TEST": "upper3"
}
{
  "TEst": "half4",
  "test": "lower4",
  "TEST": "upper4"
}
{

"TesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestT
esttest
TesttestTesttestTesttestTesttest":"1",

"TesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttest
TesttestTesttestTesttestTesttestTest12345":"2"
}
```

2. Create a flex table, dupe, and load the JSON file:

```
=> CREATE FLEX TABLE dupe();
CREATE TABLE
dbt=> COPY dupe FROM '/home/release/KData/repeated_key_name.json' parser fjsonparser();
 Rows Loaded
-------------
           8
(1 row)
```

- MAPVALUES
- MAPVERSION

MAPPUT

Accepts a VMap and one or more key/value pairs and returns a new VMap with the key/value pairs added. Keys must be set using the auxiliary function `SetMapKeys()`, and can only be constant strings. If the VMap has any of the new input keys, then the original values are replaced by the new ones.

Syntax

```
MAPPUT(VMap_data, value1 [, value2, value3, ...] using parameters
keys=SetMapKeys('key1'[, 'key2', 'key3', ...])
```

Arguments

`VMap_data`	Any VMap data. The VMap can exist as: • The `__raw__` column of a flex table • Data returned from a map function such as `maplookup()` • Other database content
value	One or more values to add to the VMap specified in `VMap_data`.

Parameters

`keys`	The keys parameter must be the result of `SetMapKeys()`. `SetMapKeys()` simply takes one or more constant strings as arguments.

The following example shows how to create a flex table and use COPY to enter some basic JSON data. After creating a second flex table (`vmapdata2`), insert the new vmap results from `mapput()`, with additional key/value pairs.

1. Create sample table:

```
=> CREATE FLEX TABLE vmapdata1();
CREATE TABLE
```

2. Load sample JSON data from STDIN:

```
=> COPY vmapdata1 FROM stdin parser fjsonparser();
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> {"aaa": 1, "bbb": 2, "ccc": 3}
>> \.
```

3. Create another flex table and use the function to insert data into it:

```
=> CREATE FLEX TABLE vmapdata2();
=> INSERT INTO vmapdata2 SELECT MAPPUT(__raw__, '7','8','9'
  using parameters keys=SetMapKeys('xxx','yyy','zzz')) from vmapdata1;
```

4. View the difference between the original and the new flex tables:

```
=> SELECT MAPTOSTRING(__raw__) FROM vmapdata1;
                     maptostring
-----------------------------------------------------
 {
   "aaa" : "1",
   "bbb" : "2",
   "ccc" : "3"
}

(1 row)
=> SELECT MAPTOSTRING(__raw__) from vmapdata2;
                     maptostring
-----------------------------------------------------------
 {
   "mapput" : {
      "aaa" : "1",
      "bbb" : "2",
      "ccc" : "3",
      "xxx" : "7",
      "yyy" : "8",
      "zzz" : "9"
   }
}
```

MAPREGEXEXTRACTOR

Extracts data from a regular expression and returns the results as a VMap. Use the `USING PARAMETERS pattern=` phrase, followed by the regular expression.

Syntax

```
MAPREGEXEXTRACTOR (record_value USING PARAMETERS pattern = phrase
                      [,use_jit = value,]
                      [record_terminator = value,]
                      [logline_column = value]])
```

Arguments

`record_value`	VARCHAR	String containing a JSON or delimited format record on which the expression will be applied.

Parameters

`pattern=`	`VARCHAR`	The regular expression as a string. **Default value:** An empty string (`""`).
`use_jit`	`BOOLEAN`	[Optional] Uses just-in-time compiling when parsing the regular expression. **Default value:** `false`.

record_terminator	VARCHAR	[Optional] The character used to separate input records. **Default value:** \n.
logline_column	VARCHAR	[Optional] The destination column containing the full string that the regular expression matched. **Default value:** An empty string (""").

Examples

These examples use the following regular expression, which searches for information that includes the timestamp, date, thread_name, and thread_id strings.

Caution:
For display purposes, this sample regular expression adds new line characters to split long lines of text. To use this expression in a query, first copy and edit the example to remove any new line characters.

This example expression loads any thread_id hex value, regardless of whether it has a 0x prefix, (<thread_id>(?:0x)?[0-9a-f]+).

```
'^(?<time>\d\d\d\d-\d\d-\d\d \d\d:\d\d:\d\d\.\d+)
 (?<thread_name>[A-Za-z ]+):(?<thread_id>(?:0x)?[0-9a-f]+)
-?(?<transaction_id>[0-9a-f])?(?:[(?<component>\w+)]
\<(?<level>\w+)\> )?(?:<(?<elevel>\w+)> @[?(?<enode>\w+)]?: )
?(?<text>.*)'
```

The following examples may include newline characters for display purposes.

1. Create a flex table, flogs:

```
=> CREATE FLEX TABLE flogs();
CREATE TABLE
```

2. Use COPY to load a sample log file (vertica.log), using the flex table fregexparser. Note that this example includes added line characters for displaying long text lines.

```
=> COPY flogs FROM '/home/dbadmin/tempdat/vertica.log' PARSER FREGEXPARSER(pattern='
^(?<time>\d\d\d\d-\d\d-\d\d \d\d:\d\d:\d\d\.\d+) (?<thread_name>[A-Za-z ]+):
(?<thread_id>(?:0x)?[0-9a-f])-?(?<transaction_id>[0-9a-f])?(?:[(?<component>\w+)]
\<(?<level>\w+)\> )?(?:<(?<elevel>\w+)> @[?(?<enode>\w+)]?: )?(?<text>.*)');
Rows Loaded
-------------
81399
```

```
(1 row)
```

3. Use MapToString to return the results from calling MapRegexExtractor with a regular expression. The output returns the results of the function in string format.

```
=> SELECT MAPTOSTRING(MapregexExtractor(E'2014-04-02 04:02:51.011
TM Moveout:0x2aab9000f860-a0000000002067 [Txn] <INFO>
Begin Txn: a0000000002067 \'Moveout: Tuple Mover\'' using PARAMETERS
pattern='^(?<time>\d\d\d\d-\d\d-\d\d \d\d:\d\d:\d\d\.\d+)
 (?<thread_name>[A-Za-z ]+):(?<thread_id>(?:0x)?[0-9a-f]+)
-?(?<transaction_id>[0-9a-f])?(?:[(?<component>\w+)]
\<(?<level>\w+)\> )?(?:<(?<elevel>\w+)> @[?(?<enode>\w+)]?: )
?(?<text>.*)')) FROM flogs where __identity__=13;
maptostring
-------------------------------------------------------------------------------------------
-------
{
"component" : "Txn",
"level" : "INFO",
"text" : "Begin Txn: a0000000002067 'Moveout: Tuple Mover'",
"thread_id" : "0x2aab9000f860",
"thread_name" : "TM Moveout",
"time" : "2014-04-02 04:02:51.011",
"transaction_id" : "a0000000002067"
}
(1 row)
```

- MAPJSONEXTRACTOR

MAPSIZE

Returns the number of virtual columns present in any VMap data. Use this scalar function to determine the size of keys.

Syntax

MAPSIZE(*VMap_data*)

Arguments

VMap_data	Any VMap data. The VMap can exist as: • The `__raw__` column of a flex table • Data returned from a map function such as `maplookup()` • Other database content

Examples

This example shows the returned sizes from the number of keys in the flex table `darkmountain`:

```
=> SELECT MAPSIZE(__raw__) FROM darkmountain;
 mapsize
---------
       3
       4
       4
       4
       4
(5 rows)
```

- MAPKEYSINFO
- MAPLOOKUP
- MAPTOSTRING
- MAPVALUES
- MAPVERSION

MAPTOSTRING

Recursively builds a string representation VMap data, including nested JSON maps. Use this transform function to display the VMap contents in a readable `LONG VARCHAR` format. Use `maptostring` to see how map data is nested before querying virtual columns with `mapvalues()`.

Syntax

`MAPTOSTRING(`*`VMap_data`* `[using parameters canonical_json={`*`true`* `|` *`false`*`}])`

Arguments

`VMap_data`	Any VMap data. The VMap can exist as: • The `__raw__` column of a flex table • Data returned from a map function such as `maplookup()` • Other database content

Parameters

`canonical_json`	*=bool* [Optional parameter] Produces canonical JSON output by default, using the first instance of any duplicate keys in the map data. Use this parameter as other UDF parameters, preceded by `using parameters`, as shown in the examples. Setting this argument to `false` maintains the previous behavior of `maptostring()` and returns same-name keys and their values. Default value: `canonical-json=true`

Examples

The following example shows how to create a sample flex table, `darkdata`and load JSON data from STDIN. By calling `maptostring()` twice with both values for the `canonical_json` parameter, you can see the different results on the flex table `__raw__` column data.

1. Create sample table:

```
=> CREATE FLEX TABLE darkdata();
CREATE TABLE
```

2. Load sample JSON data from STDIN:

```
=> COPY darkdata FROM stdin parser fjsonparser();
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> {"aaa": 1, "aaa": 2, "AAA": 3, "bbb": "aaa\"bbb"}
>> \.
```

3. Call `maptostring()` with its default behavior using canonical JSON output, and then review the flex table contents. The function returns the first duplicate key and its value (`"aaa": "1"`) but omits remaining duplicate keys (`"aaa": "2"`):

```
=> SELECT MAPTOSTRING (__raw__) FROM darkdata;
                        maptostring
-----------------------------------------------------------
 {
   "AAA" : "3",
   "aaa" : "1",
   "bbb" : "aaa\"bbb"
}
(1 row)
```

4. Next, call `maptostring()` with `using parameters canonical_json=false`). This time, the function returns the first duplicate keys and their values:

```
=> SELECT MAPTOSTRING(__raw__ using parameters canonical_json=false) FROM darkdata;
                           maptostring
-----------------------------------------------------------------

{
        "aaa":  "1",
        "aaa":  "2",
        "AAA":  "3",
        "bbb":  "aaa"bbb"
 }
(1 row)
```

- MAPKEYS
- MAPKEYSINFO
- MAPLOOKUP
- MAPSIZE
- MAPVALUES
- MAPVERSION

MAPVALUES

Returns a string representation of the top-level values from a VMap. This transform function requires an `over()` clause.

Syntax

`MAPVALUES(`*`VMap_data`*`)`

Arguments

`VMap_data`	The VMap from which values should be returned. The VMap can exist as: • The `__raw__` column of a flex table • Data returned from a map function such as `maplookup()` • Other database content
`max_value_length`	In a `__raw__` column, specifies the maximum length of values the function can return. Values that are larger than *`max_value_length`* cause the query to fail. Defaults to the smaller of VMap column length and 65K.

Examples

The following example shows how to query a `darkmountain` flex table, using an `over()` clause (in this case, the `over(PARTITION BEST)` clause) with `mapvalues()`.

```
=> SELECT * FROM (SELECT MAPVALUES(darkmountain.__raw__) OVER(PARTITION BEST) FROM darkmountain) AS
a;

MAPVERSION

Returns the version or invalidity of any map data. This scalar function returns the map version (such as `1`) or `-1`, if the map data is invalid.

Syntax

```
MAPVERSION(VMap_data)
```

Arguments

`VMap_data`	The VMap data either from a `__raw__` column in a flex table or from the data returned from a map function such as `maplookup()`.

Examples

The following example shows how to use `mapversion()` with the `darkmountain`flex table, returning `mapversion 1` for the flex table map data:

```
=> SELECT MAPVERSION(__raw__) FROM darkmountain;
 mapversion
------------
          1
          1
          1
          1
          1
(5 rows)
```

MATERIALIZE_FLEXTABLE_COLUMNS

Materializes virtual columns listed as *key_names* in the *flextable_keys* table you compute using either COMPUTE_FLEXTABLE_KEYS or COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW.

Note:
Each column that you materialize with this function counts against the data storage limit of your license. To check your Vertica license compliance, call the AUDIT() or AUDIT_FLEX() functions.

Syntax

```
MATERIALIZE_FLEXTABLE_COLUMNS('[[database.]schema.]flex-table' [, n-columns [, keys-table-name] ])
```

Arguments

[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject`

	If you specify a database, it must be the current database.
flex-table	The name of the flex table with columns to materialize. Specifying only the flex table name attempts to materialize up to 50 columns of key names in the default `flex_table_keys` table. When you use this argument, the function: • Skips any columns already materialized • Ignores any empty keys To materialize a specific number of columns, use the optional parameter `n_columns`, described next.
n-columns	The number of columns to materialize. The function attempts to materialize the number of columns from the `flex_table_keys` table, skipping any columns already materialized. Vertica tables support a total of 1600 columns, which is the largest value you can specify for `n-columns`. The function orders the materialized results by frequency, descending, *key_name* when materializing the first `n` columns.
keys-table-name	The name of a flex_keys_table from which to materialize columns. The function: • Materializes the number of columns (value of *n-columns*) from *keys-table-name* • Skips any columns already materialized • Orders the materialized results by frequency, descending, *key_name* when materializing the first `n` columns.

Examples

The following example shows how to call `MATERIALIZE_FLEXTABLE_COLUMNS` to materialize columns. First, load a sample file of tweets (`tweets_10000.json`) into the flex table `twitter_r`.

After loading data and computing keys for the sample flex table, call `materialize_flextable_columns` to materialize the first four columns:

```
=> COPY twitter_r FROM '/home/release/KData/tweets_10000.json' parser fjsonparser();
 Rows Loaded
-------------
       10000
```

```
(1 row)

=> SELECT compute_flextable_keys ('twitter_r');
              compute_flextable_keys
-----------------------------------------------------
 Please see public.twitter_r_keys for updated keys
(1 row)

=> select materialize_flextable_columns('twitter_r', 4);
    materialize_flextable_columns
-------------------------------------------------------------------------------
 The following columns were added to the table public.twitter_r:
        contributors
        entities.hashtags
        entities.urls
For more details, run the following query:
SELECT * FROM v_catalog.materialize_flextable_columns_results WHERE table_schema = 'public' and
table_name = 'twitter_r';

(1 row)
```

The last message in the example recommends querying system table MATERIALIZE_FLEXTABLE_COLUMNS_RESULTS for the results of materializing the columns, as shown:

```
=> SELECT * FROM v_catalog.materialize_flextable_columns_results WHERE table_schema = 'public' and
table_name = 'twitter_r';
table_id           | table_schema | table_name |      creation_time           |     key_name      |
status |    message
-------------------+--------------+------------+------------------------------+-------------------+--
------+---------------------
 45035996273733172 | public       | twitter_r  | 2013-11-20 17:00:27.945484-05| contributors      |
ADDED  | Added successfully
 45035996273733172 | public       | twitter_r  | 2013-11-20 17:00:27.94551-05 | entities.hashtags |
ADDED  | Added successfully
 45035996273733172 | public       | twitter_r  | 2013-11-20 17:00:27.945519-05| entities.urls     |
ADDED  | Added successfully
 45035996273733172 | public       | twitter_r  | 2013-11-20 17:00:27.945532-05| created_at        |
EXISTS | Column of same name already
(4 rows)
```

- COMPUTE_FLEXTABLE_KEYS
- COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW
- RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW

RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW

Restores the _keys table and the _view. The function also links the _keys table with its associated flex table, in cases where either table is dropped. The function also indicates whether it restored one or both objects.

Syntax

```
RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW('flex-table')
```

Arguments

flex-table	Name of a flex table

Examples

This example shows how to invoke this function with an existing flex table, restoring both the _keys table and _view:

```
=> SELECT RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW('darkdata');
                     RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEw
-------------------------------------------------------------------------------
The keys table public.darkdata_keys was restored successfully.
The view public.darkdata_view was restored successfully.
(1 row)
```

This example illustrates that the function restored darkdata_view, but that darkdata_keys did not need restoring:

```
=> SELECT RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW('darkdata');
                    RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW
-------------------------------------------------------------------------------
 The keys table public.darkdata_keys already exists and is linked to darkdata.
The view public.darkdata_view was restored successfully.
(1 row)
```

After restoring the _keys table, there is no content. To populate the flex keys, call the COMPUTE_FLEXTABLE_KEYS meta function.

```
=> SELECT * FROM darkdata_keys;
 key_name | frequency | data_type_guess
```

```
----------+-----------+-----------------
(0 rows)
```

Hadoop Functions

This section contains functions to manage interactions with Hadoop.

CLEAR_HDFS_CACHES

Clears the configuration information copied from HDFS and any cached connections.

This function affects reads using the `hdfs` scheme in the following ways:

- This function flushes information loaded from configuration files copied from Hadoop (such as core-site.xml). These files are found on the path set by the HadoopConfDir configuration parameter.
- This function flushes information about which NameNode is active in a High Availability (HA) Hadoop cluster. Therefore, the first request to Hadoop after calling this function is slower than expected.

Vertica maintains a cache of open connections to NameNodes to reduce latency. This function flushes that cache.

Syntax

```
CLEAR_HDFS_CACHES (  )
```

Privileges

Superuser

Example

The following example clears the Hadoop configuration information:

```
=> SELECT CLEAR_HDFS_CACHES();
 CLEAR_HDFS_CACHES
--------------
 Cleared
(1 row)
```

See Also

Apache Hadoop Parameters

EXTERNAL_CONFIG_CHECK

Tests the Hadoop configuration of a Vertica cluster. This function tests HDFS configuration files, HCatalog Connector configuration, and Kerberos configuration.

This function calls the following functions:

- KERBEROS_CONFIG_CHECK
- HADOOP_IMPERSONATION_CONFIG_CHECK
- HDFS_CLUSTER_CONFIG_CHECK
- HCATALOGCONNECTOR_CONFIG_CHECK

If you call this function with an argument, it passes the argument to functions it calls that also take an argument.

Syntax

```
EXTERNAL_CONFIG_CHECK( ['what_to_test' ] )
```

Arguments

what_to_test	A string specifying the authorities, nameservices, and/or HCatalog schemas to test. The format is a comma-separated list of "key=value" pairs, where keys are "authority", "nameservice", and "schema". The value

	is passed to all of the sub-functions; see those reference pages for details on how values are interpreted.

Privileges

This function does not require privileges.

Examples

The following example tests the configuration of only the nameservice named "ns1". Output has been omitted due to length.

```
=> SELECT EXTERNAL_CONFIG_CHECK('nameservice=ns1');
```

GET_METADATA

Returns the metadata of a Parquet file. Metadata includes the number and sizes of row groups, column names, and information about chunks and compression. Metadata is returned as JSON.

This function inspects one file. Parquet data usually spans many files in a single directory; choose one. The function does not accept a directory name as an argument.

Syntax

```
GET_METADATA( 'filename' )
```

Arguments

filename	The name of a Parquet file. Any path that is valid for COPY is valid for this function. This function does not operate on files in other formats.

Privileges

Superuser, or non-superuser with READ privileges on the USER-accessible storage location (see GRANT (Storage Location)).

Examples

In the following example, the "orders" directory contains many Parquet files containing data for a single table.

```
=> SELECT GET_METADATA('/data/orders/000000_0');
                                GET_METADATA
-------------------------------------------------------------------------------------------------------------
{
    "FileName": "/data/orders/000000_0",
    "FileFormat": "Parquet",
    "Version": "0",
    "CreatedBy": "parquet-mr version 1.8.1 (build 4aba4dae7bb0d4edbcf7923ae1339f28fd3f7fcf)",
    "TotalRows": "417189",
    "NumberOfRowGroups": "1",
    "NumberOfRealColumns": "1",
    "NumberOfColumns": "1",
    "Columns": [
          { "Id": "0", "Name": "o_orderkey", "PhysicalType": "INT32", "LogicalType": "NONE" }

     ],
    "RowGroups": [
         {
               "Id": "0", "TotalBytes": "1668852", "Rows": "417189",
               "ColumnChunks": [
                           {"Id": "0", "Values": "417189", "StatsSet": "True", "Stats": {"NumNulls":
"0", "DistinctValues": "0", "Max": "453984454", "Min": "414194851" },
                            "Compression": "UNCOMPRESSED", "Encodings": "BIT_PACKED RLE PLAIN ",
"UncompressedSize": "1668852", "CompressedSize": "1668852" }
               ]
         }
   ]
}

(1 row)
```

HADOOP_IMPERSONATION_CONFIG_CHECK

Reports the delegation tokens Vertica will use when accessing Kerberized data in HDFS. The HadoopImpersonationConfig configuration parameter specifies one or more authorities, nameservices, and HCatalog schemas and their associated tokens. For each tested value, the function reports what doAs user or delegation token Vertica will use for access. Use this function to confirm that you have defined your delegation tokens as you intended.

You can call this function with an argument to specify the authority, nameservice, or HCatalog schema to test, or without arguments to test all configured values.

This function does not check that you can use these delegation tokens to access HDFS.

See Proxy Users and Delegation Tokens for more about impersonation.

Syntax

```
HADOOP_IMPERSONATION_CONFIG_CHECK( ['what_to_test' ] )
```

Arguments

what_to_test	A string specifying the authorities, nameservices, and/or HCatalog schemas to test. For example, a value of 'nameservice=ns1' means the function tests only access to the nameservice "ns1" and ignores any other authorities and schemas. A value of 'nameservice=ns1, schema=hcat1' means the function tests one nameservice and one HCatalog schema. If you do not specify this argument, the function tests all authorities, nameservices, and schemas defined in HadoopImpersonationConfig .

Privileges

This function does not require privileges.

Examples

Consider the following definition of HadoopImpersonationConfig:

```
[{
        "nameservice": "ns1",
        "token": "RANDOM-TOKEN-STRING"
    },
    {
        "nameservice": "*",
        "doAs": "Paul"
    },
    {
        "schema": "hcat1",
        "doAs": "Fred"
    }
]
```

The following query tests only the "ns1" name service:

```
=> SELECT HADOOP_IMPERSONATION_CONFIG_CHECK('nameservice=ns1');

-- hadoop_impersonation_config_check --
Connections to nameservice [ns1] will use a delegation token with hash [b3dd9e71cd695d91]
```

This function returns a hash of the token for security reasons. You can call HASH_EXTERNAL_TOKEN with the expected value and compare that hash to the one in this function's output.

A query with no argument tests all values:

```
=> SELECT HADOOP_IMPERSONATION_CONFIG_CHECK();

-- hadoop_impersonation_config_check --
Connections to nameservice [ns1] will use a delegation token with hash [b3dd9e71cd695d91]
JDBC connections for HCatalog schema [hcat1] will doAs [Fred]
[!] hadoop_impersonation_config_check : [PASS]
```

HASH_EXTERNAL_TOKEN

Returns a hash of a string token, for use with HADOOP_IMPERSONATION_CONFIG_CHECK. Call HASH_EXTERNAL_TOKEN with the delegation token you expect Vertica to use and compare it to the hash in the output of HADOOP_IMPERSONATION_CONFIG_CHECK.

Syntax

```
HASH_EXTERNAL_TOKEN( 'token' )
```

Arguments

token	A string specifying the token to hash. The token is configured in the HadoopImpersonationConfig parameter.

Privileges

This function does not require privileges.

Examples

The following query tests the expected value shown in the example on the HADOOP_IMPERSONATION_CONFIG_CHECK reference page.

```
=> SELECT HASH_EXTERNAL_TOKEN('RANDOM-TOKEN-STRING');
hash_external_token
```

```
--------------------
b3dd9e71cd695d91
(1 row)
```

HCATALOGCONNECTOR_CONFIG_CHECK

Tests the configuration of a Vertica cluster that uses the HCatalog Connector to access Hive data. The function first verifies that the HCatalog Connector is properly installed and reports on the values of several related configuration parameters. It then tests the connection using HiveServer2. This function does not support the WebHCat server.

If you specify an HCatalog schema, and if you have defined a delegation token for that schema, this function uses the delegation token. Otherwise, the function uses the default endpoint without a delegation token.

See Proxy Users and Delegation Tokens for more about delegation tokens.

Syntax

```
HCATALOGCONNECTOR_CONFIG_CHECK( ['what_to_test' ] )
```

Arguments

what_to_test	A string specifying the HCatalog schemas to test. For example, a value of 'schema=hcat1' means the function tests only the "hcat1" schema and ignores any others that are found.

Privileges

This function does not require privileges.

Examples

The following query tests with the default endpoint and no delegation token.

```
=> SELECT HCATALOGCONNECTOR_CONFIG_CHECK();

-- hcatalogconnector_config_check --
```

```
    HCatalogConnectorUseHiveServer2 : [1]
    EnableHCatImpersonation : [1]
    HCatalogConnectorUseORCReader : [1]
    HCatalogConnectorUseParquetReader : [1]
    HCatalogConnectorUseTxtReader : [0]
  [INFO] Vertica is not configured to use its internal parsers for delimited files.
  [INFO] This is off by default, but will be changed in a future release.
    HCatalogConnectorUseLibHDFSPP : [1]

  [OK] HCatalog connector library is properly installed.
  [INFO] Creating JDBC connection as session user.
  [OK] Successful JDBC connection to HiveServer2 as user [USER].

  [!] hcatalogconnector_config_check : [PASS]
```

To test with the configured delegation token, pass the schema as an argument:

```
=> SELECT HCATALOGCONNECTOR_CONFIG_CHECK('schema=hcat1');
```

HDFS_CLUSTER_CONFIG_CHECK

Tests the configuration of a Vertica cluster that uses HDFS. The function scans the Hadoop configuration files found in HadoopConfDir and performs configuration checks on each cluster it finds. If you have more than one cluster configured, you can specify which one to test instead of testing all of them.

For each Hadoop cluster, it reports properties including:

- Nameservice name and associated NameNodes
- High-availability status
- RPC encryption status
- Kerberos authentication status
- HTTP(S) status

It then tests connections using `http(s)`, `hdfs`, and `webhdfs` URL schemes. It tests the latter two using both the Vertica and session user.

See Configuring the hdfs Scheme for information about configuration files and HadoopConfDir.

Syntax

```
HDFS_CLUSTER_CONFIG_CHECK( ['what_to_test' ] )
```

Arguments

what_to_test	A string specifying the authorities or nameservices to test. For example, a value of 'nameservice=ns1' means the function tests only "ns1" cluster. If you specify both an authority and a nameservice, the authority must be a NameNode in the specified nameservice for the check to pass. If you do not specify this argument, the function tests all cluster configurations found in HadoopConfDir.

Privileges

This function does not require privileges.

Examples

The following example tests all clusters.

```
=> SELECT HDFS_CLUSTER_CONFIG_CHECK();

-- hdfs_cluster_config_check --

    Hadoop Conf Path : [/conf/hadoop_conf]
  [OK] HadoopConfDir verified on all nodes
    Connection Timeout (seconds) : [60]
    Token Refresh Frequency (seconds) : [0]
    HadoopFSBlockSizeBytes (MiB) : [64]

  [OK] Found [1] hadoop cluster configurations

------------- Cluster 1 -------------
    Is DefaultFS : [true]
    Nameservice : [vmns]
    Namenodes : [node1.example.com:8020, node2.example.com:8020]
    High Availability : [true]
    RPC Encryption : [false]
    Kerberos Authentication : [true]
    HTTPS Only : [false]
  [INFO] Checking connections to [hdfs:///]
    vertica : [OK]
    dbuser : [OK]

  [INFO] Checking connections to [http://node1.example.com:50070]
  [INFO] Node is in standby
  [INFO] Checking connections to [http://node2.example.com:50070]
  [OK] Can make authenticated external curl connection
  [INFO] Checking webhdfs
```

```
    vertica : [OK]
    USER : [OK]

  [!] hdfs_cluster_config_check : [PASS]
```

KERBEROS_HDFS_CONFIG_CHECK

Note:
This function is deprecated and will be removed in a future release. Instead, use EXTERNAL_CONFIG_CHECK.

Tests the Kerberos configuration of a Vertica cluster that uses HDFS. The function succeeds if it can use both the Vertica keytab file and the session user to access HDFS, and reports errors otherwise. This function is a more specific version of KERBEROS_CONFIG_CHECK.

If the current session is not Kerberized, this function will not be able to use secured HDFS connections and will fail.

You can call this function with arguments to specify an HDFS configuration to test, or without arguments. If you call it with no arguments, this function reads the HDFS configuration files and fails if it does not find them. See Configuring the hdfs Scheme. If it finds configuration files, it tests all configured nameservices.

The function performs the following tests, in order:

- Are Kerberos services available?
- Does a keytab file exist and are the Kerberos and HDFS configuration parameters set in the database?
- Can Vertica read and invoke kinit with the keys to authenticate to HDFS and obtain the database Kerberos ticket?
- Can Vertica perform `hdfs` and `webhdfs` operations using both the database Kerberos ticket and user-forwardable tickets for the current session?
- Can Vertica connect to HiveServer2? (This function does not support WebHCat.)

If any test fails, the function returns a descriptive error message.

Syntax

```
KERBEROS_HDFS_CONFIG_CHECK( ['hdfsHost:hdfsPort',
  'webhdfsHost:webhdfsPort', 'webhcatHost' ] )
```

Arguments

hdfsHost, hdfsPort	The hostname or IP address and port of the HDFS NameNode. Vertica uses this server to access data that is specified with `hdfs` URLs. If the value is ' ', the function skips this part of the check.
webhdfsHost, webhdfsPort	The hostname or IP address and port of the WebHDFS server. Vertica uses this server to access data that is specified with `webhdfs` URLs. If the value is ' ', the function skips this part of the check.
webhcatHost	Pass any value in this position. WebHCat is deprecated and this value is ignored but must be present.

Privileges

This function does not require privileges.

SYNC_WITH_HCATALOG_SCHEMA

Copies the structure of a Hive database schema available through the HCatalog Connector to a Vertica schema. If the HCatalog schema and the target Vertica schema have matching table names, SYNC_WITH_HCATALOG_SCHEMA overwrites the Vertica tables.

This function can synchronize the HCatalog schema directly. In this case, call it with the same schema name for the *vertica_schema* and *hcatalog_schema* parameters. The function can also synchronize a different schema to the HCatalog schema.

If you change the settings of HCatalog Connector configuration parameters, you must call this function again.

Syntax

```
SYNC_WITH_HCATALOG_SCHEMA( vertica_schema, hcatalog_schema, [drop_non_existent] )
```

Parameters

vertica_schema	The target Vertica schema to store the copied HCatalog schema's metadata. This can be the same schema as *hcatalog_schema*, or it can be a separate one created with CREATE SCHEMA. **Caution:** Do not use the Vertica schema to store other data.
hcatalog_schema	The HCatalog schema to copy, created with CREATE HCATALOG SCHEMA
drop_non_existent	If `true`, drop any tables in *vertica_schema* that do not correspond to a table in *hcatalog_schema*

Privileges

Non-superuser: CREATE privileges on *vertica_schema*.

Users also require access to Hive data, one of the following:

- USAGE permissions on *hcat_schema*, if Hive does not use an authorization service to manage access.
- Permission through an authorization service (Sentry or Ranger), and access to the underlying files in HDFS. (Sentry can provide that access through ACL synchronization.)
- dbadmin user privileges, with or without an authorization service.

Data Type Matching

Hive STRING and BINARY data types are matched, in Vertica, to the VARCHAR(65000) and VARBINARY(65000) types. Adjust the data types with ALTER TABLE as needed after creating the schema. The maximum size of a VARCHAR or VARBINARY in Vertica is 65000, but you can use LONG VARCHAR and LONG VARBINARY to specify larger values.

Hive and Vertica define string length in different ways. In Hive the length is the number of characters; in Vertica it is the number of bytes. Thus, a character encoding that uses more than one byte, such as Unicode, can cause mismatches between the two. To avoid data truncation, set values in Vertica based on bytes, not characters.

If data size exceeds the column size, Vertica logs an event at read time in the QUERY_EVENTS system table.

Examples

The following example uses SYNC_WITH_HCATALOG_SCHEMA to synchronize an HCatalog schema named hcat:

```
=> CREATE HCATALOG SCHEMA hcat WITH hostname='hcathost' HCATALOG_SCHEMA='default'
   HCATALOG_USER='hcatuser';
CREATE SCHEMA
=> SELECT sync_with_hcatalog_schema('hcat', 'hcat');
sync_with_hcatalog_schema
----------------------------------------
Schema hcat synchronized with hcat
tables in hcat = 56
tables altered in hcat = 0
tables created in hcat = 56
stale tables in hcat = 0
table changes erred in hcat = 0
(1 row)

=> -- Use vsql's \d command to describe a table in the synced schema

=> \d hcat.messages
List of Fields by Tables
  Schema   |   Table  | Column  |      Type      | Size  | Default | Not Null | Primary Key | Foreign
Key
-----------+----------+---------+----------------+-------+---------+----------+-------------+--------
-----
hcat       | messages | id      | int            |     8 |         | f        | f           |
hcat       | messages | userid  | varchar(65000) | 65000 |         | f        | f           |
hcat       | messages | "time"  | varchar(65000) | 65000 |         | f        | f           |
hcat       | messages | message | varchar(65000) | 65000 |         | f        | f           |
(4 rows)
```

The following example uses SYNC_WITH_HCATALOG_SCHEMA followed by ALTER TABLE to adjust a column value:

```
=> CREATE HCATALOG SCHEMA hcat WITH hostname='hcathost' HCATALOG_SCHEMA='default'
-> HCATALOG_USER='hcatuser';
CREATE SCHEMA
=> SELECT sync_with_hcatalog_schema('hcat', 'hcat');
...
=> ALTER TABLE hcat.t ALTER COLUMN a1 SET DATA TYPE long varchar(1000000);
=> ALTER TABLE hcat.t ALTER COLUMN a2 SET DATA TYPE long varbinary(1000000);
```

The following example uses SYNC_WITH_HCATALOG_SCHEMA with a local (non-HCatalog) schema:

```
=> CREATE HCATALOG SCHEMA hcat WITH hostname='hcathost' HCATALOG_SCHEMA='default'
-> HCATALOG_USER='hcatuser';
```

```
CREATE SCHEMA
=> CREATE SCHEMA hcat_local;
CREATE SCHEMA
=> SELECT sync_with_hcatalog_schema('hcat_local', 'hcat');
```

SYNC_WITH_HCATALOG_SCHEMA_TABLE

Copies the structure of a single table in a Hive database schema available through the HCatalog Connector to a Vertica table.

This function can synchronize the HCatalog schema directly. In this case, call it with the same schema name for the *vertica_schema* and *hcatalog_schema* parameters. The function can also synchronize a different schema to the HCatalog schema.

Syntax

```
SYNC_WITH_HCATALOG_SCHEMA_TABLE( vertica_schema, hcatalog_schema, table_name )
```

Parameters

vertica_schema	The existing Vertica schema to store the copied HCatalog schema's metadata. This can be the same schema as *hcatalog_schema*, or it can be a separate one created with CREATE SCHEMA.
hcatalog_schema	The HCatalog schema to copy, created with CREATE HCATALOG SCHEMA.
table_name	The table in *hcatalog_schema* to copy. If *table_name* already exists in *vertica_schema*, the function overwrites it.

Privileges

Non-superuser: CREATE privileges on *vertica_schema*.

Users also require access to Hive data, one of the following:

- USAGE permissions on *hcat_schema*, if Hive does not use an authorization service to manage access.

- Permission through an authorization service (Sentry or Ranger), and access to the underlying files in HDFS. (Sentry can provide that access through ACL synchronization.)
- dbadmin user privileges, with or without an authorization service.

Data Type Matching

Hive STRING and BINARY data types are matched, in Vertica, to the VARCHAR(65000) and VARBINARY(65000) types. Adjust the data types with ALTER TABLE as needed after creating the schema. The maximum size of a VARCHAR or VARBINARY in Vertica is 65000, but you can use LONG VARCHAR and LONG VARBINARY to specify larger values.

Hive and Vertica define string length in different ways. In Hive the length is the number of characters; in Vertica it is the number of bytes. Thus, a character encoding that uses more than one byte, such as Unicode, can cause mismatches between the two. To avoid data truncation, set values in Vertica based on bytes, not characters.

If data size exceeds the column size, Vertica logs an event at read time in the QUERY_EVENTS system table.

Examples

The following example uses SYNC_WITH_HCATALOG_SCHEMA_TABLE to synchronize the "nation" table:

```
=> CREATE SCHEMA 'hcat_local';
CREATE SCHEMA

=> CREATE HCATALOG SCHEMA hcat WITH hostname='hcathost' HCATALOG_SCHEMA='hcat'
   HCATALOG_USER='hcatuser';
CREATE SCHEMA

=> SELECT sync_with_hcatalog_schema_table('hcat_local', 'hcat', 'nation');
sync_with_hcatalog_schema_table
-------------------------------------------------------------------------------
       Schema hcat_local synchronized with hcat for table nation
       table nation is created in schema hcat_local
       (1 row)
```

The following example shows the behavior if the "nation" table already exists in the local schema:

```
=> SELECT sync_with_hcatalog_schema_table('hcat_local','hcat','nation');
sync_with_hcatalog_schema_table
```

```
-------------------------------------------------------------------------------
       Schema hcat_local synchronized with hcat for table nation
       table nation is altered in schema hcat_local
       (1 row)
```

VERIFY_HADOOP_CONF_DIR

Verifies that the Hadoop configuration that is used to access HDFS is valid on all Vertica nodes. The configuration is valid if:

- all required configuration files are found on the path defined by the HadoopConfDir configuration parameter
- all properties needed by Vertica are set in those files

This function does not attempt to validate the settings of those properties; it only verifies that they have values.

It is possible for Hadoop configuration to be valid on some nodes and invalid on others. The function reports a validation failure if the value is invalid on any node; the rest of the output reports the details.

Syntax

```
VERIFY_HADOOP_CONF_DIR( )
```

Parameters

This function has no parameters.

Privileges

This function does not require privileges.

Examples

The following example shows the results when the Hadoop configuration is valid.

```
=> SELECT VERIFY_HADOOP_CONF_DIR();
       verify_hadoop_conf_dir

-------------------------------------------------------------------
Validation Success
v_vmart_node0001: HadoopConfDir [PG_TESTOUT/config] is valid
v_vmart_node0002: HadoopConfDir [PG_TESTOUT/config] is valid
v_vmart_node0003: HadoopConfDir [PG_TESTOUT/config] is valid
v_vmart_node0004: HadoopConfDir [PG_TESTOUT/config] is valid
       (1 row)
```

In the following example, the Hadoop configuration is valid on one node, but on other nodes a needed value is missing.

```
=> SELECT VERIFY_HADOOP_CONF_DIR();
       verify_hadoop_conf_dir
-------------------------------------------------------------------
Validation Failure
v_vmart_node0001: HadoopConfDir [PG_TESTOUT/test_configs/config] is valid
v_vmart_node0002: No fs.defaultFS parameter found in config files in [PG_TESTOUT/config]
v_vmart_node0003: No fs.defaultFS parameter found in config files in [PG_TESTOUT/config]
v_vmart_node0004: No fs.defaultFS parameter found in config files in [PG_TESTOUT/config]
       (1 row)
```

LDAP Link Functions

This section contains the functions associated with the Vertica LDAP Link service.

LDAP_LINK_DRYRUN_CONNECT

Takes a set of LDAP Link connection parameters as arguments and begins a dry run connection between the LDAP server and Vertica.

By providing an empty string for the `LDAPLinkBindPswd` argument, you can also perform an anonymous bind if your LDAP server allows unauthenticated binds.

Syntax

```
LDAP_LINK_DRYRUN_CONNECT (
    'LDAPLinkURL',
    'LDAPLinkBindDN',
    'LDAPLinkBindPswd',
    '[LDAPLinkStartTLS]',
    '[LDAPLinkTLSReqCert]',
    '[LDAPLinkTLSCACert]',
```

```
    '[LDAPLinkTLSCADir]',
)
```

Privileges

Superuser

Example

This tests the connection to an LDAP server at `ldap://glw2k8-64.dc.com` with the DN `CN=amir,OU=QA,DC=dc,DC=com` with the optional TLS parameters. This begins the connection with StartTLS but does not require a valid certificate from the client, and specifies certificate `~/ca.crt`.

```
=> SELECT LDAP_LINK_DRYRUN_CONNECT('ldap://glw2k8-
64.dc.com','CN=amir,OU=QA,DC=dc,DC=com','password',1,'allow','~/ca.crt');

                              ldap_link_dryrun_connect
-------------------------------------------------------------------------------
Dry Run Connect Completed. Query v_monitor.ldap_link_dryrun_events for results.
```

To check the results of the bind, query the system table LDAP_LINK_DRYRUN_EVENTS.

```
=> SELECT event_timestamp, event_type, entry_name, role_name, link_scope, search_base from LDAP_LINK_
DRYRUN_EVENTS;
        event_timestamp       |       event_type      |      entry_name      | link_scope | search_
base
------------------------------+-----------------------+----------------------+------------+----------
---
2019-12-09 15:41:43.589398-05 | BIND_STARTED          | -------------------- | ---------- | ---------
--
2019-12-09 15:41:43.590504-05 | BIND_FINISHED         | -------------------- | ---------- | ---------
--
```

- LDAP Link Parameters

LDAP_LINK_DRYRUN_SEARCH

Takes a set of LDAP Link connection and search parameters as arguments and begins a dry run search for users and groups that would get imported from the LDAP server.

By providing an empty string for the `LDAPLinkBindPswd` argument, you can also perform an anonymous search if your LDAP server's Access Control List (ACL) is configured to allow unauthenticated searches. The settings for allowing anonymous binds are different from the ACL settings for allowing anonymous searches.

Syntax

```
LDAP_LINK_DRYRUN_SEARCH (
    'LDAPLinkURL',
    'LDAPLinkBindDN',
    'LDAPLinkBindPswd',
    'LDAPLinkSearchBase',
    'LDAPLinkScope',
    'LDAPLinkFilterUser',
    'LDAPLinkFilterGroup',
    'LDAPLinkUserName',
    'LDAPLinkGroupName',
    'LDAPLinkGroupMembers',
    [LDAPLinkSearchTimeout],
    ['LDAPLinkJoinAttr'],
    [LDAPLinkStartTLS],
    ['LDAPLinkTLSReqCert'],
    ['LDAPLinkTLSCACert'],
    ['LDAPLinkTLSCADir'],
)
```

Privileges

Superuser

Example

This searches for users and groups in the LDAP server. In this case, the `LDAPLinkSearchBase` parameter specifies the `dc.com` domain and a sub scope, which replicates the entire subtree under the DN.

To further filter results, the function checks for users and groups with the `person` and `group` objectClass attributes. It then searches the group attribute `cn`, identifying members

of that group with the `member` attribute, and then identifying those individual users with the attribute `uid`.

```
=> SELECT LDAP_LINK_DRYRUN_SEARCH('ldap://glw2k8-
64.dc.com','CN=amir,OU=QA,DC=dc,DC=com','$vertica$','dc=DC,dc=com','sub',
'(objectClass=person)','(objectClass=group)','uid','cn','member',10,'dn',1,'allow','~/ca.crt');

                              ldap_link_dryrun_search
-------------------------------------------------------------------------------
Dry Run Search Completed. Query v_monitor.ldap_link_dryrun_events for results.
```

To check the results of the search, query the system table LDAP_LINK_DRYRUN_EVENTS.

```
=> SELECT event_timestamp, event_type, entry_name, ldapurihash, link_scope, search_base from LDAP_
LINK_DRYRUN_EVENTS;
        event_timestamp          |    event_type    |       entry_name       | ldapurihash | link_
scope | search_base

- LDAP Link Parameters

LDAP_LINK_DRYRUN_SYNC

Takes a set of LDAP Link connection and search parameters as arguments and begins a dry run synchronization between the database and the LDAP server, which maps and

synchronizes the LDAP server's users and groups with their equivalents in Vertica. This meta-function also dry runs the creation and orphaning of users and roles in Vertica.

You can view the results of the dry run in the system table LDAP_LINK_DRYRUN_EVENTS.

Syntax

```
LDAP_LINK_DRYRUN_SYNC (
    'LDAPLinkURL',
    'LDAPLinkBindDN',
    'LDAPLinkBindPswd',
    'LDAPLinkSearchBase',
    'LDAPLinkScope',
    'LDAPLinkFilterUser',
    'LDAPLinkFilterGroup',
    'LDAPLinkUserName',
    'LDAPLinkGroupName',
    'LDAPLinkGroupMembers',
    [LDAPLinkSearchTimeout],
    ['LDAPLinkJoinAttr'],
    [LDAPLinkStartTLS],
    ['LDAPLinkTLSReqCert'],
    ['LDAPLinkTLSCACert'],
    ['LDAPLinkTLSCADir'],
)
```

Privileges

Superuser

Example

To dry run map the users and groups returned from LDAP_LINK_DRYRUN_SEARCH, pass the same parameters as arguments to LDAP_LINK_DRYRUN_SYNC.

```
=> SELECT LDAP_LINK_DRYRUN_SYNC('ldap://g1w2k8-
64.dc.com','CN=amir,OU=QA,DC=dc,DC=com','$vertica$','dc=DC,dc=com','sub',
'(objectClass=person)','(objectClass=group)','uid','cn','member',10,'dn',1,'allow','~/ca.cert');

                              LDAP_LINK_DRYRUN_SYNC
-------------------------------------------------------------------------------------
Dry Run Connect and Sync Completed. Query v_monitor.ldap_link_dryrun_events for results.
```

To check the results of the sync, query the system table LDAP_LINK_DRYRUN_EVENTS.

```
=> SELECT event_timestamp, event_type, entry_name, ldapurihash, link_scope, search_base from LDAP_
LINK_DRYRUN_EVENTS;
        event_timestamp          |     event_type      |       entry_name       | ldapurihash | link_
scope | search_base
```

```

- LDAP Link Parameters

LDAP_LINK_SYNC_START

Begins the synchronization between the LDAP server and Vertica immediately rather than waiting for the interval set in LDAPLinkInterval.

Syntax

```
ldap_link_sync_start()
```

Privileges

You must be a dbadamin user.

Example

```
=> SELECT ldap_link_sync_start();
```

LDAP Link Parameters

License Management Functions

This section contains function that monitor Vertica license status and compliance.

AUDIT

Returns the raw data size (in bytes) of a database, schema, or table as it is counted in an audit of the database size. Unless you specify zero error tolerance and 100 percent confidence level, AUDIT returns only approximate results that can vary over multiple iterations.

AUDIT estimates the size for data in Vertica tables using the same data sampling method as Vertica uses, to determine if a database complies with the licensed database size allowance. Vertica does not use these results to determine whether the size of the database complies with the Vertica license's data allowance. For details, see Auditing Database Size in the Administrator's Guide.

For data stored in external tables based on ORC or Parquet format, AUDIT uses the total size of the data files. This value is never estimated—it is read from the file system storing the ORC or Parquet files (either the Vertica node's local file system, S3, or HDFS). See Reading ORC and Parquet Formats for more information about external tables based on these file formats.

Syntax

```
AUDIT('[[[database.]schema.]scope ]'[, 'granularity'] [, error-tolerance[, confidence-level]] )
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.

scope	Specifies the extent of the audit: • Empty string (' ') audits the entire database. • The name of the schema or table to audit. The schema or table to audit. To audit the database, set this parameter to an empty string.

granularity	The level at which the audit reports its results, one of the following strings:
	• `database`
	• `schema`
	• `table`
	The level of granularity must be equal to or less than the granularity of *scope*. If you omit this parameter, granularity is set to the same level as *scope*. Thus, if `online_sales` is a schema, the following statements are identical:
	`AUDIT('online_sales', 'schema');`
	`AUDIT('online_sales');`
	If AUDIT sets granularity to a level lower than the target object, it returns with a message that refers you to system table USER_AUDITS. For details, see Querying V_CATALOG.USER_AUDITS, below.

error-tolerance	Specifies the percentage margin of error allowed in the audit estimate. Enter the tolerance value as a decimal number, between 0 and 100. The default value is 5, for a 5% margin of error. This argument has no effect on audits of external tables based on ORC or Parquet files. Audits of these tables always returns the actual size of the underlying data files. Setting this value to 0 results in a full database audit, which is very resource intensive, as AUDIT analyzes the entire database. A full database audit significantly impacts performance, so Vertica does not recommend it for a production database.

	Caution: Due to the iterative sampling that the auditing process uses, setting the error tolerance to a small fraction of a percent (for example, 0.00001) can cause `AUDIT` to run for a longer period than a full database audit. The lower you specify this value, the more resources the audit uses, as it performs more data sampling.
confidence-level	Specifies the statistical confidence level percentage of the estimate. Enter the confidence value as a decimal number, between 0 and 100. The default value is 99, indicating a confidence level of 99%. This argument has no effect on audits of external tables based on ORC or Parquet files. Audits of these tables always returns the actual size of the underlying data files. The higher the confidence value, the more resources the function uses, as it performs more data sampling. Setting this value to 100 results in a full audit of the database, which is very resource intensive, as the function analyzes all of the database. A full database audit significantly impacts performance, so Vertica does not recommend it for a production database.

Privileges

Superuser, or the following privileges:

- SELECT privilege on the target tables
- USAGE privilege on the target schemas

Note:
If you audit a schema or the database, Vertica only returns the size of all objects that you have privileges to access within the audited object, as described above.

Querying V_CATALOG.USER_AUDITS

If AUDIT sets granularity to a level lower than the target object, it returns with a message that refers you to system table USER_AUDITS. To obtain audit data on objects of the specified granularity, query this table. For example, the following query seeks to audit all tables in the store schema:

```
=> SELECT AUDIT('store', 'table');
                            AUDIT
-----------------------------------------------------------
 See table sizes in v_catalog.user_audits for schema store
(1 row)
```

The next query queries USER_AUDITS and obtains the latest audits on those tables:

```
=> SELECT object_name, AVG(size_bytes)::int size_bytes, MAX(audit_start_timestamp::date) audit_start
      FROM user_audits WHERE object_schema='store'
      GROUP BY rollup(object_name) HAVING GROUPING_ID(object_name) < 1 ORDER BY GROUPING_ID();
    object_name    | size_bytes | audit_start
-------------------+------------+-------------
 store_dimension   |      22067 | 2017-10-26
 store_orders_fact |   27201312 | 2017-10-26
 store_sales_fact  |  301260170 | 2017-10-26
(3 rows)
```

Examples

See Auditing Database Size.

AUDIT_FLEX

Returns the estimated ROS size of __raw__ columns, equivalent to the export size of the flex data in the audited objects. You can audit all flex data in the database, or narrow the audit scope to a specific flex table, projection, or schema. Vertica stores the audit results in system table USER_AUDITS.

The audit excludes the following:

- Flex keys
- Other columns in the audited tables.
- Temporary flex tables

Syntax

```
AUDIT_FLEX ('[scope]')
```

Parameters

scope	Specifies the extent of the audit: • Empty string (' ') audits all flexible tables in the database. • The name of a schema, projection, or flex table.

Privileges

Superuser, or the following privileges:

- SELECT privilege on the target tables
- USAGE privilege on the target schemas

Note:
If you audit a schema or the database, Vertica only returns the size of all objects that you have privileges to access within the audited object, as described above.

Examples

Audit all flex tables in the current database:

```
dbs=> select audit_flex('');
 audit_flex
------------
 8567679
(1 row)
```

Audit the flex tables in schema `public`:

```
dbs=> select audit_flex('public');
audit_flex
------------
8567679
(1 row)
```

Audit the flex data in projection `bakery_b0`:

```
dbs=> select audit_flex('bakery_b0');
 audit_flex
------------
 8566723
(1 row)
```

Audit flex table `bakery`:

```
dbs=> select audit_flex('bakery');
 audit_flex
------------
 8566723
(1 row)
```

To report the results of all audits saved in the `USER_AUDITS`, the following shows part of an extended display from the system table showing an audit run on a schema called `test`, and the entire database, `dbs`:

```
dbs=> \x
Expanded display is on.

dbs=> select * from user_audits;
-[ RECORD 1 ]-------------------------+------------------------------

AUDIT_LICENSE_SIZE

Triggers an immediate audit of the database size to determine if it is in compliance with the raw data storage allowance included in your Vertica licenses.

If you use ORC or Parquet data stored in HDFS, results are only accurate if you run this function as a user who has access to all HDFS data. Either run the query with a principal that has read access to all such data, or use a Hadoop delegation token that grants this access. For more information about using delegation tokens, see Accessing Kerberized HDFS Data.

Syntax

```
AUDIT_LICENSE_SIZE()
```

Privileges

Superuser

Example

```
=> SELECT audit_license_size();
 audit_license_size
--------------------
Raw Data Size: 0.00TB +/- 0.00TB
License Size : 10.00TB
Utilization  : 0%
Audit Time   : 2015-09-24 12:19:15.425486-04
Compliance Status : The database is in compliance with respect to raw data size.

License End Date: 2015-11-23 00:00:00 Days Remaining: 60.53
(1 row)
```

AUDIT_LICENSE_TERM

Triggers an immediate audit to determine if the Vertica license has expired.

Syntax

```
AUDIT_LICENSE_TERM()
```

Privileges

Superuser

Example

```
=> SELECT audit_license_term();
 audit_license_term
--------------------
Raw Data Size: 0.00TB +/- 0.00TB
License Size : 10.00TB
Utilization  : 0%
Audit Time   : 2015-09-24 12:19:15.425486-04
Compliance Status : The database is in compliance with respect to raw data size.

License End Date: 2015-11-23 00:00:00 Days Remaining: 60.53
(1 row)
```

DISPLAY_LICENSE

Returns the terms of your Vertica license. The information this function displays is:

- The start and end dates for which the license is valid (or "Perpetual" if the license has no expiration).
- The number of days you are allowed to use Vertica after your license term expires (the grace period)
- The amount of data your database can store, if your license includes a data allowance.

Syntax

```
DISPLAY_LICENSE()
```

Privileges

None

Examples

```
=> SELECT DISPLAY_LICENSE();
                  DISPLAY_LICENSE
-------------------------------------------------
 Vertica Systems, Inc.
2007-08-03
Perpetual
500GB

(1 row)
```

GET_AUDIT_TIME

Reports the time when the automatic audit of database size occurs. Vertica performs this audit if your Vertica license includes a data size allowance. For details of this audit, see Managing Licenses in the Administrator's Guide. To change the time the audit runs, use the SET_AUDIT_TIME function.

Syntax

```
GET_AUDIT_TIME()
```

Privileges

None

Example

```
=> SELECT get_audit_time();
get_audit_time
-------------------------------------------------------
 The audit is scheduled to run at 11:59 PM each day.
(1 row)
```

GET_COMPLIANCE_STATUS

Displays whether your database is in compliance with your Vertica license agreement. This information includes the results of Vertica's most recent audit of the database size (if your license has a data allowance as part of its terms), the license term (if your license has an end date), and the number of nodes (if your license has a node limit).

`GET_COMPLIANCE_STATUS` measures data allowance by TBs (where a TB equals 1024^4 bytes).

The information displayed by `GET_COMPLIANCE_STATUS` includes:

- The estimated size of the database (see Auditing Database Size in the Administrator's Guide for an explanation of the size estimate).
- The raw data size allowed by your Vertica license.
- The percentage of your allowance that your database is currently using.
- The number of nodes and license limit.
- The date and time of the last audit.
- Whether your database complies with the data allowance terms of your license agreement.
- The end date of your license.
- How many days remain until your license expires.

Note:
If your license does not have a data allowance, end date, or node limit, some of the values might not appear in the output for `GET_COMPLIANCE_STATUS`.

If the audit shows your license is not in compliance with your data allowance, you should either delete data to bring the size of the database under the licensed amount, or upgrade your license. If your license term has expired, you should contact Vertica immediately to renew your license. See Managing Licenses in the Administrator's Guide for further details.

Syntax

```
GET_COMPLIANCE_STATUS()
```

Privileges

None

Examples

```
=> SELECT GET_COMPLIANCE_STATUS();
 get_compliance_status
--------------------
Raw Data Size: 0.00TB +/- 0.00TB
License Size : 10.00TB
Utilization  : 0%
Audit Time   : 2015-09-24 12:19:15.425486-04
Compliance Status : The database is in compliance with respect to raw data size.

License End Date: 2015-11-23 00:00:00 Days Remaining: 60.53
(1 row)
```

The following example shows output for a Vertica for SQL on Apache Hadoop cluster.

```
=> SELECT GET_COMPLIANCE_STATUS();
 get_compliance_status
--------------------
Node count : 4
License Node limit : 5
No size-compliance concerns for an Unlimited license

No expiration date for a Perpetual license
(1 row)
```

SET_AUDIT_TIME

Sets the time that Vertica performs automatic database size audit to determine if the size of the database is compliant with the raw data allowance in your Vertica license. Use this function if the audits are currently scheduled to occur during your database's peak activity time. This is normally not a concern, since the automatic audit has little impact on database performance.

Audits are scheduled by the preceding audit, so changing the audit time does not affect the next scheduled audit. For example, if your next audit is scheduled to take place at 11:59PM and you use SET_AUDIT_TIME to change the audit schedule 3AM, the previously scheduled 11:59PM audit still runs. As that audit finishes, it schedules the next audit to occur at 3AM.

Vertica always performs the next scheduled audit even where you have changed the audit time using SET_AUDIT_TIME and then triggered an automatic audit by issuing the statement, SELECT AUDIT_LICENSE_SIZE. Only after the next scheduled audit does Vertica begin auditing at the new time you set using SET_AUDIT_TIME. Thereafter, Vertica audits at the new time.

Syntax

```
SET_AUDIT_TIME(time)
```

time	A string containing the time in `'HH:MM AM/PM'` format (for example, `'1:00 AM'`) when the audit should run daily.

Privileges

Superuser

Example

```
=> SELECT SET_AUDIT_TIME('3:00 AM');
                            SET_AUDIT_TIME
-----------------------------------------------------------------------
 The scheduled audit time will be set to 3:00 AM after the next audit.
(1 row)
```

Multiple Active Result Sets Functions

This section contains the functions associated with the Vertica library for Multiple Active Result Sets (MARS).

CLOSE_ALL_RESULTSETS

Closes all result set sessions within Multiple Active Result Sets (MARS) and frees the MARS storage for other result sets.

Syntax

```
SELECT CLOSE_ALL_RESULTSETS ('session_id')
```

Parameters

session_id	A string that specifies the Multiple Active Result Sets session.

Privileges

None; however, without superuser privileges, you can only close your own session's results.

Examples

This example shows how you can view a MARS result set, then close the result set, and then confirm that the result set has been closed.

Query the MARS storage table. One session ID is open and three result sets appear in the output.

```
=> SELECT * FROM SESSION_MARS_STORE;

    node_name     |            session_id             | user_name | resultset_id | row_count |
remaining_row_count | bytes_used
------------------+-----------------------------------+-----------+--------------+-----------+-------
--------------+------------
 v_vmart_node0001 | server1.company.-83046:1y28gu9    | dbadmin   |            7 |    777460 |
      776460 |   89692848
 v_vmart_node0001 | server1.company.-83046:1y28gu9    | dbadmin   |            8 |    324349 |
      323349 |   81862010
 v_vmart_node0001 | server1.company.-83046:1y28gu9    | dbadmin   |            9 |    277947 |
      276947 |   32978280
(1 row)
```

Close all result sets for session server1.company.-83046:1y28gu9:

```
=> SELECT CLOSE_ALL_RESULTSETS('server1.company.-83046:1y28gu9');
                     close_all_resultsets
------------------------------------------------------------
 Closing all result sets from server1.company.-83046:1y28gu9
(1 row)
```

Query the MARS storage table again for the current status. You can see that the session and result sets have been closed:

```
=> SELECT * FROM SESSION_MARS_STORE;
```

```
    node_name     |            session_id             | user_name | resultset_id | row_count |
remaining_row_count | bytes_used
------------------+-----------------------------------+-----------+--------------+-----------+-------
--------------+------------
(0 rows)
```

CLOSE_RESULTSET

Closes a specific result set within Multiple Active Result Sets (MARS) and frees the MARS storage for other result sets.

Syntax

```
SELECT CLOSE_RESULTSET ('session_id', ResultSetID)
```

Parameters

session_id	A string that specifies the Multiple Active Result Sets session containing the ResultSetID to close.
ResultSetID	An integer that specifies which result set to close.

Privileges

None; however, without superuser privileges, you can only close your own session's results.

Examples

This example shows a MARS storage table opened. One session_id is currently open, and one result set appears in the output.

```
=> SELECT * FROM SESSION_MARS_STORE;
    node_name     |            session_id             | user_name | resultset_id | row_count |
remaining_row_count | bytes_used
------------------+-----------------------------------+-----------+--------------+-----------+-------
--------------+------------
 v_vmart_node0001 | server1.company.-83046:1y28gu9    | dbadmin   |            1 |    318718 |
      312718 |   80441904
(1 row)
```

Close user session server1.company.-83046:1y28gu9 and result set 1:

```
=> SELECT CLOSE_RESULTSET('server1.company.-83046:1y28gu9', 1);
                        close_resultset
-------------------------------------------------------------
 Closing result set 1 from server1.company.-83046:1y28gu9
(1 row)
```

Query the MARS storage table again for current status. You can see that result set 1 is now closed:

```
SELECT * FROM SESSION_MARS_STORE;

    node_name     |            session_id             | user_name | resultset_id | row_count |
remaining_row_count | bytes_used
------------------+-----------------------------------+-----------+--------------+-----------+-------
--------------+------------
(0 rows)
```

Partition Management Functions

This section contains partition management functions specific to Vertica.

CALENDAR_HIERARCHY_DAY

Specifies to group DATE partition keys into a hierarchy of years, months, and days. The Vertica **Tuple Mover** regularly evaluates partition keys against the current date, and merges partitions as needed into the appropriate year and month partition groups.

Syntax

```
CALENDAR_HIERARCHY_DAY( partition-expression[, active-months[, active-years] ] )
```

Parameters

partition-expression	The DATE expression on which to group partition keys, which must be identical to the table's PARTITION BY expression.
active-months	An integer ≥ 0 that specifies how many months preceding MONTH(CURRENT_DATE) to store unique partition keys in separate partitions. If you specify 1, only partition keys of the current month are stored in separate partitions. If you specify 0, all partition keys of the current month are merged into a partition group for that month. For details, see Hierarchical Partitioning. Default value: 2
active-years	An integer ≥ 0, specifies how many years preceding YEAR (CURRENT_DATE) to partition group keys by month in separate partitions.

	If you specify 1, only partition keys of the current year are stored in month partition groups. If you specify 0, all partition keys of the current and previous years are merged into year partition groups. For details, see Hierarchical Partitioning. Default value: 2

Important:
The CALENDAR_HIERARCHY_DAY algorithm assumes that most table activity is focused on recent dates. Setting *active-years* and *active-months* to a low number ≥ 2 serves to isolate merge activity to date-specific containers, and incurs minimal overhead. Vertica recommends that you use the default setting of 2 for *active-years* and *active-months*. For most users, these settings achieve an optimal balance between ROS storage and performance.

Usage

Specify this function in a table partition clause, as its GROUP BY expression:

```
PARTITION BY partition-expression
  GROUP BY CALENDAR_HIERARCHY_DAY(
     group-expression
      [, active-months[, active-years] ] )
```

For example:

```
=> CREATE TABLE public.store_orders
(
    order_no int,
    order_date timestamp NOT NULL,
    shipper varchar(20),
    ship_date date
);
...
=> ALTER TABLE public.store_orders
      PARTITION BY order_date::DATE
      GROUP BY CALENDAR_HIERARCHY_DAY(order_date::DATE, 3, 2) REORGANIZE;
```

For details on usage, see Hierarchical Partitioning in the Administrator's Guide.

Hierarchical Partitioning in the Administrator's Guide

COPY_PARTITIONS_TO_TABLE

Copies partitions from one table to another. This lightweight partition copy increases performance by initially sharing the same storage between two tables. After the copy operation is complete, the tables are independent of each other. Users can perform operations on one table without impacting the other. These operations can increase the overall storage required for both tables.

Note:
Although they share storage space, Vertica considers the partitions as discrete objects for license capacity purposes. For example, copying a one TB partition would only consume one TB of space. Your Vertica license, however, considers them as separate objects consuming two TB of space.

Syntax

```
COPY_PARTITIONS_TO_TABLE (
    '[[database.]schema.]source-table',
    'min-range-value',
    'max-range-value',
    '[[database.]schema.]target-table'
     [, 'force-split']
)
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.

source-table	The source table of the partitions to copy.
min-range-value *max-range-value*	The minimum and maximum value of partition keys to copy, where *min-range-value* must be ≤ *max-range-value*. To copy one partition, *min-range-value* and *max-range-value* must be equal.
target-table	The target table of the partitions to copy. If the table does not exist, Vertica creates a table from the source table's definition, by calling `CREATE TABLE` with `LIKE` and `INCLUDING PROJECTIONS` clause. The new table inherits ownership from the source table. For details, see Replicating a Table..
force-split	Optional Boolean argument, specifies whether to split ROS containers if the range of partition keys spans multiple containers or part of a single container: • `true`: Split ROS containers as needed. • `false` (default): Return with an error if ROS containers must be split to implement this operation.

Privileges

- Ownership or USAGE privileges on the source table.
- CREATE privileges on the target table, if `COPY_PARTITIONS_TO_TABLE` creates it.

Table Attribute Requirements

The following attributes of both tables must be identical:

- Column definitions, including NULL/NOT NULL constraints
- Segmentation
- Partition clause
- Number of projections
- Projection sort order
- Primary and unique key constraints. However, the key constraints do not have to be identically enabled. For more information on constraints, see Constraints in the Administrator's Guide.

> **Note:**
> If the target table has primary or unique key constraints enabled and copying or moving the partitions will insert duplicate key values into the target table, Vertica rolls back the operation.

- Check constraints. For MOVE_PARTITIONS_TO_TABLE and COPY_PARTITIONS_TO_TABLE, Vertica enforces enabled check constraints on the target table only. For SWAP_PARTITIONS_BETWEEN_TABLES, Vertica enforces enabled check constraints on both tables. If there is a violation of an enabled check constraint, Vertica rolls back the operation.
- Number and definitions of text indices.

Table Restrictions

The following restrictions apply to the source and target tables:

- If the source and target partitions are in different storage tiers, Vertica returns a warning but the operation proceeds. The partitions remain in their existing storage tier.
- The following tables cannot be used as sources or targets:
  - Temporary tables
  - Virtual tables
  - System tables
  - External tables

Examples

If you call COPY_PARTITIONS_TO_TABLE and the target table does not exist, the function creates the table automatically. In the following example, the target table partn_backup.tradfes_200801 does not exist. COPY_PARTITIONS_TO_TABLE creates the table and replicates the partition. Vertica also copies all the constraints associated with the source table except foreign key constraints.

```
=> SELECT COPY_PARTITIONS_TO_TABLE (
          'prod_trades',
          '200801',
          '200801',
          'partn_backup.trades_200801');
COPY_PARTITIONS_TO_TABLE
------------------------------------------------
 1 distinct partition values copied at epoch 15.
```

```
(1 row)
```

See Also

Archiving Partitions

DROP_PARTITIONS

This function supersedes meta-function DROP_PARTITION, which was deprecated in Vertica 9.0.

Drops the specified table partition keys.

Syntax

```
DROP_PARTITIONS (
    '[[database.]schema.]table-name',
    'min-range-value',
    'max-range-value'
    [, 'force-split']
)
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table-name	The target table. The table cannot be used as a dimension table in a pre-join projection and cannot have out-of-date (unrefreshed) projections.
min-range-value *max-range-value*	The minimum and maximum value of partition keys to drop, where *min-range-value* must be ≤ *max-range-value*. To drop one partition key, *min-range-value* and

	max-range-value must be equal.
force-split	Optional Boolean argument, specifies whether to split ROS containers if the range of partition keys spans multiple containers or part of a single container: • `true`: Split ROS containers as needed. • `false` (default): Return with an error if ROS containers must be split to implement this operation. **Note:** In rare cases, DROP_PARTITIONS executes at the same time as a mergeout operation on the same ROS container. As a result, the function cannot split the container as specified and returns with an error. When this happens, call DROP_PARTITIONS again.

Privileges

One of the following:

- DBADMIN
- Table owner
- USAGE privileges on the table schema and TRUNCATE privileges on the table

Examples

See Dropping Partitions in the Administrator's Guide.

See Also

PARTITION_TABLE

DUMP_PROJECTION_PARTITION_KEYS

Dumps the partition keys of the specified projection.

Syntax

```
DUMP_PROJECTION_PARTITION_KEYS( '[[database.]schema.]projection-name')
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
projection-name	The projection name.

Privileges

- SELECT privilege on table
- USAGE privileges on schema

Example

The following statements create the table and projection `online_sales.online_sales_fact` and `online_sales.online_sales_fact_unseg_p`, respectively, and partitions table data by the column `call_center_key`:

```
=> CREATE TABLE online_sales.online_sales_fact
(
    sale_date_key int NOT NULL,
    ship_date_key int NOT NULL,
    product_key int NOT NULL,
    product_version int NOT NULL,
    customer_key int NOT NULL,
    call_center_key int NOT NULL,
    online_page_key int NOT NULL,
    shipping_key int NOT NULL,
    warehouse_key int NOT NULL,
    promotion_key int NOT NULL,
    pos_transaction_number int NOT NULL,
    sales_quantity int,
    sales_dollar_amount float,
```

```
    ship_dollar_amount float,
    net_dollar_amount float,
    cost_dollar_amount float,
    gross_profit_dollar_amount float,
    transaction_type varchar(16)
)
PARTITION BY (online_sales_fact.call_center_key);

=> CREATE PROJECTION online_sales.online_sales_fact_unseg_p AS SELECT * from online_sales.online_
sales_fact unsegmented all nodes;
```

The following DUMP_PROJECTION_PARTITION_KEYS statement dumps the partition key from the projection online_sales.online_sales_fact_unseg_p:

```
=> SELECT DUMP_PROJECTION_PARTITION_KEYS('online_sales.online_sales_fact_unseg_p');

Partition keys on node v_vmart_node0001
  Projection 'online_sales_fact_unseg_p'
   Storage [ROS container]
     No of partition keys: 1
     Partition keys: 200
   Storage [ROS container]
     No of partition keys: 1
     Partition keys: 199
   ...
   Storage [ROS container]
     No of partition keys: 1
     Partition keys: 2
   Storage [ROS container]
     No of partition keys: 1
     Partition keys: 1

 Partition keys on node v_vmart_node0002
  Projection 'online_sales_fact_unseg_p'
   Storage [ROS container]
     No of partition keys: 1
     Partition keys: 200
   Storage [ROS container]
     No of partition keys: 1
     Partition keys: 199
...
(1 row)
```

See Also

- Partitioning Tables in the Administrator's Guide
- DUMP_PARTITION_KEYS
- DUMP_TABLE_PARTITION_KEYS
- PARTITION_PROJECTION
- PARTITION_TABLE

DUMP_TABLE_PARTITION_KEYS

Dumps the partition keys of all projections for the specified table.

Syntax

```
DUMP_TABLE_PARTITION_KEYS ( '[[database.]schema.]table-name' )
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table-name	The name of the table.

Privilege

- SELECT privilege on table
- USAGE privileges on schema

Examples

The following example creates a simple table called `states` and partitions the data by state:

```
=> CREATE TABLE states (year INTEGER NOT NULL,
       state VARCHAR NOT NULL)
       PARTITION BY state;
=> CREATE PROJECTION states_p (state, year) AS
       SELECT * FROM states
       ORDER BY state, year UNSEGMENTED ALL NODES;
```

Now dump the partition keys of all projections anchored on table `states`:

```
=> SELECT DUMP_TABLE_PARTITION_KEYS( 'states' );
      DUMP_TABLE_PARTITION_KEYS                                                                -------
-------------------------------------------------------------------------------------------
 Partition keys on node v_vmart_node0001
  Projection 'states_p'
   Storage [ROS container]
     No of partition keys: 1
     Partition keys: VT
   Storage [ROS container]
     No of partition keys: 1
     Partition keys: PA
   Storage [ROS container]
     No of partition keys: 1
     Partition keys: NY
   Storage [ROS container]
     No of partition keys: 1
     Partition keys: MA

 Partition keys on node v_vmart_node0002
...
(1 row)
```

See Also

- DUMP_PROJECTION_PARTITION_KEYS
- DUMP_TABLE_PARTITION_KEYS
- PARTITION_PROJECTION
- PARTITION_TABLE
- Partitioning Tables in the Administrator's Guide

MOVE_PARTITIONS_TO_TABLE

Moves partitions from one table to another.

Syntax

```
MOVE_PARTITIONS_TO_TABLE (
    '[[database.]schema.]source-table',
    'min-range-value',
    'max-range-value',
    '[[database.]schema.]target-table'
     [, force-split]
)
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
source-table	The source table of the partitions to move.
min-range-value *max-range-value*	The minimum and maximum value of partition keys to move, where *min-range-value* must be ≤ *max-range-value*. To move one partition, *min-range-value* and *max-range-value* must be equal.
target-table	The target table of the partitions to move. If the table does not exist, Vertica creates a table from the source table's definition, by calling `CREATE TABLE` with `LIKE` and `INCLUDING PROJECTIONS` clause. The new table inherits ownership from the source table. For details, see Replicating a Table.
force-split	Optional Boolean argument, specifies whether to split ROS containers if the range of partition keys spans multiple containers or part of a single container: • `true`: Split ROS containers as needed. • `false` (default): Return with an error if ROS containers must be split to implement this operation.

Privileges

If the target table does not exist, you must have CREATE privileges on the target schema, to enable table creation. One of the following conditions is also required:

- DBADMIN role
- Owner of the source and target tables
- USAGE privileges on source and target schemas,TRUNCATE privileges on the source table, and INSERT privileges on the target table

Table Attribute Requirements

The following attributes of both tables must be identical:

- Column definitions, including NULL/NOT NULL constraints
- Segmentation
- Partition clause
- Number of projections
- Projection sort order
- Primary and unique key constraints. However, the key constraints do not have to be identically enabled. For more information on constraints, see Constraints in the Administrator's Guide.

  > **Note:**
  > If the target table has primary or unique key constraints enabled and copying or moving the partitions will insert duplicate key values into the target table, Vertica rolls back the operation.

- Check constraints. For `MOVE_PARTITIONS_TO_TABLE` and `COPY_PARTITIONS_TO_TABLE`, Vertica enforces enabled check constraints on the target table only. For `SWAP_PARTITIONS_BETWEEN_TABLES`, Vertica enforces enabled check constraints on both tables. If there is a violation of an enabled check constraint, Vertica rolls back the operation.
- Number and definitions of text indices.

Table Restrictions

The following restrictions apply to the source and target tables:

- If the source and target partitions are in different storage tiers, Vertica returns a warning but the operation proceeds. The partitions remain in their existing storage tier.
- The following tables cannot be used as sources or targets:
  - Temporary tables
  - Virtual tables
  - System tables
  - External tables

Examples

See Archiving Partitions.

See Also

- COPY_PARTITIONS_TO_TABLE
- SWAP_PARTITIONS_BETWEEN_TABLES

PARTITION_PROJECTION

Splits **ROS** containers for a specified projection. PARTITION_PROJECTION also purges data while partitioning ROS containers if deletes were applied before the **AHM** epoch.

Syntax

```
PARTITION_PROJECTION ( '[[database.]schema.]projection')
```

Parameters

[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
projection	The projection to partition.

Privileges

- Table owner
- USAGE privilege on schema

Examples

In this example, PARTITION_PROJECTION forces a split of ROS containers on the states_p projection:

```
=> SELECT PARTITION_PROJECTION ('states_p');
  PARTITION_PROJECTION
-----------------------
 Projection partitioned
(1 row)
```

See Also

- PARTITION_TABLE
- Partitioning Tables in the Administrator's Guide

PARTITION_TABLE

Invokes the **Tuple Mover** to reorganize ROS storage containers as needed to conform with the current partitioning policy.

Syntax

```
PARTITION_TABLE ( '[schema.]table-name')
```

Parameters

[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table-name	The table to partition.

Privileges

- Table owner
- USAGE privilege on schema

Restrictions

- You cannot run PARTITION_TABLE on a table that is an anchor table for a live aggregate projection or a Top-K projection.
- To reorganize storage to conform to a new policy, run PARTITION_TABLE after changing the partition GROUP BY expression.

See Also

- PARTITION_PROJECTION
- Partitioning Existing Table Data

PURGE_PARTITION

Purges a table partition of deleted rows. Similar to PURGE and PURGE_PROJECTION, this function removes deleted data from physical storage so you can reuse the disk space. PURGE_PARTITION removes data only from the **AHM** epoch and earlier.

Syntax

```
PURGE_PARTITION ( '[[database.]schema.]table', partition-key )
```

Parameters

[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject`

	If you specify a database, it must be the current database.
table	The partitioned table to purge.
partition-key	The key of the partition to purge.

Privileges

- Table owner
- USAGE privilege on schema

Example

The following example lists the count of deleted rows for each partition in a table, then calls PURGE_PARTITION() to purge the deleted rows from the data.

```
=> SELECT partition_key,table_schema,projection_name,sum(deleted_row_count)
   AS deleted_row_count FROM partitions
   GROUP BY partition_key,table_schema,projection_name
   ORDER BY partition_key;

 partition_key | table_schema | projection_name | deleted_row_count
---------------+--------------+-----------------+-------------------
 0             | public       | t_super         |                 2
 1             | public       | t_super         |                 2
 2             | public       | t_super         |                 2
 3             | public       | t_super         |                 2
 4             | public       | t_super         |                 2
 5             | public       | t_super         |                 2
 6             | public       | t_super         |                 2
 7             | public       | t_super         |                 2
 8             | public       | t_super         |                 2
 9             | public       | t_super         |                 1
(10 rows)
=> SELECT PURGE_PARTITION('t',5); -- Purge partition with key 5.
                           purge_partition
-----------------------------------------------------------------------
 Task: merge partitions
(Table: public.t) (Projection: public.t_super)
(1 row)

=> SELECT partition_key,table_schema,projection_name,sum(deleted_row_count)
   AS deleted_row_count FROM partitions
   GROUP BY partition_key,table_schema,projection_name
   ORDER BY partition_key;

 partition_key | table_schema | projection_name | deleted_row_count
---------------+--------------+-----------------+-------------------
 0             | public       | t_super         |                 2
 1             | public       | t_super         |                 2
```

```
 2            | public       | t_super        |               2
 3            | public       | t_super        |               2
 4            | public       | t_super        |               2
 5            | public       | t_super        |               0
 6            | public       | t_super        |               2
 7            | public       | t_super        |               2
 8            | public       | t_super        |               2
 9            | public       | t_super        |               1
(10 rows)
```

See Also

SWAP_PARTITIONS_BETWEEN_TABLES

Swaps partitions between two tables.

Syntax

```
SWAP_PARTITIONS_BETWEEN_TABLES (
    '[[database.]schema.]staging-table',
    'min-range-value',
    'max-range-value',
    '[[database.]schema.]target-table'
     [, force-split]
)
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.

staging-table	The staging table from which to swap partitions.
min-range-value *max-range-value*	The minimum and maximum value of partition keys to swap, where *min-range-value* must be ≤ *max-range-value*. To swap one partition, *min-range-value* and *max-range-value* must be equal.
target-table	The table to which the partitions are to be swapped. The target table cannot be the same as the staging table.
force-split	Optional Boolean argument, specifies whether to split ROS containers if the range of partition keys spans multiple containers or part of a single container: • `true`: Split ROS containers as needed. • `false` (default): Return with an error if ROS containers must be split to implement this operation.

Privileges

One of the following:

- DBADMIN role
- Owner of both tables
- USAGE privileges on both schemas, and TRUNCATE and INSERT privileges on both tables.

Requirements

The following attributes of both tables must be identical:

- Column definitions, including NULL/NOT NULL constraints
- Segmentation
- Partition clause
- Number of projections
- Projection sort order
- Primary and unique key constraints. However, the key constraints do not have to be identically enabled. For more information on constraints, see Constraints in the Administrator's Guide.

  Note:
  If the target table has primary or unique key constraints enabled and

> copying or moving the partitions will insert duplicate key values into the target table, Vertica rolls back the operation.

- Check constraints. For MOVE_PARTITIONS_TO_TABLE and COPY_PARTITIONS_TO_TABLE, Vertica enforces enabled check constraints on the target table only. For SWAP_PARTITIONS_BETWEEN_TABLES, Vertica enforces enabled check constraints on both tables. If there is a violation of an enabled check constraint, Vertica rolls back the operation.
- Number and definitions of text indices.

Restrictions

The following restrictions apply to the source and target tables:

- If the source and target partitions are in different storage tiers, Vertica returns a warning but the operation proceeds. The partitions remain in their existing storage tier.
- The following tables cannot be used as sources or targets:
  - Temporary tables
  - Virtual tables
  - System tables
  - External tables

Examples

See Swapping Partitions.

MOVE_PARTITIONS_TO_TABLE

Privileges and Access Functions

This section contains functions for managing user and role privileges, and access policies.

ENABLED_ROLE

Checks whether a Vertica user role is enabled, and returns true or false. This function is typically used when you create access policies on database roles.

Syntax

```
ENABLED_ROLE ( 'role' )
```

Parameters

role	The role to evaluate.

Privileges

None

Examples

See:

- Creating Column Access Policies
- Creating Row Access Policies

See Also

CREATE ACCESS POLICY

GET_PRIVILEGES_DESCRIPTION

Returns the effective privileges the current user has on an object, including explicit, implicit, inherited, and role-based privileges.

Because this meta-function only returns effective privileges, GET_PRIVILEGES_DESCRIPTION only returns privileges with fully-satisfied prerequisites. For a list of prerequisites for common operations, see Privileges Required for Common Database Operations.

For example, a user must have the following privileges to query a table:

- Schema: USAGE
- Table: SELECT

If user Brooke has SELECT privileges on table `s1.t1` but lacks USAGE privileges on schema `s1`, Brooke cannot query the table, and GET_PRIVILEGES_DESCRIPTION does not return SELECT as a privilege for the table.

Note:
Inherited privileges are not displayed if privilege inheritance is disabled at the database level.

Syntax

```
GET_PRIVILEGES_DESCRIPTION( 'type', '[[database.]schema.]name' );
```

Parameters

type	Specifies an object type, one of the following: • `database` • `table` • `schema` • `view` • `sequence` • `model` • `library` • `resource pool`
`[`*database*`.]`*schema*	Specifies a database and schema, by default the current database and `public`, respectively.
name	Name of the target object

Privileges

None

Example

In the following example, user Glenn has set the REPORTER role and wants to check his effective privileges on schema `s1` and table `s1.articles`.

- Table `s1.articles` inherits privileges from its schema (`s1`).
- The REPORTER role has the following privileges:
  - SELECT on schema `s1`
  - INSERT WITH GRANT OPTION on table `s1.articles`
- User Glenn has the following privileges:
  - UPDATE and USAGE on schema `s1`.
  - DELETE on table `s1.articles`.

GET_PRIVILEGES_DESCRIPTION returns the following effective privileges for Glenn on schema `s1`:

```
=> SELECT GET_PRIVILEGES_DESCRIPTION('schema', 's1');
   GET_PRIVILEGES_DESCRIPTION
-------------------------------
 SELECT, UPDATE, USAGE
(1 row)
```

GET_PRIVILEGES_DESCRIPTION returns the following effective privileges for Glenn on table `s1.articles`:

```
=> SELECT GET_PRIVILEGES_DESCRIPTION('table', 's1.articles');
   GET_PRIVILEGES_DESCRIPTION
-------------------------------
 INSERT*, SELECT, UPDATE, DELETE
(1 row)
```

See Also

- Database Users and Privileges
- Database Roles
- Granting and Revoking Privileges

HAS_ROLE

Checks whether a Vertica user role is granted to the specified user or role, and returns true or false.

You can also query system tables ROLES, GRANTS, and USERS to obtain information on users and their role assignments. For details, see Viewing User Roles.

Behavior Type

Stable

Syntax

```
HAS_ROLE( [ 'grantee' ,] 'verify-role' );
```

Parameters

grantee	Valid only for superusers, specifies the name of a user or role to look up. If this argument is omitted, the function uses the current user name (CURRENT_USER). If you specify a role, Vertica checks whether this role is granted to the role specified in *verify-role*. **Important:** If a non-superuser supplies this argument, Vertica returns an error.
verify-role	Name of the role to verify for *grantee*.

Privileges

None

Examples

In the following example, a dbadmin user checks whether user MikeL is assigned the admnistrator role:

```
=> \c
You are now connected as user "dbadmin".
=> SELECT HAS_ROLE('MikeL', 'administrator');
 HAS_ROLE
----------
 t
(1 row)
```

User MikeL checks whether he has the regional_manager role:

```
=> \c - MikeL
You are now connected as user "MikeL".
=> SELECT HAS_ROLE('regional_manager');
 HAS_ROLE
----------
 f
(1 row)
```

The dbadmin grants the regional_manager role to the administrator role. On checking again, MikeL verifies that he now has the regional_manager role:

```
dbadmin=> \c
You are now connected as user "dbadmin".
dbadmin=> GRANT regional_manager to administrator;
GRANT ROLE
dbadmin=> \c - MikeL
You are now connected as user "MikeL".
dbadmin=> SELECT HAS_ROLE('regional_manager');
 HAS_ROLE
----------
 t
(1 row)
```

See Also

- GRANTS
- ROLES
- USERS
- Database Users and Privileges

RELEASE_SYSTEM_TABLES_ACCESS

Enables non-superuser access to all system tables. After you call this function, Vertica ignores the IS_ACCESSIBLE_DURING_LOCKDOWN setting in table SYSTEM_TABLES. To resume enforcement of access restrictions on non-superusers to system tables, call RESTRICT_SYSTEM_TABLES_ACCESS.

Syntax

```
RELEASE_SYSTEM_TABLES_ACCESS()
```

Privileges

Superuser

RESTRICT_SYSTEM_TABLES_ACCESS

Checks system table SYSTEM_TABLES to determine which system tables non-superusers can access. Non-superuser access to each system table is specified by the Boolean column IS_ACCESSIBLE_DURING_LOCKDOWN. When you call this function, Vertica checks the IS_ACCESSIBLE_DURING_LOCKDOWN setting on each system table, and enforces access on all non-superuser accordingly.

By default, Vertica enforces IS_ACCESSIBLE_DURING_LOCKDOWN settings. To enable non-superuser access to all system tables, you must explicitly call RELEASE_SYSTEM_TABLES_ACCESS.

Syntax

```
RESTRICT_SYSTEM_TABLES_ACCESS()
```

Privileges

Superuser

Profiling Functions

This section contains profiling functions specific to Vertica.

CLEAR_PROFILING

Clears from memory data for the specified profiling type.

> **Note:**
> Vertica stores profiled data in memory, so profiling can be memory intensive depending on how much data you collect.

Syntax

```
CLEAR_PROFILING( 'profiling-type' [, 'scope'] )
```

Parameters

profiling-type	The type of profiling data to clear: • `session`: Clear profiling for basic session parameters and lock time out data. • `query`: Clear profiling for general information about queries that ran, such as the query strings used and the duration of queries. • `ee`: Clear profiling for information about the execution run of each query.
scope	Specifies at what scope to clear profiling on the specified data, one of the following: • `local`: Clear profiling data for the current session. • `global`: Clear profiling data across all database sessions.

Example

The following statement clears profiled data for queries:

```
=> SELECT CLEAR_PROFILING('query');
```

See Also

- DISABLE_PROFILING
- ENABLE_PROFILING
- SHOW_PROFILING_CONFIG
- Profiling Database Performance

DISABLE_PROFILING

Disables for the current session collection of profiling data of the specified type. For detailed information, see Enabling Profiling in the Administrator's Guide

Syntax

```
DISABLE_PROFILING( 'profiling-type' )
```

Parameters

profiling-type	The type of profiling data to disable: • `session`: Disables profiling for basic session parameters and lock time out data. • `query`: Disables profiling for general information about queries that ran, such as the query strings used and the duration of queries. • `ee`: Disables profiling for information about the execution run of each query.

Example

The following statement disables profiling on query execution runs:

```
=> SELECT DISABLE_PROFILING('ee');
   DISABLE_PROFILING
----------------------
 EE Profiling Disabled
(1 row)
```

See Also

- CLEAR_PROFILING
- ENABLE_PROFILING
- SHOW_PROFILING_CONFIG

ENABLE_PROFILING

Enables collection of profiling data of the specified type for the current session. For detailed information, see Enabling Profiling in the Administrator's Guide.

Note:
Vertica stores session and query profiling data in memory, so profiling can be memory intensive, depending on how much data you collect.

Syntax

```
ENABLE_PROFILING( 'profiling-type' )
```

Parameters

profiling-type	The type of profiling data to enable: • `session`: Enable profiling for basic session parameters and lock time out data. • `query`: Enable profiling for general information about queries that ran, such as the query strings used and the

	duration of queries. • ee: Enable profiling for information about the execution run of each query.

Example

The following statement enables profiling on query execution runs:

```
=> SELECT ENABLE_PROFILING('ee');
   ENABLE_PROFILING
----------------------
 EE Profiling Enabled
(1 row)
```

See Also

- CLEAR_PROFILING
- DISABLE_PROFILING
- SHOW_PROFILING_CONFIG

SHOW_PROFILING_CONFIG

Shows whether profiling is enabled.

Syntax

```
SHOW_PROFILING_CONFIG ()
```

Example

The following statement shows that profiling is enabled globally for all profiling types (session, execution engine, and query):

```
=> SELECT SHOW_PROFILING_CONFIG();
SHOW_PROFILING_CONFIG
-----------------------------------------
 Session Profiling: Session off, Global on
 EE Profiling:      Session off, Global on
 Query Profiling:   Session off, Global on
(1 row)
```

Projection Management Functions

This section contains projection management functions specific to Vertica.

See Also

- V_CATALOG.PROJECTIONS
- V_CATALOG.PROJECTION_COLUMNS
- V_MONITOR.PROJECTION_REFRESHES
- V_MONITOR.PROJECTION_STORAGE

CLEAR_PROJECTION_REFRESHES

Clears information in system table PROJECTION_REFRESHES of projection refresh history.

System table PROJECTION_REFRESHES records information about refresh operations, successful and unsuccessful. PROJECTION_REFRESHES retains refresh data until one of the following events occurs:

- CLEAR_PROJECTION_REFRESHES is called.
- The table's storage quota is exceeded.

PROJECTION_REFRESHES checks the Boolean column IS_EXECUTING in PROJECTION_REFRESHES to determine whether refresh operations are still running or are complete. The function only removes information for refresh operations that are complete.

Syntax

```
CLEAR_PROJECTION_REFRESHES()
```

Privileges

Superuser

Example

```
=> SELECT CLEAR_PROJECTION_REFRESHES();
 CLEAR_PROJECTION_REFRESHES
----------------------------
 CLEAR
(1 row)
```

See Also

- REFRESH
- START_REFRESH
- Clearing Projection Refresh History

EVALUATE_DELETE_PERFORMANCE

Evaluates projections for potential DELETE and UPDATE performance issues. If Vertica finds any issues, it issues a warning message. When evaluating multiple projections, EVALUATE_DELETE_PERFORMANCE returns up to ten projections with issues, and the name of a table that lists all issues that it found.

> **Note:**
> EVALUATE_DELETE_PERFORMANCE returns messages that specifically reference delete performance. Keep in mind, however, that delete and update operations benefit equally from the same optimizations.

For information on resolving delete and update performance issues, see DELETE and UPDATE Optimization in the Administrator's Guide.

Syntax

```
EVALUATE_DELETE_PERFORMANCE ( ['[[database.]schema.]scope'] )
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema

	name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.

scope	Specifies the projections to evaluate, one of the following:
	• [*table.*]*projection*
	Evaluate *projection*. For example:
	`SELECT EVALUATE_DELETE_PERFORMANCE('store.store_orders_fact.store_orders_fact_b1');`
	• *table*
	Specifies to evaluate all projections of *table*. For example:
	`SELECT EVALUATE_DELETE_PERFORMANCE('store.store_orders_fact');`
	If you supply no arguments, EVALUATE_DELETE_PERFORMANCE evaluates all projections that you can access. Depending on the size of your database, this can incur considerable overhead.

Privileges

Non-superuser: SELECT privilege on the anchor table

Example

EVALUATE_DELETE_PERFORMANCE evaluates all projections of table example for potential DELETE and UPDATE performance issues.

```
=> create table example (A int, B int,C int);
CREATE TABLE
=> create projection one_sort (A,B,C) as (select A,B,C from example) order by A;
CREATE PROJECTION
=> create projection two_sort (A,B,C) as (select A,B,C from example) order by A,B;
CREATE PROJECTION
=> select evaluate_delete_performance('example');
            evaluate_delete_performance
-------------------------------------------------
 No projection delete performance concerns found.
```

```
(1 row)
```

The previous example show that the two projections one_sort and two_sort have no inherent structural issues that might cause poor DELETE performance. However, the data contained within the projection can create potential delete issues if the sorted columns do not uniquely identify a row or small number of rows.

In the following example, Perl is used to populate the table with data using a nested series of loops:

- The inner loop populates column C.
- The middle loop populates column B.
- The outer loop populates column A.

The result is column A contains only three distinct values (0, 1, and 2), while column B slowly varies between 20 and 0 and column C changes in each row:

```
=> \! perl -e 'for ($i=0; $i<3; $i++) { for ($j=0; $j<21; $j++) { for ($k=0; $k<19; $k++) { printf
"%d,%d,%d\n", $i,$j,$k;}}}' | /opt/vertica/bin/vsql -c "copy example from stdin delimiter ','
direct;"
Password:
=> select * from example;
 A | B  | C

 2 |  0 |  4
 2 |  0 |  3
 2 |  0 |  2
 2 |  0 |  1
 2 |  0 |  0
=> SELECT COUNT (*) FROM example;
 COUNT
-------
  1197
(1 row)
=> SELECT COUNT (DISTINCT A) FROM example;
 COUNT
-------
     3
(1 row)
```

EVALUATE_DELETE_PERFORMANCE is run against the projections again to determine whether the data within the projections causes any potential DELETE performance issues. Projection one_sort has potential delete issues as it only sorts on column A which has few distinct values. Each value in the sort column corresponds to many rows in the projection, which can adversely impact DELETE performance. In contrast, projection two_sort is sorted on columns A and B, where each combination of values in the two sort columns identifies just a few rows, so deletes can be performed faster:

```
=> select evaluate_delete_performance('example');
            evaluate_delete_performance
-----------------------------------------------------
 The following projections exhibit delete performance concerns:
        "public"."one_sort_b1"
        "public"."one_sort_b0"
See v_catalog.projection_delete_concerns for more details.

=> \x
Expanded display is on.
dbadmin=> select * from projection_delete_concerns;
-[ RECORD 1 ]------+-------------------------------------------------------------------------------------
-------------------------------------------------------------------------
projection_id      | 45035996273878562
projection_schema  | public
projection_name    | one_sort_b1

comment            | The squared number of rows matching each sort key is about 159201 on average.
```

If you omit supplying an argument to EVALUATE_DELETE_PERFORMANCE, it evaluates all projections that you can access:

```
=> select evaluate_delete_performance();
                          evaluate_delete_performance
-------------------------------------------------------------------------------
 The following projections exhibit delete performance concerns:
        "public"."one_sort_b0"
        "public"."one_sort_b1"
See v_catalog.projection_delete_concerns for more details.
(1 row)
```

GET_PROJECTION_SORT_ORDER

Returns the order of columns in a projection's ORDER BY clause.

Syntax

```
GET_PROJECTION_SORT_ORDER( '[[database.]schema.]projection' );
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
`projection`	The target projection.

Privileges

Non-superuser: SELECT privilege on the anchor table

Examples

```
=> SELECT get_projection_sort_order ('store_orders_super');
                                get_projection_sort_order
-----------------------------------------------------------------------------------------
 public.store_orders_super [Sort Cols: "order_no", "order_date", "shipper", "ship_date"]

(1 row)
```

GET_PROJECTION_STATUS

Returns information relevant to the status of a **projection**:

- The current K-safety status of the database
- The number of nodes in the database
- Whether the projection is segmented
- The number and names of buddy projections
- Whether the projection is safe
- Whether the projection is up to date
- Whether statistics have been computed for the projection

Use `GET_PROJECTION_STATUS` to monitor the progress of a projection data refresh.

Syntax

```
GET_PROJECTION_STATUS ( '[[database.]schema.]projection' );
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
projection	The projection for which to display status.

Examples

```
=> SELECT GET_PROJECTION_STATUS('public.customer_dimension_site01');
                                    GET_PROJECTION_STATUS
-------------------------------------------------------------------------------------------
 Current system K is 1.
# of Nodes: 4.
public.customer_dimension_site01 [Segmented: No] [Seg Cols: ] [K: 3] [public.customer_dimension_
site04, public.customer_dimension_site03,
public.customer_dimension_site02]
[Safe: Yes] [UptoDate: Yes][Stats: Yes]
```

GET_PROJECTIONS

Returns the following information about projections of the specified anchor table:

Contextual information	• Database K-safety • Number of database nodes • Number of projections for this table
Projection data	For each projection, specifies: • All buddy projections • Whether it is segmented • Whether it is safe • Whether it is up-to-date.

You can also use `GET_PROJECTIONS` to monitor the progress of a projection data refresh.

Syntax

```
GET_PROJECTIONS ( '[[database.]schema-name.]table' )
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example:

	`myschema.thisDbObject` If you specify a database, it must be the current database.
table	Anchor table of the projections to list.

Privileges

None

Examples

The following example gets information about projections for VMart table `store.store_dimension`:

```
=> SELECT GET_PROJECTIONS('store.store_dimension');
-[ RECORD 1 ]---+
GET_PROJECTIONS | Current system K is 1.
# of Nodes: 3.
Table store.store_dimension has 2 projections.

Projection Name: [Segmented] [Seg Cols] [# of Buddies] [Buddy Projections] [Safe] [UptoDate] [Stats]
-----------------------------------------------------------------------------------------------------
store.store_dimension_b1 [Segmented: Yes] [Seg Cols: "store.store_dimension.store_key"] [K: 1]
[store.store_dimension_b0] [Safe: Yes] [UptoDate: Yes] [Stats: RowCounts]
store.store_dimension_b0 [Segmented: Yes] [Seg Cols: "store.store_dimension.store_key"] [K: 1]
[store.store_dimension_b1] [Safe: Yes] [UptoDate: Yes] [Stats: RowCounts]
```

REFRESH

Synchronously refreshes one or more table projections in the foreground, and updates system table PROJECTION_REFRESHES. If you run REFRESH with no arguments, it refreshes all projections that contain stale data.

To understand projection refresh in detail, go to Refreshing Projections.

Syntax

```
REFRESH ( [ '[[database.]schema.]table-name[,…]' ] )
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table-name	The anchor table of the projections to refresh. If you specify multiple tables, `REFRESH` attempts to refresh them in parallel. Such calls are part of the Database Designer deployment (and deployment script).

Returns

Note:
If `REFRESH` does not refresh any projections, it returns a header string with no results.

Column...	Returns...
`Projection Name`	The projection targeted for refresh.
`Anchor Table`	The projection's associated anchor table.
`Status`	Projections' refresh status: • `queued`: Queued for refresh. • `refreshing`: Refresh is in process. • `refreshed`: Refresh successfully completed. • `failed`: Refresh did not successfully complete.
`Refresh Method`	Method used to refresh the projection.

Error Count	Number of times a refresh failed for the projection.
Duration (sec)	How long (in seconds) the projection refresh ran.

Privileges

- **Superuser**
- Owner of the specified tables

Refresh Methods

Vertica can refresh a projection from one of its buddies, if one is available. In this case, the target projection gets the source buddy's historical data. Otherwise, the projection is refreshed from scratch with data of the latest epoch at the time of the refresh operation. In this case, the projection cannot participate in historical queries on any epoch that precedes the refresh operation.

To determine the method used to refresh a given projection, query REFRESH_METHOD from system table PROJECTION_REFRESHES.

Examples

The following example refreshes the projections in tables t1 and t2:

```
=> SELECT REFRESH('t1, t2');
                                          REFRESH
-------------------------------------------------------------------------------------
Refresh completed with the following outcomes:

Projection Name: [Anchor Table] [Status] [Refresh Method] [Error Count] [Duration (sec)]
-------------------------------------------------------------------------------------

"public"."t1_p": [t1] [refreshed] [scratch] [0] [0]"public"."t2_p": [t2] [refreshed] [scratch] [0]
[0]
```

This next example shows that only the projection on table t was refreshed:

```
=> SELECT REFRESH('allow, public.deny, t');
                                              REFRESH
-------------------------------------------------------------------------------------

Refresh completed with the following outcomes:
```

```
Projection Name: [Anchor Table] [Status] [Refresh Method] [Error Count] [Duration (sec)]
------------------------------------------------------------------------------------------
"n/a"."n/a": [n/a] [failed: insufficient permissions on table "allow"] [] [1] [0]
"n/a"."n/a": [n/a] [failed: insufficient permissions on table "public.deny"] [] [1] [0]
"public"."t_p1": [t] [refreshed] [scratch] [0] [0]
```

See Also

- CLEAR_PROJECTION_REFRESHES
- START_REFRESH

REFRESH_COLUMNS

Refreshes table columns that are defined with the constraint SET USING or DEFAULT USING. All refresh operations associated with a call to REFRESH_COLUMNS belong to the same transaction. Thus, all tables and columns specified by REFRESH_COLUMNS must be refreshed; otherwise, the entire operation is rolled back.

Syntax

```
REFRESH_COLUMNS ( 'table-list', '[column-list]'
   [, '[refresh-mode ]' [, min-partition-key, max-partition-key] ]
)
```

Parameters

table-list	A comma-delimited list of the tables to refresh: [[*database*.]*schema*.]*table*[,…] **Important:** If you specify multiple tables, parameter *refresh-mode* must be set to REBUILD.
column-list	A comma-delimited list of columns to refresh, specified as follows: • [[[*database*.]*schema*.]*table*.]*column*[,…] • [[*database*.]*schema*.]*table*.*

	where asterisk (*) specifies to refresh all SET USING/DEFAULT USING columns in *table*. For example:
	`SELECT REFRESH_COLUMNS ('t1, t2', 't1.*, t2.b', 'REBUILD');`
	If *column-list* is set to an empty string (''), REFRESH_COLUMNS refreshes all SET USING/DEFAULT USING columns in the specified tables.
	The following requirements apply:
	• All specified columns must have a SET USING or DEFAULT USING constraint.
	• If REFRESH_COLUMNS specifies multiple tables, all column names must be qualified by their table names. If the target tables span multiple schemas, all column names must be fully qualified by their schema and table names. For example:
	`SELECT REFRESH_COLUMNS ('t1, t2', 't1.a, t2.b', 'REBUILD');`
	If you specify a database, it must be the current database.

refresh-mode	Specifies how to refresh SET USING columns: • UPDATE: Marks original rows as deleted and replaces them with new rows. In order to save these updates, you must issue a COMMIT statement. • REBUILD: Replaces all data in the specified columns. The rebuild operation is auto-committed. If set to an empty string or omitted, REFRESH_COLUMNS executes in UPDATE mode. If you specify multiple tables, you must explicitly specify REBUILD mode. In both cases, REFRESH_COLUMNS returns an error if any SET_USING column is defined as a primary or unique key in a table that enforces those constraints. See REBUILD Mode Restrictions for limitations on using the REBUILD option.
min-partition-key *max-partition-key*	Qualifies REBUILD mode, limiting the rebuild operation to one or more partitions. To specify a range of partitions,

	max-partition-key must be greater than *min-partition-key*. To update one partition, the two arguments must be equal. The following requirements apply: • The function can specify only one table to refresh. • The table must be partitioned on the specified keys. You can use these arguments to refresh columns with recently loaded data—that is, data in the latest partitions. Using this option regularly can significantly minimize the overhead otherwise incurred by rebuilding entire columns in a large table. See Partition-based REBUILD Operations below for details.

Privileges

- MODIFY privilege on the target table, USAGE privilege on its schema
- For each SET USING column to refresh that queries another table or view: SELECT privilege on the queried table/view, USAGE privilege on its schema

REBUILD versus REFRESH Modes

In general, UPDATE is a better choice when changes to SET USING column data are confined to a relatively small number of rows. Use REBUILD when a significant amount of SET USING column data is stale and must be updated. It is generally good practice to call REFRESH_COLUMNS with REBUILD on any new SET USING column—for example, to populate a SET USING column after adding it with ALTER TABLE…ADD COLUMN.

REBUILD Mode Restrictions

If you call REFRESH_COLUMNS on a SET USING column and specify the refresh mode as REBUILD, Vertica returns an error if any of the following conditions is true for that column:

- Specified as a table partition key.
- Included in an unsegmented projection of the target table.
- Included in a projection with expressions, or any live aggregate projection that invokes a user-defined transform function (UDTF).
- Included in a projection's sort order or segmentation.

- Included in a projection, and the projection omits an anchor table column that is referenced in the column's SET USING expression.
- Included in a projection's GROUPED clause.

Partition-based REBUILD Operations

If a flattened table is partitioned, you can reduce the overhead of calling REFRESH_COLUMNS in REBUILD mode, by specifying one or more partition keys. Doing so limits the rebuild operation to the specified partitions. For example, table public.orderFact is defined with SET USING column cust_name. This table is partitioned on column order_date, where the partition clause invokes Vertica function CALENDAR_HIERARCHY_DAY. Thus, you can call REFRESH_COLUMNS on specific time-delimited partitions of this table—in this case, on orders over the last two months:

```
=> SELECT REFRESH_COLUMNS ('public.orderFact',
                        'cust_name',
                        'REBUILD',
                        TO_CHAR(ADD_MONTHS(current_date, -2),'YYYY-MM')||'-01',
                        TO_CHAR(LAST_DAY(ADD_MONTHS(current_date, -1))));
      REFRESH_COLUMNS
---------------------------
 refresh_columns completed
(1 row)
```

Examples

See Flattened Table Example and SET USING versus DEFAULT.

START_REFRESH

Refreshes projections in the current schema with the latest data of their respective **anchor tables**. START_REFRESH runs asynchronously in the background, and updates system table PROJECTION_REFRESHES. This function has no effect if a refresh is already running.

To refresh only projections of a specific table, use REFRESH. When you deploy a design through Database Designer, it automatically refreshes its projections.

Syntax

```
START_REFRESH()
```

Privileges

None

Requirements

All nodes must be up.

Refresh Methods

Vertica can refresh a projection from one of its buddies, if one is available. In this case, the target projection gets the source buddy's historical data. Otherwise, the projection is refreshed from scratch with data of the latest epoch at the time of the refresh operation. In this case, the projection cannot participate in historical queries on any epoch that precedes the refresh operation.

To determine the method used to refresh a given projection, query `REFRESH_METHOD` from system table `PROJECTION_REFRESHES`.

Example

```
=> SELECT START_REFRESH();
             START_REFRESH
---------------------------------------
 Starting refresh background process.
(1 row)
```

See Also

- Refreshing Projections
- `CLEAR_PROJECTION_REFRESHES`

Purge Functions

This section contains purge functions specific to Vertica.

PURGE

Permanently removes delete vectors from ROS storage containers so disk space can be reused. PURGE removes all historical data up to and including the **Ancient History Mark** epoch.

PURGE does not delete temporary tables.

Caution:
PURGE can temporarily use significant disk space.

Syntax

```
SELECT PURGE()
```

Privileges

- Table owner
- USAGE privilege on schema

Example

After you delete data from a Vertica table, that data is marked for deletion. To see the data that is marked for deletion, query system table DELETE_VECTORS.

Run PURGE to remove the delete vectors from ROS containers.

```
=> SELECT * FROM test1;
 number
--------
      3
     12
     33
```

```
     87
     43
     99
(6 rows)

=> DELETE FROM test1 WHERE number > 50;
 OUTPUT
--------
      2
(1 row)

=> SELECT * FROM test1;
 number
--------
     43
      3
     12
     33
(4 rows)
=> SELECT node_name, projection_name, deleted_row_count FROM DELETE_VECTORS;
    node_name     | projection_name | deleted_row_count
------------------+-----------------+-------------------
 v_vmart_node0002 | test1_b1        |                 1
 v_vmart_node0001 | test1_b1        |                 1
 v_vmart_node0001 | test1_b0        |                 1
 v_vmart_node0003 | test1_b0        |                 1
(4 rows)

=> SELECT PURGE();
...
(Table: public.test1) (Projection: public.test1_b0)
(Table: public.test1) (Projection: public.test1_b1)
...
(4 rows)
```

After the ancient history mark (AHM) advances:

```
=> SELECT * FROM DELETE_VECTORS;
 (No rows)
```

See Also

- Purging Deleted Data
- PURGE_PARTITION
- PURGE_PROJECTION
- PURGE_TABLE

PURGE_PARTITION

Purges a table partition of deleted rows. Similar to PURGE and PURGE_PROJECTION, this function removes deleted data from physical storage so you can reuse the disk space.

PURGE_PARTITION removes data only from the **AHM** epoch and earlier.

Syntax

```
PURGE_PARTITION ( '[[database.]schema.]table', partition-key )
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table	The partitioned table to purge.
partition-key	The key of the partition to purge.

Privileges

- Table owner
- USAGE privilege on schema

Example

The following example lists the count of deleted rows for each partition in a table, then calls `PURGE_PARTITION()` to purge the deleted rows from the data.

```
=> SELECT partition_key,table_schema,projection_name,sum(deleted_row_count)
   AS deleted_row_count FROM partitions
   GROUP BY partition_key,table_schema,projection_name
   ORDER BY partition_key;

 partition_key | table_schema | projection_name | deleted_row_count
---------------+--------------+-----------------+-------------------
 0             | public       | t_super         |                 2
 1             | public       | t_super         |                 2
 2             | public       | t_super         |                 2
 3             | public       | t_super         |                 2
 4             | public       | t_super         |                 2
 5             | public       | t_super         |                 2
```

```
 6             | public       | t_super         |                 2
 7             | public       | t_super         |                 2
 8             | public       | t_super         |                 2
 9             | public       | t_super         |                 1
(10 rows)
=> SELECT PURGE_PARTITION('t',5); -- Purge partition with key 5.
                           purge_partition
-------------------------------------------------------------------------
 Task: merge partitions
(Table: public.t) (Projection: public.t_super)
(1 row)

=> SELECT partition_key,table_schema,projection_name,sum(deleted_row_count)
   AS deleted_row_count FROM partitions
   GROUP BY partition_key,table_schema,projection_name
   ORDER BY partition_key;

 partition_key | table_schema | projection_name | deleted_row_count
---------------+--------------+-----------------+-------------------
 0             | public       | t_super         |                 2
 1             | public       | t_super         |                 2
 2             | public       | t_super         |                 2
 3             | public       | t_super         |                 2
 4             | public       | t_super         |                 2
 5             | public       | t_super         |                 0
 6             | public       | t_super         |                 2
 7             | public       | t_super         |                 2
 8             | public       | t_super         |                 2
 9             | public       | t_super         |                 1
(10 rows)
```

See Also

- PURGE
- PURGE_PROJECTION
- PURGE_TABLE
- STORAGE_CONTAINERS

PURGE_PROJECTION

Permanently removes deleted data from physical storage so disk space can be reused. You can purge historical data up to and including the Ancient History Mark epoch.

Caution:
PURGE_PROJECTION can use significant disk space while purging the data.

See PURGE for details about purge operations.

Syntax

```
PURGE_PROJECTION ( '[[database.]schema.]projection' )
```

Parameters

[*database* .]*schema*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
`projection`	The projection to purge.

Privileges

- Table owner
- USAGE privilege on schema

Examples

The following example purges all historical data in projection `tbl_p` that precedes the Ancient History Mark epoch.

```
=> CREATE TABLE tbl (x int, y int);
CREATE TABLE
=> INSERT INTO tbl VALUES(1,2);
 OUTPUT
--------
      1
(1 row)

=> INSERT INTO tbl VALUES(3,4);
 OUTPUT
--------
      1
(1 row)

dbadmin=> COMMIT;
COMMIT
=> CREATE PROJECTION tbl_p AS SELECT x FROM tbl UNSEGMENTED ALL NODES;
WARNING 4468: Projection <public.tbl_p> is not available for query processing.
```

```
Execute the select start_refresh() function to copy data into this projection.
The projection must have a sufficient number of buddy projections and all nodes must be up before
starting a refresh
CREATE PROJECTION
=> SELECT START_REFRESH();
             START_REFRESH
---------------------------------------
 Starting refresh background process.
=> DELETE FROM tbl WHERE x=1;
 OUTPUT
--------
      1
(1 row)

=> COMMIT;
COMMIT
=> SELECT MAKE_AHM_NOW();
         MAKE_AHM_NOW
-------------------------------
 AHM set (New AHM Epoch: 9066)
(1 row)

=> SELECT PURGE_PROJECTION ('tbl_p');
 PURGE_PROJECTION
-------------------
 Projection purged
(1 row)
```

See Also

- PURGE_TABLE
- STORAGE_CONTAINERS
- Purging Deleted Data in the Administrator's Guide.

PURGE_TABLE

Note:
This function was formerly named PURGE_TABLE_PROJECTIONS(). Vertica still supports the former function name.

Permanently removes deleted data from physical storage so disk space can be reused. You can purge historical data up to and including the Ancient History Mark epoch.

Purges all projections of the specified table. You cannot use this function to purge temporary tables.

Syntax

```
PURGE_TABLE ( '[[database.]schema.]table' )
```

Parameters

[*database* .]*schema*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
`table`	The table to purge.

Privileges

- Table owner
- USAGE privilege on schema

Caution:
PURGE_TABLE could temporarily take up significant disk space while the data is being purged.

Example

The following example purges all projections for the store sales fact table located in the Vmart schema:

```
=> SELECT PURGE_TABLE('store.store_sales_fact');
```

See Also

- PURGE
- PURGE_TABLE
- STORAGE_CONTAINERS
- Purging Deleted Data

Session Management Functions

This section contains session management functions specific to Vertica.

See also the SQL system table V_MONITOR.SESSIONS.

CANCEL_REFRESH

Cancels refresh-related internal operations initiated by START_REFRESH and REFRESH.

Syntax

```
CANCEL_REFRESH()
```

Privileges

None

Notes

- Refresh tasks run in a background thread in an internal session, so you cannot use INTERRUPT_STATEMENT to cancel those statements. Instead, use CANCEL_REFRESH to cancel statements that are run by refresh-related internal sessions.
- Run CANCEL_REFRESH() on the same node on which START_REFRESH() was initiated.
- CANCEL_REFRESH() cancels the refresh operation running on a node, waits for the cancelation to complete, and returns SUCCESS.
- Only one set of refresh operations runs on a node at any time.

Example

Cancel a refresh operation executing in the background.

```
=> SELECT START_REFRESH();
             START_REFRESH
```

```
---------------------------------------
Starting refresh background process.
(1 row)
=> SELECT CANCEL_REFRESH();
              CANCEL_REFRESH
---------------------------------------
Stopping background refresh process.
(1 row)
```

See Also

- INTERRUPT_STATEMENT
- SESSIONS
- START_REFRESH
- PROJECTION_REFRESHES

CLOSE_ALL_SESSIONS

Closes all external sessions except the one that issues this function. Call this function before shutting down the Vertica database.

Vertica closes sessions asynchronously, so another session can open before this function returns. In this case, reissue this function. To view the status of all open sessions, query system table SESSIONS.

Syntax

```
CLOSE_ALL_SESSIONS()
```

Privileges

Non-superuser: None required to close your own session

Examples

Two user sessions are open on separate nodes:

```
=> SELECT * FROM sessions;
-[ RECORD 1 ]--------------+--------------------------------------------------
```

```
node_name                   | v_vmartdb_node0001
user_name                   | dbadmin
client_hostname             | 127.0.0.1:52110
client_pid                  | 4554

CLOSE_SESSION

Interrupts the specified external session, rolls back the current transaction if any, and closes the socket. You can only close your own session.

It might take some time before a session is closed. To view the status of all open sessions, query the system table SESSIONS.

For detailed information about session management options, see Managing Sessions in the Administrator's Guide.

Syntax

```
CLOSE_SESSION ( 'sessionid' )
```

Parameters

sessionid	A string that specifies the session to close. This identifier is unique within the cluster at any point in time but can be reused when the session closes.

Privileges

None

Examples

User session opened. Record 2 shows the user session running a `COPY DIRECT` statement.

```
=> SELECT * FROM sessions;
-[ RECORD 1 ]--------------+-------------------------------------------------
node_name                  | v_vmartdb_node0001
user_name                  | dbadmin
client_hostname            | 127.0.0.1:52110
client_pid                 | 4554
login_timestamp            | 2011-01-03 14:05:40.252625-05
session_id                 | stress04-4325:0x14
client_label               |
transaction_start          | 2011-01-03 14:05:44.325781
transaction_id             | 45035996273728326
transaction_description    | user dbadmin (SELECT * FROM sessions;)
statement_start            | 2011-01-03 15:36:13.896288
statement_id               | 10
last_statement_duration_us | 14978
current_statement          | select * from sessions;
ssl_state                  | None
authentication_method      | Trust
-[ RECORD 2 ]--------------+-------------------------------------------------
node_name                  | v_vmartdb_node0002
user_name                  | dbadmin
client_hostname            | 127.0.0.1:57174
client_pid                 | 30117
login_timestamp            | 2011-01-03 15:33:00.842021-05
session_id                 | stress05-27944:0xc1a
client_label               |
transaction_start          | 2011-01-03 15:34:46.538102
transaction_id             | -1
```

```
transaction_description    | user dbadmin (COPY ClickStream_Fact FROM
                             '/data/clickstream/1g/ClickStream_Fact.tbl'
                             DELIMITER '|' NULL '\\n' DIRECT;)
statement_start            | 2011-01-03 15:34:46.538862
statement_id               |
last_statement_duration_us | 26250
current_statement          | COPY ClickStream_Fact FROM '/data/clickstream
                             /1g/ClickStream_Fact.tbl' DELIMITER '|' NULL
                             '\\n' DIRECT;
ssl_state                  | None
authentication_method      | Trust
```

Close user session `stress05-27944:0xc1a`

```
=> \x
Expanded display is off.
=> SELECT CLOSE_SESSION('stress05-27944:0xc1a');
                          CLOSE_SESSION
-----------------------------------------------------------------------
 Session close command sent. Check v_monitor.sessions for progress.
(1 row)
```

Query the sessions table again for current status, and you can see that the second session has been closed:

```
=> SELECT * FROM SESSIONS;
-[ RECORD 1 ]--------------+-----------------------------------------
node_name                  | v_vmartdb_node0001
user_name                  | dbadmin
client_hostname            | 127.0.0.1:52110
client_pid                 | 4554
login_timestamp            | 2011-01-03 14:05:40.252625-05
session_id                 | stress04-4325:0x14
client_label               |
transaction_start          | 2011-01-03 14:05:44.325781
transaction_id             | 45035996273728326
transaction_description    | user dbadmin (select * from SESSIONS;)
statement_start            | 2011-01-03 16:12:07.841298
statement_id               | 20
last_statement_duration_us | 2099
current_statement          | SELECT * FROM SESSIONS;
ssl_state                  | None
authentication_method      | Trust
```

See Also

- CLOSE_ALL_SESSIONS
- SHUTDOWN

CLOSE_USER_SESSIONS

Stops the session for a user, rolls back any transaction currently running, and closes the connection. To determine the status of the sessions to close, query the SESSIONS table.

Note:
Running this function on your own sessions leaves one session running.

Syntax

```
CLOSE_USER_SESSIONS ( 'user-name' )
```

Parameters

user-name	Specifies the user whose sessions are to be closed. If you specify your own user name, Vertica closes all sessions except the one in which you issue this function.

Privileges

DBADMIN

Examples

This example closes all active session for user u1:

```
=> SELECT close_user_sessions('u1');
```

See Also

- CLOSE_ALL_SESSIONS
- CLOSE_SESSION
- SHUTDOWN

GET_NUM_ACCEPTED_ROWS

Returns the number of rows loaded into the database for the last completed load for the current session. GET_NUM_ACCEPTED_ROWS is a **meta-function**. Do not use it as a value in an INSERT query.

The number of accepted rows is not available for a load that is currently in process. Check the LOAD_STREAMS system table for its status.

This meta-function supports loads from STDIN, COPY LOCAL from a Vertica client, or a single file on the initiator. You cannot use GET_NUM_ACCEPTED_ROWS for multi-node loads.

Syntax

```
GET_NUM_ACCEPTED_ROWS();
```

Privileges

None

Note:
The data regarding accepted rows from the last load during the current session does not persist, and is lost when you initiate a new load.

Examples

This examples shows the number of accepted rows from the vmart_load_data.sql meta-command.

```
=> \i vmart_load_data.sql;
=> SELECT GET_NUM_ACCEPTED_ROWS ();
GET_NUM_ACCEPTED_ROWS
----------------------
300000
(1 row)
```

See Also

- GET_NUM_REJECTED_ROWS

GET_NUM_REJECTED_ROWS

Returns the number of rows that were rejected during the last completed load for the current session. GET_NUM_REJECTED_ROWS is a **meta-function**. Do not use it as a value in an INSERT query.

Rejected row information is unavailable for a load that is currently running. The number of rejected rows is not available for a load that is currently in process. Check the LOAD_STREAMS system table for its status.

This meta-function supports loads from STDIN, COPY LOCAL from a Vertica client, or a single file on the initiator. You cannot use GET_NUM_REJECTED_ROWS for multi-node loads.

Syntax

```
GET_NUM_REJECTED_ROWS();
```

Privileges

None

> **Note:**
> The data regarding rejected rows from the last load during the current session does not persist, and is dropped when you initiate a new load.

Examples

This example shows the number of rejected rows from the vmart_load_data.sql meta-command.

```
=>  \i vmart_load_data.sql
```

```
=> SELECT GET_NUM_REJECTED_ROWS ();
GET_NUM_REJECTED_ROWS
----------------------
0
(1 row)
```

See Also

- GET_NUM_ACCEPTED_ROWS

INTERRUPT_STATEMENT

Interrupts the specified statement in a user session, rolls back the current transaction, and writes a success or failure message to the log file.

Sessions can be interrupted during statement execution. Only statements run by user sessions can be interrupted.

Syntax

```
INTERRUPT_STATEMENT( 'session-id', statement-id )
```

Parameters

session-id	Identifies the session to interrupt. This identifier is unique within the cluster at any point in time.
statement-id	Identifies the statement to interrupt. If the *statement-id* is valid, the statement can be interrupted and INTERRUPT_STATEMENT returns a success message. Otherwise the system returns an error.

Privileges

Superuser

Messages

The following list describes messages you might encounter:

Message	Meaning
`Statement interrupt sent. Check SESSIONS for progress.`	This message indicates success.
`Session <id> could not be successfully interrupted: session not found.`	The session ID argument to the interrupt command does not match a running session.
`Session <id> could not be successfully interrupted: statement not found.`	The statement ID does not match (or no longer matches) the ID of a running statement (if any).
`No interruptible statement running`	The statement is DDL or otherwise non-interruptible.
`Internal (system) sessions cannot be interrupted.`	The session is internal, and only statements run by external sessions can be interrupted.

Examples

Two user sessions are open. RECORD 1 shows user session running `SELECT FROM SESSION`, and RECORD 2 shows user session running `COPY DIRECT`:

```
=> SELECT * FROM SESSIONS;
-[ RECORD 1 ]--------------+-----------------------------------------------------
node_name                  | v_vmartdb_node0001
user_name                  | dbadmin
client_hostname            | 127.0.0.1:52110
```

```
client_pid                 | 4554
login_timestamp            | 2011-01-03 14:05:40.252625-05
session_id                 | stress04-4325:0x14
client_label               |
transaction_start          | 2011-01-03 14:05:44.325781
transaction_id             | 45035996273728326
transaction_description    | user dbadmin (select * from sessions;)
statement_start            | 2011-01-03 15:36:13.896288
statement_id               | 10
last_statement_duration_us | 14978
current_statement          | select * from sessions;
ssl_state                  | None
authentication_method      | Trust
-[ RECORD 2 ]--------------+---------------------------------------------------
node_name                  | v_vmartdb_node0003
user_name                  | dbadmin
client_hostname            | 127.0.0.1:56367
client_pid                 | 1191
login_timestamp            | 2011-01-03 15:31:44.939302-05
session_id                 | stress06-25663:0xbec
client_label               |
transaction_start          | 2011-01-03 15:34:51.05939
transaction_id             | 54043195528458775
transaction_description    | user dbadmin (COPY Mart_Fact FROM '/data/Mart_Fact.tbl'
                             DELIMITER '|' NULL '\\n' DIRECT;)
statement_start            | 2011-01-03 15:35:46.436748
statement_id               | 5
last_statement_duration_us | 1591403
current_statement          | COPY Mart_Fact FROM '/data/Mart_Fact.tbl' DELIMITER '|'
                             NULL '\\n' DIRECT;
ssl_state                  | None
authentication_method      | Trust
```

Interrupt the `COPY DIRECT` statement running in session `stress06-25663:0xbec`:

```
=> \x
Expanded display is off.
=> SELECT INTERRUPT_STATEMENT('stress06-25663:0x1537', 5);
                      interrupt_statement
-----------------------------------------------------------------
 Statement interrupt sent. Check v_monitor.sessions for progress.
(1 row)
```

Verify that the interrupted statement is no longer active by looking at the `current_statement` column in the `SESSIONS` system table. This column becomes blank when the statement is interrupted:

```
=> SELECT * FROM SESSIONS;
-[ RECORD 1 ]--------------+---------------------------------------------------
node_name                  | v_vmartdb_node0001
user_name                  | dbadmin
client_hostname            | 127.0.0.1:52110
client_pid                 | 4554
login_timestamp            | 2011-01-03 14:05:40.252625-05
session_id                 | stress04-4325:0x14
client_label               |
```

```
transaction_start          | 2011-01-03 14:05:44.325781
transaction_id             | 45035996273728326
transaction_description    | user dbadmin (select * from sessions;)
statement_start            | 2011-01-03 15:36:13.896288
statement_id               | 10
last_statement_duration_us | 14978
current_statement          | select * from sessions;
ssl_state                  | None
authentication_method      | Trust
-[ RECORD 2 ]--------------+---------------------------------------------------
node_name                  | v_vmartdb_node0003
user_name                  | dbadmin
client_hostname            | 127.0.0.1:56367
client_pid                 | 1191
login_timestamp            | 2011-01-03 15:31:44.939302-05
session_id                 | stress06-25663:0xbec
client_label               |
transaction_start          | 2011-01-03 15:34:51.05939

- Configuration Parameters

RELEASE_ALL_JVM_MEMORY

Forces all sessions to release the memory consumed by their Java Virtual Machines (JVM).

Syntax

```
RELEASE_ALL_JVM_MEMORY();
```

Privileges

Must be a **superuser**.

Example

The following example demonstrates viewing the JVM memory use in all open sessions, then calling RELEASE_ALL_JVM_MEMORY() to release the memory:

```
=> select user_name,external_memory_kb FROM V_MONITOR.SESSIONS;
 user_name | external_memory_kb
-----------+---------------
 dbadmin   |         79705
(1 row)

=> SELECT RELEASE_ALL_JVM_MEMORY();
                           RELEASE_ALL_JVM_MEMORY
-------------------------------------------------------------------------------
 Close all JVM sessions command sent. Check v_monitor.sessions for progress.
(1 row)

=> SELECT user_name,external_memory_kb FROM V_MONITOR.SESSIONS;
 user_name | external_memory_kb
-----------+---------------
 dbadmin   |             0
(1 row)
```

See Also

- RELEASE_JVM_MEMORY

RELEASE_JVM_MEMORY

Terminates a Java Virtual Machine (JVM), making available the memory the JVM was using.

Syntax

```
RELEASE_JVM_MEMORY();
```

Privileges

None.

Examples

User session opened. RECORD 2 shows the user session running COPY DIRECT statement.

```
=> SELECT RELEASE_JVM_MEMORY();
           release_jvm_memory
----------------------------------------
Java process killed and memory released
(1 row)
```

See Also

- RELEASE_ALL_JVM_MEMORY

RESERVE_SESSION_RESOURCE

Reserves memory resources from the general resource pool for the exclusive use of the Vertica backup and restore process. No other Vertica process can access reserved resources. If insufficient resources are available, Vertica queues the reservation request.

This meta-function is a session level reservation. When a session ends Vertica automatically releases any resources reserved in that session. Because the meta-function operates at the session level, the resource name does not need to be unique across multiple sessions.

You can view reserved resources by querying the SESSIONS table.

Syntax

```
RESERVE_SESSION_RESOURCE ( 'name', memory)
```

Parameters

name	The name of the resource to reserve.
memory	The amount of memory in kilobytes to allocate to the resource.

Privileges

None

Example

Reserve 1024 kilobytes of memory for the backup and restore process:

```
=> SELECT reserve_session_resource('VBR_RESERVE',1024);
   -[ RECORD 1 ]------------+----------------
   reserve_session_resource | Grant succeed
```

RESET_SESSION

Applies your default connection string configuration settings to your current session.

Syntax

```
RESET_SESSION()
```

Examples

The following example shows how you use RESET_SESSION.

Resets the current client connection string to the default connection string settings:

```
=> SELECT RESET_SESSION();
    RESET_SESSION
----------------------
 Reset session: done.
(1 row)
```

Statistics Management Functions

This section contains Vertica functions for collecting and managing table data statistics.

ANALYZE_EXTERNAL_ROW_COUNT

Calculates the exact number of rows in an external table. ANALYZE_EXTERNAL_ROW_COUNT runs in the background.

Note:
You cannot calculate row counts on external tables with DO_TM_TASK.

Syntax

```
ANALYZE_EXTERNAL_ROW_COUNT ('[[[database.]schema.]table-name ]')
```

Parameters

[*database* .]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table-name	Specifies the name of the external table for which to calculate the exact row count. If you supply an empty string, Vertica calculate the exact number of rows for all external tables.

Privileges

Any INSERT/UPDATE/DELETE privilege on the external table

Examples

Calculate the exact row count for all external tables:

```
=> SELECT ANALYZE_EXTERNAL_ROW_COUNT('');
```

Calculate the exact row count for table `loader_rejects`:

```
=> SELECT ANALYZE_EXTERNAL_ROW_COUNT('loader_rejects');
```

See Also

- Collecting Database Statistics
- DROP_EXTERNAL_ROW_COUNT

ANALYZE_STATISTICS

Note:
ANALYZE_STATISTICS is an alias of the function ANALYZE_HISTOGRAM, which is no longer documented.

Collects and aggregates data samples and storage information from all nodes that store projections associated with the specified table. By default, Vertica analyzes multiple columns in a single-query execution plan, depending on resource limits. Such multi-column analysis facilitates the following objectives:

- Reduce plan execution latency.
- Speed up analysis of relatively small tables with many columns.

Vertica writes statistics to the database catalog. The query optimizer uses this collected data to create query plans. Without this data, the query optimizer assumes uniform distribution of data values and equal storage usage for all projections.

You can cancel statistics collection with CTRL+C or by calling INTERRUPT_STATEMENT.

Syntax

```
ANALYZE_STATISTICS ('[[[database.]schema.]table]' [, 'column-list' [, percent ]]  )
```

Returns

0—Success

If an error occurs, refer to `vertica.log` for details.

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table	Table on which to collect data. If set to an empty string, Vertica collects statistics for all database tables and their projections.
column-list	Comma-delimited list of columns in *table*, typically predicate columns. Vertica narrows the scope of the data collection to the specified columns. If you alter a table to add a column and populate its contents with either default or other values, call `ANALYZE_STATISTICS` on this column to get the most current statistics.
percent	A float value between 0 and 100 that specifies what percentage of data to read from disk (not the amount of data to analyze). If you omit this argument, Vertica sets the percentage to 10. Analyzing more than 10 percent disk space takes proportionally longer to process, but produces a higher level of sampling accuracy.

Privileges

Non-superuser:

- Schema: USAGE
- Table: One of INSERT, DELETE, or UPDATE

Restrictions

- Vertica supports ANALYZE_STATISTICS on local and global temporary tables. In both cases, you can obtain statistics only on tables that are created with the option ON COMMIT PRESERVE ROWS. Otherwise, Vertica deletes table content on committing the current transaction, so no table data is available for analysis.
- Vertica collects no statistics from the following projections:
  - Live aggregate and Top-K projections
  - Projections that are defined to include an SQL function within an expression

See Also

- Collecting Table Statistics
- ANALYZE_STATISTICS_PARTITION

ANALYZE_STATISTICS_PARTITION

Collects and aggregates data samples and storage information for a range of partitions in the specified table. Vertica writes the collected statistics to the database catalog.

You can cancel statistics collection with CTRL+C or meta-function INTERRUPT_STATEMENT.

Syntax

```
ANALYZE_STATISTICS_PARTITION ('[[database.]schema.]table', 'min-range-value','max-range-value' [,
'column-list' [, percent ]] )
```

Returns

0: Success

If an error occurs, refer to vertica.log for details.

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table	Table on which to collect data.
min-range-value *max-range-value*	Minimum and maximum value of partition keys to analyze, where *min-range-value* must be ≤ *max-range-value*. To analyze one partition, *min-range-value* and *max-range-value* must be equal.
column-list	Comma-delimited list of columns in *table*, typically a predicate column. Vertica narrows the scope of the data collection to the specified columns.
percent	Float value between 0 and 100 that specifies what percentage of data to read from disk (not the amount of data to analyze). If you omit this argument, Vertica sets the percentage to 10. Analyzing more than 10 percent disk space takes proportionally longer to process, but produces a higher level of sampling accuracy.

Privileges

Non-superuser:

- Schema: USAGE
- Table: One of INSERT, DELETE, or UPDATE

Requirements and Restrictions

The following requirements and restrictions apply to `ANALYZE_STATISTICS_PARTITION`:

- The table must be partitioned and cannot contain unpartitioned data.
- The table partition expression must specify a single column. The following expressions are supported:
  - Expressions that specify only the column—that is, partition on all column values. For example:

    ```
    PARTITION BY ship_date GROUP BY CALENDAR_HIERARCHY_DAY(ship_date, 2, 2)
    ```

  - If the column is a DATE or TIMESTAMP/TIMESTAMPTZ, the partition expression can specify a supported date/time function that returns that column or any portion of it, such as month or year. For example, the following partition expression specifies to partition on the year portion of column `order_date`:

    ```
    PARTITION BY YEAR(order_date)
    ```

  - Expressions that perform addition or subtraction on the column. For example:

    ```
    PARTITION BY YEAR(order_date) -1
    ```

- The table partition expression cannot coerce the specified column to another data type.
- Vertica collects no statistics from the following projections:
  - Live aggregate and Top-K projections
  - Projections that are defined to include an SQL function within an expression

Examples

See Collecting Partition Statistics.

DROP_EXTERNAL_ROW_COUNT

Removes external table row count statistics compiled by ANALYZE_EXTERNAL_ROW_COUNT. DROP_EXTERNAL_ROW_COUNT runs in the background.

Caution:
Statistics can be time consuming to regenerate.

Syntax

```
DROP_EXTERNAL_ROW_COUNT ('[[[database.]schema.]table-name ]');
```

Parameters

schema	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table-name	The external table for which to remove the exact row count. If you specify an empty string, Vertica drops the exact row count statistic for all external tables.

Privileges

- INSERT/UPDATE/DELETE privilege on table
- USAGE privilege on schema that contains the table

Examples

Drop row count statistics for external table `loader_rejects`:

```
=> SELECT DROP_EXTERNAL_ROW_COUNT('loader_rejects');
```

See Also

Collecting Database Statistics

DROP_STATISTICS

Removes statistical data on database projections previously generated by ANALYZE_STATISTICS. When you drop this data, the Vertica optimizer creates query plans using default statistics.

Caution:
Regenerating statistics can incur significant overhead.

Syntax

```
DROP_STATISTICS ('[[[database.]schema.]table]' [, 'category' [, '[column-list]'] ] )
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table	Table on which to drop statistics. If set to an empty string, Vertica drops statistics for all database tables and their projections.
category	Category of statistics to drop, one of the following: • `ALL` (default): Drop all statistics, including histograms and row counts. • `HISTOGRAMS`: Drop only histograms. Row count statistics remain.
column-list	Comma-delimited list of columns in *table*, typically predicate columns. Vertica narrows the scope of dropped statistics to the specified columns. If you omit this parameter or supply an empty string, Vertica drops statistics on all columns.

Privileges

Non-superuser:

- Schema: USAGE
- Table: One of INSERT, DELETE, or UPDATE

Examples

Drop all base statistics for the table `store.store_sales_fact`:

```
=> SELECT DROP_STATISTICS('store.store_sales_fact');
 DROP_STATISTICS
-----------------
               0
(1 row)
```

Drop statistics for all table projections:

```
=> SELECT DROP_STATISTICS ('');
 DROP_STATISTICS
-----------------
               0
(1 row)
```

See Also

DROP_STATISTICS_PARTITION

DROP_STATISTICS_PARTITION

Removes statistical data on database projections previously generated by ANALYZE_STATISTICS_PARTITION. When you drop this data, the Vertica optimizer creates query plans using table-level statistics, if available, or default statistics.

Syntax

```
DROP_STATISTICS_PARTITION ('[[database.]schema.]table', '[min-range-value]', '[max-range-value]' [, category [, '[column-list]'] ] )
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
`table`	Table on which to drop statistics.

min-range-value *max-range-value*	The minimum and maximum value of partition keys on which to drop statistics, where *min-range-value* must be ≤ *max-range-value*. If you supply empty strings for both parameters, Vertica drops all partition-level statistics for this table or the specified columns. **Important:** The range of keys to drop must be equal to, or a superset of, the full range of partitions previously analyzed by ANALYZE_STATISTICS_PARTITION. If the range omits any analyzed partition, DROP_STATISTICS_PARTITION drops no statistics.
category	The category of statistics to drop, one of the following: • BASE (default): Drop histograms and row counts (min/max column values, histogram). • HISTOGRAMS: Drop only histograms. Row count statistics remain. • ALL: Drop all statistics.
column-list	A comma-delimited list of columns in *table*, typically predicate columns. Vertica narrows the scope of dropped statistics to the specified columns. If you omit this parameter or supply an empty string, Vertica drops statistics on all columns.

Privileges

Non-superuser:

- Schema: USAGE
- Table: One of INSERT, DELETE, or UPDATE

See Also

DROP_STATISTICS

EXPORT_STATISTICS

Generates statistics in XML format from data previously collected by ANALYZE_STATISTICS. Before you export statistics, collect the latest data by calling ANALYZE_STATISTICS.

Syntax

```
EXPORT_STATISTICS ('[ filename ]', '[[[database.]schema.]table]' [, 'column[,…]' )
```

Parameters

filename	Specifies where to write the generated XML. If *filename* already exists, EXPORT_STATISTICS overwrites it. If you supply an empty string, EXPORT_STATISTICS writes the XML to standard output.
[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table	Specifies the table on which to export projection statistics. If you supply an empty string, Vertica exports all statistics for the database.
scope	Specifies the target table as follows: [[*database.*]*schema.*]*table* If you specify a database, it must be the current database.
column	The name of a column in *table*, typically a predicate column. You can specify multiple comma-delimited columns. Vertica narrows the scope of exported statistics to the specified columns only.

Privileges

Superuser

Restrictions

EXPORT_STATISTICS does not export statistics for LONG data type columns.

Examples

The following statement exports statistics on the VMart example database to a file:

```
=> SELECT EXPORT_STATISTICS('/opt/vertica/examples/VMart_Schema/vmart_stats.xml');
        EXPORT_STATISTICS
----------------------------------
Statistics exported successfully
(1 row)
```

The next statement exports statistics on a single column (price) from a table named food:

```
=> SELECT EXPORT_STATISTICS('/opt/vertica/examples/VMart_Schema/price.xml', 'food.price');
        EXPORT_STATISTICS
----------------------------------
Statistics exported successfully
(1 row)
```

See Also

- EXPORT_STATISTICS_PARTITION
- ANALYZE_STATISTICS
- DROP_STATISTICS
- IMPORT_STATISTICS
- VALIDATE_STATISTICS
- Collecting Database Statistics
- Best Practices For Statistics Collection

EXPORT_STATISTICS_PARTITION

Generates partition-level statistics in XML format from data previously collected by ANALYZE_STATISTICS_PARTITION.

Syntax

```
EXPORT_STATISTICS_PARTITION ('[ filename ]', '[[database.]schema.]table',
'min-range-value','max-range-value' [, 'column[,…]' )
```

Parameters

filename	Specifies where to write the generated XML. If *filename* already exists, EXPORT_STATISTICS_PARTITION overwrites it. If you supply an empty string, the function writes to standard output.
[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table	The table on which to export data.
min-range-value *max-range-value*	The minimum and maximum value of partition keys on which to export statistics, where *min-range-value* must be ≤ *max-range-value*. **Important:** The range of keys to export must be equal to, or a superset of, the full range of partitions previously analyzed by ANALYZE_STATISTICS_PARTITION. If the range omits any analyzed partition, EXPORT_STATISTICS_PARTITION exports no statistics.
column	The name of a column in *table*, typically a predicate column.

	You can specify multiple comma-delimited columns. Vertica narrows the scope of exported statistics to the specified columns only.

Privileges

Superuser

Restrictions

EXPORT_STATISTICS_PARTITION does not export statistics for LONG data type columns.

See Also

- EXPORT_STATISTICS
- ANALYZE_STATISTICS_PARTITION

IMPORT_STATISTICS

Imports statistics from the XML file that was generated by EXPORT_STATISTICS. Imported statistics override existing statistics for the projections that are referenced in the XML file.

Syntax

```
IMPORT_STATISTICS ( 'filename' )
```

Parameters

filename	The path and name of an XML input file that was generated by EXPORT_STATISTICS.

Privileges

Superuser

Restrictions

- IMPORT_STATISTICS imports only valid statistics. If the source XML file has invalid statistics for a specific column, those statistics are not imported and Vertica throws a warning. If the statistics file has an invalid structure, the import operation fails. To check a statistics file for validity, run VALIDATE_STATISTICS.
- IMPORT_STATISTICS returns warnings for LONG data type columns, as the source XML file generated by EXPORT_STATISTICS contains no statistics for columns of that type.

Example

Import the statistics for the VMart database from an XML file previously created by EXPORT_STATISTICS:

```
=> SELECT IMPORT_STATISTICS('/opt/vertica/examples/VMart_Schema/vmart_stats.xml');
                     IMPORT_STATISTICS
-------------------------------------------------------------------------------
Importing statistics for projection date_dimension_super column date_key failure (stats did not
contain row counts)

Importing statistics for projection date_dimension_super column date failure (stats did not contain
row counts)

Importing statistics for projection date_dimension_super column full_date_description failure (stats
did not contain row counts)

...

(1 row)
```

See Also

- ANALYZE_STATISTICS
- EXPORT_STATISTICS

VALIDATE_STATISTICS

Validates statistics in the XML file generated by EXPORT_STATISTICS.

Syntax

```
VALIDATE_STATISTICS ( 'XML-file' )
```

Parameters

XML-file	the path and name of the XML file that contains the statistics to validate.

Privileges

Superuser

Reporting Valid Statistics

The following example shows the results when the statistics are valid:

```
=> SELECT EXPORT_STATISTICS('cust_dim_stats.xml','customer_dimension');
    EXPORT_STATISTICS
----------------------------------
 Statistics exported successfully
(1 row)
=> SELECT VALIDATE_STATISTICS('cust_dim_stats.xml');
 VALIDATE_STATISTICS
---------------------
(1 row)
```

Identifying Invalid Statistics

If VALIDATE_STATISTICS is unable to read a document's XML, it throws this error:

```
=> SELECT VALIDATE_STATISTICS('/home/dbadmin/stats.xml');
                      VALIDATE_STATISTICS
-------------------------------------------------------------------------------
Error validating statistics file: At line 1:1. Invalid document structure
(1 row)
```

If some table statistics are invalid, VALIDATE_STATISTICS returns a report that identifies them. In the following example, the function reports that attributes distinct, buckets, rows, count, and distinctCount cannot be negative numbers.

```
=> SELECT VALIDATE_STATISTICS('/stats.xml');
WARNING 0:  Invalid value '-1' for attribute 'distinct' under column 'public.t.x'.
   Please use a positive value.
WARNING 0:  Invalid value '-1' for attribute 'buckets' under column 'public.t.x'.
   Please use a positive value.
WARNING 0:  Invalid value '-1' for attribute 'rows' under column 'public.t.x'.
```

```
   Please use a positive value.
WARNING 0:  Invalid value '-1' for attribute 'count' under bound '1', column 'public.t.x'.
   Please use a positive value.
WARNING 0:  Invalid value '-1' for attribute 'distinctCount' under bound '1', column 'public.t.x'.
   Please use a positive value.
 VALIDATE_STATISTICS
---------------------
 (1 row)
```

In this case, run ANALYZE_STATISTICS on the table again to create valid statistics.

See Also

- ANALYZE_STATISTICS
- EXPORT_STATISTICS

Storage Management Functions

This section contains storage management functions specific to Vertica.

ALTER_LOCATION_LABEL

Adds a label to a storage location, or changes or removes an existing label. You can change a location label if it is not specified by any storage policy.

Caution:
If you label an existing storage location that already contains data, and then include the labeled location in one or more storage policies, existing data could be moved. If the Tuple Mover determines data stored on a labeled location does not comply with a storage policy, it moves the data elsewhere.

Syntax

```
ALTER_LOCATION_LABEL ( 'path' , '[node]' , '[location-label]' )
```

Parameters

path	The storage location path.
node	The node where the label change is applied. If you supply an empty string, Vertica applies the change across all cluster nodes.
location-label	The label to assign to the specified storage location. If you supply an empty string, Vertica removes that storage location's label.

Privileges

Superuser

Restrictions

You can remove a location label only if both of these conditions are true:

- The label is not specified in the storage policy of a database object.
- The labeled location is not the last available storage for the objects associated with it.

Example

The following `ALTER_LOCATION_LABEL` statement applies across all cluster nodes the label `SSD` to the storage location `/home/dbadmin/SSD/tables`:

```
=> SELECT ALTER_LOCATION_LABEL('/home/dbadmin/SSD/tables','', 'SSD');
          ALTER_LOCATION_LABEL
--------------------------------------
 /home/dbadmin/SSD/tables label changed.
(1 row)
```

See Also

- Altering Location Labels
- CLEAR_OBJECT_STORAGE_POLICY
- SET_OBJECT_STORAGE_POLICY

ALTER_LOCATION_SIZE

Eon Mode only

Resizes **the depot** on one node, all nodes in a subcluster, or all nodes in the database.

> **Important:**
> If you reduce the size of the depot, Vertica may be forced to evict data from the depot often to make room for more recently-requested data. This behavior leads to more accesses to communal storage causing slower performance and higher costs due to access charges.

Syntax

```
ALTER_LOCATION_SIZE( 'location', '[target]', 'size')
```

Parameters

location	The location to resize. Valid options are: • The literal string `depot`. This argument applies to the node's current depot, no matter what its path. This is usually the argument you want to use, even if you are altering just a single node's depot. • The absolute path of the depot in the Linux filesystem. If you change the depot size on multiple nodes and specify a path, the path must be identical on all affected nodes . By default, this is not the case, as the node's name is typically this path. For example, the default depot path for node 1 in a database named verticadb is `/vertica/data/verticadb/v_verticadb_node0001_depot`.
target	The node or nodes on which to change the depot, one of the following: • Name of an individual node. • Name of a subcluster. The function resizes depots on all nodes of the specified subcluster. • Empty string. The function resizes all depots in the database.
size	Valid only if the storage location usage type is set to DEPOT, specifies the maximum amount of disk space that the depot can allocate from the storage location's file system. You can specify *size* in two ways: • *integer*%: Percentage of storage location disk size. • *integer*{K|M|G|T}: Amount of storage location disk size in kilobytes, megabytes, gigabytes, or terabytes. **Important:** However you specify this value, the depot size cannot be more than 80 percent of disk space of the file system where the depot is stored. If you specify a value that is too large, Vertica warns you of this limitation and automatically changes the value to 80% of the size of the file system.

Privileges

Superuser

Examples

On all database nodes, increase the depot's size to 80 percent of file system.

```
=> SELECT node_name, location_label, location_path, max_size
   FROM storage_locations WHERE location_usage = 'DEPOT' ORDER BY 1;
      node_name       | location_label  |                   location_path                    |  max_
size
----------------------+-----------------+----------------------------------------------------+-------
------
 v_verticadb_node0001 | auto-data-depot | /vertica/data/verticadb/v_verticadb_node0001_depot |
4982631424
 v_verticadb_node0002 | auto-data-depot | /vertica/data/verticadb/v_verticadb_node0002_depot |
4982631424
 v_verticadb_node0003 | auto-data-depot | /vertica/data/verticadb/v_verticadb_node0003_depot |
4982631424

=> SELECT alter_location_size('depot', '','80%');
 alter_location_size
---------------------
 depotSize changed.
(1 row)

=> SELECT node_name, location_label, location_path, max_size
   FROM storage_locations WHERE location_usage = 'DEPOT' ORDER BY 1;
      node_name       | location_label  |                   location_path                    |  max_
size
----------------------+-----------------+----------------------------------------------------+-------
------
 v_verticadb_node0001 | auto-data-depot | /vertica/data/verticadb/v_verticadb_node0001_depot |
6643508224
 v_verticadb_node0002 | auto-data-depot | /vertica/data/verticadb/v_verticadb_node0002_depot |
6643508224
 v_verticadb_node0003 | auto-data-depot | /vertica/data/verticadb/v_verticadb_node0003_depot |
6643508224
```

Change the depot size to 75% of the filesystem size for all nodes in the analytics subcluster.

```
=> SELECT subcluster_name,subclusters.node_name,storage_locations.max_size
       FROM subclusters INNER JOIN storage_locations
       ON subclusters.node_name = storage_locations.node_name
       WHERE storage_locations.location_usage='DEPOT';

  subcluster_name   |      node_name       |  max_size
--------------------+----------------------+------------
 default_subcluster | v_verticadb_node0001 | 4982631424

- Eon Mode Architecture

ALTER_LOCATION_USE

Alters the type of files that can be stored at the specified storage location.

Syntax

```
ALTER_LOCATION_USE ( 'path' , '[node]' , 'usage' )
```

Parameters

path	Specifies where the storage location is mounted.
node	Specifies the Vertica node with the storage location. An empty string (' ') specifies to alter the location across all cluster nodes in a single transaction.

usage	One of the following: • DATA: The storage location stores only data files. This is the supported use for both a USER storage location, and a labeled storage location. • TEMP: The location stores only temporary files that are created during loads or queries. • DATA,TEMP: The location can store both types of files.

Privileges

Superuser

USER Storage Location Restrictions

You cannot change a storage location from a USER usage type if you created the location that way, or to a USER type if you did not. You can change a USER storage location to specify DATA (storing TEMP files is not supported). However, doing so does not affect the primary objective of a USER storage location, to be accessible by non-dbadmin users with assigned privileges.

Monitoring Storage Locations

To obtain disk storage information that the database uses on each node, query system table DISK_STORAGE.

Example

The following example alters the storage location across all cluster nodes to store only data:

```
=> SELECT ALTER_LOCATION_USE ('/thirdVerticaStorageLocation/' , '' , 'DATA');
```

See Also

- Altering Location Use
- DROP_LOCATION

- RESTORE_LOCATION
- RETIRE_LOCATION
- GRANT (Storage Location)
- REVOKE (Storage Location)

CLEAR_CACHES

Clears the Vertica internal cache files.

Syntax

```
CLEAR_CACHES ( )
```

Privileges

Superuser

Notes

If you want to run benchmark tests for your queries, in addition to clearing the internal Vertica cache files, clear the Linux file system cache. The kernel uses unallocated memory as a cache to hold clean disk blocks. If you are running version 2.6.16 or later of Linux and you have root access, you can clear the kernel file system cache as follows:

1. Make sure that all data in the cache is written to disk:

   ```
   # sync
   ```

2. Writing to the `drop_caches` file causes the kernel to drop clean caches, entries, and inodes from memory, causing that memory to become free, as follows:

   - To clear the page cache:

     ```
     # echo 1 > /proc/sys/vm/drop_caches
     ```

   - To clear the entries and inodes:

     ```
     # echo 2 > /proc/sys/vm/drop_caches
     ```

- To clear the page cache, entries, and inodes:

```
# echo 3 > /proc/sys/vm/drop_caches
```

Example

The following example clears the Vertica internal cache files:

```
=> SELECT CLEAR_CACHES();
 CLEAR_CACHES
--------------
 Cleared
(1 row)
```

CLEAR_OBJECT_STORAGE_POLICY

Removes a user-defined storage policy from the specified database, schema or table. Storage containers at the previous policy's labeled location are moved to the default location. By default, this move occurs after all pending mergeout tasks return.

Syntax

```
CLEAR_OBJECT_STORAGE_POLICY ( 'object-name' ['key-min', 'key-max'] [, 'enforce-storage-move' ] )
```

Parameters

object-name	The object to clear, one of the following: • *database*: Clears *database* of its storage policy. • [*database*.]*schema*: Clears *schema* of its storage policy. • [[*database*.]*schema*.]*table*: Clears *table* of its storage policy. If *table* is in any schema other than public, you must supply the schema name. In all cases, *database* must be the name of the current database.

key-min *key-max*	Valid only if *object-name* is a table, specifies the range of table partition key values stored at the labeled location.
enforce-storage-move	Specifies when the Tuple Mover moves all existing storage containers for the specified object to its default storage location: • `false` (default): Move storage containers only after all pending mergeout tasks return. • `true`: Immediately move all storage containers to the new location. **Tip:** You can also enforce all storage policies immediately by calling Vertica meta-function `ENFORCE_OBJECT_STORAGE_POLICY`.

Privileges

Superuser

Examples

This following statement clears the storage policy for table `store.store_orders_fact`. The `true` argument specifies to implement the move immediately:

```
=> SELECT CLEAR_OBJECT_STORAGE_POLICY ('store.store_orders_fact', 'true');
                        CLEAR_OBJECT_STORAGE_POLICY
-----------------------------------------------------------------------------
 Object storage policy cleared.
Task: moving storages
(Table: store.store_orders_fact) (Projection: store.store_orders_fact_b0)
(Table: store.store_orders_fact) (Projection: store.store_orders_fact_b1)

(1 row)
```

See Also

- Clearing Storage Policies
- `ALTER_LOCATION_LABEL`

- SET_OBJECT_STORAGE_POLICY
- ENFORCE_OBJECT_STORAGE_POLICY

DROP_LOCATION

Removes the specified storage location. Dropping a storage location is a permanent operation and cannot be undone. Therefore, you must retire a storage location with RETIRE_LOCATION before dropping it.

Syntax

```
DROP_LOCATION ( 'path', '[node]' )
```

Parameters

path	Specifies where the storage location to drop is mounted.
node	The Vertica node where the location is available. If you supply an empty string, Vertica applies the change across all cluster nodes.

Privileges

Superuser

Dropping a Shared Location

When a storage location is created in a shared location such as HDFS, Vertica creates subdirectories for each node to prevent conflicts. For example, suppose you create a shared storage location in /data. The location for v_vmart_node0001 is /data/v_vmart_node0001, the location for v_vmart_node0002 is /data/v_vmart_node0002, and so on. To drop a location on only one node, use the node-specific path such as /data/v_vmart_node0002. To drop a location on all nodes, use the same path that you used to create it (/data in this example).

Storage Locations with Temp and Data Files

If you use a storage location to store data and then alter it to store only temp files, the location can still contain data files. Vertica does not let you drop a storage location containing data files. You can use the function MOVE_RETIRED_LOCATION_DATA to manually merge out the data files from the storage location, or you can drop partitions. Deleting data files does not work.

Examples

The following example shows how to drop a previously retired storage location on `v_vmart_node0003`:

```
=> SELECT DROP_LOCATION('/data', 'v_vmart_node0003');
```

See Also

- Dropping Storage Locations
- Retiring Storage Locations
- ALTER_LOCATION_USE
- RESTORE_LOCATION
- RETIRE_LOCATION
- GRANT (Storage Location)
- REVOKE (Storage Location)

ENFORCE_OBJECT_STORAGE_POLICY

Applies storage policies of the specified object immediately. By default, the Tuple Mover enforces object storage policies after all pending mergeout operations are complete. Calling this function is equivalent to setting the *enforce-storage-move* parameter on related meta-functions. You typically use this function as the last step before dropping a storage location.

Syntax

```
ENFORCE_OBJECT_STORAGE_POLICY ( 'object-name' ['key-min', 'key-max'] )
```

Parameters

object-name	Identifies the database object whose storage policies are to be applied, one of the following: • *database*: Applies *database* storage policies. • [*database*.]*schema*: Applies *schema* storage policies. • [[*database*.]*schema*.]*table*: Applies *table* storage policies. If *table* is in any schema other than public, you must supply the schema name. In all cases, *database* must be the name of the current database.
key-min *key-max*	Valid only if *object-name* is a table, specifies the range of table partition key values on which to perform the move.

Privileges

One of the following:

- Superuser
- Object owner and access to its storage location.

Examples

Apply storage policy updates to the test table:

```
=> SELECT ENFORCE_OBJECT_STORAGE_POLICY ('test');
```

See Also

- CLEAR_OBJECT_STORAGE_POLICY
- RETIRE_LOCATION
- DROP_LOCATION
- Managing Storage Locations

MEASURE_LOCATION_PERFORMANCE

Measures a storage location's disk performance.

Syntax

```
MEASURE_LOCATION_PERFORMANCE ( 'path', 'node' )
```

Parameters

path	Specifies where the storage location to measure is mounted.
node	The Vertica node where the location to be measured is available. To obtain a list of all node names on the cluster, query system table DISK_STORAGE.

Privileges

Superuser

Notes

- If you intend to create a tiered disk architecture in which projections, columns, and partitions are stored on different disks based on predicted or measured access patterns, you need to measure storage location performance for each location in which data is stored. You do not need to measure storage location performance for temp data storage locations because temporary files are stored based on available space.
- The method of measuring storage location performance applies only to configured clusters. If you want to measure a disk before configuring a cluster see Measuring Storage Performance.
- Storage location performance equates to the amount of time it takes to read and write 1MB of data from the disk. This time equates to:

  ```
  IO-time = (time-to-read-write-1MB + time-to-seek) = (1/throughput + 1/latency)
  ```

  Throughput is the average throughput of sequential reads/writes (units in MB per second).

Latency is for random reads only in seeks (units in seeks per second)

> **Note:**
> The IO time of a faster storage location is less than a slower storage location.

Example

The following example measures the performance of a storage location on v_vmartdb_node0004:

```
=> SELECT MEASURE_LOCATION_PERFORMANCE('/secondVerticaStorageLocation/' , 'v_vmartdb_node0004');
WARNING:  measure_location_performance can take a long time. Please check logs for progress
           measure_location_performance
------------------------------------------------
 Throughput : 122 MB/sec. Latency : 140 seeks/sec
```

See Also

- CREATE LOCATION
- ALTER_LOCATION_USE
- RESTORE_LOCATION
- RETIRE_LOCATION
- Measuring Storage Performance

MOVE_RETIRED_LOCATION_DATA

Moves all data from the specified retired storage location or from all retired storage locations in the database. MOVE_RETIRED_LOCATION_DATA migrates the data to non-retired storage locations according to the storage policies of the objects whose data is stored in the location. This function returns only after it completes migration of all affected storage location data.

> **Note:**
> The Tuple Mover migrates data of retired storage locations when it consolidates data into larger **ROS** containers.

Syntax

```
MOVE_RETIRED_LOCATION_DATA( ['location-path'] [, 'node'] )
```

Arguments

location-path	The path of the storage location as specified in the LOCATION_PATH column of system table STORAGE_LOCATIONS. This storage location must be marked as retired. If you omit this argument, MOVE_RETIRED_LOCATION_DATA moves data from all retired storage locations.
node	The node on which to move data of the retired storage location. If *location-path* is undefined on *node*, this function returns an error. If you omit this argument, MOVE_RETIRED_LOCATION_DATA moves data from*location-path* on all nodes.

Privileges

Superuser

Examples

1. Query system table STORAGE_LOCATIONS to show which storage locations are retired:

```
=> SELECT node_name, location_path, location_label, is_retired FROM STORAGE_LOCATIONS
   WHERE is_retired = 't';
    node_name     |    location_path     | location_label | is_retired
------------------+----------------------+----------------+------------
 v_vmart_node0001 | /home/dbadmin/SSDLoc | ssd            | t
 v_vmart_node0002 | /home/dbadmin/SSDLoc | ssd            | t
 v_vmart_node0003 | /home/dbadmin/SSDLoc | ssd            | t
(3 rows)
```

2. Query system table STORAGE_LOCATIONS for the location of the messages table, which is currently stored in retired storage location ssd:

```
=> SELECT node_name, total_row_count, location_label FROM STORAGE_CONTAINERS
   WHERE projection_name ILIKE 'messages%';
    node_name     | total_row_count | location_label
------------------+-----------------+----------------
 v_vmart_node0001 |          333514 | ssd
 v_vmart_node0001 |          333255 | ssd
 v_vmart_node0002 |          333255 | ssd
 v_vmart_node0002 |          333231 | ssd
 v_vmart_node0003 |          333231 | ssd
 v_vmart_node0003 |          333514 | ssd
(6 rows)
```

3. Call MOVE_RETIRED_LOCATION_DATA to move the data off the ssd storage location.

```
=> SELECT MOVE_RETIRED_LOCATION_DATA('/home/dbadmin/SSDLoc');
          MOVE_RETIRED_LOCATION_DATA
-----------------------------------------------
 Move data off retired storage locations done

(1 row)
```

4. Repeat the previous query to verify the storage location of the messages table:

```
=> SELECT node_name, total_row_count, storage_type, location_label FROM storage_containers
   WHERE projection_name ILIKE 'messages%';
    node_name     | total_row_count | location_label
------------------+-----------------+----------------
 v_vmart_node0001 |          333255 | base
 v_vmart_node0001 |          333514 | base
 v_vmart_node0003 |          333514 | base
 v_vmart_node0003 |          333231 | base
 v_vmart_node0002 |          333231 | base
 v_vmart_node0002 |          333255 | base
(6 rows)
```

See Also

- RETIRE_LOCATION
- RESTORE_LOCATION
- Managing Storage Locations

RESTORE_LOCATION

Restores a storage location that was previously retired with RETIRE_LOCATION.

Syntax

```
RESTORE_LOCATION ( 'location-path', 'node' )
```

Parameters

location-path	Specifies where to mount the retired storage location.
node	The Vertica node where the retired location is available. An empty string specifies to perform this operation on all nodes. The operation fails if you dropped any locations.

Privileges

Superuser

Effects of Restoring a Previously Retired Location

After restoring a storage location, Vertica re-ranks all of the cluster storage locations. It uses the newly restored location to process queries as determined by its rank.

Monitoring Storage Locations

To obtain disk storage information that the database uses on each node, query system table DISK_STORAGE.

Examples

Restore the retired storage location on node4:

```
=> SELECT RESTORE_LOCATION ('/thirdVerticaStorageLocation/' , 'v_vmartdb_node0004');
```

See Also

- Altering Location Use
- CREATE LOCATION
- ALTER_LOCATION_USE
- DROP_LOCATION

RETIRE_LOCATION

Inactivates the specified storage location. To obtain a list of all existing storage locations, query system table STORAGE_LOCATIONS.

Syntax

```
RETIRE_LOCATION ( 'location-path', 'node' [, enforce-storage-move ] )
```

Parameters

location-path	Specifies where the storage location to retire resides.
node	The Vertica node where the location is available. An empty string specifies to perform this operation on all nodes.
enforce-storage-move	If set to `true`, the location label is set to an empty string, and the data is moved elsewhere. The location can then be dropped without errors or warnings. Use this argument to expedite dropping a location.

Privileges

Superuser

Retiring a Shared Location

When you create a storage location in a shared HDFS location, Vertica creates subdirectories for each node to prevent conflicts. For example, suppose you create a shared storage location in `/data`. The location for `v_vmartdb_node0001` is `/data/v_vmartdb_node0001`, the location for `v_vmartdb_node0002 is /data/v_vmartdb_node0002`, and so on. To retire a location on only one node, use the node-specific path such as `/data/v_vmartdb_node0002`. To retire a location on all nodes, use the same path that you used to create it (in this example, `/data`).

Note:
Vertica does not identify NFS as a shared file system.

Effects of Retiring a Storage Location

RETIRE_LOCATION checks that the location is not the only storage for data and temp files. At least one location must exist on each node to store data and temp files. However, you can store both sorts of files in either the same location or separate locations.

Note:
If a location is the last available storage for its associated objects, you can retire it only if you set *enforce-storage-move* to `true`

When you retire a storage location:

- No new data is stored at the retired location, unless you first restore it RESTORE_LOCATION.
- By default, if the storage location being retired contains stored data, the data is not moved. Thus, you cannot drop the storage location. Instead, Vertica removes the stored data through one or more mergeouts. To drop the location immediately after retiring it, set parameter *enforce-storage-move* to true.
- If the storage location being retired is used only for temp files or you use *enforce-storage-move*, you can drop the location. See Dropping Storage Locations in the Administrator's Guide, and DROP_LOCATION.

Monitoring Storage Locations

To obtain disk storage information that the database uses on each node, query system table DISK_STORAGE.

Examples

The following examples show two approaches to retiring a storage location.

Specify that a storage location be dropped automatically at a future time:

```
=> SELECT RETIRE_LOCATION ('/data' , 'v_vmartdb_node0004');
```

Specify that a storage location be dropped immediately:

```
=> SELECT RETIRE_LOCATION ('/data' , 'v_vmartdb_node0004', true);
```

See Also

- Retiring Storage Locations
- CREATE LOCATION
- DROP_LOCATION
- RESTORE_LOCATION

SET_LOCATION_PERFORMANCE

Sets disk performance for a storage location.

> **Note:**
> Before calling this function, call MEASURE_LOCATION_PERFORMANCE to obtain the location's throughput and average latency .

Syntax

```
SET_LOCATION_PERFORMANCE ( 'path', 'node' , 'throughput', 'average-latency')
```

Parameters

path	Specifies where the storage location to set is mounted.
node	Specifies the Vertica node where the location to set is available.
throughput	Specifies the throughput for the location, set to a value ≥1.
average-latency	Specifies the average latency for the location, set to a value ≥1.

Privileges

Superuser

Example

The following example sets the performance of a storage location on node2 to a throughput of 122 megabytes per second and a latency of 140 seeks per second.

```
=> SELECT SET_LOCATION_PERFORMANCE('/secondVerticaStorageLocation/','node2','122','140');
```

See Also

- CREATE LOCATION
- Measuring Storage Performance
- Setting Storage Performance

SET_OBJECT_STORAGE_POLICY

Creates or changes the storage policy of a database object by assigning it a labeled storage location. The Tuple Mover uses this location to store new and existing data for this object. If the object already has an active storage policy, calling `SET_OBJECT_STORAGE_POLICY` sets this object's default storage to the new labeled location. Existing data for the object is moved to the new location.

Note:
You cannot create a storage policy on a USER type storage location.

Syntax

```
SET_OBJECT_STORAGE_POLICY (
  '[[database.]schema.]object-name', 'location-label'
   [,'key-min', 'key-max'] [, 'enforce-storage-move' ] )
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example:

	`myschema.thisDbObject` If you specify a database, it must be the current database.
object-name	Identifies the database object assigned to a labeled storage location. The *object-name* can resolve to a database, schema, or table.
location-label	The label of *object-name*'s storage location.
key-min *key-max*	Valid only if *object-name* is a table, specifies the range of table partition key values to store at the labeled location.
enforce-storage-move	Specifies when the Tuple Mover moves all existing storage containers for *object-name* to the labeled storage location: • `false` (default): Move storage containers only after all pending mergeout tasks return. • `true`: Immediately move all storage containers to the new location. **Tip:** You can also enforce all storage policies immediately by calling Vertica meta-function `ENFORCE_OBJECT_STORAGE_POLICY`

Privileges

One of the following:

- Superuser
- Object owner and access to its storage location.

Examples

See Clearing Storage Policies

See Also

- Creating Storage Policies
- Moving Data Storage Locations
- ALTER_LOCATION_LABEL
- CLEAR_OBJECT_STORAGE_POLICY

Text Search Functions

This section contains text search functions specific to Vertica.

DELETE_TOKENIZER_CONFIG_FILE

Deletes a tokenizer configuration file.

Syntax

```
SELECT v_txtindex.DELETE_TOKENIZER_CONFIG_FILE (USING PARAMETERS proc_oid='proc_oid', confirm={true |
false });
```

Parameters

`confirm = [true | false]`	Boolean flag. Indicates that the configuration file should be removed even if the tokenizer is still in use. `True` — Force deletion of the tokenizer when the used parameter value is True. `False` — Delete tokenizer if the used parameter value is False. **Default**: `False`
`proc_oid`	A unique identifier assigned to a tokenizer when it is created. Users must query the system table vs_procedures to get the proc_oid for a given tokenizer name. See Configuring a Tokenizer for more information.

Examples

The following example shows how you can use DELETE_TOKENIZER_CONFIG_FILE to delete the tokenizer configuration file:

```
=> SELECT v_txtindex.DELETE_TOKENIZER_CONFIG_FILE (USING PARAMETERS proc_oid='45035996274126984');
 DELETE_TOKENIZER_CONFIG_FILE
------------------------------
 t
(1 row)
```

GET_TOKENIZER_PARAMETER

Returns the configuration parameter for a given tokenizer.

Syntax

```
SELECT v_txtindex.GET_TOKENIZER_PARAMETER(parameter_name USING PARAMETERS proc_oid='proc_oid');
```

Parameters

parameter_name	Name of the parameter to be returned. One of the following: • stopWordsCaseInsensitive • minorSeparators • majorSeparators • minLength • maxLength • ngramsSize • used
proc_oid	A unique identifier assigned to a tokenizer when it is created. Users must query the system table vs_procedures to get the proc_oid for a given tokenizer name. See Configuring a Tokenizer for more information.

Examples

The following examples show how you can use GET_TOKENIZER_PARAMETER.

Return the stop words used in a tokenizer:

```
=> SELECT v_txtindex.GET_TOKENIZER_PARAMETER('stopwordscaseinsensitive' USING PARAMETERS proc_
oid='45035996274126984');
 getTokenizerParameter
-----------------------
 devil,TODAY,the,fox
(1 row)
```

Return the major separators used in a tokenizer:

```
=> SELECT v_txtindex.GET_TOKENIZER_PARAMETER('majorseparators' USING PARAMETERS proc_
oid='45035996274126984');
 getTokenizerParameter
-----------------------
 {}()&[]
(1 row)
```

READ_CONFIG_FILE

Reads and returns the key-value pairs of all the parameters of a given tokenizer.

You must use the OVER() clause with this function.

Syntax

```
SELECT v_txtindex.READ_CONFIG_FILE(USING PARAMETERS proc_oid='proc_oid') OVER ()
```

Parameters

proc_oid	A unique identifier assigned to a tokenizer when it is created. Users must query the system table vs_procedures to get the proc_oid for a given tokenizer name. See Configuring a Tokenizer for more information.

Examples

The following example shows how you can use READ_CONFIG_FILE to return the parameters associated with a tokenizer:

```
=> SELECT v_txtindex.READ_CONFIG_FILE(USING PARAMETERS proc_oid='45035996274126984') OVER();
               config_key | config_value
 -------------------------+--------------------
  majorseparators          | {}()&[]
  stopwordscaseinsensitive | devil,TODAY,the,fox
(2 rows)
```

SET_TOKENIZER_PARAMETER

Configures the tokenizer parameters.

> **Important:**
> `\n, \t,\r` must be entered as Unicode using Vertica notation, `U&'\000D'`, or using Vertica escaping notation, `E'\r'`. Otherwise, they are taken literally as two separate characters. For example, `"\" & "r"`.

Syntax

```
SELECT v_txtindex.SET_TOKENIZER_PARAMETER (parameter_name, parameter_value USING PARAMETERS proc_
oid='proc_oid')
```

Parameters

`parameter_name`	Name of the parameter to be configured. Use one of the following: • `stopwordsCaseInsensitive` — List of stop words. All the tokens that belong to the list are ignored. Vertica supports separators and stop words up to the first 256 Unicode characters. If you want to define a stop word that contains a comma or a backslash, then it needs to be escaped. For example: `"Dear Jack\," "Dear Jack\\"`

	Default: `''` (empty list) • `majorSeparators` — List of major separators. Enclose in quotes with no spaces between. **Default**: `E' []<>(){}|!;,''"*&?+\r\n\t'` • `minorSeparators` — List of minor separators. Enclose in quotes with no spaces between. **Default**: `E'/:=@.-$#%\\_'` • `minLength` — Minimum length a token can have, type Integer. Must be greater than 0. **Default**: `'2'` • `maxLength` — Maximum length a token can be. Type Integer. Cannot be greater than 1024 bytes. For information about increasing the token size, see Text Search Parameters. Default: `'128'` • `ngramsSize` — Integer value greater than zero. Use only with ngram tokenizers. **Default**: `'3'` • `used` — Indicates when a tokenizer configuration cannot be changed. Type Boolean. After you set used to `True`, any calls to setTokenizerParameter fail. You must set the parameter `used` to `True` before using the configured tokenizer. Doing so prevents the configuration from being modified after being used to create a text index. **Default**: `False`
`parameter_value`	The value of a configuration parameter. If you want to disable minorSeperators or stopWordsCaseInsensitive, then set their values to `''`.
`proc_oid`	A unique identifier assigned to a tokenizer when it is created. Users must query the system table vs_procedures to get the proc_oid for a

	given tokenizer name. See Configuring a Tokenizer for more information.

Examples

The following examples show how you can use SET_TOKENIZER_PARAMETER to configure stop words and separators.

Configure the stop words of a tokenizer:

```
=> SELECT v_txtindex.SET_TOKENIZER_PARAMETER('stopwordsCaseInsensitive', 'devil,TODAY,the,fox' USING
PARAMETERS proc_oid='45035996274126984');
 SET_TOKENIZER_PARAMETER
-------------------------
 t
(1 row)
```

Configure the major separators of a tokenizer:

```
=> SELECT v_txtindex.SET_TOKENIZER_PARAMETER('majorSeparators',E'{}()&[]' USING PARAMETERS proc_
oid='45035996274126984');
 SET_TOKENIZER_PARAMETER
-------------------------
 t
(1 row)
```

Table Management Functions

This section contains the functions associated with the Vertica library table management.

COPY_TABLE

Copies one table to another. This lightweight, in-memory function copies the DDL and all user-created projections from the source table. Projection statistics for the source table are also copied. Thus, the source and target tables initially have identical definitions and share the same storage.

Note:
Although they share storage space, Vertica regards the tables as discrete objects for license capacity purposes. For example, a single-terabyte table

and its copy initially consume only one TB of space. However, your Vertica license regards them as separate objects that consume two TB of space.

After the copy operation is complete, the source and copy tables are independent of each other, so you can perform DML operations on one table without impacting the other. These operations can increase the overall storage required for both tables.

Caution:
If you create multiple copies of the same table concurrently, one or more of the copy operations is liable to fail. Instead, copy tables sequentially.

Syntax

```
COPY_TABLE (
    '[[database.]schema.]source-table',
    '[[database.]schema.]target-table'
)
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
source-table	The source table to copy. Vertica copies all data from this table to the target table.
target-table	The target table of the source table. If the target table already exists, Vertica appends the source to the existing table. If the table does not exist, Vertica creates a table from the source table's definition, by calling `CREATE TABLE` with `LIKE` and `INCLUDING PROJECTIONS` clause. The new table inherits ownership from the source table. For details, see Replicating a Table.

Privileges

Non-superuser:

- Source table: INSERT, UPDATE, DELETE and SELECT
- Target schema/table (new): CREATE
- Target table (existing): INSERT

Table Attribute Requirements

The following attributes of both tables must be identical:

- Column definitions, including NULL/NOT NULL constraints
- Segmentation
- Partitioning expression
- Number of projections
- Projection sort order
- Primary and unique key constraints. However, the key constraints do not have to be identically enabled.

  

  Note:
  If the target table has primary or unique key constraints enabled and moving the partitions will insert duplicate key values into the target table, Vertica rolls back the operation. Enforcing constraints requires disk reads and can slow the copy process.

- Number and definitions of text indices.

Table Restrictions

The following restrictions apply to the source and target tables:

- If the source and target partitions are in different storage tiers, Vertica returns a warning but the operation proceeds. The partitions remain in their existing storage tier.
- If the source table contains a sequence, Vertica converts the sequence to an integer before copying it to the target table. If the target table contains auto-increment, identity, or named sequence columns, Vertica cancels the copy and displays an error message.
- The following tables cannot be used as sources or targets:

- Temporary tables
- Virtual tables
- System tables
- External tables

Examples

If you call COPY_TABLE and the target table does not exist, the function creates the table automatically. In the following example, COPY_TABLE creates the target table `public.newtable`. Vertica also copies all the constraints associated with the source table `public.product_dimension` except foreign key constraints:

```
=> SELECT COPY_TABLE ( 'public.product_dimension', 'public.newtable');
-[ RECORD 1 ]-------------------------------------------------
copy_table | Created table public.newtable.
Copied table public.product_dimension to public.newtable
```

See Also

Creating a Table from Other Tables

INFER_EXTERNAL_TABLE_DDL

Inspects a file in Parquet format and returns a CREATE EXTERNAL TABLE AS COPY statement that can be used to read the file. This statement might be incomplete. It could also contain more columns or columns with longer names than what Vertica supports; this function does not enforce Vertica system limits (see System Limits). Always inspect the output and address any issues before using it to create a table.

A Parquet file contains insufficient information to infer the type of partition columns, so this function shows these columns with a data type of "UNKNOWN" and emits a warning.

The function handles most data types found in Parquet data, including complex types. If a Parquet type is not supported in Vertica, the function emits a warning.

By default, the function fully defines complex types, including handling nested types. You can instead treat the column as a single LONG VARBINARY value, which is useful if your data contains combinations of nesting that Vertica does not support.

Syntax

```
INFER_EXTERNAL_TABLE_DDL( 'path', 'table_name, ['vertica_type_for_complex_type'] )
```

Arguments

path	Path to a file or directory using Parquet format. Any path that is valid for COPY is valid for this function. This function does not operate on files in other formats.
table_name	Name of the external table to create. This name does not depend on file contents.
vertica_type_for_complex_type	Type to use to represent all columns of complex types, if you do not want to expand them fully. The only supported value is 'long varbinary'. For more information, see Using Flexible Complex Types.

Privileges

Superuser, or non-superuser with READ privileges on the USER-accessible storage location (see GRANT (Storage Location)).

Examples

In the following example, the Parquet file contains data for a table with two INT columns. The table definition can be fully inferred, and you can use the returned SQL statement as-is.

```
=> SELECT INFER_EXTERNAL_TABLE_DDL('/data/orders/*.parquet', 'orders');

                              INFER_EXTERNAL_TABLE_DDL
-----------------------------------------------------------------------------------------------
create external table orders (
  id int,
  quantity int
) as copy from '/data/orders/*.parquet' parquet;
(1 row)
```

The following example shows output from complex types.

```
=> SELECT INFER_EXTERNAL_TABLE_DDL('/data/restaurant.parquet', 'restaurants');
                                      INFER_EXTERNAL_TABLE_DDL

-----------------------------------------------------------------------------------------------------------
---------------------
 create external table "restaurants"(
  "cuisine" varchar,
  "location_city" Array[varchar],
  "menu" Array[
    ROW(
      "item" varchar,
      "price" varchar
    )
  ],
  "name" varchar
 ) as copy from '/data/restaurant.parquet' parquet;
(1 row)
```

In the previous example, the data contains an array of structs (rows) and the function generates a definition for it. However, arrays can contain only primitive types, so you cannot actually define this table as shown. You can, however, still define the table using flexible types (see Using Flexible Complex Types). Use the optional vertica_type_for_complex_type argument to treat complex types as flexible types:

```
=> SELECT INFER_EXTERNAL_TABLE_DDL('/data/restaurant.parquet', 'restaurants', 'long varbinary');
                                      INFER_EXTERNAL_TABLE_DDL

-----------------------------------------------------------------------------------------------------------
---------------------
 create external table "restaurants"(
  "cuisine" varchar,
  "location_city" long varbinary,
  "menu" long varbinary,
  "name" varchar
 ) as copy from '/data/restaurant.parquet' parquet(allow_long_varbinary_match_complex_type='True');
(1 row)
```

The following example uses partition columns. Types of partition column cannot be determined from the data.

```
=> SELECT INFER_EXTERNAL_TABLE_DDL('/data/sales/*/*/*, 'sales');
WARNING 9262: This generated statement is incomplete because of one or more unknown column types.
Fix these data types before creating the table
                               INFER_EXTERNAL_TABLE_DDL

-------------------------------------------------------------------------
 create external table "sales"(
  "tx_id" int,
  "date" UNKNOWN,
  "region" UNKNOWN
) as copy from '/data/sales/*/*/*' parquet(hive_partition_cols='date,region');
(1 row)
```

For VARCHAR and VARBINARY columns, this function does not specify a length. The Vertica default length for these types is 80 bytes. If the Parquet data is longer, using this table definition unmodified could cause data to be truncated. Always review VARCHAR and VARBINARY columns to determine if you need to specify a length. This function emits a warning if the Parquet file contains columns of these types:

```
WARNING 9311: This generated statement contains one or more varchar/varbinary columns which default
to length 80
```

REBALANCE_TABLE

Synchronously rebalances data in the specified table.

A rebalance operation performs the following tasks:

- Distributes data based on:
  - User-defined fault groups, if specified
  - Large cluster automatic fault groups
- Redistributes database projection data across all nodes.

Syntax

```
REBALANCE_TABLE('[[database.]schema.]table-name')
```

Parameters

schema	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table-name	The table to rebalance.

Privileges

Superuser

When to Rebalance

Rebalancing is useful or even necessary after you perform the following tasks:

- Mark one or more nodes as ephemeral in preparation of removing them from the cluster.
- Add one or more nodes to the cluster so that Vertica can populate the empty nodes with data.
- Change the scaling factor of an elastic cluster, which determines the number of storage containers used to store a projection across the database.
- Set the control node size or realign control nodes on a large cluster layout
- Add nodes to or remove nodes from a fault group.

Tip:
By default, before performing a rebalance, Vertica queries system tables to compute the size of all projections involved in the rebalance task. This query can add significant overhead to the rebalance operation. To disable this query, set projection configuration parameter RebalanceQueryStorageContainers to 0.

Example

The following command shows how to rebalance data on the specified table.

```
=> SELECT REBALANCE_TABLE('online_sales.online_sales_fact');
REBALANCE_TABLE
-------------------
 REBALANCED
(1 row)
```

See Also

- REBALANCE_CLUSTER
- Rebalancing Data Across Nodes
- NODES

Tuple Mover Functions

This section contains tuple mover functions specific to Vertica.

DO_TM_TASK

Runs a **Tuple Mover** operation on the specified table or projection and commits current transactions.

Syntax

```
DO_TM_TASK('task'[, '[[database.]schema.]{ table | projection}]' )
```

Parameters

task	Specifies one of the following tuple mover operations: • `mergeout`: Consolidates ROS containers and purges deleted records. For details, see Mergeout. • `analyze_row_count`: Collects a minimal set of statistics and aggregate row counts for the specified projections, and saves it in the database catalog. Collects the number of rows in the specified projection. If you specify a table name, `DO_TM_TASK` returns the row counts for all projections of that table. For details, see Analyzing Row Counts. • `update_storage_catalog` (recommended only for Eon Mode): Updates the catalog with metadata on bundled table data. For details, see Writing Bundle Metadata to the Catalog.
[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject`

	If you specify a database, it must be the current database.
table | *projection*	Applies *task* to the specified table or projection. If you specify a projection and it is not found, DO_TM_TASK looks for a table with that name and, if found, applies the task to it and all projections associated with it. If you specify no table or projection, the task is applied to all database tables and their projections.

Privileges

- Schema: USAGE
- Table: One of INSERT, UPDATE, or DELETE

Examples

Perform mergeout on all projections of table t1:

```
=> SELECT DO_TM_TASK('mergeout', 't1');
```

Workload Management Functions

This section contains workload management functions specific to Vertica.

ANALYZE_WORKLOAD

Runs Workload Analyzer, a utility that analyzes system information held in system tables.

Workload Analyzer intelligently monitors the performance of SQL queries and workload history, resources, and configurations to identify the root causes for poor query performance. ANALYZE_WORKLOAD returns tuning recommendations for all events within the scope and time that you specify, from system table TUNING_RECOMMENDATIONS.

Tuning recommendations are based on a combination of statistics, system and **data collector** events, and database-table-projection design. Workload Analyzer recommendations can help you quickly and easily tune query performance.

See Workload Analyzer Recommendations in the Administrator's Guide for the common triggering conditions and recommendations.

Syntax

```
ANALYZE_WORKLOAD ( '[ scope ]' [, 'since-time' | save-data ] );
```

Parameters

scope	Specifies the catalog objects to analyze, as follows: `[[database.]schema.]table` If set to an empty string, Vertica returns recommendations for all database objects. If you specify a database, it must be the current database.
since-time	Specifies the start time for the analysis time span, which continues up to the current system status, inclusive. If you omit this parameter, ANALYZE_WORKLOAD returns recommendations on events since the last

	time you called this function.
	
	Note:
	You must explicitly cast strings to `TIMESTAMP` or `TIMESTAMPTZ`. For example:
	
	`SELECT ANALYZE_WORKLOAD('T1', '2010-10-04 11:18:15'::TIMESTAMPTZ);`
	`SELECT ANALYZE_WORKLOAD('T1', TIMESTAMPTZ '2010-10-04 11:18:15');`

save-data	Specifies whether to save returned values from `ANALYZE_WORKLOAD`: • `false` (default): Results are discarded. • `true`: Saves the results returned by `ANALYZE_WORKLOAD`. Subsequent calls to `ANALYZE_WORKLOAD` return results that start from the last invocation when results were saved. Object events preceding that invocation are ignored.

Return Values

Returns aggregated tuning recommendations from `TUNING_RECOMMENDATIONS`.

Privileges

Superuser

Examples

See Getting Tuning Recommendations in the Administrator's Guide.

See Also

- Analyzing Workloads
- Workload Analyzer Recommendations

CHANGE_CURRENT_STATEMENT_RUNTIME_PRIORITY

Changes the run-time priority of an active query.

Note:
This function replaces deprecated function CHANGE_RUNTIME_PRIORITY.

Syntax

```
CHANGE_CURRENT_STATEMENT_RUNTIME_PRIORITY(transaction-id, 'value')
```

Parameters

transaction-id	Identifies the transaction, obtained from the system table SESSIONS.
value	The RUNTIMEPRIORITY value: HIGH, MEDIUM, or LOW.

Privileges

- **Superuser**: None
- Non-superusers can only change the runtime priority of their own queries, and cannot raise the runtime priority of a query to a level higher than that of the resource pool.

Example

See Changing Runtime Priority of a Running Query.

CHANGE_RUNTIME_PRIORITY

Changes the run-time priority of a query that is actively running. Note that, while this function is still valid, you should instead use CHANGE_CURRENT_STATEMENT_RUNTIME_PRIORITY to change run-time priority. CHANGE_RUNTIME_PRIORITY will be deprecated in a future release of Vertica.

Syntax

```
CHANGE_RUNTIME_PRIORITY(TRANSACTION_ID,STATEMENT_ID, 'value')
```

Parameters

TRANSACTION_ID	An identifier for the transaction within the session. TRANSACTION_ID cannot be NULL. You can find the transaction ID in the Sessions table.
STATEMENT_ID	A unique numeric ID assigned by the Vertica catalog, which identifies the currently executing statement. You can find the statement ID in the Sessions table. You can specify NULL to change the run-time priority of the currently running query within the transaction.
'value'	The RUNTIMEPRIORITY value. Can be HIGH, MEDIUM, or LOW.

Privileges

No special privileges required. However, non-superusers can change the run-time priority of their own queries only. In addition, non-superusers can never raise the run-time priority of a query to a level higher than that of the resource pool.

Example

```
=> SELECT CHANGE_RUNTIME_PRIORITY(45035996273705748, NULL, 'low');
```

MOVE_STATEMENT_TO_RESOURCE_POOL

Attempts to move the specified query to the specified target pool.

Syntax

```
MOVE_STATEMENT_TO_RESOURCE_POOL (session_id , transaction_id, statement_id, target_resource_pool_name)
```

Parameters

session_id	Identifier for the session where the query you want to move is currently executing.
transaction_id	Identifier for the transaction within the session.
statement_id	Unique numeric ID for the statement you want to move.
target_resource_pool_name	Name of the existing resource pool to which you want to move the specified query.

Outputs

The function may return the following results:

MOV_REPLAN: Target pool does not have sufficient resources. See v_monitor.resource_ pool_move for details. Vertica will attempt to replan the statement on target pool.
MOV_REPLAN: Target pool has priority HOLD. Vertica will attempt to replan the statement on target pool.
MOV_FAILED: Statement not found.
MOV_NO_OP: Statement already on target pool.
MOV_REPLAN: Statement is in queue. Vertica will attempt to replan the statement on target pool.
MOV_SUCC: Statement successfully moved to target pool.

Privileges

Superuser

Examples

The following example shows how you can move a specific statement to a resource pool called my_target_pool:

```
=> SELECT MOVE_STATEMENT_TO_RESOURCE_POOL ('v_vmart_node0001.example.-31427:0x82fbm',
45035996273711993, 1, 'my_target_pool');
```

See Also:

- Manually Moving Queries to Different Resource Pools
- RESOURCE_POOL_MOVE

SLEEP

Waits a specified number of seconds before executing another statement or command.

Syntax

```
SLEEP( seconds )
```

Parameters

seconds	The wait time, specified in one or more seconds (0 or higher) expressed as a positive integer. Single quotes are optional; for example, `SLEEP(3)` is the same as `SLEEP('3')`.

Notes

- This function returns value 0 when successful; otherwise it returns an error message due to syntax errors.
- You cannot cancel a sleep operation.
- Be cautious when using SLEEP() in an environment with shared resources, such as in combination with transactions that take exclusive locks.

Example

The following command suspends execution for 100 seconds:

```
=> SELECT SLEEP(100);
 sleep
-------
     0
(1 row)
```

SQL Statements

The primary structure of a SQL query is its statement. Whether a statement stands on its own, or is part of a multi-statement query, each statement must end with a semicolon. The following example contains four common SQL statements—CREATE TABLE, INSERT, SELECT, and COMMIT:

```
=> CREATE TABLE comments (id INT, comment VARCHAR);
CREATE TABLE
=> INSERT INTO comments VALUES (1, 'Hello World');
OUTPUT
--------
1
(1 row)

=> SELECT * FROM comments;
 id |   comment
----+-------------
  1 | Hello World
(1 row)

=> COMMIT;
COMMIT
=>
```

ALTER Statements

ALTER statements let you change existing database objects.

ALTER ACCESS POLICY

Performs one of the following actions on existing access policies:

- Modify an access policy by changing its expression, and by enabling/disabling the policy.
- Copy an access policy from one table to another.

Syntax

Modify policy

```
ALTER ACCESS POLICY ON [[database.]schema.]table
   { FOR COLUMN column [ expression ] | FOR ROWS [ WHERE expression ] } ENABLE | DISABLE }
```

Copy policy

```
ALTER ACCESS POLICY ON [[database.]schema.]table
   { FOR COLUMN column | FOR ROWS } COPY TO TABLE table;
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
`table`	The name of the table that contains the access policy you want to enable, disable, or copy.
`FOR COLUMN` *`column`* [*`expression`*]	Replaces the access policy expression that was previously set for this column. Omit *`expression`* from the `FOR COLUMN` clause in order to enable or disable this policy only, or copy it to another table.
`FOR ROWS` [`WHERE` *`expression`*]	Replaces the row access policy expression that was previously set for this table. Omit `WHERE` *`expression`* from the `FOR ROWS` clause in order to enable or disable this policy only, or copy it to another table.

ENABLE | DISABLE	Indicates whether to enable or disable the access policy at the table level.

COPY TO TABLE *tablename*	Copies the existing access policy to the specified table. The copied access policy includes its enabled/disabled status.
	
	The following requirements apply:
	
	• Copying a column access policy:
	  • The target table must have a column of the same name and compatible data type.
	  • The target colum must not have an access policy.
	• Copying a row access policy: The target table must not have an access policy.

Privileges

Superuser

Examples

See Managing Access Policies

See Also

CREATE ACCESS POLICY

ALTER AUTHENTICATION

Modifies the settings for a specified authentication method.

Syntax

```
ALTER AUTHENTICATION auth_method_name {
   | { ENABLE | DISABLE }
   | { LOCAL | HOST [ { TLS | NO TLS } ] host_ip_address }
```

```
| RENAME TO new_auth_method_name
| METHOD value
| SET param=value[,…]
| PRIORITY value }
```

Parameters

Parameter Name	Description
auth_method_name	Name of the authentication method that you want to create. Type: VARCHAR
ENABLE | DISABLE	Enable or disable the specified authentication method. Default: Enabled When you perform an upgrade and use Kerberos authentication, you must manually set the authentication to ENABLE as it is disabled by default.
LOCAL | HOST [{ TLS | NO TLS } *host_ip_address*	Specify that the authentication method applies to local or remote (HOST) connections. For authentication methods that use LDAP, specify whether or not LDAP uses Transport Layer Security (TLS). For remote (HOST) connections, you must specify the IP address of the host from which the user or application is connecting, VARCHAR. Vertica supports IPv4 and IPv6 addresses.
RENAME TO *new_auth_method_name*	Rename the authentication record. Type: VARCHAR
METHOD *value*	The authentication method you are altering.
SET *param=value*	Set a parameter name and value for the authentication method that you are creating. Required only for LDAP and Ident authentication. ALTER AUTHENTICATION validates the parameters you enter. See parameters for specific authentication types in Client Authentication.

Parameter Name	Description
PRIORITY *value*	If the user is associated with multiple authentication methods, the priority value specifies which authentication method Vertica tries first. Default: 0 Type: INTEGER Higher values indicate higher priorities. For example, a priority of 10 is higher than a priority of 5; priority 0 is the lowest possible value. For details, see Priorities for Client Authentication Methods.

Privileges

Superuser

Examples

Enabling and Disabling Authentication Methods

This example uses ALTER AUTHENTICATION to disable the `v_ldap` authentication method and then enable it again:

```
=> ALTER AUTHENTICATION v_ldap DISABLE;
=> ALTER AUTHENTICATION v_ldap ENABLE;
```

Renaming Authentication Methods

This example renames the `v_kerberos` authentication method to `K5`. All users who have been granted the `v_kerberos` authentication method now have the `K5` method granted instead.

```
=> ALTER AUTHENTICATION v_kerberos RENAME TO K5;
```

Modifying Authentication Parameters

This example sets the system user for `ident1` authentication to `user1`:

```
=> CREATE AUTHENTICATION ident1 METHOD 'ident' LOCAL;
=> ALTER AUTHENTICATION ident1 SET system_users='user1';
```

When you set or modify LDAP or Ident parameters using ALTER AUTHENTICATION, Vertica validates them.

This example changes the IP address and specifies the parameters for an LDAP authentication method named `Ldap1`. Specify the bind parameters for the LDAP server. Vertica connects to the LDAP server, which authenticates the database client. If authentication succeeds, Vertica authenticates any users who have been associated with (granted) the `Ldap1` authentication method on the designated LDAP server:

```
=> CREATE AUTHENTICATION Ldap1 METHOD 'ldap' HOST '172.16.65.196';
=> ALTER AUTHENTICATION Ldap1 SET host='ldap://172.16.65.177',
   binddn_prefix='cn=', binddn_suffix=',dc=qa_domain,dc=com';
```

The next example specifies the parameters for an LDAP authentication method named `Ldap2`. Specify the LDAP search and bind parameters. Sometimes, Vertica does not have enough information to create the distinguished name (DN) for a user attempting to authenticate. In such cases, you must specify to use LDAP search and bind:

```
=> CREATE AUTHENTICATION Ldap2 METHOD 'ldap' HOST '172.16.65.196';
=> ALTER AUTHENTICATION Ldap2 SET basedn='dc=qa_domain,dc=com',
   binddn='cn=Manager,dc=qa_domain,
   dc=com',search_attribute='cn',bind_password='secret';
```

Changing the Authentication Method

This example changes the `localpwd` authentication from hash to trust:

```
=> CREATE AUTHENTICATION localpwd METHOD 'hash' LOCAL;
=> ALTER AUTHENTICATION localpwd METHOD 'trust';
```

Set Multiple Realms

This example sets another realm for the authentication method krb_local:

```
=> ALTER AUTHENTICATION krb_local set realm = 'COMPANY.COM';
```

See Also

- CREATE AUTHENTICATION
- DROP AUTHENTICATION
- GRANT (Authentication)
- REVOKE (Authentication)
- CLIENT_AUTH

ALTER DATABASE

Use ALTER DATABASE to perform the following tasks:

- Drop all fault groups and their child fault groups from a database.
- Restore down nodes, and revert active standby nodes to standby status.
- Specify the subnet name of a public network to use for import/export.
- Set and clear database configuration parameters.

To see the current value of a parameter, query system table CONFIGURATION_PARAMETERS or use SHOW DATABASE.

Syntax

```
ALTER DATABASE db-spec {
      DROP ALL FAULT GROUP
      | EXPORT ON { subnet-name | DEFAULT }
      | RESET STANDBY
      | SET [PARAMETER] parameter=value [,…]
      | CLEAR [PARAMETER] parameter[,…]
}
```

Parameters

db-spec	Specifies the database to alter, one of the following: • The database name • DEFAULT: The current database
DROP ALL FAULT GROUP	Drops all fault groups defined on the specified database.
EXPORT ON	Specifies the network to use for importing and exporting data, one of the following: • *subnet-name*: A subnet of the public network. • DEFAULT: Specifies to use a private network. For details, see Identify the Database or Nodes Used for Import/Export, and Changing Node Export Addresses.
RESET STANDBY	(Enterprise Mode only) Restores all down nodes and reverts

	their replacement nodes to standby status. If any replaced nodes cannot resume activity, Vertica leaves their standby nodes in place.
`SET [PARAMETER]`	Sets the specified parameters.
`CLEAR [PARAMETER]`	Resets the specified parameters to their default values.

Privileges

Superuser

ALTER FAULT GROUP

Modifies an existing fault group. For example, use the `ALTER FAULT GROUP` statement to:

- Add a node to or drop a node from an existing fault group
- Add a child fault group to or drop a child fault group from a parent fault group
- Rename a fault group

Syntax

```
ALTER FAULT GROUP fault-group-name {
    | ADD NODE node-name
    | DROP NODE node-name
    | ADD FAULT GROUP child-fault-group-name
    | DROP FAULT GROUP child-fault-group-name
    | RENAME TO new-fault-group-name }
```

Parameters

fault-group-name	The existing fault group name you want to modify.  **Tip:** For a list of all fault groups defined in the cluster, query the FAULT_GROUPS system table.
node-name	The node name you want to add to or drop from the existing

	(parent) fault group.
child-fault-group-name	The name of the child fault group you want to add to or remove from an existing parent fault group.
new-fault-group-name	The new name for the fault group you want to rename.

Privileges

Superuser

Example

This example shows how to rename the `parent0` fault group to `parent100`:

```
=> ALTER FAULT GROUP parent0 RENAME TO parent100;
ALTER FAULT GROUP
```

Verify the change by querying the FAULT_GROUPS system table:

```
=> SELECT member_name FROM fault_groups;
   member_name
----------------------
v_exampledb_node0003
parent100
mygroup
(3 rows)
```

See Also

- CREATE FAULT GROUP
- V_CATALOG.FAULT_GROUPS
- V_CATALOG.CLUSTER_LAYOUT
- Fault Groups
- High Availability With Fault Groups

ALTER FUNCTION Statements

Vertica provides ALTER statements for each type of user-defined extension. Each ALTER statement modifies the metadata of a user-defined function in the Vertica catalog:

ALTER statement	Extension
ALTER FUNCTION (Scalar)	User-defined scalar functions (UDSFs)
ALTER AGGREGATE FUNCTION	User-defined aggregate functions (UDAFs)
ALTER ANALYTIC FUNCTION	User-defined analytic functions (UDAnF)
ALTER TRANSFORM FUNCTION	User-defined transform functions (UDTFs)
ALTER statements for user-defined load:	
• ALTER SOURCE	Load source functions
• ALTER FILTER	Load filter functions
• ALTER PARSER	Load parser functions

Vertica also provides ALTER FUNCTION (SQL), which modifies the metadata of a user-defined SQL function.

ALTER AGGREGATE FUNCTION

Alters a user-defined aggregate function.

Syntax

```
ALTER AGGREGATE FUNCTION [[db-name.]schema.]function-name( [ parameter-list ] ) {
    OWNER TO new-owner
    | RENAME TO new-name
    | SET SCHEMA new-schema
}
```

Parameters

[*db-name.*]*schema*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current

	database.
function-name	Name of the SQL function to alter.
arg-list	Comma-delimited list of parameters that are defined for this function. If none, specify an empty list. **Note:** Vertica supports function overloading, and uses the parameter list to identify the function to alter.
OWNER TO *new-owner*	Transfers function ownership to another user.
RENAME TO *new-name*	Renames this function.
SET SCHEMA *new-schema*	Moves the function to another schema.

Privileges

Non-superuser: USAGE on the schema and one of the following:

- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

For these operations…	Schema privileges required…
RENAME TO (rename function)	CREATE, USAGE
SET SCHEMA (move function to another schema)	CREATE: destination schema USAGE: current schema

See Also

CREATE AGGREGATE FUNCTION

ALTER ANALYTIC FUNCTION

Alters a user-defined analytic function.

Syntax

```
ALTER ANALYTIC FUNCTION [[db-name.]schema.]function-name( [ parameter-list ] ) {
    OWNER TO new-owner
    | RENAME TO new-name
    | SET FENCED boolean-expr
    | SET SCHEMA new-schema
}
```

Parameters

[*db-name.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
function-name	Name of the function to alter.
parameter-list	Comma-delimited list of parameters that are defined for this function. If none, specify an empty list. **Note:** Vertica supports function overloading, and uses the parameter list to identify the function to alter.
`OWNER TO` *new-owner*	Transfers function ownership to another user.
`RENAME TO` *new-name*	Renames this function.
`SET FENCED { true | false }`	Specifies whether to enable fenced mode for this function.
`SET SCHEMA` *new-schema*	Moves the function to another schema.

Privileges

Non-superuser: USAGE on the schema and one of the following:

- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

Operation	Schema privileges required
RENAME TO (rename function)	CREATE, USAGE
SET SCHEMA (move function to another schema)	• CREATE: destination schema • USAGE: current schema

See Also

CREATE ANALYTIC FUNCTION

ALTER FILTER

Alters a user-defined filter.

Syntax

```
ALTER FILTER [[db-name.]schema.]function-name( [ parameter-list ] ) {
    OWNER TO new-owner
    | RENAME TO new-name
    | SET FENCED boolean-expr
    | SET SCHEMA new-schema
}
```

Parameters

[*db-name.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.

function-name	Name of the function to alter.
parameter-list	Comma-delimited list of parameters that are defined for this function. If none, specify an empty list. **Note:** Vertica supports function overloading, and uses the parameter list to identify the function to alter.
OWNER TO *new-owner*	Transfers function ownership to another user.
RENAME TO *new-name*	Renames this function.
SET FENCED { true | false }	Specifies whether to enable fenced mode for this function.
SET SCHEMA *new-schema*	Moves the function to another schema.

Privileges

Non-superuser: USAGE on the schema and one of the following:

- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

Operation	Schema privileges required
RENAME TO (rename function)	CREATE, USAGE
SET SCHEMA (move function to another schema)	• CREATE: destination schema • USAGE: current schema

See Also

CREATE FILTER

ALTER FUNCTION (SQL)

Alters a user-defined SQL function.

Syntax

```
ALTER FUNCTION [[db-name.]schema.]function-name( [arg-list] ) {
    OWNER TO new-owner
    | RENAME TO new-name
    | SET SCHEMA new-schema
}
```

Parameters

[*db-name.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
function-name	The name of the SQL function to alter.
arg-list	A comma-delimited list of function argument names. If none, specify an empty list.
`OWNER TO` *new-owner*	Transfers function ownership to another user.
`RENAME TO` *new-name*	Renames this function.
`SET SCHEMA` *new-schema*	Moves the function to another schema.

Privileges

Non-superuser: USAGE on the schema and one of the following:

- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

For these operations…	Schema privileges required…
RENAME TO (rename function)	CREATE, USAGE
SET SCHEMA (move function to another schema)	CREATE: destination schema USAGE: current schema

Examples

Rename function `SQL_one` to `SQL_two`:

```
=> ALTER FUNCTION SQL_one (int, int) RENAME TO SQL_two;
```

Move function `SQL_two` to schema `macros`:

```
=> ALTER FUNCTION SQL_two (int, int) SET SCHEMA macros;
```

Reassign ownership of `SQL_two`:

```
=> ALTER FUNCTION SQL_two (int, int) OWNER TO user1;
```

See Also

- CREATE FUNCTION (SQL)
- User-Defined SQL Functions

ALTER FUNCTION (Scalar)

Alters a user-defined scalar function.

Syntax

```
ALTER FUNCTION [[db-name.]schema.]function-name( [ parameter-list] ) {
    OWNER TO new-owner
    | RENAME TO new-name
```

```
    | SET FENCED boolean-expr
    | SET SCHEMA new-schema
}
```

Parameters

[*db-name.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
function-name	Name of the function to alter.
parameter-list	Comma-delimited list of parameters that are defined for this function. If none, specify an empty list. **Note:** Vertica supports function overloading, and uses the parameter list to identify the function to alter.
`OWNER TO` *new-owner*	Transfers function ownership to another user.
`RENAME TO` *new-name*	Renames this function.
`SET FENCED { true | false }`	Specifies whether to enable fenced mode for this function.
`SET SCHEMA` *new-schema*	Moves the function to another schema.

Privileges

Non-superuser: USAGE on the schema and one of the following:

- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

Operation	Schema privileges required
RENAME TO (rename function)	CREATE, USAGE
SET SCHEMA (move function to another schema)	• CREATE: destination schema • USAGE: current schema

Examples

Rename function UDF_one to UDF_two:

```
=> ALTER FUNCTION UDF_one (int, int) RENAME TO UDF_two;
```

Move function UDF_two to schema macros:

```
=> ALTER FUNCTION UDF_two (int, int) SET SCHEMA macros;
```

Disable fenced mode for function UDF_two:

```
=> ALTER FUNCTION UDF_two (int, int) SET FENCED false;
```

See Also

CREATE FUNCTION (Scalar)

ALTER PARSER

Alters a user-defined parser.

Syntax

```
ALTER PARSER [[db-name.]schema.]function-name( [ parameter-list ] ) {
    OWNER TO new-owner
    | RENAME TO new-name
    | SET FENCED boolean-expr
    | SET SCHEMA new-schema
}
```

Parameters

[*db-name.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
function-name	Name of the function to alter.
parameter-list	Comma-delimited list of parameters that are defined for this function. If none, specify an empty list. **Note:** Vertica supports function overloading, and uses the parameter list to identify the function to alter.
`OWNER TO` *new-owner*	Transfers function ownership to another user.
`RENAME TO` *new-name*	Renames this function.
`SET FENCED { true | false }`	Specifies whether to enable fenced mode for this function.
`SET SCHEMA` *new-schema*	Moves the function to another schema.

Privileges

Non-superuser: USAGE on the schema and one of the following:

- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

Operation	Schema privileges required
RENAME TO (rename function)	CREATE, USAGE
SET SCHEMA (move function to another schema)	• CREATE: destination schema • USAGE: current schema

See Also

CREATE PARSER

ALTER SOURCE

Alters a user-defined load source function.

Syntax

```
ALTER SOURCE [[db-name.]schema.]function-name( [ parameter-list ] ) {
    OWNER TO new-owner
    | RENAME TO new-name
    | SET FENCED boolean-expr
    | SET SCHEMA new-schema
}
```

Parameters

[*db-name.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
function-name	Name of the function to alter.
parameter-list	Comma-delimited list of parameters that are defined for this function. If none, specify an empty list.

	Note: Vertica supports function overloading, and uses the parameter list to identify the function to alter.
`OWNER TO` *new-owner*	Transfers function ownership to another user.
`RENAME TO` *new-name*	Renames this function.
`SET FENCED { true | false }`	Specifies whether to enable fenced mode for this function.
`SET SCHEMA` *new-schema*	Moves the function to another schema.

Privileges

Non-superuser: USAGE on the schema and one of the following:

- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

Operation	Schema privileges required
RENAME TO (rename function)	CREATE, USAGE
SET SCHEMA (move function to another schema)	• CREATE: destination schema • USAGE: current schema

See Also

CREATE SOURCE

ALTER TRANSFORM FUNCTION

Alters a user-defined transform function.

Syntax

```
ALTER TRANSFORM FUNCTION [[db-name.]schema.]function-name( [ parameter-list ] ) {
    OWNER TO new-owner
    | RENAME TO new-name
    | SET FENCED { true | false }
    | SET SCHEMA new-schema
}
```

Parameters

[*db-name.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
function-name	Name of the function to alter.
parameter-list	Comma-delimited list of parameters that are defined for this function. If none, specify an empty list. **Note:** Vertica supports function overloading, and uses the parameter list to identify the function to alter.
`OWNER TO` *new-owner*	Transfers function ownership to another user.
`RENAME TO` *new-name*	Renames this function.
`SET FENCED { true | false }`	Specifies whether to enable fenced mode for this function.
`SET SCHEMA` *new-schema*	Moves the function to another schema.

Privileges

Non-superuser: USAGE on the schema and one of the following:

- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

Operation	Schema privileges required
RENAME TO (rename function)	CREATE, USAGE
SET SCHEMA (move function to another schema)	• CREATE: destination schema • USAGE: current schema

See Also

CREATE TRANSFORM FUNCTION

ALTER HCATALOG SCHEMA

Alters parameter values on a schema that was created with CREATE HCATALOG SCHEMA. HCatalog schemas are used by the HCatalog Connector to access data stored in a Hive data warehouse. For more information, see Using the HCatalog Connector in Integrating with Apache Hadoop.

Some parameters cannot be altered after creation. If you need to change one of those values, delete and recreate the schema instead. You can use ALTER HCATALOG SCHEMA to change the following parameters:

- HOSTNAME
- PORT
- HIVESERVER2_HOSTNAME
- WEBSERVICE_HOSTNAME
- WEBSERVICE_PORT
- WEBHDFS_ADDRESS
- HCATALOG_CONNECTION_TIMEOUT
- HCATALOG_SLOW_TRANSFER_LIMIT
- HCATALOG_SLOW_TRANSFER_TIME
- SSL_CONFIG
- CUSTOM_PARTITIONS

Syntax

```
ALTER HCATALOG SCHEMA schema-name SET [param=value]+;
```

Parameters

Parameter	Description
schema-name	The name of the schema in the Vertica catalog to alter. The tables in the Hive database are available through this schema.
param	The name of the parameter to alter.
value	The new value for the parameter. You must specify a value; this statement does not read default values from configuration files like CREATE HCATALOG SCHEMA.

Privileges

One of the following:

- Superuser
- Schema owner

Examples

The following example shows how to change the Hive metastore hostname and port for the "hcat" schema. In this example, Hive uses High Availability metastore.

```
=> ALTER HCATALOG SCHEMA hcat SET
HOSTNAME='thrift://ms1.example.com:9083,thrift://ms2.example.com:9083';
```

The following example shows the error you receive if you try to set an unalterable parameter.

```
=> ALTER HCATALOG SCHEMA hcat SET HCATALOG_USER='admin';
   ERROR 4856: Syntax error at or near "HCATALOG_USER" at character 39
```

ALTER LIBRARY

Replaces the library file that is currently associated with a UDx library in the Vertica catalog. Vertica automatically distributes copies of the updated file to all cluster nodes. UDxs defined in the catalog that reference the updated library automatically start using the updated library file.

> **Important:**
> The current and replacement libraries must be developed in the same language.

Syntax

```
ALTER LIBRARY [[database.]schema.]library-name  [DEPENDS 'support-path'] AS 'library-path';
```

Parameters

schema	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
library-name	The name of an existing library created with `CREATE LIBRARY`.
`DEPENDS '` *support-path*`'`	Indicates that the UDx library depends on one or more files or libraries, where *support-path* specifies one or more absolute paths to these dependencies on the initiator node. **Note:** `DEPENDS` is ignored for R, as R packages must be installed locally on each node, including external dependencies. For example, the following statement specifies a single dependency: `=> CREATE LIBRARY mylib AS '/path/to/java_udx' DEPENDS '/path/to/jar/this.jar' LANGUAGE 'Java';`

	DEPENDS can specify multiple support paths as follows:
	• Separate multiple paths with colons (:). For example:
	`=> CREATE LIBRARY mylib AS '/path/to/java_udx'`
	`DEPENDS '/path/to/jars/this.jar:/path/to/jars/that.jar'`
	`LANGUAGE 'Java';`
	• Specify a directory that contains multiple libraries with a trailing slash (/), optionally followed by asterisk wildcard (*). For example, the following DEPENDS clauses are identical:
	`DEPENDS '/home/mydir/mylibs/'`
	`DEPENDS '/home/mydir/mylibs/*'`
	DEPENDS can specify libraries with multiple directory levels. For details, see Multi-level Library Dependencies.
	Important: The performance of CREATE LIBRARY is liable to degrade in Eon Mode, in proportion to the number and depth of dependencies specified by the DEPENDS clause.

AS *library-path*	The absolute path on the initiator node file system of the replacement library file.

Privileges

Superuser

Requirements

The original and replacement libraries must comply with the following requirements, otherwise ALTER LIBRARY returns with an error:

- The libraries must be developed in the same programming language.
- Function signatures must match.

Multi-level Library Dependencies

If a DEPENDS clause specifies a library with multiple directory levels, Vertica follows the library path to include all subdirectories of that library. For example, the following CREATE

LIBRARY statement enables UDx library mylib to import all Python packages and modules that it finds in subdirectories of site-packages:

```
=> CREATE LIBRARY mylib AS '/path/to/python_udx' DEPENDS '/path/to/python/site-packages' LANGUAGE
'Python';
```

Important:
DEPENDS can specify Java library dependencies that are up to 100 levels deep.

Examples

This example shows how to update an already-defined library myFunctions with a new file.

```
=> ALTER LIBRARY myFunctions AS '/home/dbadmin/my_new_functions.so';
```

Developing User-Defined Extensions (UDxs)

ALTER LOAD BALANCE GROUP

Changes the configuration of a load balance group.

Syntax

```
ALTER LOAD BALANCE GROUP group_name {
    RENAME TO new-name |
    SET FILTER TO 'ip-cidr-addr' |
    SET POLICY TO 'policy' |
    ADD {ADDRESS | FAULT GROUP | SUBCLUSTER} add-list |
    DROP  {ADDRESS | FAULT GROUP | SUBCLUSTER} drop-list
}
```

Parameters

group_name	Name of an existing load

	balance group to change.
`RENAME TO new-name`	Renames the group to *new_name*.
`SET FILTER TO 'ip-cidr-addr'`	Changes the IP address filter that selects which members of a fault group or groups are included in the load balance group. This setting is only valid if the load balance group contains fault groups.
`SET POLICY TO 'policy'`	Changes the policy the load balance group uses to select the target node for the incoming connection. One of: • ROUNDROBIN • RANDOM • NONE See CREATE LOAD BALANCE GROUP for details.
`ADD {ADDRESS | FAULT GROUP | SUBCLUSTER }`	Adds objects of the specified type to the load balance group. Load balance groups can only contain one type of object. For example, if you created the load balance group using a list of addresses, you can only add additional addresses, not fault groups or subclusters.
add-list	A comma-delimited list of objects (addresses, fault groups, or subclusters) to add to the fault group.
`DROP {ADDRESS | FAULT GROUP | SUBCLUSTER}`	Removes objects of the specified type from the load balance group (addresses, fault

	groups, or subclusters). The object type must match the type of the objects already in the load balance group.
drop-list	The list of objects to remove from the load balance group.

Privileges

Superuser

Example

Remove an address from the load balance group named group_2.

```
=> SELECT * FROM LOAD_BALANCE_GROUPS;
  name   |   policy   | filter |         type          | object_name
---------+------------+--------+-----------------------+-------------
 group_1 | ROUNDROBIN |        | Network Address Group | node01
 group_1 | ROUNDROBIN |        | Network Address Group | node02
 group_2 | ROUNDROBIN |        | Network Address Group | node03
(3 rows)

=> ALTER LOAD BALANCE GROUP group_2 DROP ADDRESS node03;
ALTER LOAD BALANCE GROUP

=> SELECT * FROM LOAD_BALANCE_GROUPS;
  name   |   policy   | filter |         type          | object_name
---------+------------+--------+-----------------------+-------------
 group_1 | ROUNDROBIN |        | Network Address Group | node01
 group_1 | ROUNDROBIN |        | Network Address Group | node02
 group_2 | ROUNDROBIN |        | Empty Group           |
(3 rows)
```

The following example adds three network addresses to the group named group_2:

```
=> ALTER LOAD BALANCE GROUP group_2 ADD ADDRESS node01,node02,node03;
ALTER LOAD BALANCE GROUP
=> SELECT * FROM load_balance_groups WHERE name = 'group_2';
-[ RECORD 1 ]----------------------
name        | group_2
policy      | ROUNDROBIN
filter      |
type        | Network Address Group
object_name | node01
-[ RECORD 2 ]----------------------
name        | group_2
policy      | ROUNDROBIN
```

```
filter      |
type        | Network Address Group
object_name | node02
-[ RECORD 3 ]----------------------
name        | group_2
policy      | ROUNDROBIN
filter      |
type        | Network Address Group
object_name | node03
```

See Also

ALTER MODEL

Allows users to rename an existing model, change ownership, or move it to a another schema.

Syntax

```
ALTER MODEL [[database.]schema.]model
   { OWNER TO owner
     | RENAME TO new-name
     | SET SCHEMA schema
 }
```

Parameters

[*database* .]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
model	Identifies the model to alter.
`OWNER TO` *owner*	Reassigns ownership of this model to *owner*. If a non-superuser, you must be the current owner.
`RENAME TO`	Renames the mode, where *new-name* conforms to conventions described in Identifiers. It must also be unique among all names of sequences,

	tables, projections, views, and models within the same schema.
SET SCHEMA *schema*	Moves the model from one schema to another.

Privileges

Non-superuser: USAGE on the schema and one of the following:

- Model owner
- ALTER privilege on the model

For certain operations, non-superusers must have the following schema privileges:

Schema privileges required...	For these operations...
CREATE, USAGE	Rename model
CREATE: destination schema USAGE: current schema	Move model to another schema

Examples

See Altering Models.

ALTER NETWORK ADDRESS

Changes the configuration of an existing network address.

Syntax

```
ALTER NETWORK ADDRESS address_name {
    RENAME TO new_name |
    SET TO 'ip_addr' [PORT port_number]|
    [ENABLE | DISABLE]
    }
```

Parameters

address_name	The name of an existing network address to change.
RENAME TO *new_name*	Renames the network address to *new_name*. This name change does not effect the network address's membership in load balance groups.
SET TO '*ip_addr*'	Changes the IP address assigned to the network address.
PORT *port_number*	Sets the port number for the network address. You must supply a network address when altering the port number.
[ENABLE | DISABLE]	Enables or disables the network address.

Example

This example renames the network address test_addr to alt_node1, then changes its IP address to 192.168.1.200 with port number 4000:

```
=> ALTER NETWORK ADDRESS test_addr RENAME TO alt_node1;
ALTER NETWORK ADDRESS
=> ALTER NETWORK ADDRESS alt_node1 SET TO '192.168.1.200' PORT 4000;
ALTER NETWORK ADDRESS
```

See Also

ALTER NETWORK INTERFACE

Lets you rename a network interface.

Syntax

```
ALTER NETWORK INTERFACE network-interface-name RENAME TO new-network-interface-name
```

Parameters

network-interface-name	The name of the existing network interface.
new-network-interface-name	The new name for the network interface.

Privileges

Superuser

Examples

This example shows how to rename a network interface.

```
=> ALTER NETWORK INTERFACE myNetwork RENAME TO myNewNetwork;
```

ALTER NODE

Sets and clears node-level configuration parameters on the specified node. `ALTER NODE` also performs the following management tasks:

- Changes the node type.
- Specifies the network interface of the public network on individual nodes that are used for import and export.
- Replaces a down node.

For information about removing a node, see

- Removing Nodes From a Database
- Removing Hosts From a Cluster

Syntax

```
ALTER NODE node-name {
    EXPORT ON { network-interface | DEFAULT }
    | [IS] node-type
    | REPLACE [ WITH standby-node ]
    | RESET
    | SET [PARAMETER] parameter=value[,…]
```

```
    | CLEAR [PARAMETER] parameter[,…]
}
```

Parameters

node-name	The name of the node to alter.
[IS] *node-type*	Changes the node type, where *node-type* is one of the following: • PERMANENT: (default): A node that stores data. • EPHEMERAL: A node that is in transition from one type to another—typically, from PERMANENT to either STANDBY or EXECUTE. • STANDBY: A node that is reserved to replace any node when it goes down. A standby node stores no segments or data until it is called to replace a down node. When used as a replacement node, Vertica changes its type to PERMANENT. For more information, see Active Standby Nodes. • EXECUTE: A node that is reserved for computation purposes only. An execute node contains no segments or data. **Note:** STANDBY and EXECUTE node types are supported only in Enterprise Mode.
EXPORT ON	Specifies the network to use for importing and exporting data, one of the following: • *network-interface*: The name of a network interface of the public network. • DEFAULT: Use the default network interface of the public network, as

	specified by ALTER DATABASE.
REPLACE [WITH *standby-node*]	(Enterprise Mode only) Replaces the specified node with an available active standby node. If you omit the WITH clause, Vertica tries to find a replacement node from the same fault group as the down node. If you specify a node that is not down, Vertica ignores this statement.
RESET	(Enterprise Mode only) Restores the specified down node and returns its replacement to standby status. If the down node cannot resume activity, Vertica ignores this statement and leaves the standby node in place.
SET [PARAMETER] *parameter=value*	Sets one or more configuration parameters to the specified value at the node level.
CLEAR [PARAMETER] *parameter*	Clears one or more specified configuration parameters.

Privileges

Superuser

Examples

Specify to use the default network interface of public network on v_vmart_node0001 for import/export operations:

```
=> ALTER NODE v_vmart_node0001 EXPORT ON DEFAULT;
```

Replace down node v_vmart_node0001 with an active standby node, then restore it:

```
=> ALTER NODE v_vmart_node0001 REPLACE WITH standby1;
...
=> ALTER NODE v_vmart_node0001 RESET;
```

Set and clear configuration parameter MaxClientSessions:

```
=> ALTER NODE v_vmart_node0001 SET MaxClientSessions = 0;
...
=> ALTER NODE v_vmart_node0001 CLEAR MaxClientSessions;
```

Set the node type as EPHEMERAL:

```
=> ALTER NODE v_vmart_node0001 IS EPHEMERAL;
```

ALTER NOTIFIER

Updates an existing notifier.

> **Note:**
> To change the action URL associated with an existing identifier, drop the notifier and re-create it.

Syntax

```
ALTER NOTIFIER notifier-name parameter[...]
```

parameter

```
[NO] CHECK COMMITTED
ENABLE | DISABLE
IDENTIFIED BY uuid
MAXMEMORYSIZE max-memory-size
MAXPAYLOAD max-payload-size
PARAMETERS 'adapter-params'
```

Parameters

notifier-name	Specifies the notifier to update.
[NO] CHECK COMMITTED	Specifies to wait for delivery confirmation before sending the next message in the queue. Not all messaging systems support delivery confirmation.
ENABLE|DISABLE	Specifies whether to enable or disable the notifier.
IDENTIFIED BY *uuid*	Specifies the notifier's unique identifier. If set, all the messages published by this notifier have this attribute.

MAXMEMORYSIZE	The maximum size of the internal notifier, up to 2 TB, specified in kilobytes, megabytes, gigabytes, or terabytes as follows: `MAXMEMORYSIZE integer{K|M|G|T}` If the queue exceeds this size, the notifier drops excess messages.
MAXPAYLOAD	The maximum size of the message, up to 2 TB, specified in kilobytes, megabytes, gigabytes, or terabytes as follows: `MAXPAYLOAD integer{K|M|G|T}` The default setting is adapter-specific—for example, 1 M for Kafka.
PARAMETERS '*adapter-params*'	Specifies one or more optional adapter parameters that are passed as a string to the adapter. Adapter parameters apply only to the adapter associated with the notifier. For Kafka notifiers, refer to Kafka and Vertica Configuration Settings.

Privileges

Superuser

Examples

Update the settings on an existing notifier:

```
=> ALTER NOTIFIER my_dc_notifier
       ENABLE
       MAXMEMORYSIZE '2G'
       IDENTIFIED BY 'f8b0278a-3282-4e1a-9c86-e0f3f042a971'
       CHECK COMMITTED;
```

See Also

- CREATE NOTIFIER
- DROP NOTIFIER
- Monitoring Vertica Using Notifiers in the Administrator's Guide.

ALTER PROJECTION

Changes the DDL of the specified projection.

Syntax

```
ALTER PROJECTION [[database.]schema.]projection RENAME TO new-name
```

Parameters

schema	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
projection	The projection to change, where *projection* can be one of the following: • Projection base name: Rename all projections that share this base name. • Projection name: Rename the specified projection and its base name. If the projection is segmented, its buddies are unaffected by this change. See Projection Naming for projection name conventions.
new-name	The new projection name.

Privileges

Non-superuser, CREATE and USAGE on the schema and one of the following:

- Anchor table owner
- ALTER privilege on the anchor table

Examples

```
=> SELECT export_tables('','public.store_orders');

                export_tables
---------------------------------------------

CREATE TABLE public.store_orders
(
    order_no int,
    order_date timestamp NOT NULL,
    shipper varchar(20),
    ship_date date NOT NULL
);
(1 row)

=> CREATE PROJECTION store_orders_p AS SELECT * from store_orders;
CREATE PROJECTION

=> ALTER PROJECTION store_orders_p RENAME to store_orders_new;
ALTER PROJECTION
```

See Also

CREATE PROJECTION

ALTER PROFILE

Changes a profile. All parameters that are not set in a profile inherit their setting from the default profile. You can use ALTER PROFILE to change the default profile.

Syntax

```
ALTER PROFILE name LIMIT [ password-parameter setting ]...
```

password-parameter

```
    PASSWORD_LIFE_TIME
    PASSWORD_GRACE_TIME
    FAILED_LOGIN_ATTEMPTS
    PASSWORD_LOCK_TIME
    PASSWORD_REUSE_MAX
    PASSWORD_REUSE_TIME
    PASSWORD_MAX_LENGTH
    PASSWORD_MIN_LENGTH
```

```
PASSWORD_MIN_LETTERS
PASSWORD_MIN_UPPERCASE_LETTERS
PASSWORD_MIN_LOWERCASE_LETTERS
PASSWORD_MIN_DIGITS
PASSWORD_MIN_SYMBOLS
```

Parameters

Note:
To reset a parameter to inherit from the default profile, set its value to `default`.

Name	Description
name	The name of the profile to create, where *name* conforms to conventions described in Identifiers. To modify the default profile, set *name* to `default`. For example: `ALTER PROFILE DEFAULT LIMIT PASSWORD_MIN_SYMBOLS 1;`
`PASSWORD_LIFE_TIME`	Set to an integer value, one of the following: • ≥ 1: The number of days a password remains valid. • `UNLIMITED`: Password remains valid indefinitely. After your password's lifetime and grace period expire, you must change your password on your next login, if you have not done so already.
`PASSWORD_GRACE_TIME`	Set to an integer value, one of the following: • ≥ 1: The number of days a password can be used after it expires. • `UNLIMITED`: No grace period.
`FAILED_LOGIN_ATTEMPTS`	Set to an integer value, one of the following: • ≥ 1: The number of consecutive failed login attempts Vertica allows before locking your account. • `UNLIMITED`: Vertica allows an unlimited number of failed login attempts.

Name	Description
PASSWORD_ LOCK_TIME	Set to an integer value, one of the following: • ≥ 1: The number of days your account is locked after too many failed login attempts. The account is automatically unlocked when the lock time elapses. • UNLIMITED: Account remains indefinitely inaccessible until a superuser manually unlocks it.
PASSWORD_ REUSE_MAX	Set to an integer value, one of the following: • ≥ 1: The number of times you must change your password before you can reuse an earlier password. • UNLIMITED: You can reuse an earlier password without any intervening changes.
PASSWORD_ REUSE_TIME	Set to an integer value, one of the following: • ≥ 1: The number of days that must pass after a password is set before you can reuse it. • UNLIMITED: You can reuse an earlier password immediately.
PASSWORD_MAX_ LENGTH	The maximum number of characters allowed in a password, one of the following: • Integer between 8 and 100, inclusive • UNLIMITED: Maximum of 100 characters
PASSWORD_MIN_ LENGTH	The minimum number of characters required in a password, one of the following: • 0 to PASSWORD_MAX_LENGTH • UNLIMITED: Minimum of PASSWORD_MAX_LENGTH
PASSWORD_MIN_ LETTERS	Minimum number of letters (a-z and A-Z) that must be in a password, one of the following: • Integer between 0 and PASSWORD_MAX_LENGTH, inclusive • UNLIMITED: 0 (no minimum)
PASSWORD_MIN_ UPPERCASE_ LETTERS	Minimum number of uppercase letters (A-Z) that must be in a password, one of the following: • Integer between 0 and PASSWORD_MAX_LENGTH, inclusive • UNLIMITED: 0 (no minimum)

Name	Description
PASSWORD_MIN_LOWERCASE_LETTERS	Minimum number of lowercase letters (a-z) that must be in a password, one of the following: • Integer between 0 and PASSWORD_MAX_LENGTH, inclusive • UNLIMITED: 0 (no minimum)
PASSWORD_MIN_DIGITS	Minimum number of digits (0-9) that must be in a password, one of the following: • Integer between 0 and PASSWORD_MAX_LENGTH, inclusive • UNLIMITED: 0 (no minimum)
PASSWORD_MIN_SYMBOLS	Minimum number of symbols—printable non-letter and non-digit characters such as $, #, @—that must be in a password, one of the following: • Integer between 0 and PASSWORD_MAX_LENGTH, inclusive • UNLIMITED: 0 (no minimum)

Privileges

Superuser

Profile Settings and Client Authentication

The following profile settings affect client authentication methods, such as LDAP or GSS:

- FAILED_LOGIN_ATTEMPTS
- PASSWORD_LOCK_TIME

All other profile settings are used only by Vertica to manage its passwords.

Example

```
ALTER PROFILE sample_profile LIMIT FAILED_LOGIN_ATTEMPTS 3;
```

See Also

- CREATE PROFILE
- DROP PROFILE
- Creating a Database Name and Password

ALTER PROFILE RENAME

Rename an existing profile.

Syntax

```
ALTER PROFILE name RENAME TO new-name;
```

Parameters

name	The current name of the profile.
new-name	The new name for the profile.

Privileges

Superuser

Examples

This example shows how to rename an existing profile.

```
ALTER PROFILE sample_profile RENAME TO new_sample_profile;
```

See Also

- ALTER PROFILE
- CREATE PROFILE

- DROP PROFILE

ALTER RESOURCE POOL

Modifies an existing resource pool by setting one or more parameters.

> **Note:**
> You can use `ALTER RESOURCE POOL` to modify some parameters in Vertica built-in resource pools. For details on default settings and restrictions, see Built-In Resource Pools Configuration.

Syntax

```
ALTER RESOURCE POOL pool-name [ FOR { SUBCLUSTER subcluster-name | CURRENT SUBCLUSTER } ] [
parameter-name setting ]…
```

Parameters

pool-name	The name of the resource pool. Built-in pool names cannot be used for user-defined pools. **Note:** If you specify a resource pool name with uppercase letters, Vertica converts them to lowercase letters.
[SUBCLUSTER *subcluster-name* | CURRENT SUBCLUSTER]	Eon Mode only. Specifies the subcluster that the resource pool you are altering belongs to. If you specify a subcluster when altering a global resource pool, then the settings that you change override the global resource pool settings for that subcluster only. • SUBCLUSTER — Use this keyword to alter the resource pool for a subcluster with the name *subcluster-name* if you are not connected to it, and it exists. • CURRENT SUBCLUSTER — Alters the resource pool for the subcluster that you are currently connected to.

	Note: If you specify a subcluster, you can alter only the MAXMEMORYSIZE, MAXQUERYMEMORYSIZE, and MEMORYSIZE parameters for built-in pools.
parameter-name	The parameter to set, listed below.
setting	The value to set on *parameter-name*. To reset this parameter to its default value, specify DEFAULT. **Note:** Default values specified in this table pertain only to user-defined resource pools. For built-in pool default values, see Built-In Resource Pools Configuration, or query system table RESOURCE_POOL_DEFAULTS.
CASCADE TO	Specifies a secondary resource pool for executing queries that exceed the RUNTIMECAP setting of their assigned resource pool: `CASCADE TO secondary-pool`
CPUAFFINITYMODE	Specifies whether the resource pool has exclusive or shared use of the CPUs specified in CPUAFFINITYSET: `CPUAFFINITYMODE { SHARED | EXCLUSIVE | ANY }` • SHARED: Queries that run in this pool share its CPUAFFINITYSET CPUs with other Vertica resource pools. • EXCLUSIVE: Dedicates CPUAFFINITYSET CPUs to this resource pool only, and excludes other Vertica resource pools. If CPUAFFINITYSET is set as a percentage, then that percentage of CPU resources available to Vertica is assigned solely for this resource pool. • ANY (default): Queries in this resource pool can run on any CPU, invalid if CPUAFFINITYSET designates CPU resources.

	Important: CPUAFFINITYMODE and CPUAFFINITYSET must be set together in the same statement.
CPUAFFINITYSET	Specifies which CPUs are available to this resource pool. All cluster nodes must have the same number of CPUs. The CPU resources assigned to this set are unavailable to general resource pools. `CPUAFFINITYSET { 'cpu-index[,…]' | 'cpu-index$_i$-cpu-index$_n$' | 'integer%' | NONE }` • *cpu-index*[,…]: Dedicates one or more comma-delimited CPUs to this pool. • *cpu-index$_i$-cpu-index$_n$*: Dedicates a range of contiguous CPU indexes to this pool • *integer*%: Percentage of all available CPUs to use for this pool. Vertica rounds this percentage down to include whole CPU units. • NONE (default): No affinity set is assigned to this resource pool. The queries associated with this pool are executed on any CPU. **Important:** CPUAFFINITYSET and CPUAFFINITYMODE must be set together in the same statement.
EXECUTIONPARALLELISM	Limits the number of threads used to process any single query issued in this resource pool. `EXECUTIONPARALLELISM { limit | AUTO }` • *limit*: An integer value between 1 and the number of cores. Setting this parameter to a reduced value increases throughput of short queries issued in the pool, especially if the queries are executed concurrently. • AUTO or 0 (default): Vertica calculates the setting from the number of cores, available memory, and amount of data in the system. Unless memory is limited, or the amount of

	data is very small, Vertica sets this parameter to the number of cores on the node.
MAXCONCURRENCY	Sets the maximum number of concurrent execution slots available to the resource pool, across the cluster: `MAXCONCURRENCY { integer | NONE }` NONE (default) specifies unlimited number of concurrent execution slots.
MAXMEMORYSIZE	The maximum size per node the resource pool can grow by borrowing memory from the GENERAL pool: `MAXMEMORYSIZE { 'integer%' | 'integer{K|M|G|T}' | NONE }` • *integer*%: Percentage of total memory • *integer*{K|M|G|T}: Amount of memory in kilobytes, megabytes, gigabytes, or terabytes • NONE (default): Unlimited, pool can borrow any amount of available memory from the GENERAL pool.
MAXQUERYMEMORYSIZE	The maximum amount of memory that this pool can allocate at runtime to process a query. If the query requires more memory than this setting, Vertica stops execution and returns an error. Set this parameter as follows: `MAXQUERYMEMORYSIZE { 'integer%' | 'integer{K|M|G|T}' | NONE }` • *integer*%: Percentage of MAXMEMORYSIZE for this pool. • *integer*{K|M|G|T}: Amount of memory in kilobytes, megabytes, gigabytes, or terabytes, up to the value of MAXMEMORYSIZE. • NONE (default): Unlimited; pool can borrow any amount of available memory from the GENERAL

	MAXMEMORYSIZE. **Important:** Changes to MAXQUERYMEMORYSIZE are applied retroactively to queries that are currently executing. If you reduce this setting, queries that were budgeted with the previous memory size are liable to fail if they try to allocate more memory than the new setting allows.
MEMORYSIZE	The amount of total memory available to the Vertica resource manager that is allocated to this pool per node: `MEMORYSIZE { 'integer%' | 'integer{K|M|G|T}' }` • *integer*%: Percentage of total memory • *integer*{K|M|G|T}: Amount of memory in kilobytes, megabytes, gigabytes, or terabytes **Default:** 0%. No memory allocated, the resource pool borrows memory from the GENERAL pool.

PLANNEDCONCURRENCY	Specifies the preferred number queries to execute concurrently in the resource pool. This setting applies to the entire cluster:
	
	`PLANNEDCONCURRENCY { num-queries | AUTO }`
	
	• *num-queries*: Integer value ≥ 1, specifies the preferred number of concurrently executing queries. When possible, query resource budgets are limited to allow this level of concurrent execution.
	• AUTO (default): Value is calculated automatically at query runtime. Vertica sets this parameter to the lower of these two calculations, but never less than 4:
	  • Number of logical cores
	  • Memory divided by 2GB

	For clusters where the number of logical cores differs on different nodes, AUTO can apply differently on each node. Distributed queries run like the minimal effective planned concurrency. Single node queries run with the planned concurrency of the initiator. **Tip:** Change this parameter only after evaluating performance over a period of time.

PRIORITY	Specifies priority of queries in this pool when they compete for resources in the GENERAL pool:
	
	`PRIORITY { integer | HOLD }`
	
	• *integer*: A negative or positive integer value, where higher numbers denote higher priority:
	  • User-defined pools: -100 to 100
	  • Built-in pools SYSQUERY, RECOVERY, and TM: -110 to 110
	• HOLD: Sets priority to -999. Queries in this pool are queued until QUEUETIMEOUT is reached.
	
	Default: 0

QUEUETIMEOUT	Species how long a request can wait for pool resources before it is rejected: `QUEUETIMEOUT { integer | NONE }` • *integer*: Maximum wait time in seconds • NONE: No maximum wait time, request can be queued indefinitely. Default: 300 seconds
RUNTIMECAP	Prevents runaway queries by setting the maximum time a query in the pool can execute. If a query exceeds this setting, it tries to cascade to a secondary pool: `RUNTIMECAP { 'interval' | NONE }` • *interval*: An interval of 1 minute or 100 seconds; should not exceed one year. • NONE (default): No time limit on queries

	running in this pool. To specify a value in days, provide an integer value. To provide a value less than one day, provide the interval in the format `hours:minutes:seconds`. For example a value of `1:30:00` would equal 90 minutes. If the user or session also has a `RUNTIMECAP`, the shorter limit applies.
`RUNTIMEPRIORITY`	Determines how the resource manager should prioritize dedication of run-time resources (CPU, I/O bandwidth) to queries already running in this resource pool: `RUNTIMEPRIORITY { HIGH | MEDIUM | LOW }` **Default**: `MEDIUM`
`RUNTIMEPRIORITYTHRESHOLD`	Specifies in seconds a time limit in which a query must finish before the resource manager assigns to it the resource pool's `RUNTIMEPRIORITY`. All queries begin running at a `HIGH` priority. When a query's duration exceeds this threshold, it is assigned the `RUNTIMEPRIORITY` of the resource pool. `RUNTIMEPRIORITYTHRESHOLD` *`seconds`* **Default:** `2`
`SINGLEINITIATOR`	By default, set to false for backward compatibility. Do not change this setting.

Privileges

Superuser

Examples

This example shows how to alter resource pool `ceo_pool` by setting the priority to `5`.

```
=> ALTER RESOURCE POOL ceo_pool PRIORITY 5;
```

This example shows how to designate a secondary resource pool for `ceo_pool`.

```
=> CREATE RESOURCE POOL second_pool;
=> ALTER RESOURCE POOL ceo_pool CASCADE TO second_pool;
```

This Eon Mode example decreases the MEMORYSIZE of the built-in TM resource pool to 0% on the analytics_1 secondary subcluster because secondary subclusters do not run Tuple Mover operations:

```
=> ALTER RESOURCE POOL TM FOR SUBCLUSTER analytics_1 MEMORYSIZE '0%';
ALTER RESOURCE POOL
```

See Scenario 2 for more information.

ALTER ROLE

Renames an existing role.

Note:
You cannot use ALTER ROLE to rename a role that was added to the Vertica database with the LDAPLink service.

Syntax

```
ALTER ROLE name RENAME TO new-name
```

Parameters

name	The role to rename.
new-name	The role's new name.

Privileges

Superuser

Example

```
=> ALTER ROLE applicationadministrator RENAME TO appadmin;
ALTER ROLE
```

See Also

- CREATE ROLE
- DROP ROLE

ALTER ROUTING RULE

Changes an existing load balancing policy routing rule.

Syntax

```
ALTER ROUTING RULE rule_name {
    RENAME TO new_name |
    SET ROUTE TO 'ip_addr'|
    SET GROUP TO group_name
    }
```

Parameters

rule_name	The name of the existing routing rule to change.
RENAME TO new_name	Changes the name of the routing rule to *new_name*.
SET ROUTE TO '*ip_addr*'	Changes the IP address range that this rule applies to. The *ip_addr* is the new range of incoming IP addresses in CIDR format.
SET GROUP TO *group_name*	Changes the load balancing group that handles the connections that match this rule .

Example

This example changes the routing rule named etl_rule so it uses the load balancing group named etl_rule to handle incoming connections in the IP address range of 10.20.100.0 to 10.20.100.255.

```
=> ALTER ROUTING RULE etl_rule SET GROUP TO etl_group;
ALTER ROUTING RULE
=> ALTER ROUTING RULE etl_rule SET ROUTE TO '10.20.100.0/24';
ALTER ROUTING RULE
=> \x
Expanded display is on.
=> SELECT * FROM routing_rules WHERE NAME = 'etl_rule';
-[ RECORD 1 ]----+---------------
name             | etl_rule
source_address   | 10.20.100.0/24
destination_name | etl_group
```

See Also

ALTER SCHEMA

Changes one or more schemas in one of the following ways:

- Enables or disables inheritance of schema privileges by tables created in the schemas.
- Reassigns schema ownership to another user.
- Renames schemas.

Syntax

Set inheritance of schema privileges

```
ALTER SCHEMA [database.]schema DEFAULT {INCLUDE | EXCLUDE} SCHEMA PRIVILEGES
```

Reassign schema ownership

```
ALTER SCHEMA [database.]schema OWNER TO user-name [CASCADE]
```

Rename schemas

```
ALTER SCHEMA [database.]schema[,…] RENAME TO new-schema-name[,…]
```

Parameters

[*database.*]*schema*	The schema to modify. If you specify a database, it must be the current database.
DEFAULT {INCLUDE | EXCLUDE} SCHEMA PRIVILEGES	Specifies whether to enable or disable default inheritance of privileges for new tables in the specified schema: • EXCLUDE SCHEMA PRIVILEGES (default): Disables inheritance of schema privileges. • INCLUDE SCHEMA PRIVILEGES: Specifies to grant tables in the specified schema the same privileges granted to that schema. This option has no effect on existing tables in the schema. See also Enabling Schema Inheritance.
OWNER TO	Reassigns schema ownership to the specified user: `OWNER TO user-name [CASCADE]` By default, ownership of objects in the reassigned schema remain unchanged. To reassign ownership of schema objects to the new schema owner, qualify the OWNER TO clause with CASCADE. For details, see Cascading Schema Ownership below.
RENAME TO	Renames one or more schemas: `RENAME TO new-schema-name[,…]` The following requirements apply: • The new schema name conforms to

	conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, models, and schemas in the database. • If you specify multiple schemas to rename, the source and target lists must have the same number of names. **Caution:** Renaming a schema referenced by a view causes the view to fail unless another schema is created to replace it.

Privileges

One of the following:

- Superuser
- Schema owner

Cascading Schema Ownership

By default, `ALTER SCHEMA…OWNER TO` does not affect ownership of objects in the target schema or the privileges granted on them. If you qualify the `OWNER TO` clause with `CASCADE`, Vertica acts as follows on objects in the target schema:

- Transfers ownership of objects owned by the previous schema owner to the new owner.
- Revokes all object privileges granted by the previous schema owner.

If issued by non-superusers, `ALTER SCHEMA…OWNER TO CASCADE` ignores all objects that belong to other users, and returns with notices on the objects that it cannot change.

For example:

1. Schema `ms` is owned by user `mayday`, and contains two tables: `ms.t1` owned by mayday, and `ms.t2` owned by user `joe`:

```
=> \dt
                          List of tables
     Schema     |         Name          | Kind  |  Owner   | Comment
----------------+-----------------------+-------+----------+---------
 ms             | t1                    | table | mayday   |
```

```
 ms             | t2                    | table | joe     |
```

2. User `mayday` transfers ownership of schema `ms` to user `dbadmin`, using `CASCADE`. On return, `ALTER SCHEMA` notifies user `mayday` that it cannot transfer ownership of table `ms.t2` and its projections, which are owned by user `joe`:

```
=> \c - mayday
You are now connected as user "mayday".
=> ALTER SCHEMA ms OWNER TO dbadmin CASCADE;
NOTICE 3583:  Insufficient privileges on ms.t2
NOTICE 3583:  Insufficient privileges on ms.t2_b0
NOTICE 3583:  Insufficient privileges on ms.t2_b1
ALTER SCHEMA
=> \c
You are now connected as user "dbadmin".
=> \dt
                          List of tables
     Schema     |         Name          | Kind  |  Owner  | Comment
----------------+-----------------------+-------+---------+---------
 ms             | t1                    | table | dbadmin |
 ms             | t2                    | table | joe     |
```

3. User `dbadmin` transfers ownership of schema `ms` to user `pat`, again using `CASCADE`. This time, because `dbadmin` is a superuser, `ALTER SCHEMA` transfers ownership of all `ms` tables to user `pat`

```
=> ALTER SCHEMA ms OWNER TO pat CASCADE;
ALTER SCHEMA
=> \dt
                          List of tables
     Schema     |         Name          | Kind  |  Owner  | Comment
----------------+-----------------------+-------+---------+---------
 ms             | t1                    | table | pat     |
 ms             | t2                    | table | pat     |
```

Swapping Schemas

Renaming schemas is useful for swapping schemas without actually moving data. To facilitate the swap, enter a non-existent, temporary placeholder schema. For example, the following `ALTER SCHEMA` statement uses the temporary schema *`temps`* to facilitate swapping schema S1 with schema S2. In this example, *S1* is renamed to *`temps`*. Then *S2* is renamed to *S1*. Finally, *`temps`* is renamed to *S2*.

```
=> ALTER SCHEMA S1, S2, temps RENAME TO temps, S1, S2;
```

Examples

The following example renames schemas S1 and S2 to S3 and S4, respectively:

```
=> ALTER SCHEMA S1, S2 RENAME TO S3, S4;
```

This example sets the default behavior for new table t2 to automatically inherit the schema's privileges:

```
=> ALTER SCHEMA s1 DEFAULT INCLUDE SCHEMA PRIVILEGES;
=> CREATE TABLE s1.t2 (i, int);
```

This example sets the default for new tables to not automatically inherit privileges from the schema:

```
=> ALTER SCHEMA s1 DEFAULT EXCLUDE SCHEMA PRIVILEGES;
```

See Also

- CREATE SCHEMA
- DROP SCHEMA

ALTER SEQUENCE

Changes a named sequence in two ways:

- Sets parameters that control sequence behavior—for example, its start value, and range of minimum and maximum values. These changes take effect only when you start a new database session.
- Sets sequence name, schema, or ownership. These changes take effect immediately.

Note:
You can only modify a named sequence—that is, a sequence that was defined by CREATE SEQUENCE. AUTO_INCREMENT and IDENTITY sequences are owned by the table where they were created, and cannot be changed independently of that table.

Syntax

Change sequence behavior:

```
ALTER SEQUENCE [[database.]schema.]sequence
    [ INCREMENT [ BY ] integer ]
    [ MINVALUE integer | NO MINVALUE ]
    [ MAXVALUE integer | NO MAXVALUE ]
    [ RESTART [ WITH ] integer ]
    [ CACHE integer | NO CACHE ]
    [ CYCLE | NO CYCLE ]
```

Change sequence name, schema, or ownership:

```
ALTER SEQUENCE [schema.]sequence-name {
    RENAME TO seq-name
    | SET SCHEMA schema-name]
    | OWNER TO owner-name
}
```

Parameters

schema	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database. If you do not specify a schema, the table is created in the default schema.
sequence	The name of the sequence to alter.
`INCREMENT [BY]` *integer*	A positive or negative integer that specifies how much to increment or decrement the sequence on each call to NEXTVAL, by default set to 1. **Note:** Setting this parameter to *integer* guarantees that column values always increment by at least *integer*. However, column values can sometimes increment by more than *integer* unless you also set the `NO CACHE` parameter.

MINVALUE *integer* NO MINVALUE (default)	Modifies the minimum value a sequence can generate. If you change this value and the current value exceeds the range, the current value is changed to the minimum value if increment is greater than zero, or to the maximum value if increment is less than zero.
MAXVALUE *integer* NO MAXVALUE (default)	Modifies the maximum value for the sequence. If you change this value and the current value exceeds the range, the current value is changed to the minimum value if increment is greater than zero, or to the maximum value if increment is less than zero.
RESTART [WITH] *integer*	Changes the current value of the sequence to *integer*. The next call to NEXTVAL returns *integer*. **Caution:** Using ALTER SEQUENCE to set a sequence start value below its current value can result in duplicate keys.
CACHE *integer* NO CACHE (default)	Specifies how many sequence numbers are pre-allocated and stored in memory for faster access. Vertica sets up caching for each session, and distributes it across all nodes. By default, the sequence cache is set to 250,000. For details, see Distributing Named Sequences in the Administrator's Guide.

CYCLE
NO CYCLE (default)
	Specifies whether the sequence can wrap when its minimum or maximum values are reached:
	• CYCLE: The sequence wraps as follows:
	  • When an incrementing sequence reaches its upper limit, it is reset to its minimum value.
	  • When an decrementing sequence reaches its lower limit, it is reset to its maximum value.
	• NO CYCLE (default): Calls to NEXTVAL return an error after the sequence reaches its maximum or minimum value.

RENAME TO *seq-name*	Renames a sequence within the current schema, where *seq-name* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
SET SCHEMA *schema-name*	Moves the sequence to schema *schema-name*.

OWNER TO *owner-name*	Reassigns the current sequence owner to the specified owner.

Privileges

Non-superuser: USAGE on the schema and one of the following:

- Sequence owner
- ALTER privilege on the sequence

For certain operations, non-superusers must have the following schema privileges:

Schema privileges required...	For these operations...
CREATE, USAGE	Rename sequence
CREATE: destination schema USAGE: current schema	Move sequence to another schema

Examples

See Altering Sequences in the Administrator's Guide.

See Also

CREATE SEQUENCE

ALTER SUBCLUSTER

Changes the configuration of a subcluster. You can use this statement to rename a subcluster or make it the **default subcluster**.

Syntax

```
ALTER SUBCLUSTER subcluster-name {
    RENAME TO new-name |
    SET DEFAULT
}
```

Parameters

subcluster-name	The name of the subcluster to alter.
RENAME TO *new-name*	Changes the name of the subcluster to *new-name*.
SET DEFAULT	Makes the subcluster the default subcluster. When you add new nodes to the database and do not specify a subcluster to contain them, Vertica adds them to the default subcluster. There can be only one default subcluster at a time. The subcluster that was previously the default subcluster becomes a non-default subcluster.

Privileges

Superuser

Examples

This example makes the analytics_cluster the default subcluster:

```
=> SELECT DISTINCT subcluster_name FROM SUBCLUSTERS WHERE is_default = true;
  subcluster_name
--------------------
 default_subcluster
(1 row)

=> ALTER SUBCLUSTER analytics_cluster SET DEFAULT;
ALTER SUBCLUSTER
=> SELECT DISTINCT subcluster_name FROM SUBCLUSTERS WHERE is_default = true;
  subcluster_name
-------------------
 analytics_cluster
(1 row)
```

This example renames default_subcluster to load_subcluster:

```
=> ALTER SUBCLUSTER default_subcluster RENAME TO load_subcluster;
ALTER SUBCLUSTER

=> SELECT DISTINCT subcluster_name FROM subclusters;
  subcluster_name
-------------------
 load_subcluster
 analytics_cluster
```

```
(2 rows)
```

See Also

ALTER SESSION

ALTER SESSION sets and clears session-level configuration parameter values for the current session.

Syntax

```
ALTER SESSION {
    SET [PARAMETER] parameter-name=value[,…]
    | CLEAR [PARAMETER [FOR]] parameter-name[,…]
    | SET UDPARAMETER [ FOR libname ] key=value[,…]
    | CLEAR UDPARAMETER { [ FOR libname ] key[,…] | ALL }
}
```

Parameters

SET [PARAMETER]	Sets one or more configuration parameters to the specified value. For a list of parameters that you can set, query the SESSION_PARAMETERS table.
CLEAR [PARAMETER [FOR]]	Clears one or more specified configuration parameters .
SET UDPARAMETER	Sets one or more user-defined session parameters (*key*=*value*) to be used with a UDx. Key value sizes are restricted as follows: • Set from client side: 128 characters • Set from UDx side: unlimited You can limit the SET operation's scope to a single library by including the clause FOR *libname*. For example: `=> ALTER SESSION SET UDPARAMETER FOR securelib username='alice';`

	If you specify a library, then only that library can access the parameter's value. Use this restriction to protect parameters that hold sensitive data, such as credentials.
`CLEAR UDPARAMETER`	Clears user-defined parameters, specified by one of the following options: • `[FOR libname] key[,…]`: Clears the *key*-specified parameters, optionally scoped to library *libname*. • `ALL`: Clears all user-defined parameters in the current session.

Privileges

None

Examples

Set and clear a parameter

- Force all UDxes that support fenced mode to run in fenced mode, even if their definition specifies `NOT FENCED`:

```
=> ALTER SESSION SET ForceUDxFencedMode = 1;
ALTER SESSION
```

- Clear `ForceUDxFencedMode` at the session level. Its value is reset to its default value `0`:

```
=> ALTER SESSION CLEAR ForceUDxFencedMode;
ALTER SESSION
=> SELECT parameter_name, current_value, default_value FROM configuration_parameters WHERE
parameter_name = 'ForceUDxFencedMode';
   parameter_name    | current_value | default_value
---------------------+---------------+---------------
 ForceUDxFencedMode | 0             | 0
(1 row)
```

Set and clear a user-defined parameter

- Set the value of user-defined parameter `RowCount` in library `MyLibrary` to 25.

```
=> ALTER SESSION SET UDPARAMETER FOR MyLibrary RowCount = 25;
ALTER SESSION
```

- Clear `RowCount` at the session level:

```
=> ALTER SESSION CLEAR UDPARAMETER FOR MyLibrary RowCount;
ALTER SESSION
```

ALTER SUBNET

Renames an existing subnet.

Syntax

```
ALTER SUBNET subnet-name RENAME TO new-subnet-name
```

Parameters

subnet-name	The name of the existing subnet.
new-subnet-name	The new name for the subnet.

Privileges

Superuser

Examples

```
=> ALTER SUBNET mysubnet RENAME TO myNewSubnet;
```

ALTER TABLE

Modifies the metadata of an existing table. All changes are auto-committed.

General Usage

```
ALTER TABLE [[database.]schema.]table {
    ADD COLUMN [ IF NOT EXISTS ] column datatype
       [ column-constraint ]
       [ ENCODING encoding-type ]
       [ PROJECTIONS (projections-list) | ALL PROJECTIONS ]
    | ADD table-constraint
    | ALTER COLUMN column {
        ENCODING encoding-type PROJECTIONS (projection-list)
        | { SET | DROP } expression }
    | ALTER CONSTRAINT constraint-name { ENABLED | DISABLED }
    | DROP CONSTRAINT constraint-name [ CASCADE | RESTRICT ]
    | DROP [ COLUMN ] [ IF EXISTS ] column [ CASCADE | RESTRICT ]
    | FORCE OUTER integer
    | { INCLUDE | EXCLUDE | MATERIALIZE } [ SCHEMA ] PRIVILEGES
    | OWNER TO owner
    | partition-clause [ REORGANIZE ]
    | REMOVE PARTITIONING
    | RENAME [ COLUMN ] name TO new-name
    | REORGANIZE
    | SET ActivePartitionCount expression
    | SET SCHEMA schema
}
```

Note:
Several ALTER TABLE clauses cannot be specified with other clauses in the same statement (see Exclusive ALTER TABLE Clauses below). Otherwise, ALTER TABLE supports multiple comma-delimited clauses. For example, the following ALTER TABLE statement changes table my-table in two ways: reassigns ownership to user Joe, and sets constraint UNIQUE on column b:

```
ALTER TABLE my-table OWNER TO Joe, ADD CONSTRAINT unique_b UNIQUE (b) ENABLED;
```

Table Renaming

```
ALTER TABLE [[database.]schema.]table[,…] RENAME TO new-table-name[,…]
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table	The table to alter.

ADD COLUMN	Adds a column to the table and, by default, to all its superprojections:
	`ADD COLUMN [IF NOT EXISTS] column datatype [ NULL | NOT NULL ] [ENCODING encoding-type] [PROJECTIONS (projections-list) | ALL PROJECTIONS]`
	The optional clause `IF NOT EXISTS` generates an informational message if *column* already exists under the specified name. If you omit this option and *column* exists, Vertica generates a `ROLLBACK` error message.
	You can qualify the new column definition with one of these options:
	• *column-constraint* specifies a column constraint as follows:
	`{NULL | NOT NULL} | [ DEFAULT default-expr ] [ SET USING using-expr ] } | DEFAULT USING exp}`
	• `ENCODING` specifies the column's encoding type, by default set to `AUTO`.
	• `PROJECTIONS` adds the new column to one or more existing projections of this table, specified as a comma-delimted list of projection base names. Vertica adds the column to all buddies of each projection. The projection list cannot

	include projections with pre-aggregated data such as live aggregate projections; otherwise, Vertica rolls back the ALTER TABLE statement. • ALL PROJECTIONS adds the column to all projections of this table, excluding projections with pre-aggregated data.
ADD *table-constraint*	Adds a constraint to a table that does not have any associated projections. See Constraints in the Administrator's Guide.
ALTER COLUMN	You can alter an existing column in one of two ways: • Set encoding on a column for one or more projections of this table: ENCODING *encoding-type* PROJECTIONS (*projections-list*) where *projections-list* is a comma-delimited list of projections to update with the new encoding. You can specify each projection in two ways: • Projection base name: Update all projections that share this base name. • Projection name: Update the specified projection. If the projection is segmented, the change is propagated to all buddies. If one of the projections does not contain the target column, Vertica returns with a rollback error. For details, see Projection Column Encoding. • Set or drop a setting for a column of scalar data: `SET { DEFAULT expression	USING expression	DEFAULT USING expression	NOT NULL	DATA TYPE datatype }` `DROP { DEFAULT	SET USING	DEFAULT USING	NOT NULL }`

	Setting a DEFAULT or SET USING expression has no effect on existing column values. To refresh the column with its DEFAULT or SET USING expression, update it as follows • SET USING column: Call REFRESH_COLUMNS on the table. • DEFAULT column, update the column as follows: `UPDATE table-name SET column-name=DEFAULT;`
ALTER CONSTRAINT	Specifies whether to enforce primary key, unique key, and check constraints: `ALTER CONSTRAINT constraint-name {ENABLED | DISABLED}` See Constraint Enforcement in the Administrator's Guide.
DROP CONSTRAINT	Drops the specified table constraint from the table: `DROP CONSTRAINT constraint-name [CASCADE | RESTRICT]` You can qualify DROP CONSTRAINT with one of these options: • CASCADE : Drops a constraint and all dependencies in other tables. • RESTRICT: Does not drop a constraint if there are dependent objects. Same as the default behavior. Dropping a table constraint has no effect on views that reference the table.
DROP [COLUMN]	Drops the specified column from the table and that column's ROS containers: `DROP [COLUMN] [IF EXISTS] column [CASCADE | RESTRICT]` You can qualify DROP COLUMN with one of these options: • IF EXISTS specifies to generate an

	informational message if the column does not exist. If you omit this option and the column does not exist, Vertica generates a `ROLLBACK` error message. • `CASCADE` is required if the column has dependencies. • `RESTRICT` drops the column only from the given table. See Dropping Table Columns in the Administrator's Guide.
`FORCE OUTER` *integer*	Specifies whether a table is joined to another as an inner or outer input. For details, see Controlling Join Inputs in Analyzing Data.

`{ INCLUDE`
`| EXCLUDE`
`| MATERIALIZE }`
`[SCHEMA] PRIVILEGES`
	Specifies default inheritance of schema privileges for this table:
	
	• `EXCLUDE [SCHEMA] PRIVILEGES` (default) disables inheritance of privileges from the schema.
	• `INCLUDE [SCHEMA] PRIVILEGES` grants the table the same privileges granted to its schema.
	• `MATERIALIZE`: Copies grants to the table and creates a GRANT object on the table. This disables the inherited privileges flag on the table, so you can:
	
	  • Grant more specific privileges at the table level
	  • Use schema-level privileges as a template
	  • Move the table to a different schema
	  • Change schema privileges without affecting the table
	
	  Note:
	  If inherited privileges are disabled at the database level, schema privileges can still be materialized.
	
	See also Setting Privilege Inheritance on Tables and Views in the Administrator's Guide.

OWNER TO *owner*	Changes the table owner. See Changing Table Ownership in the Administrator's Guide.
partition-clause [REORGANIZE]	Invalid for external tables, logically divides table data storage through a PARTITION BY clause: `PARTITION BY partition-expression [ GROUP BY group-expression ] [ SET ACTIVEPARTITIONCOUNT integer ]` For details, see Partition Clause. If you qualify the partition clause with REORGANIZE and the table previously specified no partitioning, the Vertica **Tuple Mover** immediately implements the partition clause. If the table previously specified partitioning, the Tuple Mover evaluates ROS storage containers and reorganizes them as needed to conform with the new partition clause.
REMOVE PARTITIONING	Specifies to remove partitioning from a table definition. The **Tuple Mover** subsequently removes existing partitions from ROS containers.
RENAME [COLUMN]	Renames the specified column within the table. See Renaming Columns in the Administrator's Guide.
REORGANIZE	Valid only for partitioned tables, invokes the **Tuple Mover** to reorganize ROS storage containers as needed to conform with the table's current partition clause. ALTER TABLE…REORGANIZE and Vertica meta-function PARTITION_TABLE operate identically. REORGANIZE can also qualify a new partition clause.
SET ActivePartitionCount *expression*	Valid only for partitioned tables, specifies how many partitions are active for this table, where *expression* is one of the following: • Unsigned integer: Supersedes configuration parameter ActivePartitionCount. • DEFAULT: Removes the table-level active partition count. The table obtains its active

	partition count from configuration parameter `ActivePartitionCount`. For details on usage, see Active and Inactive Partitions in the Administrator's Guide.
`SET SCHEMA`	Moves the table from one schema to another. Vertica automatically moves all projections that are anchored to the source table to the destination schema. It also moves all `IDENTITY` and `AUTO_INCREMENT` columns to the destination schema. For details, see Moving Tables to Another Schema in the Administrator's Guide.
`RENAME TO`	Renames one or more tables: `RENAME TO new-table-name[,…]` The following requirements apply: • The renamed table must be in the same schema as the original table. • The new table name conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema. • If you specify multiple tables to rename, the source and target lists must have the same number of names.

Privileges

Non-superuser: USAGE on the schema and one of the following:

- Table owner
- ALTER privileges

Non-superusers must also have SELECT privileges to enable or disable constraint enforcement, or remove partitioning.

For certain operations, non-superusers must have the following schema privileges:

Schema privileges required…	For these operations…
CREATE, USAGE	Rename table
CREATE: destination schema USAGE: current schema	Move table to another schema

Exclusive ALTER TABLE Clauses

The following `ALTER TABLE` clauses cannot be combined with another `ALTER TABLE` clause:

- `ADD COLUMN`
- `DROP COLUMN`
- `RENAME COLUMN`
- `SET SCHEMA`
- `RENAME [TO]`

Node Down

In Enterprise mode, a number of ALTER TABLE operations are not supported when one or more nodes are down:

- `ALTER COLUMN… ADD` *table-constraint*
- `ALTER COLUMN… SET DATA TYPE`
- `ALTER COLUMN… { SET DEFAULT | DROP DEFAULT }`
- `ALTER COLUMN… { SET USING | DROP SET USING }`
- `ALTER CONSTRAINT`
- `DROP COLUMN`
- `DROP CONSTRAINT`

Note:
This restriction applies only to Enterprise mode; in Eon mode, it is ignored.

Pre-Aggregated Projection Restrictions

You cannot modify the metadata of anchor table columns that are included in live aggregate or Top-K projections. You also cannot drop these columns. To make these changes, you must first drop all live aggregate and Top-K projections that are associated with it.

External Table Restrictions

Not all ALTER TABLE options pertain to external tables. For instance, you cannot add a column to an external table, but you can rename the table:

```
=> ALTER TABLE mytable RENAME TO mytable2;
ALTER TABLE
```

Locked Tables

If the operation cannot obtain an O lock on the target table, Vertica tries to close any internal Tuple Mover sessions that are running on that table. If successful, the operation can proceed. Explicit Tuple Mover operations that are running in user sessions do not close. If an explicit Tuple Mover operation is running on the table, the operation proceeds only when the operation is complete.

See Also

- Working with Vertica-Managed Tables
- Altering Table Definitions
- Adding Table Columns

Table-Constraint

Adds a constraint to table metadata. You can specify table constraints with CREATE TABLE, or add a constraint to an existing table with ALTER TABLE. For details, see Setting Constraints in the Administrator's Guide.

Note:
Adding a constraint to a table that is referenced in a view does not affect the view.

Syntax

```
[ CONSTRAINT constraint-name ]
{
... PRIMARY KEY (column[,... ]) [ ENABLED | DISABLED ]
```

```
... | FOREIGN KEY (column[,... ] ) REFERENCES table [ (column[,...]) ]
... | UNIQUE (column[,...]) [ ENABLED | DISABLED ]
... | CHECK (expression) [ ENABLED | DISABLED ]
}
```

Parameters

CONSTRAINT *constraint-name*	Assigns a name to the constraint. Vertica recommends that you name all constraints.
PRIMARY KEY	Defines one or more NOT NULL columns as the primary key as follows: `PRIMARY KEY (column[,...]) [ ENABLED | DISABLED]` You can qualify this constraint with the keyword ENABLED or DISABLED. See Enforcing Constraints below. If you do not name a primary key constraint, Vertica assigns the name C_PRIMARY.
FOREIGN KEY	Adds a referential integrity constraint defining one or more columns as foreign keys as follows: `FOREIGN KEY (column[,... ]) REFERENCES table [(column[,... ])]` If you omit *column*, Vertica references the primary key in *table*. If you do not name a foreign key constraint, Vertica assigns the name C_FOREIGN. **Important:** Adding a foreign key constraint requires the following privileges (in addition to privileges also required by ALTER TABLE): • REFERENCES on the referenced table • USAGE on the schema of the referenced table
UNIQUE	Specifies that the data in a column or group of columns is unique with respect to all table rows, as follows: `UNIQUE (column[,...]) [ENABLED | DISABLED]` You can qualify this constraint with the keyword ENABLED or

	DISABLED. See Enforcing Constraints below. If you do not name a unique constraint, Vertica assigns the name C_UNIQUE.
CHECK	Specifies a check condition as an expression that returns a Boolean value, as follows: `CHECK (expression) [ENABLED | DISABLED]` You can qualify this constraint with the keyword ENABLED or DISABLED. See Enforcing Constraints below. If you do not name a check constraint, Vertica assigns the name C_CHECK.

Privileges

Non-superusers: table owner, or the following privileges:

- USAGE on schema
- ALTER on table
- SELECT on table to enable or disable constraint enforcement

Enforcing Constraints

A table can specify whether Vertica automatically enforces a primary key, unique key or check constraint with the keyword ENABLED or DISABLED. If you omit ENABLED or DISABLED, Vertica determines whether to enable the constraint automatically by checking the appropriate configuration parameter:

- EnableNewPrimaryKeysByDefault
- EnableNewUniqueKeysByDefault
- EnableNewCheckConstraintsByDefault

For details, see Constraint Enforcement.

Examples

The following example creates a table (t01) with a primary key constraint.

```
CREATE TABLE t01 (id int CONSTRAINT sampleconstraint PRIMARY KEY);
CREATE TABLE
```

This example creates the same table without the constraint, and then adds the constraint with `ALTER TABLE ADD CONSTRAINT`

```
CREATE TABLE t01 (id int);
CREATE TABLE

ALTER TABLE t01 ADD CONSTRAINT sampleconstraint PRIMARY KEY(id);
WARNING 2623:  Column "id" definition changed to NOT NULL
ALTER TABLE
```

The following example creates a table (`addapk`) with two columns, adds a third column to the table, and then adds a primary key constraint on the third column.

```
=> CREATE TABLE addapk (col1 INT, col2 INT);
CREATE TABLE

=> ALTER TABLE addapk ADD COLUMN col3 INT;
ALTER TABLE

=> ALTER TABLE addapk ADD CONSTRAINT col3constraint PRIMARY KEY (col3) ENABLED;
WARNING 2623:  Column "col3" definition changed to NOT NULL
ALTER TABLE
```

Using the sample table `addapk`, check that the primary key constraint is enabled (`is_enabled` is `t`).

```
=> SELECT constraint_name, column_name, constraint_type, is_enabled FROM PRIMARY_KEYS WHERE table_
name IN ('addapk');

 constraint_name | column_name | constraint_type | is_enabled
-----------------+-------------+-----------------+------------
 col3constraint  | col3        | p               | t
(1 row)
```

This example disables the constraint using `ALTER TABLE ALTER CONSTRAINT`.

```
=> ALTER TABLE addapk ALTER CONSTRAINT col3constraint DISABLED;
```

Check that the primary key is now disabled (`is_enabled` is `f`).

```
=> SELECT constraint_name, column_name, constraint_type, is_enabled FROM PRIMARY_KEYS WHERE table_
name IN ('addapk');

 constraint_name | column_name | constraint_type | is_enabled
-----------------+-------------+-----------------+------------
 col3constraint  | col3        | p               | f
(1 row)
```

For a general discussion of constraints, see Constraints. For additional examples of creating and naming constraints, see Naming Constraints.

Projection Column Encoding

After you create a table and its projections, you can call ALTER TABLE…ALTER COLUMN to set or change the encoding type of an existing column in one or more projections. For example:

```
ALTER TABLE store.store_dimension ALTER COLUMN store_region
  ENCODING rle PROJECTIONS (store.store_dimension_p1_b0, store.store_dimension_p2);
```

In this example, the ALTER TABLE statement specifies to set RLE encoding on column `store_region` for two projections: `store_dimension_p1_b0` and `store_dimension_p2`. The `PROJECTIONS` list references the two projections by their projection name and base name, respectively. You can reference a projection either way; in both cases, the change is propagated to all buddies of the projection and stored in its DDL accordingly:

```
=> select export_objects('','store.store_dimension');

                          export_objects
------------------------------------------------------------------
CREATE TABLE store.store_dimension
(
    store_key int NOT NULL,
    store_name varchar(64),
    store_number int,
    store_address varchar(256),
    store_city varchar(64),
    store_state char(2),
    store_region varchar(64)
);

CREATE PROJECTION store.store_dimension_p1
(
 store_key,
 store_name,
 store_number,
 store_address,
 store_city,
 store_state,
 store_region ENCODING RLE
)
AS
 SELECT store_dimension.store_key,
        store_dimension.store_name,
        store_dimension.store_number,
        store_dimension.store_address,
        store_dimension.store_city,
```

```
        store_dimension.store_state,
        store_dimension.store_region
 FROM store.store_dimension
 ORDER BY store_dimension.store_key
SEGMENTED BY hash(store_dimension.store_key) ALL NODES KSAFE 1;

CREATE PROJECTION store.store_dimension_p2
(
 store_key,
 store_name,
 store_number,
 store_address,
 store_city,
 store_state,
 store_region ENCODING RLE
)
AS
 SELECT …
```

Important:
When you add or change a column's encoding type, it has no immediate effect on existing projection data. Vertica applies the encoding only to newly loaded data, and to existing data on mergeout.

ALTER USER

Changes user account parameters and user-level configuration parameters.

Syntax

```
ALTER USER user-name {
   account-parameter setting[,…]
   | SET [PARAMETER] cfg-parameter=value[,…]
   | CLEAR [PARAMETER] cfg-parameter[,…]
}
```

Parameters

user-name	Name of the user. Names that contain special characters must be double-quoted. To enforce case-sensitivity, use double-quotes. For details on name requirements, see Creating a Database Name and Password.

account-parameter value	Specifies user account settings (see below). **Note:** Changes to a user account apply only to the current session and to all later sessions launched by this user.
SET [PARAMETER]	Sets the specified configuration parameters. The new setting applies only to the current session, and to all later sessions launched by this user. Concurrent user sessions are unaffected by new settings unless they call meta-function RESET_SESSION.
CLEAR [PARAMETER]	Resets the specified configuration parameters to their default values.

Important:
SET | CLEAR PARAMETER can specify only user-level configuration parameters, otherwise Vertica returns an error. For details, see Setting User-Level Configuration Parameters below.

User Account Parameters

Specify one or more user-account parameters and their settings as a comma-delimited list:

account-parameter setting[,…]

Important:
The following user-account parameters are invalid for a user who is added to the Vertica database with the LDAPLink service:

- IDENTIFIED BY
- PROFILE
- SECURITY ALGORITHM

Parameter	Settings
ACCOUNT	Locks or unlocks user access to the database, set to one of the following: • UNLOCK (default) • LOCK prevents a new user from logging in.

Parameter	Settings
	This can be useful when creating an account for a user who does not need immediate access. **Tip:** To automate account locking, set a maximum number of failed login attempts with `CREATE PROFILE`.
`DEFAULT ROLE`	Specifies what roles are the default roles for this user, set to one of the following: • `NONE` (default): Removes all default roles. • *`role`*`[,…]`: Comma-delimited list of roles. • `ALL`: Sets as default all user roles. • `ALL EXCEPT` *`role`*`[,…]`: Comma - delimited list of roles to exclude as default roles. Default roles are automatically activated when a user logs in. The roles specified by this parameter supersede any roles assigned earlier. **Note:** `DEFAULT ROLE` cannot be specified in combination with other `ALTER USER` parameters.
`GRACEPERIOD`	Specifies how long a user query can block on any session socket, one of the following: • `NONE` (default): Removes any grace period previously set on session queries. • `'`*`interval`*`'`: Specifies as an interval the maximum grace period for current session queries, up to 20 days. For details, see Handling Session Socket Blocking.
`IDENTIFIED BY '[`*`new-password`*`]' [REPLACE '`*`current-password`*`']`	Sets a new password for the user, where *`new-password`* must conform to the password

Parameter	Settings
	complexity policy set by the user's profile. Superusers can change the password for any user, and are not required to specify the REPLACE clause. Non-superusers can only change their own password, and must supply their current password with the REPLACE clause. If you supply an empty string, the user's current password is removed, and the user is no longer prompted for a password when starting a new session. For details, see Password Guidelines and Creating a Database Name and Password.
IDLESESSIONTIMEOUT	The length of time the system waits before disconnecting an idle session, one of the following: • NONE (default): No limit set for this user. If you omit this parameter, no limit is set for this user. • '*interval*' An interval value, up to one year. For details, see Managing Client Connections.
MAXCONNECTIONS	Specifies the maximum number of connections the user can have to the server, one of the following: • NONE (default): No limit set. If you omit this parameter, the user can have an unlimited number of connections across the database cluster. • *integer* ON DATABASE: Sets to *integer* the maximum number of connections across the database cluster. • *integer* ON NODE: Sets to *integer* the maximum number of connections to each

Parameter	Settings
	node. For details, see Managing Client Connections.

MEMORYCAP	Specifies how much memory can be allocated to user requests, set to one of the following expressions:
	
	• NONE (default): No limit
	• A string value that specifies the memory limit, one of the following:
	
	  • *int*% — Expresses the maximum as a percentage of total memory available to the Resource Manager, where *int* is an integer value between 0 and 100.For example:
	
	  MEMORYCAP '40%'
	
	  • *int*{K|M|G|T} — Expresses memory allocation in kilobytes, megabytes, gigabytes, or terabytes. For example:
	
	  MEMORYCAP '10G'

PASSWORD EXPIRE	Forces immediate expiration of the user's password. The user must change the password on the next login. **Note:** PASSWORD EXPIRE has no effect when using external password authentication methods such as LDAP or Kerberos.
PROFILE	Assigns a profile that controls password requirements for this user, set to one of the following: • DEFAULT (default): Assigns the default database profile to this user. • *profile-name*: A profile that is defined

Parameter	Settings
	by CREATE PROFILE.
RENAME TO	Assigns the user a new user name. All privileges assigned to the user remain unchanged. **Note:** RENAME TO cannot be specified in combination with other ALTER USER parameters.
RESOURCE POOL	Assigns a default resource pool to this user.
RUNTIMECAP	Specifies how long this user's queries can execute, set to one of the following: • NONE (default): No limit set for this user. If you omit this parameter, no limit is set for this user. • '*interval*' An interval value, up to one year. A query's runtime limit can be set at three levels: the user's runtime limit, the user's resource pool, and the session setting. For more information, see Setting a Runtime Limit for Queries in the Administrator's Guide.
SEARCH_PATH	Specifies the user's default search path that tells Vertica which schemas to search for unqualified references to tables and UDFs, set to one of the following: • DEFAULT (default): Sets the search path as follows: `"$user", public, v_catalog, v_monitor, v_internal` • Comma-delimited list of schemas. For details, see Setting Search Paths in the Administrator's Guide.
SECURITY_ALGORITHM '*algorithm*'	Set the user-level security algorithm for hash authentication, where *algorithm* is one of the

Parameter	Settings
	following: • NONE (default): Uses the MD5 algorithm for hash authentication. • MD5 • SHA512 The user's password expires when you change the SECURITY_ALGORITHM value, and must be reset.

TEMPSPACECAP	Limits how much temporary file storage is available for user requests, set to one of the following:
	• NONE (default): No limit
	• A string value that specifies the memory limit, one of the following:
	  • *int*% — Expresses the maximum as a percentage of total memory available to the Resource Manager, where *int* is an integer value between 0 and 100.For example:
	  MEMORYCAP '40%'
	  • *int*{K|M|G|T} — Expresses memory allocation in kilobytes, megabytes, gigabytes, or terabytes. For example:
	  TEMPSPACECAP '10G'

Privileges

Non-superusers can change the following options on their own user accounts:

- IDENTIFIED BY
- RESOURCE POOL
- SEARCH_PATH
- SECURITY_ALGORITHM

When changing a another user's default resource pool to one outside of the PUBLIC schema, the user must have USAGE privileges on the resource pool from at least one of the following:

- Object ownership
- Explicit grant to the user
- Default role

Setting User-Level Configuration Parameters

SET | CLEAR PARAMETER can specify only user-level configuration parameters, otherwise Vertica returns an error. Only superusers can set and clear user-level parameters, unless they are also supported at the session level.

To get the names of user-level parameters, query system table CONFIGURATION_PARAMETERS. For example:

```
SELECT parameter_name, allowed_levels FROM configuration_parameters
      WHERE allowed_levels ilike '%USER%' AND parameter_name ilike '%depot%';
     parameter_name      |     allowed_levels
-------------------------+------------------------
 UseDepotForWrites       | SESSION, USER, DATABASE
 DepotOperationsForQuery | SESSION, USER, DATABASE
 UseDepotForReads        | SESSION, USER, DATABASE
(3 rows)
```

The following example sets the user-level configuration parameter DepotOperationsForQuery for a specific user:

```
=> SHOW USER user1 ALL;
          name           | setting
-------------------------+---------
 DepotOperationsForQuery | Fetches
(1 row)

=> ALTER USER user1 SET PARAMETER UseDepotForWrites=0;
ALTER USER
=> SHOW USER user1 ALL;
          name           | setting
-------------------------+---------
 DepotOperationsForQuery | Fetches
 UseDepotForWrites       | 0
(2 rows)
```

Setting User Account Parameters: Examples

Change user's password

```
=> CREATE USER user1;
=> ALTER USER user1 IDENTIFIED BY 'newpassword';
```

Change user's security algorithm and password

Change a user's hash authentication and password to `SHA-512` and `newpassword`, respectively. When you execute the `ALTER USER` statement, Vertica hashes the password, using the SHA-512 algorithm, and saves the hashed version:

```
=> CREATE USER user1;
=> ALTER USER user1 SECURITY_ALGORITHM 'SHA512' IDENTIFIED BY 'newpassword'
```

Assign user default roles

Make a user's assigned roles the user's default roles:

```
=> CREATE USER user1;
CREATE USER
=> GRANT role1, role2, role3 to user1;
=> ALTER USER user1 DEFAULT ROLE ALL;
```

Assign user default roles with EXCEPT

Set all user-assigned roles to default roles except `role1`:

```
=> CREATE USER user2;
CREATE USER
=> GRANT role1, role2, role3 to user2;
=> ALTER USER user2 DEFAULT ROLE ALL EXCEPT role1;
```

See Also

- CREATE USER
- DROP USER
- SHOW USER

ALTER VIEW

Modifies the metadata of an existing **view**. The changes are auto-committed.

Syntax

General Usage

```
ALTER VIEW [[database.]schema.]view {
    | OWNER TO owner
    | SET SCHEMA schema
    | { INCLUDE | EXCLUDE | MATERIALIZE } [ SCHEMA ] PRIVILEGES
}
```

View Renaming

```
ALTER VIEW [[database.]schema.]view[,…] RENAME TO new-view-name[,…]
```

Parameters

[*database*.]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.

view	The view to alter.
SET SCHEMA *schema*	Moves the view from one schema to another.
OWNER TO *owner*	Changes the view owner. **Important:** The new view owner should also have SELECT privileges on the objects that the view references; otherwise the view is inaccessible to that user.

{ INCLUDE | EXCLUDE | MATERIALIZE } [SCHEMA] PRIVILEGES	Specifies default inheritance of schema privileges for this view:
	• EXCLUDE [SCHEMA] PRIVILEGES (default) disables inheritance of privileges from the schema.
	• INCLUDE [SCHEMA] PRIVILEGES grants the view the same privileges granted to its schema.
	• MATERIALIZE: Copies grants to the view and creates a GRANT object on the view. This disables the inherited privileges flag on the view, so you can:
	  • Grant more specific privileges at the view level
	  • Use schema-level privileges as a template
	  • Move the view to a different schema
	  • Change schema privileges without affecting the view
	Note:
	If inherited privileges are disabled at the database level, schema privileges can still be materialized.
	
	See also Setting Privilege Inheritance on Tables and Views in the Administrator's Guide.

RENAME TO	Renames one or more views: `RENAME TO new-view-name[,…]` The following requirements apply: • The new view name conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema. • If you specify multiple views to rename, the source and target

	lists must have the same number of names. • Renaming a view requires USAGE and CREATE privileges on the schema that contains the view.

Privileges

Non-superuser: USAGE on the schema and one of the following:

- View owner
- ALTER privilege on the view

For certain operations, non-superusers must have the following schema privileges:

Schema privileges required…	For these operations…
CREATE, USAGE	Rename view
CREATE: destination schema USAGE: current schema	Move view to another schema

Example

Rename view `view1` to `view2`:

```
=> CREATE VIEW view1 AS SELECT * FROM t;
CREATE VIEW
=> ALTER VIEW view1 RENAME TO view2;
ALTER VIEW
```

ACTIVATE DIRECTED QUERY

Activates a directed query and makes it available to the query optimizer across all sessions.

Syntax

`ACTIVATE DIRECTED QUERY` *`query-name`*

Parameters

query-name	Identifies the directed query to activate. To obtain identifiers for directed queries, use GET DIRECTED QUERY, or query the system table V_CATALOG.DIRECTED_QUERIES.

Privileges

Superuser

Activation Life Cycle

After you activate a directed query, it remains active until it is explicitly deactivated by DEACTIVATE DIRECTED QUERY or removed from storage by DROP DIRECTED QUERY. If a directed query is active at the time of database shutdown, Vertica automatically reactivates it when you restart the database.

Examples

See Activating and Deactivating Directed Queries.

BEGIN

Starts a transaction block. BEGIN is a synonym for START TRANSACTION.

Syntax

```
BEGIN [ WORK | TRANSACTION ] [ isolation-level ] [ transaction-mode]
```

and where *transaction_mode* is one of:

```
READ { ONLY | WRITE }
```

Parameters

`WORK | TRANSACTION`	Optional keywords for readability purposes only.
`isolation-level`	Specifies the transaction's isolation level, which determines what data the transaction can access when other transactions are running concurrently. You can set *`isolation-level`* to one of the following: • `READ COMMITTED` (default) • `SERIALIZABLE` • `REPEATABLE READ` (automatically converted to `SERIALIZABLE`) • `READ UNCOMMITTED` (automatically converted to `READ COMMITTED`) For detailed information, see Transactions in Vertica Concepts.
`transaction-mode`	
`READ { ONLY | WRITE }`	Transaction mode can be one of the following: • `READ WRITE`—(default)The transaction is read/write. • `READ ONLY`—The transaction is read-only. Setting the transaction session mode to read-only disallows the following SQL commands, but does not prevent all disk write operations: • INSERT, UPDATE, DELETE, and COPY if the table they would write to is not a temporary table • All CREATE, ALTER, and DROP commands • GRANT, REVOKE, and EXPLAIN if the command it would run is among those listed.

Privileges

None

Examples

This example shows how to begin a transaction and set the isolation level.

```
=> BEGIN TRANSACTION ISOLATION LEVEL READ COMMITTED READ WRITE;
BEGIN

=> CREATE TABLE sample_table (a INT);
CREATE TABLE

=> INSERT INTO sample_table (a) VALUES (1);
OUTPUT
--------
1
(1 row)
```

See Also

- Transactions
- Creating Transactions
- COMMIT
- END
- ROLLBACK

COMMENT ON Statements

COMMENT ON statements let you create comments on database objects, such as schemas, tables, and libraries. Each object can have one comment. Comments are stored in the system table COMMENTS.

COMMENT ON CONSTRAINT

Adds, revises, or removes a comment on a constraint. Each object can have one comment. Comments are stored in the system table COMMENTS.

Syntax

```
COMMENT ON CONSTRAINT constraint ON [[database.]schema.]table IS ... {'comment' | NULL };
```

Parameters

constraint	The name of the constraint associated with the comment.
[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table	The name of the table constraint with which to associate a comment.
comment	Specifies the comment text to add. If a comment already exists for this constraint, this comment overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.

NULL	Removes an existing comment.

Privileges

Non-superuser: object owner

Example

The following example adds a comment to the `constraint_x` constraint on the promotion_dimension table:

```
=> COMMENT ON CONSTRAINT constraint_x ON promotion_dimension IS 'Primary key';
```

The following example removes a comment from the `constraint_x` constraint on the promotion_dimension table:

```
=> COMMENT ON CONSTRAINT constraint_x ON promotion_dimension IS NULL;
```

COMMENT ON FUNCTION

Adds, revises, or removes a comment on a function. Each object can have one comment. Comments are stored in the system table COMMENTS.

Syntax

```
COMMENT ON FUNCTION [[database.]schema.]function (function-args) IS { 'comment' | NULL };
```

Parameters

[*database*.]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.

function	The name of the function with which to associate the comment.
function-args	The function arguments.
comment	Specifies the comment text to add. If a comment already exists for this function, this overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.
NULL	Removes an existing comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the `macros.zerowhennull (x INT)` function:

```
=> COMMENT ON FUNCTION macros.zerowhennull(x INT) IS 'Returns a 0 if not NULL';
```

The following example removes a comment from the `macros.zerowhennull (x INT)` function:

```
=> COMMENT ON FUNCTION macros.zerowhennull(x INT) IS NULL;
```

COMMENT ON AGGREGATE FUNCTION

Adds, revises, or removes a comment on an aggregate function. Each object can have one comment. Comments are stored in the system table COMMENTS.

Syntax

```
COMMENT ON AGGREGATE FUNCTION [[database.]schema.]function (function-args) IS { 'comment' | NULL };
```

Parameters

[*database* .]*schema*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
function	The name of the aggregate function with which to associate the comment.
function-args	The function arguments.
comment	Specifies the comment text to add. If a comment already exists for this function, this overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.
NULL	Removes an existing comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the `APPROXIMATE_MEDIAN(x FLOAT)` function:

```
=> COMMENT ON AGGREGATE FUNCTION APPROXIMATE_MEDIAN(x FLOAT) IS 'alias of APPROXIMATE_PERCENTILE with
0.5 as its parameter';
```

The following example removes a comment from the `APPROXIMATE_MEDIAN(x FLOAT)` function:

```
=> COMMENT ON AGGREGATE FUNCTION APPROXIMATE_MEDIAN(x FLOAT) IS NULL;
```

COMMENT ON ANALYTIC FUNCTION

Adds, revises, or removes a comment on an analytic function. Each object can have one comment. Comments are stored in the system table COMMENTS.

Syntax

```
COMMENT ON ANALYTIC FUNCTION [[database.]schema.]function (function-args) IS { 'comment' | NULL };
```

Parameters

[*database*.]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
function	The name of the analytic function with which to associate the comment.
function-args	The function arguments.
comment	Specifies the comment text to add. If a comment already exists for this function, this overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.
NULL	Removes an existing comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the user-defined an_rank() function:

```
=> COMMENT ON ANALYTIC FUNCTION an_rank() IS 'built from the AnalyticFunctions library';
```

The following example removes a comment from the user-defined an_rank() function:

```
=> COMMENT ON ANALYTIC FUNCTION an_rank() IS NULL;
```

COMMENT ON LIBRARY

Adds, revises, or removes a comment on a library . Each object can have one comment. Comments are stored in the system table COMMENTS.

Syntax

```
COMMENT ON LIBRARY [[database.]schema.]library IS {'comment' | NULL}
```

Parameters

[*database*.]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
library	The name of the library associated with the comment.
comment	Specifies the comment text to add. If a comment already exists for this library, this comment overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.
NULL	Removes an existing comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the library `MyFunctions`:

```
=> COMMENT ON LIBRARY MyFunctions IS 'In development';
```

The following example removes a comment from the library `MyFunctions`:

```
=> COMMENT ON LIBRARY MyFunctions IS NULL;
```

See Also

- COMMENTS

COMMENT ON NODE

Adds, revises, or removes a comment on a node. Each object can have one comment. Comments are stored in the system table COMMENTS.

Dropping an object drops all comments associated with the object.

Syntax

```
COMMENT ON NODE node-name IS  { 'comment' | NULL }
```

Parameters

node-name	The name of the node associated with the comment.
comment	Specifies the comment text to add. If a comment already exists for this node, this comment overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.
NULL	Removes an existing comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment for the `initiator node`:

```
=> COMMENT ON NODE initiator IS 'Initiator node';
```

The following example removes a comment from the `initiator node`:

```
=> COMMENT ON NODE initiator IS NULL;
```

See Also

COMMENTS

COMMENT ON PROJECTION

Adds, revises, or removes a comment on a projection. Each object can have one comment. Comments are stored in the system table `COMMENTS`.

Dropping an object drops all comments associated with the object.

Syntax

```
COMMENT ON PROJECTION [[database.]schema.]projection IS { 'comment' | NULL }
```

Parameters

[*database*.]*schema*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject`

	If you specify a database, it must be the current database.
projection	The name of the projection associated with the comment.
comment	Specifies the text of the comment to add. If a comment already exists for this projection, the comment you enter here overwrites the previous comment. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.
NULL	Removes an existing comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the `customer_dimension_vmart_node01` projection:

```
=> COMMENT ON PROJECTION customer_dimension_vmart_node01 IS 'Test data';
```

The following example removes a comment from the `customer_dimension_vmart_node01` projection:

```
=> COMMENT ON PROJECTION customer_dimension_vmart_node01 IS NULL;
```

See Also

COMMENTS

COMMENT ON PROJECTION COLUMN

Adds, revises, or removes a projection column comment. Each object can have one comment. Comments are stored in the system table COMMENTS.

Syntax

```
COMMENT ON COLUMN [[database.]schema.]projection.column IS {'comment' | NULL}
```

Parameters

[*database*.]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
projection.*column*	The name of the projection and column with which to associate the comment.
comment	Specifies the comment text to add. If a comment already exists for this column, this comment overwrites the previous comment. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.
NULL	Removes an existing comment.

Privileges

Non-superuser: object owner

Example

The following example adds a comment to the `customer_name` column in the customer_ dimension projection:

```
=> COMMENT ON COLUMN customer_dimension_vmart_node01.customer_name IS 'Last name only';
```

The following example removes a comment from the `customer_name` column in the customer_dimension projection:

```
=> COMMENT ON COLUMN customer_dimension_vmart_node01.customer_name IS NULL;
```

COMMENT ON SCHEMA

Adds, revises, or removes a comment on a schema. Each object can have one comment. Comments are stored in the system table COMMENTS.

Syntax

```
COMMENT ON SCHEMA schema-name IS {'comment' | NULL}
```

Parameters

schema-name	The schema associated with the comment.
comment	Text of the comment to add. If a comment already exists for this schema, the comment you enter here overwrites the previous comment. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.
NULL	Removes an existing comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the public schema:

```
=> COMMENT ON SCHEMA public  IS 'All users can access this schema';
```

The following example removes a comment from the public schema.

```
=> COMMENT ON SCHEMA public IS NULL;
```

COMMENT ON SEQUENCE

Adds, revises, or removes a comment on a sequence. Each object can have one comment. Comments are stored in the system table COMMENTS.

Syntax

```
COMMENT ON SEQUENCE [[database.]schema.]sequence IS { 'comment' | NULL }
```

Parameters

[*database*.]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
sequence	The name of the sequence associated with the comment.
comment	Specifies the text of the comment to add. If a comment already exists for this sequence, this comment overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.
NULL	Removes an existing comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the sequence called prom_seq.

```
=> COMMENT ON SEQUENCE prom_seq IS 'Promotion codes';
```

The following example removes a comment from the prom_seq sequence.

```
=> COMMENT ON SEQUENCE prom_seq IS NULL;
```

COMMENT ON TABLE

Adds, revises, or removes a comment on a table. Each object can have one comment. Comments are stored in the system table COMMENTS.

Syntax

```
COMMENT ON TABLE [[database.]schema.]table IS { 'comment' | NULL }
```

Parameters

[*database*.]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table	The name of the table with which to associate the comment.
comment	Specifies the text of the comment to add. Enclose the text of the comment within single-quotes. If a comment already exists for this table, the comment you enter here overwrites the previous comment. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.
NULL	Removes a previously added comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the promotion_dimension table:

```
=> COMMENT ON TABLE promotion_dimension IS '2011 Promotions';
```

The following example removes a comment from the promotion_dimension table:

```
=> COMMENT ON TABLE promotion_dimension IS NULL;
```

COMMENT ON TABLE COLUMN

Adds, revises, or removes a table column comment. Each object can have one comment. Comments are stored in the system table COMMENTS.

Syntax

```
COMMENT ON COLUMN [[database.]schema.]table.column IS {'comment' | NULL}
```

Parameters

[*database*.]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table.*column*	The name of the table and column with which to associate the comment.
comment	Specifies the comment text to add. If a comment already exists for this column, this comment overwrites the previous comment. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.
NULL	Removes an existing comment.

Privileges

Non-superuser: object owner

Example

The following example adds a comment to the `transaction_time` column in the `store_sales_fact` table in the `store` schema:

```
=> COMMENT ON COLUMN store.store_sales_fact.transaction_time IS 'GMT';
```

The following example removes a comment from the `transaction_time` column in the `store_sales_fact` table in the `store` schema:

```
=> COMMENT ON COLUMN store.store_sales_fact.transaction_time IS NULL;
```

COMMENT ON TRANSFORM FUNCTION

Adds, revises, or removes a comment on a user-defined transform function. Each object can have one comment. Comments are stored in the system table `COMMENTS`.

Syntax

```
COMMENT ON TRANSFORM FUNCTION [[database.]schema.]tfunction
...( [ tfunction-arg-name tfunction-arg-type ][,…] ) IS {'comment' | NULL}
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
tfunction	The name of the transform function with which to associate

	the comment.
tfunction-arg-name tfunction-arg-type	The names and data types of one or more transform function arguments. If you supply argument names and types, each type must match the type specified in the library used to create the original transform function.
comment	Specifies the comment text to add. If a comment already exists for this transform function, this comment overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.
NULL	Removes an existing comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the `macros.zerowhennull (x INT)` UTF function:

```
=> COMMENT ON TRANSFORM FUNCTION macros.zerowhennull(x INT) IS 'Returns a 0 if not NULL';
```

The following example removes a comment from the `acros.zerowhennull (x INT)` function by using the `NULL` option:

```
=> COMMENT ON TRANSFORM FUNCTION macros.zerowhennull(x INT) IS NULL;
```

COMMENT ON VIEW

Adds, revises, or removes a comment on a view. Each object can have one comment. Comments are stored in the system table `COMMENTS`.

Syntax

```
COMMENT ON VIEW [[database.]schema.]view IS { 'comment' | NULL }
```

Parameters

[*database* .]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
view	The name of the view with which to associate the comment.
comment	Specifies the text of the comment to add. If a comment already exists for this view, this comment overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.
NULL	Removes an existing comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment from the `curr_month_ship` view:

```
=> COMMENT ON VIEW curr_month_ship IS 'Shipping data for the current month';
```

The following example removes a comment from the `curr_month_ship` view:

```
=> COMMENT ON VIEW curr_month_ship IS NULL;
```

COMMIT

Ends the current transaction and makes all changes that occurred during the transaction permanent and visible to other users.

COMMIT is a synonym for END

Syntax

```
COMMIT [ WORK | TRANSACTION ]
```

Parameters

WORK TRANSACTION	Optional keywords for readability only.

Privileges

None

Examples

This example shows how to commit an insert.

```
=> CREATE TABLE sample_table (a INT);
=> INSERT INTO sample_table (a) VALUES (1);
OUTPUT
--------
1
=> COMMIT;
```

See Also

- Transactions
- Creating Transactions
- BEGIN

- ROLLBACK
- START TRANSACTION

CONNECT TO VERTICA

Connects to another Vertica database to enable importing and exporting data across Vertica databases, with `COPY FROM VERTICA` and `EXPORT TO VERTICA`, respectively.

After you establish a connection to another database, the connection remains open in the current session until you explicitly close it with `DISCONNECT`. You can have only one connection to another database at a time. However, you can establish successive connections to different databases in the same session.

By default, invoking `CONNECT TO VERTICA` occurs over the Vertica private network. For information about creating a connection over a public network, see Using Public and Private IP Networks.

> **Important:**
> Copy and export operations can fail if either side of the connection is a single-node cluster installed to `localhost`.

Syntax

```
CONNECT TO VERTICA db-spec USER username PASSWORD 'password' ON 'host', port [TLSMODE PREFER]
```

Parameters

db-spec	The target database, either the database name or `DEFAULT`.
username	The username to use when connecting to the other database.
password	A string containing the password to use to connect to the target database. If the target database has no password, and you supply one, the connection succeeds; however, Vertica returns no indication that you supplied an incorrect password.
host	A string containing the host name of one of the nodes in the other

	database.
port	The port number of the other database as an integer.
TLSMODE PREFER	Overrides the value of configuration parameter ImportExportTLSMode for this connection to PREFER. If ImportExportTLSMode is set to *_FORCE you cannot override it.

Privileges

None

Security Requirements

When importing from or exporting to a Vertica database, you can connect only to a database that uses trusted (username only) or password-based authentication, as described in Security and Authentication. SSL authentication is not supported.

If configured with a certificate, Vertica encrypts data during transmission using TLS and attempts to encrypt plan metadata. You can set configuration parameter ImportExportTLSMode to require encryption for plan metadata.

Example

```
=> CONNECT TO VERTICA ExampleDB USER dbadmin PASSWORD 'Password123' ON 'VerticaHost01',5433;
CONNECT
```

COPY

COPY bulk-loads data into a Vertica database. By default, COPY automatically commits itself and any current transaction except when loading temporary tables. If COPY is terminated or interrupted Vertica rolls it back.

COPY reads data as UTF-8 encoding.

For information on loading one or more files or pipes on a cluster host or on a client system, see COPY LOCAL.

Syntax

```
COPY [[database.]schema-name.]target-table
   [ ( { column-as-expression | column }
       [ DELIMITER [ AS ] 'char' ]
       [ ENCLOSED [ BY ] 'char' ]
       [ ENFORCELENGTH ]
       [ ESCAPE [ AS ] 'char' | NO ESCAPE ]
       [ FILLER datatype]
       [ FORMAT 'format' ]
       [ NULL [ AS ] 'string' ]
       [ TRIM 'byte' ]
       [,...] ) ]
   [ COLUMN OPTION ( column
       [ DELIMITER [ AS ] 'char' ]
       [ ENCLOSED [ BY ] 'char' ]
       [ ENFORCELENGTH ]
       [ ESCAPE [ AS ] 'char' | NO ESCAPE ]
       [ FORMAT 'format' ]
       [ NULL [ AS ] 'string' ]
       [ TRIM 'byte' ]
     [,...] ) ]
FROM {
   [ LOCAL ] STDIN [ input-format ]
   | 'path-to-data' [ ON { nodename | (nodeset) | ANY NODE } ] [ input-format ] }[,...]
   | LOCAL 'path-to-data' [ input-format ] [,...]
   | VERTICA source-database.[source-schema.]source-table[( source-column[,...] ) ]
  }
  | [ WITH ] UDL-clause[...]
}
   [ ABORT ON ERROR ]
   [ DELIMITER [ AS ] 'char' ]
   [ ENCLOSED [ BY ] 'char'
   [ ENFORCELENGTH ]
   [ ERROR TOLERANCE ]
   [ ESCAPE [ AS ] 'char' | NO ESCAPE ]
   [ EXCEPTIONS 'path' [ ON nodename ] [,...]
   [ NULL [ AS ] 'string' ]
   [ RECORD TERMINATOR 'string' ]
   [ REJECTED DATA {'path' [ ON nodename ] [,...] | AS TABLE reject-table} ]
   [ REJECTMAX integer ]
   [ SKIP integer ]
   [ SKIP BYTES integer ]
   [ STREAM NAME  'streamName']
   [ TRAILING NULLCOLS ]
   [ TRIM 'byte' ]
   [ [  WITH ] PARSER parser ([ arg=value[,...] ]) ] ]
   [ NO COMMIT ]
```

Parameters

See COPY Parameters

Privileges

Superusers have full COPY privileges. The following requirements apply to non-superusers:

- INSERT privilege on table
- USAGE privilege on schema
- USER-accessible storage location
- Applicable READ or WRITE privileges granted to the storage location where files are read or written

COPY can specify a path to store rejected data and exceptions. If the path resolves to a storage location, the following privileges apply to non-superusers:

- The storage location was created with the USER option (see CREATE LOCATION).
- The user must has READ access to the storage location, as described in GRANT (Storage Location)

COPY Parameters

Parameters and their descriptions are divided into the following sections:

- Target Options
- Column Options
- Input Options
- Handling Options
- Parser-Specific Options

Target Options

The following parameters apply to the target tables and their columns:

[*database.*]*schema*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.

	COPY ignores *schema-name* when used in CREATE EXTERNAL TABLE or CREATE FLEX EXTERNAL TABLE statements.
target-table	The target columnar or flexible table for loading new data. Vertica loads the data into all projections that include columns from the schema table.
column-as-expression	Specifies the expression used to compute values for the target column. For example: `COPY t(year AS TO_CHAR(k, 'YYYY')) FROM 'myfile.dat'` Use this option to transform data when it is loaded into the target database. For details about: • Expressions with COPY: See Transforming Data During Loads. • Fillers: See Manipulating Source Data Columns.
column	Restricts the load to one or more specified columns in the table. If you omit specifying columns, COPY loads all columns by default. Table columns that you omit from the column list are assigned their DEFAULT or SET USING values, if any; otherwise, COPY inserts NULL. If you leave the column parameter blank to load all columns in the table, you can use the optional parameter COLUMN OPTION to specify parsing options for specific columns. The data file must contain the same number of columns as the COPY command's column list. For example, in a table T1 with nine columns (C1 through C9), the following statement loads the three columns of data in each record to columns C1, C6, and C9, respectively: `=> COPY T1 (C1, C6, C9);`
COLUMN OPTION	Specifies load metadata for one or more columns declared

	in the table column list. For example, you can specify that a column has its own `DELIMITER`, `ENCLOSED BY`, `NULL as'NULL'` expression, and so on. You do not have to specify every column name explicitly in the `COLUMN OPTION` list, but each column you specify must correspond to a column in the table column list.

Column Options

Depending on how they are specified, the following COPY options can qualify specific columns or all columns. Some parser-specific options can also apply to either specific columns or all columns. See Global and Column-Specific Options for more information about these two modes.

`ENFORCELENGTH`	If specified, `COPY` rejects data rows of type `char`, `varchar`, `binary`, and `varbinary`, or elements of those types in collections, if they are larger than the declared size. By default, `COPY` truncates offending rows of these data types and elements of these types in collections, but does not reject the rows. For more details, see Tracking Load Exceptions and Rejections Status in the Administrator's Guide. If a collection does not fit with all of its elements, `COPY` rejects the row without truncating. It does not reduce the number of elements. This can happen if each element is individually within limits but the number of elements causes the collection to exceed the maximum size for the column.
`FILLER` *`datatype`*	Specifies not to copy the data of an input column, one of the following: • Ignore data of the input column. • Transform input column data before loading it into the target table. For details, see Manipulating Source Data Columns.
`FORMAT '`*`format`*`'`	Specifies the input formats to use when loading date/time and binary columns, where *`format`* can be one of the following:

	These are the valid input formats when loading binary columns: • octal • hex • bitstream See Loading Binary (Native) Data to learn more about these formats. When loading date/time columns, using FORMAT significantly improves load performance. COPY supports the same formats as the TO_DATE function. See the following topics for additional information: • Template Patterns for Date/Time Formatting • Template Pattern Modifiers for Date/Time Formatting If you specify invalid format strings, the COPY operation returns an error.
NULL [AS]	The string representing a null value. The default is an empty string (''). You can specify a null value as any ASCII value in the range E'\001' to E'\177' inclusive (any ASCII character except NULL: E'\000'). You cannot use the same character for both the DELIMITER and NULL options. For more information, see Loading Delimited Data.

Input Options

The following options are available for specifying source data:

LOCAL	Specifies to load a data file on a client system, rather than on a cluster host. LOCAL can qualify the STDIN and *path-to-data* parameters. For details, see COPY LOCAL. **Restrictions:** Invalid for CREATE EXTERNAL TABLE AS COPY
STDIN	Reads from the client a standard input instead of a file. STDIN takes one input source only. To load multiple input sources, use *path-to-data*. User must have INSERT privileges on the table and USAGE

	privileges on its schema. **Restrictions:** Invalid for CREATE EXTERNAL TABLE AS COPY
path-to-data	Specifies the absolute path of the file (or files) containing the data, which can be from multiple input sources. • If the file is stored in HDFS, *path-to-data* is a URL in the `hdfs` scheme, typically `hdfs:///path/to/file`. See Using HDFS URLs. • If the file is stored in an S3 bucket, *path-to-data* is a URL in the format `s3://bucket/path`. • If the file is stored in Google Cloud Storage, *path-to-data* is a URL in the format `gs://bucket/path`. • If the file is on the local disk or an NFS mount, *path-to-data* is a local (Linux) file path. *path-to-data* can optionally contain wildcards to match more than one file. The file or files must be accessible to the local client or the host on which the COPY statement runs. COPY skips empty files in the file list. A file list that includes directories causes the query to fail. See Specifying Where to Load Data From. The supported patterns for wildcards are specified in the Linux Manual Page for Glob (7), and for ADO.net platforms, through the .NET Directory.getFiles method. You can use variables to construct the pathname as described in Using Load Scripts. If *path-to-data* resolves to a storage location on a local file system, and the user invoking COPY is not a superuser, the following requirements apply: • The storage location was created with CREATE LOCATION…USAGE USER. • The user must already have READ access to the file storage location. Further, if a user has privileges but is not a superuser, and invokes COPY from that storage location, Vertica ensures that symbolic links do not result in unauthorized access.

ON *nodename*	Specifies the node on which the data to copy resides and the node that should parse the load file. If you omit *nodename*, the location of the input file defaults to the initiator node. Use *nodename* to copy and parse a load file from a node other than the COPY initiator node. **Note:** *nodename* is invalid with STDIN and LOCAL.
ON (*nodeset*)	Specifies a set of nodes on which to perform the load. The same data must be available for load on all named nodes. *nodeset* is a comma-separated list of node names in parentheses. For example: `=> COPY t FROM 'file1.txt' ON (v_vmart_node0001, v_vmart_ node0002);` Vertica apportions the load among all of the specified nodes. If you also specify ERROR TOLERANCE or REJECTMAX, Vertica instead chooses a single node on which to perform the load. If the data is available on all nodes, you usually use ON ANY NODE. However, you can use ON *nodeset* to do manual load-balancing among concurrent loads.
ON ANY NODE	Specifies that the source file to load is available on all nodes, so COPY opens the file and parses it from any node in the cluster. For an Eon Mode database, COPY uses nodes within the same subcluster as the initiator. **Caution:** The file must be the same on all nodes. If the file differs on two nodes, an incorrect or incomplete result is returned, with no error or warning. Vertica attempts to apportion the load among several nodes if the file is large enough to benefit from apportioning. It chooses a single node if ERROR TOLERANCE or REJECTMAX is specified. You can use a wildcard or glob (such as *.dat) to load multiple input files, combined with the ON ANY NODE

	clause. If you use a glob, COPY distributes the list of files to all cluster nodes and spreads the workload. ON ANY NODE is invalid with STDIN and LOCAL. STDIN can only use the client host, and LOCAL indicates a client node. ON ANY NODE is the default for HDFS and S3 paths and does not need to be specified.
input-format	Specifies the input format, one of the following: • UNCOMPRESSED (default) • BZIP • GZIP • LZO • ZSTD Input files can be of any format. If you use wildcards, all qualifying input files must be in the same format. To load different file formats, specify the format types specifically. The following requirements and restrictions apply: • When using concatenated BZIP or GZIP files, verify that all source files terminate with a record terminator before concatenating them. • Concatenated BZIP and GZIP files are not supported for NATIVE (binary) and NATIVE VARCHAR formats. • LZO files are assumed to be compressed with lzop. Vertica supports the following lzop arguments: --no-checksum / -F --crc32 --adler32 --no-name / -n --name / -N --no-mode --no-time --fast --best Numbered compression levels • BZIP, GZIP, ZSTD, and LZO compression cannot be

	used with ORC format.
VERTICA	See COPY FROM VERTICA.

[WITH] *UDL-clause*[…]	Specifies one or more user-defined load functions—one source, and optionally one or more filters and one parser, as follows:
	`SOURCE source( [arg=value[,…] ] )`
	`[ FILTER filter( [arg=value[,…] ] ) ]…`
	`[ PARSER parser( [arg=value[,…] ] ) ]`
	To use a flex table parser for column tables, use the PARSER parameter followed by a flex table parser argument. For supported flex table parsers, see Bulk Loading Data into Flex Tables.

Handling Options

The following parameters provide various options for controlling how COPY handles different contingencies:

ABORT ON ERROR	Specifies that COPY stops if any row is rejected. The statement is rolled back and no data is loaded.
COLSIZES (*integer*[,…])	Specifies column widths when loading fixed-width data. COPY requires that you specify the COLSIZES when using the FIXEDWIDTH parser. COLSIZES and the list of integers must correspond to the columns listed in the table column list. For more information, see Loading Fixed-Width Format Data in the Administrator's Guide.
ERROR TOLERANCE	Specifies that COPY treats each source during execution independently when loading data. The statement is not rolled back if a single source is invalid. The invalid

	source is skipped and the load continues. Using this parameter disables apportioned load. **Restrictions:** Invalid for ORC or Parquet data
EXCEPTIONS	Specifies the file name or absolute path of the file in which to write exceptions, as follows: `EXCEPTIONS 'path' [ ON nodename[,…]]` Exceptions describe why each rejected row was rejected. Each exception describes the corresponding record in the file specified by the `REJECTED DATA` option. Files are written on the node or nodes executing the load. If the file already exists, it is overwritten. To collect all exceptions in one place, use the `REJECTED DATA AS TABLE` clause and exceptions are automatically listed in the table's `rejected_reason` column. **Note:** `EXCEPTIONS` is incompatible with `REJECTED DATA AS TABLE`. The `ON` *nodename* clause moves existing exceptions files on *nodename* to the indicated *path* on the same node. For more information, see Saving Load

	Exceptions (EXCEPTIONS) in the Administrator's Guide.
	
	If you use this parameter with COPY…ON ANY NODE, you must still specify the individual nodes for the exception files, as in the following example:
	
	`EXCEPTIONS '/home/ex01.txt' on v_db_node0001,'/home/ex02.txt'`
	
	`node0002,'/home/ex03.txt' on v_db_node0003`
	
	If *path* resolves to a storage location, the following privileges apply to non-superusers:
	
	• The storage location must be created with the USER option (see CREATE LOCATION).
	• The user must have READ access to the storage location where the files exist, as described in GRANT (Storage Location).

REJECTED DATA	Specifies where to write each row that failed to load. If this parameter is specified, records that failed due to parsing errors are always written. Records that failed due to an error during a transformation are written only if configuration parameter CopyFaultTolerantExpressions is set.
	
	The syntax for this parameter is:
	
	`REJECTED DATA`
	
	`AS TABLE reject-table }`
	
	Vertica can write rejected data to the specified path or to a table:

	• *'path'* [ON *nodename*]: Copies the rejected row data to the specified path on the node executing the load. If qualified by ON *nodename*, Vertica moves existing rejected data files on *nodename* to *path* on the same node. The value of *path* can be a directory or a file prefix. If there are multiple load sources, *path* is always treated as a directory. If there are not multiple load sources but *path* ends with '/', or if a directory of that name already exists, it is also treated as a directory. Otherwise, *path* is treated as a file prefix. Files are written on the node or nodes executing the load. If the file already exists, it is overwritten. When this parameter is used with LOCAL, the output is written to the client. **Note:** Do not qualify *path* with ON ANY NODE. To collect all rejected data in one place regardless of how the load is distributed, use a table. • AS TABLE *reject-table*: Saves rejected rows to

	reject-table.  **Note:** `REJECTED DATA AS TABLE` is incompatible with `EXCEPTIONS`. For more information about both options, see Handling Messy Data.
`REJECTMAX` *integer*	The maximum number of logical records that can be rejected before a load fails. For details, see Handling Messy Data. `REJECTMAX` disables apportioned load.
`SKIP` *integer*	The number of records to skip in a load file. For example, you can use the `SKIP` option to omit table header information. **Restrictions:** Invalid for ORC or Parquet data
`STREAM NAME`	Supplies a `COPY` load stream identifier. Using a stream name helps to quickly identify a particular load. The `STREAM NAME` value that you supply in the load statement appears in the STREAM_NAME column of system tables LOAD_STREAMS and LOAD_SOURCES. A valid stream name can contain any combination of alphanumeric or special characters up to 128 bytes in length. By default, Vertica names streams by table and file name. For example, if you are loading two files (`f1`, `f2`)

	into TableA, their default stream names are TableA-f1, TableA-f2, respectively. For example: `=> COPY mytable FROM myfile DELIMITER '| stream name';`
WITH *Parsers for Various Data Formats*	Specifies the parser to use when bulk loading columnar tables, one of the following: • NATIVE • NATIVE VARCHAR • FIXEDWIDTH • ORC (Parser) • PARQUET (Parser) By default, COPY uses the DELIMITER parser for UTF-8 format, delimited text input data. To use a flex table parser for column tables, use the PARSER parameter followed by a flex table parser argument. For parser descriptions, see Flex Parsers Reference. For parser support for complex data types, see the documentation of the specific type. **Note:** You do not specify the DELIMITER parser directly; absence of a specific parser indicates the default. For more information, see Parsers for Various Data Formats in Getting Data into Vertica. The following restrictions apply:

	• These parsers are not applicable when loading flexible tables. • The ORC and PARQUET parsers are for use with Hadoop files in those formats. The files do not need to be stored in HDFS. For details on using these formats, see Reading ORC and Parquet Formats. • COPY LOCAL does not support NATIVE and NATIVE VARCHAR parsers. • To use a flex table parser for column tables, use the PARSER parameter followed by a flex table parser argument. For supported flex table parsers, see Bulk Loading Data into Flex Tables.
NO COMMIT	Prevents the COPY statement from committing its transaction automatically when it finishes copying data. This option must be the last COPY statement parameter. For more information, see Using Transactions to Stage a Load. **Restrictions:** Invalid for ORC or Parquet data , ignored by CREATE EXTERNAL TABLE AS COPY

Parser-Specific Options

The following parameters apply only when using specific parsers. The parsers that support each option follow the option name.

DELIMITER (DELIMITED)	Indicates the single ASCII character used to separate

	columns within each record of a file. You can use any ASCII value in the range E'\000' to E'\177', inclusive. You cannot use the same character for both the DELIMITER and NULL parameters. For more information, see Loading Delimited Data. **Default:** Vertical bar ('|').
ENCLOSED [BY] (DELIMITED)	Sets the quote character within which to enclose data, allowing delimiter characters to be embedded in string values. You can choose any ASCII value in the range E'\001' to E'\177' inclusive (any ASCII character except NULL: E'\000'). By default, ENCLOSED BY has no value, meaning data is not enclosed by any sort of quote character.
ESCAPE [AS] (DELIMITED)	Sets the escape character. Once set, the character following the escape character is interpreted literally, rather than as a special character. You can define an escape character using any ASCII value in the range E'\001' to E'\177', inclusive (any ASCII character except NULL: E'\000'). The COPY statement does not interpret the data it reads in as String Literals. It also does not follow the same escape rules as other SQL statements (including the COPY parameters). When reading data, COPY interprets only the characters defined by these options as special values: • ESCAPE [AS] • DELIMITER • ENCLOSED [BY] • RECORD TERMINATOR • All COLLECTION options **Default:** Backslash ('\').
NO ESCAPE (DELIMITED	Eliminates escape-character handling. Use this option if you do not need any escape character and you want to prevent characters in your data from being interpreted as escape sequences.
RECORD TERMINATOR (DELIMITED)	Specifies the literal character string indicating the end of

	a data file record. For more information about using this parameter, see Loading Delimited Data.
TRAILING NULLCOLS (DELIMITED)	Specifies that if Vertica encounters a record with insufficient data to match the columns in the table column list, COPY inserts the missing columns with NULL values. For other information and examples, see Loading Fixed-Width Format Data
COLLECTIONDELIMITER (DELIMITED)	For columns of collection types, indicates the single ASCII character used to separate elements within each collection. You can use any ASCII value in the range E'\000' to E'\177', inclusive. No COLLECTION option may have the same value as any other COLLECTION option. For more information, see Loading Delimited Data. **Default:** Comma (',').
COLLECTIONOPEN, COLLECTIONCLOSE (DELIMITED)	For columns of collection types, these options indicate the characters that mark the beginning and end of the collection. It is an error to use these characters elsewhere within the list of elements without escaping them. No COLLECTION option may have the same value as any other COLLECTION option. **Default:** Square brackets ('[' and ']').
COLLECTIONNULLELEMENT (DELIMITED)	The string representing a null element value in a collection. You can specify a null value as any ASCII value in the range E'\001' to E'\177' inclusive (any ASCII value except NULL: E'\000'). No COLLECTION option may have the same value as any other COLLECTION option. For more information, see Loading Delimited Data. **Default:** 'null'
COLLECTIONENCLOSE (DELIMITED)	For columns of collection types, sets the quote character within which to enclose individual elements, allowing delimiter characters to be embedded in string values. You can choose any ASCII value in the range E'\001' to E'\177' inclusive (any ASCII character except NULL: E'\000'). No COLLECTION option may have the same value as any other COLLECTION option.

	Default: double quote ('"')
`SKIP BYTES` *integer* (FIXEDWIDTH)	The total number of bytes in a record to skip.
`TRIM` (FIXEDWIDTH)	Trims the number of bytes you specify from a column. This option is only available when loading fixed-width data. You can set TRIM at the table level for a column, or as part of the COLUMN OPTION parameter.

DELIMITED (Parser)

Use the DELIMITED parser, which is the default, to load delimited text data using COPY. You can specify the delimiter, escape characters, how to handle null values, and other parameters.

The DELIMITED parser supports reading one-dimensional collections (arrays or sets) of scalar types.

COPY Options

The following options are specific to this parser. See COPY Parameters for other applicable options.

DELIMITER	Indicates the single ASCII character used to separate columns within each record of a file. You can use any ASCII value in the range E'\000' to E'\177', inclusive. You cannot use the same character for both the DELIMITER and NULL parameters. For more information, see Loading Delimited Data. **Default:** Vertical bar ('|').
ENCLOSED [BY]	Sets the quote character within which to enclose data, allowing delimiter characters to be embedded in string values. You can choose any ASCII value in the range E'\001' to E'\177' inclusive (any ASCII character except NULL: E'\000'). By default, ENCLOSED BY has no value, meaning data is not enclosed by any sort of quote

	character.
ESCAPE [AS]	Sets the escape character. Once set, the character following the escape character is interpreted literally, rather than as a special character. You can define an escape character using any ASCII value in the range E'\001' to E'\177', inclusive (any ASCII character except NULL: E'\000'). The COPY statement does not interpret the data it reads in as String Literals. It also does not follow the same escape rules as other SQL statements (including the COPY parameters). When reading data, COPY interprets only the characters defined by these options as special values: • ESCAPE [AS] • DELIMITER • ENCLOSED [BY] • RECORD TERMINATOR • All COLLECTION options **Default:** Backslash ('\').
NO ESCAPE	Eliminates escape-character handling. Use this option if you do not need any escape character and you want to prevent characters in your data from being interpreted as escape sequences.
RECORD TERMINATOR	Specifies the literal character string indicating the end of a data file record. For more information about using this parameter, see Loading Delimited Data.
TRAILING NULLCOLS	Specifies that if Vertica encounters a record with insufficient data to match the columns in the table column list, COPY inserts the missing columns with NULL values. For other information and examples, see Loading Fixed-Width Format Data
COLLECTIONDELIMITER	For columns of collection types, indicates the single ASCII character used to separate elements within each collection. You can use any ASCII value in the range E'\000' to E'\177', inclusive. No COLLECTION option may have the same value as any other COLLECTION option. For more

	information, see Loading Delimited Data. **Default:** Comma (',').
COLLECTIONOPEN, COLLECTIONCLOSE	For columns of collection types, these options indicate the characters that mark the beginning and end of the collection. It is an error to use these characters elsewhere within the list of elements without escaping them. No COLLECTION option may have the same value as any other COLLECTION option. **Default:** Square brackets ('[' and ']').
COLLECTIONNULLELEMENT	The string representing a null element value in a collection. You can specify a null value as any ASCII value in the range E'\001' to E'\177' inclusive (any ASCII value except NULL: E'\000'). No COLLECTION option may have the same value as any other COLLECTION option. For more information, see Loading Delimited Data. **Default:** 'null'
COLLECTIONENCLOSE	For columns of collection types, sets the quote character within which to enclose individual elements, allowing delimiter characters to be embedded in string values. You can choose any ASCII value in the range E'\001' to E'\177' inclusive (any ASCII character except NULL: E'\000'). No COLLECTION option may have the same value as any other COLLECTION option. **Default:** double quote ('"')

Examples

The following example shows the default behavior, in which the delimiter character is '|'

```
=> CREATE TABLE employees (id INT, name VARCHAR(50), department VARCHAR(50));
CREATE TABLE

=> COPY employees FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 42|Sheldon Cooper|Physics
```

```
>> 17|Howard Wolowitz|Astronomy
>> \.

=> SELECT * FROM employees;
 id |      name       |  department
----+-----------------+--------------
 17 | Howard Wolowitz | Astrophysics
 42 | Sheldon Cooper  | Physics
(2 rows)
```

The following example shows loading array values with the default options.

```
=> CREATE TABLE researchers (id INT, name VARCHAR, grants ARRAY[VARCHAR], values ARRAY[INT]);
CREATE TABLE

=> COPY researchers FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 42|Sheldon Cooper|[US-7376,DARPA-1567]|[65000,135000]
>> 17|Howard Wolowitz|[NASA-1683,NASA-7867,SPX-76]|[16700,85000,45000]
>> \.

=> SELECT * FROM researchers;
 id |      name       |               grants               |       values
----+-----------------+------------------------------------+--------------------
 17 | Howard Wolowitz | ["NASA-1683","NASA-7867","SPX-76"] | [16700,85000,45000]
 42 | Sheldon Cooper  | ["US-7376","DARPA-1567"]           | [65000,135000]
(2 rows)
```

In the following example, collections are enclosed in braces and delimited by periods, and the arrays contain null values.

```
=> COPY researchers FROM STDIN COLLECTIONOPEN '{' COLLECTIONCLOSE '}' COLLECTIONDELIMITER '.';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 19|Leonard|{"us-1672".null."darpa-1963"}|{16200.null.16700}
>> \.

=> SELECT * FROM researchers;
 id |      name       |               grants               |       values
----+-----------------+------------------------------------+--------------------
 17 | Howard Wolowitz | ["NASA-1683","NASA-7867","SPX-76"] | [16700,85000,45000]
 42 | Sheldon Cooper  | ["US-7376","DARPA-1567"]           | [65000,135000]
 19 | Leonard         | ["us-1672",null,"darpa-1963"]      | [16200,null,16700]
(3 rows)
```

ORC (Parser)

Use the ORC clause with the COPY statement to load data in the ORC format.

The ORC clause can be used alone or with optional parameters.

Parameters

`hive_partition_cols`	Comma-separated list of columns that are partition columns in the data. See Using Partition Columns.
`flatten_complex_type_null`	Whether to flatten a null struct value to null values for all of its fields (true) or reject a row containing a null struct value (false, default). See Reading Structs.
`allow_no_match`	Whether to accept a path containing a glob with no matching files and report zero rows in query results. If this parameter is not set, Vertica returns an error if the path in the FROM clause does not match at least one file.

Examples

Use the ORC clause without parameters if your data is not partitioned.

```
=> COPY t FROM 's3://AWS_DataLake/sales.orc' ORC;
```

In the following example, the "id" and "name" columns are included in the data and the "created" and "region" columns are partition columns. Partition columns must be listed last when defining columns.

```
=> CREATE EXTERNAL TABLE t (id int, name varchar(50), created date, region varchar(50))
   AS COPY FROM 'hdfs:///path/*/*/*'
   ORC(hive_partition_cols='created,region');
```

In the following example, the data contains structs and a null value should not reject the row.

```
=> CREATE EXTERNAL TABLE customers_expanded (...)
    AS COPY FROM '...' ORC(flatten_complex_type_nulls='True');
```

PARQUET (Parser)

Use the PARQUET clause with the COPY statement to load data in the Parquet format. When loading data into Vertica you can read all primitive types, UUIDs, and arrays of primitive types. When creating an external table you can additionally read structs and multi-dimensional arrays (arrays of arrays). See Loading Complex Types for further information on using arrays.

The PARQUET clause can be used alone or with optional parameters.

Vertica does not support Parquet files that were written using the DATA_PAGE_V2 page type.

Parameters

`hive_partition_cols`	Comma-separated list of columns that are partition columns in the data. See Using Partition Columns.
`flatten_complex_type_null`	Whether to flatten a null struct value to null values for all of its fields (true) or reject a row containing a null struct value (false, default). See Reading Structs.
`allow_no_match`	Whether to accept a path containing a glob with no matching files and report zero rows in query results. If this parameter is not set, Vertica returns an error if the path in the FROM clause does not match at least one file.
`skip_strong_schema_match`	**Deprecated:** This argument will be removed in a future release. See Using Flexible Complex Types instead. When defining a ROW in an external table, whether to allow the ROW in the Vertica table definition and the struct in the Parquet data to have different structures. By default, Vertica requires that a ROW contain all and only the fields and nesting structure found in the Parquet data definition (schema). Set this parameter to true to override this behavior. Regardless of the value of this parameter, the primitive types must match for all fields.

`allow_long_varbinary_match_complex_type`	Whether to enable flexible column types (see Using Flexible Complex Types). If true, the Parquet parser allows a complex type in the data to match a table column defined as LONG VARBINARY. If false, the Parquet parser requires strong typing of complex types. With the parameter set you can still use strong typing. Set this parameter to false if you want use of flexible columns to be treated as an error.

Loading Complex Types

Pqrquet data containing one-dimensional arrays (arrays of primitive types) can be loaded into Vertica-managed tables. The native array type is a different type than the external-table type; that is, the types have different OIDs. Syntactically they are the same, both in how you define them in tables and in how you query them.

The native array type does not support multi-dimensional arrays. If your data contains such arrays, you can read them directly using external tables. Alternatively, you can create the external table and then use CREATE TABLE AS SELECT to create a new Vertica-managed table, extracting each nested array as its own column.

Vertica supports only 3-level-encoded arrays, not 2-level-encoded.

Vertica does not support the `required` mode for complex types, only `optional`.

Data Types

The Parquet loader maps Parquet data types to Vertica data types as follows.

Parquet Logical Type	Vertica Data Type
StringLogicalType	VARCHAR
MapLogicalType	MAP
ListLogicalType	ARRAY/SET
IntLogicalType	INT/NUMERIC
DecimalLogicalType	NUMERIC
DateLogicalType	DATE

Parquet Logical Type	Vertica Data Type
TimeLogicalType	TIME
TimestampLogicalType	TIMESTAMP
UUIDLogicalType	UUID

The following logical types are not supported:

- EnumLogicalType
- IntervalLogicalType
- JSONLogicalType
- BSONLogicalType
- UnknownLogicalType

Parquet Physical Type	Vertica Data Type
BOOLEAN	BOOLEAN
INT32/INT64	INT
INT96	Not supported
FLOAT	DOUBLE
DOUBLE	DOUBLE
BYTE_ARRAY	VARBINARY
FIXED_LEN_BYTE_ARRAY	BINARY

Examples

Use the PARQUET clause without parameters if your data is not partitioned.

```
=> COPY t FROM 's3://AWS_DataLake/sales.parquet' PARQUET;
```

In the following example, the "id" and "name" columns are included in the data and the "created" and "region" columns are partition columns. Partition columns must be listed last when defining columns.

```
=> CREATE EXTERNAL TABLE t (id int, name varchar(50), created date, region varchar(50))
   AS COPY FROM 'hdfs:///path/*/*/*'
   PARQUET(hive_partition_cols='created,region');
```

In the following example, the data contains structs and a null value should not reject the row.

```
=> CREATE EXTERNAL TABLE customers_expanded (...)
    AS COPY FROM '...' PARQUET(flatten_complex_type_nulls='True');
```

In the following example, the data directory contains no files.

```
=> CREATE EXTERNAL TABLE customers (...)
    AS COPY FROM 'hdfs:///data/*.parquet' PARQUET;
=> SELECT COUNT(*) FROM customers;
ERROR 7869: No files match when expanding glob: [hdfs:///data/*.parquet]
```

To read zero rows instead of producing an error, use the allow_no_match parameter with PARQUET:

```
=> CREATE EXTERNAL TABLE customers (...)
    AS COPY FROM 'hdfs:///data/*.parquet' PARQUET(allow_no_match='true');
=> SELECT COUNT(*) FROM customers;
 count
-------
     0
(1 row)
```

To allow reading a complex type (menu, in this example) as a flexible column type, use the allow_long_varbinary_match_complex_type parameter:

```
=> CREATE EXTERNAL TABLE restaurants(name VARCHAR, cuisine VARCHAR, location_city ARRAY[VARCHAR],
menu LONG VARBINARY)
    AS COPY FROM '/data/rest*.parquet'
    PARQUET(allow_long_varbinary_match_complex_type='True');
```

FJSONPARSER (Parser)

Parses and loads a JSON file. This file can contain either repeated JSON data objects (including nested maps), or an outer list of JSON elements.

For a flex table, the parser stores the JSON data in a single-value VMap. For a hybrid or columnar table, the parser loads data directly in any table column with a column name that matches a key in the JSON source data.

If the JSON data contains complex types (arrays, structs, or maps), you can load those columns into VMap columns in columnar tables. Specify a column type of LONG VARBINARY for these columns. To preserve the indexing in complex types, set flatten_maps to false.

Syntax

```
FJSONPARSER ( [parameter-name='value'[,…]] )
```

Parameters

`flatten_maps`	Boolean, specifies whether to flatten sub-maps within the JSON data, separating map levels with a period (`.`). **Default:** true
`flatten_arrays`	Boolean, specifies whether to convert lists to sub-maps with integer keys. When lists are flattened, key names are concatenated as for maps. Lists are not flattened by default. **Default:** false
`reject_on_duplicate`	Boolean, specifies whether to ignore duplicate records (false), or to reject duplicates (true). In either case, the load continues. **Default:** false
`reject_on_empty_key`	Boolean, specifies whether to reject any row containing a field key without a value. **Default:** false
`omit_empty_keys`	Boolean, specifies whether to omit any field key from the load data that does not have a value. **Default:** false

`record_terminator`	When set, any invalid JSON records are skipped and parsing continues with the next record. Records must be terminated uniformly. For example, if your input file has JSON records terminated by newline characters, set this parameter to `E'\n'`). If any invalid JSON records exist, parsing continues after the next `record_terminator`. When you omit this parameter, parsing ends at the first invalid JSON record.
`reject_on_materialized_type_error`	Boolean, specifies whether to reject a data row that contains a materialized column value that cannot be coerced into a compatible data type. **Default:** false
`start_point`	String that specifies the name of a key in the JSON load data at which to begin parsing. The parser ignores all data before the `start_point` value. The value is loaded for each object in the file. The parser processes data after the first instance, and up to the second, ignoring any remaining data.
`start_point_occurrence`	Iinteger that indicates the *n*th occurrence of the value you specify with `start_point`. Use in conjunction with `start_point` when load data has multiple start values and you know the occurrence at which to begin parsing. **Default:** 1
`suppress_nonalphanumeric_key_chars`	Boolean, specifies whether to suppress non-alphanumeric characters in JSON key values. The parser replaces these characters with an underscore (_) when this parameter is true.

	Default: false
key_separator	Specifies a non-default character for the parser to use when concatenating key names. **Default:** period (.)

Examples

The following example loads JSON data from STDIN using the default parameters.

```
=> CREATE TABLE super(age INT, name VARCHAR);
CREATE TABLE

=> COPY super FROM STDIN PARSER FJSONPARSER();
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> {"age": 5, "name": "Tim"}
>>  {"age": 3}
>>  {"name": "Fred"}
>>  {"name": "Bob", "age": 10}
>> \.
=> SELECT * FROM super;
 age | name
-----+------
     | Fred
  10 | Bob
   5 | Tim
   3 |
(4 rows)
```

The following example loads a complex type, rejecting rows that are missing keys within the nested records. Notice that while the data has two restaurants, only one is loaded.

```
$ cat rest1.json
{
    "name" : "Bob's pizzeria",
    "cuisine" : "Italian",
    "location_city" : ["Cambridge", "Pittsburgh"],
    "menu" : [{"item" : "cheese pizza", "" : "$8.25"},
              {"item" : "spinach pizza", "price" : "$10.50"}]
}
{
    "name" : "Bakersfield Tacos",
    "cuisine" : "Mexican",
    "location_city" : ["Pittsburgh"],
    "menu" : [{"item" : "veggie taco", "price" : "$9.95"},
              {"item" : "steak taco", "price" : "$10.95"}]
}
```

```
=> CREATE TABLE rest (name VARCHAR, cuisine VARCHAR, location_city LONG VARBINARY, menu LONG
VARBINARY);

=> COPY rest FROM '/data/rest1.json' PARSER fjsonparser(flatten_maps=false, reject_on_empty_
key=true);
Rows Loaded
------------
          1
(1 row)

=> SELECT maptostring(location_city), maptostring(menu) FROM rest;
        maptostring        |                          maptostring

---------------------------+-------------------------------------------------------
 {
    "0": "Pittsburgh"
} | {
    "0": {
        "item": "veggie taco",
        "price": "$9.95"
    },
    "1": {
        "item": "steak taco",
        "price": "$10.95"
    }
}
(1 row)
```

To instead load partial data, use omit_empty_keys to bypass the missing keys while loading everything else:

```
=> COPY rest FROM '/data/rest1.json' PARSER fjsonparser(flatten_maps=false, omit_empty_keys=true);
 Rows Loaded
-------------
           2
(1 row)

=> SELECT maptostring(location_city), maptostring(menu) from rest;
                   maptostring                   |               maptostring

-------------------------------------------------+---------------------------------
 {
    "0": "Pittsburgh"
}                        | {
    "0": {
        "item": "veggie taco",
        "price": "$9.95"
    },
    "1": {
        "item": "steak taco",
        "price": "$10.95"
    }
}
 {
    "0": "Cambridge",
    "1": "Pittsburgh"
```

```
} | {
    "0": {
        "item": "cheese pizza"
    },
    "1": {
        "item": "spinach pizza",
        "price": "$10.50"
    }
}
(2 rows)
```

For other examples, see Loading JSON Data.

FAVROPARSER (Parser)

Parses data from an Avro file. The input file must use binary serialization encoding. Use this parser to load data into columnar, flex, and hybrid tables.

If the Avro data contains complex types (arrays, structs, or maps), you can load those columns into VMap columns in columnar tables. Specify a column type of LONG VARBINARY for these columns.

Note:
The parser `favroparser` does not support Avro files with separate schema files. The Avro file must have its related schema in the file you are loading.

Syntax

```
FAVROPARSER ( [parameter-name='value'[,…]] )
```

Parameters

`flatten_arrays`	Boolean, specifies whether to flatten all Avro arrays. Key names are concatenated with nested levels. **Default:** false
`flatten_maps`	Boolean, specifies whether to flatten all Avro maps. Key names are concatenated

	with nested levels. **Default**:true
`flatten_records`	Boolean, specifies whether to flatten all Avro records. Key names are concatenated with nested levels. **Default**:true
`reject_on_materialized_type_error`	Boolean, specifies whether to reject any row value for a materialized column that the parser cannot coerce into a compatible data type. See Using Flex Table Parsers. **Default**:false

Examples

This example shows how to create and load a flex table with Avro data using `favroparser`. After loading the data, you can query virtual columns.

```
=> CREATE FLEX TABLE avro_basic();
CREATE TABLE

=> COPY avro_basic FROM '/home/dbadmin/data/weather.avro' PARSER FAVROPARSER();
Rows Loaded
-------------
5
(1 row)

=> SELECT station, temp, time FROM avro_basic;
station | temp |     time
---------+------+---------------
mohali  | 0    | -619524000000
lucknow | 22   | -619506000000
norwich | -11  | -619484400000
ams     | 111  | -655531200000
baddi   | 78   | -655509600000
(5 rows)
```

For more information, see Loading Avro Data.

COPY Restrictions

Invalid Data

COPY considers the following data invalid:

- Missing columns (an input line has fewer columns than the recipient table).
- Extra columns (an input line has more columns than the recipient table).
- Empty columns for an INTEGER or DATE/TIME data type. If a column is empty for either of these types, COPY does not use the default value that was defined by CREATE TABLE. However, if you do not supply a column option as part of the COPY statement, the default value is used.
- Incorrect representation of a data type. For example, trying to load a non-numeric value into an INTEGER column is invalid.

Constraint Violations

If any primary key, unique key, or check constraints are enabled for automatic enforcement, Vertica enforces those constraints when you insert values into a table. If a violation occurs, Vertica rolls back the SQL statement and returns an error. This behavior occurs for INSERT, UPDATE, COPY, and MERGE SQL statements.

Note:
Automatic constraint enforcement requires that you have SELECT privileges on the table containing the constraint.

Empty Line Handling

When COPY encounters an empty line while loading data, the line is neither inserted nor rejected, but COPY increments the line record number. Consider this behavior when evaluating rejected records. If you return a list of rejected records and COPY encountered an empty row while loading data, the position of rejected records is not incremented by one, as demonstrated in the following example.

```
--- Load these values into a table that defines the first column as INT.
--- Errors on lines 3, 4, and 8:
=> \! cat -n /home/dbadmin/test.txt
```

```
     1 1|A|2
     2 2|B|4
     3 A|D|7
     4 A|E|7
     5
     6
     7 6|A|3
     8 B|A|3

--- Empty rows 5 and 6 shift the reporting of the error on row 8.
=> SELECT row_number, rejected_data, rejected_reason FROM test_bad;
 row_number | rejected_data | rejected_reason
------------+---------------+-------------------------------------------------
          3 | A|D|7 | Invalid integer format 'A' for column 1 (c1)
          4 | A|E|7 | Invalid integer format 'A' for column 1 (c1)
          6 | B|A|3 | Invalid integer format 'B' for column 1 (c1)
(3 rows)
```

Compressed File Errors

When loading compressed files, COPY might abort and report an error, if the file seems to be corrupted. For example, this behavior can occur if reading the header block fails.

COPY Examples

For additional examples, see the reference pages for specific parsers: DELIMITED (Parser), ORC (Parser), and PARQUET (Parser).

Specifying String Options

Use COPY with `FORMAT`, `DELIMITER`, `NULL`, and `ENCLOSED BY` options:

```
=> COPY public.customer_dimension (customer_since FORMAT 'YYYY')
   FROM STDIN
   DELIMITER ','
   NULL AS 'null'
   ENCLOSED BY '"';
```

Use COPY with `DELIMITER` and `NULL` options. This example sets and references a vsql variable `input_file`:

```
=> \set input_file ../myCopyFromLocal/large_table.gzip
=> COPY store.store_dimension
   FROM :input_file
   DELIMITER '|'
   NULL ''
   RECORD TERMINATOR E'\f';
```

Including Multiple Source Files

Create table `sampletab`, and then copy multiple source files to the table:

```
=> CREATE TABLE sampletab (a int);
CREATE TABLE
=> COPY sampletab FROM '/home/dbadmin/one.dat', 'home/dbadmin/two.dat';
 Rows Loaded
-------------
           2
(1 row)
```

Use wildcards to indicate a group of files:

```
=> COPY myTable FROM 'hdfs:///mydirectory/ofmanyfiles/*.dat';
```

Wildcards can include regular expressions:

```
=> COPY myTable FROM 'hdfs:///mydirectory/*_[0-9]';
```

Specify multiple paths in a single COPY statement:

```
=> COPY myTable FROM 'hdfs:///data/sales/01/*.dat', 'hdfs:///data/sales/02/*.dat',
       'hdfs:///data/sales/historical.dat';
```

Distributing a Load

Load data that is shared across all nodes. Vertica distributes the load across all nodes, if possible:

```
=> COPY sampletab FROM '/data/file.dat' ON ANY NODE;
```

Note:
`ON ANY NODE` is the default for loads from HDFS, so it does not need to be specified.

Load data from two files. Because the first load file does not specify nodes (or ON ANY NODE), the initiator performs the load. Loading the second file is distributed across all nodes.

```
=> COPY sampletab FROM '/data/file1.dat', '/data/file2.dat' ON ANY NODE;
```

Specify different nodes for each load file. COPY specifies to distribute the load of two files as follows:

- `file1.dat` on nodes `v_vmart_node0001` and `v_vmart_node0002`
- `file2.dat` on nodes `v_vmart_node0003` and `v_vmart_node0004`

```
=> COPY sampletab FROM '/data/file1.dat' ON (v_vmart_node0001, v_vmart_node0002),
       '/data/file2.dat' ON (v_vmart_node0003, v_vmart_node0004);
```

Loading Data from Shared Storage

To load data from HDFS or S3, use URLs in the corresponding schemes, `hdfs:///path` and `s3://bucket/path`, respectively.

Note:
Loads from HDFS and S3 default to `ON ANY NODE`; you do not need to specify it.

Load a file stored in HDFS using the default NameNode or nameservice. See Using HDFS URLs for more information about HDFS URLs.

```
=> COPY t FROM 'hdfs:///opt/data/file1.dat';
```

Load data from a particular HDFS name service (testNS). You specify a name service if your database is configured to read from more than one HDFS cluster.

```
=> COPY t FROM 'hdfs://testNS/opt/data/file2.csv';
```

Load data from an S3 bucket. See Loading from an S3 Bucket for more information.

```
=> COPY t FROM 's3://AWS_DataLake/*' ORC;
```

Loading Hadoop Native Formats

Load data in the ORC format from HDFS:

```
=> COPY t FROM 'hdfs:///opt/data/sales.orc' ORC;
```

Load Parquet data from an S3 bucket:

```
=> COPY t FROM 's3://AWS_DataLake/sales.parquet' PARQUET;
```

Loading Data into a Flex Table

Create a Flex table and copy JSON data into it, using the flex table parser `fjsonparser`:

```
=> CREATE FLEX TABLE darkdata();
CREATE TABLE
=> COPY tweets FROM '/myTest/Flexible/DATA/tweets_12.json' parser fjsonparser();
 Rows Loaded
-------------
          12
(1 row)
```

Using Named Pipes

COPY supports named pipes that follow the same naming conventions as file names on the given file system. Permissions are `open`, `write`, and `close`.

Create named pipe `pipe1` and set two vsql variables, `dir` and `file`:

```
=> \! mkfifo  pipe1
=> \set dir `pwd`/
=> \set file '''':dir'pipe1'''
```

Copy an uncompressed file from the named pipe:

```
=> \! cat pf1.dat > pipe1 &
=> COPY large_tbl FROM :file delimiter '|';
=> SELECT * FROM large_tbl;
=> COMMIT;
```

Loading Compressed Data

Copy a GZIP file from a named pipe and uncompress it:

```
=> \! gzip pf1.dat
=> \! cat pf1.dat.gz > pipe1 &
=> COPY large_tbl FROM :file ON site01 GZIP delimiter '|';
=> SELECT * FROM large_tbl;
=> COMMIT;
=> \!gunzip pf1.dat.gz
```

Copy a BZIP file from a named pipe and then uncompress it:

```
=> \! bzip2 pf1.dat
=> \! cat pf1.dat.bz2 > pipe1 &
=> COPY large_tbl FROM :file ON site01 BZIP delimiter '|';
=> SELECT * FROM large_tbl;
=> COMMIT;
=> \! bunzip2 pf1.dat.bz2
```

Copy an LZO file from a named pipe and then uncompress it:

```
=> \! lzop pf1.dat
=> \! cat pf1.dat.lzo > pipe1 &
=> COPY large_tbl FROM :file ON site01 LZO delimiter '|';
=> SELECT * FROM large_tbl;
=> COMMIT;
=> \! lzop -d pf1.dat.lzo
```

COPY LOCAL

Using the COPY statement with its `LOCAL` option lets you load a data file on a client system, rather than on a cluster host. COPY LOCAL supports the `STDIN` and `'pathToData'`

parameters, but not the `[ON nodename]` clause. COPY LOCAL does not support multiple file batches in NATIVE or NATIVE VARCHAR formats. COPY LOCAL does not support reading ORC or Parquet files; use ON NODE instead. COPY LOCAL does not support CURRENT_LOAD_SOURCE().

The COPY LOCAL option is platform-independent. The statement works in the same way across all supported Vertica platforms and drivers. For more details about using COPY LOCAL with supported drivers, see the Connecting to Vertica section for your platform.

COPY LOCAL must be the first statement in any multi-statement query you make with the ODBC client library. Using it as the second or later statement results in an error. When using other client libraries, such as JDBC, COPY LOCAL should always be the first statement in a multi-statement query. Also, do not use it multiple times in the same query.

Note:
On Windows clients, the path you supply for the COPY LOCAL file is limited to 216 characters due to limitations in the Windows API.

`COPY LOCAL` does not automatically create exceptions and rejections files, even if exceptions occur.

Privileges

User must have INSERT privilege on the table and USAGE privilege on the schema.

How Copy Local Works

COPY LOCAL loads data in a platform-neutral way. The COPY LOCAL statement loads all files from a local client system to the Vertica host, where the server processes the files. You can copy files in various formats: uncompressed, compressed, fixed-width format, in bzip or gzip format, or specified as a bash glob. Files of a single format (such as all bzip, or gzip) can be comma-separated in the list of input files. You can also use any of the applicable COPY statement options (as long as the data format supports the option). For instance, you can define a specific delimiter character, or how to handle NULLs, and so forth.

Note:
The Linux `glob` command returns files that match the pattern you enter, as specified in the Linux Manual Page for Glob (7). For ADO.net platforms, specify patterns and wildcards as described in the .NET Directory.getFiles Method.

For more information about using the COPY LOCAL option to load data, see COPY for syntactical descriptions, and Specifying Where to Load Data From for detailed examples.

The Vertica host uncompresses and processes the files as necessary, regardless of file format or the client platform from which you load the files. Once the server has the copied files, Vertica maintains performance by distributing file parsing tasks, such as encoding, compressing, uncompressing, across nodes.

Viewing Copy Local Operations in a Query Plan

When you use the COPY LOCAL option, the GraphViz query plan includes a label for Load-Client-File, rather than Load-File. Following is a section from a sample query plan:

```
------------------------------------------------
  PLAN:  BASE BULKLOAD PLAN  (GraphViz Format)
------------------------------------------------
 digraph G {
 graph [rankdir=BT, label = " BASE BULKLOAD PLAN \nAll Nodes Vector:
 \n\n  node[0]=initiator (initiator) Up\n", labelloc=t, labeljust=l ordering=out]
.
.
.
10[label = "Load-Client-File(/tmp/diff) \nOutBlk=[UncTuple]",
color = "green", shape = "ellipse"];
```

Examples

The following example shows a load from a local file.

```
$ cat > t.dat
12
17
9
^C

=> CREATE TABLE numbers (value INT);
CREATE TABLE

=> COPY numbers FROM LOCAL 't.dat';
 Rows Loaded
-------------
           3
(1 row)

=> SELECT * FROM numbers;
 value
-------
```

```
    12
    17
     9
(3 rows)
```

COPY FROM VERTICA

Imports data from another Vertica database. `COPY FROM VERTICA` is similar to COPY, but supports only a subset of its parameters.

> **Important:**
> The source database must be no more than one major release behind the target database.

Syntax

```
COPY [[database.]schema-name.]target-table
    [( target-columns )]
    FROM VERTICA source-database.[schema.]source-table
    [( source-columns )]
    [STREAM NAME 'stream name']
    [NO COMMIT]
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
target-table	The target table for the imported data. Vertica loads the data into all projections that include columns from the schema table.
target-columns	A comma-delimited list of columns in *target-table* to store the copied data. See Mapping Between Target and

	Source Columns below. **Note:** You cannot use column fillers as part of the column definition.
source-database	The source database of the data to import. A connection to this database must already exist in the current session before starting the copy operation; otherwise Vertica returns an error. For details, see CONNECT TO VERTICA.
[*schema.*]*source-table*	The table that is the source of the imported data. If *schema* is any schema other than public, you must supply the schema name.
source-columns	A comma-delimited list of the columns in the source table to import. If omitted, all columns are exported. See Mapping Between Target and Source Columns below.
STREAM NAME	Specifies a COPY load stream identifier. Using a stream name helps to quickly identify a particular load. The STREAM NAME value that you specify in the load statement appears in the stream column of the LOAD_STREAMS system table.
NO COMMIT	Prevents COPY from committing its transaction automatically when it finishes copying data. For details, see Using Transactions to Stage a Load.

Privileges

- Source table: SELECT
- Source table schema: USAGE
- Target table: INSERT
- Target table schema: USAGE

Mapping Between Target and Source Columns

If you copy all table data from one database to another, COPY FROM VERTICA can omit specifying column lists if column definitions in both tables comply with the following

conditions:

- Same number of columns
- Identical column names
- Same sequence of columns
- Matching or compatible column data types

If any of these conditions is not true, the `COPY FROM VERTICA` statement must include column lists that explicitly map target and source columns to each other, as follows:

- Contain the same number of columns.
- List source and target columns in the same order.
- Pair columns with the same (or compatible) data types.

Node Failure During COPY

See Handling Node Failure During Copy/Export.

Examples

The following example copies the contents of an entire table from the `vmart` database to an identically-defined table in the current database:

```
=> CONNECT TO VERTICA vmart USER dbadmin PASSWORD 'myPassword' ON 'VertTest01',5433;
CONNECT
=> COPY customer_dimension FROM  VERTICA vmart.customer_dimension;
 Rows Loaded
-------------
      500000
(1 row)
=> DISCONNECT vmart;
DISCONNECT
```

For more examples, see Copying Data from Another Vertica Database.

See Also

`EXPORT TO VERTICA`

CREATE Statements

CREATE statements let you create new database objects such as tables and users.

CREATE ACCESS POLICY

Creates a secure access policy that filters access to table data to users and roles. You can create access policies for table rows and columns. Vertica applies the access policy filters with each query, and returns only the data that is permissible for the current user or role.

Syntax

```
CREATE ACCESS POLICY ON [[database.]schema.]table { FOR COLUMN column | FOR ROWS WHERE } expression {
ENABLE | DISABLE }
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table	The table with the target column or rows.
`FOR COLUMN` *column*	The column on which to apply this access policy. Must not be a column with an external data type (see Complex Types).
`FOR ROWS WHERE`	The rows on which to apply this access policy.
expression	An SQL expression that specifies conditions for accessing row or column data: • Row access policies limits access to specific rows in a table, as specified by the policy's `WHERE` expression. Only rows that satisfy this expression are fetched from the table. For details and sample usage, see Creating Row Access Policies. • Column access policies limit access to specific table columns. The access policy expression can also specify how to render column data to specific users and roles.

	For details and sample usage, see Creating Column Access Policies.
`ENABLE | DISABLE`	Specifies whether to enable the access policy. If you specify `DISABLE`, Vertica does not use this policy. To enable a diasbled policy, call `ALTER ACCESS POLICY`.

Privileges

Superuser

See Also

- Access Policies
- ALTER ACCESS POLICY
- DROP ACCESS POLICY

CREATE AUTHENTICATION

Creates and enables an authentication method associated with users or roles. Vertica enables the authentication method automatically.

Syntax

```
CREATE AUTHENTICATION auth-method-name METHOD 'auth-type' access-method
```

Parameters

Name	Description
auth-method-name	Name of the authentication method to create, where *auth-method-name* conforms to conventions described in Identifiers.

Name	Description
auth-type	Name of the authentication method to use, one of the following: • gss • ident • ldap • hash • reject • trust • tls
access-method	The access method the client uses to connect, specified in one of the following ways: • LOCAL Matches connection attempts made using local domain sockets. • HOST [TLS | NO TLS] '*host-ip-address*' Matches connection attempts made using TCP/IP, where *host-ip-address* can be an IPv4 or IPv6 address. You can qualify HOST with one of the following options ◦ TLS (default): Match an SSL/TLS-wrapped TCP socket. ◦ NO TLS: Match a plain (non-SSL/TLS) socket only.

Privileges

DBADMIN

Examples

See Creating Authentication Records.

See Also

- ALTER AUTHENTICATION
- DROP AUTHENTICATION

- GRANT (Authentication)
- REVOKE (Authentication)

CREATE CERTIFICATE

Creates a certificate, Certificate Authority (CA), or intermediate CA.

CA certificates can be used to sign other certificates and for parameters like SSLCA.

Syntax

```
CREATE [CA] CERTIFICATE certificate_name
    {AS 'cert' [KEY key_name]
    | SUBJECT 'subject_name'
      [ SIGNED BY ca_cert ]
      [ VALID FOR days ]
      [ EXTENSIONS 'ext' = 'val',... ]
      [ KEY key_name ]}
```

Parameters

CA	Specifies the certificate as a CA or intermediate certificate. Excluding this argument will create a normal certificate.
certificate_name	The name of the certificate.
'*cert*'	The contents of the imported certificate. This parameter should include the entire chain of certificates, excluding the CA certificate.
key_name	The name of the key. This parameter only needs to be set for client/server certificates and CA certificates that you intend to sign other certificates with while in Vertica. If your imported CA certificate will only be used for validating other certificates, you do not need to specify a key.
'*subject_name*'	The entity to issue the certificate to.
ca_cert	The name of the CA that signed the certificate.

	When adding a CA certificate, this parameter is optional. Specifying it will create an intermediate CA that cannot be used to sign other CA certificates. When creating a certificate, this parameter is required.
days	The number of days that the certificate is valid.
'*ext*' = '*val*'	Specifies certificate extensions. For a full list of extensions, see the OpenSSL documentation.
key_name	The name of the certificate's private key. When importing a certificate, this parameter is required.

Privileges

Superuser

Default Extensions

CREATE CERTIFICATE includes several extensions by default. These differ based on the type of certificate you create a:
CA Certificate:

- `'basicConstraints' = 'critical, CA:true'`
- `'keyUsage' = 'critical, digitalSignature, keyCertSign'`
- `'nsComment' = Vertica generated [CA] certificate'`
- `'subjectKeyIdentifier' = 'hash'`

Certificate:

- `'basicConstraints' = 'CA:false'`
- `'keyUsage' = 'critical, digitalSignature, keyEncipherment'`

Examples

See Generating TLS Certificates and Keys.

- CREATE KEY

CREATE DIRECTED QUERY

Saves an association between an input query and a query that is annotated with optimizer hints.

Syntax

Optimizer-generated

```
CREATE DIRECTED QUERY OPT[IMIZER] directedqueryID
[COMMENT 'comments'] input-query
```

User-generated (custom)

```
CREATE DIRECTED QUERY CUSTOM directedqueryID
[COMMENT 'comments'] annotated-query
```

Parameters

OPT[IMIZER]	Directs the query optimizer to generate an annotated query from *input-query*, and associate both in the new directed query.
CUSTOM	Specifies to associate *annotated-query* with the query previously specified by SAVE QUERY.
directedqueryID	A unique identifier for the directed query, a string that conforms to conventions described in Identifiers.
COMMENT '*comments*'	Comments about the directed query, up to 128 characters. Comments can be useful for future reference—for example, explain why a given directed query was created. If you omit this argument, Vertica inserts one of the following comments: • Optimizer-generated directed query • Custom directed query
input-query	The input query to associate with an optimizer-generated directed

	query. The input query supports only one optimizer hint, IGNORECONST.
annotated-query	A query with embedded optimizer hints to associate with the input query most recently saved with SAVE QUERY.

Privileges

Superuser

Description

CREATE DIRECTED QUERY associates an input query with a query annotated with optimizer hints. It stores the association under a unique identifier. CREATE DIRECTED QUERY has two variants:

- CREATE DIRECTED QUERY OPTIMIZER directs the query optimizer to generate annotated SQL from the specified input query. The annotated query contains hints that the optimizer can use to recreate its current query plan for that input query.
- CREATE DIRECTED QUERY CUSTOM specifies an annotated query supplied by the user. Vertica associates the annotated query with the input query specified by the last SAVE QUERY statement.

In both cases, Vertica associates the annotated query and input query, and registers their association in the system table V_CATALOG.DIRECTED_QUERIES under query_name.

Caution:
Vertica associates a saved query and directed query without checking whether the two are compatible. Be careful to sequence SAVE QUERY and CREATE DIRECTED QUERY CUSTOM so the saved and directed queries are correctly matched.

See Also

Creating Directed Queries

CREATE EXTERNAL TABLE AS COPY

CREATE EXTERNAL TABLE AS COPY creates a table definition for data external to your Vertica database. This statement is a combination of the CREATE TABLE and COPY statements, supporting a subset of each statement's parameters.

Canceling a CREATE EXTERNAL TABLE AS COPY statement can cause unpredictable results. If you need to make a change, allow the statement to complete, drop the table, and then retry.

You can use ALTER TABLE to change the data types of columns instead of dropping and recreating the table.

You can use CREATE EXTERNAL TABLE AS COPY with any types except types from the Place package.

Note:
Vertica does not create superprojections for external tables, since external tables are not stored in the database.

Syntax

```
CREATE EXTERNAL TABLE [ IF NOT EXISTS ] [[database.]schema.]table-name
    ( column-definition[,…] )
[{INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES]
AS COPY
    [ ( { column-as-expression | column }
       [ DELIMITER [ AS ] 'char' ]
       [ ENCLOSED [ BY ] 'char' ]
       [ ENFORCELENGTH ]
       [ ESCAPE [ AS ] 'char' | NO ESCAPE ]
       [ FILLER datatype ]
       [ FORMAT 'format' ]
       [ NULL [ AS ] 'string' ]
       [ TRIM 'byte' ]
    [,…] ) ]
    [ COLUMN OPTION ( column
       [ DELIMITER [ AS ] 'char' ]
       [ ENCLOSED [ BY ] 'char' ]
       [ ENFORCELENGTH ]
       [ ESCAPE [ AS ] 'char' | NO ESCAPE ]
       [ FORMAT 'format' ]
       [ NULL [ AS ] 'string' ]
       [ TRIM 'byte' ]
    [,…] ) ]
FROM {
      'path-to-data' [ ON { nodename | (nodeset) | ANY NODE } ] [ input-format ] }[,…]
      | [ WITH ] SOURCE source( [arg=value[,…] ] )
```

```
}
      [ NATIVE
      | FIXEDWIDTH COLSIZES {( integer )[,…]}
      | NATIVE VARCHAR
      | ORC
      | PARQUET
      ]
   [ ABORT ON ERROR ]
   [ DELIMITER [ AS ] 'char' ]
   [ ENCLOSED BY 'char' [ AND 'char' ] ]
   [ ENFORCELENGTH ]
   [ ERROR TOLERANCE ]
   [ ESCAPE AS 'char' | NO ESCAPE ]
   [ EXCEPTIONS 'path' [ ON nodename ] [,…] ]
   [ [ WITH ] FILTER filter( [ arg=value[,…] ] ) ]
   [ NULL [ AS ] 'string' ]
   [ [ WITH ] PARSER parser([arg=value [,…] ]) ]
   [ RECORD TERMINATOR 'string' ]
   [ REJECTED DATA 'path' [ ON nodename ] [,…] ]
   [ REJECTMAX integer ]
   [ SKIP integer ]
   [ SKIP BYTES integer ]
   [ TRAILING NULLCOLS ]
   [ TRIM 'byte' ]
```

Parameters

For all supported parameters, see the CREATE TABLE and COPY statements. For information on using this statement with UDLs, see User-Defined Load (UDL).

For additional guidance on using COPY parameters, see Specifying Where to Load Data From.

Privileges

Superuser, or non-superuser with the following privileges:

- READ privileges on the USER-accessible storage location, see GRANT (Storage Location)
- Full access (including SELECT) to an external table that the user has privileges to create

ORC and Parquet Data

When using the ORC and Parquet formats, Vertica supports some additional options in the COPY statement and data structures for columns. See Reading ORC and Parquet Formats.

If ORC or Parquet data is partitioned, Vertica expects Hive-style partitioning. If you see unexpected results when reading data, verify that globs in your file paths correctly align with the partition structure. See Troubleshooting Reads from ORC and Parquet Files.

Examples

The following example defines an external table for data stored in HDFS:

```
=> CREATE EXTERNAL TABLE sales (itemID INT, date DATE, price FLOAT)
    AS COPY FROM 'hdfs:///dat/ext1.csv' DELIMITER ',';
```

The following example uses data in the Parquet format that is stored in S3:

```
=> CREATE EXTERNAL TABLE sales (itemID INT, date DATE, price FLOAT)
    AS COPY FROM 's3://datalake/sales/*.parquet' PARQUET;
```

The following example creates an external table using partitioned data in the ORC format. The table includes four columns. Two columns, "id" and "name", are in the data files. The other two, "created" and "region", are partition columns. For more about partition columns, see Using Partition Columns.

```
=> CREATE EXTERNAL TABLE t (id int, name varchar(50), created date, region varchar(50))
   AS COPY FROM 'hdfs:///path/*/*/*'
   ORC(hive_partition_cols='created,region');
```

The following example creates an external table from data in Google Cloud Storage:

```
=> CREATE EXTERNAL TABLE sales (itemID INT, date DATE, price FLOAT)
    AS COPY FROM 'gs://data/sales/*.csv';
```

The following example creates an external table for data containing structs, and specifies that null struct values should be treated as null values of the individual struct fields instead of rejected rows. See Reading Structs.

```
=> CREATE EXTERNAL TABLE customers_expanded (name VARCHAR, street VARCHAR,
    city VARCHAR, postalcode VARCHAR, account INT)
    AS COPY FROM '    ' PARQUET(flatten_complex_type_nulls='True');
```

The following example creates an external table for data containing arrays:

```
=> CREATE EXTERNAL TABLE cust (cust_custkey int, cust_custname varchar(50), cust_coststaddress ARRAY
[varchar(100)],
   cust_custaddressln2 ARRAY[varchar(100)], cust_custcity ARRAY[varchar(50)], cust_coststate ARRAY
[char(2)], cust_custzip ARRAY[int],
   cust_email varchar(50), cust_phone varchar(30))
   AS COPY FROM '    ' PARQUET;
```

The following examples create external tables from data in the local file system:

```
=> CREATE EXTERNAL TABLE ext1 (x integer) AS COPY FROM '/tmp/ext1.dat' DELIMITER ',';
=> CREATE EXTERNAL TABLE ext2 (x integer) AS COPY FROM '/tmp/ext2.dat.bz2' BZIP DELIMITER ',';
=> CREATE EXTERNAL TABLE ext3 (x integer, y integer) AS COPY (x as '5', y) FROM '/tmp/ext3.dat.bz2'
BZIP DELIMITER ',';
```

To allow users without superuser access to use external tables with data on the local file system, S3, or GCS, create a location for 'user' usage and grant access to it. This example shows granting access to a user named Bob to any external table whose data is located under /tmp (including in subdirectories to any depth):

```
=> CREATE LOCATION '/tmp' ALL NODES USAGE 'user';
=> GRANT ALL ON LOCATION '/tmp' to Bob;
```

The following example shows CREATE EXTERNAL TABLE using a user-defined source:

```
=> CREATE SOURCE curl AS LANGUAGE 'C++' NAME 'CurlSourceFactory' LIBRARY curllib;
=> CREATE EXTERNAL TABLE curl_table1 as COPY SOURCE CurlSourceFactory;
```

Creating External Tables in the Administrator's Guide

CREATE FAULT GROUP

Creates a fault group, which can contain the following:

- One or more nodes
- One or more child fault groups
- One or more nodes and one or more child fault groups

The CREATE FAULT GROUP statement creates an empty fault group. You must run the ALTER FAULT GROUP statement to add nodes or other fault groups to an existing fault group.

Note:
Prior to Vertica version 9.3.0, fault groups defined subclusters in Eon Mode databases. Starting in 9.3.0, you can directly create subclusters. This statement works when the database is in Eon Mode. However, fault groups in an Eon Mode database have no effect, and you are unable to manipulate the fault group in any way. Eon Mode databases upgraded from versions earlier than 9.3.0 have their fault groups automatically converted to

subclusters. See Subclusters for more information.

Fault groups continue to work as before in Enterprise Mode databases.

Syntax

```
CREATE FAULT GROUP name
```

Parameters

name	The name of the fault group to create, unique among all fault groups, where *name* conforms to conventions described in Identifiers.

Privileges

Superuser

Example

The following command creates a fault group called `parent0`:

```
=> CREATE FAULT GROUP parent0;
CREATE FAULT GROUP
```

To add nodes or other fault groups to the `parent0` fault group, run the ALTER FAULT GROUP statement.

- V_CATALOG.FAULT_GROUPS
- V_CATALOG.CLUSTER_LAYOUT
- Fault Groups
- High Availability With Fault Groups

CREATE FLEXIBLE TABLE

Creates a flexible (flex) table in the logical schema.

When you create a flex table, Vertica automatically creates two dependent objects:

- Keys table that is named *flex-table-name*_keys
- View that is named *flex-table-name*_view

The flex table requires the keys table and view. Neither of these objects can exist independently of the flex table.

Syntax

Create with column definitions

```
CREATE [[ scope ] TEMP[ORARY]] FLEX[IBLE] TABLE [ IF NOT EXISTS ] [[database.]schema.]table-name
    ( [ column-definition[,…] [, table-constraint ][,…] ] )
    [ ORDER BY column[,…] ]
    [ segmentation-spec ]
    [ KSAFE [k-num] ]
    [ partition-clause]
    [ {INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES ]
```

Create from another table

```
CREATE FLEX[IBLE] TABLE [[database.]schema.] table-name
  [ ( column-name-list ) ]
  [ {INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES ]
AS  query [ ENCODED BY column-ref-list ]
```

Parameters

For general parameter descriptions, see CREATE TABLE; for parameters specific to temporary flex tables, see CREATE TEMPORARY TABLE and Creating Flex Tables.

You cannot partition a flex table on any virtual column (key).

Privileges

Non-superuser: CREATE privilege on table schema

Default Columns

The CREATE statement can omit specifying any column definitions.
CREATE FLEXIBLE TABLE always creates two columns automatically:

__raw__	LONG VARBINARY type column to store unstructured data

	that you load. By default, this column has a `NOT NULL` constraint.
`__identity__`	IDENTITY column that is used for segmentation and sorting when no other column is defined.

Default Projections

Vertica automatically creates **superprojections** for both the flex table and keys tables when you create them.

If you create a flex table with one or more of the ORDER BY, ENCODED BY, SEGMENTED BY, or KSAFE clauses, the clause information is used to create projections. If no clauses are in use, Vertica uses the following defaults:

Table	Sort order	Encoding	Segmentation	K-safety
Flexible table	`ORDER BY *.__identity__`	none	`SEGMENTED BY hash *.__identity__`	1
Keys table	`ORDER BY *._keys_frequency`	RLE	`UNSEGMENTED ALL NODES`	1

Note:
When you build a view for a flex table (see BUILD_FLEXTABLE_VIEW), the view is ordered by frequency, desc, and key_name.

Examples

The following example creates a flex table named `darkdata` without specifying any column information. Vertica creates a default superprojection and buddy projection as part of creating the table:

```
=> CREATE FLEXIBLE TABLE darkdata();
CREATE TABLE
=> \dj darkdata1*
                        List of projections
 Schema |         Name         |  Owner  |       Node       | Comment
--------+----------------------+---------+------------------+---------
```

```
 public | darkdata1_b0         | dbadmin |                  |
 public | darkdata1_b1         | dbadmin |                  |
 public | darkdata1_keys_super | dbadmin | v_vmart_node0001 |
 public | darkdata1_keys_super | dbadmin | v_vmart_node0002 |
 public | darkdata1_keys_super | dbadmin | v_vmart_node0003 |
(5 rows)

=> SELECT export_objects('','darkdata1_b0');
CREATE PROJECTION public.darkdata1_b0 /*+basename(darkdata1),createtype(P)*/
(
 __identity__,
 __raw__
)
AS
 SELECT darkdata1.__identity__,
        darkdata1.__raw__
 FROM public.darkdata1
 ORDER BY darkdata1.__identity__
SEGMENTED BY hash(darkdata1.__identity__) ALL NODES OFFSET 0;

SELECT MARK_DESIGN_KSAFE(1);
(1 row)

=> select export_objects('','darkdata1_keys_super');
CREATE PROJECTION public.darkdata1_keys_super /*+basename(darkdata1_keys),createtype(P)*/
(
 key_name,
 frequency,
 data_type_guess
)
AS
 SELECT darkdata1_keys.key_name,
        darkdata1_keys.frequency,
        darkdata1_keys.data_type_guess
 FROM public.darkdata1_keys
 ORDER BY darkdata1_keys.frequency
UNSEGMENTED ALL NODES;

SELECT MARK_DESIGN_KSAFE(1);
(1 row)
```

The following example creates a table called `darkdata1` with one column definition (`date_col`). The statement specifies the `partition by` clause to partition the data by year. Vertica creates a default superprojection and buddy projections as part of creating the table:

```
=> CREATE FLEX TABLE darkdata1 (date_col date NOT NULL) partition by
  extract('year' from date_col);
CREATE TABLE
```

See Also

- Creating Flex Tables
- CREATE FLEXIBLE EXTERNAL TABLE AS COPY

CREATE FLEXIBLE EXTERNAL TABLE AS COPY

CREATE FLEXIBLE EXTERNAL TABLE AS COPY creates a flexible external table. This statement combines statements CREATE FLEXIBLE TABLE and COPY statements, supporting a subset of each statement's parameters.

You can also use user-defined load functions (UDLs) to create external flex tables. For details about creating and using flex tables, see Using Flex Tables.

Note:
Vertica does not create a superprojection for an external table when you create it.

For details about creating and using flex tables, see Creating Flex Tables in Using Flex Tables.

Caution:
Canceling a CREATE FLEX EXTERNAL TABLE AS COPY statement can cause unpredictable results. Vertica recommends that you allow the statement to finish, then use DROP TABLE after the table exists.

Syntax

```
CREATE FLEX[IBLE] EXTERNAL TABLE [ IF NOT EXISTS ] [[database.]schema.]table-name
   ( [ column-definition[,…] ] )
   [ INCLUDE | EXCLUDE [SCHEMA] PRIVILEGES ]
AS COPY [ ( { column-as-expression | column } [ FILLER datatype ] ]
   FROM {
      'path-to-data' [ ON nodename | ON ANY NODE | ON (nodeset) ] input-format [,…]
      | [ WITH ] UDL-clause[…]
   }
   [ ABORT ON ERROR ]
   [ DELIMITER [ AS ] 'char' ]
   [ ENCLOSED [ BY ] 'char' ]
   [ ENFORCELENGTH ]
   [ ESCAPE [ AS ] 'char' | NO ESCAPE ]
   [ EXCEPTIONS 'path' [ ON nodename ] [,…] ]
   [ NULL [ AS ] 'string' ]
```

```
[ RECORD TERMINATOR 'string' ]
[ REJECTED DATA 'path' [ ON nodename ][,…] ]
[ REJECTMAX integer ]
[ SKIP integer ]
[ SKIP BYTES integer ]
[ TRAILING NULLCOLS ]
[ TRIM 'byte' ]
```

Parameters

For parameter descriptions, see CREATE TABLE and COPY Parameters.

Note:
CREATE FLEXIBLE EXTERNAL TABLE AS COPY supports only a subset of CREATE TABLE and COPY parameters.

Privileges

Superuser, or non-superuser with the following privileges:

- READ privileges on the USER-accessible storage location, see GRANT (Storage Location)
- Full access (including SELECT) to an external table that the user has privileges to create

Examples

To create an external flex table:

```
=> CREATE flex external table mountains() AS COPY FROM 'home/release/KData/kmm_ountains.json' PARSER
fjsonparser();
CREATE TABLE
```

As with other flex tables, creating an external flex table produces two regular tables: the named table and its associated _keys table. The keys table is not an external table:

```
=> \dt mountains
                List of tables
 Schema |   Name    | Kind  |  Owner   | Comment
--------+-----------+-------+----------+---------
 public | mountains | table | release |
(1 row)
```

You can use the helper function, COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW, to compute keys and create a view for the external table:

```
=> SELECT compute_flextable_keys_and_build_view ('appLog');

                    compute_flextable_keys_and_build_view
-------------------------------------------------------------------------------------------------
Please see public.appLog_keys for updated keys
The view public.appLog_view is ready for querying
(1 row)
```

1. Check the keys from the _keys table for the results of running the helper application:

```
=> SELECT * FROM appLog_keys;
                          key_name                          | frequency |   data_type_guess
------------------------------------------------------------+-----------+------------------
contributors                                                |         8 | varchar(20)
coordinates                                                 |         8 | varchar(20)
created_at                                                  |         8 | varchar(60)
entities.hashtags                                           |         8 | long varbinary(186)
.
.
.
retweeted_status.user.time_zone                             |         1 | varchar(20)
retweeted_status.user.url                                   |         1 | varchar(68)
retweeted_status.user.utc_offset                            |         1 | varchar(20)
retweeted_status.user.verified                              |         1 | varchar(20)
(125 rows)
```

2. Query from the external flex table view:

```
=> SELECT "user.lang" FROM appLog_view;
 user.lang
-----------
it
en
es
en
en
es
tr
en
(12 rows)
```

- CREATE EXTERNAL TABLE AS COPY

CREATE FUNCTION Statements

Vertica provides CREATE statements for each type of user-defined extension. Each CREATE statement adds a user-defined function to the Vertica catalog:

CREATE statement	Extension
CREATE FUNCTION (Scalar)	User-defined scalar functions (UDSFs)
CREATE AGGREGATE FUNCTION	User-defined aggregate functions (UDAFs)
CREATE ANALYTIC FUNCTION	User-defined analytic functions (UDAnF)
CREATE TRANSFORM FUNCTION	User-defined transform functions (UDTFs)
CREATE statements for user-defined load:	
• CREATE SOURCE	Load source functions
• CREATE FILTER	Load filter functions
• CREATE PARSER	Load parser functions

Vertica also provides CREATE FUNCTION (SQL), which stores SQL expressions as functions that you can invoke in a query.

CREATE AGGREGATE FUNCTION

Adds to the catalog a user-defined aggregate function (UDAF) that is stored in a shared Linux library. CREATE AGGREGATE FUNCTION automatically determines the function parameters and return value from data supplied by the factory class. Vertica supports overloading aggregate functions. When you call the SQL function, Vertica passes the input table to the function in the library to process.

Syntax

```
CREATE [ OR REPLACE ] AGGREGATE FUNCTION [[database.]schema.]function-name AS
  [ LANGUAGE 'language' ]
  NAME 'factory'
  LIBRARY library
```

Parameters

OR REPLACE	Specifies to overwrite an existing function of the same name and matching arguments; otherwise the CREATE statement returns with a rollback error.

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
function-name	Identifies the function to create, where *function* conforms to conventions described in Identifiers. **Tip:** This name does not need to match the name of the factory, but it is less confusing if they are the same or similar.
LANGUAGE '*language*'	The language used to develop this function, currently C++ only (the default).
NAME '*factory*'	Name of the shared library factory class that generates the object to handle function processing.
LIBRARY *library*	Name of the shared library that contains the C++ object to process this function. This library must already be loaded by CREATE LIBRARY.

Privileges

Non-superuser:

- CREATE privilege on the function's schema
- USAGE privilege on the function's library

Examples

The following example demonstrates loading a library named AggregateFunctions then defining a function named ag_avg and ag_cat that are mapped to the ag_cat AverageFactory and ConcatenateFactory classes in the library:

```
=> CREATE LIBRARY AggregateFunctions AS '/opt/vertica/sdk/examples/build/AggregateFunctions.so';
CREATE LIBRARY
```

```
=> CREATE AGGREGATE FUNCTION ag_avg AS LANGUAGE 'C++' NAME 'AverageFactory'
   library AggregateFunctions;
CREATE AGGREGATE FUNCTION
=> CREATE AGGREGATE FUNCTION ag_cat AS LANGUAGE 'C++' NAME 'ConcatenateFactory'
   library AggregateFunctions;
CREATE AGGREGATE FUNCTION
=> \x
Expanded display is on.
select * from user_functions;
-[ RECORD 1 ]----------+-----------------------------------------------------------------
schema_name            | public
function_name          | ag_avg
procedure_type         | User Defined Aggregate
function_return_type   | Numeric
function_argument_type | Numeric
function_definition    | Class 'AverageFactory' in Library 'public.AggregateFunctions'
volatility             |
is_strict              | f
is_fenced              | f
comment                |
-[ RECORD 2 ]----------+-----------------------------------------------------------------
schema_name            | public
function_name          | ag_cat
procedure_type         | User Defined Aggregate
function_return_type   | Varchar
function_argument_type | Varchar
function_definition    | Class 'ConcatenateFactory' in Library 'public.AggregateFunctions'
volatility             |
is_strict              | f
is_fenced              | f
comment                |
```

See Also

- CREATE LIBRARY
- DROP AGGREGATE FUNCTION
- USER_FUNCTIONS
- Developing User-Defined Extensions (UDxs)
- User-Defined Aggregate Functions

CREATE ANALYTIC FUNCTION

Adds to the catalog a user-defined analytic function (UDAnF) that is stored in a shared Linux library. CREATE ANALYTIC FUNCTION automatically determines the function parameters and return value from data supplied by the factory class. Vertica supports overloading analytic functions. When you call the SQL function, Vertica passes the input table to the function in the library to process.

Syntax

```
CREATE [ OR REPLACE ] ANALYTIC FUNCTION function-name AS
    [ LANGUAGE 'language' ]
    NAME 'factory'
    LIBRARY library
    [ FENCED | NOT FENCED ]
```

Parameters

OR REPLACE	Specifies to overwrite an existing function of the same name and matching arguments; otherwise the CREATE statement returns with a rollback error.
function-name	Identifies the function to create, where *function* conforms to conventions described in Identifiers. **Tip:** This name does not need to match the name of the factory, but it is less confusing if they are the same or similar.
LANGUAGE '*language*'	Language used to develop this function, one of the following: • C++ (default) • Java
NAME '*factory*'	Name of the C++ factory class in the shared library that generates the object to handle function processing.
LIBRARY *library*	Name of the shared library that contains the C++ object to process this function. This library must already be loaded by CREATE LIBRARY.
FENCED | NOT FENCED	Enables or disables fenced mode for this function. **Default**: FENCED

Privileges

Non-superuser:

- CREATE privilege on the function's schema
- USAGE privilege on the function's library

Examples

This example shows how to create an analytic function named an_rank based on the factory class named RankFactory in the AnalyticFunctions library..

```
=> CREATE ANALYTIC FUNCTION an_rank AS LANGUAGE 'C++'
   NAME 'RankFactory' LIBRARY AnalyticFunctions;
```

See Also

Analytic Functions (UDAnFs)

CREATE FILTER

Adds a user-defined load filter function to the catalog. CREATE FILTER automatically determines the function parameters and return value from data supplied by the factory class. Vertica supports overloading load filter functions. When you call the SQL function, Vertica passes the input table to the function in the library to process.

Important:
Installing an untrusted UDL function can compromise the security of the server. UDx's can contain arbitrary code. In particular, UD source functions can read data from any arbitrary location. It is up to the developer of the function to enforce proper security limitations. Superusers must not grant access to UDx's to untrusted users.

Syntax

```
CREATE [ OR REPLACE ] FILTER [[database.]schema.]function-name AS
   [ LANGUAGE 'language' ]
```

```
NAME 'factory' LIBRARY library
[ FENCED | NOT FENCED ]
```

Parameters

OR REPLACE	Specifies to overwrite an existing function of the same name and matching arguments; otherwise the CREATE statement returns with a rollback error.
[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
function-name	Identifies the function to create, where *function* conforms to conventions described in Identifiers. **Tip:** This name does not need to match the name of the factory, but it is less confusing if they are the same or similar.
LANGUAGE '*language*'	The language used to develop this function, one of the following: • C++ (default) • `Java` • `Python`
NAME '*factory*'	Name of the shared library factory class that generates the object to handle function processing. This is the same name used by the RegisterFactory class.
LIBRARY *library*	Name of the shared library that contains the object to process this function. This library must already be loaded by CREATE LIBRARY.
FENCED | NOT FENCED	Enables or disables fenced mode for this function. **Default**: `FENCED`

Privileges

Superuser

Example

The following example demonstrates loading a library named iConverterLib, then defining a function named Iconverter that is mapped to the iConverterFactory factory class in the library:

```
=> CREATE LIBRARY iConverterLib as '/opt/vertica/sdk/examples/build/IconverterLib.so';
CREATE LIBRARY
=> CREATE FILTER Iconverter AS LANGUAGE 'C++' NAME 'IconverterFactory' LIBRARY IconverterLib;
CREATE FILTER FUNCTION
=> \x
Expanded display is on.
=> SELECT * FROM user_functions;
-[ RECORD 1 ]----------+--------------------
schema_name            | public
function_name          | Iconverter
procedure_type         | User Defined Filter
function_return_type   |
function_argument_type |
function_definition    |
volatility             |
is_strict              | f
is_fenced              | f
comment                |
```

See Also

- CREATE LIBRARY
- DROP FILTER
- USER_FUNCTIONS
- User-Defined Load (UDL)

CREATE FUNCTION (SQL)

Stores SQL expressions as functions for use in queries. User-defined SQL functions are useful for executing complex queries and combining Vertica built-in functions. You simply call the function in a given query. If multiple SQL functions with same name and argument type are in the search path, Vertica calls the first match that it finds.

SQL functions are flattened in all cases, including DDL.

Syntax

```
CREATE [ OR REPLACE ] FUNCTION
    [[database.]schema.]function-name( [ arg-list ] )
    RETURN return-type
    AS
    BEGIN
       RETURN expression;
    END;
```

Parameters

`OR REPLACE`	Specifies to overwrite an existing function of the same name and arguments. If you only change the function arguments, Vertica ignores this option and maintains both functions under the same name.
`[`*`database`*`.]`*`schema`*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
`function-name`	Names the SQL function to create, where *`function-name`* conforms to conventions described in Identifiers.
`arg-list`	A comma-delimited list of argument names and their data types, specified in this format: *`argname argtype`*`[,…]` where: • *`argname`* is the name of an argument passed to *`function-name`*. • *`argtype`* is *`argname`*'s data type.
`return-type`	The data type that this function returns.
`RETURN` *`expression`*	Specifies the SQL function (function body), where *`expression`* can contain built-in functions, operators, and

	argument names specified in the `CREATE FUNCTION` statement. A semicolon at the end of the expression is required. **Note:** The `CREATE FUNCTION` definition allows only one `RETURN` expression. Return expressions do not support the following: • `FROM`, `WHERE`, `GROUP BY`, `ORDER BY`, and `LIMIT` clauses • Aggregation, analytics, and meta functions

Privileges

Non-superuser:

- CREATE privilege on the function's schema
- USAGE privilege on the function's library

Strictness and Volatility

Vertica infers the **strictness** and volatility (**stable**, **immutable**, or **volatile**) of an SQL function from its definition. Vertica then determines the correctness of usage, such as where an immutable function is expected but a volatile function is provided.

SQL Functions and Views

You can create views on the queries that use SQL functions and then query the views. When you create a view, an SQL function replaces a call to the user-defined function with the function body in a view definition. Therefore, when the body of the user-defined function is replaced, the view should also be replaced.

Examples

See Creating User-Defined SQL Functions

See Also

- ALTER FUNCTION (Scalar)
- DROP FUNCTION
- User-Defined SQL Functions

CREATE FUNCTION (Scalar)

Adds a user-defined scalar function (UDSF) to the catalog. UDSFs take in a single row of data and return a single value. These functions can be used anywhere a native Vertica function or statement can be used, except `CREATE TABLE` with its `PARTITION BY` or any segmentation clause.

CREATE FUNCTION automatically determines the function parameters and return value from data supplied by the factory class. Vertica supports overloading analytic functions. When you call the SQL function, Vertica passes the parameters to the function in the library to process.

Syntax

```
CREATE [ OR REPLACE ] FUNCTION [[database.]schema.]function AS
   [ LANGUAGE 'language' ]
   NAME 'factory'
   LIBRARY library
   [ FENCED | NOT FENCED ]
```

Parameters

`OR REPLACE`	Specifies to overwrite an existing function of the same name and matching arguments; otherwise the CREATE statement returns with a rollback error.
`[`*`database`*`.]`*`schema`*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject`

	If you specify a database, it must be the current database.
function	Identifies the function to create, where *function* conforms to conventions described in Identifiers. **Tip:** This name does not need to match the name of the factory, but it is less confusing if they are the same or similar.
LANGUAGE '*language*'	Language used to develop this function, one of the following: • C++ (default) • Python • Java • R
NAME '*factory*'	Name of the shared library factory class that generates the object to handle function processing.
LIBRARY *library*	Name of the file that contains the C++ library, Python file, Java Jar file, or R functions file to process this function. This library must already be loaded by CREATE LIBRARY.
FENCED | NOT FENCED	Enables or disables fenced mode for this function. Functions written in Java and R always run in fenced mode. **Default**: FENCED

Privileges

- CREATE privilege on the function's schema
- USAGE privilege on the function's library

Examples

The following example demonstrates loading a library named `scalarfunctions`, then defining a function named `Add2ints` that is mapped to the `Add2intsInfo` factory class in the library:

```
=> CREATE LIBRARY ScalarFunctions AS '/opt/vertica/sdk/examples/build/ScalarFunctions.so';
CREATE LIBRARY
=> CREATE FUNCTION Add2Ints AS LANGUAGE 'C++' NAME 'Add2IntsFactory' LIBRARY ScalarFunctions;
CREATE FUNCTION
=> \x
Expanded display is on.
=> SELECT * FROM USER_FUNCTIONS;

-[ RECORD 1 ]----------+--------------------------------------------------
schema_name            | public
function_name          | Add2Ints
procedure_type         | User Defined Function
function_return_type   | Integer
function_argument_type | Integer, Integer
function_definition    | Class 'Add2IntsFactory' in Library 'public.ScalarFunctions'
volatility             | volatile
is_strict              | f
is_fenced              | t
comment                |

=> \x
Expanded display is off.
=> -- Try a simple call to the function
=> SELECT Add2Ints(23,19);
 Add2Ints
----------
       42
(1 row)
```

Developing User-Defined Extensions (UDxs)

CREATE PARSER

Adds a user-defined load parser function to the catalog. CREATE PARSER automatically determines the function parameters and return value from data supplied by the factory class. Vertica supports overloading load parser functions. When you call the SQL function, Vertica passes the input table to the function in the library to process.

Important:
Installing an untrusted UDL function can compromise the security of the server. UDx's can contain arbitrary code. In particular, UD source functions can read data from any arbitrary location. It is up to the developer of the function to enforce proper security limitations. Superusers must not grant access to UDx's to untrusted users.

Syntax

```
CREATE [ OR REPLACE ] PARSER [[database.]schema.]function-name AS
   [ LANGUAGE 'language' ]
   NAME 'factory'
   LIBRARY library
   [ FENCED | NOT FENCED ]
```

Parameters

OR REPLACE	Specifies to overwrite an existing function of the same name and matching arguments; otherwise the CREATE statement returns with a rollback error.
[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
function-name	Identifies the function to create, where *function* conforms to conventions described in Identifiers. **Tip:** This name does not need to match the name of the factory, but it is less confusing if they are the same or similar.
LANGUAGE '*language*'	The language used to develop this function, one of the following: • C++ (default) • Java • Python
NAME '*factory*'	Name of the shared library factory class that generates the object to handle function processing. This is the same name used by the RegisterFactory class.
LIBRARY *library*	Name of the shared library that contains the object to

	process this function. This library must already be loaded by CREATE LIBRARY.
FENCED | NOT FENCED	Enables or disables fenced mode for this function. **Default**: FENCED

Privileges

Superuser

Example

The following example demonstrates loading a library named BasicIntegrerParserLib, then defining a function named BasicIntegerParser that is mapped to the BasicIntegerParserFactory factory class in the library:

```
=> CREATE LIBRARY BasicIntegerParserLib as '/opt/vertica/sdk/examples/build/BasicIntegerParser.so';
CREATE LIBRARY
=> CREATE PARSER BasicIntegerParser AS LANGUAGE 'C++' NAME 'BasicIntegerParserFactory' LIBRARY
BasicIntegerParserLib;
CREATE PARSER FUNCTION
=> \x
Expanded display is on.
=> SELECT * FROM user_functions;
-[ RECORD 1 ]----------+--------------------
schema_name            | public
function_name          | BasicIntegerParser
procedure_type         | User Defined Parser
function_return_type   |
function_argument_type |
function_definition    |
volatility             |
is_strict              | f
is_fenced              | f
comment                |
```

See Also

- CREATE LIBRARY
- DROP PARSER
- USER_FUNCTIONS
- User-Defined Load (UDL)

CREATE SOURCE

Adds a user-defined load source function to the catalog. CREATE SOURCE automatically determines the function parameters and return value from data supplied by the factory class. Vertica supports overloading load source functions. When you call the SQL function, Vertica passes the input table to the function in the library to process.

> **Important:**
> Installing an untrusted UDL function can compromise the security of the server. UDx's can contain arbitrary code. In particular, UD source functions can read data from any arbitrary location. It is up to the developer of the function to enforce proper security limitations. Superusers must not grant access to UDx's to untrusted users.

Syntax

```
CREATE [ OR REPLACE ] SOURCE [[database.]schema.]function-name AS
    [ LANGUAGE 'language' ]
    NAME 'factory'
    LIBRARY library
    [ FENCED | NOT FENCED ]
```

Parameters

OR REPLACE	Specifies to overwrite an existing function of the same name and matching arguments; otherwise the CREATE statement returns with a rollback error.
[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
function-name	Identifies the function to create, where *function* conforms to conventions described in Identifiers.

	Tip: This name does not need to match the name of the factory, but it is less confusing if they are the same or similar.
LANGUAGE '*Language*'	Language used to develop this function, one of the following: • C++ (default) • Java
NAME '*factory*'	Name of the shared library factory class that generates the object to handle function processing. This is the same name used by the RegisterFactory class.
LIBRARY *library*	Name of the shared library that contains the object to process this function. This library must already be loaded by CREATE LIBRARY.
FENCED | NOT FENCED	Enables or disables fenced mode for this function. **Default:** FENCED

Privileges

Superuser

Example

The following example demonstrates loading a library named curllib, then defining a function named curl that is mapped to the CurlSourceFactory factory class in the library:

```
=> CREATE LIBRARY curllib as '/opt/vertica/sdk/examples/build/cURLLib.so';
CREATE LIBRARY
=> CREATE SOURCE curl AS LANGUAGE 'C++' NAME 'CurlSourceFactory' LIBRARY curllib;
CREATE SOURCE
=> \x
Expanded display is on.
=> SELECT * FROM user_functions;
-[ RECORD 1 ]----------+--------------------
schema_name            | public
function_name          | curl
procedure_type         | User Defined Source
function_return_type   |
function_argument_type |
```

```
function_definition    |
volatility             |
is_strict              | f
is_fenced              | f
comment                |
```

See Also

- CREATE LIBRARY
- DROP SOURCE
- USER_FUNCTIONS
- User-Defined Load (UDL)

CREATE TRANSFORM FUNCTION

Adds to the catalog a user-defined transform function (UDTF) that is stored in a shared Linux library. CREATE TRANSFORM FUNCTION automatically determines the function parameters and return value from data supplied by the factory class. Vertica supports overloading transform functions. When you call the SQL function, Vertica passes the input table to the transform function in the library to process.

Syntax

```
CREATE [ OR REPLACE ] TRANSFORM FUNCTION function-name AS
    [ LANGUAGE 'language' ]
    NAME 'factory'
    LIBRARY library
    [ FENCED | NOT FENCED ]
```

Parameters

OR REPLACE	Specifies to overwrite an existing function of the same name and matching arguments; otherwise the CREATE statement returns with a rollback error.
function-name	Identifies the function to create, where *function* conforms to conventions described in Identifiers.

	Tip: This name does not need to match the name of the factory, but it is less confusing if they are the same or similar.
`LANGUAGE '`*`Language`*`'`	The language used to develop this function, one of the following: • `C++` (default) • `Java` • `R` • `Python`
`NAME '`*`factory`*`'`	Name of the shared library factory class or R factory function that generates the object to handle function processing.
`LIBRARY` *`library`*	Name of the shared library that contains the object to process this function. This library must already be loaded by CREATE LIBRARY.
`FENCED | NOT FENCED`	Enables or disables fenced mode for this function. Functions written in R always run in fenced mode. **Default:** `FENCED`

Privileges

Non-superuser:

- CREATE privilege on the function's schema
- USAGE privilege on the function's library

Restrictions

A query that includes a UDTF cannot:

- Include statements other than the SELECT statement that calls this UDTF and a PARTITION BY expression
- Call an analytic function

- Call another UDTF
- Include one of the following clauses:
  - TIMESERIES
  - Pattern matching
  - Gap filling and interpolation

Examples

This example shows how to add a UDTF to the catalog.

```
=> CREATE TRANSFORM FUNCTION transFunct AS LANGUAGE 'C++' NAME 'myFactory' LIBRARY myFunction;
```

CREATE HCATALOG SCHEMA

Define a schema for data stored in a Hive data warehouse using the HCatalog Connector. For more information, see Using the HCatalog Connector in Integrating with Apache Hadoop.

Most of the optional parameters are read out of Hadoop configuration files if available. If you copied the Hadoop configuration files as described in Configuring Vertica for HCatalog, you can omit most parameters. By default this statement uses the values specified in those configuration files. If the configuration files are complete, the following is a valid statement:

```
=> CREATE HCATALOG SCHEMA hcat;
```

If a value is not specified in the configuration files and a default is shown in the parameter list, then that default value is used.

Some parameters apply only if you are using HiveServer2 (the default). Others apply only if you are using WebHCat, a legacy Hadoop service. When using HiveServer2, use HIVESERVER2_HOSTNAME to specify the server host. When using WebHCat, use WEBSERVICE_HOSTNAME to specify the server host.

If you need to use WebHCat you must also set the HCatalogConnectorUseHiveServer2 configuration parameter to 0. See Apache Hadoop Parameters.

After creating the schema, you can change many (but not all) parameters using ALTER HCATALOG SCHEMA.

Syntax

```
CREATE HCATALOG SCHEMA [IF NOT EXISTS] schemaName
    [AUTHORIZATION user-id]
    [WITH [param=value [,...] ] ]
```

Arguments

Argument	Description
[IF NOT EXISTS]	If given, the statement exits without an error when the schema named in *schemaName* already exists.
schemaName	The name of the schema to create in the Vertica catalog. The tables in the Hive database will be available through this schema.
AUTHORIZATION *user-id*	The name of a Vertica account to own the schema being created. This parameter is ignored if Kerberos authentication is being used; in that case the current vsql user is used.

Parameters

Parameter	Description
HOSTNAME	The hostname, IP address, or URI of the database server that stores the Hive data warehouse's metastore information. If you specify this parameter and do not also specify PORT, then this value must be in the URI format used for hive.metastore.uris in hive-site.xml. If the Hive metastore supports High Availability, you can specify a comma-separated list of URIs for this value. If this value is not specified, hive-site.xml must be available.

PORT	The port number on which the metastore database is running. If you specify this parameter, you must also specify HOSTNAME and it must be a name or IP address (not a URI).
HIVESERVER2_HOSTNAME	The hostname or IP address of the HiveServer2 service. This parameter is optional if in hive-site.xml you set one of the following properties: • hive.server2.thrift.bind.host to a valid host • hive.server2.support.dynamic.service.discovery to true This parameter is ignored if you are using WebHCat.
WEBSERVICE_HOSTNAME	The hostname or IP address of the WebHCat service, if using WebHCat instead of HiveServer2. If this value is not specified, webhcat-site.xml must be available.
WEBSERVICE_PORT	The port number on which the WebHCat service is running, if using WebHCat instead of HiveServer2. If this value is not specified, webhcat-site.xml must be available.
WEBHDFS_ADDRESS	The host and port ("host:port") for the WebHDFS service. This parameter is used only for reading ORC and Parquet files. If this value is not set, hdfs-site.xml must be available to read these file types through the HCatalog Connector.
HCATALOG_SCHEMA	The name of the Hive schema or database that the Vertica schema is being mapped to. The default is *schemaName*.
CUSTOM_PARTITIONS	Whether the Hive schema uses custom partition locations ('YES' or 'NO'). If the schema uses custom partition locations, then Vertica queries Hive to get those locations when executing queries. These additional Hive queries can be expensive, so use this parameter only if you need to. The default is 'NO' (disabled). For more information, see Using Partitioned Data in Integrating with Apache Hadoop.
HCATALOG_USER	The username of the HCatalog user to use when making calls to the HiveServer2 or WebHCat server. The default is the current database user.
HCATALOG_CONNECTION_TIMEOUT	The number of seconds the HCatalog Connector waits for a successful connection to the HiveServer or WebHCat server. A value of 0 means wait indefinitely.

HCATALOG_SLOW_TRANSFER_LIMIT	The lowest data transfer rate (in bytes per second) from the HiveServer2 or WebHCat server that the HCatalog Connector accepts. See HCATALOG_SLOW_TRANSFER_TIME for details.
HCATALOG_SLOW_TRANSFER_TIME	The number of seconds the HCatalog Connector waits before enforcing the data transfer rate lower limit. After this time has passed, the HCatalog Connector tests whether the data transfer rate is at least as fast as the value set in HCATALOG_SLOW_TRANSFER_LIMIT. If it is not, then the HCatalog Connector breaks the connection and terminates the query.
SSL_CONFIG	The path of the Hadoop ssl-client.xml configuration file. This parameter is required if you are using HiveServer2 and it uses SSL wire encryption. This parameter is ignored if you are using WebHCat.

The default values for HCATALOG_CONNECTOR_TIMEOUT, HCATALOG_SLOW_TRANSFER_LIMIT, and HCATALOG_SLOW_TRANSFER_TIME are set by the database configuration parameters HCatConnectionTimeout, HCatSlowTransferLimit, and HCatSlowTransferTime. See Apache Hadoop Parameters in the Administrator's Guide for more information.

Configuration Files

The HCatalog Connector uses the following values from the Hadoop configuration files if you do not override them when creating the schema.

File	Properties
hive-site.xml	hive.server2.thrift.bind.host (used for HIVESERVER2_HOSTNAME)
	hive.server2.thrift.port
	hive.server2.transport.mode
	hive.server2.authentication
	hive.server2.authentication.kerberos.principal
	hive.server2.support.dynamic.service.discovery
	hive.zookeeper.quorum (used as HIVESERVER2_HOSTNAME if dynamic service discovery is enabled)

File	Properties
	hive.zookeeper.client.port
	hive.server2.zookeeper.namespace
	hive.metastore.uris (used for HOSTNAME and PORT)
ssl-client.xml	ssl.client.truststore.location
	ssl.client.truststore.password

Privileges

The user must be a superuser or be granted all permissions on the database to use this statement.

The user also requires access to Hive data in one of the following ways:

- Have USAGE permissions on *hcatalog_schema*, if Hive does not use an authorization service (Sentry or Ranger) to manage access.
- Have permission through an authorization service, if Hive uses it to manage access. In this case you must either set EnableHCatImpersonation to 0, to access data as the Vertica principal, or grant users access to the HDFS data. For Sentry, you can use ACL synchronization to manage HDFS access.
- Be the dbadmin user, with or without an authorization service.

Examples

The following example shows how to use CREATE HCATALOG SCHEMA to define a new schema for tables stored in a Hive database and then query the system tables that contain information about those tables:

```
=> CREATE HCATALOG SCHEMA hcat WITH HOSTNAME='hcathost' PORT=9083
   HCATALOG_SCHEMA='default' HIVESERVER2_HOSTNAME='hs.example.com'
   SSL_CONFIG='/etc/hadoop/conf/ssl-client.xml' HCATALOG_USER='admin';
CREATE SCHEMA
=> \x
Expanded display is on.

=> SELECT * FROM v_catalog.hcatalog_schemata;
-[ RECORD 1 ]----------------+-------------------------------------------
schema_id                    | 45035996273748224
schema_name                  | hcat
```

```
schema_owner_id              | 45035996273704962
schema_owner                 | admin
create_time                  | 2017-12-05 14:43:03.353404-05
hostname                     | hcathost
port                         | -1
hiveserver2_hostname         | hs.example.com
webservice_hostname          |
webservice_port              | 50111
webhdfs_address              | hs.example.com:50070
hcatalog_schema_name         | default
ssl_config                   | /etc/hadoop/conf/ssl-client.xml
hcatalog_user_name           | admin
hcatalog_connection_timeout  | -1
hcatalog_slow_transfer_limit | -1
hcatalog_slow_transfer_time  | -1
custom_partitions            | f

=> SELECT * FROM v_catalog.hcatalog_table_list;
-[ RECORD 1 ]------+------------------
table_schema_id    | 45035996273748224
table_schema       | hcat
hcatalog_schema    | default
table_name         | nation
hcatalog_user_name | admin
-[ RECORD 2 ]------+------------------
table_schema_id    | 45035996273748224
table_schema       | hcat
hcatalog_schema    | default
table_name         | raw
hcatalog_user_name | admin
-[ RECORD 3 ]------+------------------
table_schema_id    | 45035996273748224
table_schema       | hcat
hcatalog_schema    | default
table_name         | raw_rcfile
hcatalog_user_name | admin
-[ RECORD 4 ]------+------------------
table_schema_id    | 45035996273748224
table_schema       | hcat
hcatalog_schema    | default
table_name         | raw_sequence
hcatalog_user_name | admin
```

The following example shows how to specify more than one metastore host.

```
=> CREATE HCATALOG SCHEMA hcat
   WITH HOSTNAME='thrift://node1.example.com:9083,thrift://node2.example.com:9083';
```

The following example shows how to include custom partition locations:

```
=> CREATE HCATALOG SCHEMA hcat WITH HCATALOG_SCHEMA='default'
       HIVESERVER2_HOSTNAME='hs.example.com'
       CUSTOM_PARTITIONS='yes';
```

CREATE KEY

Creates a private key.

Syntax

```
CREATE KEY name
       { 'AES' [ PASSWORD 'password' ] | 'RSA' }
       {LENGTH length | AS key_text}
```

Parameters

name	The name of the key.
password	Password for the key.
length	Size of the key in bits. Example: 2048

key_text	The contents of the key to import.
	
	Example:
	
	`-----BEGIN RSA PRIVATE KEY----`
	`-...ABCD1234...-----END RSA PRIVATE KEY-----`

Privileges

Superuser

Examples

See Generating TLS Certificates and Keys.

- CREATE CERTIFICATE

CREATE LIBRARY

Loads a library containing user defined extensions (UDxs) into the Vertica catalog. Vertica automatically distributes copies of the library file and supporting libraries to all cluster nodes. UDxs defined in the catalog that reference the updated library automatically start using the new library file.

Because libraries are added to the database catalog, they persist across database restarts.

After loading a library in the catalog, you can use statements such as CREATE FUNCTION to define the extensions contained in the library. See Developing User-Defined Extensions (UDxs) in Extending Vertica for details.

Syntax

```
CREATE [OR REPLACE] LIBRARY
    [[database.]schema.]library-name
    AS 'library-path'
    [ DEPENDS 'support-path' ]
    [ LANGUAGE 'language' ]
```

Parameters

OR REPLACE	Specifies to replace the current library loaded as *library-name*. If omitted, *library-name* must be unique in the schema, otherwise the statement returns with an error.
[*database* .]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
library-name	A name to assign to this library, where *library-name* conforms to

	conventions described in Identifiers. Use this name in a CREATE FUNCTION statement to enable user defined functions stored in the library. **Tip:** While not required, it is good practice to match *library-name* to the library file name.
AS *library-path*	The absolute path on the initiator node file system of the library to load.

DEPENDS '*support-path*'	Indicates that the UDx library depends on one or more files or libraries, where *support-path* specifies one or more absolute paths to these dependencies on the initiator node.
	
	Note:
	DEPENDS is ignored for R, as R packages must be installed locally on each node, including external dependencies.
	
	For example, the following statement specifies a single dependency:
	
	`=> CREATE LIBRARY mylib AS '/path/to/java_udx' DEPENDS '/path/to/jar/this.jar' LANGUAGE 'Java';`
	
	DEPENDS can specify multiple support paths as follows:
	
	• Separate multiple paths with colons (:). For example:
	
	`=> CREATE LIBRARY mylib AS '/path/to/java_udx' DEPENDS '/path/to/jars/this.jar:/path/to/jars/that.jar' LANGUAGE 'Java';`
	
	• Specify a directory that contains multiple libraries with a trailing slash (/), optionally followed by asterisk wildcard (*). For example, the following DEPENDS clauses are identical:
	
	`DEPENDS '/home/mydir/mylibs/'`
	`DEPENDS '/home/mydir/mylibs/*'`
	
	DEPENDS can specify libraries with multiple directory levels. For details, see Multi-level Library Dependencies.
	
	Important:
	The performance of CREATE LIBRARY is liable to degrade in Eon Mode, in proportion to the number and depth of dependencies specified by the DEPENDS clause.

	If your Java library depends on native libraries (SO files), use DEPENDS to specify the path and call `System.loadLibrary()` in your UDx to load the native libraries from that path.
LANGUAGE '*Language*'	The programming language used to develop the function, where *Language* is one of the following: • C++ (default) • Python • Java • R

Privileges

Superuser

Requirements

- Vertica makes its own copies of the library files. Later modification or deletion of the original files specified in the statement does not affect the library defined in the catalog. To update the library, use ALTER LIBRARY.
- Loading a library does not guarantee that it functions correctly. CREATE LIBRARY performs some basic checks on the library file to verify it is compatible with Vertica. The statement fails if it detects that the library was not correctly compiled or it finds other basic incompatibilities. However, CREATE LIBRARY cannot detect many other issues in shared libraries.

Multi-level Library Dependencies

If a DEPENDS clause specifies a library with multiple directory levels, Vertica follows the library path to include all subdirectories of that library. For example, the following CREATE LIBRARY statement enables UDx library `mylib` to import all Python packages and modules that it finds in subdirectories of `site-packages`:

```
=> CREATE LIBRARY mylib AS '/path/to/python_udx' DEPENDS '/path/to/python/site-packages' LANGUAGE
'Python';
```

Important:
DEPENDS can specify Java library dependencies that are up to 100 levels

deep.

Examples

Load library `MyFunctions` in the home directory of the dbadmin account:

```
=> CREATE LIBRARY MyFunctions AS 'home/dbadmin/my_functions.so';
```

Load library `MyOtherFunctions` located in the directory where you started vsql:

```
=> \set libfile '\''`pwd`'/MyOtherFunctions.so\'';
=> CREATE LIBRARY MyOtherFunctions AS :libfile;
```

Load a Java library named `JavaLib.jar` that depends on multiple support JAR files in the `/home/dbamin/mylibs` subdirectory:

```
=> CREATE LIBRARY DeleteVowelsLib AS '/home/dbadmin/JavaLib.jar'
   DEPENDS '/home/dbadmin/mylibs/*' LANGUAGE 'JAVA';
```

CREATE LOAD BALANCE GROUP

Creates a group of network addresses that can be targeted by a load balancing routing rule. You create a group either using a list of network addresses, or basing it on one or more fault groups or subclusters.

Note:
You cannot add multiple network addresses for one node to the same load balancing group.

Syntax

```
CREATE LOAD BALANCE GROUP group_name WITH {
      ADDRESS address[,...]
    | FAULT GROUP  fault_group[,...] FILTER 'IP_range'
    | SUBCLUSTER subcluster[,...] FILTER 'IP_range'
    }
    [ POLICY 'policy_setting' ]
```

Parameters

group_name	Name of the group to create. You use this name later when defining load balancing rules.
address[,...]	Comma-delimited list of network addresses you created earlier.
fault_group[,...]	Comma-delimited list of fault groups to use as the basis of the load balance group. **Note:** Before you create your load balance group from a fault group, you must create network addresses on the nodes you want in your load balance group. Load balance groups only work with the network addresses you define on nodes, rather than IP addresses. See CREATE NETWORK ADDRESS.
subcluster[,...]	Comma-delimited list of subclusters to use as the basis of the load balance group. **Note:** As with fault groups, you must create network addresses on the nodes in the subcluster you want to be part of the load balance group.
IP_range	Range of IP addresses in CIDR notation to include in the load balance group from the fault groups or subclusters. This range can be either IPv4 or IPv6. Only nodes that have a network address with an IP address that falls within this range are added to the load balancing group.
policy_setting	Determines how the initially-contacted node chooses a target from the group, one of the following: • ROUNDROBIN (default) rotates among the available members of the load balancing group. The initially-contacted node keeps track of which node it chose last time, and chooses the next one in the cluster.

	Note: Each node in the cluster maintains its own round-robin pointer that indicates which node it should pick next for each load-balancing group. Therefore, if clients connect to different initial nodes, they may be redirected to the same node. • RANDOM chooses an available node from the group randomly. • NONE disables load balancing.

Privileges

Superuser

Examples

The following statement demonstrates creating a load balance group that contains several network addresses:

```
=> CREATE NETWORK ADDRESS addr01 ON v_vmart_node0001 WITH '10.20.110.21';
CREATE NETWORK ADDRESS
=> CREATE NETWORK ADDRESS addr02 ON v_vmart_node0002 WITH '10.20.110.22';
CREATE NETWORK ADDRESS
=> CREATE NETWORK ADDRESS addr03 on v_vmart_node0003 WITH '10.20.110.23';
CREATE NETWORK ADDRESS
=> CREATE NETWORK ADDRESS addr04 on v_vmart_node0004 WITH '10.20.110.24';
CREATE NETWORK ADDRESS
=> CREATE LOAD BALANCE GROUP group_1 WITH ADDRESS addr01, addr02;
CREATE LOAD BALANCE GROUP
=> CREATE LOAD BALANCE GROUP group_2 WITH ADDRESS addr03, addr04;
CREATE LOAD BALANCE GROUP

=> SELECT * FROM LOAD_BALANCE_GROUPS;
    name    |   policy   |     filter      |         type          | object_name
------------+------------+-----------------+-----------------------+-------------
 group_1    | ROUNDROBIN |                 | Network Address Group | addr01
 group_1    | ROUNDROBIN |                 | Network Address Group | addr02
 group_2    | ROUNDROBIN |                 | Network Address Group | addr03
 group_2    | ROUNDROBIN |                 | Network Address Group | addr04
(4 rows)
```

This example demonstrates creating a load balancing group using a fault group:

```
=> CREATE FAULT GROUP fault_1;
CREATE FAULT GROUP
=> ALTER FAULT GROUP fault_1 ADD NODE  v_vmart_node0001;
ALTER FAULT GROUP
=> ALTER FAULT GROUP fault_1 ADD NODE  v_vmart_node0002;
ALTER FAULT GROUP
=> ALTER FAULT GROUP fault_1 ADD NODE  v_vmart_node0003;
ALTER FAULT GROUP
=> ALTER FAULT GROUP fault_1 ADD NODE  v_vmart_node0004;
ALTER FAULT GROUP
=> SELECT node_name,node_address,node_address_family,export_address
   FROM v_catalog.nodes;
    node_name     | node_address | node_address_family | export_address
------------------+--------------+---------------------+----------------
 v_vmart_node0001 | 10.20.110.21 | ipv4                | 10.20.110.21
 v_vmart_node0002 | 10.20.110.22 | ipv4                | 10.20.110.22
 v_vmart_node0003 | 10.20.110.23 | ipv4                | 10.20.110.23
 v_vmart_node0004 | 10.20.110.24 | ipv4                | 10.20.110.24
(4 rows)

=> CREATE LOAD BALANCE GROUP group_all WITH FAULT GROUP fault_1 FILTER
   '0.0.0.0/0';
CREATE LOAD BALANCE GROUP

=> CREATE LOAD BALANCE GROUP group_some WITH FAULT GROUP fault_1 FILTER
   '10.20.110.21/30';
CREATE LOAD BALANCE GROUP

=> SELECT * FROM LOAD_BALANCE_GROUPS;
      name      |   policy   |     filter      |         type          | object_name
----------------+------------+-----------------+-----------------------+-------------
 group_all      | ROUNDROBIN | 0.0.0.0/0       | Fault Group           | fault_1
 group_some     | ROUNDROBIN | 10.20.110.21/30 | Fault Group           | fault_1
(2 rows)
```

See Also

CREATE LOCAL TEMPORARY VIEW

Creates or replaces a local temporary view. Views are read only, so they do not support insert, update, delete, or copy operations. Local temporary views are session-scoped, so they are visible only to their creator in the current session. Vertica drops the view when the session ends.

Note:
Vertica does not support global temporary views.

Syntax

```
CREATE [OR REPLACE] LOCAL TEMP[ORARY] VIEW view [ (column[,…] ) ] AS query
```

Parameters

OR REPLACE	Specifies to overwrite the existing view *view-name*. If you omit this option and *view-name* already exists, CREATE VIEW returns an error.
view	Identifies the view to create, where *view* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
column[,…]	A list of names to use as view column names. Vertica maps view column names to query columns according to the order of their respective lists. By default, the view uses column names as they are specified in the query. Each view can contain up to 1600 columns.
AS *query*	A SELECT statement that the temporary view executes. The SELECT statement can reference tables, temporary tables, and other views.

Privileges

See Creating Views

Example

The following CREATE LOCAL TEMPORARY VIEW statement creates the temporary view myview. This view sums all individual incomes of customers listed in the store.store_sales_fact table, and groups results by state:

```
=> CREATE LOCAL TEMP VIEW myview AS
   SELECT SUM(annual_income), customer_state FROM public.customer_dimension
     WHERE customer_key IN (SELECT customer_key FROM store.store_sales_fact)
     GROUP BY customer_state
     ORDER BY customer_state ASC;
```

The following example uses the temporary view `myview` with a `WHERE` clause that limits the results to combined salaries greater than $2 billion:

```
=> SELECT * FROM myview WHERE SUM > 2000000000;

     SUM     | customer_state
-------------+----------------
  2723441590 | AZ
 29253817091 | CA
  4907216137 | CO
  3769455689 | CT
  3330524215 | FL
  4581840709 | IL
  3310667307 | IN
  2793284639 | MA
  5225333668 | MI
  2128169759 | NV
  2806150503 | PA
  2832710696 | TN
 14215397659 | TX
  2642551509 | UT
(14 rows)
```

- Creating Views

CREATE LOCATION

Creates a storage location where Vertica can store data. After you create the location, you create storage policies that assign the storage location to the database objects that will store data in the location.

Caution:
While no technical issue prevents you from using `CREATE LOCATION` to add one or more Network File System (NFS) storage locations, Vertica does not support NFS data or catalog storage except for MapR mount points. You will be unable to run queries against any other NFS data. When creating locations on MapR file systems, you must specify `ALL NODES SHARED`.

If you use HDFS storage locations, the HDFS data must be available when you start Vertica. Your HDFS cluster must be operational, and the ROS files

must be present. If you moved data files, or they are corrupted, or your HDFS cluster is not responsive, Vertica cannot start.

Syntax

```
CREATE LOCATION 'path'
    [NODE 'nodename' | ALL NODES]
    [SHARED]
    [USAGE 'use-type']
    [LABEL 'label']
    [LIMIT 'size']
```

Arguments

path	Specifies where to store this location's data. The type of file system on which the location is based determines the *path* format. See Location Paths below.
ALL NODES NODE '*node-name*'	Specifies the node or nodes on which the storage location is defined, one of the following: • ALL NODES (default): Create the storage location on all nodes. • NODE '*node-name*': Create the storage location on a single node, where *node-name* identifies the node in system table NODES.
SHARED	Indicates the location set by the *path* is shared (used by all nodes) rather than local to each node. For details, see Shared Versus Local Storage. **Note:** If *path* is set to S3 comunal storage, SHARED is always implied and can be omitted.
USAGE '*use-type*'	The type of data the storage location can hold, where *use-type* is one of the following: • DATA,TEMP (default): The storage location can store persistent and temporary DML-generated data, and data for temporary tables. • TEMP: A *path*-specified location to store DML-generated

	temporary data. If *path* is set to S3, then this location is used only when configuration parameter RemoteStorageForTemp is set to 1, and TEMP must be qualified with ALL NODES SHARED. For details, see S3 Storage of Temporary Data. • DATA: The storage location can only store persistent data. • USER: Users with READ and WRITE privileges can access data of this storage location on the local Linux file system, on S3 communal storage, and external tables. • DEPOT: The storage location is used in **Eon Mode** to store the depot. Only create DEPOT storage locations on local Linux filesystems. **Note:** Vertica allows a single DEPOT storage location per node. If you want to move your depot to different location (on a different file system, for example) you must first drop the old depot storage location, then create the new location.
LABEL '*label*'	A label for the storage location, used when assigning the storage location to data objects. You use this name later when assigning the storage location to data objects. **Important:** You must supply a label for depot storage locations.
LIMIT '*size*'	Valid only if the storage location usage type is set to DEPOT, specifies the maximum amount of disk space that the depot can allocate from the storage location's file system. You can specify *size* in two ways: • *integer*%: Percentage of storage location disk size. • *integer*{K|M|G|T}: Amount of storage location disk size in kilobytes, megabytes, gigabytes, or terabytes. **Important:** However you specify this value, the depot size cannot be more than 80 percent of disk space of the file system where the depot is stored. If you specify a value

	that is too large, Vertica warns you of this limitation and automatically changes the value to 80% of the size of the file system. If you omit this parameter, it is set to 60 percent.

Privileges

Superuser

File System Permissions

The Vertica process must have read and write permissions to the location where data is be stored. Each file system has its own requirements:

File system	Requirements
Linux	**Database superuser** account (usually named dbadmin) must have full read and write access to the directory in the *path* argument.
HDFS without Kerberos	Hadoop user whose username matches the Vertica database administrator username (usually dbadmin). This Hadoop user must have read and write access to the HDFS directory specified in the *path* argument
HDFS with Kerberos	Hadoop user whose username matches the principal in the keytab file on each Vertica node. This is not the same as the database administrator username. This Hadoop user must have read and write access to the HDFS directory stored in the path argument

Location Paths

Location path formats vary, depending on the storage location's file system:

File system	Path
Linux	Absolute path to the directory where Vertica can write the storage location's data.
HDFS	URL in the `hdfs` scheme. To use HDFS URLs, you must give Vertica

File system	Path
	access to some HDFS configuration files. For details, see Using HDFS URLs and Configuring the hdfs Scheme.
S3	URLs with the following form: `s3://bucket/path`
Google Cloud storage	URLs with the following form: `gs://bucket/path`

Examples

Create a storage location in the local Linux file system for temporary data storage.

```
=> CREATE LOCATION '/home/dbadmin/testloc' USAGE 'TEMP' LABEL 'tempfiles';
```

Create a storage location on HDFS in the `/user/dbadmin` directory. The HDFS cluster does not use Kerberos.

```
=> CREATE LOCATION 'hdfs://hadoopNS/vertica/colddata' ALL NODES SHARED
   USAGE 'data' LABEL 'coldstorage';
```

Create the same storage location, but on a Hadoop cluster that uses Kerberos. Note the output that reports the principal being used.

```
=> CREATE LOCATION 'hdfs://hadoopNS/vertica/colddata' ALL NODES SHARED
                   USAGE 'data' LABEL 'coldstorage';
NOTICE 0: Performing HDFS operations using kerberos principal [vertica/hadoop.example.com]
CREATE LOCATION
```

Create a location for user data, grant access to it, and use it to create an external table.

```
=> CREATE LOCATION '/tmp' ALL NODES USAGE 'user';
CREATE LOCATION
=> GRANT ALL ON LOCATION '/tmp' to Bob;
GRANT PRIVILEGE
=> CREATE EXTERNAL TABLE ext1 (x integer) AS COPY FROM '/tmp/data/ext1.dat' DELIMITER ',';
CREATE TABLE
```

- SET_OBJECT_STORAGE_POLICY

CREATE NETWORK ADDRESS

Creates a network address that can be used as part of a connection load balancing policy. A network address creates a name in the Vertica catalog for an IP address and port number associated with a node. Nodes can have multiple network addresses, up to one for each IP address they have on the network.

Syntax

```
CREATE NETWORK ADDRESS name ON node WITH 'ip_address' [PORT port_number] [ENABLED | DISABLED]
```

Parameters

name	A name to give to the network address. You can use this name when creating connection load balancing groups.
node	The name of the node on which to create the network address. This should be name of the node as it appears in the node_name column of system table NODES.
ip_address	The IP address on the node to be associated with the network address. This can be an IPv4 or and IPv6 address. **Note:** Vertica does not verify that the IP address you supply in this parameter is actually associated with the node. Be sure that the IP address actually belongs to the node. If you do not, your load balancing policy could send a client connection to the wrong node, or even a non-Vertica host. Vertica does reject IP address that are invalid for a node. For example, it checks whether the IP address falls in the loopback address range of 127.0.0.0/8. If it finds that the IP address is invalid,

	CREATE NETWORK ADDRESS returns an error.
PORT *port_number*	Sets the port number for the network address. You must supply a network address when altering the port number.
[ENABLE | DISABLE]	Enables or disables the network address.

Privileges

Superuser

Examples

The following example creates three network addresses, one for each node in a three-node cluster:

```
=> SELECT node_name,export_address from v_catalog.nodes;
      node_name      | export_address
---------------------+----------------
 v_vmart_br_node0001 | 10.20.100.62
 v_vmart_br_node0002 | 10.20.100.63
 v_vmart_br_node0003 | 10.20.100.64
(3 rows)

=> CREATE NETWORK ADDRESS node01 ON v_vmart_br_node0001 WITH '10.20.100.62';
CREATE NETWORK ADDRESS
=> CREATE NETWORK ADDRESS node02 ON v_vmart_br_node0002 WITH '10.20.100.63';
CREATE NETWORK ADDRESS
=> CREATE NETWORK ADDRESS node03 ON v_vmart_br_node0003 WITH '10.20.100.64';
```

See Also

CREATE NETWORK INTERFACE

Identifies a network interface to which a node belongs.

Deprecated:
This statement has been deprecated. Instead, use `CREATE NETWORK ADDRESS`.

Use this statement when you want to configure import/export operations from individual nodes to other Vertica clusters. By default, when you install Vertica, it creates interfaces for all connected networks. You would only need CREATE NETWORK INTERFACE in situations where the network topology has changed since you installed Vertica.

Syntax

```
CREATE NETWORK INTERFACE network-interface-name ON node-name [WITH] 'node-IP-address' [PORT port_number]
[ENABLED | DISABLED]
```

network-interface-name	The name you assign to the network interface, where *network-interface-name* conforms to conventions described in Identifiers.
node-name	The name of the node.
node-IP-address	The node's IP address, either a public or private IP address. For more information, see Using Public and Private IP Networks.
PORT *port_number*	Sets the port number for the network interface. You must supply a network interface when altering the port number.
[ENABLE | DISABLE]	Enables or disables the network interface.

Privileges

Superuser

Examples

Create a network interface:

```
=> CREATE NETWORK INTERFACE mynetwork ON v_vmart_node0001 WITH '123.4.5.6' PORT 456 ENABLED;
```

CREATE NOTIFIER

Creates a push-based notifier to send event notifications and messages out of Vertica.

Syntax

```
CREATE NOTIFIER [ IF NOT EXISTS ] notifier-name ACTION action-url
   [ ENABLE | DISABLE ]
   [ MAXPAYLOAD max-payload-size ]
   MAXMEMORYSIZE max-memory-size
   [ IDENTIFIED BY uuid ]
   [ [NO] CHECK COMMITTED ]
   [ PARAMETERS 'adapter-params' ]
```

Parameters

IF NOT EXISTS	Specifies to generate an informational message if an object already exists under the specified name. If you omit this option and the object exists, Vertica generates a ROLLBACK error message. In both cases, the object is not created. The IF NOT EXISTS clause is useful for SQL scripts where you want to create an object if it does not already exist, and reuse the existing object if it does. For related information, see ON_ERROR_STOP.
notifier-name	This notifier's unique identifier.
ACTION *action-url*	Identifies the target Kafka server, where *action-url* has the following format: kafka://*kafka-server-ip-address*:*port-number* For example: kafka://127.0.0.1:9092
ENABLE|DISABLE	Specifies whether to enable or disable the notifier. If you omit this parameter, Vertica sets this notifier to ENABLE.
MAXPAYLOAD	The maximum size of the message, up to 10^9 bytes, specified in kilobytes or megabytes as follows: MAXPAYLOAD *integer*{K|M} The default setting is adapter-specific—for example, 1 M for Kafka.
MAXMEMORYSIZE	The maximum size of the internal notifier, up to 2 TB, specified in kilobytes, megabytes, gigabytes, or terabytes as follows:

	MAXMEMORYSIZE *integer*{K|M|G|T} If the queue exceeds this size, the notifier drops excess messages.
IDENTIFIED BY *uuid*	Specifies the notifier's unique identifier. If set, all the messages published by this notifier have this attribute.
[NO] CHECK COMMITTED	Specifies to wait for delivery confirmation before sending the next message in the queue. Not all messaging systems support delivery confirmation.
PARAMETERS '*adapter-params*'	Specifies one or more optional adapter parameters that are passed as a string to the adapter. Adapter parameters apply only to the adapter associated with the notifier. For Kafka notifiers, refer to Kafka and Vertica Configuration Settings.

Privileges

Database Superuser

Examples

Create a Kafka notifier:

```
=> CREATE NOTIFIER my_dc_notifier
       ACTION 'kafka://172.16.20.10:9092'
       MAXMEMORYSIZE '1G'
       IDENTIFIED BY 'f8b0278a-3282-4e1a-9c86-e0f3f042a971'
       NO CHECK COMMITTED;
```

Create a notifier with an adapter-specific parameter:

```
=> CREATE NOTIFIER my_notifier
       ACTION 'kafka://127.0.0.1:9092'
       MAXMEMORYSIZE '10M'
       PARAMETERS 'queue.buffering.max.ms=1000';
```

See Also

- ALTER NOTIFIER
- DROP NOTIFIER

- Monitoring Vertica Using Notifiers in the Administrator's Guide.

CREATE PROCEDURE

Important:
Currently, external procedures are only available in **Enterprise Mode**. **Eon Mode** does not support external procedures.

Adds an external procedure to Vertica. See Implementing External Procedures in Extending Vertica for more information about external procedures.

Syntax

```
CREATE PROCEDURE [[database.]schema.]procedure( [ argument-list] )
    AS 'executable'
    LANGUAGE 'language'
    USER 'OS-user'
```

Parameters

[*database* .]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
procedure	Specifies a name for the external procedure, where *procedure-name* conforms to conventions described in Identifiers.
argument-list	A comma-delimited list of procedure arguments, where each argument is specified as follows: `[ argname ] argtype` • *argname* optionally provides a descriptive name for this argument. • *argtype* must be one of the following data types supported by Vertica: BIGINT, BOOLEAN, DECIMAL, DOUBLE PRECISION, FLOAT, FLOAT8, INT, INT8, INTEGER, MONEY, NUMBER, NUMERIC, REAL,

	SMALLINT, TINYINT, VARCHAR. If the procedure is defined with no arguments, supply an empty argument list.
executable	The name of the executable program in the procedures directory.
language	Specifies the procedure language, set to EXTERNAL.
USER	The owner of the file. The external program must allow execute privileges for this user. The user cannot be root.

Privileges

Superuser

System Security

- A procedure file must be owned by the database administrator (OS account) or by a user in the same group as the administrator. (The procedure file owner cannot be root.) The procedure file must also have the set UID attribute enabled, and allow read and execute permission for the group.
- External procedures that you create with CREATE PROCEDURE are always run with Linux dbadmin privileges. If a dbadmin or pseudosuperuser grants a non-dbadmin permission to run a procedure using GRANT (Procedure), be aware that the non-dbadmin user runs the procedure with full Linux dbadmin privileges.

Examples

The following example shows how to create procedure `helloplanet` for external procedure file `helloplanet.sh`. This file accepts one varchar argument.

Create the file:

```
#!/bin/bash
echo "hello planet argument: $1" >> /tmp/myprocedure.log
```

Create the procedure with the following SQL:

```
=> CREATE PROCEDURE helloplanet(arg1 varchar) AS 'helloplanet.sh' LANGUAGE 'external' USER 'dbadmin';
```

See Also

- DROP PROCEDURE
- Installing External Procedure Executable Files

CREATE PROFILE

Creates a profile that controls password requirements for users.

Syntax

```
CREATE PROFILE profile-name LIMIT [ password-parameter setting ]…
```

password-parameter

```
PASSWORD_LIFE_TIME
PASSWORD_GRACE_TIME
FAILED_LOGIN_ATTEMPTS
PASSWORD_LOCK_TIME
PASSWORD_REUSE_MAX
PASSWORD_REUSE_TIME
PASSWORD_MAX_LENGTH
PASSWORD_MIN_LENGTH
PASSWORD_MIN_LETTERS
PASSWORD_MIN_UPPERCASE_LETTERS
PASSWORD_MIN_LOWERCASE_LETTERS
PASSWORD_MIN_DIGITS
PASSWORD_MIN_SYMBOLS
```

Parameters

Note:
All parameters that are not explicitly set in a new profile are set to `default`, and inherit their settings from the default profile.

Name	Description
profile-name	The name of the profile to create, where *name* conforms to conventions described in Identifiers.
PASSWORD_	Set to an integer value, one of the following:

Name	Description
LIFE_TIME	• ≥ 1: The number of days a password remains valid. • UNLIMITED: Password remains valid indefinitely. After your password's lifetime and grace period expire, you must change your password on your next login, if you have not done so already.
PASSWORD_ GRACE_TIME	Set to an integer value, one of the following: • ≥ 1: The number of days a password can be used after it expires. • UNLIMITED: No grace period.
FAILED_LOGIN_ ATTEMPTS	Set to an integer value, one of the following: • ≥ 1: The number of consecutive failed login attempts Vertica allows before locking your account. • UNLIMITED: Vertica allows an unlimited number of failed login attempts.
PASSWORD_ LOCK_TIME	Set to an integer value, one of the following: • ≥ 1: The number of days your account is locked after too many failed login attempts. The account is automatically unlocked when the lock time elapses. • UNLIMITED: Account remains indefinitely inaccessible until a superuser manually unlocks it.
PASSWORD_ REUSE_MAX	Set to an integer value, one of the following: • ≥ 1: The number of times you must change your password before you can reuse an earlier password. • UNLIMITED: You can reuse an earlier password without any intervening changes.
PASSWORD_ REUSE_TIME	Set to an integer value, one of the following: • ≥ 1: The number of days that must pass after a password is set before you can reuse it. • UNLIMITED: You can reuse an earlier password immediately.
PASSWORD_MAX_ LENGTH	The maximum number of characters allowed in a password, one of the following:

Name	Description
	• Integer between 8 and 100, inclusive • UNLIMITED: Maximum of 100 characters
PASSWORD_MIN_LENGTH	The minimum number of characters required in a password, one of the following: • 0 to PASSWORD_MAX_LENGTH • UNLIMITED: Minimum of PASSWORD_MAX_LENGTH
PASSWORD_MIN_LETTERS	Minimum number of letters (a-z and A-Z) that must be in a password, one of the following: • Integer between 0 and PASSWORD_MAX_LENGTH, inclusive • UNLIMITED: 0 (no minimum)
PASSWORD_MIN_UPPERCASE_LETTERS	Minimum number of uppercase letters (A-Z) that must be in a password, one of the following: • Integer between 0 and PASSWORD_MAX_LENGTH, inclusive • UNLIMITED: 0 (no minimum)
PASSWORD_MIN_LOWERCASE_LETTERS	Minimum number of lowercase letters (a-z) that must be in a password, one of the following: • Integer between 0 and PASSWORD_MAX_LENGTH, inclusive • UNLIMITED: 0 (no minimum)
PASSWORD_MIN_DIGITS	Minimum number of digits (0-9) that must be in a password, one of the following: • Integer between 0 and PASSWORD_MAX_LENGTH, inclusive • UNLIMITED: 0 (no minimum)
PASSWORD_MIN_SYMBOLS	Minimum number of symbols—printable non-letter and non-digit characters such as $, #, @—that must be in a password, one of the following: • Integer between 0 and PASSWORD_MAX_LENGTH, inclusive • UNLIMITED: 0 (no minimum)

Privileges

Superuser

Profile Settings and Client Authentication

The following profile settings affect client authentication methods, such as LDAP or GSS:

- FAILED_LOGIN_ATTEMPTS
- PASSWORD_LOCK_TIME

All other profile settings are used only by Vertica to manage its passwords.

Example

```
=> CREATE PROFILE sample_profile LIMIT PASSWORD_MAX_LENGTH 20;
```

See Also

- ALTER PROFILE
- DROP PROFILE
- Creating a Database Name and Password
- Profiles

CREATE PROJECTION

Creates metadata for a **projection** in the Vertica catalog.

> **Note:**
> For detailed information about using CREATE PROJECTION to create live aggregate projections and Top-K projections, see CREATE PROJECTION (Live Aggregate Projections). To create live aggregate projections that support user-defined transform functions, see CREATE PROJECTION (UDTFs).

Syntax

```
CREATE PROJECTION [ IF NOT EXISTS ] [[database.]schema.]projection
[ (
     { projection-col | grouped-clause
          [ ENCODING encoding-type ]
          [ ACCESSRANK integer ]
        }[,…]
   ) ]
AS SELECT
   select-list FROM [[database.]schema.]table [ [AS] alias]
   [ ORDER BY column-expr[,…] ]
   [ segmentation-spec ]
   [ KSAFE [ k-num ] ]
```

Parameters

IF NOT EXISTS	Specifies to generate an informational message if an object already exists under the specified name. If you omit this option and the object exists, Vertica generates a ROLLBACK error message. In both cases, the object is not created. The IF NOT EXISTS clause is useful for SQL scripts where you want to create an object if it does not already exist, and reuse the existing object if it does. For related information, see ON_ERROR_STOP.
[*database.*]*schema*	Specifies the schema for this projection and its anchor table, where *schema* must be the same for both. If you specify a database, it must be the current database.
projection	Identifies the projection to create, where *projection* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema. If the projection is segmented, Vertica uses this string as the projection base name when it creates unique identifiers for buddy projections. For more information, see Projection Naming in the Administrator's Guide.
projection-col	The name of a projection column. The list of projection columns must match the *select-list* columns and

	expressions in number, type, and sequence. If projection column names are omitted, Vertica uses the anchor table column names specified in *select-list*.
grouped-clause	See GROUPED Clause.
ENCODING *encoding-type*	Specifies the column encoding type, by default set to AUTO.
ACCESSRANK *integer*	Overrides the default access rank for a column. Use this parameter to increase or decrease the speed at which Vertica accesses a column. For more information, see Overriding Default Column Ranking.

select-list	Specifies the columns or column expressions to select from the specified table, one of the following:
	
	• * (asterisk)
	Lists all columns in the queried tables.
	
	• *expression* [[AS] *output-name*] }[,…]
	A table column or column expression to select from the queried tables. You can optionally qualify *expression* with an output name, which can be used in two ways:
	
	  • Label the column for display.
	  • Refer to the column in the projection's ORDER BY clause.

FROM *table* [[AS] ALIAS]	Specifies the projection's anchor table, optionally qualified by an alias.
ORDER BY	Specifies columns from the SELECT list on which to sort the projection. The ORDER BY Clause cannot include qualifiers ASC or DESC. Vertica always stores projection data in ascending sort order. If you order by a column with a collection data type (ARRAY or SET), queries that use that column in an ORDER BY clause perform the sort again. This is because projections and queries perform the ordering differently. If you omit the ORDER BY clause, Vertica uses *select-list* to sort the projection.

segmentation-spec	Specifies how to distribute projection data with one of the following clauses:
	• *hash-segmentation-clause*: Specifies to segment projection data evenly and distribute across cluster nodes:
	`SEGMENTED BY expression ALL NODES [ OFFSET offset ]`
	• *unsegmented-clause*: Specifies to create an unsegmented projection:
	`UNSEGMENTED ALL NODES`
	If the anchor table and projection both omit specifying segmentation, the projection is defined with a hash segmentation clause that includes all columns in the SELECT list , as follows:
	`SEGMENTED BY HASH(column-expr[,…]) ALL NODES OFFSET 0;`
	Tip: Vertica recommends segmenting large tables.

KSAFE [*k-num*]	Specifies K-safety for the projection, where *k-num* must be equal to or greater than system K-safety. Vertica ignores this parameter if set for unsegmented projections. If you omit *k-num*, Vertica uses system K-safety. For general information, see K-Safety in an Enterprise Mode Database in Vertica Concepts.

Privileges

Superuser, or the following:

- Anchor table owner
- CREATE privilege on the schema

Requirements

- To prevent data loss and inconsistencies, tables must have at least one **superprojection**. You cannot drop a projection if that projection is the table's only superprojection.

- You cannot drop a buddy projection if dropping that projection violates system **K-safety**.

See Also

Working with Projections

Encoding Types

Vertica supports various encoding and compression types, specified by the following `ENCODING` parameter arguments:

- AUTO (default)
- BLOCK_DICT
- BLOCKDICT_COMP
- BZIP_COMP
- COMMONDELTA_COMP
- DELTARANGE_COMP
- DELTAVAL
- GCDDELTA
- GZIP_COMP
- RLE
- Zstandard Compression

Note:
Vertica supports the following encoding for numeric data types:

- Precision ≤ 18: `AUTO`, `BLOCK_DICT`, `BLOCKDICT_COMP`, `COMMONDELTA_COMP`, `DELTAVAL`, `GCDDELTA`, and `RLE`
- Precision > 18: `AUTO`, `BLOCK_DICT`, `BLOCKDICT_COMP`, `RLE`

You can set encoding types on a projection column when you create the projection. You can also change the encoding of one or more projection columns for a given table with ALTER TABLE...ALTER COLUMN.

AUTO (default)

AUTO encoding is ideal for sorted, many-valued columns such as primary keys. It is also suitable for general purpose applications for which no other encoding or compression

scheme is applicable. Therefore, it serves as the default if no encoding/compression is specified.

Column data type	Default encoding type
BINARY/VARBINARY BOOLEAN CHAR/VARCHAR FLOAT	Lempel-Ziv-Oberhumer-based (LZO) compression
DATE/TIME/TIMESTAMP INTEGER INTERVAL	Compression scheme based on the delta between consecutive column values.

The CPU requirements for this type are relatively small. In the worst case, data might expand by eight percent (8%) for LZO and twenty percent (20%) for integer data.

BLOCK_DICT

For each block of storage, Vertica compiles distinct column values into a dictionary and then stores the dictionary and a list of indexes to represent the data block.

BLOCK_DICT is ideal for few-valued, unsorted columnswhere saving space is more important than encoding speed. Certain kinds of data, such as stock prices, are typically few-valued within a localized area after the data is sorted, such as by stock symbol and timestamp, and are good candidates for BLOCK_DICT. By contrast, long CHAR/VARCHAR columns are not good candidates for BLOCK_DICT encoding.

CHAR and VARCHAR columns that contain 0x00 or 0xFF characters should not be encoded with BLOCK_DICT. Also, BINARY/VARBINARY columns do not support BLOCK_DICT encoding.

BLOCK_DICT encoding requires significantly higher CPU usage than default encoding schemes. The maximum data expansion is eight percent (8%).

BLOCKDICT_COMP

This encoding type is similar to BLOCK_DICT except dictionary indexes are entropy coded. This encoding type requires significantly more CPU time to encode and decode and has a poorer worst-case performance. However, if the distribution of values is extremely skewed, using `BLOCK_DICT_COMP` encoding can lead to space savings.

BZIP_COMP

BZIP_COMP encoding uses the bzip2 compression algorithm on the block contents. See bzip web site for more information. This algorithm results in higher compression than the automatic LZO and gzip encoding; however, it requires more CPU time to compress. This algorithm is best used on large string columns such as VARCHAR, VARBINARY, CHAR, and BINARY. Choose this encoding type when you are willing to trade slower load speeds for higher data compression.

COMMONDELTA_COMP

This compression scheme builds a dictionary of all deltas in the block and then stores indexes into the delta dictionary using entropy coding.

This scheme is ideal for sorted FLOAT and INTEGER-based (DATE/TIME/TIMESTAMP/INTERVAL) data columns with predictable sequences and only occasional sequence breaks, such as timestamps recorded at periodic intervals or primary keys. For example, the following sequence compresses well: 300, 600, 900, 1200, 1500, 600, 1200, 1800, 2400. The following sequence does not compress well: 1, 3, 6, 10, 15, 21, 28, 36, 45, 55.

If delta distribution is excellent, columns can be stored in less than one bit per row. However, this scheme is very CPU intensive. If you use this scheme on data with arbitrary deltas, it can cause significant data expansion.

DELTARANGE_COMP

This compression scheme is primarily used for floating-point data; it stores each value as a delta from the previous one.

This scheme is ideal for many-valued FLOAT columns that are sorted or confined to a range. Do not use this scheme for unsorted columns that contain NULL values, as the storage cost for representing a NULL value is high. This scheme has a high cost for both compression and decompression.

To determine if DELTARANGE_COMP is suitable for a particular set of data, compare it to other schemes. Be sure to use the same sort order as the projection, and select sample data that will be stored consecutively in the database.

DELTAVAL

For INTEGER and DATE/TIME/TIMESTAMP/INTERVAL columns, data is recorded as a difference from the smallest value in the data block. This encoding has no effect on other data types.

DELTAVAL is best used for many-valued, unsorted integer or integer-based columns. CPU requirements for this encoding type are minimal, and data never expands.

GCDDELTA

For INTEGER and DATE/TIME/TIMESTAMP/INTERVAL columns, and NUMERIC columns with 18 or fewer digits, data is recorded as the difference from the smallest value in the data block divided by the greatest common divisor (GCD) of all entries in the block. This encoding has no effect on other data types.

ENCODING GCDDELTA is best used for many-valued, unsorted, integer columns or integer-based columns, when the values are a multiple of a common factor. For example, timestamps are stored internally in microseconds, so data that is only precise to the millisecond are all multiples of 1000. The CPU requirements for decoding GCDDELTA encoding are minimal, and the data never expands, but GCDDELTA may take more encoding time than DELTAVAL.

GZIP_COMP

This encoding type uses the gzip compression algorithm. See gzip web site for more information. This algorithm results in better compression than the automatic LZO compression, but lower compression than BZIP_COMP. It requires more CPU time to compress than LZO but less CPU time than BZIP_COMP. This algorithm is best used on large string columns such as VARCHAR, VARBINARY, CHAR, and BINARY. Use this encoding when you want a better compression than LZO, but at less CPU time than bzip2.

RLE

RLE (run length encoding) replaces sequences (runs) of identical values with a single pair that contains the value and number of occurrences. Therefore, it is best used for low

cardinality columns that are present in the ORDER BY clause of a projection.

The Vertica execution engine processes RLE encoding run-by-run and the Vertica optimizer gives it preference. Use it only when run length is large, such as when low-cardinality columns are sorted.

Zstandard Compression

Vertica supports three ZSTD compression types:

- `ZSTD_COMP` provides high compression ratios. This encoding type has a higher compression than gzip. Use this when you want a better compression than gzip. For general use cases, use this or the `ZSTD_FAST_COMP` encoding type.
- `ZSTD_FAST_COMP` uses the fastest compression level that the zstd library provides. It is the fastest encoding type of the zstd library, but takes up more space than the other two encoding types. For general use cases, use this or the `ZSTD_COMP` encoding type.
- `ZSTD_HIGH_COMP` offers the best compression in the zstd library. It is slower than the other two encoding types. Use this type when you need the best compression, with slower CPU time.

GROUPED Clause

Enterprise Mode only

Groups two or more columns into a single disk file. This minimizes file I/O for work loads that:

- Read a large percentage of the columns in a table.
- Perform single row look-ups.
- Query against many small columns.
- Frequently update data in these columns.

If you have data that is always accessed together and it is not used in predicates, you can increase query performance by grouping these columns. Once grouped, queries can no longer independently retrieve from disk all records for an individual column independent of the other columns within the group.

Note:
RLE encoding is reduced when an RLE column is grouped with one or more

non-RLE columns.

When grouping columns you can:

- Group some of the columns:

  ```
  (a, GROUPED(b, c), d)
  ```

- Group all of the columns:

  ```
  (GROUPED(a, b, c, d))
  ```

- Create multiple groupings in the same projection:

  ```
  (GROUPED(a, b), GROUPED(c, d))
  ```

Note:
Vertica performs dynamic column grouping. For example, to provide better read and write efficiency for small loads, Vertica ignores any projection-defined column grouping (or lack thereof) and groups all columns together by default.

Grouping Correlated Columns

The following example shows how to group highly correlated columns `bid` and `ask`. The `stock` column is stored separately.

```
=> CREATE TABLE trades (stock CHAR(5), bid INT, ask INT);
=> CREATE PROJECTION tradeproj (stock ENCODING RLE,
   GROUPED(bid ENCODING DELTAVAL, ask))
   AS (SELECT * FROM trades) KSAFE 1;
```

The following example show how to create a projection that uses expressions in the column definition. The projection contains two integer columns `a` and `b`, and a third column `product_value` that stores the product of `a` and `b`:

```
=> CREATE TABLE values (a INT, b INT
=> CREATE PROJECTION product (a, b, product_value) AS
   SELECT a, b, a*b FROM values ORDER BY a KSAFE;
```

Hash Segmentation Clause

Specifies how to segment projection data for distribution across all cluster nodes. You can specify segmentation for a table and a projection. If a table definition specifies

segmentation, Vertica uses it for that table's auto-projections.

It is strongly recommended that you use Vertica's built-in HASH function, which distributes data evenly across the cluster, and facilitates optimal query execution.

Syntax

```
SEGMENTED BY expression ALL NODES [ OFFSET offset ]
```

Parameters

SEGMENTED BY *expression*	A general SQL expression. Hash segmentation is the preferred method of segmentation. Vertica recommends using its built-in HASH function, whose arguments resolve to table columns. If you use an expression other than HASH, Vertica issues a warning. The segmentation expression should specify columns with a large number of unique data values and acceptable skew in their data distribution. In general, primary key columns that meet these criteria are good candidates for hash segmentation. For details, see Expression Requirements below.
ALL NODES	Automatically distributes data evenly across all nodes when the projection is created. Node ordering is fixed.
OFFSET *offset*	A zero-based offset that indicates on which node to start segmentation distribution. This option is not valid for CREATE TABLE and CREATE TEMPORARY TABLE. **Important:** If you create a projection for a table with the OFFSET option, be sure to create enough copies of each projection segment to satisfy system K-safety; otherwise, Vertica regards the projection as unsafe and cannot use it to query the table.

	You can ensure K-safety compliance when you create projections by combining `OFFSET` and `KSAFE` options in the `CREATE PROJECTION` statement. On executing this statement, Vertica automatically creates the necessary number of projection copies.

Expression Requirements

A segmentation expression must specify table columns as they are defined in the source table. Projection column names are not supported.

The following restrictions apply to segmentation expressions:

- All leaf expressions must be constants or column references to a column in the `CREATE PROJECTION` 's `SELECT` list.
- The expression must return the same value over the life of the database.
- Aggregate functions are not allowed.
- The expression must return non-negative `INTEGER` values in the range `0 <= x < 2`^{63}, and values are generally distributed uniformly over that range.

> **Note:**
> If the expression produces a value outside the expected range—for example, a negative value—no error occurs, and the row is added to the projection's first segment.

Examples

The following `CREATE PROJECTION` statement creates projection `public.employee_dimension_super`. It specifies to include all columns in table `public.employee_dimension`. The hash segmentation clause invokes the Vertica `HASH` function to segment projection data on the column `employee_key`; it also includes the `ALL NODES` clause, which specifies to distribute projection data evenly across all nodes in the cluster:

```
=> CREATE PROJECTION public.employee_dimension_super
    AS SELECT * FROM public.employee_dimension
    ORDER BY employee_key
    SEGMENTED BY hash(employee_key) ALL NODES;
```

Unsegmented Clause

Specifies to distribute identical copies of table or projection data on all nodes across the cluster. Use this clause to facilitate distributed query execution on tables and projections that are too small to benefit from segmentation.

Vertica uses the same name to identify all instances of an unsegmented projection. For more information about projection name conventions, see Projection Naming.

Syntax

```
UNSEGMENTED ALL NODES
```

Example

This example creates an unsegmented projection for table `store.store_dimension`:

```
=> CREATE PROJECTION store.store_dimension_proj (storekey, name, city, state)
             AS SELECT store_key, store_name, store_city, store_state
             FROM store.store_dimension
             UNSEGMENTED ALL NODES;
CREATE PROJECTION

=>  SELECT anchor_table_name anchor_table, projection_name, node_name
      FROM PROJECTIONS WHERE projection_basename='store_dimension_proj';
  anchor_table   |   projection_name    |    node_name
-----------------+----------------------+-----------------
 store_dimension | store_dimension_proj | v_vmart_node0001
 store_dimension | store_dimension_proj | v_vmart_node0002
 store_dimension | store_dimension_proj | v_vmart_node0003
(3 rows)
```

CREATE PROJECTION (Live Aggregate Projections)

Creates metadata for live aggregate projections in the Vertica catalog. Top-K projections are a type of live aggregate projection.

Information here focuses on creating live aggregate projections. For details about creating other types of projections, including projections with expressions, see CREATE PROJECTION.

Syntax

Grouping aggregate function results

```
CREATE PROJECTION [ IF NOT EXISTS ] [[database.]schema.]projection
...[ (
........{ projection-col | grouped-clause
......... [ ENCODING encoding-type ]
......... [ ACCESSRANK integer ]
........} [,…]
...) ]
AS SELECT {table-col | expr-with-table-cols }[,…] FROM [[database.]schema.]table [ [AS] alias]
... GROUP BY column-expr
... [ KSAFE [ k-num ] ]
```

Top-K aggregation

```
CREATE PROJECTION [ IF NOT EXISTS ] projection-name
...[ (
........{ projection-col | grouped-clause
......... [ ENCODING encoding-type ]
......... [ ACCESSRANK integer ]
........} [,…]
.....)
...]
AS SELECT {table-col | expr-with-table-cols } [,…] FROM [[database.]schema.]table [ [AS] alias]
... LIMIT num-rows OVER (PARTITION BY column-expr ORDER BY column-expr)
... [ KSAFE [ k-num ] ]
```

Parameters

`IF NOT EXISTS`	Specifies to generate an informational message if an object already exists under the specified name. If you omit this option and the object exists, Vertica generates a `ROLLBACK` error message. In both cases, the object is not created. The `IF NOT EXISTS` clause is useful for SQL scripts where you want to create an object if it does not already exist, and reuse the existing object if it does. For related information, see `ON_ERROR_STOP`.
[*database.*]*schema*	Specifies the schema for this projection and its anchor table, where *schema* must be the same for both. If you

	specify a database, it must be the current database.
projection	Identifies the projection to create, where *projection* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
projection-col	The name of a projection column. If you do not specify projection column names, Vertica uses the anchor table column names in the SELECT statement.
grouped-clause	See GROUPED Clause.
ENCODING *encoding-type*	Specifies the column encoding type, by default set to AUTO.
ACCESSRANK *integer*	Overrides the default access rank for a column. Use this parameter to increase or decrease the speed at which Vertica accesses a column. For more information, see Overriding Default Column Ranking.
table-col *expr-with-table-cols*	A table column or expression of table columns to be included in the projection. If you specify projection column names, the two lists of projection columns and table columns/expressions must exactly match in number and order.
FROM *table* [[AS] ALIAS]	Specifies the projection's anchor table, optionally qualified by an alias.
GROUP BY *column-expr* [,…]	One or more column expressions from the SELECT list. The first *column-expr* must be the first column expression in the SELECT list, the second *column-expr* must be the second column expression in the SELECT list, and so on.
LIMIT *num-rows*	The number of rows to return from the specified partition.
OVER (PARTITION BY *column-expr* [,…]	Specifies window partitioning by one or more column expressions from the SELECT list. The first *column-expr*

	is the first column expression in the SELECT list, the second *column-expr* is the second column expression in the SELECT list, and so on.
ORDER BY *column-expr* [,…] [ASC | DESC]	The order in which the top *k* rows are returned, by default in ascending (ASC) order. All column expressions must be from the SELECT list, where the first *column-expr* must be the first column expression in the SELECT list to follow the last PARTITION BY column expression. Top-K projections support ORDER BY NULLS FIRST/LAST.
KSAFE [*k-num*]	Specifies K-safety for the projection, where *k-num* must be equal to or greater than system K-safety. Vertica ignores this parameter if set for unsegmented projections. If you omit *k-num*, Vertica uses system K-safety. For general information, see K-Safety in an Enterprise Mode Database in Vertica Concepts.

Privileges

Superuser, or the following:

- Anchor table owner
- CREATE privilege on the schema

Requirements and Restrictions

Vertica does not regard live aggregate projections as **superprojections**, even those that include all table columns.

For other requirements and restrictions, see:

- Creating Live Aggregate Projections
- Creating Top-K Projections

Examples

See:

- Live Aggregate Projection Example
- Top-K Projection Examples

CREATE PROJECTION (UDTFs)

Creates metadata in the Vertica catalog for projections that invoke user-defined transform functions (UDTFs).

> **Important:**
> Currently, live aggregate projections can only reference UDTFs that are developed in C++.

Syntax

```
CREATE PROJECTION [ IF NOT EXISTS ] [[database.]schema.]projection
...[ (
........{ projection-column | grouped-clause
......... [ ENCODING encoding-type ]
......... [ ACCESSRANK integer ]
........} [,…]
...) ]
AS {
      batch-query FROM { prepass-query sq-results | table [ [AS] ALIAS] }
      | prepass-query
   }
```

batch-query

```
SELECT { table-column | expr-with-table-columns }[,…], batch-udtf(batch-args)
   OVER (PARTITION BATCH BY partition-column-expr[,…] )
   [ AS (batch-output-columns) ]
```

prepass-query

```
SELECT { table-column | expr-with-table-columns }[,…], prepass-udtf(prepass-args)
   OVER (PARTITION PREPASS BY partition-column-expr[,…] )
   [ AS (prepass-output-columns) ] FROM table-ref
```

Parameters

IF NOT EXISTS	Specifies to generate an informational message if an object already exists under the specified name. If you omit this option and the object exists, Vertica generates a ROLLBACK error message. In both cases, the object is not created.

	The `IF NOT EXISTS` clause is useful for SQL scripts where you want to create an object if it does not already exist, and reuse the existing object if it does. For related information, see `ON_ERROR_STOP`.
[*database.*]*schema*	Specifies the schema for this projection and its anchor table, where *schema* must be the same for both. If you specify a database, it must be the current database.
projection	Identifies the projection to create, where *projection* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema. The projection is created in the same schema as the anchor table.
projection-column	The name of a projection column. If you do not specify projection column names, Vertica uses the anchor table column names that are specified in the `SELECT` statement.
grouped-clause	See GROUPED Clause.
`ENCODING` *encoding-type*	Specifies the column encoding type, by default set to AUTO.
`ACCESSRANK` *integer*	Overrides the default access rank for a column. Use this parameter to increase or decrease the speed at which Vertica accesses a column. For more information, see Overriding Default Column Ranking.
table-column | *expr-with-table-columns*	A table column or expression of table columns to include in the projection.
batch-udtf(*batch-args*)	The batch UDTF to invoke each time the following events occur: • Tuple mover mergeout

	• Queries on the projection • If invoked singly, on data load operations **Important:** If the projection definition includes a pre-pass subquery, *batch-args* must exactly match the pre-pass UDTF output columns, in name and order.
prepass-udtf(*prepass-args*)	The pre-pass UDTF to invoke on each load operation such as COPY or INSERT. If specified in a subquery, the pre-pass UDTF returns transformed data to the batch query for further processing. Otherwise, the pre-pass query results are added to projection data storage.
OVER (PARTITION BATCH BY *partition-column-expr*[,…]	Specifies the UDTF type and how to partition the data it returns: • BATCH identifies the UDTF as a batch UDTF. • PREPASS identifies the UDTF as a pre-pass UDTF. In both cases, the OVER clause specifies partitioning with one or more column expressions from the SELECT list. The first *partition-column-expr* is the first column expression in the SELECT list, the second *partition-column-expr* is the second column expression in the SELECT list, and so on. **Note:** The projection is implicitly segmented and ordered on PARTITION BY columns.
AS (*batch-output-columns*) AS (*prepass-output-columns*)	Optionally names columns that are returned by the UDTF. If a pre-pass subquery omits this clause, the outer batch query UDTF arguments (*batch-args*) must reference the column names as they are defined in the pre-pass UDTF.

table [[AS] ALIAS]	Specifies the projection's anchor table, optionally qualified by an alias.
sq-results	Subquery result set that is returned to the outer batch UDTF.

Privileges

Superuser, or the following:

- Anchor table owner
- CREATE privilege on the schema
- EXECUTE privileges on all UDTFs that are referenced by the projection

Restrictions

Vertica does not regard live aggregate projections as **superprojections**, even one that includes all table columns.

UDTF Types

CREATE PROJECTION can define live aggregate projections that invoke user-defined transform functions (UDTFs). Vertica invokes UDTFs at multiple points of projection processing:

- **Pre-pass UDTFs:** Invoked when data is loaded into the projection's anchor table—for example through COPY or INSERT statements. A pre-pass UDTF transforms the new data before it is stored in the projection's ROS containers. You identify a pre-pass UDTF in the projection's PARTITION BY clause, through the keyword PREPASS.
- **Batch UDTFs:** Invoked on three events: the Vertica tuple mover consolidates stored projection data (mergeout); the projection is queried; and if invoked singly, data load operations. In all cases, the UDTF aggregates projection data and stores the aggregated results. Aggregation is cumulative across mergeout and load operations, and is completed (if necessary) on query execution. You identify a batch UDTF in the projection's PARTITION BY clause, through the keyword BATCH.

Vertica stores all UDTF results in projection ROS containers, thereby enabling faster response time when you query the projection.

UDTF Specification Options

A projection definition can specify up to two UDTFs, in any of the following ways:

- **Single pre-pass UDTF:** The pre-pass UDTF transforms newly loaded data and stores it in the projection. Use the following syntax:

```
=> CREATE PROJECTION projection-name
    ({ projection-column | grouped-clause
         [ ENCODING encoding-type ]
         [ ACCESSRANK integer ] })
    AS SELECT ..., udtf(args)
    OVER(PARTITION PREPASS BY partition-columns) AS (prepass-output-columns) FROM table-
ref;
```

- **Single batch UDTF:** The batch UDTF transforms and aggregates projection data on mergeout, insert, and query operations. Use the following syntax:

```
=> CREATE PROJECTION projection-name
    ({ projection-column | grouped-clause
         [ ENCODING encoding-type ]
         [ ACCESSRANK integer ] })
    AS SELECT ..., udtf(args)
    OVER(PARTITION BATCH BY partition-columns) AS (batch-output-columns) FROM table-ref;
```

- **Pre-pass and batch UDTFs:** You can define a projection with a subquery that invokes a pre-pass UDTF. The pre-pass UDTF returns transformed data to the top-level batch query. The batch UDTF then iteratively aggregates all projection data. Use the following syntax:

```
=> CREATE PROJECTION projection-name
    ({ projection-column | grouped-clause
         [ ENCODING encoding-type ]
         [ ACCESSRANK integer ] })
    AS SELECT ..., batch-udtf(batch-args)
    OVER ( PARTITION BATCH BY partition-columns ) AS (batch-output-columns)
    FROM ( SELECT ..., prepass-udtf(prepass-args)
        OVER ( PARTITION PREPASS BY partition-columns) AS (prepass-output-columns)
        FROM table-ref ) sq-ref;
```

Examples

See Examples in Pre-Aggregating UDTF Results.

Pre-Aggregating UDTF Results

CREATE RESOURCE POOL

Creates a custom resource pool and sets one or more resource pool parameters.

Syntax

```
CREATE RESOURCE POOL pool-name [ FOR { SUBCLUSTER subcluster-name | CURRENT SUBCLUSTER } ] [
parameter-name setting ]…
```

Parameters

pool-name	The name of the resource pool. Built-in pool names cannot be used for user-defined pools. **Note:** If you specify a resource pool name with uppercase letters, Vertica converts them to lowercase letters.
[SUBCLUSTER *subcluster-name* | CURRENT SUBCLUSTER]	Eon Mode only. Specifies the subcluster that you are creating the resource pool for. When omitted, the resource pool is created globally. Attempting to create a global resource pool that has the same name as a subcluster-specific resource pool returns an error. • SUBCLUSTER — Use this keyword to create the resource pool for a subcluster with the name *subcluster-name* if you are not connected to it, and it exists. • CURRENT SUBCLUSTER — Creates the resource pool for the subcluster that you are currently connected to.
parameter-name	The parameter to set, listed below.
setting	The value to set on *parameter-name*. To reset this parameter to its default value, specify DEFAULT.

	Note: Default values specified in this table pertain only to user-defined resource pools. For built-in pool default values, see Built-In Resource Pools Configuration, or query system table RESOURCE_POOL_DEFAULTS.
CASCADE TO	Specifies a secondary resource pool for executing queries that exceed the RUNTIMECAP setting of their assigned resource pool: `CASCADE TO secondary-pool`
CPUAFFINITYMODE	Specifies whether the resource pool has exclusive or shared use of the CPUs specified in CPUAFFINITYSET: `CPUAFFINITYMODE { SHARED | EXCLUSIVE | ANY }` • SHARED: Queries that run in this pool share its CPUAFFINITYSET CPUs with other Vertica resource pools. • EXCLUSIVE: Dedicates CPUAFFINITYSET CPUs to this resource pool only, and excludes other Vertica resource pools. If CPUAFFINITYSET is set as a percentage, then that percentage of CPU resources available to Vertica is assigned solely for this resource pool. • ANY (default): Queries in this resource pool can run on any CPU, invalid if CPUAFFINITYSET designates CPU resources. **Important:** CPUAFFINITYMODE and CPUAFFINITYSET must be set together in the same statement.

CPUAFFINITYSET	Specifies which CPUs are available to this resource pool. All cluster nodes must have the same number of CPUs. The CPU resources assigned to this set are unavailable to general resource pools.
	`CPUAFFINITYSET {`
	`  'cpu-index[,…]'`
	`| 'cpu-index`$_i$`-cpu-index`$_n$`'`
	`| 'integer%'`

	| NONE } • *cpu-index*[,…]: Dedicates one or more comma-delimited CPUs to this pool. • $cpu\text{-}index_i$-$cpu\text{-}index_n$: Dedicates a range of contiguous CPU indexes to this pool • *integer*%: Percentage of all available CPUs to use for this pool. Vertica rounds this percentage down to include whole CPU units. • NONE (default): No affinity set is assigned to this resource pool. The queries associated with this pool are executed on any CPU. **Important:** CPUAFFINITYSET and CPUAFFINITYMODE must be set together in the same statement.
EXECUTIONPARALLELISM	Limits the number of threads used to process any single query issued in this resource pool. EXECUTIONPARALLELISM { *limit* | AUTO } • *limit*: An integer value between 1 and the number of cores. Setting this parameter to a reduced value increases throughput of short queries issued in the pool, especially if the queries are executed concurrently. • AUTO or 0 (default): Vertica calculates the setting from the number of cores, available memory, and amount of data in the system. Unless memory is limited, or the amount of data is very small, Vertica sets this parameter to the number of cores on the node.
MAXCONCURRENCY	Sets the maximum number of concurrent execution slots available to the resource pool, across the cluster: MAXCONCURRENCY { *integer* | NONE } NONE (default) specifies unlimited number of concurrent execution slots.
MAXMEMORYSIZE	The maximum size per node the resource pool can

	grow by borrowing memory from the GENERAL pool:
	`MAXMEMORYSIZE {`
	`  'integer%'`
	`| 'integer{K|M|G|T}'`
	`| NONE`
	`}`
	• *integer*%: Percentage of total memory
	• *integer*{K|M|G|T}: Amount of memory in kilobytes, megabytes, gigabytes, or terabytes
	• NONE (default): Unlimited, pool can borrow any amount of available memory from the GENERAL pool.

MAXQUERYMEMORYSIZE	The maximum amount of memory that this pool can allocate at runtime to process a query. If the query requires more memory than this setting, Vertica stops execution and returns an error.
	Set this parameter as follows:
	`MAXQUERYMEMORYSIZE {`
	`  'integer%'`
	`| 'integer{K|M|G|T}'`
	`| NONE`
	`}`
	• *integer*%: Percentage of MAXMEMORYSIZE for this pool.
	• *integer*{K|M|G|T}: Amount of memory in kilobytes, megabytes, gigabytes, or terabytes, up to the value of MAXMEMORYSIZE.
	• NONE (default): Unlimited; pool can borrow any amount of available memory from the GENERAL pool, within the limits set by MAXMEMORYSIZE.

MEMORYSIZE	The amount of total memory available to the Vertica resource manager that is allocated to this pool per node:
	`MEMORYSIZE {`
	`  'integer%'`
	`| 'integer{K|M|G|T}'`
	`}`
	• *integer*%: Percentage of total memory
	• *integer*{K|M|G|T}: Amount of memory in kilobytes, megabytes, gigabytes, or terabytes

	Default: 0%. No memory allocated, the resource pool borrows memory from the GENERAL pool.

PLANNEDCONCURRENCY	Specifies the preferred number queries to execute concurrently in the resource pool. This setting applies to the entire cluster:
	`PLANNEDCONCURRENCY { num-queries | AUTO }`
	• *num-queries*: Integer value ≥ 1, specifies the preferred number of concurrently executing queries. When possible, query resource budgets are limited to allow this level of concurrent execution.
	• AUTO (default): Value is calculated automatically at query runtime. Vertica sets this parameter to the lower of these two calculations, but never less than 4:
	  • Number of logical cores
	  • Memory divided by 2GB
	For clusters where the number of logical cores differs on different nodes, AUTO can apply differently on each node. Distributed queries run like the minimal effective planned concurrency. Single node queries run with the planned concurrency of the initiator.
	Tip: Change this parameter only after evaluating performance over a period of time.

PRIORITY	Specifies priority of queries in this pool when they compete for resources in the GENERAL pool:
	`PRIORITY { integer | HOLD }`
	• *integer*: A negative or positive integer value, where higher numbers denote higher priority:
	  • User-defined pools: -100 to 100
	  • Built-in pools SYSQUERY, RECOVERY, and TM: -110 to 110
	• HOLD: Sets priority to -999. Queries in this pool are queued until QUEUETIMEOUT is reached.
	Default: 0

QUEUETIMEOUT	Species how long a request can wait for pool resources before it is rejected: `QUEUETIMEOUT { integer | NONE }` • *integer*: Maximum wait time in seconds • NONE: No maximum wait time, request can be queued indefinitely. Default: 300 seconds
RUNTIMECAP	Prevents runaway queries by setting the maximum time a query in the pool can execute. If a query exceeds this setting, it tries to cascade to a secondary pool: `RUNTIMECAP { 'interval' | NONE }` • *interval*: An interval of 1 minute or 100 seconds; should not exceed one year. • NONE (default): No time limit on queries running in this pool. To specify a value in days, provide an integer value. To provide a value less than one day, provide the interval in the format `hours:minutes:seconds`. For example a value of `1:30:00` would equal 90 minutes. If the user or session also has a RUNTIMECAP, the shorter limit applies.
RUNTIMEPRIORITY	Determines how the resource manager should prioritize dedication of run-time resources (CPU, I/O bandwidth) to queries already running in this resource pool: `RUNTIMEPRIORITY { HIGH | MEDIUM | LOW }` **Default**: MEDIUM
RUNTIMEPRIORITYTHRESHOLD	Specifies in seconds a time limit in which a query must finish before the resource manager assigns to it the resource pool's RUNTIMEPRIORITY. All queries begin running at a HIGH priority. When a query's duration exceeds this threshold, it is assigned the RUNTIMEPRIORITY of the resource pool.

	RUNTIMEPRIORITYTHRESHOLD *seconds* **Default:** 2
SINGLEINITIATOR	By default, set to false for backward compatibility. Do not change this setting.

Privileges

Superuser

Examples

This example shows how to create a resource pool with MEMORYSIZE of 1800 MB.

```
=> CREATE RESOURCE POOL ceo_pool MEMORYSIZE '1800M' PRIORITY 10;
CREATE RESOURCE POOL
```

Assuming the CEO report user already exists, associate this user with the preceding resource pool using ALTER USER statement.

```
=> GRANT USAGE ON RESOURCE POOL ceo_pool to ceo_user;
GRANT PRIVILEGE
=> ALTER USER ceo_user RESOURCE POOL ceo_pool;
ALTER USER
```

Issue the following command to confirm that the ceo_user is associated with the ceo_pool:

```
=> SELECT * FROM users WHERE user_name ='ceo_user';
-[ RECORD 1 ]-----+--------------------------------------------------
user_id           | 45035996273733402
user_name         | ceo_user
is_super_user     | f
profile_name      | default
is_locked         | f
lock_time         |
resource_pool     | ceo_pool
memory_cap_kb     | unlimited
temp_space_cap_kb | unlimited
run_time_cap      | unlimited
all_roles         |
default_roles     |
search_path       | "$user", public, v_catalog, v_monitor, v_internal
```

This example shows how to create and designate secondary resource pools.

```
=> CREATE RESOURCE POOL rp3 RUNTIMECAP '5 minutes';
=> CREATE RESOURCE POOL rp2 RUNTIMECAP '3 minutes' CASCADE TO rp3;
=> CREATE RESOURCE POOL rp1 RUNTIMECAP '1 minute' CASCADE TO rp2;
=> SET SESSION RESOURCE_POOL = rp1;
```

This Eon Mode example confirms the current subcluster name, then creates a resource pool for the current subcluster:

```
=> SELECT CURRENT_SUBCLUSTER_NAME();
 CURRENT_SUBCLUSTER_NAME
-------------------------
 analytics_1
(1 row)

=> CREATE RESOURCE POOL dashboard FOR SUBCLUSTER analytics_1;
CREATE RESOURCE POOL
```

Built-In Pools

Vertica is preconfigured with built-in pools for various system tasks:

- GENERAL
- BLOBDATA
- DBD
- JVM
- METADATA
- RECOVERY
- REFRESH
- SYSQUERY
- TM

Built-in pools can be customized to suit your usage requirements. See ALTER RESOURCE POOL for details on resource pool settings.

GENERAL

Catch-all pool used to answer requests that have no specific **resource pool** associated with them. Any memory left over after memory has been allocated to all other pools is automatically allocated to the GENERAL pool. The MEMORYSIZE parameter of the GENERAL pool is undefined (variable), however, the GENERAL pool must be at least 1GB in size and cannot be smaller than 25% of the memory in the system.

The MAXMEMORYSIZE parameter of the GENERAL pool has special meaning; when set as a % value it represents the percent of total physical RAM on the machine that the **Resource Manager** can use for queries. By default, it is set to 95%. MAXMEMORYSIZE governs the total amount of RAM that the Resource Manager can use for queries, regardless of whether it is set to a percent or to a specific value (for example, '10GB').

User-defined pools can borrow memory from the GENERAL pool to satisfy requests that need extra memory until the MAXMEMORYSIZE parameter of that pool is reached. If the pool is configured to have MEMORYSIZE equal to MAXMEMORYSIZE, it cannot borrow any memory from the GENERAL pool. When multiple pools request memory from the GENERAL pool, they are granted access to general pool memory according to their priority setting. In this manner, the GENERAL pool provides some elasticity to account for point-in-time deviations from normal usage of individual resource pools.

Vertica recommends reducing the GENERAL pool MAXMEMORYSIZE if your catalog uses over 5 percent of overall memory. You can calculate what percentage of GENERAL pool memory the catalog uses as follows:

```
=> WITH memory_use_metadata AS (SELECT node_name, memory_size_kb FROM resource_pool_status WHERE
pool_name='metadata'),
        memory_use_general  AS (SELECT node_name, memory_size_kb FROM resource_pool_status WHERE
pool_name='general')
   SELECT m.node_name, ((m.memory_size_kb/g.memory_size_kb) * 100)::NUMERIC(4,2) pct_catalog_usage
   FROM memory_use_metadata m JOIN memory_use_general g ON m.node_name = g.node_name;
    node_name     | pct_catalog_usage
------------------+-------------------
 v_vmart_node0001 |              0.41
 v_vmart_node0002 |              0.37
 v_vmart_node0003 |              0.36
(3 rows)
```

BLOBDATA

Controls resource usage for in-memory blobs. *In-memory blobs* are objects used by a number of the machine learning SQL functions. You should adjust this pool if you plan on processing large machine learning workloads. For information about tuning the pool, see Tuning for Machine Learning.

If a query using the BLOBDATA pool exceeds its query planning budget, then it spills to disk. For more information about tuning your query budget, see Query Budgeting.

DBD

Controls resource usage for **Database Designer** processing. Use of this pool is enabled by configuration parameter DBDUseOnlyDesignerResourcePool, by default set to false.

By default, QUEUETIMEOUT is set to 0 for this pool. When resources are under pressure, this setting causes the DBD to time out immediately, and not be queued to run later. Database Designer then requests the user to run the designer later, when resources are more available.

Important:
Do not change QUEUETIMEOUT or any DBD resource pool parameters.

JVM

Controls Java Virtual Machine resources used by Java User Defined Extensions. When a Java UDx starts the JVM, it draws resources from the those specified in the JVM resource pool. Vertica does not reserve memory in advance for the JVM pool. When needed, the pool can expand to 10% of physical memory or 2 GB of memory, whichever is smaller. If you are buffering large amounts of data, you may need to increase the size of the JVM resource pool.

You can adjust the size of your JVM resource pool by changing its configuration settings. Unlike other resource pools, the JVM resource pool does not release resources until a session is closed.

METADATA

Tracks memory allocated for catalog data and storage data structures. This pool increases in size as Vertica metadata consumes additional resources. Memory assigned to the METADATA pool is subtracted from the GENERAL pool, enabling the Vertica resource manager to make more effective use of available resources. If the METADATA resource pool reaches 75% of the GENERAL pool, Vertica stops updating METADATA memory size and displays a warning message in `vertica.log`. You can enable or disable the METADATA pool with configuration parameter EnableMetadataMemoryTracking.

If you created a "dummy" or "swap" resource pool to protect resources for use by your operating system, you can replace that pool with the METADATA pool.

Users cannot change the parameters of the METADATA resource pool.

RECOVERY

Used by queries issued when recovering another node of the database. The MAXCONCURRENCY parameter is used to determine how many concurrent recovery threads to use. You can use the PLANNEDCONCURRENCY parameter (by default, set to twice the `MAXCONCURRENCY`) to tune how to apportion memory to recovery queries.

See Tuning for Recovery.

REFRESH

Used by queries issued by `PROJECTION_REFRESHES` operations. **Refresh** does not currently use multiple concurrent threads; thus, changes to the MAXCONCURRENCY values have no effect.

See Scenario: Tuning for Refresh.

SYSQUERY

Runs queries against all system monitoring and catalog tables. The SYSQUERY pool reserves resources for system table queries so that they are never blocked by contention for

available resources.

TM

The **Tuple Mover** (TM) pool. You can set the MAXCONCURRENCY parameter for the TM pool to allow concurrent TM operations.

See Scenario 2.

For More Information

For descriptions of resource pool parameters, see CREATE RESOURCE POOL.

Built-In Resource Pools Configuration

To view the current and default configuration for built-in resource pools, query the system tables RESOURCE_POOLS and RESOURCE_POOL_DEFAULTS, respectively. The sections below provide this information, and also indicate which built-in pool parameters can be modified with ALTER RESOURCE POOL:

- GENERAL
- BLOBDATA
- DBD
- JVM
- METADATA
- RECOVERY
- REFRESH
- SYSQUERY
- TM

GENERAL

Parameter	Settings
MEMORYSIZE	Empty / cannot be set
MAXMEMORYSIZE	The maximum memory to use for all resource pools,

Parameter	Settings
	one of the following: `MAXMEMORYSIZE { 'integer%' | 'integer{K|M|G|T}' }` • *integer%*: Percentage of total system RAM, must be ≥ 25% **Caution:** Setting this parameter to 100% generates a warning of potential swapping. • *integer*{K|M|G|T}: Amount of memory in kilobytes, megabytes, gigabytes, or terabytes, must be ≥ 1GB For example, if your node has 64GB of memory, setting MAXMEMORYSIZE to 50% allocates half of available memory. Thus, the maximum amount of memory available to all resource pools is 32GB. **Default:** 95%
MAXQUERYMEMORYSIZE	The maximum amount of memory allocated by this pool to process any query: `MAXQUERYMEMORYSIZE { 'integer%' | 'integer{K|M|G|T}' }` • *integer%*: Percentage of MAXMEMORYSIZE for this pool. • *integer*{K|M|G|T}: Amount of memory in kilobytes, megabytes, gigabytes, or terabytes
EXECUTIONPARALLELISM	**Default:** AUTO
PRIORITY	**Default:** 0
RUNTIMEPRIORITY	**Default:** Medium
RUNTIMEPRIORITYTHRESHOLD	**Default:** 2

Parameter	Settings
QUEUETIMEOUT	**Default:** 00:05 (minutes)
RUNTIMECAP	Prevents runaway queries by setting the maximum time a query in the pool can execute. If a query exceeds this setting, it tries to cascade to a secondary pool: `RUNTIMECAP { 'interval' | NONE }` • *interval*: An interval of 1 minute or 100 seconds; should not exceed one year. • NONE (default): No time limit on queries running in this pool.
PLANNEDCONCURRENCY	The number of concurrent queries you expect to run against the resource pool, an integer ≥ 4. If set to AUTO (default), Vertica automatically sets PLANNEDCONCURRENCY at query runtime, choosing the lower of these two values: • Number of cores • Memory/2GB **Important:** In systems with a large number of cores, the default AUTO setting of PLANNEDCONCURRENCY is liable to be too low. In this case, set the parameter to the actual number of cores: `ALTER RESOURCE POOL general PLANNEDCONCURRENCY #cores;` **Default:** AUTO
MAXCONCURRENCY	**Default:** Empty **Caution:** Must be set ≥ 1, otherwise Vertica generates a warning that system queries might be unable to execute.
SINGLEINITIATOR	**Default:** False.

Parameter	Settings
	Important: Included for backwards compatibility. Do not change.
CPUAFFINITYSET	**Default:** Empty
CPUAFFINITYMODE	**Default:** ANY
CASCADETO	**Default:** Empty

BLOBDATA

MAXCONCURRENCY	Empty / cannot be set
SINGLEINITIATOR	FALSE **Important:** Included for backwards compatibility. Do not change.
CPUAFFINITYSET	Empty / cannot be set
CPUAFFINITYMODE	ANY / cannot be set
CASCADETO	Empty / cannot be set

METADATA

Parameter	Default Setting
MEMORYSIZE	0%
MAXMEMORYSIZE	Unlimited
MAXQUERYMEMORYSIZE	Empty / cannot be set
EXECUTIONPARALLELISM	AUTO
PRIORITY	108
RUNTIMEPRIORITY	HIGH
RUNTIMEPRIORITYTHRESHOLD	0
QUEUETIMEOUT	0
RUNTIMECAP	NONE
PLANNEDCONCURRENCY	AUTO
MAXCONCURRENCY	0
SINGLEINITIATOR	FALSE. **Important:** Included for backwards compatibility. Do not change.
CPUAFFINITYSET	Empty / cannot be set
CPUAFFINITYMODE	ANY / cannot be set
CASCADETO	Empty / cannot be set

RECOVERY

Parameter	Default Setting
MEMORYSIZE	0%
MAXMEMORYSIZE	The maximum size per node the resource pool can grow by borrowing memory from the GENERAL pool: `MAXMEMORYSIZE { 'integer%' | 'integer{K|M|G|T}' | NONE }` • *integer*%: Percentage of total memory • *integer*{K|M|G|T}: Amount of memory in kilobytes, megabytes, gigabytes, or terabytes • NONE (default): Unlimited, pool can borrow any amount of available memory from the GENERAL pool. **Caution:** Setting must resolve to ≥ 25%. Otherwise, Vertica generates a warning that system queries might be unable to execute.
MAXQUERYMEMORYSIZE	Empty / cannot be set
EXECUTIONPARALLELISM	AUTO
PRIORITY	One of the following: • Enterprise Mode: 107 • Eon Mode: 110 **Caution:** Change these settings only under guidance from Vertica technical support.
RUNTIMEPRIORITY	MEDIUM
RUNTIMEPRIORITYTHRESHOLD	60

Parameter	Default Setting
QUEUETIMEOUT	00:05 (minutes)
RUNTIMECAP	NONE
PLANNEDCONCURRENCY	AUTO
MAXCONCURRENCY	By default, set as follows: `(numberCores / 2) + 1` Thus, given a system with four cores, MAXCONCURRENCY has a default setting of 3. **Note:** 0 or NONE (unlimited) are invalid settings.
SINGLEINITIATOR	True. **Important:** Included for backwards compatibility. Do not change.
CPUAFFINITYSET	Empty / cannot be set
CPUAFFINITYMODE	ANY / cannot be set
CASCADETO	Empty / cannot be set

REFRESH

Parameter	Default Setting
MEMORYSIZE	0%
MAXMEMORYSIZE	NONE (unlimited)
MAXQUERYMEMORYSIZE	Empty / cannot be set
EXECUTIONPARALLELISM	AUTO
PRIORITY	-10

Parameter	Default Setting
RUNTIMEPRIORITY	MEDIUM
RUNTIMEPRIORITYTHRESHOLD	60
QUEUETIMEOUT	00:05 (minutes)
RUNTIMECAP	NONE (unlimited)
PLANNEDCONCURRENCY	AUTO (4)
MAXCONCURRENCY	3 This parameter must be set ≥ 1.
SINGLEINITIATOR	True. **Important:** Included for backwards compatibility. Do not change.
CPUAFFINITYSET	Empty / cannot be set
CPUAFFINITYMODE	ANY / cannot be set
CASCADETO	Empty / cannot be set

SYSQUERY

Parameter	Default Setting
MEMORYSIZE	1G **Caution:** Setting must resolve to ≥ 20M, otherwise Vertica generates a

Parameter	Default Setting
	 warning that system queries might be unable to execute, and diagnosing problems might be difficult.
MAXMEMORYSIZE	Empty (unlimited)
MAXQUERYMEMORYSIZE	Empty / cannot be set
EXECUTIONPARALLELISM	AUTO
PRIORITY	110
RUNTIMEPRIORITY	HIGH
RUNTIMEPRIORITYTHRESHOLD	0
QUEUETIMEOUT	00:05 (minutes)
RUNTIMECAP	NONE
PLANNEDCONCURRENCY	AUTO
MAXCONCURRENCY	Empty  **Caution:** Must be set ≥ 1, otherwise Vertica generates a warning that system queries might be unable to

Parameter	Default Setting
	execute.
SINGLEINITIATOR	False. **Important:** Included for backwards compatibility. Do not change.
CPUAFFINITYSET	Empty / cannot be set
CPUAFFINITYMODE	
CASCADETO	

TM

Parameter	Default Setting

MEMORYSIZE	5% (of the GENERAL pool's MAXMEMORYSIZE setting) + 2GB
	
	Important:
	You can estimate the optimal amount of RAM for the TM resource pool as follows:
	`GbRAM / (6 * #table-cols) > 10`
	where *#table-cols* is the number of columns in the largest database table. For example, given a 100-column table, MEMORYSIZE needs least 6GB of RAM:
	`6144MB / (6 * 100)  = 10.24`

MAXMEMORYSIZE	Unlimited
MAXQUERYMEMORYSIZE	Empty / cannot be set

Parameter	Default Setting
EXECUTIONPARALLELISM	AUTO
PRIORITY	105
RUNTIMEPRIORITY	MEDIUM
RUNTIMEPRIORITYTHRESHOLD	60
QUEUETIMEOUT	00:05 (minutes)
RUNTIMECAP	NONE
PLANNEDCONCURRENCY	7
MAXCONCURRENCY	7 **Note:** 0 or NONE (unlimited) are invalid settings.
SINGLEINITIATOR	True **Important:** Included for backwards compatibility. Do not change.
CPUAFFINITYSET	Empty / cannot be set
CPUAFFINITYMODE	ANY / cannot be set
CASCADETO	Empty / cannot be set

CREATE ROLE

Creates a **role**. After creating a role, use GRANT statements to specify role permissions.

Syntax

```
CREATE ROLE role
```

Parameters

role	The name for the new role, where *role* conforms to conventions described in Identifiers.

Privileges

Superuser

Examples

This example shows to create an empty role called roleA.

```
=> CREATE ROLE roleA;
CREATE ROLE
```

See Also

- ALTER ROLE
- DROP ROLE

CREATE ROUTING RULE

Creates a load balancing routing rule that directs incoming client connections from an IP address range to a group of Vertica nodes. This group of Vertica nodes is defined by a load balance group. Once you create a routing rule, any client connection originating from the rule's IP address range is redirected to one of the nodes in the load balance group if the client opts into load balancing.

Syntax

```
CREATE ROUTING RULE rule_name ROUTE 'address_range' TO group_name
```

Arguments

rule_name	A name for the routing rule.
'address_range'	The IP address range of incoming client connections to redirect. This range must be in CIDR format.
group_name	The name of the load balance group to handle the client connections from the address range. You create this group using the CREATE LOAD BALANCE GROUP statement.

Privileges

The user must be a **superuser**.

Examples

The following example creates a routing rule that routes all client connections from 192.168.1.0 to 192.168.1.255 to a load balance group named internal_clients:

```
=> CREATE ROUTING RULE internal_clients ROUTE '192.168.1.0/24' TO group_internal;
CREATE ROUTING RULE
```

See Also

CREATE SCHEMA

Defines a schema.

Syntax

```
CREATE SCHEMA [ IF NOT EXISTS ] [database.]schema
   [ AUTHORIZATION username]
   [ DEFAULT { INCLUDE | EXCLUDE } [ SCHEMA ] PRIVILEGES ]
```

Parameters

`IF NOT EXISTS`	Specifies to generate an informational message if an object already exists under the specified name. If you omit this option and the object exists, Vertica generates a `ROLLBACK` error message. In both cases, the object is not created. The `IF NOT EXISTS` clause is useful for SQL scripts where you want to create an object if it does not already exist, and reuse the existing object if it does. For related information, see `ON_ERROR_STOP`.
`[`*`database`*`.]`*`schema`*	Identifies the schema to create, where *`schema`* conforms to conventions described in Identifiers. The following naming requirements also apply: • The name must be unique among all other schema names in the database. • It must comply with keyword restrictions. • It cannot begin with `v_`; this prefix is reserved for Vertica system tables. • If you specify a database, it must be the current database.
`AUTHORIZATION` *`username`*	Valid only for superusers, assigns ownership of the schema to another user. By default, the user who creates a schema is also assigned ownership. After you create a schema, you can reassign ownership to another user with `ALTER SCHEMA`.
`DEFAULT {INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES`	Specifies whether to enable or disable default inheritance of privileges for new tables in the specified schema: • `EXCLUDE SCHEMA PRIVILEGES` (default): Disables inheritance of schema privileges. • `INCLUDE SCHEMA PRIVILEGES`: Specifies to grant tables in the specified schema the same privileges granted to that schema. This option has no effect on existing tables in the schema.

	If you omit `INCLUDE PRIVILEGES`, you must explicitly grant schema privileges on the desired tables. For more information see Enabling Schema Inheritance.

Privileges

- Superuser
- CREATE privilege for the database

Supported Sub-statements

`CREATE SCHEMA` can include one or more sub-statements—for example, to create tables or projections within the new schema. Supported sub-statements include:

- `CREATE TABLE` / `CREATE TEMPORARY TABLE`
- GRANT Statements
- `CREATE PROJECTION`
- `CREATE SEQUENCE`
- `CREATE TEXT INDEX`
- `CREATE VIEW`

`CREATE SCHEMA` statement and all sub-statements are treated as a single transaction. If any statement fails, Vertica rolls back the entire transaction. The owner of the new schema is assigned ownership of all objects that are created within this transaction.

For example, the following `CREATE SCHEMA` statement also grants privileges on the new schema, and creates a table and view of that table:

```
=> \c - Joan
You are now connected as user "Joan".
=> CREATE SCHEMA s1
     GRANT USAGE, CREATE ON SCHEMA s1 TO public
     CREATE TABLE s1.t1 (a varchar)
     CREATE VIEW s1.t1v AS SELECT * FROM s1.t1;
CREATE SCHEMA
=> \dtv s1.*
             List of tables
 Schema | Name | Kind  | Owner | Comment
--------+------+-------+-------+---------
 s1     | t1   | table | Joan  |
 s1     | t1v  | view  | Joan  |
(2 rows)
```

Examples

Create schema `s1`:

```
=> CREATE SCHEMA s1;
```

Create schema `s2` if it does not already exist:

```
=> CREATE SCHEMA IF NOT EXISTS s2;
```

If the schema already exists, Vertica returns a rollback message:

```
=> CREATE SCHEMA IF NOT EXISTS s2;
NOTICE 4214:  Object "s2" already exists; nothing was done
```

Create table `t1` in schema `s1`, then grant users `Fred` and `Aniket` access to all existing tables and all privileges on table `t1`:

```
=> CREATE TABLE s1.t1 (c INT);
CREATE TABLE
=> GRANT USAGE ON SCHEMA s1 TO Fred, Aniket;
GRANT PRIVILEGE
=> GRANT ALL PRIVILEGES ON TABLE s1.t1 TO Fred, Aniket;
GRANT PRIVILEGE
```

Enable inheritance on new schema `s3` so all tables created in it automatically inherit its privileges. In this case, new table `s3.t2` inherits USAGE, CREATE, and SELECT privileges, which are automatically granted to all database users:

```
=> CREATE SCHEMA s3 DEFAULT INCLUDE SCHEMA PRIVILEGES;
CREATE SCHEMA
=> GRANT USAGE, CREATE, SELECT, INSERT ON SCHEMA S3 TO PUBLIC;
GRANT PRIVILEGE
=> CREATE TABLE s3.t2(i int);
WARNING 6978: Table "t2" will include privileges from schema "s3"
CREATE TABLE
```

See Also

- ALTER SCHEMA
- DROP SCHEMA

CREATE SEQUENCE

Defines a new named sequence number generator object. Like AUTO_INCREMENT and IDENTITY sequences, named sequences let you set the default values of primary key columns. Sequences guarantee uniqueness, and avoid constraint enforcement problems and overhead.

For more information about sequence types and their usage, see Sequences.

Syntax

```
CREATE SEQUENCE [ IF NOT EXISTS ] [[database.]schema.]sequence
   [ INCREMENT [ BY ] integer ]
   [ MINVALUE integer | NO MINVALUE ]
   [ MAXVALUE maxvalue | NO MAXVALUE ]
   [ START [ WITH ] integer ]
   [ CACHE integer | NO CACHE ]
   [ CYCLE | NO CYCLE ]
```

Parameters

`IF NOT EXISTS`	Specifies to generate an informational message if an object already exists under the specified name. If you omit this option and the object exists, Vertica generates a `ROLLBACK` error message. In both cases, the object is not created. The `IF NOT EXISTS` clause is useful for SQL scripts where you want to create an object if it does not already exist, and reuse the existing object if it does. For related information, see `ON_ERROR_STOP`.
[*database* .]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
sequence	Identifies the sequence to create, where *sequence* conforms to

	conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
INCREMENT [BY] *integer*	A positive or negative integer that specifies how much to increment or decrement the sequence on each call to NEXTVAL, by default set to 1. **Note:** Setting this parameter to *integer* guarantees that column values always increment by at least *integer*. However, column values can sometimes increment by more than *integer* unless you also set the NO CACHE parameter.
MINVALUE *integer* NO MINVALUE (default)	Determines the minimum value a sequence can generate. If you omit this clause or specify NO MINVALUE, default values are used: 1 and -2^{63}-1 for ascending and descending sequences, respectively.
MAXVALUE *integer* NO MAXVALUE (default)	Determines the maximum value for the sequence. If you omit this clause or specify NO MAXVALUE, default values are used: 2^{63}-1 and -1 for ascending and descending sequences, respectively.
START [WITH] *integer*	Sets the sequence start value to *integer*. The next call to NEXTVAL returns *integer*. If you omit this clause, the sequence start value is set to MINVALUE for ascending sequences, and MAXVALUE for descending sequences.
CACHE *integer* NO CACHE	Specifies whether to cache unique sequence numbers on each node for faster access. CACHE takes an integer argument as follows: • >1 specifies how many unique numbers each node caches per session. • 0 or 1 specifies to disable caching (equivalent to NO CACHE). If you omit this clause, the sequence cache is set to 250,000. For details, see Sequence Caching in the Administrator's Guide.
CYCLE NO CYCLE (default)	Specifies whether the sequence can wrap when its minimum or maximum values are reached: • CYCLE: The sequence wraps as follows:

	• When an incrementing sequence reaches its upper limit, it is reset to its minimum value. • When an decrementing sequence reaches its lower limit, it is reset to its maximum value. • `NO CYCLE` (default): Calls to NEXTVAL return an error after the sequence reaches its maximum or minimum value.

Privileges

Non-superusers: CREATE privilege on the schema

Examples

See Creating and Using Named Sequences.

See Also

- ALTER SEQUENCE
- DROP SEQUENCE

CREATE SUBNET

Identifies the subnet to which the nodes of a Vertica database belong. Use this statement to configure import/export from a database to other Vertica clusters.

Syntax

```
CREATE SUBNET subnet-name WITH 'subnet-prefix'
```

Parameters

subnet-name	A name you assign to the subnet, where *subnet-name* conforms to conventions described in Identifiers.
subnet-prefix	The routing prefix expressed in quad-dotted decimal

	representation. Refer to system table NETWORK_INTERFACES to get the prefix of all available IP networks.

You can then configure the database to use the subnet for import/export. For details, see Identify the Database or Nodes Used for Import/Export in the Administrator's Guide.

Privileges

Superuser

Examples

```
=> CREATE SUBNET mySubnet WITH '123.4.5.6';
```

CREATE TABLE

Creates a table in the logical schema.

Syntax

Create with column definitions

```
CREATE TABLE [ IF NOT EXISTS ] [[database.]schema.]table
   ( column-definition[,…] [, table-constraint ][,…] )
   [ ORDER BY column[,…] ]
   [ segmentation-spec ]
   [ KSAFE [k-num] ]
   [ partition-clause]
   [ {INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES ]
```

Create from another table

```
CREATE TABLE [ IF NOT EXISTS ] [[database.]schema.]table { AS-clause | LIKE-clause }
```

AS-clause

```
[ ( column-name-list ) ]
[ {INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES ]
AS  [  /*+ LABEL */ ] [ AT epoch ] query [ ENCODED BY column-ref-list ] [ segmentation-spec ]
```

LIKE-clause

```
LIKE [[database.]schema.]existing-table
  [ {INCLUDING | EXCLUDING} PROJECTIONS ]
  [ {INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES ]
```

Parameters

IF NOT EXISTS	Specifies to generate an informational message if an object already exists under the specified name. If you omit this option and the object exists, Vertica generates a ROLLBACK error message. In both cases, the object is not created. The IF NOT EXISTS clause is useful for SQL scripts where you want to create an object if it does not already exist, and reuse the existing object if it does. For related information, see ON_ERROR_STOP.
[*database*.]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table	Identifies the table to create, where *table* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
column-definition	Defines a table column. A table can have up to 1600 columns.
table-constraint	Adds a constraint to table metadata.
ORDER BY *column*[,…]	Invalid for external tables, specifies columns from the SELECT list on which to sort the superprojection that is automatically created for this table. The ORDER BY clause cannot include qualifiers ASC or DESC. Vertica always stores projection data in ascending sort order.

	If you omit the ORDER BY clause, Vertica uses the SELECT list order as the projection sort order.
segmentation-spec	Invalid for external tables, specifies how to distribute data for auto-projections of this table. Supply one of the following clauses: • *hash-segmentation-clause*: Specifies to segment data evenly and distribute across cluster nodes. Vertica recommends segmenting large tables. For details, see Hash Segmentation Clause. • *unsegmented-clause*: Specifies to create an unsegmented projection. For details, see Unsegmented Clause. If this clause is omitted, Vertica generates auto-projections with default hash segmentation.
KSAFE [*k-num*]	Invalid for external tables, specifies K-safety of auto-projections created for this table, where *k-num* must be equal to or greater than system K-safety. If you omit this option, the projection uses the system K-safety level. For general information, see K-Safety in an Enterprise Mode Database in Vertica Concepts.
partition-clause	Invalid for external tables, logically divides table data storage through a PARTITION BY clause: `PARTITION BY partition-expression [ GROUP BY group-expression ] [ ACTIVEPARTITIONCOUNT integer ]` For details, see Partition Clause.
column-name-list	Valid only when creating a table from a query (AS *query*), defines column names that map to the query output. If you omit this list, Vertica uses the query output column names. The names in *column-name-list* and queried columns must be the same in number. For example:

	``` CREATE TABLE customer_occupations (name, profession) AS SELECT customer_name, occupation FROM customer_ dimension; ``` This clause and the ENCODED BY clause are mutually exclusive. Column name lists are invalid for external tables
{ INCLUDE | EXCLUDE } [SCHEMA] PRIVILEGES	Specifies default inheritance of schema privileges for this table: • INCLUDE [SCHEMA] PRIVILEGES specifies that the table inherits privileges that are set on its schema. This is the default behavior if privileges inheritance is enabled for the schema. • EXCLUDE [SCHEMA] PRIVILEGES disables inheritance of privileges from the schema. For details, see Inherited Privileges in the Administrator's Guide.
AS *query*	Creates and loads a table from the results of a query, specified as follows: ``` AS [/*+ LABEL */] [AT epoch] query ``` You cannot use SELECT AS to query tables containing complex types, even if you do not select the columns with those types. Complex types are supported only in external tables. See Complex Types. For details, see Creating a Table from a Query in the Administrator's Guide.
ENCODED BY *column-ref-list*	A comma-delimited list of columns from the source table, where each column is qualified by one or both of the following encoding options: • ACCESSRANK *integer*: Overrides the default access rank for a column, useful for prioritizing access to a column. See Prioritizing Column Access Speed.

	• ENCODING *encoding-type*: Specifies the type of encoding to use on the column. The default encoding type is AUTO. This option and *column-name-list* are mutually exclusive. This option is invalid for external tables
LIKE *existing-table*	Creates the table by replicating an existing table. You can qualify the LIKE clause with one of the following options: • EXCLUDING PROJECTIONS (default): Do not copy projections from the source table. • INCLUDING PROJECTIONS: Copy current projections from the source table for the new table. • {INCLUDE|EXCLUDE} [SCHEMA] PRIVILEGES: See description above). For details, see Replicating a Table in the Administrator's Guide.

Privileges

Non-superuser:

- CREATE privileges on the table schema
- If creating a table that includes a named sequence:
  - SELECT privilege on sequence object
  - USAGE privilege on sequence schema
- If creating a table with the LIKE clause, source table owner

Examples

- Creating Tables
- Replicating a Table
- Creating a Table from a Query

See Also

- CREATE TEMPORARY TABLE
- CREATE EXTERNAL TABLE AS COPY
- CREATE FLEXIBLE TABLE

Column-Definition

Specifies the name, data type, and constraints to be applied to a column.

Syntax

```
column-namedata-type
    [ column-constraint ][…]
    [ ENCODING encoding-type ]
    [ ACCESSRANK integer ]
```

Parameters

column-name	The name of a column to be created or added.
data-type	One of the supported data types. **Tip:** When specifying the maximum column width in a CREATE TABLE statement, use the width in bytes (octets) for any of the string types. Each UTF-8 character might require four bytes, but European languages generally require a little over one byte per character, while Oriental languages generally require a little under three bytes per character.
column-constraint	Specifies a column constraint for this column.
ENCODING *encoding-type*	Specifies the column encoding type, by default set to AUTO.
ACCESSRANK *integer*	Overrides the default access rank for a column. Use this

	parameter to increase or decrease the speed at which Vertica accesses a column. For more information, see Overriding Default Column Ranking.

Example

The following example creates a table named `Employee_Dimension` and its associated superprojection in the `Public` schema. The `Employee_key` column is designated as a primary key, and RLE encoding is specified for the `Employee_gender` column definition:

```
=> CREATE TABLE Public.Employee_Dimension (
    Employee_key                    integer PRIMARY KEY NOT NULL,
    Employee_gender                 varchar(8) ENCODING RLE,
    Courtesy_title                  varchar(8),
    Employee_first_name             varchar(64),
    Employee_middle_initial         varchar(8),
    Employee_last_name              varchar(64)
);
```

Column-Name-List

Used to rename columns when creating a table or temporary table from a query (`CREATE TABLE AS SELECT`); also used to specify the column's encoding type and **access rank** .

Syntax

```
column-name-list
... [ ENCODING encoding-type ]
... [ ACCESSRANK integer ]
... [ GROUPED ( column-reference[,…] ) ]
```

Parameters

column-name	Specifies the new name for the column.
ENCODING *encoding-type*	Specifies the type of encoding to use on the column. The default encoding type is AUTO.
ACCESSRANK *integer*	Overrides the default access rank for a column, useful for prioritizing access to a column. See Prioritizing Column Access Speed in the

	Administrator's Guide.
GROUPED	Groups two or more columns . For detailed information, see GROUPED Clause.

Requirements

- A column in the list can not specify the column's data type or any constraint. These are derived from the queried table.
- If the query output has expressions other than simple columns (for example, constants or functions) then an alias must be specified for that expression, or the column name list must include all queried columns.
- CREATE TABLE can specify encoding types and access ranks in the column name list or the query's ENCODED BY clause, but not in both. For example, the following CREATE TABLE statement sets encoding and access rank on two columns in the column name list:

```
=> CREATE TABLE promo1 (state ENCODING RLE ACCESSRANK 1, zip ENCODING RLE,…)
     AS SELECT * FROM customer_dimension ORDER BY customer_state;
```

The next statement specifies the same encoding and access rank in the query's ENCODED BY clause.

```
=> CREATE TABLE promo2
     AS SELECT * FROM customer_dimension ORDER BY customer_state
     ENCODED BY customer_state ENCODING RLE ACCESSRANK 1, customer_zip ENCODING RLE;
```

Column-Constraint

Adds a constraint to a column's metadata. For details, see Constraints.

Syntax

```
[ { AUTO_INCREMENT | IDENTITY } [ (args) ] ]
[ CONSTRAINT constraint-name ] {
   [ CHECK (expression) [ ENABLED | DISABLED ] ]
   [ [ DEFAULT expression ] [ SET USING expression } | DEFAULT USING expression ]
   [ NULL | NOT NULL ]
   [ { PRIMARY KEY [ ENABLED | DISABLED ] REFERENCES table [( column )] } ]
   [ UNIQUE [ ENABLED | DISABLED ] ]
}
```

Parameters

Note:
You can specify enforcement of several constraints by qualifying them with the keywords ENABLED or DISABLED. See Enforcing Constraints below.

AUTO_INCREMENT | IDENTITY	Creates a table column whose values are automatically generated by and managed by the database. You cannot change or load values in this column. You can set this constraint on only one table column. AUTO_INCREMENT and IDENTITY are synonyms. For details on this constraint and optional arguments, see AUTO_INCREMENT and IDENTITY Sequences. These options are invalid for temporary tables.
CONSTRAINT *constraint-name*	Assigns a name to the constraint, valid for the following constraints: • PRIMARY KEY • REFERENCES (foreign key) • CHECK • UNIQUE If you omit assigning a name to these constraints, Vertica assigns its own name. For details, see Naming Constraints. Vertica recommends that you name all constraints.
CHECK (*expression*)	Adds check condition *expression*, which returns a Boolean value.
DEFAULT	Specifies this column's default value: `DEFAULT default-expr` Vertica evaluates the DEFAULT expression and sets the column on load operations, if the operation

	omits a value for the column. For details about valid expressions, see Defining Column Values.
SET USING	Specifies to set values in this column from the specified expression: `SET USING using-expr` Vertica evaluates the SET USING expression and refreshes column values only when the function REFRESH_COLUMNS is invoked. For details about valid expressions, see Defining Column Values.
DEFAULT USING	Defines the column with DEFAULT and SET USING constraints, specifying the same expression for both. DEFAULT USING columns support the same expressions as SET USING columns, and are subject to the same restrictions.
NULL | NOT NULL	Specifies whether the column can contain null values: • NULL: Allows null values in the column. If you set this constraint on a primary key column, Vertica ignores it and sets it to NOT NULL. • NOT NULL: Specifies that the column must be set to a value during insert and update operations. If the column has no default value and no value is provided, INSERT or UPDATE returns an error. If you omit this constraint, the default is NULL for all columns except primary key columns, which Vertica always sets to NOT NULL. **External tables:** If you specify NOT NULL and the column contains null values, queries are liable to return errors or generate unexpected behavior. Specify NOT NULL for an external table column only if you are sure that the column does not contain nulls.

PRIMARY KEY	Identifies this column as the table's primary key.
REFERENCES	Identifies this column as a foreign key: `REFERENCES table [column]` where *column* is the primary key in *table*. If you omit *column*, Vertica references the primary key in *table*.
UNIQUE	Requires column data to be unique with respect to all table rows.

Privileges

Table owner or user WITH GRANT OPTION is grantor.

- REFERENCES privilege on table to create foreign key constraints that reference this table
- USAGE privilege on schema that contains the table

Enforcing Constraints

The following constraints can be qualified with the keyword ENABLED or DISABLED:

- PRIMARY KEY
- UNIQUE
- CHECK

If you omit ENABLED or DISABLED, Vertica determines whether to enable the constraint automatically by checking the appropriate configuration parameter:

- EnableNewPrimaryKeysByDefault
- EnableNewUniqueKeysByDefault
- EnableNewCheckConstraintsByDefault

For details, see Constraint Enforcement.

Partition Clause

Specifies partitioning of table data, through a PARTITION BY clause in the table definition:

`PARTITION BY partition-expression [ GROUP BY group-expression ] [ ActivePartitionCountExpr ]`

`PARTITION BY partition-expression`	For each table row, resolves to a partition key that is derived from one or more table columns. **Caution:** Avoid partitioning tables on LONG VARBINARY and LONG VARCHAR columns. Doing so can adversely impact performance.
`GROUP BY group-expression`	For each table row, resolves to a partition group key that is derived from the partition key. Vertica uses group keys to merge partitions into separate partition groups. `GROUP BY` must use the same expression as `PARTITION BY`. For example: `...PARTITION BY (i+j) GROUP BY ( CASE WHEN (i+j) < 5 THEN 1 WHEN (i+j) < 10 THEN 2 ELSE 3);` For details on partitioning table data by groups, see Partition Grouping and Hierarchical Partitioning in the Administrator's Guide.

ActivePartitionCountExpr	Specifies how many partitions are active for this table, specified as follows:
	
	• In partition clause of `CREATE TABLE`:
	
	`ACTIVEPARTITIONCOUNT integer`
	
	• In partition clause of `ALTER TABLE`:
	
	`SET ACTIVEPARTITIONCOUNT integer`
	
	This setting supersedes configuration parameter `ActivePartitionCount`.

	For details on usage, see Active and Inactive Partitions in the Administrator's Guide.

Partitioning Requirements and Restrictions

`PARTITION BY` expressions can specify leaf expressions, functions, and operators. The following requirements and restrictions apply:

- All table projections must include all columns referenced in the expression; otherwise, Vertica cannot resolve the expression.
- The expression can reference multiple columns, but it must resolve to a single non-null value for each row.

  Note:
  You can avoid null-related errors with the function ZEROIFNULL. This function can check a `PARTITION BY` expression for null values and evaluate them to 0. For example:

  ```
  CREATE TABLE t1 (a int, b int) PARTITION BY (ZEROIFNULL(a));
  CREATE TABLE
  ```

- All leaf expressions must be constants or table columns.
- All other expressions must be functions and operators. The following restrictions apply to functions:
  - They must be **immutable**—that is, they return the same value regardless of time and locale and other session- or environment-specific conditions.
  - They cannot be aggregate functions.
  - They cannot be Vertica meta-functions.
- The expression cannot include queries.

GROUP BY expressions do not support modulo (%) operations.

Examples

See Defining Partitions and Hierarchical Partitioning in the Administrator's Guide

See Also

Partitioning Tables in the Administrator's Guide

Table-Constraint

Adds a constraint to table metadata. You can specify table constraints with CREATE TABLE, or add a constraint to an existing table with ALTER TABLE. For details, see Setting Constraints in the Administrator's Guide.

> **Note:**
> Adding a constraint to a table that is referenced in a view does not affect the view.

Syntax

```
[ CONSTRAINT constraint-name ]
{
... PRIMARY KEY (column[,... ]) [ ENABLED | DISABLED ]
... | FOREIGN KEY (column[,... ] ) REFERENCES table [ (column[,...]) ]
... | UNIQUE (column[,...]) [ ENABLED | DISABLED ]
... | CHECK (expression) [ ENABLED | DISABLED ]
}
```

Parameters

CONSTRAINT *constraint-name*	Assigns a name to the constraint. Vertica recommends that you name all constraints.
PRIMARY KEY	Defines one or more NOT NULL columns as the primary key as follows: `PRIMARY KEY (column[,...]) [ ENABLED | DISABLED]` You can qualify this constraint with the keyword ENABLED or DISABLED. See Enforcing Constraints below. If you do not name a primary key constraint, Vertica assigns the name C_PRIMARY.
FOREIGN KEY	Adds a referential integrity constraint defining one or more columns as foreign keys as follows: `FOREIGN KEY (column[,... ]) REFERENCES table [(column[,... ])]`

	If you omit *column*, Vertica references the primary key in *table*. If you do not name a foreign key constraint, Vertica assigns the name C_FOREIGN. **Important:** Adding a foreign key constraint requires the following privileges (in addition to privileges also required by ALTER TABLE): • REFERENCES on the referenced table • USAGE on the schema of the referenced table
UNIQUE	Specifies that the data in a column or group of columns is unique with respect to all table rows, as follows: `UNIQUE (column[,...]) [ENABLED | DISABLED]` You can qualify this constraint with the keyword ENABLED or DISABLED. See Enforcing Constraints below. If you do not name a unique constraint, Vertica assigns the name C_UNIQUE.
CHECK	Specifies a check condition as an expression that returns a Boolean value, as follows: `CHECK (expression) [ENABLED | DISABLED]` You can qualify this constraint with the keyword ENABLED or DISABLED. See Enforcing Constraints below. If you do not name a check constraint, Vertica assigns the name C_CHECK.

Privileges

Non-superusers: table owner, or the following privileges:

- USAGE on schema
- ALTER on table
- SELECT on table to enable or disable constraint enforcement

Enforcing Constraints

A table can specify whether Vertica automatically enforces a primary key, unique key or check constraint with the keyword ENABLED or DISABLED. If you omit ENABLED or DISABLED, Vertica determines whether to enable the constraint automatically by checking the appropriate configuration parameter:

- EnableNewPrimaryKeysByDefault
- EnableNewUniqueKeysByDefault
- EnableNewCheckConstraintsByDefault

For details, see Constraint Enforcement.

Examples

The following example creates a table (t01) with a primary key constraint.

```
CREATE TABLE t01 (id int CONSTRAINT sampleconstraint PRIMARY KEY);
CREATE TABLE
```

This example creates the same table without the constraint, and then adds the constraint with ALTER TABLE ADD CONSTRAINT

```
CREATE TABLE t01 (id int);
CREATE TABLE

ALTER TABLE t01 ADD CONSTRAINT sampleconstraint PRIMARY KEY(id);
WARNING 2623:  Column "id" definition changed to NOT NULL
ALTER TABLE
```

The following example creates a table (addapk) with two columns, adds a third column to the table, and then adds a primary key constraint on the third column.

```
=> CREATE TABLE addapk (col1 INT, col2 INT);
CREATE TABLE

=> ALTER TABLE addapk ADD COLUMN col3 INT;
ALTER TABLE

=> ALTER TABLE addapk ADD CONSTRAINT col3constraint PRIMARY KEY (col3) ENABLED;
WARNING 2623:  Column "col3" definition changed to NOT NULL
ALTER TABLE
```

Using the sample table addapk, check that the primary key constraint is enabled (is_enabled is t).

```
=> SELECT constraint_name, column_name, constraint_type, is_enabled FROM PRIMARY_KEYS WHERE table_
name IN ('addapk');

 constraint_name | column_name | constraint_type | is_enabled
-----------------+-------------+-----------------+------------
 col3constraint  | col3        | p               | t
(1 row)
```

This example disables the constraint using `ALTER TABLE ALTER CONSTRAINT`.

```
=> ALTER TABLE addapk ALTER CONSTRAINT col3constraint DISABLED;
```

Check that the primary key is now disabled (`is_enabled` is `f`).

```
=> SELECT constraint_name, column_name, constraint_type, is_enabled FROM PRIMARY_KEYS WHERE table_
name IN ('addapk');

 constraint_name | column_name | constraint_type | is_enabled
-----------------+-------------+-----------------+------------
 col3constraint  | col3        | p               | f
(1 row)
```

For a general discussion of constraints, see Constraints. For additional examples of creating and naming constraints, see Naming Constraints.

CREATE TEMPORARY TABLE

Creates a table whose data persists only during the current session. Temporary table data is not visible to other sessions.

Syntax

Create with column definitions

```
CREATE [ scope ] TEMP[ORARY] TABLE [ IF NOT EXISTS ] [[database.]schema.]table-name
   ( column-definition[,…] )
   [ table-constraint ]
   [ ON COMMIT { DELETE | PRESERVE } ROWS ]
   [ NO PROJECTION ]
   [ ORDER BY table-column[,…] ]
   [ segmentation-spec ]
   [ KSAFE [k-num] ]
   [ {INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES ]
```

Create from another table

```
CREATE TEMP[ORARY] TABLE [ IF NOT EXISTS ] [[database.]schema.]table-name
   [ ( column-name-list ) ]
   [ ON COMMIT { DELETE | PRESERVE } ROWS ]
AS  [ /*+ hint[, hint] */ ] [ AT epoch ] query [ ENCODED BY column-ref-list ]
```

Parameters

scope	Specifies visibility of the table definition: • GLOBAL: The table definition is visible to all sessions, and persists until you explicitly drop the table. • LOCAL: the table definition is visible only to the session in which it is created, and is dropped when the session ends. If no scope is specified, Vertica uses the default that is set by configuration parameter DefaultTempTableLocal. Regardless of this setting, retention of temporary table data is set by the keywords ON COMMIT DELETE and ON COMMIT PRESERVE (see below). For more information, see Creating Temporary Tables.
IF NOT EXISTS	Specifies to generate an informational message if an object already exists under the specified name. If you omit this option and the object exists, Vertica generates a ROLLBACK error message. In both cases, the object is not created. The IF NOT EXISTS clause is useful for SQL scripts where you want to create an object if it does not already exist, and reuse the existing object if it does. For related information, see ON_ERROR_STOP.
[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.

	If you do not specify a schema, the table is created in the default schema.
table-name	Identifies the table to create, where *table-name* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
column-definition	Defines a table column. A table can have up to 1600 columns.
table-constraint	Adds a constraint to table metadata.
ON COMMIT	Specifies whether data is transaction- or session-scoped: `ON COMMIT {PRESERVE | DELETE} ROWS` • DELETE (default) marks the temporary table for transaction-scoped data. Vertica removes all table data after each commit. • PRESERVE marks the temporary table for session-scoped data, which is preserved beyond the lifetime of a single transaction. Vertica removes all table data when the session ends.
NO PROJECTION	Prevents Vertica from creating auto-projections for this table. A superprojection is created only when data is explicitly loaded into this table. NO PROJECTION is invalid with the following clauses: • ORDER BY • KSAFE • Any segmentation clause (*hash-segmentation-clause* or *unsegmented-clause*).
{INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES	Specifies default inheritance of schema privileges for this table: • INCLUDE [SCHEMA] PRIVILEGES specifies that the table inherits privileges that are set on its schema. This is the default behavior if privileges inheritance is enabled for the schema. • EXCLUDE [SCHEMA] PRIVILEGES disables inheritance of privileges from the schema.

	For details, see Inherited Privileges in the Administrator's Guide.
ORDER BY *table-column*[,…]	Invalid for external tables, specifies columns from the SELECT list on which to sort the superprojection that is automatically created for this table. The ORDER BY clause cannot include qualifiers ASC or DESC. Vertica always stores projection data in ascending sort order. If you omit the ORDER BY clause, Vertica uses the SELECT list order as the projection sort order.
segmentation-spec	Invalid for external tables, specifies how to distribute data for auto-projections of this table. Supply one of the following clauses: • *hash-segmentation-clause*: Specifies to segment data evenly and distribute across cluster nodes. Vertica recommends segmenting large tables. For details, see Hash Segmentation Clause. • *unsegmented-clause*: Specifies to create an unsegmented projection. For details, see Unsegmented Clause. If this clause is omitted, Vertica generates auto-projections with default hash segmentation.
KSAFE [*k-num*]	Invalid for external tables, specifies K-safety of auto-projections created for this table, where *k-num* must be equal to or greater than system K-safety. If you omit this option, the projection uses the system K-safety level. For general information, see K-Safety in an Enterprise Mode Database in Vertica Concepts. **Eon Mode**: K-safety of temporary tables is always set to 0, regardless of system K-safety. If a CREATE TEMPORARY TABLE statement sets *k-num* greater than 0, Vertica returns an warning.
column-name-list	Valid only when creating a table from a query (AS *query*), defines column names that map to the query output. If you omit this list, Vertica uses the query output column names. The names in *column-name-list* and queried columns must

	be the same in number.
	
	For example:
	
	`CREATE TABLE customer_occupations (name, profession)`
	`  AS SELECT customer_name, occupation FROM customer_dimension;`
	
	This clause and the ENCODED BY clause are mutually exclusive. Column name lists are invalid for external tables

AS *query*	Creates and loads a table from the results of a query, specified as follows: `AS [ /*+ LABEL */ ] [ AT epoch ] query` You cannot use SELECT AS to query tables containing complex types, even if you do not select the columns with those types. Complex types are supported only in external tables. See Complex Types. For details, see Creating a Table from a Query in the Administrator's Guide.
ENCODED BY *column-ref-list*	A comma-delimited list of columns from the source table, where each column is qualified by one or both of the following encoding options: • ACCESSRANK *integer*: Overrides the default access rank for a column, useful for prioritizing access to a column. See Prioritizing Column Access Speed. • ENCODING *encoding-type*: Specifies the type of encoding to use on the column. The default encoding type is AUTO. This option and *column-name-list* are mutually exclusive. This option is invalid for external tables

Privileges

The following privileges are required:

- CREATE privileges on the table schema
- If creating a temporary table that includes a named sequence:
  - SELECT privilege on sequence object
  - USAGE privilege on sequence schema

Restrictions

- Queries on temporary tables are subject to the same restrictions on SQL support as persistent tables.
- You cannot add projections to non-empty, global temporary tables (ON COMMIT PRESERVE ROWS). Make sure that projections exist before you load data. See Auto-Projections in the Administrator's Guide.
- While you can add projections for temporary tables that are defined with ON COMMIT DELETE ROWS specified, be aware that you might lose all data.
- Mergeout operations cannot be used on session-scoped temporary data.
- In general, session-scoped temporary table data is not visible using system (virtual) tables.
- Temporary tables do not recover. If a node fails, queries that use the temporary table also fail. Restart the session and populate the temporary table.

See Also

- Creating Temporary Tables
- ALTER TABLE
- CREATE TABLE

CREATE TEXT INDEX

Creates a text index used to perform text searches.

Syntax

```
CREATE TEXT INDEX [[database.]schema.]txtindex-name
 ON [schema.]source-table (unique-id, text-field [, column-name,…])
 [STEMMER {stemmer-name(stemmer-input-data-type)| NONE}]
 [TOKENIZER tokenizer-name(tokenizer-input-data-type)];
```

Parameters

[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database. If you do not specify a schema, the table is created in the default schema.
txtindex-name	The text index name.
source-table	The source table to index.
unique-id	The name of the column in the source table that contains a unique identifier. Any data type is permissible. The column must be the primary key in the source table.
text-field	The name of the column in the source table that contains the text field. Valid data types are: • CHAR • VARCHAR • LONG VARCHAR • VARBINARY • LONG VARBINARY Nulls are allowed.
column-name	The name of a column or columns to be included as additional columns.
stemmer-name	The name of the stemmer.
stemmer-input-data-type	The input data type of the *stemmer-name* function.
tokenizer-name	Specifies the name of the tokenizer.

tokenizer-input-data-type	This value is the input data type of the *tokenizer-name* function. It can accept any number of arguments. If a Vertica Tokenizers is used, then this parameter can be omitted.

Privileges

The index automatically inherits the query permissions of its parent table. The table owner and dbadmin will be allowed to create and/or modify the indices.

Important:
Do not alter the contents or definitions of the text index. If the contents or definitions of the text index are altered, then the results will not appropriately match the source table.

Requirements

- Requires there be a column with a unique identifier set as the primary key.
- The source table must have an associated projection, and must be both sorted and segmented by the primary key.

Behavior

If data within a table is partitioned, then an extra column appears in the text index, showing the partition.

Examples

The following example shows how to create a text index with an additional unindexed column on the table t_log using the CREATE TEXT INDEX statement:

```
=> CREATE TEXT INDEX t_log_index ON t_log (id, text, day_of_week);
CREATE INDEX

=> SELECT * FROM t_log_index;
        token          | doc_id | day_of_week
-----------------------+--------+-------------
'catalog               |      1 | Monday
```

```
'dbadmin'              |      2 | Monday
2014-06-04             |      1 | Monday
2014-06-04             |      2 | Monday
2014-06-04             |      3 | Monday
2014-06-04             |      4 | Monday
2014-06-04             |      5 | Monday
2014-06-04             |      6 | Monday
2014-06-04             |      7 | Monday
2014-06-04             |      8 | Monday
45035996273704966      |      3 | Tuesday
45035996273704968      |      4 | Tuesday
<INFO>                 |      1 | Tuesday
<INFO>                 |      6 | Tuesday
<INFO>                 |      7 | Tuesday
<INFO>                 |      8 | Tuesday
<WARNING>              |      2 | Tuesday
<WARNING>              |      3 | Tuesday
<WARNING>              |      4 | Tuesday
<WARNING>              |      5 | Tuesday

...

(97 rows)
```

The following example shows a text index, tpart_index, created from a partitioned source table:

```
=> SELECT * FROM tpart_index;
         token          | doc_id | partition
------------------------+--------+-----------
 0                      |      4 |      2014
 0                      |      5 |      2014
 11:00:49.568           |      4 |      2014
 11:00:49.568           |      5 |      2014
 11:00:49.569           |      6 |      2014
 <INFO>                 |      6 |      2014

- DROP TEXT INDEX

CREATE USER

Adds a name to the list of authorized database users.

Note:
New users lack default access to schema PUBLIC. Be sure to assign new users USAGE privileges to the PUBLIC schema (GRANT USAGE ON SCHEMA PUBLIC)

Syntax

```
CREATE USER user-name [ account-parameter value[,…] ]
```

Parameters

user-name	Name of the new user. Names that contain special characters must be double-quoted. To enforce case-sensitivity, use double-quotes. For details on name requirements, see Creating a Database Name and Password.
account-parameter value	One or more user account parameter settings (see below).

User Account Parameters

Specify one or more user account parameters as a comma-delimited list:

```
account-parameter setting[,…]
```

Parameter	Settings
ACCOUNT	Locks or unlocks user access to the database, set to one of the following: • UNLOCK (default) • LOCK prevents a new user from logging in. This can be useful when creating an account for a user who does not need immediate access. **Tip:** To automate account locking, set a maximum number of failed login attempts with CREATE PROFILE.
GRACEPERIOD	Specifies how long a user query can block on any session socket, set to one of the following: • NONE (default): Removes any grace period previously set on session queries. • '*interval*': Specifies as an interval the maximum grace period for current session queries, up to 20 days. For details, see Handling Session Socket Blocking.
IDENTIFIED BY '[*password*]'	Sets the new user's password, where *password* must conform to the password complexity policy set by the user's profile. If you supply an empty string or omit this parameter, the user is assigned no password and is not prompted for one when connecting. For details, see Password Guidelines and Creating a Database Name and Password.
IDLESESSIONTIMEOUT	The length of time the system waits before disconnecting an idle session, set to one of the following: • NONE (default): No limit set for this user. If you omit this parameter, no limit is set for this user.

Parameter	Settings
	• '*interval*' An interval value, up to one year. For details, see Managing Client Connections.

MAXCONNECTIONS	Specifies the maximum number of connections the user can have to the server, set to one of the following:
	
	• NONE (default): No limit set. If you omit this parameter, the user can have an unlimited number of connections across the database cluster.
	• *integer* [*connection-mode*]: Specifies the maximum number of connections allowed to the user, where *connection-mode* is one of the following:
	
	  • ON DATABASE (default): Allows up to *integer* connections across the database cluster.
	  • ON NODE: Allows up to *integer* connections to each node.
	
	For details, see Managing Client Connections.

MEMORYCAP	Specifies how much memory can be allocated to user requests, set to one of the following:
	
	• NONE (default): No limit
	• A string value that specifies the memory limit, one of the following:
	
	  • *int*% — Expresses the maximum as a percentage of total memory available to the Resource Manager, where *int* is an integer value between 0 and 100.For example:
	
	  MEMORYCAP '40%'
	
	  • *int*{K|M|G|T} — Expresses memory allocation in kilobytes, megabytes,

Parameter	Settings
	gigabytes, or terabytes. For example: `MEMORYCAP '10G'`
`PASSWORD EXPIRE`	Forces immediate expiration of the user's password. The user must change the password on the next login. **Note:** `PASSWORD EXPIRE` has no effect when using external password authentication methods such as LDAP or Kerberos.
`PROFILE`	Assigns a profile that controls password requirements for this user, set to one of the following: • `DEFAULT` (default): Assigns the default database profile to this user. • *`profile-name`*: A profile that is defined by CREATE PROFILE. If you omit this parameter, the user is assigned the default profile.
`RESOURCE POOL`	Assigns a default resource pool to this user. The user must also be granted privileges to this pool, unless privileges to the pool are set to `PUBLIC`.
`RUNTIMECAP`	Specifies how long this user's queries can execute, set to one of the following: • `NONE` (default): No limit set for this user. If you omit this parameter, no limit is set for this user. • '*`interval`*' An interval value, up to one year. A query's runtime limit can be set at three levels: the user's runtime limit, the user's resource pool, and the session setting. For more information, see Setting a Runtime Limit for Queries in the Administrator's Guide.

Parameter	Settings
SEARCH_PATH	Specifies the user's default search path that tells Vertica which schemas to search for unqualified references to tables and UDFs, set to one of the following: • DEFAULT (default): Sets the search path as follows: `"$user", public, v_catalog, v_monitor, v_internal` • Comma-delimited list of schemas. For details, see Setting Search Paths in the Administrator's Guide.

TEMPSPACECAP	Limits how much temporary file storage is available for user requests, set to one of the following:
	• NONE (default): No limit
	• A string value that specifies the memory limit, one of the following:
	  • *int*% — Expresses the maximum as a percentage of total memory available to the Resource Manager, where *int* is an integer value between 0 and 100.For example:
	  `MEMORYCAP '40%'`
	  • *int*{K|M|G|T} — Expresses memory allocation in kilobytes, megabytes, gigabytes, or terabytes. For example:
	  `TEMPSPACECAP '10G'`

Privileges

Superuser

User Name Best Practices

Vertica database user names are logically separate from user names of the operating system in which the server runs. If all the users of a particular server also have accounts on the server's machine, it makes sense to assign database user names that match their operating system user names. However, a server that accepts remote connections might many database users with no local operating system account. In this case, there is no need to connect database and system user names.

Examples

```
=> CREATE USER Fred IDENTIFIED BY 'Mxyzptlk';
=> GRANT USAGE ON SCHEMA PUBLIC to Fred;
```

See Also

- ALTER USER
- DROP USER

CREATE VIEW

Defines a **view**. Views are read only, so they do not support insert, update, delete, or copy operations.

Syntax

```
CREATE [ OR REPLACE ] VIEW [[database.]schema.]view [ (column[,…]) ]
  [ {INCLUDE|EXCLUDE} [SCHEMA] PRIVILEGES ] AS query
```

Parameters

OR REPLACE	Specifies to overwrite the existing view *view-name*. If you omit this option and *view-name* already exists, CREATE VIEW returns an error.

	Any grants assigned to the view before you execute a CREATE OR REPLACE remain on the updated view. See GRANT (View).
[*database*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
view	Identifies the view to create, where *view* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
column[,…]	A list of names to use as view column names. Vertica maps view column names to query columns according to the order of their respective lists. By default, the view uses column names as they are specified in the query. Each view can contain up to 1600 columns.
query	A SELECT statement that the temporary view executes. The SELECT statement can reference tables, temporary tables, and other views. The statement can reference individual fields from ROW columns.
{INCLUDE|EXCLUDE} [SCHEMA] PRIVILEGES	Specifies whether this view inherits schema privileges: • INCLUDE PRIVILEGES specifies that the view inherits privileges that are set on its schema. This is the default behavior if privileges inheritance is enabled for the schema. • EXCLUDE PRIVILEGES disables inheritance of privileges from the schema. For details, see Inherited Privileges in the Administrator's Guide.

Privileges

See Creating Views

Examples

The following example shows how to create a view that contains data from multiple tables.

```
=> CREATE VIEW temp_t0 AS SELECT * from t0_p1 UNION ALL
     SELECT * from t0_p2 UNION ALL
       SELECT * from t0_p3 UNION ALL
         SELECT * from t0_p4 UNION ALL
           SELECT * from t0_p5;
```

See Also

- ALTER VIEW
- CREATE LOCAL TEMPORARY VIEW
- Creating Views
- DROP VIEW
- GRANT (View)
- REVOKE (View)

DEACTIVATE DIRECTED QUERY

Deactivates one or more directed queries previously activated by ACTIVATE DIRECTED QUERY.

Syntax

DEACTIVATE DIRECTED QUERY {*query-name*|*input-query*}

Arguments

query-name	Identifies the directed query to deactivate. To obtain identifiers for directed queries, use GET DIRECTED QUERY, or query the system table V_CATALOG.DIRECTED_QUERIES.
input-query	The input query of the directed queries to deactivate. Use this argument to deactivate multiple direct queries that map to the same input query.

Privileges

Superuser

DELETE

Removes the specified rows from a table and returns a count of the deleted rows. A count of 0 is not an error, but indicates that no rows matched the condition. An unqualified DELETE statement (omits a WHERE clause) removes all rows but leaves intact table columns, projections, and constraints.

DELETE supports subqueries and joins, so you can delete values in a table based on values in other tables.

Important:
Vertica's implementation of DELETE differs from traditional databases: it does not delete data from disk storage; it marks rows as deleted so they are available for historical queries.

Syntax

```
DELETE [ /*+ LABEL */ ]  FROM [[database.]schema.]table [ where-clause ]
```

Parameters

LABEL	Assigns a label to a statement in order to identify it for profiling and debugging.
[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table	Any table, including temporary tables.

where-clause	Specifies which rows to mark for deletion. If you omit this clause, DELETE behavior varies depending on whether the table is persistent or temporary. See below for details.

Privileges

Table owner or user with GRANT OPTION is grantor.

- DELETE privilege on table
- USAGE privilege on the schema of the target table
- SELECT privilege on a table when the DELETE statement includes a WHERE or SET clause that specifies columns from that table.

Committing INSERT, UPDATE, and DELETE

Vertica follows the SQL-92 transaction model, so successive INSERT, UPDATE, and DELETE statements are included in the same transaction. You do not need to explicitly start this transaction; however, you must explicitly end it with COMMIT, or implicitly end it with COPY; otherwise Vertica discards all changes that were made within the transaction.

Restrictions

You cannot execute DELETE on a projection.

Deleting from Persistent Tables

DELETE removes data directly from the ROS.

Deleting from a Temporary Table

DELETE execution on temporary tables varies, depending on whether the table was created with ON COMMIT DELETE ROWS (default) or ON COMMIT PRESERVE ROWS:

- If DELETE contains a WHERE clause that specifies which rows to remove, behavior is identical: DELETE marks the rows for deletion. In both cases, you cannot roll back to an earlier savepoint.
- If DELETE omits a WHERE clause and the table was created with ON COMMIT PRESERVE ROWS, Vertica marks all table rows for deletion. If the table was created with ON COMMIT DELETE ROWS, DELETE behaves like TRUNCATE TABLE and removes all rows from storage.

> **Note:**
> If you issue an unqualified DELETE statement on a temporary table created with ON COMMIT DELETE ROWS, Vertica removes all rows from storage but does not end the transaction.

Examples

The following command removes all rows from temporary table temp1:

```
=> DELETE FROM temp1;
```

The following command deletes all records from anchor table T where C1 = C2 - C1.

```
=> DELETE FROM T WHERE C1=C2-C1;
```

The following command deletes all records from the customer table in the retail schema where the state attribute is in MA or NH:

```
=> DELETE FROM retail.customer WHERE  state IN ('MA', 'NH');
```

For examples that show how to nest a subquery within a DELETE statement, see Subqueries in UPDATE and DELETE in Analyzing Data.

- Best Practices for DELETE and UPDATE

DISCONNECT

Closes a connection to another Vertica database that was opened in the same session with `CONNECT TO VERTICA`.

Note:
Closing your session also closes the database connection. However, it is a good practice to explicitly close the connection to the other database, both to free up resources and to prevent issues with other SQL scripts that might be running in your session. Always closing the connection prevents potential errors if you run a script in the same session that attempts to open a connection to the same database, since each session can only have one connection to a given database at a time.

Syntax

```
DISCONNECT db-spec
```

Parameters

db-spec	Specifies the target database, either the database name or DEFAULT.

Privileges

None

Example

```
=> DISCONNECT DEFAULT;
DISCONNECT
```

DROP Statements

DROP statements let you delete database objects such as schemas, tables, and users.

DROP ACCESS POLICY

Removes an access policy from a column or row.

Syntax

```
DROP ACCESS POLICY ON table FOR { COLUMN column | ROWS}
```

Parameters

table	Name of the table that contains the column access policy to remove
column	Name of the column that contains the access policy to remove

Privileges

Superuser

Examples

These examples show various cases where you can drop an access policy.

Drop column access policy:

```
=> DROP ACCESS POLICY ON customer FOR COLUMN Customer_Number;
```

Drop row access policy on a table:

```
=> DROP ACCESS POLICY ON customer_info FOR ROWS;
```

DROP AGGREGATE FUNCTION

Drops a User Defined Aggregate Function (UDAF) from the Vertica catalog.

Syntax

```
DROP AGGREGATE FUNCTION [ IF EXISTS ] [[database.]schema.]function( [ arglist ] )
```

Parameters

`IF EXISTS`	Specifies not to report an error if the function to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
[*database* .]*schema*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
`function`	Specifies a name of the SQL function to drop. If the function name is schema-qualified, the function is dropped from the specified schema (as noted above).
`arglist`	A comma delimited list of argument names and data types that are passed to the function, formatted as follows: `[argname] argname[,…]` • *`argname`* optionally specifies the argument name, typically a column name. • *`argtype`* specifies the argument's data type, where *`argtype`* matches a Vertica data type.

Privileges

One of the following:

- Superuser
- Owner

Requirements

- To drop a function, you must specify the argument types because several functions might share the same name with different parameters.
- Vertica does not check for dependencies, so if you drop a SQL function where other objects reference it (such as views or other SQL functions), Vertica returns an error when those objects are used and not when the function is dropped.

Example

The following command drops the ag_avg function:

```
=> DROP AGGREGATE FUNCTION ag_avg(numeric);
DROP AGGREGATE FUNCTION
```

See Also

- ALTER FUNCTION (Scalar)
- CREATE AGGREGATE FUNCTION
- GRANT (User Defined Extension)
- REVOKE (User Defined Extension)
- USER_FUNCTIONS
- User-Defined SQL Functions
- Developing User-Defined Extensions (UDxs)
- User-Defined Aggregate Functions

DROP ANALYTIC FUNCTION

Drops a user-defined analytic function from the Vertica catalog.

Syntax

```
DROP ANALYTIC FUNCTION [ IF EXISTS ] [[database.]schema.]function( [ arglist ] )
```

Parameters

`IF EXISTS`	Specifies not to report an error if the function to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
`[`*`database`*`.]`*`schema`*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
`function`	Specifies a name of the SQL function to drop. If the function name is schema-qualified, the function is dropped from the specified schema (as noted above).
`arglist`	A comma delimited list of argument names and data types that are passed to the function, formatted as follows: `{ [`*`argname`*`] `*`argtype`*` }[,…]` • *`argname`* optionally specifies the argument name, typically a column name. • *`argtype`* specifies the argument's data type, where *`argtype`* matches a Vertica data type.

Privileges

Non-superuser: Owner

Requirements

- To drop a function, you must specify the argument types because several functions might share the same name with different parameters.
- Vertica does not check for dependencies, so if you drop a SQL function where other objects reference it (such as views or other SQL functions), Vertica returns an error when those objects are used and not when the function is dropped.

Example

The following command drops the analytic_avg function:

```
=> DROP ANALYTIC FUNCTION analytic_avg(numeric);
DROP ANALYTIC FUNCTION
```

See Also

Analytic Functions (UDAnFs)

DROP AUTHENTICATION

Drops an authentication method.

Syntax

DROP AUTHENTICATION [IF EXISTS] *auth-method-name* [CASCADE]

Parameters

IF EXISTS	Specifies not to report an error if the authentication method to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
auth-method-name	Name of the authentication method to drop.
CASCADE	Required if the authentication method to drop is granted to users. In this case, omission of this option causes the drop operation to fail.

Privileges

Superuser

Examples

Delete authentication method `md5_auth`:

```
=> DROP AUTHENTICATION md5_auth;
```

Use CASCADE to drop authentication method that was granted to a user:

```
=> CREATE AUTHENTICATION localpwd METHOD 'password' LOCAL;
=> GRANT AUTHENTICATION localpwd TO jsmith;
=> DROP AUTHENTICATION localpwd CASCADE;
```

See Also

- ALTER AUTHENTICATION
- CREATE AUTHENTICATION
- GRANT (Authentication)
- REVOKE (Authentication)

DROP CERTIFICATE

Drops a TLS certificate from the database.

To view existing certificates, query CERTIFICATES.

Syntax

```
DROP CERTIFICATE [ IF EXISTS ] certificate-name [,…] [ CASCADE ]
```

Parameters

`IF EXISTS`	Vertica does not report an error if the certificate to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
`certificate-`	The name of the certificate to drop.

name	
CASCADE	Drops dependent objects before dropping the certificate.

Privileges

Ownership of the certificate

Examples

Drop `server_cert`, if it exists:

```
=> DROP CERTIFICATE server_cert;
DROP CERTIFICATE;
```

Drop a CA certificate and its dependencies (typically the certificates that it has signed):

```
=> DROP CERTIFICATE ca_cert CASCADE;
DROP CERTIFICATE;
```

See Also

- CREATE CERTIFICATE
- DROP KEY

DROP DIRECTED QUERY

Removes a directed query from the database. If the directed query is active, Vertica deactivates it before removal.

Syntax

`DROP DIRECTED QUERY` *`directedqueryID`*

Arguments

directedqueryID	Identifies the directed query to remove from the database. To obtain identifiers for directed queries, use GET DIRECTED QUERY, or query the system table V_CATALOG.DIRECTED_QUERIES.

Privileges

Superuser

DROP FAULT GROUP

Removes the specified fault group and its child fault groups, placing all nodes under the parent of the dropped fault group.

To drop all fault groups, use ALTER DATABASE..DROP ALL FAULT GROUP.

To add an orphaned node back to a fault group, you must manually reassign it to a new or existing fault group with CREATE FAULT GROUP and ALTER FAULT GROUP…ADD NODE.

Tip:
For a list of all fault groups defined in the cluster, query system table FAULT_GROUPS .

Syntax

```
DROP FAULT GROUP [ IF EXISTS ] fault-group
```

Parameters

IF EXISTS	Specifies not to report an error if *fault-group* does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
fault-group	Specifies the name of the fault group to drop.

Privileges

Superuser

Examples

```
=> DROP FAULT GROUP group2;
DROP FAULT GROUP
```

See Also

- Fault Groups
- High Availability with Fault Groups
- CLUSTER_LAYOUT

DROP FILTER

Drops a User Defined Load Filter function from the Vertica catalog.

Syntax

```
DROP FILTER [[database.]schema.]filter()
```

Parameters

[*database*.]*schema*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
`filter`()	Specifies the filter function to drop. You must append empty parentheses to the function name.

Privileges

Non-superuser:

- Owner or DROP privilege
- USAGE privilege on schema

Example

The following command drops the `Iconverter` filter function::

```
=> drop filter Iconverter();
DROP FILTER
```

See Also

- ALTER FUNCTION (Scalar)
- CREATE FILTER
- USER_FUNCTIONS
- User-Defined Load (UDL)

DROP FUNCTION

Drops an SQL function or user-defined functions (UDFs) from the Vertica catalog.

Syntax

```
DROP FUNCTION [ IF EXISTS ] [[database.]schema.]function[,…] ( [ arg-list ] )
```

Parameters

`IF EXISTS`	Specifies not to report an error if the function to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
`[database.]schema`	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
`function`	The SQL or user-defined function (UDF) to drop, where UDFs can be one of the following types: • Scalar function (UDSF) • Analytic function (UDAnF) • Load (UDL) functions: source, filter, and parser **Note:** You drop aggregate and transformation functions with `DROP AGGREGATE FUNCTION` and `DROP TRANSFORM FUNCTION`, respectively.
`arg-list`	A comma-delimited list of arguments as defined for this function when it was created, specified as follows: `[arg-name] arg-type[,…]`

	where *arg-name* optionally qualifies *arg-type*: • *arg-name* is typically a column name. • *arg-type* is the name of an SQL data type supported by Vertica.

Privileges

Non-superuser, one of the following:

- Owner or DROP privilege
- USAGE privilege on schema

Requirements

- To drop a function, you must specify the argument types because several functions might share the same name with different parameters.
- Vertica does not check for dependencies when you drop a SQL function, so if other objects reference it (such as views or other SQL functions), Vertica returns an error only when those objects are used.

Example

The following command drops the `zerowhennull` function in the `macros` schema:

```
=>  DROP FUNCTION macros.zerowhennull(x INT);
DROP FUNCTION
```

See Also

DROP KEY

Drops a cryptographic key from the database.

To view existing cryptographic keys, query CRYPTOGRAPHIC_KEYS.

Syntax

```
DROP KEY [ IF EXISTS ] key-name [,…] [ CASCADE ]
```

Parameters

IF EXISTS	Vertica does not report an error if the key to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
key-name	The name of the cryptographic key to drop.
CASCADE	Drops dependent objects before dropping the key.

Privileges

Ownership of the key

Examples

Drop k_ca, if it exists:

```
=> DROP KEY k_ca IF EXISTS;
DROP KEY;
```

Drop k_client and its dependencies (the certificate it's associated with):

```
=> DROP KEY k_client CASCADE;
DROP KEY;
```

See Also

- CREATE KEY
- DROP CERTIFICATE

DROP LIBRARY

Removes a shared library from the database. The library file is deleted from managed directories on the Vertica nodes. The user defined functions (UDFs) in the library are no longer available. See Developing User-Defined Extensions (UDxs) in Extending Vertica for details.

Syntax

```
DROP LIBRARY [ IF EXISTS ] [[database.]schema.]library [  CASCADE]
```

Parameters

IF EXISTS	Specifies not to report an error if the library to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
[*database* .]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
library	The name of the library to drop, the same name used in CREATE LIBRARY to load the library.
CASCADE	Drops any functions that were defined using the library. DROP LIBRARY fails if CASCADE is omitted and one or more UDFs use the target library.

Privileges

Superuser

Examples

```
=> DROP LIBRARY MyFunctions CASCADE;
```

DROP LOAD BALANCE GROUP

Deletes a load balancing group.

Syntax

```
DROP LOAD BALANCE GROUP [ IF EXISTS ] group_name [ CASCADE ]
```

Parameters

IF EXISTS	Specifies not to report an error if the load balance group to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
group_name	The name of the group to drop.
[CASCADE]	Also drops all load balancing routing rules that target this group. If you do not supply this keyword and one or more routing rules target *group_name*, this statement fails with an error message.

Privileges

Superuser

Examples

The following statement demonstrates the error you get if the load balancing group has a dependent routing rule, and the use of the CASCADE keyword:

```
=> DROP LOAD BALANCE GROUP group_all;
NOTICE 4927:  The RoutingRule catch_all depends on LoadBalanceGroup group_all
ROLLBACK 3128:  DROP failed due to dependencies
DETAIL:  Cannot drop LoadBalanceGroup group_all because other objects depend on it
HINT:  Use DROP ... CASCADE to drop the dependent objects too

=> DROP LOAD BALANCE GROUP group_all CASCADE;
DROP LOAD BALANCE GROUP
```

See Also

DROP MODEL

Removes one or more models from the Vertica database.

Syntax

```
DROP MODEL [ IF EXISTS ] [[database.]schema.]model[,…]
```

Parameters

`IF EXISTS`	Specifies not to report an error if the models to drop do not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
[*database* .]*schema*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
`model`	The model to drop.

Privileges

One of the following:

- Superuser
- Non-superuser: model owner

Examples

See Dropping Models in Analyzing Data.

DROP NETWORK ADDRESS

Deletes a network address from the catalog. A network address is a name for a IP address and port on a node for use in connection load balancing policies.

Syntax

```
DROP NETWORK ADDRESS [ IF EXISTS ] address-name [ CASCADE ]
```

Parameters

IF EXISTS	Specifies not to report an error if the network address to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
address-name	Name of the network address to drop.
CASCADE	Removes the network address from any load balancing groups that target it. If you do not supply this keyword and one or more load balance groups include this address, this statement fails with an error message.

Privileges

Superuser

Examples

The following statement demonstrates the error you get if the network address has a dependent load balance group, and the use of the CASCADE keyword:

```
=> DROP NETWORK ADDRESS node01;
NOTICE 4927:  The LoadBalanceGroup group_1 depends on NetworkInterface node01
NOTICE 4927:  The LoadBalanceGroup group_random depends on NetworkInterface node01
ROLLBACK 3128:  DROP failed due to dependencies
DETAIL:  Cannot drop NetworkInterface node01 because other objects depend on it
HINT:  Use DROP ... CASCADE to drop the dependent objects too
=> DROP NETWORK ADDRESS node01 CASCADE;
```

```
DROP NETWORK ADDRESS
```

DROP NETWORK INTERFACE

Removes a network interface from Vertica. You can use the CASCADE option to also remove the network interface from any node definition. (See Identify the Database or Nodes Used for Import/Export for more information.)

Syntax

```
DROP NETWORK INTERFACE [ IF EXISTS ] network-interface-name [ CASCADE ]
```

Parameters

The parameters are defined as follows:

IF EXISTS	Specifies not to report an error if the network interface to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
network-interface-name	The network interface to remove.
CASCADE	Removes the network interface from all node definitions.

Privileges

Superuser

Examples

```
=> DROP NETWORK INTERFACE myNetwork;
```

DROP NOTIFIER

Drops a push-based notifier created by `CREATE NOTIFIER`.

Syntax

```
DROP NOTIFIER [ IF EXISTS ] notifier-name
```

Parameters

`IF EXISTS`	Specifies not to report an error if notifier to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
notifier-name	The notifier's unique identifier.

DROP PARSER

Drops a User Defined Load Parser function from the Vertica catalog.

Syntax

```
DROP PARSER[[database.]schema.]parser()
```

Parameters

[*database* .]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
parser()	The name of the parser function to drop. You must append empty parentheses to the function name.

Privileges

Non-superuser:

- Owner or DROP privilege
- USAGE privilege on schema

Examples

```
=> DROP PARSER BasicIntegerParser();
DROP PARSER
```

See Also

- ALTER FUNCTION (Scalar)
- CREATE PARSER
- GRANT (User Defined Extension)
- REVOKE (User Defined Extension)
- USER_FUNCTIONS
- User-Defined Load (UDL)

DROP PROCEDURE

Removes an external procedure from Vertica. Only the reference to the procedure is removed. The external file remains in the *database*/*procedures* directory of each database node.

Syntax

```
DROP PROCEDURE [ IF EXISTS ] [[database.]schema.]procedure( [ arg-list ] )
```

Parameters

IF EXISTS	Specifies not to report an error if the procedure to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent

	objects before attempting to create them.
[*database*.]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
procedure	Specifies the procedure to drop.
arg-list	A comma-delimited list of arguments defined for this procedure when it was created, specified as follows: [*arg-name*] *arg-type*[,…] where *arg-name* optionally qualifies *arg-type*. If no arguments are defined for this procedure, specify empty parentheses.

Privileges

Non-superuser:

- Owner or DROP privilege
- USAGE privilege on schema

Example

```
=> DROP PROCEDURE helloplanet(arg1 varchar);
```

See Also

CREATE PROCEDURE

DROP PROFILE

Removes a user-defined profile (created by `CREATE PROFILE`) from the database. You cannot drop the `DEFAULT` profile.

Syntax

```
DROP PROFILE [ IF EXISTS ] profile-name[,…] [ CASCADE ]
```

Parameters

IF EXISTS	Specifies not to report an error if the profile to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
profile-name	The profile to drop.
CASCADE	Moves all users assigned to the dropped profiles to the DEFAULT profile. If you omit this option and a targeted profile has users assigned to it, Vertica returns an error.

Privileges

Superuser

Example

```
=> DROP PROFILE sample_profile;
```

DROP PROJECTION

Marks a **projection** to drop from the catalog so it is unavailable to user queries.

Syntax

```
DROP PROJECTION [ IF EXISTS ] { [[database.]schema.]projection[,…] } [ RESTRICT | CASCADE ]
```

Parameters

`IF EXISTS`	Specifies not to report an error if the projection to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
`[`*`database`*`.]`*`schema`*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
`projection`	Specifies a projection to drop: • If the projection is unsegmented, all projection replicas in the database cluster are dropped. • If the projection is segmented, drop all buddy projections by specifying the projection base name. You can also specify the name of a specific buddy projection as long as dropping it so does not violate system **K-safety**. See Projection Naming for projection name conventions.
`RESTRICT | CASCADE`	Specifies whether to drop the projection when it contains objects: • `RESTRICT` (default): Drop the projection only if it contains no objects. • `CASCADE`: Drop the projection even if it contains objects.

Privileges

Non-superuser: owner of the anchor table

Restrictions

The following restrictions apply to dropping a projection:

- The projection cannot be the anchor table's **superprojection**.
- You cannot drop a buddy projection if doing so violates system **K-safety**.
- Another projection must be available to enforce the same primary or unique key constraint.

See Also

- CREATE PROJECTION
- GET_PROJECTIONS

DROP RESOURCE POOL

Drops a user-created resource pool. All memory allocated to the pool is returned back to the GENERAL pool.

Syntax

```
DROP RESOURCE POOL pool-name [ FOR { SUBCLUSTER subcluster-name | CURRENT SUBCLUSTER } ]
```

Parameters

pool-name	Specifies the resource pool to drop.
[SUBCLUSTER *subcluster-name* | CURRENT SUBCLUSTER]	Eon Mode only. Specifies the subcluster that you are dropping the resource pool from. When omitted, the resource pool is dropped globally. Attempting to drop a global resource pool while specifying a subcluster returns an error. • SUBCLUSTER — Use this keyword to drop the resource pool for a subcluster with the name *subcluster-name* if you are not connected to it, and it exists. • CURRENT SUBCLUSTER — Drops the specified resource pool from the subcluster that you are currently connected to.

Privileges

Superuser

Dropping a Secondary Pool

If you try to drop a resource pool that is a secondary pool for another resource pool, Vertica returns an error. The error lists the resource pools that depend on the secondary pool you tried to drop. To drop a secondary resource pool, first set the CASCADE TO parameter to DEFAULT on the primary resource pool, and then drop the secondary pool.

For example, you can drop resource pool rp2, which is a secondary pool for rp1, as follows:

```
=> ALTER RESOURCE POOL rp1 CASCADE TO DEFAULT;
=> DROP RESOURCE POOL rp2;
```

Transferring Resource Requests

Any requests queued against the pool are transferred to the GENERAL pool according to the priority of the pool compared to the GENERAL pool. If the pool's priority is higher than the GENERAL pool, the requests are placed at the head of the queue; otherwise the requests are placed at the end of the queue.

Any users who are using the pool are switched to use the GENERAL pool with a NOTICE:

```
NOTICE:  Switched the following users to the General pool: username
```

DROP RESOURCE POOL returns an error if the user does not have permission to use the GENERAL pool. Existing sessions are transferred to the GENERAL pool regardless of whether the session's user has permission to use the GENERAL pool. This can result in additional user privileges if the pool being dropped is more restrictive than the GENERAL pool. To prevent giving users additional privileges, follow this procedure to drop restrictive pools:

1. Revoke the permissions on the pool for all users.
2. Close any sessions that had permissions on the pool.
3. Drop the resource pool.

Examples

This example drops a user-defined resource pool:

```
=> DROP RESOURCE POOL ceo_pool;
```

This Eon Mode example returns the current subcluster, then drops a user-defined resource pool for the current subcluster:

```
=> SELECT CURRENT_SUBCLUSTER_NAME();
 CURRENT_SUBCLUSTER_NAME
-------------------------
 analytics_1
(1 row)

=> DROP RESOURCE POOL dashboard FOR CURRENT SUBCLUSTER;
DROP RESOURCE POOL
```

See Also

- ALTER RESOURCE POOL
- CREATE RESOURCE POOL
- Managing Workloads

DROP ROLE

Removes a role from the database.

You cannot use DROP ROLE on a role added to the Vertica database with the LDAPLink service.

Syntax

```
DROP ROLE [ IF EXISTS ] role-name[,…] [ CASCADE ]
```

Parameters

IF EXISTS	Specifies not to report an error if the roles to drop do not exist. Use this

	clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
role-name	The name of the role to drop
CASCADE	Revoke the role from users and other roles before dropping the role

Privileges

Superuser

Examples

```
=> DROP ROLE appadmin;
NOTICE:  User bob depends on Role appadmin
ROLLBACK:  DROP ROLE failed due to dependencies
DETAIL:  Cannot drop Role appadmin because other objects depend on it
HINT:  Use DROP ROLE ... CASCADE to remove granted roles from the dependent users/roles
=> DROP ROLE appadmin CASCADE;
DROP ROLE
```

See Also

- ALTER ROLE
- CREATE ROLE

DROP ROUTING RULE

Deletes a routing rule from the catalog. Dropping the routing rule

Syntax

```
DROP ROUTING RULE [ IF EXISTS ] rule-name
```

Parameters

IF EXISTS	Specifies not to report an error if the routing rule to drop does not exist.

	Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
rule-name	Name of the rule to drop.

Privileges

Superuser

Examples

```
=> DROP ROUTING RULE internal_clients;
DROP ROUTING RULE
```

DROP SCHEMA

Permanently removes a schema from the database. Be sure that you want to remove the schema before you drop it, because DROP SCHEMA is an irreversible process. Use the CASCADE parameter to drop a schema containing one or more objects.

Syntax

```
DROP SCHEMA [ IF EXISTS ] [database.]schema[,…] [ CASCADE | RESTRICT ]
```

Parameters

IF EXISTS	Specifies not to report an error if the schemas to drop do not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
[*database*.]*schema*	Name of the schema to drop. If you specify a database, it must be the current database.
CASCADE	Specifies to drop the schema and all objects in it, regardless of who owns those objects.

	Caution: Objects in other schemas that depend on objects in the dropped schema—for example, user-defined functions—also are silently dropped.
RESTRICT	Drops the schema only if it is empty (default).

Privileges

Non-superuser: schema owner

Restrictions

- You cannot drop the PUBLIC schema.
- If a user is accessing an object within a schema that is in the process of being dropped, the schema is not deleted until the transaction completes.
- Canceling a DROP SCHEMA statement can cause unpredictable results.

Examples

The following example drops schema S1 only if it doesn't contain any objects:

```
=> DROP SCHEMA S1;
```

The following example drops schema S1 whether or not it contains objects:

```
=> DROP SCHEMA S1 CASCADE;
```

DROP SEQUENCE

Removes the specified named sequence number generator.

Syntax

```
DROP SEQUENCE [ IF EXISTS ] [[database.]schema.]sequence[,…]
```

Parameters

`IF EXISTS`	Specifies not to report an error if the sequences to drop do not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
[*database* .]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
sequence	Name of the sequence to drop.

Privileges

Non-superusers: sequence or schema owner

Restrictions

- For sequences specified in a table's default expression, the default expression fails the next time you try to load data. Vertica does not check for these instances.
- `DROP SEQUENCE` does not support the `CASCADE` keyword. Sequences used in a default expression of a column cannot be dropped until all references to the sequence are removed from the default expression.

Example

The following command drops the sequence named `sequential`.

```
=> DROP SEQUENCE sequential;
```

See Also

- ALTER SEQUENCE
- CREATE SEQUENCE

- CURRVAL
- GRANT (Sequence)
- NEXTVAL
- Sequences

DROP SOURCE

Drops a User Defined Load Source function from the Vertica catalog.

Syntax

```
DROP SOURCE [[database.]schema.]source()
```

Parameters

[*database*.]*schema*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
`source`()	Specifies the source function to drop. You must append empty parentheses to the function name.

Privileges

Non-superuser:

- Owner or DROP privilege
- USAGE privilege on schema

Example

The following command drops the `curl` source function:

```
=> DROP SOURCE curl();
DROP SOURCE
```

See Also

- ALTER FUNCTION (Scalar)
- CREATE SOURCE
- GRANT (User Defined Extension)
- REVOKE (User Defined Extension)
- USER_FUNCTIONS
- User-Defined Load (UDL)

DROP SUBNET

Removes a subnet from Vertica.

Caution:
Before removing a subnet, be sure your database is not configured to allow export on the public subnet.

Syntax

```
DROP SUBNET [ IF EXISTS ] subnet-name[,…] [ CASCADE ]
```

Parameters

The parameters are defined as follows:

IF EXISTS	Specifies not to report an error if the subnets to drop do not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
subnet-name	A subnet to remove.
CASCADE	Removes the specified subnets from all database definitions.

Privileges

Superuser

Examples

```
=> DROP SUBNET mySubnet;
```

See Also

Identify the Database or Nodes Used for Import/Export

DROP TABLE

Removes one or more tables and their **projections**. When you run DROP TABLE, the change is auto-committed.

Syntax

```
DROP TABLE [ IF EXISTS ] [ [database.]schema.]table[,…] [ CASCADE ]
```

Parameters

IF EXISTS	Specifies not to report an error if one or more of the tables to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
[*database* .]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.

table	The table to drop.
CASCADE	Specifies to drop all projections of the target tables. CASCADE is optional if the target tables have only auto-projections. If you omit this option and any of the tables has non-superprojections, Vertica returns an error and rolls back the entire drop operation. This option is not valid for external tables.

Privileges

Non-superuser:

- Table: owner, or DROP privilege
- Table schema: owner, or USAGE privilege

Requirements

- Do not cancel an executing DROP TABLE. Doing so can leave the database in an inconsistent state.
- Check that the target table is not in use, either directly or indirectly—for example, in a view.
- If you drop and restore a table that is referenced by a view, the new table must have the same name and column definitions.

Examples

See Dropping Tables

See Also

- DROP PROJECTION
- TRUNCATE TABLE

DROP TEXT INDEX

Drops a text index used to perform text searches.

Note:
When a source table is dropped that has a text index associated with it, the text index is also dropped.

Syntax

```
DROP TEXT INDEX [ IF EXISTS ] [[database.]schema.]idx-table
```

Parameters

`IF EXISTS`	Specifies not to report an error if the text index to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
[*database* .]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
idx-table	Specifies the text index name. When using more than one schema, specify the schema that contains the index in the `DROP TEXT INDEX` statement.

Privileges

- dbadmin
- Table owner
- DROP privileges on the source table

Examples

```
=> DROP TEXT INDEX t_text_index;
DROP INDEX
```

See Also

- Using Text Search
- CREATE TEXT INDEX

DROP TRANSFORM FUNCTION

Drops a user-defined transform function (UDTF) from the Vertica catalog.

Syntax

```
DROP TRANSFORM FUNCTION [ IF EXISTS ] [[database.]schema.]function( [ arg-list ] )
```

Parameters

`IF EXISTS`	Specifies not to report an error if the function to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
[*database* .]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
function	Specifies the transform function to drop.
arg-list	A comma-delimited list of arguments as defined for this function when it was created, specified as follows: [*arg-name*] *arg-type*[,…] where *arg-name* optionally qualifies *arg-type*: • *arg-name* is typically a column name. • *arg-type* is the name of an SQL data type supported by Vertica.

	Note: You can omit *arg-list* when dropping a polymorphic function.

Privileges

One of the following:

- **Superuser**
- Schema or function owner

Example

The following command drops the `tokenize` UDTF in the `macros` schema:

```
=> DROP TRANSFORM FUNCTION macros.tokenize(varchar);
DROP TRANSFORM FUNCTION
```

The following command drops the `Pagerank` polymorphic function in the `online` schema:

```
=> DROP TRANSFORM FUNCTION online.Pagerank();
DROP TRANSFORM FUNCTION
```

See Also

CREATE TRANSFORM FUNCTION

DROP USER

Removes a name from the list of authorized database users.

DROP USER can not remove a user that was added to the Vertica database with the LDAPLink service.

Syntax

```
DROP USER [ IF EXISTS ] user-name[,…] [ CASCADE ]
```

Parameters

IF EXISTS	Specifies not to report an error if the users to drop do not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
user-name	The name of a user to drop.
CASCADE	Drops all user-defined objects created by the user dropped, including schema, table and all views that reference the table, and the table's associated projections.

Privileges

Superuser

Examples

DROP USER fails if objects exist that were created by the user, such as schemas, and tables and their associated projections:

```
=> DROP USER user1;
NOTICE:  Table T_tbd1 depends on User user1
ROLLBACK:  DROP failed due to dependencies
DETAIL:  Cannot drop User user1 because other objects depend on it
HINT:  Use DROP ... CASCADE to drop the dependent objects too
```

DROP USER CASCADE succeeds regardless of any pre-existing user-defined objects. The statement forcibly drops all user-defined objects, such as schemas, tables and their associated projections:

```
=> DROP USER user1 CASCADE;
```

Caution:
Tables owned by the user being dropped cannot be recovered after you issue DROP USER CASCADE.

DROP USER succeeds if no user-defined objects exist (no schemas, tables or projections defined by the user):

```
=> CREATE USER user2;
CREATE USER
=> DROP USER user2;
DROP USER
```

See Also

- ALTER USER
- CREATE USER

DROP VIEW

Removes the specified view. Vertica does not check for dependencies on the dropped view. After dropping a view, other views that reference it fail.

If you drop a view and replace it with another view or table with the same name and column names, other views that reference that name use the new view. If you change the column data type in the new view, the server coerces the old data type to the new one if possible; otherwise, it returns an error.

Syntax

```
DROP VIEW [ IF EXISTS ] [[database.]schema.]view[,…]
```

Parameters

`IF EXISTS`	Specifies not to report an error if the views to drop do not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.
[*database* .]*schema*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
view	Name of a view to drop.

Privileges

One of the following

- View owner and USAGE privileges
- Schema owner

Examples

```
=> DROP VIEW myview;
```

END

Ends the current transaction and makes all changes that occurred during the transaction permanent and visible to other users.

Syntax

```
COMMIT [ WORK | TRANSACTION ]
```

Parameters

WORK | TRANSACTION	Have no effect; they are optional keywords for readability.

Privileges

None

Notes

COMMIT is a synonym for END.

Examples

This example shows how to end a transaction.

```
=> CREATE TABLE sample_table (a INT);
=> INSERT INTO sample_table (a) VALUES (1);
OUTPUT
--------
1
=> END;
COMMIT
```

See Also

- Transactions
- Creating Transactions
- BEGIN
- ROLLBACK
- START TRANSACTION

EXPLAIN

Returns a formatted description of the Vertica optimizer's plan for executing the specified statement.

Syntax

```
EXPLAIN [/*+ ALLNODES */] [explain-options] sql-statement
```

Parameters

/*+ALLNODES*/	Specifies to create a query plan that assumes all nodes are active, not valid with LOCAL option.
explain-options	One or more EXPLAIN options, specified in the order shown: `[ LOCAL ] [ VERBOSE ] [ JSON ] [ ANNOTATED ]`

	• LOCAL: On a multi-node database, shows the local query plans assigned to each node, which together comprise the total (global) query plan. If you omit this option, Vertica shows only the global query plan. Local query plans are shown only in DOT language source, which can be rendered in Graphviz. This option is incompatible with the hint /*+ALL NODES*/. If you specify both, EXPLAIN returns with an error. • VERBOSE: Increases the level of detail in the rendered query plan. • JSON: Renders the query plan in JSON format. This option is compatible only with VERBOSE. • ANNOTATED: Embeds optimizer hints that encapsulate the query plan for this query. Vertica uses these hints to create directed queries. For more information, see Directed Queries in the Administrator's Guide. This option is compatible with LOCAL and VERBOSE.
sql-statement	A query or DML statement—for example, SELECT, INSERT, UPDATE, COPY, and MERGE.

Privileges

The same privileges required by the specified statement.

Requirements

The following requirements apply to EXPLAIN's ability to produce useful information:

- Reasonably representative statistics of your data must be available. See Collecting Statistics in the Administrator's Guide for details.
- EXPLAIN produces useful output only if projections are available for the queried tables.
- Qualifier options must be specified in the order shown earlier, otherwise EXPLAIN returns with an error. If an option is incompatible with any preceding options, EXPLAIN ignores them.

See Also

Viewing Query Plans in the Administrator's Guide

EXPORT TO PARQUET

Exports a table, columns from a table, or query results to files in the Parquet format. You can use an OVER() clause to partition the data before export. Partitioning data can improve query performance by enabling partition pruning; see Improving Query Performance.

There are some limitations on the queries you can use in an export statement. See Query Restrictions.

You can export data stored in Vertica in ROS format and data from external tables.

EXPORT TO PARQUET returns the number of rows written and logs information about exported files in a system table. See Monitoring Exports.

During an export to HDFS or an NFS mount point, Vertica writes files to a temporary directory in the same location as the destination and renames the directory when the export is complete. Do not attempt to use the files in the temporary directory. During an export to S3 or GCS, Vertica writes files directly to the destination path, so you must wait for the export to finish before reading the files. (For more about special S3 and GCS considerations, see Exporting to S3 and GCS.)

Syntax

```
EXPORT TO PARQUET ( directory = 'path'
                  [, param=value [,...] ] )
      [ OVER (over-clause ) ]
      AS SELECT query-expression;
```

Parameters

`directory`	The destination directory for the Parquet files. The directory must not exist, and the current user must have permission to write it. The destination can be on HDFS (`hdfs`), AWS (`s3`), GCS (`gs`), or an NFS mount point on the local file system.

`compression`	Column compression type, one of Snappy or Uncompressed. The default is Snappy.
`rowGroupSizeMB`	The uncompressed size of exported row groups, in MB (integer). The minimum value is 1 and the maximum value is `fileSizeMB` (or unlimited if `fileSizeMB` is 0). The default is 512. The row groups in the exported files are smaller because Parquet files are compressed on write. For best performance when exporting to HDFS, set *`size`* to be smaller than the HDFS block size.
`fileSizeMB`	The maximum file size of a single output Parquet file. By default, Vertica limits exports to a file size of 10GB. This value is a hint, not a hard limit. A value of 0 means there is no limit. This value affects the size of individual output files, not the total output size. For smaller values Vertica divides the output into more files; all data is still exported.
`fileMode`	For writes to HDFS only, permission to apply to all exported files. You can specify the value in Unix octal format (such as '665') or "user-group-other" format (such as 'rwxr-xr-x'). The value must be formatted as a string even if using the octal format. Valid octal values range from '0' to '1777'. See HDFS Permissions in the Apache Hadoop documentation. The default is '660' regardless of the value of fs.permissions.umask-mode in hdfs-site.xml. When writing files to any destination other than HDFS, this parameter has no effect.
`dirMode`	For writes to HDFS only, permission to apply to all exported directories. Values follow the same rules as those for *`fileMode`*. Further, you must give the Vertica HDFS user full permission (at least 'rwx------' or '700'). The default is '755' regardless of the value of fs.permissions.umask-mode in hdfs-site.xml. When writing files to any destination other than HDFS, this parameter has no effect.

`int96AsTimestamp`	Whether to export timestamps as int96 physical type (true) or int64 physical type (false). The default is true.

Arguments

over-clause	Specifies how to partition table data using PARTITION BY. Within partitions you can sort by using ORDER BY. See SQL Analytics. This clause may contain column references but not expressions. If you partition data, Vertica creates a Hive-style partition directory structure, transforming column names to lowercase. See Using Partition Columns for a description of the directory structure. If you omit this clause, Vertica optimizes for maximum parallelism.
query-expression	Specifies the data to be exported. See SELECT for the syntax. See Query Restrictions for important limitations.

Privileges

- SELECT privileges on the source table
- USAGE privileges on source table schema
- Write privileges for the destination directory

Query Restrictions

You must provide an alias column label for selected column targets that are expressions.

The query can contain only a single outer SELECT statement. For example, you cannot use UNION as in the following example.

```
=> EXPORT TO PARQUET(directory = '/mnt/shared_nfs/accounts/rm')
   OVER(PARTITION BY hash)
   AS
   SELECT 1 as account_id, '{}' as json, 0 hash
   UNION ALL
   SELECT 2 as account_id, '{}' as json, 1 hash;
ERROR 8975:  Only a single outer SELECT statement is supported
```

```
HINT:  Please use a subquery for multiple outer SELECT statements
```

Instead, rewrite the query to use a subquery:

```
=> EXPORT TO PARQUET(directory = '/mnt/shared_nfs/accounts/rm')
   OVER(PARTITION BY hash)
   AS
   SELECT
    account_id,
    json
   FROM
   (
     SELECT 1 as account_id, '{}' as json, 0 hash
     UNION ALL
     SELECT 2 as account_id, '{}' as json, 1 hash
   ) a;
 Rows Exported
---------------
             2
(1 row)
```

To use composite statements such as UNION, INTERSECT, and EXCEPT, rewrite them as subqueries.

Data Types

EXPORT TO PARQUET does not support the following data types:

- INTERVAL
- TIME/TIMETZ
- UUID Data Type
- ARRAY, except for native arrays which are supported
- SET
- ROW
- MAP

Decimal precision must be <= 38.

Vertica does not convert TIMESTAMP values to UTC. To avoid problems arising from time zones, use TIMESTAMPTZ instead of TIMESTAMP.

The exported Hive types might not be identical to the Vertica types. For example, a Vertica INT is exported as a Hive BIGINT. When defining Hive external tables to read exported data, you might have to adjust column definitions.

This operation exports raw Flex columns as binary data.

Output Files

EXPORT TO PARQUET always creates the output directory, even if the query produces zero rows.

Be careful to avoid concurrent exports to the same output destination. Doing so is an error on any file system and can produce incorrect results.

You must use a shared file location for output. If you use a directory in the local file system, it must be an NFS-mounted directory.

For output to the local file system, you must have a USER storage location.

Output file names follow the pattern: [8-character hash]-[node name]-[thread_id].parquet. Column names in partition directories are lowercase.

When exporting to S3 the maximum size of all output is 5TB. You might have to divide large exports into more than one piece.

Vertica does not support simultaneous exports to the same directory in HDFS, S3, or GCS. The results are undefined.

When exporting to the local file system, the permission mode is 700 for directories and 600 for files. You cannot override these values.

Parquet files exported to a local file system by any Vertica user are owned by the Vertica superuser. Parquet files exported to HDFS, S3, or GCS are owned by the Vertica user who exported the data.

Examples

The following example demonstrates exporting all columns from the T1 table in the public schema, using Snappy compression (the default).

```
=> EXPORT TO PARQUET(directory = 'hdfs:///user1/data')
  AS SELECT * FROM public.T1;
```

The following example demonstrates exporting the results of a query using more than one table.

```
=> EXPORT TO PARQUET(directory='s3://DataLake/sales_by_region')
   AS SELECT sale.price, sale.date, store.region
   FROM public.sales sale
   JOIN public.vendor store ON sale.distribID = store.ID;
```

The following example demonstrates partitioning and exporting data. EXPORT TO PARQUET first partitions the data on region and then, within each partition, sorts by store.

```
=> EXPORT TO PARQUET(directory = 'gs://DataLake/user2/data')
  OVER(PARTITION BY store.region ORDER BY store.ID)
  AS SELECT sale.price, sale.date, store.ID
  FROM public.sales sale
  JOIN public.vendor store ON sale.distribID = store.ID;
```

The following example uses an alias column label for a selected column target that is an expression.

```
=> EXPORT TO PARQUET(directory = 'hdfs:///user3/data')
  OVER(ORDER BY col1) AS SELECT col1 + col1 AS A, col2
  FROM public.T3;
```

The following example sets permissions for the output.

```
=> EXPORT TO PARQUET(directory = 'hdfs:///user1/data',
     fileMode='432', dirMode='rwxrw-r-x')
  AS SELECT * FROM public.T1;
```

EXPORT TO VERTICA

Exports table data from one Vertica database to another.

Important:
The source database must be no more than one major release behind the target database.

Syntax

```
EXPORT TO VERTICA
   database.[schema.]target-table [ ( target-columns ) ]
   { AS SELECT query-expression | FROM [schema.]source-table[ ( source-columns ) ] };
```

Parameters

database	The target database of the data to export. A connection to this database must already exist in the current session before starting the copy operation; otherwise Vertica

	returns an error. For details, see CONNECT TO VERTICA.
[*schema.*]*target-table*	The table to store the exported data.
target-columns	A comma-delimited list of columns in *target-table* to store the exported data. See Mapping Between Source and Target Columns, below.
query-expression	Specifies the data to export.
[*schema.*]*source-table*	The table that contains the data to export.
source-columns	A comma-delimited list of the columns in the source table to export. If omitted, all columns are exported. See Mapping Between Source and Target Columns, below.

Privileges

- Source table: SELECT
- Source table schema: USAGE
- Target table: INSERT
- Target table schema: USAGE

Mapping Between Source and Target Columns

If you export all table data from one database to another, EXPORT TO VERTICA can omit specifying column lists if column definitions in both tables comply with the following conditions:

- Same number of columns
- Identical column names
- Same sequence of columns
- Matching or compatible column data types

If any of these conditions is not true, the EXPORT TO VERTICA statement must include column lists that explicitly map source and target columns to each other, as follows:

- Contain the same number of columns.
- List source and target columns in the same order.
- Pair columns with the same (or compatible) data types.

Examples

See Exporting Data to Another Vertica Database.

See Also

- Handling Node Failure During Copy/Export
- COPY FROM VERTICA

GET DIRECTED QUERY

Returns a list of directed queries that map to the specified input query

Syntax

```
GET DIRECTED QUERY input-query
```

Parameters

input-query	An input query that is associated with one or more directed queries.

Returns

A list of one or more directed queries that map to the specified input query. Each list item includes six fields:

query-name	A unique identifier that is associated with this directed query and used by statements such as ACTIVATE DIRECTED QUERY.
is_active	A Boolean field that specifies whether the directed query is active.
vertica_version	The Vertica version that was current when this directed query was created.
comment	A user-supplied comment specified on creation of the direct query.

creation_date	The creation timestamp of this directed query.
annotated_query	The annotated query that was saved with CREATE DIRECTED QUERY.

Privileges

None required

Examples

See Getting Directed Queries in the Administrator's Guide.

See Also

V_CATALOG.DIRECTED_QUERIES

GRANT Statements

GRANT statements grant privileges on database objects to users and roles.

> **Important:**
> In a database with trust authentication, GRANT statements appear to work as expected but have no real effect on database security.

GRANT (Authentication)

Associates an authentication record to one or more users and roles.

Syntax

```
GRANT AUTHENTICATION auth-method-name TO grantee[,…]
```

Parameters

auth-method-name	Name of the authentication method to associate with one or more users or roles.
grantee	Specifies who is associated with the authentication method, one of the following: • User name • Role • PUBLIC: The default role of all users.

Privileges

Superuser

Examples

- Associate v_ldap authentication with user jsmith:

```
=> GRANT AUTHENTICATION v_ldap TO jsmith;
```

- Associate v_gss authentication to the role DBprogrammer:

```
=> CREATE ROLE DBprogrammer;
=> GRANT AUTHENTICATION v_gss TO DBprogrammer;
```

- Associate client authentication method v_localpwd with role PUBLIC, which is assigned by default to all users:

```
=> GRANT AUTHENTICATION v_localpwd TO PUBLIC;
```

See Also

- REVOKE (Authentication)
- Granting and Revoking Privileges

GRANT (Database)

Grants database privileges to users and roles.

Syntax

```
GRANT { privilege[,…] | ALL [ PRIVILEGES ] }
   ON DATABASE db-spec
   TO grantee[,…]
   [ WITH GRANT OPTION ]
```

Parameters

privilege	The following privileges are valid for a database: • CREATE: Create schemas. • TEMP: Create temporary tables. By default, all users are granted this privilege through their DEFAULT role.

`ALL [PRIVILEGES]`	Grants all database privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack. The optional keyword `PRIVILEGES` conforms with the SQL standard.
db-spec	Specifies the current database, set to the database name or `DEFAULT`.
grantee	Specifies who is granted privileges, one of the following: • *user-name* • *role* • `PUBLIC`: Default role of all users
`WITH GRANT OPTION`	Gives *grantee* the privilege to grant the same privileges to other users or roles, and also revoke them. For details, see Granting Privileges.

Privileges

Non-superuser: Privileges grantee given the option (`WITH GRANT OPTION`) of granting privileges to other users or roles.

Example

The following example grants user Fred the right to create schemas in the current database.

```
=> GRANT CREATE ON DATABASE DEFAULT TO Fred;
```

See Also

- REVOKE (Database)
- Granting and Revoking Privileges

GRANT (Library)

Grants usage privileges on one or more libraries to users and roles.

For example, when working with the Connector Framework Service, you might need to grant a user usage privileges to a library to be able to set UDSession parameters. For more information see Implementing CFS.

Syntax

```
GRANT { USAGE | ALL [ PRIVILEGES ] }  |
   ON LIBRARY [[database.]schema.]library[,…]
   TO grantee[,…]
   [ WITH GRANT OPTION ]
```

Parameters

USAGE	Enables grantees access to functions in the specified libraries. **Important:** To execute functions inside the library, users must also have separate EXECUTE privileges on them, and USAGE privileges on their respective schemas.
ALL [PRIVILEGES]	Grants all library privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard.
[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
library	The target library.
grantee	Specifies who is granted privileges, one of the following: • *user-name* • *role* • PUBLIC: Default role of all users

`WITH GRANT OPTION`	Gives *`grantee`* the privilege to grant the same privileges to other users or roles, and also revoke them. For details, see Granting Privileges.

Privileges

Non-superusers require USAGE on the schema and one of the following:

- Owner
- Privileges grantee given the option (`WITH GRANT OPTION`) of granting privileges to other users or roles.

Example

Grant USAGE privileges on the `MyFunctions` library to `Fred`:

```
=> GRANT USAGE ON LIBRARY MyFunctions TO Fred;
```

See Also

- REVOKE (Library)
- Granting and Revoking Privileges

GRANT (Model)

Grants usage privileges on a model to users and roles.

Syntax

```
GRANT { privilege[,…] | ALL [ PRIVILEGES ] [ EXTEND ] }
   ON MODEL [[database.]schema.]model-name[,…]
   TO grantee[,…]
   [ WITH GRANT OPTION ]
```

Parameters

privilege	The following privileges are valid for models: • USAGE • ALTER • DROP
ALL [PRIVILEGES][EXTEND]	Grants all model privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack. You can qualify ALL with two optional keywords: • PRIVILEGES conforms with the SQL standard. • EXTEND extends the semantics of ALL to include ALTER and DROP privileges. An unqualified ALL excludes these two privileges. This option enables backward compatibility with GRANT ALL usage in pre-9.2.1 Vertica releases.
[*database*.]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
model-name	The model on which to grant the privilege.
grantee	Specifies who is granted privileges, one of the following: • *user-name* • *role* • PUBLIC: Default role of all users
WITH GRANT OPTION	Gives *grantee* the privilege to grant the same privileges to other users or roles, and also revoke them. For details, see Granting Privileges.

Privileges

Non-superusers require USAGE on the schema and one of the following:

- Owner
- Privileges grantee given the option (`WITH GRANT OPTION`) of granting privileges to other users or roles.

Example

This example grants USAGE privileges on the mySvmClassModel model to user1:

```
=> GRANT USAGE ON MODEL mySvmClassModel TO user1;
```

See Also

- REVOKE (Model)
- Managing Model Security

GRANT (Procedure)

Grants procedure privileges to users and roles.

Important:
External procedures that you create with CREATE PROCEDURE are always run with Linux dbadmin privileges. If a dbadmin or pseudosuperuser grants a non-dbadmin permission to run a procedure using GRANT (Procedure), be aware that the non-dbadmin user runs the procedure with full Linux dbadmin privileges.

Syntax

```
GRANT { EXECUTE | ALL [ PRIVILEGES ] }
   ON PROCEDURE [[database.]schema.]procedure( [arg-list] )[,…]
   TO grantee[,…]
   [ WITH GRANT OPTION ]
```

Parameters

EXECUTE	Enables grantees to run the specfied procedures.
ALL [PRIVILEGES]	Grants all procedure privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard.
[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
procedure	The target procedure.
arg-list	A comma-delimited list of procedure arguments, where each argument is specified as follows: `[ argname ] argtype` If the procedure is defined with no arguments, supply an empty argument list.
grantee	Specifies who is granted privileges, one of the following: • *user-name* • *role* • PUBLIC: Default role of all users
WITH GRANT OPTION	Gives *grantee* the privilege to grant the same privileges to other users or roles, and also revoke them. For details, see Granting Privileges.

Privileges

Non-superuser, one of the following:

- Owner
- Privileges grantee given the option (`WITH GRANT OPTION`) of granting privileges to other users or roles.

Example

Grant EXECUTE privileges on the `tokenize` procedure to users `Bob` and `Jules`, and to the role `Operator`:

```
=> GRANT EXECUTE ON PROCEDURE tokenize(varchar) TO Bob, Jules, Operator;
```

See Also

- REVOKE (Procedure)
- Granting and Revoking Privileges

GRANT (Resource Pool)

Grants USAGE privileges on resource pools to users and roles. Users can access their resource pools with ALTER USER or SET SESSION RESOURCE POOL.

Syntax

```
GRANT USAGE
   ON RESOURCE POOL resource-pool[,…]
   [FOR SUBCLUSTER subcluster | FOR CURRENT SUBCLUSTER]
   TO grantee[,…]
   [ WITH GRANT OPTION ]
```

Parameters

USAGE	Enables grantees to acess the specified resource pools.
ALL [PRIVILEGES]	Grants all resource pool privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack.

	The optional keyword PRIVILEGES conforms with the SQL standard.
resource-pool	A resource pool on which to grant the specified privileges.
subcluster	The subcluster for the resource pool.
grantee	Specifies who is granted privileges, one of the following: • *user-name* • *role* • PUBLIC: Default role of all users
WITH GRANT OPTION	Gives *grantee* the privilege to grant the same privileges to other users or roles, and also revoke them. For details, see Granting Privileges.

Privileges

Non-superuser, one of the following:

- Ownership
- GRANT OPTION on the object

Examples

Grant user Joe USAGE privileges on resource pool Joe_pool.

```
=> CREATE USER Joe;
CREATE USER
=> CREATE RESOURCE POOL Joe_pool;
CREATE RESOURCE POOL
=> GRANT USAGE ON RESOURCE POOL Joe_pool TO Joe;
GRANT PRIVILEGE
```

Grant user Joe USAGE privileges on resource pool Joe_pool for subcluster sub1.

```
=> GRANT USAGE on RESOURCE POOL Joe_pool FOR SUBCLUSTER sub1 TO Joe;
GRANT PRIVILEGE
```

See Also

- REVOKE (Resource Pool)
- Granting and Revoking Privileges

GRANT (Role)

Assigns roles to users or other roles.

> **Note:**
> Granting a role does not activate the role automatically; you must enable it with SET ROLE command.

Syntax

```
GRANT role[,…] TO grantee[,…] [ WITH ADMIN OPTION ]
```

Parameters

role	A role to grant
grantee	Designates users to be granted the specified roles, one of the following: • User name • Role • PUBLIC: The default role of all users.
WITH ADMIN OPTION	Gives *grantee* the privilege to grant the specified roles to other users or roles. For details, see Granting Privileges .

Privileges

Non-superuser: Roles grantee given the option (WITH GRANT OPTION) of granting the same roles to other users or roles.

Examples

See Granting Database Roles.

See Also

REVOKE (Role)

GRANT (Schema)

Grants schema privileges to users and roles. By default, only superusers and the schema owner have the following schema privileges:

- Create objects within a schema.
- Alter and drop a schema.

> **Note:**
> By default, new users cannot access schema PUBLIC. You must explicitly grant all new users USAGE privileges on the PUBLIC schema.

Syntax

```
GRANT { privilege[,…] | ALL [ PRIVILEGES ] [ EXTEND ] }
   ON SCHEMA [database.]schema[,…]
   TO grantee[,…]
   [ WITH GRANT OPTION ]
```

Parameters

privilege	One of the following privileges: • USAGE: Enables access to objects in the specified schemas. Grantees can then be granted privileges on individual objects in these schemas in order to access them, for example, with GRANT TABLE and GRANT VIEW. • CREATE: Create and rename objects in the

	specified schemas, and move objects from other schemas.
	
	You can also grant the following privileges on a schema, to be inherited by tables and their projections, and by views of that schema. If inheritance is enabled for the database and schema, these privileges are automatically granted to those objects on creation:
	
	• SELECT: Query tables and views. SELECT privileges are granted by default to the PUBLIC role.
	• INSERT: Insert rows, or and load data into tables with COPY.
	Note: `COPY FROM STDIN` is allowed for users with INSERT privileges, while `COPY FROM file` requires admin privileges.
	• UPDATE: Update table rows.
	• DELETE: Delete table rows.
	• REFERENCES: Create foreign key constraints on this table. This privilege must be set on both referencing and referenced tables.
	• TRUNCATE: Truncate table contents. Non-owners of tables can also execute the following partition operations on them:
	  • DROP_PARTITIONS
	  • SWAP_PARTITIONS_BETWEEN_TABLES
	  • MOVE_PARTITIONS_TO_TABLE
	• ALTER: Modify the DDL of tables and views with ALTER TABLE and ALTER VIEW, respectively.
	• DROP: Drop tables and views.

ALL [PRIVILEGES][EXTEND]	Grants USAGE AND CREATE privileges. Inherited privileges must be granted explicitly. You can qualify ALL with two optional keywords: • PRIVILEGES conforms with the SQL standard. • EXTEND extends the semantics of ALL to

	include ALTER and DROP privileges. An unqualified ALL excludes these two privileges. This option enables backward compatibility with GRANT ALL usage in pre-9.2.1 Vertica releases.
[*database.*]*schema*	Specifies a target schema. If you specify a database, it must be the current database.
grantee	Specifies who is granted privileges, one of the following: • *user-name* • *role* • PUBLIC: Default role of all users
WITH GRANT OPTION	Gives *grantee* the privilege to grant the same privileges to other users or roles, and also revoke them. For details, see Granting Privileges.

Privileges

Non-superusers, one of the following:

- Schema owner
- Privileges grantee given the option (WITH GRANT OPTION) of granting privileges to other users or roles.

Examples

Grant user Joe USAGE privilege on schema online_sales.

```
=> CREATE USER Joe;
CREATE USER

=> GRANT USAGE ON SCHEMA online_sales TO Joe;
GRANT PRIVILEGE
```

See Also

- REVOKE (Schema)
- Granting and Revoking Privileges

GRANT (Sequence)

Grants sequence privileges to users and roles.

Syntax

```
GRANT { privilege[,…] | ALL [ PRIVILEGES ] [ EXTEND ] }
   ON {
     SEQUENCE [[database.]schema.]sequence[,…]
     | ALL SEQUENCES IN SCHEMA [database.]schema[,…] }
   TO grantee[,…]
   [ WITH GRANT OPTION ]
```

Parameters

privilege	The following privileges are valid for sequences: • SELECT: Execute functions CURRVAL and NEXTVAL on the specified sequences. • ALTER: Modify a sequence's DDL with ALTER SEQUENCE • DROP: Drop this sequence with DROP SEQUENCE.
ALL [PRIVILEGES][EXTEND]	Grants all sequence privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack You can qualify ALL with two optional keywords: • PRIVILEGES conforms with the SQL standard.

	• EXTEND extends the semantics of ALL to include ALTER and DROP privileges. An unqualified ALL excludes these two privileges. This option enables backward compatibility with GRANT ALL usage in pre-9.2.1 Vertica releases.
[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
SEQUENCE *sequence*	Specifies the sequence on which to grant privileges.
ALL SEQUENCES IN SCHEMA *schema*	Grants the specified privileges on all sequences in schema *schema*.
grantee	Specifies who is granted privileges, one of the following: • *user-name* • *role* • PUBLIC: Default role of all users
WITH GRANT OPTION	Gives *grantee* the privilege to grant the same privileges to other users or roles, and also revoke them. For details, see Granting Privileges.

Privileges

Non-superusers require USAGE on the schema and one of the following:

- Owner
- Privileges grantee given the option (WITH GRANT OPTION) of granting privileges to other users or roles.

Examples

This example shows how to grant user Joe all privileges on sequence my_seq.

```
=> CREATE SEQUENCE my_seq START 100;
CREATE SEQUENCE

=> GRANT ALL PRIVILEGES ON SEQUENCE my_seq TO Joe;
GRANT PRIVILEGE
```

See Also

- REVOKE (Sequence)
- Granting and Revoking Privileges

GRANT (Storage Location)

Grants privileges to users and roles on a USER-defined storage location. For details, see Creating Storage Locations.

Syntax

```
GRANT { privilege[,…] | ALL [ PRIVILEGES ] }
   ON LOCATION 'path' [ ON node ]
   TO grantee[,…]
   [ WITH GRANT OPTION ]
```

Parameters

privilege	The following privileges are valid for storage locations: • READ: Copy data from files in the storage location into a table. • WRITE: Export data from the database to the storage location. With WRITE privileges, grantees can also save COPY statement rejected data and exceptions

	files to the storage location.
`ALL [PRIVILEGES]`	Grants all storage location privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack. The optional keyword `PRIVILEGES` conforms with the SQL standard.
`ON LOCATION '`*`path`*`' [ ON `*`node`*`]`	Specifies the path name mount point of the storage location. If qualified by `ON NODE`, Vertica grants access to the storage location residing on *node*. If no node is specified, the grant operation applies to all nodes on the specified path. All nodes must be on the specified path; otherwise, the entire grant operation rolls back.
grantee	Specifies who is granted privileges, one of the following: • *user-name* • *role* • PUBLIC: Default role of all users
`WITH GRANT OPTION`	Gives *grantee* the privilege to grant the same privileges to other users or roles, and also revoke them. For details, see Granting Privileges.

Privileges

Non-superuser, one of the following:

- Ownership
- GRANT OPTION on the object

Note:
Only a superuser can add, alter, retire, drop, and restore a location.

Examples

Create a storage location:

```
=> CREATE LOCATION '/home/dbadmin/UserStorage/BobStore' NODE 'v_mcdb_node0007' USAGE 'USER';
CREATE LOCATION
```

Grant user Bob all available privileges to the /BobStore location:

```
=> GRANT ALL ON LOCATION '/home/dbadmin/UserStorage/BobStore' TO Bob;
GRANT PRIVILEGE
```

Revoke all storage location privileges from Bob:

```
=> REVOKE ALL ON LOCATION '/home/dbadmin/UserStorage/BobStore' FROM Bob;
REVOKE PRIVILEGE
```

Grant privileges to Bob on the BobStore location again, specifying a node:

```
=> GRANT ALL ON LOCATION '/home/dbadmin/UserStorage/BobStore' ON v_mcdb_node0007 TO Bob;
GRANT PRIVILEGE
```

Revoke all storage location privileges from Bob:

```
=> REVOKE ALL ON LOCATION '/home/dbadmin/UserStorage/BobStore' ON v_mcdb_node0007 FROM Bob;
REVOKE PRIVILEGE
```

See Also

- Storage Management Functions
- REVOKE (Storage Location)
- Granting and Revoking Privileges

GRANT (Table)

Grants table privileges to users and roles. Users must also be granted USAGE on the table schema.

Syntax

```
GRANT { privilege[,…] | ALL [ PRIVILEGES ] [ EXTEND ] }
   ON {
     [ TABLE ] [[database.]schema.]table[,…]
     | ALL TABLES IN SCHEMA [database.]schema[,…] }
   TO grantee[,…]
   [ WITH GRANT OPTION ]
```

Parameters

privilege	The following privileges are valid for tables:
	
	Important:
	Only SELECT privileges are valid for system tables.
	
	• SELECT: Query tables. SELECT privileges are granted by default to the PUBLIC role.
	• INSERT: Insert table rows with INSERT, and load data with COPY.
	Note:
	`COPY FROM STDIN` is allowed for users with INSERT privileges, while `COPY FROM file` requires admin privileges.
	• UPDATE: Update table rows.
	• DELETE: Delete table rows.
	• REFERENCES: Create foreign key constraints on this table. This privilege must be set on both referencing and referenced tables.
	• TRUNCATE: Truncate table contents. Non-owners of tables can also execute the following partition operations on them:
	  • DROP_PARTITIONS
	  • SWAP_PARTITIONS_BETWEEN_TABLES

	• MOVE_PARTITIONS_TO_TABLE • ALTER: Modify a table's DDL with ALTER TABLE. • DROP: Drop a table.
ALL [PRIVILEGES][EXTEND]	Invalid for system tables, grants all table privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack. You can qualify ALL with two optional keywords: • PRIVILEGES conforms with the SQL standard. • EXTEND extends the semantics of ALL to include ALTER and DROP privileges. An unqualified ALL excludes these two privileges. This option enables backward compatibility with GRANT ALL usage in pre-9.2.1 Vertica releases.
[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` One exception applies: you can specify system tables without their schema name. If you specify a database, it must be the current database.
TABLE *table*	Specifies the table on which to grant privileges. **Note:** The table can be a global temporary table, but not a local temporary table. See Creating Temporary Tables

	 in the Administrator's Guide.
`ON ALL TABLES IN SCHEMA` *`schema`*	Grants the specified privileges on all tables and views in schema *`schema`*.
`grantee`	Specifies who is granted privileges, one of the following: • *`user-name`* • *`role`* • `PUBLIC`: Default role of all users
`WITH GRANT OPTION`	Gives *`grantee`* the privilege to grant the same privileges to other users or roles, and also revoke them. For details, see Granting Privileges.

Privileges

Non-superusers require USAGE on the schema and one of the following:

- Owner
- Privileges grantee given the option (`WITH GRANT OPTION`) of granting privileges to other users or roles.

Examples

Grant user `Joe` all privileges on table `customer_dimension`:

```
=> CREATE USER Joe;
CREATE USER
=> GRANT ALL PRIVILEGES ON TABLE customer_dimension TO Joe;
GRANT PRIVILEGE
```

Grant user `Joe` SELECT privileges on all system tables:

```
=> GRANT SELECT on all tables in schema V_MONITOR, V_CATALOG TO Joe;
GRANT PRIVILEGE
```

See Also

- REVOKE (Table)
- Granting and Revoking Privileges

GRANT (User Defined Extension)

Grants privileges on a user-defined extension (UDx) to users and roles.

Syntax

```
GRANT { privilege[,…] | ALL [ PRIVILEGES ] [ EXTEND ] }
   ON {
       UDx-type [[database.]schema.]function-name( [arg-list] )[,…]
       | ALL FUNCTIONS IN SCHEMA schema[,…] }
   TO grantee[,…]
   [ WITH GRANT OPTION ]
```

Parameters

privilege	The following privileges are valid for user-defined extensions: • EXECUTE • ALTER • DROP **Note:** Users can only call a UDx function on which they have EXECUTE privilege, and USAGE privilege on its schema.
ALL [PRIVILEGES][EXTEND]	Grants all function privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack You can qualify ALL with two optional

	keywords: • PRIVILEGES conforms with the SQL standard. • EXTEND extends the semantics of ALL to include ALTER and DROP privileges. An unqualified ALL excludes these two privileges. This option enables backward compatibility with GRANT ALL usage in pre-9.2.1 Vertica releases.
ON *UDx-type*	Specifies the function's user-defined extension (UDx) type, where *UDx-type* is one of the following: • FUNCTION • AGGREGATE FUNCTION • ANALYTIC FUNCTION • TRANSFORM FUNCTION • FILTER • PARSER • SOURCE
[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
function-name	Name of the user-defined function on which to grant privileges.
ON ALL FUNCTIONS IN SCHEMA *schema*	Grants privileges on all functions in the specified schema.
arg-list	Required for all polymorphic functions, a comma-delimited list of function arguments, where each argument is

	specified as follows: `[ argname ] argtype` If the procedure is defined with no arguments, supply an empty argument list.
grantee	Specifies who is granted privileges, one of the following: • *user-name* • *role* • PUBLIC: Default role of all users **Note:** Grantees must have USAGE privileges on the schema.
WITH GRANT OPTION	Gives *grantee* the privilege to grant the same privileges to other users or roles, and also revoke them. For details, see Granting Privileges.

Privileges

Non-superusers require USAGE on the schema and one of the following:

- Owner
- Privileges grantee given the option (WITH GRANT OPTION) of granting privileges to other users or roles.

Examples

Grant EXECUTE privileges on the myzeroifnull SQL function to users Bob and Jules, and to the role Operator. The function takes one integer argument:

```
=> GRANT EXECUTE ON FUNCTION myzeroifnull (x INT) TO Bob, Jules, Operator;
```

Grant EXECUTE privileges on all functions in the zero-schema schema to user Bob:

```
=> GRANT EXECUTE ON ALL FUNCTIONS IN SCHEMA zero-schema TO Bob;
```

Grant EXECUTE privileges on the `tokenize` transform function to user `Bob` and the role `Operator`:

```
=> GRANT EXECUTE ON TRANSFORM FUNCTION tokenize(VARCHAR) TO Bob, Operator;
```

Grant EXECUTE privileges on the `ExampleSource()` source to user `Alice`:

```
=> CREATE USER Alice;
=> GRANT USAGE ON SCHEMA hdfs TO Alice;
=> GRANT EXECUTE ON SOURCE ExampleSource() TO Alice;
```

Grant all privileges on the `ExampleSource()` source to user `Alice`:

```
=> GRANT ALL ON SOURCE ExampleSource() TO Alice;
```

Grant all privileges on polymorphic function `Pagerank` to the dbadmin role:

```
=> GRANT ALL ON TRANSFORM FUNCTION Pagerank(z varchar) to dbadmin;
```

See Also

- REVOKE (User Defined Extension)
- Granting and Revoking Privileges
- Developing User-Defined Extensions (UDxs)

GRANT (View)

Grants view privileges to users and roles.

Syntax

```
GRANT { privilege[,…] | ALL [ PRIVILEGES ] [ EXTEND ] }
   ON [[database.]schema.]view[,…]
   TO grantee[,…]
   [ WITH GRANT OPTION ]
```

Parameters

privilege	The following privileges are valid for views: • SELECT

	• ALTER • DROP
`ALL [PRIVILEGES][EXTEND]`	Grants all view privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack. You can qualify `ALL` with two optional keywords: • `PRIVILEGES` conforms with the SQL standard. • `EXTEND` extends the semantics of `ALL` to include ALTER and DROP privileges. An unqualified `ALL` excludes these two privileges. This option enables backward compatibility with `GRANT ALL` usage in pre-9.2.1 Vertica releases.
`[`*`database`*`.]`*`schema`*	Specifies a schema, by default `public`. If *`schema`* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
`view`	The target view.
`grantee`	Specifies who is granted privileges, one of the following: • *`user-name`* • *`role`* • PUBLIC: Default role of all users
`WITH GRANT OPTION`	Gives *`grantee`* the privilege to grant the same privileges to other users or roles, and also revoke them. For details, see Granting Privileges.

Privileges

Non-superusers require USAGE on the schema and one of the following:

- Owner
- Privileges grantee given the option (`WITH GRANT OPTION`) of granting privileges to other users or roles.

Note:
As view owner, you can grant other users SELECT privilege on the view only if one of the following is true:

- You own the view's base table.
- You have SELECT...WITH GRANT OPTION privilege on the view's base table.

Examples

Grant user `Joe` all privileges on view `ship`.

```
=> CREATE VIEW ship AS SELECT * FROM public.shipping_dimension;
CREATE VIEW
=> GRANT ALL PRIVILEGES ON ship TO Joe;
GRANT PRIVILEGE
```

See Also

REVOKE (View)

INSERT

Inserts values into all projections of the specified table. You must insert one complete tuple at a time. If no projections are associated with the target table, Vertica creates a superprojection to store the inserted values.

`INSERT` works for flex tables as well as regular database tables.

Syntax

```
INSERT [ /*+LABEL (label-string)*/ ] INTO [[database.]schema.]table-name
    [ ( column-list ) ]
    { DEFAULT VALUES | VALUES ( values-list ) | SELECT query-expression }
```

Parameters

LABEL	Assigns a label to a statement to identify it for profiling and debugging.
[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table-name	The target table. You cannot invoke `INSERT` on a projection. This can be a flex table.
column-list	A comma-delimited list of one or more target columns in this table, listed in any order. `VALUES` clause values are mapped to columns in the same order. If you omit this list, Vertica maps `VALUES` clause values to columns according to column order in the table definition. A list of target columns is invalid with `DEFAULT VALUES`.
`DEFAULT VALUES`	Fills all columns with their default values as specified in the table definition. You cannot specify a list of target columns with this option.
`VALUES` (*values-list*)	A comma-delimited list of one or more values to insert in the target columns, where each value is one of the following: • *expression* resolves to a value to insert in the target column. The expression must not nest other expressions or include Vertica meta-functions. • `DEFAULT` inserts the default value as specified in the table definition. If no value is supplied for a column, Vertica implicitly adds a `DEFAULT` value, if defined. Otherwise Vertica inserts a `NULL` value. If the column is defined as `NOT NULL`, `INSERT` returns an error.

SELECT *query-expression*	Specifies a query that returns the rows to insert. Isolation level applies only to the SELECT clauses and works like any query.

Privileges

- Table owner or user with GRANT OPTION is grantor
- INSERT privilege on table
- USAGE privilege on schema that contains the table

Committing INSERT, UPDATE, and DELETE

Vertica follows the SQL-92 transaction model, so successive INSERT, UPDATE, and DELETE statements are included in the same transaction. You do not need to explicitly start this transaction; however, you must explicitly end it with COMMIT, or implicitly end it with COPY; otherwise Vertica discards all changes that were made within the transaction.

Restrictions

- Vertica does not support subqueries as the target of an INSERT statement.
- If any primary key, unique key, or check constraints are enabled for automatic enforcement, Vertica enforces those constraints when you insert values into a table. If a violation occurs, Vertica rolls back the SQL statement and returns an error. This behavior occurs for INSERT, UPDATE, COPY, and MERGE SQL statements.

Note:
Automatic constraint enforcement requires that you have SELECT privileges on the table containing the constraint.

Examples

```
=> INSERT INTO t1 VALUES (101, 102, 103, 104);
=> INSERT INTO customer VALUES (10, 'male', 'DPR', 'MA', 35);
=> INSERT INTO start_time VALUES (12, 'film','05:10:00:01');
=> INSERT INTO retail.t1 (C0, C1) VALUES (1, 1001);
=> INSERT INTO films SELECT * FROM tmp_films WHERE date_prod < '2004-05-07';
```

Vertica does not support subqueries or nested expressions as the target of an INSERT statement. For example, the following query returns an error message:

```
=> INSERT INTO t1 (col1, col2) VALUES ('abc', (SELECT mycolumn FROM mytable));
ERROR 4821:  Subqueries not allowed in target of insert
```

You can rewrite the above query as follows:

```
=> INSERT INTO t1 (col1, col2) (SELECT 'abc', mycolumn FROM mytable);
 OUTPUT
--------
      0
(1 row)
```

The following example shows how to use INSERT...VALUES with flex tables:

```
=> CREATE FLEX TABLE flex1();
 CREATE TABLE
=> INSERT INTO flex1(a,b) VALUES (1, 'x');
 OUTPUT
--------
      1
(1 row)
=> SELECT MapToString(__raw__) FROM flex1;
           MapToString
---------------------------------
{
"a" : "1",
"b" : "x"
}
(1 row)
```

The next example shows how to use INSERT...SELECT with flex tables:

```
=> CREATE FLEX TABLE flex2();
 CREATE TABLE
=> INSERT INTO flex2(a, b) SELECT a, b, '2016-08-10 11:10' c,      'Hello' d, 3.1415 e, f from flex1;
 OUTPUT
--------
      1
(1 row)
=> SELECT MapToString(__raw__) FROM flex2;
           MapToString
---------------------------------
{
"a" : "1",
"b" : "x",
"c" : "2016-08-10",
"d" : "Hello",
"e" : 3.1415,
"f" : null
}
(1 row)
```

LOCK TABLE

Locks a table, giving the caller's session exclusive access to certain operations. Tables are automatically unlocked after the current transaction ends (that is, after COMMIT or ROLLBACK).

LOCK TABLE can be useful for preventing deadlocks. For details, see Deadlocks.

To view existing locks, see LOCKS.

Note:
READ COMMITTED Isolation (default) and SERIALIZABLE Isolation automatically handle locks for you, and the vast majority of users can rely on them exclusively; LOCK TABLE is only for advanced users who need granular control over locks for more complex workloads.

To implement pessimistic concurrency without manually locking tables, you can use SELECT...FOR UPDATE to acquire an EXCLUSIVE (X) lock on the table.

Syntax

```
LOCK [ TABLE ] [[database.]schema.] table [,...]
    IN { lock_type } MODE
    [ NOWAIT ]
```

Parameters

[[*database*.]*schema*.]	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table	The table to lock.
lock_type	The type of lock, one of the following: • SHARE • INSERT

	• INSERT VALIDATE • SHARE INSERT • EXCLUSIVE • NOT DELETE • USAGE • OWNER
[NOWAIT]	If specified, LOCK TABLE returns and reports an error immediately if it cannot acquire the lock. Otherwise, LOCK TABLE waits for incompatible locks to be released by their respective sessions, returning an error if the lock is not released after a certain amount of time, as defined by LockTimeout.

Privileges

Required privileges depend on the type of lock requested:

Lock	Privileges
SHARED (S)	SELECT
INSERT (I)	INSERT
SHARE INSERT	SELECT, INSERT
INSERT VALIDATE (IV)	SELECT, INSERT
EXCLUSIVE (X)	UPDATE, DELETE
NOT DELETE (T)	SELECT
USAGE	All privileges
Owner	All privileges

Examples

See Lock Examples.

MERGE

Performs update and insert operations on a target table based on the results of a join with another data set, such as a table or view. The join can match a source row with only one target row; otherwise, Vertica returns an error.

For details, see Merging Table Data.

Syntax

```
MERGE [ /*+ LABEL */ ]
    INTO [[database.]schema.]target-table [ [AS] alias ]
    USING source-dataset
    ON  join-condition matching-clause[ matching-clause ]
```

Returns

Number of target table rows updated or inserted

Parameters

LABEL	Assigns a label to a statement in order to identify it for profiling and debugging.
[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
target-table	The table on which to perform update and insert operations. `MERGE` takes an X (exclusive) lock on the target table during the operation.

	Important: The total number of target table columns cannot exceed 831.
source-dataset	The data to join to *target-table*, one of the following: • [[*database.*]*schema.*]*table* [[AS] *alias*] • [[*database.*]*schema.*]*view* [[AS] *alias*] • (*subquery*) *sq-alias* The specified data set typically supplies the data used to update the target table and populate new rows. You can specify an external table.
ON *join-condition*	The conditions on which to join the target table and source data set. **Tip:** The Vertica query optimizer can create an optimized query plan for a MERGE statement only if the target table join column has a unique or primary key constraint. For details, see MERGE Optimization in the Administrator's Guide.
matching-clause	One of the following clauses: • WHEN MATCHED THEN UPDATE • WHEN NOT MATCHED THEN INSERT MERGE supports one instance of each clause, and must include at least one.
WHEN MATCHED THEN UPDATE	For each *target-table* row that is joined (matched) to *source-dataset*, specifies to update one or more columns: `WHEN MATCHED [ AND update-filter ] THEN UPDATE SET { column = expression }[,…]`

	update-filter optionally filters the set of matching rows. The update filter can specify any number of conditions. Vertica evaluates each matching row against this filter, and updates only the rows that evaluate to true. For details, see Update and Insert Filters in the Administrator's Guide.
	
	Note:
	Vertica also supports Oracle syntax for specifying update filters:
	
	`WHEN MATCHED THEN UPDATE`
	`  SET { column = expression }[,…]`
	`  [ WHERE update-filter ]`
	
	The following requirements apply:
	
	• A MERGE statement can contain only one WHEN MATCHED clause.
	• *target-column* can only specify a column name in the target table. It cannot be qualified with a table name.
	
	For details, see Merging Table Data in the Administrator's Guide.

WHEN NOT MATCHED THEN INSERT	For each *source-dataset* row that is not joined (not matched) to *target-table*, specifies to:
	
	• Insert a new row into *target-table*.
	• Populate each new row with the values specified in *values-list*.
	
	`WHEN NOT MATCHED [ AND insert-filter ] THEN INSERT`
	`  [ ( column-list ) ] VALUES ( values-list )`
	
	column-list is a comma-delimited list of one or more target columns in the target table, listed in any order. MERGE maps *column-list* columns to *values-list* values in the same order, and each column-value pair must be compatible. If you omit *column-list*, Vertica

	maps *values-list* values to columns according to column order in the table definition. *insert-filter* optionally filters the set of non-matching rows. The insert filter can specify any number of conditions. Vertica evaluates each non-matching source row against this filter. For each row that evaluates to true, Vertica inserts a new row in the target table. For details, see Update and Insert Filters in the Administrator's Guide. **Note:** Vertica also supports Oracle syntax for specifying insert filters: `WHEN NOT MATCHED THEN INSERT [ ( column-list ) ] VALUES ( values-list [ WHERE insert-filter ]` The following requirements apply: • A MERGE statement can contain only one WHEN NOT MATCHED clause. • *column-list* can only specify column names in the target table. It cannot be qualified with a table name. • Insert filter conditions can only reference the source data. If any condition references the target table, Vertica returns an error. For details, see Merging Table Data in the Administrator's Guide.

Privileges

MERGE requires the following privileges:

- SELECT permissions on the source data and INSERT, UPDATE, and DELETE permissions on the target table.

- Automatic constraint enforcement requires SELECT permissions on the table containing the constraint.
- SELECT permissions on the target table if the condition in the syntax reads data from the target table. The following example grants user1 access to target table t2:

For example, the following GRANT statement grants user1 access to target table t2. This allows user1 to run the MERGE statement that follows:

```
=> GRANT SELECT, INSERT, UPDATE, DELETE ON TABLE t2 to user1;
GRANT PRIVILEGE

=>\c - user1
You are now connected as user "user1".

=> MERGE INTO t2 USING t1 ON t1.a = t2.a
WHEN MATCHED THEN UPDATE SET b = t1.b
WHEN NOT MATCHED THEN INSERT (a, b) VALUES (t1.a, t1.b);
```

Improving MERGE Performance

You can improve MERGE performance in several ways:

- Design projections for optimal MERGE performance.
- Facilitate creation of optimized query plans.
- Use a source data set that is smaller than the target table.

For details, see MERGE Optimization in the Administrator's Guide.

Constraint Enforcement

MERGE respects all enforced constraints in the target table. If the merge operation attempts to copy values that violate those constraints, MERGE returns with an error and rolls back the merge operation.

Caution:
If you run MERGE multiple times using the same target and source table, each iteration is liable to introduce duplicate values into the target columns and return with an error.

Columns Prohibited from Merge

The following columns cannot be specified in a merge operation; attempts to do so return with an error:

- Identity/auto-increment columns, or columns whose default value is set to a named sequence.
- Vmap columns such as `__raw__` in flex tables.

Examples

See:

- Basic MERGE Example
- MERGE Source Options
- MERGE Matching Clauses
- Update and Insert Filters

PROFILE

Profiles a single SQL statement.

Syntax

```
PROFILE { sql-statement }
```

Parameters

sql-statement	A query (SELECT) statement or DML statement--for example, you can profile INSERT, UPDATE, COPY, and MERGE.

Output

Writes profile summary to stderr, saves details to system catalog V_MONITOR.EXECUTION_ENGINE_PROFILES.

Privileges

The same privileges required to run the profiled statement

Description

PROFILE generates detailed information about how the target statement executes, and saves that information in the system catalog V_MONITOR.EXECUTION_ENGINE_PROFILES. Query output is preceded by a profile summary: profile identifiers transaction_id and statement_id, initiator memory for the query, and total memory required. For example:

```
=> PROFILE SELECT customer_name, annual_income FROM public.customer_dimension WHERE (customer_gender,
annual_income) IN (SELECT customer_gender, MAX(annual_income) FROM public.customer_dimension GROUP BY
customer_gender);
NOTICE 4788:  Statement is being profiled
HINT:  Select * from v_monitor.execution_engine_profiles where transaction_id=45035996274683334 and
statement_id=7;
NOTICE 3557:  Initiator memory for query: [on pool general: 708421 KB, minimum: 554324 KB]
NOTICE 5077:  Total memory required by query: [708421 KB]
  customer_name   | annual_income
------------------+---------------
 Emily G. Vogel   |        999998
 James M. McNulty |        999979
(2 rows)
```

Use profile identifiers to query the table for profile information on a given query.

Profiling Single Statements

RELEASE SAVEPOINT

Destroys a savepoint without undoing the effects of commands executed after the savepoint was established.

Syntax

```
RELEASE [ SAVEPOINT ] savepoint_name
```

Parameters

savepoint_name	Specifies the name of the savepoint to destroy.

Privileges

None

Notes

Once destroyed, the savepoint is unavailable as a rollback point.

Example

The following example establishes and then destroys a savepoint called my_savepoint. The values 101 and 102 are both inserted at commit.

```
=> INSERT INTO product_key VALUES (101);
=> SAVEPOINT my_savepoint;
=> INSERT INTO product_key VALUES (102);
=> RELEASE SAVEPOINT my_savepoint;
=> COMMIT;
```

See Also

- SAVEPOINT
- ROLLBACK TO SAVEPOINT

REVOKE Statements

REVOKE statements let you revoke privileges on database objects from users and roles.

> **Important:**
> In a database with trust authentication, REVOKE statements appear to work as expected but have no real effect on database security.

REVOKE (Authentication)

Revokes privileges on an authentication method from users and roles.

Syntax

```
REVOKE AUTHENTICATION auth-method-name FROM grantee[,…]
```

Parameters

auth-method-name	Name of the target authentication method.
grantee	Specifies whose privileges are revoked, one of the following: • User name • Role • PUBLIC: The default role of all users

Privileges

Superuser

Examples

- Revoke `v_ldap` authentication from user `jsmith`:

```
=> REVOKE AUTHENTICATION v_ldap FROM jsmith;
```

- Revoke `v_gss` authentication from the role `DBprogrammer`:

```
=> REVOKE AUTHENTICATION v_gss FROM DBprogrammer;
```

- Revoke `localpwd` as the default client authentication method:

```
=> REVOKE AUTHENTICATION localpwd FROM PUBLIC;
```

See Also

- ALTER AUTHENTICATION
- CREATE AUTHENTICATION
- DROP AUTHENTICATION
- GRANT (Authentication)

REVOKE (Database)

Revokes database privileges from users and roles.

Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[,…] | ALL [ PRIVILEGES ] }
   ON DATABASE db-spec
   FROM grantee[,…]
   [ CASCADE ]
```

Parameters

GRANT OPTION FOR	Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.

privilege	The database privilege to revoke, one of the following: • CREATE: Create schemas. • TEMP: Create temporary tables.
ALL [PRIVILEGES]	Revokes all database privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack. The optional keyword PRIVILEGES is supported to comply with the SQL standard.
ON DATABASE *db-spec*	Specifies the current database, set to the database name or DEFAULT.
grantee	Specifies whose privileges are revoked, one of the following: • User name • Role • PUBLIC: The default role of all users
CASCADE	If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.

Privileges

Non-superuser, one of the following:

- Ownership
- GRANT OPTION on the object

Examples

Revoke user Fred's privilege to create schemas in the current database:

```
=> REVOKE CREATE ON DATABASE DEFAULT FROM Fred;
```

Revoke user Fred's privilege to create temporary tables in the current database:

```
=> REVOKE TEMP ON DATABASE DEFAULT FROM Fred;
```

See Also

- GRANT (Database)
- Granting and Revoking Privileges

REVOKE (Library)

Revokes library privileges from users and roles.

Syntax

```
REVOKE [ GRANT OPTION FOR ] { USAGE | ALL [ PRIVILEGES ] }
   ON LIBRARY [[database.]schema.]library[,…]
   FROM grantee[,…]
   [ CASCADE ]
```

Parameters

GRANT OPTION FOR	Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.
USAGE	Revokes access to the specified libraries. **Important:** Privileges on functions in these libraries must be separately revoked.
ALL [PRIVILEGES]	Revokes all library privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard.
[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject`

	If you specify a database, it must be the current database.
library	The target library.
grantee	Specifies whose privileges are revoked, one of the following: • User name • Role • PUBLIC: The default role of all users
CASCADE	If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.

Examples

These commands show how to create a new library, and then grant and revoke user Fred's USAGE privilege on that library.

```
=> CREATE LIBRARY MyFunctions AS 'home/dbadmin/my_functions.so';
=> GRANT USAGE ON LIBRARY MyFunctions TO Fred;
=> REVOKE USAGE ON LIBRARY MyFunctions FROM Fred;
```

See Also

- GRANT (Library)
- Granting and Revoking Privileges

REVOKE (Model)

Revokes model privileges from users and roles.

Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[,…] | ALL [ PRIVILEGES ] }
   ON MODEL [[database.]schema.]model-name [,…]
   FROM grantee[,…]
   [ CASCADE ]
```

Parameters

GRANT OPTION FOR	Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.
USAGE	One of the following privileges: • USAGE: Usage of the specified models • ALTER • DROP
ALL [PRIVILEGES]	Revokes all model privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard.
[*database*.]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
model-name	Name of the target model.
grantee	Specifies whose privileges are revoked, one of the following: • User name • Role • PUBLIC: The default role of all users
CASCADE	If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.

Privileges

Non-superuser, one of the following:

- Ownership
- GRANT OPTION on the object

Example

Revoke user `Fred`'s USAGE privilege on model `mySvmClassModel`:

```
=> REVOKE USAGE ON mySvmClassModel FROM Fred;
```

See Also

- GRANT (Model)
- Managing Model Security

REVOKE (Procedure)

Revokes procedure privileges from users and roles.

Syntax

```
REVOKE [ GRANT OPTION FOR ] { EXECUTE | ALL PRIVILEGES }
   ON PROCEDURE [[database.]schema.]procedure( [argument-list] )[,…]
   FROM grantee[,…]
   [ CASCADE ]
```

Parameters

GRANT OPTION FOR	Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.
EXECUTE	Revokes grantees ability to run the specified procedures.
ALL [PRIVILEGES]	Revokes all procedure privileges that also belong to the revoker. Users cannot revoke privileges that they themselves

	lack. The optional keyword `PRIVILEGES` conforms with the SQL standard.
[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
procedure	The target procedure.
argument-list	A comma-delimited list of procedure arguments, where each argument is specified as follows: [*argname*] *argtype* If the procedure is defined with no arguments, supply an empty argument list.
grantee	Specifies whose privileges are revoked, one of the following: • User name • Role • PUBLIC: The default role of all users
CASCADE	If the target grantees have a grant option to extend the specified privileges to other users, `CASCADE` specifies to search for these users and revoke the privileges from them also.

Privileges

Non-superuser, one of the following:

- Ownership
- GRANT OPTION on the object

Examples

This example revokes user `Bob`'s execute privilege on the `tokenize` procedure.

```
=> REVOKE EXECUTE ON PROCEDURE tokenize(varchar) FROM Bob;
```

See Also

- GRANT (Procedure)
- Granting and Revoking Privileges

REVOKE (Resource Pool)

Revokes resource pool access privileges from users and roles.

Vertica checks resource pool privileges at runtime. Revoking a user's privileges for a resource pool can have an immediate effect on the user's current session. For example, a user query might require USAGE privileges on a resource pool. If you revoke those privileges from that user, subsequent attempts by the user to execute that query fail and return with an error message.

Syntax

```
REVOKE  [ GRANT OPTION FOR ] { USAGE | ALL PRIVILEGES }
   ON RESOURCE POOL resource-pool[,…]
   [FOR SUBCLUSTER subcluster | FOR CURRENT SUBCLUSTER]
   FROM grantee[,…]
   [ CASCADE ]
```

Parameters

GRANT OPTION FOR	Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.
USAGE	Revokes grantee's access to the specified resource pool.
ALL PRIVILEGES	Revokes all resource pool privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack.

	The optional keyword PRIVILEGES conforms with the SQL standard.
resource-pool	The target resource pool.
subcluster	The subcluster for the resource pool.
grantee	Specifies whose privileges are revoked, one of the following: • User name • Role • PUBLIC: The default role of all users
CASCADE	If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.

Privileges

Non-superuser, one of the following:

- Ownership
- GRANT OPTION on the object

Examples

Revoke user Joe's USAGE privileges on resource pool Joe_pool.

```
=> REVOKE USAGE ON RESOURCE POOL Joe_pool FROM Joe;
REVOKE PRIVILEGE
```

Revoke user Joe's USAGE privileges on resource pool Joe_pool for subcluster sub1.

```
=> REVOKE USAGE ON RESOURCE POOL Joe_pool FOR SUBCLUSTER sub1 FROM Joe;
REVOKE PRIVILEGE
```

See Also

- GRANT (Resource Pool)
- Granting and Revoking Privileges

REVOKE (Role)

Revokes a role from users and roles.

Syntax

```
REVOKE [ ADMIN OPTION FOR ] role[,…]
   FROM grantee[,…]
   [ CASCADE ]
```

Parameters

ADMIN OPTION FOR	Revokes from the grantees the authority to assign the specified roles to other users or roles. Current roles for grantees remain unaffected. If you omit this clause, Vertica revokes role assignment privileges and the current roles .
role	Role to revoke.
grantee	Specifies whose privileges are revoked, one of the following: • User name • Role • PUBLIC: The default role of all users
CASCADE	If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.

Privileges

One of the following:

- Superuser
- Privileges grantee who was given the option (WITH ADMIN OPTION) of extending these privileges to other users

Examples

This example shows the revocation of the pseudosuperuser role from the dbadmin user:

```
=> REVOKE pseudosuperuser from dbadmin;
```

This example shows the revocation of administration access from the dbadmin user for the pseudosuperuser role. The ADMIN OPTION command does not remove the pseudosuperuser role.

```
=> REVOKE ADMIN OPTION FOR pseudosuperuser FROM dbadmin;
```

Notes

If the role you are trying to revoke was not already granted to the user, Vertica returns a NOTICE:

```
=> REVOKE commentor FROM Sue;
NOTICE 2022:  Role "commentor" was not already granted to user "Sue"
REVOKE ROLE
```

See Also

- GRANT (Role)
- Granting and Revoking Privileges

REVOKE (Schema)

Revokes schema privileges from users and roles.

Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[,…] | ALL [ PRIVILEGES ] }
   ON SCHEMA [database.]schema[,…]
   FROM grantee[,…]
   [ CASCADE ]
```

Parameters

`GRANT OPTION FOR`	Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.

privilege	The schema privilege to revoke, one of the following:
	• USAGE: Access objects in the specified schemas.
	• CREATE: Create objects in the specified schemas.
	
	You can also revoke privileges from tables and views that they inherited on creation from this schema. When you revoke inherited privileges at the schema level, Vertica automatically applies the revocation to all tables and views that inherited these privileges.
	
	• SELECT: Query tables and views. SELECT privileges are granted by default to the PUBLIC role.
	• INSERT: Insert rows, or and load data into tables with COPY.
	Note: `COPY FROM STDIN` is allowed for users with INSERT privileges, while `COPY FROM file` requires admin privileges.
	• UPDATE: Update table rows.
	• DELETE: Delete table rows.
	• REFERENCES: Create foreign key constraints on this table. This privilege must be set on both referencing and referenced tables.
	• TRUNCATE: Truncate table contents. Non-owners of tables can also execute the following partition operations on them:
	  • DROP_PARTITIONS
	  • SWAP_PARTITIONS_BETWEEN_TABLES
	  • MOVE_PARTITIONS_TO_TABLE
	• ALTER: Modify the DDL of tables and views with ALTER TABLE and ALTER VIEW, respectively.
	• DROP: Drop tables and views.

ALL [PRIVILEGES]	Revokes USAGE AND CREATE privileges. Users cannot revoke privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard. **Important:** Inherited privileges must be explicitly revoked.
[*database.*]*schema*	The schema on which to revoke privileges. If you specify a database, it must be the current database.
grantee	Specifies whose privileges are revoked, one of the following: • User name • Role • PUBLIC: The default role of all users
CASCADE	If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.

Privileges

Non-superuser, one of the following:

- Ownership
- GRANT OPTION on the object

Examples

Revoke user Joe's USAGE privilege on schema online_sales.

```
=> REVOKE USAGE ON SCHEMA online_sales FROM Joe;
REVOKE PRIVILEGE
```

See Also

- GRANT (Schema)
- Granting and Revoking Privileges

REVOKE (Sequence)

Revokes sequence privileges from users and roles.

Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[,…] | ALL [ PRIVILEGES ] }
   ON {
     SEQUENCE [[database.]schema.]sequence[,…]
     | ALL SEQUENCES IN SCHEMA [database.]schema[,…] }
   FROM grantee[,…]
   [ CASCADE ]
```

Parameters

GRANT OPTION FOR	Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.
privilege	One of the following privileges: • SELECT: Execute functions CURRVAL and NEXTVAL on the specified sequences. • ALTER: Modify a sequence's DDL with ALTER SEQUENCE • DROP: Drop this sequence with DROP SEQUENCE.
ALL [PRIVILEGES]	Revokes all sequence privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack. The optional keyword PRIVILEGES is supported to comply with the SQL standard.
[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public,

	you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
SEQUENCE *sequence*	Specifies the sequence on which to revoke privileges.
ALL SEQUENCES IN SCHEMA *schema*	Revokes the specified privileges on all sequences in schema *schema*.
grantee	Specifies whose privileges are revoked, one of the following: • User name • Role • PUBLIC: The default role of all users
CASCADE	If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.

Privileges

Non-superuser, one of the following:

- Ownership
- GRANT OPTION on the object

Examples

Revoke user Joe's privileges on sequence my_seq.

```
=> REVOKE ALL PRIVILEGES ON SEQUENCE my_seq FROM Joe;
REVOKE PRIVILEGE
```

See Also

- GRANT (Sequence)
- Granting and Revoking Privileges

REVOKE (Storage Location)

Revokes privileges on a USER-defined storage location from users and roles. For more information, see Creating Storage Locations in the Administrator's Guide.

Note:
If the storage location is dropped, Vertica automatically revokes all privileges on it.

Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[,…] | ALL [ PRIVILEGES ] }
   ON LOCATION 'path' [ ON node ]
   FROM grantee[,…]
   [ CASCADE ]
```

Parameters

`GRANT OPTION FOR`	Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.
privilege	One of the following privileges: • `READ`: Copy data from files in the storage location into a table. • `WRITE`: Export data from the database to the storage location. With `WRITE` privileges, grantees can also save `COPY` statement rejected data and exceptions files to the storage location.

ALL [PRIVILEGES]	Revokes all storage location privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack. The optional keyword PRIVILEGES is supported to comply with the SQL standard.
ON LOCATION '*path*' [ON *node*]	Specifies the path name mount point of the storage location. If qualified by ON NODE, Vertica revokes access to the storage location residing on *node*. If no node is specified, the revoke operation applies to all nodes on the specified path. All nodes must be on the specified path; otherwise, the entire revoke operation rolls back.
grantee	Specifies whose privileges are revoked, one of the following: • User name • Role • PUBLIC: The default role of all users
CASCADE	If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.

Privileges

Non-superuser, one of the following:

- Ownership
- GRANT OPTION on the object

Examples

See GRANT (Storage Location).

See Also

Granting and Revoking Privileges

REVOKE (Table)

Revokes table privileges from users and roles.

Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[,…] | ALL [ PRIVILEGES ] }
   ON {
     [ TABLE ] [[database.]schema.]table[,…]
     | ALL TABLES IN SCHEMA [database.]schema[,…] }
   FROM grantee[,…]
   [ CASCADE ]
```

Parameters

GRANT OPTION FOR	Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.
privilege	One of the following privileges: • SELECT: Query tables. SELECT privileges are granted by default to the PUBLIC role. • INSERT: Insert table rows with INSERT, and load data with COPY. **Note:** COPY FROM STDIN is allowed for users with INSERT privileges, while COPY FROM *file* requires admin privileges. • UPDATE: Update table rows. • DELETE: Delete table rows. • REFERENCES: Create foreign key constraints on this table. This privilege must be set on both referencing and referenced tables.

	• TRUNCATE: Truncate table contents. Non-owners of tables can also execute the following partition operations on them:
	  • DROP_PARTITIONS
	  • SWAP_PARTITIONS_BETWEEN_TABLES
	  • MOVE_PARTITIONS_TO_TABLE
	• ALTER: Modify a table's DDL with ALTER TABLE.
	• DROP: Drop a table.

ALL [PRIVILEGES]	Revokes all table privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack. The optional keyword PRIVILEGES is supported to comply with the SQL standard.
[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` One exception applies: you can specify system tables without their schema name. If you specify a database, it must be the current database.
TABLE *table*	Specifies the table on which to revoke privileges.
ON ALL TABLES IN SCHEMA *schema*	Revokes the specified privileges on all tables and views in schema *schema*.
grantee	Specifies whose privileges are revoked, one of the following: • User name • Role • PUBLIC: The default role of all users

CASCADE	If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.

Privileges

Non-superuser, one of the following:

- Ownership
- GRANT OPTION on the object

Examples

Revoke user Joe's privileges on table customer_dimension.

```
=> REVOKE ALL PRIVILEGES ON TABLE customer_dimension FROM Joe;
REVOKE PRIVILEGE
```

See Also

- GRANT (Table)
- Granting and Revoking Privileges

REVOKE (User Defined Extension)

Revokes privileges on one or more user-defined extensions from users and roles.

Syntax

```
REVOKE [ GRANT OPTION FOR ] { EXECUTE | ALL PRIVILEGES }
   ON {
       UDx-type [[database.]schema.]function-name( [argument-list] )[,…]
       | ALL FUNCTIONS IN SCHEMA schema[,…] }
   FROM grantee[,…]
```

Parameters

GRANT OPTION FOR	Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.
EXECUTE	Revokes grantees ability to run the specified functions.
ALL [PRIVILEGES]	Revokes all function privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard.
ON *UDx-type*	Specifies the function's user-defined extension (UDx) type, where *UDx-type* is one of the following: • FUNCTION • AGGREGATE FUNCTION • ANALYTIC FUNCTION • TRANSFORM FUNCTION • FILTER • PARSER • SOURCE
[*database*.]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
function-name	The name of the user-defined function on which to revoke privileges.

ON ALL FUNCTIONS IN SCHEMA *schema*	Revokes privileges on all functions in the specified schema.
argument-list	Required for all polymorphic functions, a comma-delimited list of function arguments, where each argument is specified as follows: [*argname*] *argtype* If the procedure is defined with no arguments, supply an empty argument list.
grantee	Specifies whose privileges are revoked, one of the following: • User name • Role • PUBLIC: The default role of all users
CASCADE	If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.

Privileges

Non-superuser, one of the following:

- Owner of the target function
- Privileges grantee who was given the option (WITH GRANT OPTION) of extending these privileges to other users

Examples

Revoke EXECUTE privileges from user Bob on function myzeroifnull:

```
=> REVOKE EXECUTE ON FUNCTION myzeroifnull (x INT) FROM Bob;
```

Revoke all privileges from user Doug on function Pagerank:

```
=> REVOKE ALL ON TRANSFORM FUNCTION Pagerank (t float) FROM Doug;
```

Revoke EXECUTE privileges on all functions in the zero-schema schema from user Bob:

```
=> REVOKE EXECUTE ON ALL FUNCTIONS IN SCHEMA zero-schema FROM Bob;
```

Revoke EXECUTE privileges from user Bob on the `tokenize` function:

```
=> REVOKE EXECUTE ON TRANSFORM FUNCTION tokenize(VARCHAR) FROM Bob;
```

Revoke all privileges on the `ExampleSource()` source from user Alice:

```
=> REVOKE ALL ON SOURCE ExampleSource() FROM Alice;
```

See Also

- GRANT (User Defined Extension)
- Granting and Revoking Privileges in the Administrator's Guide
- Developing User-Defined Extensions (UDxs) in Extending Vertica

REVOKE (View)

Revokes privileges on a view from users and roles.

Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[,…] | ALL [ PRIVILEGES ] }
   ON [[database.]schema.]view[,…]
   FROM grantee[,…]
   [ CASCADE ]
```

Parameters

`GRANT OPTION FOR`	Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.
privilege	One of the following: • SELECT: Query the specified views. • ALTER: Modify a view's DDL with `ALTER VIEW` • DROP: Drop this view with `DROP VIEW`.

ALL PRIVILEGES	Revokes all privileges that pertain to views that also belong to the revoker. Users cannot revoke privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard.
[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
view	The view on which to revoke privileges.
grantee	Specifies whose privileges are revoked, one of the following: • User name • Role • PUBLIC: The default role of all users
CASCADE	If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.

Examples

Revoke SELECT privileges from user Joe on view test_view.

```
=> REVOKE SELECT ON test_view FROM Joe;
REVOKE PRIVILEGE
```

See Also

- GRANT (View)
- Granting and Revoking Privileges

ROLLBACK

Ends the current transaction and discards all changes that occurred during the transaction.

Syntax

```
ROLLBACK [ WORK | TRANSACTION ]
```

Parameters

WORK | TRANSACTION	Have no effect; they are optional keywords for readability.

Privileges

None

Notes

When an operation is rolled back, any locks that are acquired by the operation are also rolled back.

ABORT is a synonym for ROLLBACK.

Examples

This example shows how to roll back from a DELETE transaction.

```
=> SELECT * FROM sample_table;
a
---
1
(1 row)

=> DELETE FROM sample_table WHERE a = 1;

=> SELECT * FROM sample_table;
a
```

```
---
(0 rows)
=> ROLLBACK;
=> SELECT * FROM sample_table;
a
---
1
(1 row)
```

This example shows how to roll back the changes you made since the BEGIN statement.

```
=> BEGIN TRANSACTION ISOLATION LEVEL READ COMMITTED READ ONLY;
BEGIN
=> ROLLBACK TRANSACTION;
ROLLBACK
```

See Also

- Transactions
- Creating Transactions
- BEGIN
- COMMIT
- END
- START TRANSACTION

ROLLBACK TO SAVEPOINT

Rolls back all commands that have been entered within the transaction since the given savepoint was established.

Syntax

```
ROLLBACK TO [SAVEPOINT] savepoint_name
```

Parameters

savepoint_name	Specifies the name of the savepoint to roll back to.

Privileges

None

Notes

- The savepoint remains valid and can be rolled back to again later if needed.
- When an operation is rolled back, any locks that are acquired by the operation are also rolled back.
- ROLLBACK TO SAVEPOINT implicitly destroys all savepoints that were established after the named savepoint.

Example

The following example rolls back the values 102 and 103 that were entered after the savepoint, `my_savepoint`, was established. Only the values 101 and 104 are inserted at commit.

```
=> INSERT INTO product_key VALUES (101);
=> SAVEPOINT my_savepoint;
=> INSERT INTO product_key VALUES (102);
=> INSERT INTO product_key VALUES (103);
=> ROLLBACK TO SAVEPOINT my_savepoint;
=> INSERT INTO product_key VALUES (104);
=> COMMIT;
```

- SAVEPOINT

SAVE QUERY

Saves an input query to associate with a custom directed query.

Syntax

SAVE QUERY *input-query*

Parameters

input-query	The input query to associate with a custom directed query. The input query supports only one optimizer hint, IGNORECONST.

Privileges

Superuser

Description

SAVE QUERY saves the specified input query for use by the next invocation of CREATE DIRECTED QUERY CUSTOM. CREATE DIRECTED QUERY CUSTOM pairs the saved query with its annotated query argument to create a directed query. Both statements must be issued in the same user session.

The saved query remains available until the one of the following events occurs:

- The next invocation of CREATE DIRECTED QUERY, whether invoked with CUSTOM or OPTIMIZER.
- Another invocation of SAVE QUERY.
- The session ends.

Caution:
Vertica associates a saved query with a directed query without checking whether the input and annotated queries are compatible. Be careful to sequence SAVE QUERY and CREATE DIRECTED QUERY CUSTOM so the saved and directed queries are correctly matched.

Examples

See Custom Directed Queries.

SAVEPOINT

Creates a special mark, called a savepoint, inside a transaction. A savepoint allows all commands that are executed after it was established to be rolled back, restoring the transaction to the state it was in at the point in which the savepoint was established.

Tip:
Savepoints are useful when creating nested transactions. For example, a savepoint could be created at the beginning of a subroutine. That way, the result of the subroutine could be rolled back if necessary.

Syntax

```
SAVEPOINT savepoint_name
```

Parameters

savepoint_name	Specifies the name of the savepoint to create.

Privileges

None

Notes

- Savepoints are local to a transaction and can only be established when inside a transaction block.
- Multiple savepoints can be defined within a transaction.
- If a savepoint with the same name already exists, it is replaced with the new savepoint.

Example

The following example illustrates how a savepoint determines which values within a transaction can be rolled back. The values 102 and 103 that were entered after the savepoint, `my_savepoint`, was established are rolled back. Only the values 101 and 104 are inserted at commit.

```
=> INSERT INTO T1 (product_key) VALUES (101);
=> SAVEPOINT my_savepoint;
=> INSERT INTO T1 (product_key) VALUES (102);
=> INSERT INTO T1 (product_key) VALUES (103);
=> ROLLBACK TO SAVEPOINT my_savepoint;
=> INSERT INTO T1 (product_key) VALUES (104);
=> COMMIT;
=> SELECT product_key FROM T1;
.
.
.
101
104
(2 rows)
```

See Also

- RELEASE SAVEPOINT
- ROLLBACK TO SAVEPOINT

SELECT

Returns a result set from one or more data sources—tables, views, joined tables, and named subqueries.

Syntax

```
[ AT epoch ] SELECT [ /*+ LABEL(label-name)*/ ] [ ALL | DISTINCT ]
    { * | expression [ [AS] output-name] }[,…]
    [ into-table-clause ]
    [ from-clause ]
    [ where-clause ]
    [ time-series-clause ]
    [ group-by-clause[,…] ]
    [ having-clause[,…] ]
    [ match-clause ]
    [ UNION { ALL | DISTINCT } ]
```

```
[ except-clause ]
[ intersect-clause ]
[ ORDER BY expression { ASC | DESC }[,…] ]
[ LIMIT { count | ALL } ]
[ OFFSET start-row ]
[ FOR UPDATE [ OF table-name[,…] ] ]
```

Parameters

Note:
SELECT clauses such as INTO and WHERE are discussed in sub-sections of this page.

AT *epoch*	Returns data from the specified epoch, where epoch is one of the following: • EPOCH LATEST: Return data up to but not including the current epoch. The result set includes data from the latest committed DML transaction. • EPOCH *integer*: Return data up to and including the *integer*-specified epoch. • TIME '*timestamp*': Return data from the *timestamp*-specified epoch. **Note:** These options are ignored if used to query temporary or external tables. See Epochs for additional information about how Vertica uses epochs. For details, see Historical Queries.
/*+LABEL(*label-name*)*/	Assigns a label to a query so you can identify it for profiling and debugging. In a UNION statement, only the first SELECT statement can be labeled; Vertica ignores labels in subsequent SELECT statements.

ALL | DISTINCT	• ALL (default): Retains duplicate rows in result set or group. • DISTINCT: Removes duplicate rows from the result set or group. The ALL or DISTINCT qualifier must immediately follow the SELECT keyword. Only one instance of this keyword can appear in the select list.
*	Lists all columns in the queried tables. **Caution:** Selecting all columns from the queried tables can produce a very large wide set, which can adversely affect performance.
expression[[AS] *output-name*]	A table column or column expression to select from the queried tables. You can optionally qualify *expression* with an output name, which can be used in several ways: • Label the column for display. • Refer to the column's value in ORDER BY and GROUP BY clauses (it cannot be referenced in WHERE or HAVING clauses).
from-clause	A comma-separated list of data sources to query.
FOR UPDATE	Specifies to obtain an X lock on all tables specified in the query, most often used from READ COMMITTED isolation. FOR UPDATE requires update/delete permissions on the queried tables and cannot be issued from a read-only transaction.

Privileges

Non-superusers:

- USAGE on the schema
- SELECT on the table or view

Note:
As view owner, you can grant other users SELECT privilege on the view only if one of the following is true:

- You own the view's base table.
- You have SELECT...WITH GRANT OPTION privilege on the view's base table.

Example

When multiple clients run transactions as in the following example query, deadlocks can occur if FOR UPDATE is not used. Two transactions acquire an S lock, and when both attempt to upgrade to an X lock, they encounter deadlocks:

```
=> SELECT balance FROM accounts WHERE account_id=3476 FOR UPDATE;
    …
=> UPDATE accounts SET balance = balance+10 WHERE account_id=3476;
=> COMMIT;
```

- Subqueries
- Joins

EXCEPT Clause

Combines two or more SELECT queries. EXCEPT returns distinct results of the left-hand query that are not also found in the right-hand query.

Note:
MINUS is an alias for EXCEPT.

Syntax

```
SELECT
    EXCEPT except-query[…]
    [ ORDER BY { column-name  | ordinal-number } [ ASC | DESC ] [,…] ]
    [ LIMIT { integer | ALL } ]
    [ OFFSET integer ]
```

Notes

- Use the EXCEPT clause to filter out specific results from a SELECT statement. The EXCEPT query operates on the results of two or more SELECT queries. It returns only those rows in the left-hand query that are not also present in the right-hand query.
- Vertica evaluates multiple EXCEPT clauses in the same SELECT query from left to right, unless parentheses indicate otherwise.
- You cannot use the ALL keyword with an EXCEPT query.
- The results of each SELECT statement must be union compatible. Each statement must return the same number of columns, and the corresponding columns must have compatible data types. For example, you cannot use the EXCEPT clause on a column of type INTEGER and a column of type VARCHAR. If statements do not meet these criteria, Vertica returns an error.

  

  Note:
  The Data Type Coercion Chart lists the data types that can be cast to other data types. If one data type can be cast to the other, those two data types are compatible.

- You can use EXCEPT in FROM, WHERE, and HAVING clauses.
- You can order the results of an EXCEPT operation by including an ORDER BY operation in the statement. When you write the ORDER BY list, specify the column names from the leftmost SELECT statement, or specify integers that indicate the position of the columns by which to sort.
- The rightmost ORDER BY, LIMIT, or OFFSET clauses in an EXCEPT query do not need to be enclosed in parentheses, because the rightmost query specifies that Vertica perform the operation on the results of the EXCEPT operation. Any ORDER BY, LIMIT, or OFFSET clauses contained in SELECT queries that appear earlier in the EXCEPT query must be enclosed in parentheses.
- Vertica supports EXCEPT noncorrelated subquery predicates. For example:

```
=> SELECT * FROM T1
   WHERE T1.x IN
```

```
      (SELECT MAX(c1) FROM T2
       EXCEPT
          SELECT MAX(cc1) FROM T3
       EXCEPT
          SELECT MAX(d1) FROM T4);
```

Examples

Consider the following three tables:

Company_A

```
  Id  | emp_lname |      dept      | sales
------+-----------+----------------+-------
 1234 | Stephen   | auto parts     |  1000
 5678 | Alice     | auto parts     |  2500
 9012 | Katherine | floral         |   500
 3214 | Smithson  | sporting goods |  1500
(4 rows)
```

Company_B

```
  Id  | emp_lname |    dept     | sales
------+-----------+-------------+-------
 4321 | Marvin    | home goods  |   250
 8765 | Bob       | electronics | 20000
 9012 | Katherine | home goods  |   500
 3214 | Smithson  | home goods  |  1500
(4 rows)
```

Company_C

```
  Id  | emp_lname |      dept      | sales
------+-----------+----------------+-------
 3214 | Smithson  | sporting goods |  1500
 5432 | Madison   | sporting goods |   400
 7865 | Cleveland | outdoor        |  1500
 1234 | Stephen   | floral         |  1000
(4 rows)
```

The following query returns the IDs and last names of employees that exist in Company_A, but not in Company_B:

```
=> SELECT id, emp_lname FROM Company_A
   EXCEPT
   SELECT id, emp_lname FROM Company_B;
  id  | emp_lname
------+-----------
 1234 | Stephen
 5678 | Alice
(2 rows)
```

The following query sorts the results of the previous query by employee last name:

```
=> SELECT id, emp_lname FROM Company_A
   EXCEPT
   SELECT id, emp_lname FROM Company_B
   ORDER BY emp_lname ASC;
  id  | emp_lname
------+-----------
 5678 | Alice
 1234 | Stephen
(2 rows)
```

If you order by the column position, the query returns the same results:

```
=> SELECT id, emp_lname FROM Company_A
   EXCEPT
   SELECT id, emp_lname FROM Company_B
   ORDER BY 2 ASC;
  id  | emp_lname
------+-----------
 5678 | Alice
 1234 | Stephen
(2 rows)
```

The following query returns the IDs and last names of employees that exist in Company_A, but not in Company_B or Company_C:

```
=> SELECT id, emp_lname FROM Company_A
   EXCEPT
   SELECT id, emp_lname FROM Company_B
   EXCEPT
   SELECT id, emp_lname FROM Company_C;
  id  | emp_lname
------+-----------
 5678 | Alice
(1 row)
```

The following query shows the results of mismatched data types:

```
=> SELECT id, emp_lname FROM Company_A
   EXCEPT
   SELECT emp_lname, id FROM Company_B;
ERROR 3429:  For 'EXCEPT', types int and varchar are inconsistent
DETAIL:  Columns: id and emp_lname
```

Using the VMart example database, the following query returns information about all Connecticut-based customers who bought items through stores and whose purchases amounted to more than $500, except for those customers who paid cash:

```
=> SELECT customer_key, customer_name FROM public.customer_dimension
      WHERE customer_key IN (SELECT customer_key FROM store.store_sales_fact
         WHERE sales_dollar_amount > 500
         EXCEPT
         SELECT customer_key FROM store.store_sales_fact
         WHERE tender_type = 'Cash')
      AND customer_state = 'CT';
 customer_key |    customer_name
--------------+---------------------
        15084 | Doug V. Lampert
        21730 | Juanita F. Peterson
        24412 | Mary U. Garnett
        25840 | Ben Z. Taylor
        29940 | Brian B. Dobisz
        32225 | Ruth T. McNulty
        33127 | Darlene Y. Rodriguez
        40000 | Steve L. Lewis
        44383 | Amy G. Jones
        46495 | Kevin H. Taylor
(10 rows)
```

See Also

- SELECT
- INTERSECT Clause
- UNION Clause
- Subqueries

FROM Clause

A comma-separated list of data sources to query.

Syntax

```
FROM dataset[,…] [ TABLESAMPLE(percent) ]
```

Parameters

dataset	A set of data to query, one of the following: • Table reference • Joined tables • Named subquery: *subquery* [AS] *name*

TABLESAMPLE(*percent*)	Specifies to return a random sampling of records, where *percent* specifies the approximate sampling size. The *percent* value must be between 0 and 100, exclusive, and can include decimal values. The number of records returned is not guaranteed to be the exact percentage specified. All rows of the data have equal opportunities to be selected. Vertica performs sampling before applying other query filters.

Examples

Count all records in `customer_dimension` table:

```
=> SELECT COUNT(*) FROM customer_dimension;
 COUNT
-------
 50000
(1 row)
```

Return a small sampling of rows in table `customer_dimension`:

```
=> SELECT customer_name, customer_state FROM customer_dimension TABLESAMPLE(0.5) WHERE customer_
state='IL';
    customer_name    | customer_state
---------------------+----------------
 Amy Y. McNulty      | IL
 Daniel C. Nguyen    | IL
 Midori O. Greenwood | IL
 Meghan U. Lampert   | IL
 Tiffany Y. Lang     | IL
 Laura S. King       | IL
 Steve T. Nguyen     | IL
 Craig S. Webber     | IL
 Luigi A. Lewis      | IL
 Mark W. Williams    | IL
(10 rows)
```

Table-Reference

Syntax

```
[[database.]schema.]table[ [AS] alias]
```

Parameters

[*database* .]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table	A table in the logical schema.
[AS] *alias*	A temporary name used for references to *table*.

Joined-Table

Specifies how to join tables.

Syntax

table-reference [*join-type*] JOIN *table-reference*[TABLESAMPLE(*sampling-pct*)] [ON *join-predicate*]

Parameters

table-reference	A table or another *joined-table*.
join-type	Valid Values: • INNER (default). INNER JOIN is equivalent to a query that specifies its join predicate in a WHERE clause. • LEFT [OUTER] • RIGHT [OUTER] • FULL [OUTER] • NATURAL • CROSS
TABLESAMPLE	Specifies to use simple random sampling to return an approximate percentage of records. All rows in the total potential return set are equally eligible to be included in the

	sampling. Vertica performs this sampling before other filters in the query are applied. The number of records returned is not guaranteed to be the exact percentage of records defined by *sampling-pct*. The TABLESAMPLE option is valid only with user-defined tables and Data Collector (DC) tables. Views and system tables are not supported.
sampling-pct	Specifies the percentage of records to be returned as a part of sampling. The value must be greater than 0 and less than 100.
ON *join-predicate*	An equi-join based on one or more columns in the joined tables. invalid for NATURAL and CROSS joins, required for all other join types.

Alternative JOIN Syntax Options

Vertica supports two older join syntax conventions:

- Table joins specified by join predicate in a WHERE clause
- Table joins specified by a USING clause

For details, see Join Syntax in Analyzing Data.

Examples

The following SELECT statement qualifies its JOIN clause with the TABLESAMPLE option:

```
=> SELECT user_id.id, user_name.name FROM user_name TABLESAMPLE(50)
     JOIN user_id TABLESAMPLE(50) ON user_name.id = user_id.id;
  id  |  name
------+--------
  489 | Markus
 2234 | Cato
  763 | Pompey
(3 rows)
```

GROUP BY Clause

Use the GROUP BY clause with aggregate functions in a SELECT statement to collect data across multiple records. Vertica groups the results into one or more sets of rows that match an expression.

The GROUP BY clause without aggregates is similar to using SELECT DISTINCT.

ROLLUP is an extension to the GROUP BY clause. ROLLUP performs subtotal aggregations.

Syntax

```
GROUP BY [/*+GBYTYPE(algorithm)*/] { expression | aggregate-expression }[,…]
```

Arguments

/*+GBYTYPE (*algorithm*)*/	Specifies which algorithm has precedence for implementing this GROUP BY clause, over the algorithm the Vertica query optimizer might otherwise choose. You can set *algorithm* to one of the following values: • HASH: GROUPBY HASH algorithm • PIPE: GROUPBY PIPELINED algorithm For more information about both algorithms, see GROUP BY Implementation Options.
expression	Any expression, including constants and column references in the tables specified in the FROM clause. For example: `column,… column, (expression)`
aggregate-expression	An ordered list of columns, expressions, CUBE, GROUPING SETS, or ROLLUP aggregates. You can include CUBE and ROLLUP aggregates within a GROUPING SETS aggregate. CUBE and ROLLUP aggregates can result in a large amount of output. In that

	case, use GROUPING SETS to return only certain results.
	
	You cannot include any aggregates within a CUBE or ROLLUP expression.
	
	You can append multiple GROUPING SETS, CUBE, or ROLLUP aggregates in the same query. Examples:
	
	`GROUP BY a,b,c,d, ROLLUP(a,b)`
	`GROUP BY a,b,c,d, CUBE((a,b),c,d)`
	`GROUP BY a,b,c,d, CUBE(a,b), ROLLUP (c,d)`
	`GROUP BY ROLLUP(a), CUBE(b), GROUPING SETS(c)`
	`GROUP BY a,b,c,d, GROUPING SETS ((a,d),(b,c),CUBE(a,b))`
	`GROUP BY a,b,c,d, GROUPING SETS ((a,d),(b,c),(a,b),(a),(b),())`

Usage Considerations

- *expression* cannot include aggregate functions. However, you can use the GROUP BY clause with CUBE, GROUPING SETS, and ROLLUP to return summary values for each group.
- When you create a GROUP BY clause, you must include all non-aggregated columns that appear in the SELECT list.
- If the GROUP BY clause includes a WHERE clause, Vertica ignores all rows that do not satisfy the WHERE clause.

Examples

This example shows how to use the WHERE clause with GROUP BY. In this case, the example retrieves all employees whose last name begins with S, and ignores all rows that do not meet this criteria. The GROUP BY clause uses the ILIKE function to retrieve only last names beginning with S. The aggregate function SUM computes the total vacation days for each group.

```
=> SELECT employee_last_name, SUM(vacation_days)
   FROM employee_dimension
   WHERE employee_last_name ILIKE 'S%'
   GROUP BY employee_last_name;
 employee_last_name | SUM
--------------------+------
 Sanchez            | 2892
 Smith              | 2672
 Stein              | 2660
(3 rows)
```

The GROUP BY clause in the following example groups results by vendor region, and vendor region's biggest deal:

```
=> SELECT vendor_region, MAX(deal_size) AS "Biggest Deal"
   FROM vendor_dimension
   GROUP BY vendor_region;
 vendor_region | Biggest Deal
---------------+--------------
 East          |       990889
 MidWest       |       699163
 NorthWest     |        76101
 South         |       854136
 SouthWest     |       609807
 West          |       964005
(6 rows)
```

The following query modifies the previous one with a HAVING clause, which specifies to return only groups whose maximum deal size exceeds $900,000:

```
=> SELECT vendor_region, MAX(deal_size) as "Biggest Deal"
   FROM vendor_dimension
   GROUP BY vendor_region
   HAVING MAX(deal_size) > 900000;
 vendor_region | Biggest Deal
---------------+--------------
 East          |       990889
 West          |       964005
(2 rows)
```

You can use the GROUP BY clause with one-dimensional arrays of scalar types. In the following example, grants is an ARRAY[VARCHAR] and grant_values is an ARRAY[INT].

```
=> CREATE TABLE employees (id INT, department VARCHAR(50), grants ARRAY[VARCHAR], grant_values ARRAY
[INT]);

=> COPY employees FROM STDIN;
42|Physics|[US-7376,DARPA-1567]|[65000,135000]
36|Physics|[US-7376,DARPA-1567]|[10000,25000]
33|Physics|[US-7376]|[30000]
36|Astronomy|[US-7376,DARPA-1567]|[5000,4000]
\.

=> SELECT department, grants, SUM(apply_sum(grant_values)) FROM employees GROUP BY grants,
department;
 department |          grants          |  SUM
------------+--------------------------+--------
 Physics    | ["US-7376","DARPA-1567"] | 235000
 Astronomy  | ["US-7376","DARPA-1567"] |   9000
 Physics    | ["US-7376"]              |  30000
(3 rows)
```

The GROUP BY clause without aggregates is similar to using SELECT DISTINCT. For example, the following two queries return the same results:

```
=> SELECT DISTINCT household_id FROM customer_dimension;
```

```
=> SELECT household_id FROM customer_dimension GROUP BY household_id;
```

- GROUPING
- GROUPING_ID
- GROUPING SETS Aggregate
- ROLLUP

ROLLUP Aggregate

Automatically performs subtotal aggregations as an extension to the GROUP BY clause. ROLLUP performs these aggregations across multiple dimensions, at different levels, within a single SQL query.

You can use the ROLLUP clause with three grouping functions:

- GROUPING
- GROUP_ID
- GROUPING_ID

Syntax

ROLLUP *grouping-expression*[,…]

Parameters

group-expression	One or both of the following: • An expression that is not an aggregate or a grouping function that includes constants and column references in FROM-specified tables. For example: `column1, (column2+1), column3+column4` • A multilevel expression, one of the following:

	• ROLLUP • CUBE • GROUPING SETS

Restrictions

GROUP BY ROLLUP does not sort results. To sort data, an ORDER BY clause must follow the GROUP BY clause.

Levels of Aggregation

If *n* is the number of grouping columns, ROLLUP creates *n*+1 levels of subtotals and grand total. Because ROLLUP removes the right-most column at each step, specify column order carefully.

Suppose that ROLLUP(A, B, C) creates four groups:

- (A, B, C)
- (A, B)
- (A)
- ()

Because ROLLUP removes the right-most column at each step, there are no groups for (A, C) and (B, C).

If you enclose two or more columns in parentheses, GROUP BY treats them as a single entity. For example:

- ROLLUP(A, B, C) creates four groups:

  ```
  (A, B, C)
  (A, B)
  (A)
  ()
  ```

- ROLLUP((A, B), C) treats (A, B) as a single entity and creates three groups:

  ```
  (A, B, C)
  (A, B)
  ()
  ```

Example: Aggregating the Full Data Set

The following example shows how to use the GROUP BY clause to determine family expenses for electricity and books over several years. The SUM aggregate function computes

the total amount of money spent in each category per year.

Suppose you have a table that contains information about family expenses for books and electricity:

```
=> SELECT * FROM expenses ORDER BY Category, Year;
 Year |  Category   | Amount
------+-------------+--------
2005  | Books       |  39.98
2007  | Books       |  29.99
2008  | Books       |  29.99
2005  | Electricity | 109.99
2006  | Electricity | 109.99
2007  | Electricity | 229.98
```

For the `expenses` table, `ROLLUP` computes the subtotals in each category between 2005–2007:

- Books: $99.96
- Electricity: $449.96
- Grand total: $549.92.

Use the `ORDER BY` clause to sort the results:

```
=> SELECT Category, Year, SUM(Amount) FROM expenses
   GROUP BY ROLLUP(Category, Year) ORDER BY 1,2, GROUPING_ID();
 Category    | Year |  SUM
-------------+------+--------
 Books       | 2005 |  39.98
 Books       | 2007 |  29.99
 Books       | 2008 |  29.99
 Books       |      |  99.96
 Electricity | 2005 | 109.99
 Electricity | 2006 | 109.99
 Electricity | 2007 | 229.98
 Electricity |      | 449.96
             |      | 549.92
```

Example: Using ROLLUP with the HAVING Clause

This example shows how to use the HAVING clause with `ROLLUP` to restrict the `GROUP BY` results. The following query produces only those `ROLLUP` categories where `year` is subtotaled, based on the expression in the `GROUPING` function:

```
=> SELECT Category, Year, SUM(Amount) FROM expenses
   GROUP BY ROLLUP(Category,Year) HAVING GROUPING(Year)=1
```

```
   ORDER BY 1, 2, GROUPING_ID();
 Category    | Year |  SUM
-------------+------+--------
 Books       |      |  99.96
 Electricity |      | 449.96
             |      | 549.92
```

The next example rolls up on (`Category`, `Year`), but not on the full results. The `GROUPING_ID` function specifies to aggregate less than three levels:

```
=> SELECT Category, Year, SUM(Amount) FROM expenses
   GROUP BY ROLLUP(Category,Year) HAVING GROUPING_ID(Category,Year)<3
   ORDER BY 1, 2, GROUPING_ID();
 Category    | Year |  SUM
-------------+------+--------
 Books       | 2005 |  39.98
 Books       | 2007 |  29.99
 Books       | 2008 |  29.99
 Books       |      |  99.96
 Electricity | 2005 | 109.99
 Electricity | 2006 | 109.99
 Electricity | 2007 | 229.98
 Electricity |      | 449.96
```

GROUP_ID

Uniquely identifies duplicate sets for GROUP BY queries that return duplicate grouping sets. This function returns one or more integers, starting with zero (0), as identifiers.

For the number of duplicates *n* for a particular grouping, GROUP_ID returns a range of sequential numbers, 0 to *n*–1. For the first each unique group it encounters, GROUP_ID returns the value 0. If GROUP_ID finds the same grouping again, the function returns 1, then returns 2 for the next found grouping, and so on.

Note:
Use GROUP_ID only in SELECT statements that contain a GROUP BY aggregate: CUBE, GROUPING SETS, and ROLLUP.

Behavior Type

Immutable

Syntax

```
GROUP_ID ()
```

Examples

This example shows how GROUP_ID creates unique identifiers when a query produces duplicate groupings. For an expenses table, the following query groups the results by category of expense and year and rolls up the sum for those two columns. The results have duplicate groupings for category and NULL. The first grouping has a GROUP_ID of 0, and the second grouping has a GROUP_ID of 1.

```
=> SELECT Category, Year, SUM(Amount), GROUPING_ID(Category, Year),
   GROUP_ID() FROM expenses GROUP BY Category, ROLLUP(Category,Year)
   ORDER BY Category, Year, GROUPING_ID();
  Category   | Year |  SUM   | GROUPING_ID | GROUP_ID
-------------+------+--------+-------------+----------
 Books       | 2005 |  39.98 |           0 |        0
 Books       | 2007 |  29.99 |           0 |        0
 Books       | 2008 |  29.99 |           0 |        0
 Books       |      |  99.96 |           1 |        0
 Books       |      |  99.96 |           1 |        1
 Electricity | 2005 | 109.99 |           0 |        0
 Electricity | 2006 | 109.99 |           0 |        0
 Electricity | 2007 | 229.98 |           0 |        0
 Electricity |      | 449.96 |           1 |        1
 Electricity |      | 449.96 |           1 |        0
```

- CUBE Aggregate
- GROUPING
- GROUPING_ID
- GROUPING SETS Aggregate

- GROUP BY Clause
- ROLLUP Aggregate

GROUPING

Disambiguates the use of NULL values when GROUP BY queries with multilevel aggregates generate NULL values to identify subtotals in grouping columns. Such NULL values from the original data can also occur in rows. GROUPING returns 1, if the value of *expression* is:

- NULL, representing an aggregated value
- 0 for any other value, including NULL values in rows

Note:
Use GROUPING only in SELECT statements that contain a GROUP BY aggregate: CUBE, GROUPING SETS, and ROLLUP.

Behavior Type

Immutable

Syntax

```
GROUPING ( expression )
```

Parameters

expression	An expression in the GROUP BY clause

Examples

The following query uses the GROUPING function, taking one of the GROUP BY expressions as an argument. For each row, GROUPING returns one of the following:

- 0: The column is part of the group for that row
- 1: The column is not part of the group for that row

The 1 in the GROUPING(Year) column for electricity and books indicates that these values are subtotals. The right-most column values for both GROUPING(Category) and

GROUPING(Year) are 1. This value indicates that neither column contributed to the GROUP BY. The final row represents the total sales.

```
=> SELECT Category, Year, SUM(Amount),
   GROUPING(Category), GROUPING(Year) FROM expenses
   GROUP BY ROLLUP(Category, Year) ORDER BY Category, Year, GROUPING_ID();
   Category  | Year |  SUM   | GROUPING | GROUPING
-------------+------+--------+----------+----------
 Books       | 2005 |  39.98 |        0 |        0
 Books       | 2007 |  29.99 |        0 |        0
 Books       | 2008 |  29.99 |        0 |        0
 Books       |      |  99.96 |        0 |        1
 Electricity | 2005 | 109.99 |        0 |        0
 Electricity | 2006 | 109.99 |        0 |        0
 Electricity | 2007 | 229.98 |        0 |        0
 Electricity |      | 449.96 |        0 |        1
             |      | 549.92 |        1 |        1
```

See Also

- CUBE Aggregate
- GROUP_ID
- GROUPING_ID
- GROUPING SETS Aggregate
- GROUP BY Clause
- ROLLUP Aggregate

GROUPING_ID

Concatenates the set of Boolean values generated by the GROUPING function into a bit vector. GROUPING_ID treats the bit vector as a binary number and returns it as a base-10 value that identifies the grouping set combination.

By using GROUPING_ID you avoid the need for multiple, individual GROUPING functions. GROUPING_ID simplifies row-filtering conditions, because rows of interest are identified using a single return from GROUPING_ID = *n*. Use GROUPING_ID to identify grouping combinations.

Note:
Use GROUPING_ID only in SELECT statements that contain a GROUP BY aggregate: CUBE, GROUPING SETS, and ROLLUP.

Behavior Type

Immutable

Syntax

```
GROUPING_ID ( [expression[,…] )
```

expression	An expression that matches one of the expressions in the GROUP BY clause. If the GROUP BY clause includes a list of expressions, GROUPING_ID returns a number corresponding to the GROUPING bit vector associated with a row.

Examples

This example shows how calling GROUPING_ID without an expression returns the GROUPING bit vector associated with a full set of multilevel aggregate expressions. The GROUPING_ID value is comparable to GROUPING_ID(a,b) because GROUPING_ID() includes all columns in the GROUP BY ROLLUP:

```
=> SELECT a,b,COUNT(*), GROUPING_ID() FROM T GROUP BY ROLLUP(a,b);
```

In the following query, the GROUPING(Category) and GROUPING(Year) columns have three combinations:

- 0,0
- 0,1
- 1,1

```
=> SELECT Category, Year, SUM(Amount),
   GROUPING(Category), GROUPING(Year) FROM expenses
   GROUP BY ROLLUP(Category, Year) ORDER BY Category, Year, GROUPING_ID();
  Category   | Year |  SUM   | GROUPING | GROUPING
-------------+------+--------+----------+----------
 Books       | 2005 |  39.98 |        0 |        0
 Books       | 2007 |  29.99 |        0 |        0
 Books       | 2008 |  29.99 |        0 |        0
 Books       |      |  99.96 |        0 |        1
 Electricity | 2005 | 109.99 |        0 |        0
 Electricity | 2006 | 109.99 |        0 |        0
 Electricity | 2007 | 229.98 |        0 |        0
```

```
 Electricity |      | 449.96 |        0 |        1
             |      | 549.92 |        1 |        1
```

GROUPING_ID converts these values as follows:

Binary Set Values	Decimal Equivalents
00	0
01	1
11	3
0	Category, Year

The following query returns the single number for each GROUP BY level that appears in the gr_id column:

```
=> SELECT Category, Year, SUM(Amount),
   GROUPING(Category),GROUPING(Year),GROUPING_ID(Category,Year) AS gr_id
   FROM expenses GROUP BY ROLLUP(Category, Year);
  Category   | Year |  SUM   | GROUPING | GROUPING | gr_id
-------------+------+--------+----------+----------+-------
 Books       | 2008 |  29.99 |        0 |        0 |     0
 Books       | 2005 |  39.98 |        0 |        0 |     0
 Electricity | 2007 | 229.98 |        0 |        0 |     0
 Books       | 2007 |  29.99 |        0 |        0 |     0
 Electricity | 2005 | 109.99 |        0 |        0 |     0
 Electricity |      | 449.96 |        0 |        1 |     1
             |      | 549.92 |        1 |        1 |     3
 Electricity | 2006 | 109.99 |        0 |        0 |     0
 Books       |      |  99.96 |        0 |        1 |     1
```

The gr_id value determines the GROUP BY level for each row:

GROUP BY Level	GROUP BY Row Level
3	Total sum
1	Category
0	Category, year

You can also use the DECODE function to give the values more meaning by comparing each search value individually:

```
=> SELECT Category, Year, SUM(AMOUNT), DECODE(GROUPING_ID(Category, Year),
       3, 'Total',
       1, 'Category',
```

```
      0, 'Category,Year')
   AS GROUP_NAME FROM expenses GROUP BY ROLLUP(Category, Year);
  Category   | Year |  SUM   |  GROUP_NAME
-------------+------+--------+--------------
 Electricity | 2006 | 109.99 | Category,Year
 Books       |      |  99.96 | Category
 Electricity | 2007 | 229.98 | Category,Year
 Books       | 2007 |  29.99 | Category,Year
 Electricity | 2005 | 109.99 | Category,Year
 Electricity |      | 449.96 | Category
             |      | 549.92 | Total
 Books       | 2005 |  39.98 | Category,Year
 Books       | 2008 |  29.99 | Category,Year
```

See Also

- CUBE Aggregate
- GROUP_ID
- GROUPING
- GROUPING SETS Aggregate
- GROUP BY Clause
- ROLLUP Aggregate

CUBE Aggregate

Automatically performs all possible aggregations of the specified columns, as an extension to the GROUP BY clause.

You can use the ROLLUP clause with three grouping functions:

- GROUPING
- GROUP_ID
- GROUPING_ID

Syntax

GROUP BY *group-expression*[,…]

Parameters

group-expression	One or both of the following:

	• An expression that is not an aggregate or a grouping function that includes constants and column references in FROM-specified tables. For example:
	`column1, (column2+1), column3+column4`
	• A multilevel expression, one of the following:
	  • ROLLUP
	  • CUBE
	  • GROUPING SETS

Restrictions

- GROUP BY CUBE does not order data. If you want to sort data, use the ORDER BY Clause. The ORDER BY clause must come *after* the GROUP BY clause.
- You can use CUBE inside a GROUPING SETS expression, but not inside a ROLLUP expression or another CUBE expression.

Levels of CUBE Aggregation

If *n* is the number of grouping columns, CUBE creates 2^n levels of aggregations. For example:

CUBE (A, B, C) creates all possible groupings, resulting in eight groups:

- (A, B, C)
- (A, B)
- (A, C)
- (B, C)
- (A)
- (B)
- (C)
- ()

If you increase the number of CUBE columns, the number of CUBE groupings increases exponentially. The CUBE query may be resource intensive and produce combinations that

are not of interest. In that case, consider using the GROUPING SETS Aggregate , which allows you to choose specific groupings.

Example: Using CUBE to Return All Groupings

Suppose you have a table that contains information about family expenses for books and electricity:

```
=> SELECT * FROM expenses ORDER BY Category, Year;
 Year |  Category   | Amount
------+-------------+--------
2005  | Books       |  39.98
2007  | Books       |  29.99
2008  | Books       |  29.99
2005  | Electricity | 109.99
2006  | Electricity | 109.99
2007  | Electricity | 229.98
```

To aggregate the data by both Category and Year using the CUBE aggregate:

```
=> SELECT Category, Year, SUM(Amount) FROM expenses
   GROUP BY CUBE(Category, Year) ORDER BY 1, 2, GROUPING_ID();
 Category    | Year |  SUM
-------------+------+--------
 Books       | 2005 |  39.98
 Books       | 2007 |  29.99
 Books       | 2008 |  29.99
 Books       |      |  99.96
 Electricity | 2005 | 109.99
 Electricity | 2006 | 109.99
 Electricity | 2007 | 229.98
 Electricity |      | 449.96
             | 2005 | 149.97
             | 2006 | 109.99
             | 2007 | 259.97
             | 2008 |  29.99
             |      | 549.92
```

The results include subtotals for each category and year, and a grand total ($549.92).

Example: Using CUBE with the HAVING Clause

This example shows how you can restrict the GROUP BY results, use the HAVING clause with the CUBE aggregate. This query returns only the category totals and the full total:

```
=> SELECT Category, Year, SUM(Amount) FROM expenses
   GROUP BY CUBE(Category,Year) HAVING GROUPING(Year)=1;
 Category    | Year |  SUM
-------------+------+--------
 Books       |      |  99.96
 Electricity |      | 449.96
             |      | 549.92
```

The next query returns only the aggregations for the two categories for each year. The GROUPING ID function specifies to omit the grand total ($549.92):

```
=> SELECT Category, Year, SUM (Amount) FROM expenses
   GROUP BY CUBE(Category,Year) HAVING GROUPING_ID(Category,Year)<2
   ORDER BY 1, 2, GROUPING_ID();
 Category   | Year |  SUM
------------+------+--------
 Books      | 2005 |  39.98
 Books      | 2007 |  29.99
 Books      | 2008 |  29.99
 Books      |      |  99.96
 Electrical | 2005 | 109.99
 Electrical | 2006 | 109.99
 Electrical | 2007 | 229.98
 Electrical |      | 449.96
```

- GROUPING
- GROUPING_ID
- GROUPING SETS Aggregate
- ROLLUP Aggregate

GROUPING SETS Aggregate

The `GROUPING SETS` aggregate is an extension to the GROUP BY clause that automatically performs subtotal aggregations on groupings that you specify.

You can use the `GROUPING SETS` clause with three grouping functions:

- GROUPING
- GROUP_ID
- GROUPING_ID

To sort data, use the ORDER BY clause. The ORDER BY clause must follow the GROUP BY clause.

Syntax

GROUP BY *group-expression*[,…]

Parameters

group-expression	One or both of the following:
	• An expression that is not an aggregate or a grouping function that includes constants and column references in FROM-specified tables. For example:
	`column1, (column2+1), column3+column4`
	• A multilevel expression, one of the following:
	  • ROLLUP
	  • CUBE
	  • GROUPING SETS

Defining the Groupings

GROUPING SETS allows you to specify exactly which groupings you want in the results. You can also concatenate the groupings as follows:

The following example clauses result in the groupings shown.

This clause...	Defines groupings...
`...GROUP BY GROUPING SETS(A,B,C,D)...`	(A), (B), (C), (D)
`...GROUP BY GROUPING SETS((A),(B),(C),(D))...`	(A), (B), (C), (D)
`...GROUP BY GROUPING SETS((A,B,C,D))...`	(A, B, C, D)
`...GROUP BY GROUPING SETS(A,B),GROUPING SETS(C,D)...`	(A, C), (B, C), (A, D), (B, C)
`...GROUP BY GROUPING SETS((A,B)),GROUPING SETS(C,D)...`	(A, B, C), (A, B, D)

This clause...	Defines groupings...
`...GROUP BY GROUPING SETS(A,B),GROUPING SETS(ROLLUP(C,D))...`	(A,B), (A,B,C), (A,B,C,D)
`...GROUP BY A,B,C,GROUPING SETS(ROLLUP(C, D))...`	(A, B, C, D), (A, B, C), (A, B, C) The clause contains two groups (A, B, C). In the HAVING clause, use the GROUP_ID function as a predicate, to eliminate the second grouping.

Example: Selecting Groupings

This example shows how to select only those groupings you want. Suppose you want to aggregate on columns only, and you do not need the grand total. The first query omits the total. In the second query, you add () to the GROUPING SETS list to get the total. Use the ORDER BY clause to sort the results by grouping:

```
=> SELECT Category, Year, SUM(Amount) FROM expenses
   GROUP BY GROUPING SETS((Category, Year), (Year))
   ORDER BY 1, 2, GROUPING_ID();
  Category  | Year |  SUM
------------+------+--------
 Books      | 2005 |  39.98
 Books      | 2007 |  29.99
 Books      | 2008 |  29.99
 Electrical | 2005 | 109.99
 Electrical | 2006 | 109.99
 Electrical | 2007 | 229.98
            | 2005 | 149.97
            | 2006 | 109.99
            | 2007 | 259.97
            | 2008 |  29.99

=> SELECT Category, Year, SUM(Amount) FROM expenses
   GROUP BY GROUPING SETS((Category, Year), (Year), ())
   ORDER BY 1, 2, GROUPING_ID();
  Category  | Year |  SUM
------------+------+--------
 Books      | 2005 |  39.98
 Books      | 2007 |  29.99
 Books      | 2008 |  29.99
 Electrical | 2005 | 109.99
 Electrical | 2006 | 109.99
 Electrical | 2007 | 229.98
            | 2005 | 149.97
            | 2006 | 109.99
            | 2007 | 259.97
```

```
           | 2008 |  29.99
           |      | 549.92
```

HAVING Clause

Filters the results of a GROUP BY clause. Semantically, the HAVING clause occurs after the GROUP BY operation. It was added to the SQL standard because a WHERE clause cannot specify aggregate functions.

Syntax

```
HAVING condition[,…]
```

Parameters

condition	Unambiguously references a grouping column, unless the reference appears in an aggregate function.

Example

The following example returns the employees with salaries greater than $50,000:

```
=> SELECT employee_last_name, MAX(annual_salary) as "highest_salary"
   FROM employee_dimension
   GROUP BY employee_last_name
   HAVING MAX(annual_salary) > 50000;
 employee_last_name | highest_salary
--------------------+----------------
```

```
  Bauer             |         920149
  Brown             |         569079
  Campbell          |         649998
  Carcetti          |         195175
  Dobisz            |         840902
  Farmer            |         804890
  Fortin            |         481490
  Garcia            |         811231
  Garnett           |         963104
  Gauthier          |         927335
(10 rows)
```

INTERSECT Clause

Calculates the intersection of the results of two or more SELECT queries. INTERSECT returns distinct values by both the query on the left and right sides of the INTERSECT operand.

Syntax

```
SELECT
    INTERSECT query[…]
    [ order-by-clause ]
    [ limit-clause ]
    [ offset-clause ]
```

Notes

- Use the INTERSECT clause to return all elements that are common to the results of all the SELECT queries. The INTERSECT query operates on the results of two or more SELECT queries. INTERSECT returns only the rows that are returned by all the specified queries.
- You cannot use the ALL keyword with an INTERSECT query.
- The results of each SELECT query must be union compatible; they must return the same number of columns, and the corresponding columns must have compatible data types. For example, you cannot use the INTERSECT clause on a column of type INTEGER and a column of type VARCHAR. If the SELECT queries do not meet these criteria, Vertica returns an error.

Note:
The Data Type Coercion Chart lists the data types that can be cast to other data types. If one data type can be cast to the other, those two data types are compatible.

- Order the results of an INTERSECT operation by using an ORDER BY clause. In the ORDER BY list, specify the column names from the leftmost SELECT statement or specify integers that indicate the position of the columns by which to sort.
- You can use INTERSECT in FROM, WHERE, and HAVING clauses.
- The rightmost ORDER BY, LIMIT, or OFFSET clauses in an INTERSECT query do not need to be enclosed in parentheses because the rightmost query specifies that Vertica perform the operation on the results of the INTERSECT operation. Any ORDER BY, LIMIT, or OFFSET clauses contained in SELECT queries that appear earlier in the INTERSECT query must be enclosed in parentheses.
- The order by column names is from the first select.
- Vertica supports INTERSECT noncorrelated subquery predicates. For example:

```
=> SELECT * FROM T1
   WHERE T1.x IN
      (SELECT MAX(c1) FROM T2
       INTERSECT
          SELECT MAX(cc1) FROM T3
       INTERSECT
          SELECT MAX(d1) FROM T4);
```

Examples

Consider the following three tables:

Company_A

```
id       emp_lname     dept          sales
------+------------+----------------+-------
1234  | Stephen    | auto parts     | 1000
5678  | Alice      | auto parts     | 2500
9012  | Katherine  | floral         |  500
3214  | Smithson   | sporting goods | 1500
```

Company_B

```
id       emp_lname     dept        sales
------+------------+-------------+-------
4321  | Marvin     | home goods  |   250
9012  | Katherine  | home goods  |   500
8765  | Bob        | electronics | 20000
3214  | Smithson   | home goods  |  1500
```

Company_C

```
  id  | emp_lname |      dept      | sales
------+-----------+----------------+-------
 3214 | Smithson  | sporting goods |  1500
```

```
 5432 | Madison   | sporting goods |   400
 7865 | Cleveland | outdoor        |  1500
 1234 | Stephen   | floral         |  1000
```

The following query returns the IDs and last names of employees that exist in both Company_A and Company_B:

```
=> SELECT id, emp_lname FROM Company_A
   INTERSECT
   SELECT id, emp_lname FROM Company_B;
 id   | emp_lname
------+-----------
 3214 | Smithson
 9012 | Katherine
(2 rows)
```

The following query returns the same two employees in descending order of sales:

```
=> SELECT id, emp_lname, sales FROM Company_A
   INTERSECT
   SELECT id, emp_lname, sales FROM Company_B
   ORDER BY sales DESC;
  id  | emp_lname | sales
------+-----------+-------
 3214 | Smithson  |  1500
 9012 | Katherine |   500
(2 rows)
```

The following query returns the employee who works for both companies whose sales in Company_B are greater than 1000:

```
=> SELECT id, emp_lname, sales FROM Company_A
   INTERSECT
   (SELECT id, emp_lname, sales FROM company_B WHERE sales > 1000)
   ORDER BY sales DESC;
  id  | emp_lname | sales
------+-----------+-------
 3214 | Smithson  |  1500
(1 row)
```

In the following query returns the ID and last name of the employee who works for all three companies:

```
=> SELECT id, emp_lname FROM Company_A
    INTERSECT
   SELECT id, emp_lname FROM Company_B
   INTERSECT
   SELECT id, emp_lname FROM Company_C;
  id  | emp_lname
------+-----------
 3214 | Smithson
(1 row)
```

The following query shows the results of a mismatched data types; these two queries are not union compatible:

```
=> SELECT id, emp_lname FROM Company_A
    INTERSECT
   SELECT emp_lname, id FROM Company_B;
ERROR 3429:  For 'INTERSECT', types int and varchar are inconsistent
DETAIL:  Columns: id and emp_lname
```

Using the VMart example database, the following query returns information about all Connecticut-based customers who bought items online and whose purchase amounts were between $400 and $500:

```
=> SELECT customer_key, customer_name from public.customer_dimension
       WHERE customer_key IN (SELECT customer_key
         FROM online_sales.online_sales_fact
         WHERE sales_dollar_amount > 400
         INTERSECT
         SELECT customer_key FROM online_sales.online_sales_fact
         WHERE sales_dollar_amount > 500)
      AND customer_state = 'CT' ORDER BY customer_key;
 customer_key |     customer_name
--------------+-----------------------
           39 | Sarah S. Winkler
           44 | Meghan H. Overstreet
           70 | Jack X. Cleveland
          103 | Alexandra I. Vu
          110 | Matt . Farmer
          173 | Mary R. Reyes
          188 | Steve G. Williams
          233 | Theodore V. McNulty
          250 | Marcus E. Williams
          294 | Samantha V. Young
          313 | Meghan P. Pavlov
          375 | Sally N. Vu
          384 | Emily R. Smith
          387 | Emily L. Garcia
…
```

The previous query and the next one are equivalent, and return the same results:

```
=> SELECT customer_key,customer_name FROM public.customer_dimension
       WHERE customer_key IN (SELECT customer_key
      FROM online_sales.online_sales_fact
         WHERE sales_dollar_amount > 400
         AND sales_dollar_amount < 500)
   AND customer_state = 'CT' ORDER BY customer_key;
```

INTO TABLE Clause

Creates a table from a query result set.

Syntax

Permanent table

```
INTO [TABLE] [[database.]schema.]table
```

Temporary table

```
INTO [scope] TEMP[ORARY] [TABLE] [[database.]schema.]table
   [ ON COMMIT { PRESERVE | DELETE } ROWS ]
```

Parameters

scope	Specifies visibility of a temporary table definition: • GLOBAL (default): The table definition is visible to all sessions, and persists until you explicitly drop the table. • LOCAL: The table definition is visible only to the session in which it is created, and is dropped when the session ends. Regardless of this setting, retention of temporary table data is set by the keywords ON COMMIT DELETE ROWS and ON COMMIT PRESERVE ROWS (see below). For more information, see Creating Temporary Tables in the Administrator's Guide.
[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply

	the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table	The name of the table to create.
ON COMMIT { PRESERVE | DELETE } ROWS	Specifies whether data is transaction- or session-scoped: • DELETE (default) marks the temporary table for transaction-scoped data. Vertica removes all table data after each commit. • PRESERVE marks the temporary table for session-scoped data, which is preserved beyond the lifetime of a single transaction. Vertica removes all table data when the session ends.

Examples

The following SELECT statement has an INTO TABLE clause that creates table newTable from customer_dimension:

```
=> SELECT * INTO TABLE newTable FROM customer_dimension;
```

The following SELECT statement creates temporary table newTempTable. By default, temporary tables are created at a global scope, so its definition is visible to other sessions and persists until it is explicitly dropped. No customer_dimension data is copied into the new table, and Vertica issues a warning accordingly:

```
=> SELECT * INTO TEMP TABLE newTempTable FROM customer_dimension;
WARNING 4102:  No rows are inserted into table "public"."newTempTable" because
  ON COMMIT DELETE ROWS is the default for create temporary table
HINT:  Use "ON COMMIT PRESERVE ROWS" to preserve the data in temporary table
CREATE TABLE
```

The following SELECT statement creates local temporary table newTempTableLocal. This table is visible only to the session in which it was created, and is automatically dropped when the session ends. The INTO TABLE clause includes ON COMMIT PRESERVE ROWS, so Vertica copies all selection data into the new table:

```
=> SELECT * INTO LOCAL TEMP TABLE newTempTableLocal ON COMMIT PRESERVE ROWS
     FROM customer_dimension;
CREATE TABLE
```

LIMIT Clause

Specifies the maximum number of result set rows to return, either from the entire result set, or from windows of a partitioned result set.

Syntax

Applied to entire result set:

```
LIMIT { num-rows | ALL }
```

Applied to windows of a partitioned result set:

```
LIMIT num-rows OVER ( PARTITION BY column-expr-x, ORDER BY column-expr-y [ASC | DESC]
```

Parameters

num-rows	The maximum number of rows to return.
ALL	Returns all rows, valid only when LIMIT is applied to the entire result set.
OVER()	Specifies how to partition and sort input data with respect to the current row. The input data is the result set that the query returns after it evaluates FROM, WHERE, GROUP BY, and HAVING clauses. For details, see Using LIMIT with Window Partitioning below.

Limiting Returned Rows

LIMIT specifies to return only top-k rows from the queried dataset. Row precedence is determined by the query's ORDER BY clause.

Important:
The following dependencies apply:

- Always use an ORDER BY clause with LIMIT. Otherwise, the query returns an undefined subset of the result set. The ORDER BY clause must precede LIMIT.
- When a SELECT statement specifies both LIMIT and OFFSET, Vertica first processes the OFFSET, and then applies LIMIT to the remaining rows.

For example, the following query returns the first 10 rows of data in table `customer_dimension`, as ordered by columns `store_region` and `number_of_employees`:

```
=> SELECT store_region, store_city||', '||store_state location, store_name, number_of_employees
     FROM store.store_dimension WHERE number_of_employees <= 12 ORDER BY store_region, number_of_
employees LIMIT 10;
 store_region |    location    | store_name | number_of_employees
--------------+----------------+------------+---------------------
 East         | Stamford, CT   | Store219   |                  12
 East         | New Haven, CT  | Store66    |                  12
 East         | New York, NY   | Store122   |                  12
 MidWest      | South Bend, IN | Store134   |                  10
 MidWest      | Evansville, IN | Store30    |                  11
 MidWest      | Green Bay, WI  | Store27    |                  12
 South        | Mesquite, TX   | Store124   |                  10
 South        | Cape Coral, FL | Store18    |                  11
 South        | Beaumont, TX   | Store226   |                  11
 South        | Houston, TX    | Store33    |                  11
(10 rows)
```

Using LIMIT with Window Partitioning

You can use LIMIT to apply window partitioning on query results, and limit the number of rows that are returned in each window:

```
SELECT … FROM dataset LIMIT num-rows OVER ( PARTITION BY column-expr-x, ORDER BY column-expr-y [ASC |
DESC] )
```

where querying *dataset* returns *num-rows* rows in each *column-expr-x* partition with the highest or lowest values of *column-expr-y*.

For example, the following statement queries table `store.store_dimension` and specifies window partitioning on the result set. LIMIT is set to 2, so each window partition can display no more than two rows. The `OVER` clause specifies to partition the result set by `store_region`, where each partition window displays for one region the two stores with the smallest number of employees:

```
=> SELECT store_region, store_city||', '||store_state location, store_name, number_of_employees FROM
store.store_dimension
```

```
    LIMIT 2 OVER (PARTITION BY store_region ORDER BY number_of_employees ASC);
 store_region |      location       | store_name | number_of_employees
--------------+---------------------+------------+---------------------
 West         | Norwalk, CA         | Store43    |                  10
 West         | Lancaster, CA       | Store95    |                  11
 East         | Stamford, CT        | Store219   |                  12
 East         | New York, NY        | Store122   |                  12
 SouthWest    | North Las Vegas, NV | Store170   |                  10
 SouthWest    | Phoenix, AZ         | Store228   |                  11
 NorthWest    | Bellevue, WA        | Store200   |                  19
 NorthWest    | Portland, OR        | Store39    |                  22
 MidWest      | South Bend, IN      | Store134   |                  10
 MidWest      | Evansville, IN      | Store30    |                  11
 South        | Mesquite, TX        | Store124   |                  10
 South        | Beaumont, TX        | Store226   |                  11
(12 rows)
```

MATCH Clause

A SQL extension that lets you screen large amounts of historical data in search of event patterns, the MATCH clause provides subclasses for analytic partitioning and ordering and matches rows from the result table based on a pattern you define.

You specify a pattern as a regular expression, which is composed of event types defined in the DEFINE subclause, where each event corresponds to a row in the input table. Then you can search for the pattern within a sequence of input events. Pattern matching returns the contiguous sequence of rows that conforms to PATTERN subclause. For example, pattern P (A B* C) consist of three event types: A, B, and C. When Vertica finds a match in the input table, the associated pattern instance must be an event of type A followed by 0 or more events of type B, and an event of type C.

Pattern matching is particularly useful for clickstream analysis where you might want to identify users' actions based on their Web browsing behavior (page clicks). For details, see Event Series Pattern Matching.

Syntax

```
MATCH ( [ PARTITION BY table-column ] ORDER BY table-column
    DEFINE event-name AS boolean-expr [,…]
    PATTERN pattern-name AS ( regexp )
    [ rows-match-clause ] )
```

Parameters

PARTITION BY	Defines the window data scope in which the pattern, defined in the PATTERN subclause, is matched. The partition clause partitions the data by matched patterns defined in the PATTERN subclause. For each partition, data is sorted by the ORDER BY clause. If the partition clause is omitted, the entire data set is considered a single partition.
ORDER BY	Defines the window data scope in which the pattern, defined in the PATTERN subclause, is matched. For each partition, the order clause specifies how the input data is ordered for pattern matching. **Note:** The ORDER BY clause is mandatory.

DEFINE	Defines the boolean expressions that make up the event types in the regular expressions. For example:
	
	`DEFINE`
	`  Entry    AS RefURL  NOT ILIKE '%website2.com%' AND PageURL ILIKE`
	`                                '%website2.com%',`
	`  Onsite   AS PageURL ILIKE     '%website2.com%' AND Action='V',`
	`  Purchase AS PageURL ILIKE     '%website2.com%' AND Action='P'`
	
	The DEFINE subclause accepts a maximum of 52 events. See Event Series Pattern Matching in Machine Learning for Predictive Analytics for examples.

event-name	Name of the event to evaluate for each row—in the earlier example, `Entry, Onsite, Purchase`. **Note:** Event names are case insensitive and follow the same naming conventions as those used for tables and columns.
boolean-expr	Expression that returns true or false. boolean_expr can include Boolean Operators and relational (comparison)

<table>
<tr><td></td><td>operators. For example:

<pre>Purchase AS PageURL ILIKE '%website2.com%' AND Action = 'P'</pre></td></tr>
<tr><td>PATTERN
pattern-name</td><td>Name of the pattern defined in the PATTERN subclause; for example, P is the pattern name defined below:

<pre>PATTERN P AS (…)</pre>A PATTERN is a search pattern that is comprised of a name and a regular expression.

  Note:
Vertica supports one pattern per query.</td></tr>
<tr><td>regexp</td><td>A regular expression comprised of event types defined in the DEFINE subclause and one or more quantifiers below. When Vertica evaluates the MATCH clause, the regular expression identifies the rows that meet the expression criteria.

<table>
<tr><td>*</td><td>Match 0 or more times</td></tr>
<tr><td>*?</td><td>Match 0 or more times, not greedily</td></tr>
<tr><td>+</td><td>Match 1 or more times</td></tr>
<tr><td>+?</td><td>Match 1 or more times, not greedily</td></tr>
<tr><td>?</td><td>Match 0 or 1 time</td></tr>
<tr><td>??</td><td>Match 0 or 1 time, not greedily</td></tr>
<tr><td>*+</td><td>Match 0 or more times, possessive</td></tr>
<tr><td>++</td><td>Match 1 or more times, possessive</td></tr>
<tr><td>?+</td><td>Match 0 or 1 time, possessive</td></tr>
<tr><td>|</td><td>Alternation. Matches expression before or after the vertical bar. Similar to a Boolean or.</td></tr>
</table></td></tr>
<tr><td>rows-match-clause</td><td>Specifies how to resolve more than one event evaluating to true for a single row, one of the following:</td></tr>
</table>

	• `ROWS MATCH ALL EVENTS`: If more than one event evaluates to true for a single row, Vertica returns this error :
	
	`ERROR: pattern events must be mutually exclusive`
	`HINT:  try using ROWS MATCH FIRST EVENT`
	
	• `ROWS MATCH FIRST EVENT`: If more than one event evaluates to true for a given row, Vertica uses the first event in the SQL statement for that row.

Pattern Semantic Evaluation

- The semantic evaluating ordering of the SQL clauses is: FROM -> WHERE -> PATTERN MATCH -> SELECT.
- Data is partitioned as specified in the PARTITION BY clause. If the partition clause is omitted, the entire data set is considered a single partition.
- For each partition, the order clause specifies how the input data is ordered for pattern matching.
- Events are evaluated for each row. A row could have 0, 1, or *N* events evaluate to true. If more than one event evaluates to true for the same row, Vertica returns a run-time error unless you specify ROWS MATCH FIRST EVENT. If you specify ROWS MATCH FIRST EVENT and more than one event evaluates to TRUE for a single row, Vertica chooses the event that was defined first in the SQL statement to be the event it uses for the row.
- Vertica performs pattern matching by finding the contiguous sequence of rows that conforms to the pattern defined in the PATTERN subclause.

For each match, Vertica outputs the rows that contribute to the match. Rows not part of the match (do not satisfy one or more predicates) are not output.

- Vertica reports only non-overlapping matches. If an overlap occurs, Vertica chooses the first match found in the input stream. After finding the match, Vertica looks for the next match, starting at the end of the previous match.
- Vertica reports the longest possible match, not a subset of a match. For example, consider pattern: A*B with input: AAAB. Because A uses the greedy regular expression quantifier (*), Vertica reports all A inputs (AAAB), not AAB, AB, or B.

Notes and Restrictions

- DISTINCT and GROUP BY/HAVING clauses are not allowed in pattern match queries.
- The following expressions are not allowed in the DEFINE subclause:
  - Subqueries, such as `DEFINE X AS c IN (SELECT c FROM table1)`
  - Analytic functions, such as `DEFINE X AS c < LEAD(1) OVER (ORDER BY 1)`
  - Aggregate functions, such as `DEFINE X AS c < MAX(1)`
- You cannot use the same pattern name to define a different event; for example, the following is not allowed for X:

```
DEFINE   X AS c1 <  3
  X AS c1  >= 3
```

- Used with MATCH clause, Vertica Pattern Matching Functions provide additional data about the patterns it finds. For example, you can use the functions to return values representing the name of the event that matched the input row, the sequential number of the match, or a partition-wide unique identifier for the instance of the pattern that matched.

Examples

For examples, see Event Series Pattern Matching in Machine Learning for Predictive Analytics.

- PATTERN_ID

Event Series Pattern Matching

The SQL MATCH Clause syntax lets you screen large amounts of historical data in search of event patterns. You specify a pattern as a regular expression and can then search for the

pattern within a sequence of input events. MATCH provides subclauses for analytic data partitioning and ordering, and the pattern matching occurs on a contiguous set of rows.

Pattern matching is particularly useful for clickstream analysis where you might want to identify users' actions based on their Web browsing behavior (page clicks). A typical online clickstream funnel is:

Company home page -> product home page -> search -> results -> purchase online

Using this clickstream funnel, you can search for a match on the user's sequence of web clicks and identify that user:

- Landed on the company home page
- Navigated to the product page
- Ran a search
- Clicked a link from the search results
- Made a purchase

Clickstream Funnel Schema

The examples in this topic use this clickstream funnel and the following `clickstream_log` table schema:

```
=> CREATE TABLE clickstream_log (
  uid INT,             --user ID
  sid INT,             --browsing session ID, produced by previous sessionization computation
  ts TIME,             --timestamp that occurred during the user's page visit
  refURL VARCHAR(20),  --URL of the page referencing PageURL
  pageURL VARCHAR(20), --URL of the page being visited
  action CHAR(1)       --action the user took after visiting the page ('P' = Purchase, 'V' = View)
);

INSERT INTO clickstream_log VALUES (1,100,'12:00','website1.com','website2.com/home', 'V');
INSERT INTO clickstream_log VALUES (1,100,'12:01','website2.com/home','website2.com/floby', 'V');
INSERT INTO clickstream_log VALUES (1,100,'12:02','website2.com/floby','website2.com/shamwow', 'V');
INSERT INTO clickstream_log values (1,100,'12:03','website2.com/shamwow','website2.com/buy', 'P');
INSERT INTO clickstream_log values (2,100,'12:10','website1.com','website2.com/home', 'V');
INSERT INTO clickstream_log values (2,100,'12:11','website2.com/home','website2.com/forks', 'V');
INSERT INTO clickstream_log values (2,100,'12:13','website2.com/forks','website2.com/buy', 'P');
COMMIT;
```

Here's the clickstream_log table's output:

```
=> SELECT * FROM clickstream_log;
 uid | sid |    ts    |        refURL        |       pageURL        | action
-----+-----+----------+----------------------+----------------------+--------
   1 | 100 | 12:00:00 | website1.com         | website2.com/home    | V
   1 | 100 | 12:01:00 | website2.com/home    | website2.com/floby   | V
   1 | 100 | 12:02:00 | website2.com/floby   | website2.com/shamwow | V
```

```
   1 | 100 | 12:03:00 | website2.com/shamwow | website2.com/buy     | P
   2 | 100 | 12:10:00 | website1.com         | website2.com/home    | V
   2 | 100 | 12:11:00 | website2.com/home    | website2.com/forks   | V
   2 | 100 | 12:13:00 | website2.com/forks   | website2.com/buy     | P
(7 rows)
```

Example

This example includes the Vertica Pattern Matching Functions to analyze users' browsing history over website2.com. It identifies patterns where the user performed the following tasks:

- Landed on website2.com from another web site (Entry)
- Browsed to any number of other pages (Onsite)
- Made a purchase (Purchase)

In the following statement, pattern P (`Entry Onsite* Purchase`) consist of three event types: Entry, Onsite, and Purchase. When Vertica finds a match in the input table, the associated pattern instance must be an event of type Entry followed by 0 or more events of type Onsite, and an event of type Purchase

```
=> SELECT uid,
       sid,
       ts,
       refurl,
       pageurl,
       action,
       event_name(),
       pattern_id(),
       match_id()
FROM clickstream_log
MATCH
  (PARTITION BY uid, sid ORDER BY ts
   DEFINE
     Entry    AS RefURL  NOT ILIKE '%website2.com%' AND PageURL ILIKE '%website2.com%',
     Onsite   AS PageURL ILIKE     '%website2.com%' AND Action='V',
     Purchase AS PageURL ILIKE     '%website2.com%' AND Action = 'P'
   PATTERN
     P AS (Entry Onsite* Purchase)
   ROWS MATCH FIRST EVENT);
```

In the output below, the first four rows represent the pattern for user 1's browsing activity, while the following three rows show user 2's browsing habits.

```
 uid | sid |    ts    |        refurl        |       pageurl        | action | event_name | pattern_
id | match_id
-----+-----+----------+----------------------+----------------------+--------+------------+----------
--+----------
   1 | 100 | 12:00:00 | website1.com         | website2.com/home    | V      | Entry      |
1 |        1
```

```
   1 | 100 | 12:01:00 | website2.com/home    | website2.com/floby   | V      | Onsite     |
1 |       2
   1 | 100 | 12:02:00 | website2.com/floby   | website2.com/shamwow | V      | Onsite     |
1 |       3
   1 | 100 | 12:03:00 | website2.com/shamwow | website2.com/buy     | P      | Purchase   |
1 |       4
   2 | 100 | 12:10:00 | website1.com         | website2.com/home    | V      | Entry      |
1 |       1
   2 | 100 | 12:11:00 | website2.com/home    | website2.com/forks   | V      | Onsite     |
1 |       2
   2 | 100 | 12:13:00 | website2.com/forks   | website2.com/buy     | P      | Purchase   |
1 |       3
(7 rows)
```

- Pattern Matching Functions

MINUS Clause

MINUS is an alias for EXCEPT.

OFFSET Clause

Omits a specified number of rows from the beginning of the result set.

Syntax

```
OFFSET rows
```

Parameters

start-row	Specifies the first row to include in the result set. All preceding rows are omitted.

Dependencies

- Use an ORDER BY clause with OFFSET. Otherwise, the query returns an undefined subset of the result set.
- OFFSET must follow the ORDER BY clause in a SELECT statement or UNION clause.
- When a SELECT statement or UNION clause specifies both LIMIT and OFFSET, Vertica first processes the OFFSET statement, and then applies the LIMIT statement to the remaining rows.

Example

The following query returns 14 rows from the customer_dimension table:

```
=> SELECT customer_name, customer_gender FROM customer_dimension
   WHERE occupation='Dancer' AND customer_city = 'San Francisco' ORDER BY customer_name;
    customer_name     | customer_gender
----------------------+-----------------
 Amy X. Lang          | Female
 Anna H. Li           | Female
 Brian O. Weaver      | Male
 Craig O. Pavlov      | Male
 Doug Z. Goldberg     | Male
 Harold S. Jones      | Male
 Jack E. Perkins      | Male
 Joseph W. Overstreet | Male
 Kevin . Campbell     | Male
 Raja Y. Wilson       | Male
 Samantha O. Brown    | Female
 Steve H. Gauthier    | Male
 William . Nielson    | Male
 William Z. Roy       | Male
(14 rows)
```

If you modify the previous query to specify an offset of 8 (OFFSET 8) clause, Vertica skips the first eight rows of the previous result set. The query returns the following results:

```
=> SELECT customer_name, customer_gender FROM customer_dimension
   WHERE occupation='Dancer' AND customer_city = 'San Francisco' ORDER BY customer_name OFFSET 8;
   customer_name   | customer_gender
-------------------+-----------------
 Kevin . Campbell  | Male
 Raja Y. Wilson    | Male
 Samantha O. Brown | Female
 Steve H. Gauthier | Male
 William . Nielson | Male
 William Z. Roy    | Male
(6 rows)
```

ORDER BY Clause

Sorts a query result set on one or more columns.

Syntax

```
ORDER BY expression [ ASC | DESC ] [,…]
```

Parameters

expression	One of the following: • Name or ordinal number of a SELECT list item. Ordinal numbers are invalid for an ORDER BY clause of an analytic function's OVER clause. • Arbitrary expression formed from columns that do not appear in the SELECT list • CASE expression

Notes

- The ordinal number refers to the position of the result column, counting from the left beginning at one. This makes it possible to order by a column that does not have a unique name. (You can assign a name to a result column using the AS clause.)
- While the user's current locale and collation sequence are used to compare strings and determine the results of the ORDER BY clause of a query, Vertica projection data is always stored sorted by the ASCII (binary) collating sequence.
- For INTEGER, INT, and DATE/TIME data types, NULL appears first (smallest) in ascending order.
- For FLOAT, BOOLEAN, CHAR, VARCHAR, ARRAY, and SET, NULL appears last (largest) in ascending order.
- The ORDER BY clause may contain only columns or expressions that are in the window partition clause (see Window Partition Clause).
- When ordering by a collection column, you cannot use DISTINCT.

Examples

The follow example returns all the city and deal size for customer Metamedia, sorted by deal size in descending order.

```
=> SELECT customer_city, deal_siz FROM customer_dimension WHERE customer_name = 'Metamedia'
   ORDER BY deal_size DESC;
  customer_city   | deal_size
------------------+-----------
 El Monte         |   4479561
 Athens           |   3815416
 Ventura          |   3792937
 Peoria           |   3227765
 Arvada           |   2671849
 Coral Springs    |   2643674
 Fontana          |   2374465
 Rancho Cucamonga |   2214002
 Wichita Falls    |   2117962
 Beaumont         |   1898295
 Arvada           |   1321897
 Waco             |   1026854
 Joliet           |    945404
 Hartford         |    445795
(14 rows)
```

The following example uses a transform function. It returns an error because the ORDER BY column is not in the window partition.

```
=> CREATE TABLE t(geom geometry(200), geog geography(200));
=> SELECT PolygonPoint(geom) OVER(PARTITION BY geom)
   AS SEL_0 FROM t ORDER BY geog;
ERROR 2521: Cannot specify anything other than user defined transforms and partitioning expressions
in the ORDER BY list
```

The following example, using the same table, corrects this error.

```
=> SELECT PolygonPoint(geom) OVER(PARTITION BY geom)
   AS SEL_0 FROM t ORDER BY geom;
```

The following example uses an array in the ORDER BY clause.

```
=> CREATE TABLE employees (id INT, department VARCHAR(50), grants ARRAY[VARCHAR], grant_values ARRAY
[INT]);

=> COPY employees FROM STDIN;
42|Physics|[US-7376,DARPA-1567]|[65000,135000]
36|Physics|[US-7376,DARPA-1567]|[10000,25000]
33|Physics|[US-7376]|[30000]
36|Astronomy|[US-7376,DARPA-1567]|[5000,4000]
\.

=>SELECT * FROM employees ORDER BY grant_values;
```

```
 id | department |          grants          |  grant_values
----+------------+--------------------------+----------------
 36 | Astronomy  | ["US-7376","DARPA-1567"] | [5000,4000]
 36 | Physics    | ["US-7376","DARPA-1567"] | [10000,25000]
 33 | Physics    | ["US-7376"]              | [30000]
 42 | Physics    | ["US-7376","DARPA-1567"] | [65000,135000]
(4 rows)
```

TIMESERIES Clause

Provides gap-filling and interpolation (GFI) computation, an important component of time series analytics computation. See Time Series Analytics in Analyzing Data for details and examples.

Syntax

```
TIMESERIES slice-time AS 'length-and-time-unit-expr' OVER (
... [ PARTITION BY (column-expr[,…] ]
... ORDER BY time-expr )
... [ ORDER BY table-column[,…] ]
```

Parameters

slice-time	A time column produced by the TIMESERIES clause, which stores the time slice start times generated from gap filling. **Note:** This parameter is an alias, so you can use any name that an alias would take.
length-and-time-unit-expr	An INTERVAL DAY TO SECOND literal that specifies the length of time unit of time slice computation. For example: `TIMESERIES slice_time AS '3 seconds' ...`
OVER()	Specifies partitioning and ordering for the function. OVER() also specifies that the time series function operates on a query result set—that is, the rows that are returned after the FROM, WHERE, GROUP BY, and HAVING clauses are evaluated.

PARTITION BY (*column-expr* [,…])	Partitions the data by the specified column expressions. Gap filling and interpolation is performed on each partition separately
ORDER BY *time-expr*	Sorts the data by the TIMESTAMP expression *time-expr*, which computes the time information of the time series data. **Note:** The TIMESERIES clause requires an ORDER BY operation on the timestamp column.

Notes

If the *window-partition-clause* is not specified in TIMESERIES OVER(), for each defined time slice, exactly one output record is produced; otherwise, one output record is produced per partition per time slice. Interpolation is computed there.

Given a query block that contains a TIMESERIES clause, the following are the semantic phases of execution (after evaluating the FROM and the optional WHERE clauses):

1. Compute *time-expression*.
2. Perform the same computation as the TIME_SLICE() function on each input record based on the result of *time-exp* and '*length-and-time-unit-expr*'.
    1. Perform gap filling to generate time slices missing from the input.
    2. Name the result of this computation as *slice_time*, which represents the generated "time series" column (alias) after gap filling.
3. Partition the data by *expression*, *slice-time*. For each partition, do step 4.
4. Sort the data by *time-expr*. Interpolation is computed here.

There is semantic overlap between the TIMESERIES clause and the TIME_SLICE function with the following key differences:

- TIMESERIES only supports the interval qualifier DAY TO SECOND; it does not allow YEAR TO MONTH.
- Unlike TIME_SLICE, the time slice length and time unit expressed in *length-and-time-unit-expr* must be constants so gaps in the time slices are well-defined.
- TIMESERIES performs gap filling; the TIME_SLICE function does not.
- TIME_SLICE can return the start or end time of a time slice, depending on the value of its fourth input parameter (*start-or-end*). TIMESERIES, on the other hand, always returns the start time of each time slice. To output the end time of each time

slice, write a SELECT statement like the following:

```
=> SELECT slice_time + <slice_length>;
```

Restrictions

- When the TIMESERIES clause occurs in a SQL query block, only the following clauses can be used in the same query block:
  - SELECT
  - FROM
  - WHERE
  - ORDER BY
- GROUP BY and HAVING clauses are not allowed. If a GROUP BY operation is needed before or after gap-filling and interpolation (GFI), use a subquery and place the GROUP BY In the outer query. For example:

```
=> SELECT symbol, AVG(first_bid) as avg_bid FROM (
        SELECT symbol, slice_time, TS_FIRST_VALUE(bid1) AS first_bid
        FROM Tickstore
        WHERE symbol IN ('MSFT', 'IBM')
        TIMESERIES slice_time AS '5 seconds' OVER (PARTITION BY symbol ORDER BY ts)
        ) AS resultOfGFI
GROUP BY symbol;
```

- When the TIMESERIES clause is present in the SQL query block, the SELECT list can include only the following:
  - Time series aggregate functions such as TS_FIRST_VALUE and TS_LAST_VALUE
  - *slice_time* column
  - PARTITION BY expressions
  - TIME_SLICE function

  For example, the following two queries return a syntax error because bid1 is not a PARTITION BY or GROUP BY column:

```
=> SELECT bid, symbol, TS_FIRST_VALUE(bid) FROM Tickstore
   TIMESERIES slice_time AS '5 seconds' OVER (PARTITION BY symbol ORDER BY ts);
   ERROR:  column "Tickstore.bid" must appear in the PARTITION BY list of Timeseries clause
or be used in a Timeseries Output function
=> SELECT bid, symbol, AVG(bid) FROM Tickstore
   GROUP BY symbol;
   ERROR:  column "Tickstore.bid" must appear in the GROUP BY clause or be used in an
aggregate function
```

Examples

For examples, see Gap Filling and Interpolation (GFI) in Analyzing Data.

See Also

- TIME_SLICE
- TS_FIRST_VALUE
- TS_LAST_VALUE
- Gap Filling and Interpolation (GFI)

UNION Clause

Combines the results of multiple SELECT statements. You can include UNION in FROM, WHERE, and HAVING clauses.

Syntax

```
select-stmt UNION { ALL | DISTINCT } select-stmt [ UNION  { ALL | DISTINCT } select-stmt ]…
    [ ORDER BYexpression { ASC | DESC }[,…] ]
    [ LIMIT { count | ALL } ]
    [ OFFSETstart ]
```

Parameters

select-stmt	A SELECT statement that returns one or more rows, depending on whether you specify keywords DISTINCT or ALL. The following options also apply: • The first SELECT statement can include the hint LABEL. Vertica ignores LABEL hints in subsequent SELECT statements. • Each SELECT statement can specify its own ORDER BY, LIMIT, and OFFSET clauses. A SELECT statement with one or more of these clauses must be enclosed by parentheses. See also: ORDER BY, LIMIT, and OFFSET Clauses in UNION.
DISTINCT | ALL	Specifies whether to return unique rows: • DISTINCT (default) returns only unique rows. • ALL concatenates all rows, including duplicates. For best performance, use UNION ALL.

Requirements

- All rows of the UNION result set must be in the result set of at least one of its SELECT statements.
- Each SELECT statement must specify the same number of columns.
- Data types of corresponding SELECT statement columns must be compatible, otherwise Vertica returns an error.

ORDER BY, LIMIT, and OFFSET Clauses in UNION

A UNION statement can specify its own ORDER BY, LIMIT, and OFFSET clauses. For example, given the tables described below in Examples, the following query orders the UNION result set by emp_name and limits output to the first two rows:

```
=> SELECT id, emp_name FROM company_a UNION ALL SELECT id, emp_name FROM company_b ORDER BY emp_name
LIMIT 2;
  id  | emp_name
------+----------
 5678 | Alice
 8765 | Bob
(2 rows)
```

Each SELECT statement in a UNION clause can specify its own ORDER BY, LIMIT, and OFFSET clauses. In this case, the SELECT statement must be enclosed by parentheses. Vertica processes the SELECT statement ORDER BY, LIMIT, and OFFSET clauses before it processes the UNION clauses.

For example, each SELECT statement in the following UNION specifies its own ORDER BY and LIMIT clauses. Vertica processes the individual queries and then concatenates the two result sets:

```
=> (SELECT id, emp_name FROM company_a ORDER BY emp_name LIMIT 2)
   UNION ALL
   (SELECT id, emp_name FROM company_b ORDER BY emp_name LIMIT 2);
  id  | emp_name
------+-----------
 5678 | Alice
 9012 | Katherine
 8765 | Bob
 9012 | Katherine
(4 rows)
```

The following requirements and restrictions determine how Vertica processes a UNION clause that contains ORDER BY, LIMIT, and OFFSET clauses:

- A UNION's ORDER BY clause must specify columns from the first (leftmost) SELECT statement.
- Always use an ORDER BY clause with LIMIT and OFFSET. Otherwise, the query returns an undefined subset of the result set.
- ORDER BY must precede LIMIT and OFFSET.
- When a SELECT or UNION statement specifies both LIMIT and OFFSET, Vertica first processes the OFFSET statement, and then applies the LIMIT statement to the remaining rows.

UNION in Non-Correlated Subqueries

Vertica supports UNION in noncorrelated subquery predicates. For example:

```
=> SELECT DISTINCT customer_key, customer_name FROM public.customer_dimension WHERE customer_key IN
     (SELECT customer_key FROM store.store_sales_fact WHERE sales_dollar_amount > 500
      UNION ALL
      SELECT customer_key FROM online_sales.online_sales_fact WHERE sales_dollar_amount > 500)
   AND customer_state = 'CT';
 customer_key |     customer_name
--------------+-----------------------
         7021 | Luigi T. Dobisz
         1971 | Betty V. Dobisz
        46284 | Ben C. Gauthier
        33885 | Tanya Y. Taylor
         5449 | Sarah O. Robinson
        29059 | Sally Z. Fortin
        11200 | Foodhope
        15582 | John J. McNulty
        24638 | Alexandra F. Jones
 …
```

Examples

The examples that follow use these two tables:

company_a

```
  ID    emp_name       dept       sales
------+------------+-------------+-------
1234  | Stephen    | auto parts  | 1000
5678  | Alice      | auto parts  | 2500
9012  | Katherine  | floral      |  500
```

company_b

```
  ID    emp_name       dept       sales
------+------------+-------------+-------
4321  | Marvin     | home goods  |   250
9012  | Katherine  | home goods  |   500
8765  | Bob        | electronics | 20000
```

Find all employee IDs and names from company_a and company_b

The UNION statement specifies DISTINCT to combine unique IDs and last names of employees; Katherine works for both companies, so she appears only once in the result set. DISTINCT is the default and can be omitted:

```
=> SELECT id, emp_name FROM company_a UNION DISTINCT SELECT id, emp_name FROM company_b ORDER BY id;
  id  | emp_name
------+-----------
 1234 | Stephen
 4321 | Marvin
 5678 | Alice
 8765 | Bob
 9012 | Katherine
(5 rows)
```

The next UNION statement specifies the option ALL. Katherine works for both companies, so the query returns two records for her:

```
=> SELECT id, emp_name FROM company_a UNION ALL SELECT id, emp_name FROM company_b ORDER BY id;
  id  | emp_name
------+-----------
 1234 | Stephen
 5678 | Alice
 9012 | Katherine
 4321 | Marvin
 9012 | Katherine
 8765 | Bob
(6 rows)
```

Find the top two top performing salespeople in each company

Each SELECT statement specifies its own ORDER BY and LIMIT clauses, so the UNION statement concatenates the result sets as returned by each query:

```
=> (SELECT id, emp_name, sales FROM company_a ORDER BY sales DESC LIMIT 2)
   UNION ALL
   (SELECT id, emp_name, sales FROM company_b ORDER BY sales DESC LIMIT 2);
  id  |  emp_name | sales
------+-----------+-------
 8765 | Bob       | 20000
 5678 | Alice     |  2500
 1234 | Stephen   |  1000
 9012 | Katherine |   500
(4 rows)
```

Find all employee orders by sales
The UNION statement specifies its own ORDER BY clause, which Vertica applies to the entire result:

```
=> SELECT id, emp_name, sales FROM company_a
   UNION
   SELECT id, emp_name, sales FROM company_b
   ORDER BY sales;
  id  |  emp_name | sales
------+-----------+-------
 4321 | Marvin    |   250
 9012 | Katherine |   500
 1234 | Stephen   |  1000
 5678 | Alice     |  2500
 8765 | Bob       | 20000
(5 rows)
```

Calculate the sum of sales for each company grouped by department
Each SELECT statement has its own GROUP BY clause. UNION combines the aggregate results from each query:

```
=> (SELECT 'Company A' as company, dept, SUM(sales) FROM company_a
    GROUP BY dept)
    UNION
   (SELECT 'Company B' as company, dept, SUM(sales) FROM company_b
    GROUP BY dept)
    ORDER BY 1;
 company   |    dept     |  sum
-----------+-------------+-------
 Company A | auto parts  |  3500
 Company A | floral      |   500
 Company B | electronics | 20000
 Company B | home goods  |   750
(4 rows)
```

See Also

- SELECT
- EXCEPT Clause
- INTERSECT Clause
- Subqueries

WHERE Clause

Specifies which rows to include in a query's result set.

Syntax

```
WHERE boolean-expression [ subquery ]…
```

Parameters

boolean-expression	An expression that returns true or false. The result set only includes rows that evaluate to true. The expression can include boolean operators and the following elements: • BETWEEN predicate • Boolean predicate • Column value predicate • IN predicate • Join predicate • LIKE predicate • NULL predicate Use parentheses to group expressions, predicates, and boolean operators. For example: `… WHERE NOT (A=1 AND B=2) OR C=3;`

Example

The following example returns the names of all customers in the Eastern region whose name starts with the string `Amer`:

```
=> SELECT DISTINCT customer_name
   FROM customer_dimension
   WHERE customer_region = 'East'
   AND customer_name ILIKE 'Amer%';
 customer_name
---------------
 Americare
 Americom
 Americore
 Americorp
 Ameridata
 Amerigen
 Amerihope
 Amerimedia
 Amerishop
 Ameristar
```

```
 Ameritech
(11 rows)
```

WITH Clause

A WITH clause defines one or more named common table expressions (CTEs). Each CTE encapsulates a result set that can be referenced by another CTE in the same WITH clause, or by the primary query of the WITH clause. Vertica can execute the CTE on each reference (inline expansion), or materialize the result set as a temporary table that it reuses for all references. In both cases, WITH clauses can help simplify complicated queries and avoid statement repetition.

Syntax

```
WITH [ /*+ENABLE_WITH_CLAUSE_MATERIALIZATION */ ] {
   cte-identifier [ ( column-aliases ) ] AS (
   [ subordinate-WITH-clause ]
   query-expression )
} [,…]
```

Parameters

/*+ENABLE_WITH_CLAUSE_MATERIALIZATION*/	Enables materialization of all queries in the current WITH clause. Otherwise, materialization is set by configuration parameter WithClauseMaterialization, by default set to 0 (disabled). If WithClauseMaterialization is disabled, materialization is automatically cleared when the primary query of the WITH clause returns. For details, see Materialization of WITH Clause.
cte-identifier	Identifies a common table expression (CTE) within a WITH clause. This identifier is available to CTEs of the same

	WITH clause, and of parent and child WITH clauses (if any). CTE identifiers of the outermost (primary) WITH clause are also available to the primary query.
	
	All CTE identifiers of the same WITH clause must be unique. For example, the following WITH clause defines two CTEs, so they require unique identifiers: `regional_sales` and `top_regions`:
	
	`WITH`
	`-- query sale amounts for each region`
	`regional_sales AS (SELECT … ),`
	`top_regions AS ( SELECT … )`
	`)`

column-aliases	A comma-delimited list of result set column aliases. These aliases map to column expressions in the CTE query. If omitted, result set columns can only be referenced by the names used in the query.
	
	In the following example, CTE `revenue` specifies a column list of `vkey` and `total_revenue`. These map to column `vendor_key` and aggregate expression `SUM(total_order_cost)`, respectively. The primary query references these aliases:
	
	`WITH revenue ( vkey, total_revenue ) AS (`
	`SELECT vendor_key, SUM(total_order_cost)`
	`FROM store.store_orders_fact`
	`GROUP BY vendor_key ORDER BY 1)`
	
	`SELECT v.vendor_name, v.vendor_address, v.vendor_city, r.total_revenue`

	<pre>FROM vendor_dimension v JOIN
	revenue r ON v.vendor_key = r.vkey
	WHERE r.total_revenue = (SELECT MAX
	(total_revenue) FROM revenue)
	ORDER BY vendor_name;</pre>

subordinate-WITH-clause	A WITH clause that is nested within the current one. CTEs of this WITH clause can only reference CTEs of the same clause, and of parent and child WITH clauses. **Important:** The primary query can only reference CTEs in the primary (outermost) WITH clause. It cannot reference the CTEs of any nested WITH clause.
query-expression	The query of a given CTE.

Restrictions

- A WITH query cannot refer to its own output.
- WITH clauses only support SELECT and INSERT statements. They do not support UPDATE, or DELETE statements.

Examples

Single WITH clause with single CTE

The following SQL defines a WITH clause with one CTE, `revenue`, which aggregates data in table `store.store_orders_fact`. The primary query references the WITH clause result set twice: in its `JOIN` clause and predicate:

```
-- define WITH clause
WITH revenue ( vkey, total_revenue ) AS (
      SELECT vendor_key, SUM(total_order_cost)
      FROM store.store_orders_fact
      GROUP BY vendor_key ORDER BY 1)
-- End WITH clause
```

```
-- primary query
SELECT v.vendor_name, v.vendor_address, v.vendor_city, r.total_revenue
FROM vendor_dimension v JOIN revenue r ON v.vendor_key = r.vkey
WHERE r.total_revenue = (SELECT MAX(total_revenue) FROM revenue )
ORDER BY vendor_name;
   vendor_name    | vendor_address | vendor_city | total_revenue
------------------+----------------+-------------+---------------
 Frozen Suppliers | 471 Mission St | Peoria      |      49877044
(1 row)
```

Single WITH clause and multiple CTEs

In the following example, the WITH clause contains two CTEs:

- `regional_sales` totals sales for each region
- `top_regions` uses the result set from `regional_sales` to identify the three regions with the highest sales:

The primary query aggregates sales by region and departments in the `top_regions` result set:

```
WITH
-- query sale amounts for each region
   regional_sales (region, total_sales) AS (
        SELECT sd.store_region, SUM(of.total_order_cost) AS total_sales
        FROM store.store_dimension sd JOIN store.store_orders_fact of ON sd.store_key = of.store_key
        GROUP BY store_region ),
-- query previous result set
   top_regions AS (
        SELECT region, total_sales
        FROM regional_sales ORDER BY total_sales DESC LIMIT 3
     )

-- primary query
-- aggregate sales in top_regions result set
SELECT sd.store_region AS region, pd.department_description AS department, SUM(of.total_order_cost)
AS product_sales
FROM store.store_orders_fact of
JOIN store.store_dimension sd ON sd.store_key = of.store_key
JOIN public.product_dimension pd ON of.product_key = pd.product_key
WHERE sd.store_region IN (SELECT region FROM top_regions)
GROUP BY ROLLUP (region, department) ORDER BY region, product_sales DESC, GROUPING_ID();

 region  |            department            | product_sales
---------+----------------------------------+---------------
 East    |                                  |    1716917786

(43 rows)
```

INSERT statement that includes WITH clause

The following SQL uses a WITH clause to insert data from a JOIN query into table `total_store_sales`:

```
CREATE TABLE total_store_sales (store_key int, region VARCHAR(20), store_sales numeric (12,2));

INSERT INTO total_store_sales
WITH store_sales AS (
        SELECT sd.store_key, sd.store_region::VARCHAR(20), SUM (of.total_order_cost)
        FROM store.store_dimension sd JOIN store.store_orders_fact of ON sd.store_key = of.store_key
        GROUP BY sd.store_region, sd.store_key ORDER BY sd.store_region, sd.store_key)
SELECT * FROM store_sales;

=> SELECT * FROM total_store_sales ORDER BY region, store_key;
 store_key |  region   | store_sales
-----------+-----------+-------------
         2 | East      | 47668303.00
         6 | East      | 48136354.00
        12 | East      | 46673113.00
        22 | East      | 48711211.00
        24 | East      | 48603836.00
        31 | East      | 46836469.00
        36 | East      | 48461449.00
```

```
        37 | East      | 48018279.00
        41 | East      | 48713084.00
        44 | East      | 47808362.00
        49 | East      | 46990023.00
        50 | East      | 47643329.00
         9 | MidWest   | 46851087.00
        15 | MidWest   | 48787354.00
        27 | MidWest   | 48497620.00
        29 | MidWest   | 47639234.00

WITH Clauses

SET Statements

SET statements let you change how the database operates, such as changing the autocommit settings or the resource pool your session uses.

SET DATESTYLE

Specifies how to format date/time output for the current session. Use SHOW DATESTYLE to verify the current output settings.

Syntax

```
SET DATESTYLE TO { arg | 'arg' }[, arg | 'arg' ]
```

Parameters

SET DATESTYLE has a single parameter, which can be set to one or two arguments that specify date ordering and style. Each argument can be specified singly or in combination with the other; if combined, they can be specified in any order.

The following table describes each style and the date ordering arguments it supports:

Date style arguments	Order arguments	Example
ISO (ISO 8601/SQL standard)	n/a	2016-03-16 00:00:00
GERMAN	n/a	16.03.2016 00:00:00
SQL	MDY	03/16/2016 00:00:00
	DMY (default)	16/03/2016 00:00:00
POSTGRES	MDY (default)	Wed Mar 16 00:00:00 2016
	DMY	Wed 16 Mar 00:00:00 2016

Vertica ignores the order argument for date styles ISO and GERMAN. If the date style is SQL or POSTGRES, the order setting determines whether dates are output in MDY or DMY order. Neither SQL nor POSTGRES support YMD order. If you specify YMD for SQL or POSTGRES, Vertica ignores it and uses their default MDY order.

Date styles and ordering can also affect how Vertica interprets input values. For more information, see Date/Time Literals.

Privileges

None

Input Dependencies

In some cases, input format can determine output, regardless of date style and order settings:

- Vertica ISO output for DATESTYLE is ISO long form, but several input styles are accepted. If the year appears first in the input, YMD is used for input and output,

regardless of the DATESTYLE value.

- INTERVAL input and output share the same format, with the following exceptions:
  - Units like CENTURY or WEEK are converted to years and days.
  - AGO is converted to the appropriate sign.

  If the date style is set to ISO, output follows this format:

```
[ quantity unit […] ] [ days ] [ hours:minutes:seconds ]
```

Example

```
=> CREATE TABLE t(a DATETIME);
CREATE TABLE
=> INSERT INTO t values ('3/16/2016');
 OUTPUT
--------
      1
(1 row)

=> SHOW DATESTYLE;
   name    | setting
-----------+----------
 datestyle | ISO, MDY
(1 row)

=> SELECT * FROM t;
          a
---------------------
 2016-03-16 00:00:00
(1 row)

=> SET DATESTYLE TO German;
SET
=> SHOW DATESTYLE;
   name    |   setting
-----------+-------------
 datestyle | German, DMY
(1 row)

=> SELECT * FROM t;
          a
---------------------
 16.03.2016 00:00:00
(1 row)

=> SET DATESTYLE TO SQL;
SET
=> SHOW DATESTYLE;
   name    | setting
-----------+----------
 datestyle | SQL, DMY
(1 row)

=> SELECT * FROM t;
          a
```

```
---------------------
 16/03/2016 00:00:00
(1 row)

=> SET DATESTYLE TO Postgres, MDY;
SET
=> SHOW DATESTYLE;
   name    |    setting
-----------+---------------
 datestyle | Postgres, MDY
(1 row)

=> SELECT * FROM t;
            a
--------------------------
 Wed Mar 16 00:00:00 2016
(1 row)
```

SET ESCAPE_STRING_WARNING

Issues a warning when a backslash is used in a string literal during the current **session**.

Syntax

```
SET ESCAPE_STRING_WARNING TO { ON | OFF }
```

Parameters

ON	[Default] Issues a warning when a back slash is used in a string literal. **Tip:** Organizations that have upgraded from earlier versions of Vertica can use this as a debugging tool for locating backslashes that used to be treated as escape characters, but are now treated as literals.
OFF	Ignores back slashes within string literals.

Privileges

None

Notes

- This statement works under vsql only.
- Turn off standard conforming strings before you turn on this parameter.

Tip:
To set escape string warnings across all sessions, use the EscapeStringWarnings configuration parameter. See the Internationalization Parameters in the Administrator's Guide.

Examples

The following example shows how to turn OFF escape string warnings for the session.

```
=> SET ESCAPE_STRING_WARNING TO OFF;
```

See Also

- SET STANDARD_CONFORMING_STRINGS

SET INTERVALSTYLE

Specifies whether to include units in interval output for the current **session**.

Syntax

```
SET INTERVALSTYLE TO [ plain | units ]
```

Parameters

`plain`	(default) Sets the default interval output to omit units.
`units`	Enables interval output to include subtype unit identifiers. When `INTERVALSTYLE` is set to units, the DATESTYLE parameter controls output. If you enable units and they do not display in the

	output, check the DATESTYLE parameter value, which must be set to ISO or POSTGRES for interval units to display.

Privileges

None

Examples

See Setting Interval Unit Display.

SET LOCALE

Specifies locale for the current **session**.

You can also set the current locale with the vsql command `\locale`.

Syntax

```
SET LOCALE TO ICU-locale-identifier
```

Parameters

locale-identifier	Specifies the ICU locale identifier to use, by default set to: `en_US@collation=binary` If set to an empty string, Vertica sets locale to en_US_POSIX. The following requirements apply: • Vertica only supports the COLLATION keyword. • Single quotes are mandatory to specify collation.

Privileges

None

Commonly Used Locales

For details on identifier options, see About Locale in the Administrator's Guide. For a complete list of locale identifiers, see the ICU Project.

de_DE	German (Germany)
en_GB	English (Great Britain)
es_ES	Spanish (Spain)
fr_FR	French (France)
pt_BR	Portuguese (Brazil)
pt_PT	Portuguese (Portugal)
ru_RU	Russian (Russia)
ja_JP	Japanese (Japan)
zh_CN	Chinese (China, simplified Han)
zh_Hant_TW	Chinese (Taiwan, traditional Han)

Examples

Set session locale to en_GB:

```
=> SET LOCALE TO en_GB;
INFO 2567:  Canonical locale: 'en_GB'
Standard collation: 'LEN'
English (United Kingdom)
SET
```

Use the short form of a locale:

```
=> SET LOCALE TO LEN;
INFO 2567:  Canonical locale: 'en'
Standard collation: 'LEN'
English
SET
```

Specify collation:

```
=> SET LOCALE TO 'tr_tr@collation=standard';
INFO 2567:  Canonical locale: 'tr_TR@collation=standard'
Standard collation: 'LTR'
Turkish (Turkey, collation=standard)  Türkçe (Türkiye, Sıralama=standard)
SET
```

- Implement Locales for International Data Sets
- About Locale

SET ROLE

Enables a role for the user's current session. The user can access privileges that have been granted to the role. Enabling a role has no effect on roles that are currently enabled.

Tip:
Use SHOW AVAILABLE ROLES to list granted roles.

Syntax

```
SET ROLE roles-expression
```

Parameters

roles-expression	Specifies what roles are the default roles for this user, with one of the following expressions: • NONE (default): Disables all roles. • *roles-list*: A comma-delimited list of roles to enable. You can only set roles that are currently granted to you. • ALL [EXCEPT *roles-list*]: Enables all roles currently granted to this user, excluding any comma-delimited roles specified in the optional EXCEPT clause. • DEFAULT: Enables all default roles of the current user, as set by ALTER USER…DEFAULT ROLE.

Privileges

None

Examples

This example shows the following:

- SHOW AVAILABLE_ROLES; lists the roles available to the user, but not enabled.
- SET ROLE applogs; enables the applogs role for the user.
- SHOW ENABLED_ROLES; lists the applogs role as enabled (SET) for the user.
- SET ROLE appuser; enables the appuser role for the user.
- SHOW ENABLED_ROLES now lists both applogs and appuser as enabled roles for the user.
- SET ROLE NONE disables all the users' enabled roles .
- SHOW ENABLED_ROLES shows that no roles are enabled for the user.

```
=> SHOW AVAILABLE_ROLES;
      name       |          setting
-----------------+---------------------------
 available roles | applogs, appadmin, appuser
(1 row)

=> SET ROLE applogs;
SET
=> SHOW ENABLED_ROLES;
     name      | setting
---------------+---------
 enabled roles | applogs
(1 row)

=> SET ROLE appuser;
SET
=> SHOW ENABLED_ROLES;
     name      |     setting
---------------+-----------------
 enabled roles | applogs, appuser
(1 row)

=> SET ROLE NONE;
SET

=> SHOW ENABLED_ROLES;
     name      | setting
---------------+---------
 enabled roles |
(1 row)
```

Set User Default Roles

Though the DBADMIN user is normally responsible for setting a user's default roles, as a user you can set your own role. For example, if you run SET ROLE NONE all of your enabled roles are disabled. Then it was determined you need access to role1 as a default role. The DBADMIN uses ALTER USER to assign you a default role:

```
=> ALTER USER user1 default role role1;
```

This example sets role1 as user1's default role because the DBADMIN assigned this default role using ALTER USER.

```
user1 => SET ROLE default;
user1 => SHOW ENABLED_ROLES;
    name      | setting
----------------------
enabled roles |   role1
(1 row)
```

Set All Roles as Default

This example makes all roles granted to user1 default roles:

```
user1 => SET ROLE all;
user1 => show enabled roles;
    name      |   setting
---------------------------------
enabled roles | role1, role2, role3
(1 row)
```

Set All Roles as Default With EXCEPT

This example makes all the roles granted to the user default roles with the exception of role1.

```
user1 => set role all except role1;
user1 => SHOW ENABLED_ROLES
     name     | setting
---------------------------
enabled roles | role2, role3
(1 row)
```

SET SEARCH_PATH

Specifies the order in which Vertica searches schemas when a SQL statement specifies a table name that is unqualified by a schema name. SET SEARCH_PATH overrides the

current session's search path, which is initially set from the user profile. This search path remains in effect until the next SET SEARCH_PATH statement, or the session ends. For details, see Setting Search Paths in the Administrator's Guide.

To view the current search path, use SHOW SEARCH_PATH.

Syntax

```
SET SEARCH_PATH { TO | = } { schema-list | DEFAULT }
```

Parameters

schema-list	A comma-delimited list of schemas that indicates the order in which Vertica searches schemas for a table whose name is unqualified by a schema name. If the search path includes a schema that does not exist, or for which the user lacks access privileges, Vertica silently skips over that schema.
DEFAULT	Sets the search path to the database default: `"$user", public, v_catalog, v_monitor, v_internal`

Privileges

None

Examples

Show the current search path:

```
=> SHOW SEARCH_PATH;
    name     |                       setting
-------------+-------------------------------------------------
 search_path | "$user", public, v_catalog, v_monitor, v_internal
(1 row)
```

Reset the search path to schemas store and public:

```
=> SET SEARCH_PATH TO store, public;
=> SHOW SEARCH_PATH;
    name     |                     setting
-------------+-----------------------------------------------
```

```
 search_path | store, public, v_catalog, v_monitor, v_internal
(1 row)
```

Reset the search path to the database default settings:

```
=> SET SEARCH_PATH TO DEFAULT;
SET
=> SHOW SEARCH_PATH;
    name     |                      setting
-------------+-----------------------------------------------------
 search_path | "$user", public, v_catalog, v_monitor, v_internal
(1 row)
```

SET SESSION AUTOCOMMIT

Sets whether statements automatically commit their transactions on completion. This statement is primarily used by the client drivers to enable and disable autocommit, you should never have to directly call it.

Syntax

```
SET SESSION AUTOCOMMIT TO { ON | OFF }
```

Parameters

ON	Enable autocommit. Statements automatically commit their transactions when they complete. This is the default setting for connections made using the Vertica client libraries.
OFF	Disable autocommit. Transactions are not automatically committed. This is the default for interactive sessions (connections made through **vsql**).

Privileges

None

Examples

This examples show how to set AUTOCOMMIT to 'on' and then to 'off'.

```
=> SET SESSION AUTOCOMMIT TO on;
SET
=> SET SESSION AUTOCOMMIT TO off;
SET
```

See Also

- Client Libraries

SET SESSION CHARACTERISTICS AS TRANSACTION

Sets the isolation level and access mode of all transactions that start after this statement is issued.

A transaction retains its isolation level until it completes, even if the session's isolation level changes during the transaction. Vertica internal processes (such as the **Tuple Mover** and **refresh** operations) and DDL operations always run at the SERIALIZABLE isolation level to ensure consistency.

Syntax

```
SET SESSION CHARACTERISTICS AS TRANSACTION setting[, setting]
```

setting = one or both of the following:

- ISOLATION LEVEL *argument*
- READ ONLY | READ WRITE

ISOLATION LEVEL Arguments

The ISOLATION LEVEL clause determines what data the transaction can access when other transactions run concurrently. You cannot change the isolation level after the first query (SELECT) or DML statement (INSERT, DELETE, UPDATE) if a transaction has run.

Set ISOLATION LEVEL to one of the following arguments:

SERIALIZABLE	Sets the strictest level of SQL transaction isolation. This level emulates transactions serially, rather than concurrently. It holds

	locks and blocks write operations until the transaction completes. Applications that use SERIALIZABLE must be prepared to retry transactions in the event of serialization failures. This isolation level is not recommended for normal query operations. Setting the transaction isolation level to SERIALIZABLE does not apply to temporary tables. Temporary tables are isolated by their transaction scope.
REPEATABLE READ	Automatically converted to SERIALIZABLE.
READ COMMITTED	The default setting, allows concurrent transactions.
READ UNCOMMITTED	Automatically converted to READ COMMITTED.

READ WRITE/READ ONLY

You can set the transaction access mode with one of the following:

READ WRITE	Default
READ ONLY	Disallows SQL statements that require write access: • INSERT, UPDATE, DELETE, and COPY operations on any non-temporary table. • CREATE, ALTER, and DROP • GRANT, REVOKE • EXPLAIN if the SQL statement to explain requires write access. **Note:** Setting the transaction session mode to read-only does not prevent all write operations.

Privileges

None

Viewing Session Transaction Characteristics

SHOW TRANSACTION_ISOLATION and SHOW TRANSACTION_READ_ONLY show the transaction settings for the current session:

```
=> SHOW TRANSACTION_ISOLATION;
         name          |   setting
-----------------------+--------------
 transaction_isolation | SERIALIZABLE
(1 row)

=> SHOW TRANSACTION_READ_ONLY;
         name          | setting
-----------------------+---------
 transaction_read_only | true
(1 row)
```

SET SESSION GRACEPERIOD

Sets how long a session socket remains blocked while awaiting client input or output for a given query. If the socket is blocked for a continuous period that exceeds the grace period setting, the server shuts down the socket and throws a fatal error. The session is then terminated. If no grace period is set, the query can maintain its block on the socket indefinitely.

Vertica applies a session's grace period and RUNTIMECAP settings independently. If no grace period is set, a query can continue to block indefinitely on a session socket, regardless of the query's RUNTIMECAP setting.

Syntax

```
SET SESSION GRACEPERIOD duration
```

Parameters

duration	Specifies how long a query can block on any session socket, one of the following: • '*interval*': Specifies as an interval the maximum grace period for current session queries, up to 20 days.

	• =DEFAULT: Sets the grace period for queries in this session to the user's GRACEPERIOD value. A new session is initially set to this value. • NONE: Valid only for superusers, removes any grace period previously set on session queries.

Privileges

- **Superusers** can increase session grace period to any value, regardless of database or node settings.
- Non-superusers can only set the session grace period to a value equal to or lower than their own user setting. If no grace period is explicitly set for a user, the grace period for that user is inherited from the node or database settings.

Examples

See Handling Session Socket Blocking in the Administrator's Guide.

SET SESSION IDLESESSIONTIMEOUT

Sets the maximum amount of time that a session can remain idle before it exits.

Note:
An idle session has no queries running.

Syntax

```
SET SESSION IDLESESSIONTIMEOUT duration
```

Parameters

duration	Specifies the amount of time a session can remain idle before it exits: • NONE (default): No idle timeout set on the session. • '*interval*': Specifies as an interval the maximum amount of time a session can remain idle.

	• =DEFAULT: Sets the idle timeout period for this session to the user's IDLESESSIONTIMEOUT value.

Privileges

- **Superusers** can increase the time a session can remain idle to any value, regardless of database or node settings.
- Non-superusers can only set the session idle time to a value equal to or lower than their own user setting. If no session idle time is explicitly set for a user, the session idle time for that user is inherited from the node or database settings.

Examples

See Managing Client Connections in the Administrator's Guide.

SET SESSION MEMORYCAP

Limits how much memory can be allocated to any request in the current **session**. This limit only applies to the current session; it does not limit the total amount of memory used by multiple sessions.

Syntax

```
SET SESSION MEMORYCAP limit
```

Parameters

limit	One of the following:
	• '*max-expression*': A string value that specifies the memory limit, one of the following:
	  • *int*% — Expresses the maximum as a percentage of total memory available to the **Resource Manager**, where *int* is an integer value between 0 and 100.For example:
	  MEMORYCAP '40%'

	• *int*{K|M|G|T} — Expresses memory allocation in kilobytes, megabytes, gigabytes, or terabytes. For example: `MEMORYCAP '10G'` • =DEFAULT: Sets the memory cap for queries in this session to the user's MEMORYCAP value. A new session is initially set to this value. • NONE: Removes the memory cap for this session.

Privileges

- **Superusers** can increase session memory cap to any value.
- Non-superusers can only set the session memory cap to a value equal to or lower than their own user setting.

Examples

Set the session memory cap to 2 gigabytes:

```
=> SET SESSION MEMORYCAP '2G';
SET
=> SHOW MEMORYCAP;
   name    | setting
-----------+---------
 memorycap | 2097152
(1 row)
```

Revert the memory cap to the default setting as specified in the user profile:

```
=> SET MEMORYCAP=DEFAULT;
SET
=> SHOW MEMORYCAP;
   name    | setting
-----------+---------
 memorycap | 2013336
(1 row)
```

Managing Workloads

SET SESSION MULTIPLEACTIVERESULTSETS

Enables or disable the execution of multiple active result sets (MARS) on a single JDBC connection. Using this option requires an active JDBC connection.

Syntax

```
SET SESSION MULTIPLEACTIVERESULTSETS TO { ON | OFF }
```

Parameters

ON	Enable MultipleActiveResultSets.Allows you to execute multiple result sets on a single connection.
OFF	Disable MultipleActiveResultSets. Allows only one active result set per connection. (Default value.)

Privileges

None

Examples

This example shows how you can set MultipleActiveResultSets to on and then to off:

```
=> SET SESSION MULTIPLEACTIVERESULTSETS TO on;
SET
=> SET SESSION MULTIPLEACTIVERESULTSETS TO off;
SET
```

SET SESSION RESOURCE_POOL

Associates the user **session** with the specified resource pool.

Syntax

```
SET SESSION RESOURCE_POOL = { pool-name | DEFAULT }
```

Parameters

pool-name	The name of an existing resource pool to associate with the current session.
DEFAULT	Sets the session's resource pool to the user's default resource pool.

Privileges

- **Superusers** can assign their session to any available resource pool.
- Non-superusers must have USAGE privileges for the resource pool.

Examples

This example sets `ceo_pool` as the session resource pool:

```
=> SET SESSION RESOURCE_POOL = ceo_pool;
SET
```

See Also

- ALTER RESOURCE POOL
- CREATE RESOURCE POOL
- CREATE USER
- DROP RESOURCE POOL
- GRANT (Resource Pool)
- SET SESSION MEMORYCAP
- Managing Workloads

SET SESSION RUNTIMECAP

Sets the maximum amount of time queries can run in a give session. If a query exceeds its session's RUNTIMECAP setting, Vertica terminates the query and returns an error. You cannot increase the RUNTIMECAP beyond the limit that is set in your user profile.

Note:
Vertica does not strictly enforce session RUNTIMECAP settings. If you time a query, you might discover that it runs longer than the RUNTIMECAP setting.

Syntax

```
SET SESSION RUNTIMECAP duration
```

Parameters

duration	Specifies how long a given query can run in the current session, one of the following: • NONE (default): Removes a runtime limit for all current session queries. • '*interval*': Specifies as an interval the maximum runtime for current session queries, up to one year—for example, 1 minute or 100 seconds. • =DEFAULT: Sets maximum runtime for queries in this session to the user's RUNTIMECAP value.

Privileges

- **Superusers** can increase session RUNTIMECAP to any value.
- Non-superusers can only set the session RUNTIMECAP to a value equal to or lower than their own user RUNTIMECAP.

Examples

Set the maximum query runtime for the current session to 10 minutes:

```
=> SET SESSION RUNTIMECAP '10 minutes';
```

Revert the session RUNTIMECAP to your user default setting:

```
=> SET SESSION RUNTIMECAP =DEFAULT;
SET
=> SHOW RUNTIMECAP;
    name     |  setting
-------------+-----------
 runtimecap | UNLIMITED
(1 row)
```

See Also

- Setting a Runtime Limit for Queries
- Managing Workloads

SET SESSION TEMPSPACECAP

Sets the maximum amount of temporary file storage space that any request issued by the **session** can consume. If a query's execution plan requires more storage space than the session TEMPSPACECAP, it returns an error.

Syntax

```
SET SESSION TEMPSPACECAP limit
```

Parameters

limit	Sets how much memory can be allocated for temporary space to the current session, where *limit* is specified in this format: • NONE (default): Unlimited temporary storage space • = DEFAULT: Session TEMPSPACECAP is set to the user's TEMPSPACECAP value. • '*max-expression*': A string value that specifies the memory limit, one of the following: • *int*% — Expresses the maximum as a percentage of total memory available to the Resource Manager,

	where *int* is an integer value between 0 and 100.For example:
	`SET SESSION TEMPSPACECAP '40%';`
	• *int*{K|M|G|T} — Expresses memory allocation in kilobytes, megabytes, gigabytes, or terabytes. For example:
	`SET SESSION TEMPSPACECAP'10G;`

Privileges

Nonsuperusers:

- Restricted to setting only their own sessions
- Session TEMPSPACECAP cannot be greater than their own TEMPSPACECAP.

Examples

Set the session TEMPSPACECAP to 20 gigabytes:

```
=> SET SESSION TEMPSPACECAP '20G';
SET
=> SHOW TEMPSPACECAP;
     name     | setting
--------------+----------
 tempspacecap | 20971520
(1 row)
```

Note:
SHOW displays the TEMPSPACECAP in kilobytes.

Set the session TEMPSPACECAP to unlimited:

```
=> SET SESSION TEMPSPACECAP NONE;
SET
=> SHOW TEMPSPACECAP;
     name     |  setting
--------------+-----------
 tempspacecap | UNLIMITED
(1 row)
```

See Also

- ALTER USER
- CREATE USER
- Managing Workloads

SET STANDARD_CONFORMING_STRINGS

Treats backslashes as escape characters for the current **session**.

Syntax

```
SET STANDARD_CONFORMING_STRINGS TO { ON | OFF }
```

Parameters

ON	Makes ordinary string literals ('...') treat back slashes (\) literally. This means that back slashes are treated as string literals, not escape characters. (This is the default.)
OFF	Treats back slashes as escape characters.

Privileges

None

Notes

- This statement works under vsql only.
- When standard conforming strings are on, Vertica supports SQL:2008 string literals within Unicode escapes.
- Standard conforming strings must be ON to use Unicode-style string literals (U&'\nnnn').

Tip:
To set conforming strings across all sessions (permanently), use the`StandardConformingStrings` as described in Internationalization Parameters in the Administrator's Guide.

Examples

The following example shows how to turn off conforming strings for the session.

```
=> SET STANDARD_CONFORMING_STRINGS TO OFF;
```

The following command lets you verify the settings:

```
=> SHOW STANDARD_CONFORMING_STRINGS;
            name             | setting
-----------------------------+---------
 standard_conforming_strings | off
(1 row)
```

The following example shows how to turn on conforming strings for the session.

```
=> SET STANDARD_CONFORMING_STRINGS TO ON;
```

See Also

- SET ESCAPE_STRING_WARNING

SET TIME ZONE

Changes the TIME ZONE run-time parameter for the current **session**. Use SHOW TIMEZONE to show the session's current time zone.

If you set the timezone using POSIX format, the timezone abbreviation you use overrides the default timezone abbreviation. If the date style is set to POSTGRES, the timezone abbreviation you use is also used when converting a timestamp to a string.

Syntax

```
SET TIME ZONE TO { value | 'value' }
```

Note:
Vertica treats literals `TIME ZONE` and `TIMEZONE` as synonyms.

Parameters

value	One of the following: • A time zone literal supported by Vertica. To view the default list of valid literals, see the files in the following directory: `/opt/vertica/share/timezonesets` • A signed integer representing an offset from UTC in hours • An interval value • Constants `LOCAL` and `DEFAULT`, which respectively set the time zone to the one specified in environment variable `TZ`, or if `TZ` is undefined, to the operating system time zone.

Privileges

None

Examples

```
=> SET TIME ZONE TO DEFAULT;
=> SET TIME ZONE TO 'PST8PDT'; -- Berkeley, California
=> SET TIME ZONE TO 'Europe/Rome'; -- Italy
=> SET TIME ZONE TO '-7'; -- UDT offset equivalent to PDT
=> SET TIME ZONE TO INTERVAL '-08:00 HOURS';
```

See Also

Using Time Zones With Vertica

Time Zone Names for Setting TIME ZONE

The time zone names listed below are recognized by Vertica as valid settings for the SQL time zone (the TIME ZONE run-time parameter).

Note:
Time zone and daylight-saving rules are controlled by individual governments, and are subject to change. For the latest information, see Sources for Time Zone and Daylight Saving Time Data.

These names are not the same as the names shown in `/opt/vertica/share/timezonesets`, which are recognized by Vertica in date/time input values. The TIME ZONE names listed below imply a local Daylight Saving Time rule, where date/time input names represent a fixed offset from UTC.

In many cases, the same zone has several names. These are grouped together. The list is sorted primarily by commonly used zone names.

In addition to the names in the list, Vertica accepts time zone names as one of the following:

- *STDoffset*
- *STDoffsetDST*

where *STD* is a zone abbreviation, *offset* is a numeric offset in hours west from UTC, and *DST* is an optional Daylight Saving Time zone abbreviation, assumed to stand for one hour ahead of the given offset.

For example, if `EST5EDT` were not already a recognized zone name, Vertica accepts it as functionally equivalent to USA East Coast time. When a Daylight Saving Time zone name is present, Vertica assumes it uses USA time zone rules, so this feature is of limited use outside North America.

Caution:
Be aware that this provision can lead to silently accepting invalid input, as there is no check on the reasonableness of the zone abbreviations. For example, `SET TIME ZONE TO FOOBANKO` works, leaving the system effectively using a rather peculiar abbreviation for GMT.

Time Zone

- Africa
- America
- Antarctica
- Asia
- Atlantic
- Australia

- CET
- EET
- Etc/GMT
    - GMT
    - GMT+0
    - GMT-0
    - GMT0
    - Greenwich
    - Etc/Greenwich
- Europe
- Factory
- Indian
- MET
- Pacific
- UCT Etc
- UCT
- UTC
    - Universal Zulu
    - Etc/UTC
    - Etc/Universal
    - Etc/Zulu
- WET

SHOW

Shows run-time parameters for the current session.

Syntax

```
SHOW { parameter | ALL }
```

Parameters

ALL	Shows all run-time settings.
AUTOCOMMIT	Returns on/off to indicate whether statements automatically commit their transactions when they complete.

AVAILABLE ROLES	Lists all **roles** available to the user.
DATESTYLE	Shows the current style of date values. See SET DATESTYLE.
ENABLED ROLES	Shows the roles enabled for the current session. See SET ROLE.
ESCAPE_STRING_WARNING	Returns on/off to indicate whether warnings are issued when backslash escapes are found in strings. See SET ESCAPE_STRING_WARNING.
GRACEPERIOD	Shows the session GRACEPERIOD set by SET SESSION GRACEPERIOD.
IDLESESSIONTIMEOUT	Shows how long the session can remain idle before it times out.
INTERVALSTYLE	Shows whether units are output when printing intervals. See SET INTERVALSTYLE.
LOCALE	Shows the current locale. See SET LOCALE.
MEMORYCAP	Shows the maximum amount of memory that any request use. See SET MEMORYCAP.
MULTIPLEACTIVERESULTSETS	Returns on/off to indicate whether multiple active result sets on one connection are allowed. See SET SESSION MULTIPLEACTIVERESULTSETS
RESOURCE POOL	Shows the resource pool that the session is using. See SET RESOURCE POOL.
RUNTIMECAP	Shows the maximum amount of time that queries can run in the session. See SET RUNTIMECAP.

SEARCH_PATH	Shows the order in which Vertica searches schemas. See SET SEARCH_PATH. For example:
	`=> SHOW SEARCH_PATH;`
	`name | setting`
	`search_path | "$user", public, v_catalog, v_monitor, v_internal`
	`(1 row)`

STANDARD_CONFORMING_STRINGS	Shows whether backslash escapes are enabled for the session. See SET STANDARD_CONFORMING_STRINGS.
TEMPSPACECAP	Shows the maximum amount of temporary file space that queries can use in the session. See SET TEMPSPACECAP.
TIMEZONE	Shows the timezone set in the current session. See SET TIMEZONE.

TRANSACTION_ISOLATION	Shows the current transaction isolation setting, as described in SET SESSION CHARACTERISTICS AS TRANSACTION. For example:
	`=> SHOW TRANSACTION_ISOLATION;`
	`name | setting`
	`----------+---------`
	`transaction_isolation | READ COMMITTED`
	`(1 row)`

TRANSACTION_READ_ONLY	Returns true/false to indicate the current read-only setting, as described in SET SESSION CHARACTERISTICS AS TRANSACTION. For example:
	`=> SHOW TRANSACTION_READ_ONLY;`
	`name | setting`
	`----------+---------`
	`transaction_read_only | false`
	`(1 row)`

Privileges

None

Examples

Display all current runtime parameter settings:

```
=> SHOW ALL;
           name            |                       setting
```

```
-----------------------------+-------------------------------------------------------------
 locale                      | en_US@collation=binary (LEN_KBINARY)
 autocommit                  | off
 standard_conforming_strings | on
 escape_string_warning       | on
 multipleactiveresultsets    | off
 datestyle                   | ISO, MDY
 intervalstyle               | plain
 timezone                    | America/New_York
 search_path                 | "$user", public, v_catalog, v_monitor, v_internal, v_func
 transaction_isolation       | READ COMMITTED
 transaction_read_only       | false
 resource_pool               | general
 memorycap                   | UNLIMITED
 tempspacecap                | UNLIMITED
 runtimecap                  | UNLIMITED
 idlesessiontimeout          | UNLIMITED
 graceperiod                 | UNLIMITED
 enabled roles               | dbduser*, dbadmin*, pseudosuperuser*
 available roles             | dbduser*, dbadmin*, pseudosuperuser*
 (19 rows)
```

SHOW CURRENT

Displays active configuration parameter values that are set at all levels. Vertica first checks values set at the session level. If a value is not set for a configuration parameter at the session level, Vertica next checks if the value is set for the node where you are logged in, and then checks the database level. If no values are set, `SHOW CURRENT` shows the default value for the configuration parameter. If the configuration parameter requires a restart to take effect, the active values shown might differ from the set values.

Syntax

```
SHOW CURRENT { parameter-name[,…] | ALL }
```

Parameters

parameter-name	Names of configuration parameters to show.
ALL	Shows all configuration parameters set at all levels.

Privileges

Non-superuser: SHOW CURRENT ALL returns masked parameter settings. Attempts to view specific parameter settings return an error.

Examples

Show configuration parameters and their settings at all levels.

```
=> SHOW CURRENT ALL;
level    |    name                    |setting
---------+----------------------------+---------
DEFAULT  | ActivePartitionCount       | 1
DEFAULT  | AdvanceAHMInterval         | 180
DEFAULT  | AHMBackupManagement        | 0
DATABASE | AnalyzeRowCountInterval    | 3600
SESSION  | ForceUDxFencedMode         | 1
NODE     | MaxClientSessions          | 0
...
```

SHOW DATABASE

Displays configuration parameter values that are set for the database.

Important:
You can also get detailed information on configuration parameters, including their current and default values, by querying system table CONFIGURATION_PARAMETERS.

Note:
If the configuration parameter is set but requires a database restart to take effect, the value shown might differ from the active value.

Syntax

```
SHOW DATABASE db-spec { parameter-name[,…] | ALL }
```

Parameters

db-spec	Specifies the current database, set to the database name or DEFAULT.
parameter-name	Names of one or more configuration parameters to show. Non-superusers can only specify parameters whose settings are not masked by SHOW DATABASE…ALL, otherwise Vertica returns an error. If you specify a single parameter that is not set, SHOW DATABASE returns an empty row for that parameter. To obtain the names of database-level parameters, query system table CONFIGURATION_PARAMETERS.
ALL	Shows all configuration parameters set at the database level. For non-superusers, Vertica masks settings of security parameters, which only superusers can access.

Privileges

- Superuser: Shows all database parameter settings.
- Non-superuser: Masks all security parameter settings, which only superusers can access. To determine which parameters require superuser privileges, query system table CONFIGURATION_PARAMETERS.

Examples

Show to a non-superuser all configuration parameters that are set on the database:

```
=> SHOW DATABASE DEFAULT ALL;
              name              | setting
--------------------------------+----------
 AllowNumericOverflow           | 1
 CopyFaultTolerantExpressions   | 1
 EnableSSL                      | 1
 GlobalHeirUsername             | ********
 MaxClientSessions              | 50
 NumericSumExtraPrecisionDigits | 0
(6 rows)
```

Show settings for two configuration parameters:

```
=> SHOW DATABASE DEFAULT AllowNumericOverflow, NumericSumExtraPrecisionDigits;
              name              | setting
--------------------------------+---------
 AllowNumericOverflow           | 1
 NumericSumExtraPrecisionDigits | 0
(2 rows)
```

SHOW NODE

Displays configuration parameter values that are set for a node. If you specify a parameter that is not set, `SHOW NODE` returns an empty row for that parameter.

Note:
If the configuration parameter is set but requires a database restart to take effect, the value shown might differ from the active value.

Syntax

```
SHOW NODE node-name { parameter-name [,…] | ALL }
```

Parameters

node-name	Name of the target node.
parameter-name	Names of one or more node-level configuration parameters. To obtain the names of node-level parameters, query system table `CONFIGURATION_PARAMETERS`.
`ALL`	Shows all configuration parameters set at the node level.

Privileges

None

Examples

View all configuration parameters and their settings for node `v_vmart_node0001`:

```
=> SHOW NODE v_vmart_node0001 ALL;
           name            | setting
---------------------------+---------
 DefaultIdleSessionTimeout | 5 hour
 MaxClientSessions         | 20
```

SHOW SESSION

Displays configuration parameter values that are set for the current session. If you specify a parameter that is not set, `SHOW SESSION` returns an empty row for that parameter.

> **Note:**
> If the configuration parameter is set but requires a database restart to take effect, the value shown might differ from the active value.

Syntax

```
SHOW SESSION { ALL | UDPARAMETER ALL }
```

Parameters

`ALL`	Shows all Vertica configuration parameters set at the session level.
`UDPARAMETER ALL`	Shows all parameters defined by user-defined extensions. These parameters are not shown in the CONFIGURATION_PARAMETERS table.

Privileges

None

Examples

View all Vertica configuration parameters and their settings for the current session. User-defined parameters are not included:

```
=> SHOW SESSION ALL;
name                        |                      setting
----------------------------+-----------------------------------------------------
locale                      | en_US@collation=binary (LEN_KBINARY)
autocommit                  | off
standard_conforming_strings | on
escape_string_warning       | on
datestyle                   | ISO, MDY
intervalstyle               | plain
timezone                    | America/New_York
search_path                 | "$user", public, v_catalog, v_monitor, v_internal
transaction_isolation       | READ COMMITTED
transaction_read_only       | false
resource_pool               | general
memorycap                   | UNLIMITED
tempspacecap                | UNLIMITED
runtimecap                  | UNLIMITED
enabled roles               | dbduser*, dbadmin*, pseudosuperuser*
available roles             | dbduser*, dbadmin*, pseudosuperuser*
ForceUDxFencedMode          | 1
(17 rows)
```

SHOW USER

Displays configuration parameter values that are set for a user.

Syntax

```
SHOW USER user-name [PARAMETER] { cfg-parameter [,…] | ALL }
```

Parameters

user-name	Name of the target user.

cfg-parameter	Names of one or more user-level configuration parameters. To get the names of user-level parameters, query system table CONFIGURATION_PARAMETERS. For example:
	`SELECT parameter_name, allowed_levels FROM configuration_parameters WHERE allowed_levels ilike '%USER%' AND parameter_name ilike '%depot%';`
	`parameter_name | allowed_levels`
	`UseDepotForWrites | SESSION, USER, DATABASE`
	`DepotOperationsForQuery | SESSION, USER, DATABASE`

	UseDepotForReads | SESSION, USER, DATABASE (3 rows)
ALL	Shows all configuration parameters set at the user level.

Privileges

Non-superuser: Can only view configuration parameter settings specific to that user.

Examples

```
=> SHOW USER user1 ALL;
          name           | setting
-------------------------+---------
 DepotOperationsForQuery | Fetches
(1 row)

=> ALTER USER user1 SET PARAMETER UseDepotForWrites=0;
ALTER USER
=> SHOW USER user1 ALL;
          name           | setting
-------------------------+---------
 DepotOperationsForQuery | Fetches
 UseDepotForWrites       | 0
(2 rows)
```

See Also

ALTER USER

START TRANSACTION

Starts a transaction block.

Syntax

```
START TRANSACTION [ isolation_level ]
```

where *isolation_level* is one of:

```
ISOLATION LEVEL { SERIALIZABLE | REPEATABLE READ | READ COMMITTED | READ UNCOMMITTED }READ { ONLY | WRITE
}
```

Parameters

Isolation level, described in the following table, determines what data the transaction can access when other transactions are running concurrently. The isolation level cannot be changed after the first query (SELECT) or DML statement (INSERT, DELETE, UPDATE) has run. A transaction retains its isolation level until it completes, even if the session's isolation level changes during the transaction. Vertica internal processes (such as the **Tuple Mover** and **refresh** operations) and DDL operations always run at the SERIALIZABLE isolation level to ensure consistency.

`WORK | TRANSACTION`	Have no effect; they are optional keywords for readability.
`ISOLATION LEVEL { SERIALIZABLE | REPEATABLE READ | READ COMMITTED | READ UNCOMMITTED }`	• SERIALIZABLE—Sets the strictest level of SQL transaction isolation. This level emulates transactions serially, rather than concurrently. It holds locks and blocks write operations until the transaction completes. Not recommended for normal query operations. • REPEATABLE READ—Automatically converted to SERIALIZABLE by Vertica. • READ COMMITTED (Default)—Allows concurrent transactions. Use READ COMMITTED isolation for normal query operations, but be aware that there is a subtle difference between them. SeeTransactionsfor more information. • READ UNCOMMITTED—Automatically converted to READ COMMITTED by Vertica.
`READ {WRITE | ONLY}`	Determines whether the transaction is read/write or read-only. Read/write is the default. Setting the transaction session mode to read-only disallows the following SQL commands, but does not prevent all disk write operations: • INSERT, UPDATE, DELETE, and COPY if the table they would write to is not a temporary table • All CREATE, ALTER, and DROP commands • GRANT, REVOKE, and EXPLAIN if the command it would run is among those listed.

Privileges

None

Notes

BEGIN performs the same function as START TRANSACTION.

Examples

This example shows how to start a transaction.

```
= > START TRANSACTION ISOLATION LEVEL READ COMMITTED READ WRITE;
START TRANSACTION

=> CREATE TABLE sample_table (a INT);
CREATE TABLE

=> INSERT INTO sample_table (a) VALUES (1);
OUTPUT
--------
1
(1 row)
```

See Also

- Transactions
- Creating Transactions
- COMMIT
- END
- ROLLBACK

TRUNCATE TABLE

Removes all storage associated with a table, while leaving the table definition intact. TRUNCATE TABLE auto-commits the current transaction after statement execution and cannot be rolled back.

TRUNCATE TABLE also performs the following actions:

- Removes all table history preceding the current epoch, regardless of where that data resides (WOS or ROS) or how it is segmented. After TRUNCATE TABLE returns, AT EPOCH queries on the truncated table return nothing.
- Drops all table- and partition-level statistics.

Syntax

```
TRUNCATE TABLE [[database.]schema.]table-name
```

Parameters

[*database.*]*schema*	Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table-name	The name of the anchor table or temporary table to truncate. You cannot truncate an external table.

Privileges

Non-superuser:

- Table owner
- USAGE privileges on table schema

Examples

See Truncating Tables in the Administrator's Guide.

See Also

- DELETE
- DROP TABLE

UPDATE

Replaces the values of the specified columns in all rows for which a specific condition is true. All other columns and rows in the table are unchanged. If successful, UPDATE returns the number of rows updated. A count of 0 indicates no rows matched the condition.

Important:
Vertica's implementation of UPDATE differs from traditional databases: it does not delete data from disk storage; it writes two rows: one with new data and one marked for deletion. Rows marked for deletion remain available for historical queries.

Syntax

```
UPDATE [ /*+ LABEL */ ]  [[database.]schema.]table-reference [AS] alias
    SET set-expression [,…]
    [ FROM from-list ]
    [ where-clause ]
```

Parameters

LABEL	Assigns a label to a statement in order to identify it for profiling and debugging.
[*database.*]*schema*	Specifies a schema, by default `public`. If *schema* is any schema other than `public`, you must supply the schema name. For example: `myschema.thisDbObject` If you specify a database, it must be the current database.
table-reference	Specifies a table, one of the following: • An optionally qualified table name with optional table aliases, column aliases, and outer joins. • An outer join table.

	You cannot update a projection.
alias	A temporary name used to reference the table.

SET *set-expression*[,…]	Specifies the columns to update. Each *set-expression* in the SET clause specifies a target column and its new value as follows:
	`column-name = { expression | DEFAULT }`
	where:
	• *column-name* is any column that does not have primary key or foreign key **referential integrity** constraints.
	• *expression* specifies a value to assign to the column. The expression can use the current values of this and other table columns. For example:
	`UPDATE T1 SET C1 = C1+1`
	UPDATE only modifies the columns specified by the SET clause. Unspecified columns remain unchanged.

FROM *from-list*	A list of table expressions, allowing columns from other tables to appear in the WHERE condition and the UPDATE expressions. This is similar to the list of tables that can be specified in the FROM Clause of a SELECT command. **Important:** *from-list* must not include the target table.

Privileges

Table owner or user with GRANT OPTION is grantor.

- UPDATE privilege on table
- USAGE privilege on schema that contains the table
- SELECT privilege on the table when executing an UPDATE statement that references table column values in a WHERE or SET clause

Subqueries and Joins

UPDATE supports subqueries and joins, which is useful for updating values in a table based on values that are stored in other tables. For details, see Subqueries in UPDATE and DELETE Statements in Analyzing Data.

Committing INSERT, UPDATE, and DELETE

Vertica follows the SQL-92 transaction model, so successive INSERT, UPDATE, and DELETE statements are included in the same transaction. You do not need to explicitly start this transaction; however, you must explicitly end it with COMMIT, or implicitly end it with COPY; otherwise Vertica discards all changes that were made within the transaction.

Restrictions

- The table you specify in the UPDATE list cannot also appear in the FROM list (no self joins); for example, the following UPDATE statement is not allowed:

```
=> BEGIN;
=> UPDATE result_table
   SET address='new' || r2.address
   FROM result_table r2
   WHERE r2.cust_id = result_table.cust_id + 10;
   ERROR:  Self joins in UPDATE statements are not allowed
   DETAIL:  Target relation result_table also appears in the FROM list
```

- If the joins specified in the WHERE predicate produce more than one copy of the row in the table to be updated, the new value of the row in the table is chosen arbitrarily.
- If any primary key, unique key, or check constraints are enabled for automatic enforcement, Vertica enforces those constraints when you insert values into a table. If a violation occurs, Vertica rolls back the SQL statement and returns an error. This behavior occurs for INSERT, UPDATE, COPY, and MERGE SQL statements.

Note:
Automatic constraint enforcement requires that you have SELECT privileges on the table containing the constraint.

Examples

In the `fact` table, modify the `price` column value for all rows where the `cost` column value is greater than 100:

```
=> UPDATE fact SET price = price - cost * 80 WHERE cost > 100;
```

In the `retail.customer` table, set the `state` column to `NH` when the `CID` column value is greater than 100:

```
=> UPDATE retail.customer SET state = 'NH' WHERE CID > 100;
```

To use table aliases in `UPDATE` queries, consider the following two tables:

```
=> SELECT * FROM result_table;
 cust_id |      address
---------+--------------------
      20 | Lincoln Street
      30 | Beach Avenue
      30 | Booth Hill Road
      40 | Mt. Vernon Street
      50 | Hillside Avenue
(5 rows)
=> SELECT * FROM new_addresses;
 new_cust_id | new_address
-------------+--------------
          20 | Infinite Loop
          30 | Loop Infinite
          60 | New Addresses
(3 rows)
```

The following query and subquery use table aliases to update the `address` column in `result_table` (alias `r`) with the new address from the corresponding column in the `new_addresses` table (alias `n`):

```
=> UPDATE result_table r
   SET address=n.new_address
   FROM new_addresses n
   WHERE r.cust_id = n.new_cust_id;
```

`result_table` shows the `address` field updates made for customer IDs 20 and 30:

```
=> SELECT * FROM result_table ORDER BY cust_id;
 cust_id |     address
---------+-----------------
      20 | Infinite Loop
      30 | Loop Infinite
      30 | Loop Infinite
      40 | Mt. Vernon Street
```

```
      50 | Hillside Avenue
(5 rows)
```

Vertica System Tables

Vertica provides system tables that let you monitor your database and evaluate settings of its objects. You can query these tables just as you do other tables, depending on privilege requirements.

See Also

- Using System Tables
- Monitoring Vertica

V_CATALOG Schema

The system tables in this section reside in the `v_catalog` schema. These tables provide information (metadata) about the objects in a database; for example, tables, constraints, users, projections, and so on.

ACCESS_POLICY

Provides information about access policies associated with specific tables.

Column Name	Data Type	Description
ACCESS_POLICY_OID	INTEGER	A unique identifier for the access policy.
TABLE_NAME	VARCHAR	Name of the table with which the access policy is assigned.
IS_POLICY_ENABLED	BOOLEAN	Indicates whether or not you have enabled the access policy.
POLICY_TYPE	VARCHAR	The type of access policy assigned to the table, valid values are: • Column Policy • Row Policy
EXPRESSION	VARCHAR	The expression used when creating the access policy.
COLUMN_NAME	VARCHAR	The column to which the access policy is assigned.

ALL_TABLES

Provides summary information about tables in a Vertica database.

Column Name	Data Type	Description
SCHEMA_NAME	VARCHAR	The name of the schema that contains the table.
TABLE_ID	INTEGER	Catalog-assigned numeric value that uniquely identifies the table.
TABLE_NAME	VARCHAR	The table name.
TABLE_TYPE	VARCHAR	The type of table, which can be one of the following: • TABLE • SYSTEM TABLE • VIEW • GLOBAL TEMPORARY • LOCAL TEMPORARY
REMARKS	VARCHAR	A brief comment about the table. You define this field by using the COMMENT ON TABLE and COMMENT ON VIEW commands.

Example

```
onenode=> SELECT DISTINCT table_name, table_type FROM all_tables
          WHERE table_name ILIKE 't%';
       table_name       |  table_type
------------------------+--------------
 types                  | SYSTEM TABLE
 trades                 | TABLE
 tuple_mover_operations | SYSTEM TABLE
 tables                 | SYSTEM TABLE
 tuning_recommendations | SYSTEM TABLE
 testid                 | TABLE
 table_constraints      | SYSTEM TABLE
 transactions           | SYSTEM TABLE
(8 rows)
onenode=> SELECT table_name, table_type FROM all_tables
          WHERE table_name ILIKE 'my%';
 table_name | table_type
------------+------------
 mystocks   | VIEW
(1 row)
=> SELECT * FROM all_tables LIMIT 4;
-[ RECORD 1 ]-------------------------------------------
schema_name | v_catalog
table_id    | 10206
table_name  | all_tables
table_type  | SYSTEM TABLE
remarks     | A complete listing of all tables and views
-[ RECORD 2 ]-------------------------------------------
```

```
schema_name | v_catalog
table_id    | 10000
table_name  | columns
table_type  | SYSTEM TABLE
remarks     | Table column information
-[ RECORD 3 ]-------------------------------------------
schema_name | v_catalog
table_id    | 10054
table_name  | comments
table_type  | SYSTEM TABLE
remarks     | User comments on catalog objects
-[ RECORD 4 ]-------------------------------------------
schema_name | v_catalog
table_id    | 10134
table_name  | constraint_columns
table_type  | SYSTEM TABLE
remarks     | Table column constraint information
```

AUDIT_MANAGING_USERS_PRIVILEGES

Provides summary information about privileges, creating, modifying, and deleting users, and authentication changes. This table is a join of LOG_PARAMS, LOG_QUERIES, and LOG_TABLES filtered on the Managing_Users_Privileges category.

Column Name	Data Type	Description
ISSUED_TIME	VARCHAR	The time at which the query was executed.
USER_NAME	VARCHAR	Name of the user who issued the query at the time Vertica recorded the session.
USER_ID	INTEGER	Numeric representation of the user who ran the query.
HOSTNAME	VARCHAR	The hostname, IP address, or URL of the database server.
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
AUDIT_TYPE	VARCHAR	The type of operation for the audit: • Query • Parameter • Table

Column Name	Data Type	Description
AUDIT_TAG_NAME	VARCHAR	The tag name for the specific parameter, query, or table.
REQUEST_TYPE	VARCHAR	The type of query request. Examples include, but are not limited to: • QUERY • DDL • LOAD • UTILITY • TRANSACTION • PREPARE • EXECUTE • SET • SHOW
REQUEST_ID	INTEGER	The ID of the privilege request.
SUBJECT	VARCHAR	The name of the table or parameter that was queried or the subject of a query.
REQUEST	VARCHAR	Lists the privilege request.
SUCCESS	VARCHAR	Indicates whether or not the operation was successful.
CATEGORY	VARCHAR	The audit parent category, Managing_Users_Privileges.

CATALOG_SUBSCRIPTION_CHANGES

Lists the changes made to catalog subscriptions.

Column Name	Data Type	Description
EVENT_TIMESTAMP	TIMESTAMP	The time a catalog subscription changed.
SESSION_ID	VARCHAR	A unique numeric ID assigned by the Vertica catalog, which identifies the session for which profiling information is captured. This identifier is unique within the cluster at any point in time but

Column Name	Data Type	Description
		can be reused when the session closes.
USER_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies the user.
USER_NAME	VARCHAR	The user who made changes to the subscriptions.
TRANSACTION_ID	INTEGER	Identifier for the transaction within the session, if any. If a session is active but no transaction has begun, TRANSACTION_ID returns NULL.
SHARD_NAME	VARCHAR	The name of the shard.
SHARD_OID	INTEGER	The OID of the shard.
SUBSCRIBER_NODE_NAME	VARCHAR	The node name or names subscribed to the shard.
SUBSCRIBER_NODE_OID	INTEGER	The OID of the subscribing node or nodes.
OLD_STATE	VARCHAR	The previous state of the node subscription.
NEW_STATE	VARCHAR	The current state of the node subscription.
WAS_PRIMARY	BOOLEAN	Defines whether the node was the primary subscriber.
IS_PRIMARY	BOOLEAN	Defines whether the node is currently the primary subscriber.
CATALOG_VERSION	INTEGER	The version of the catalog at the time of the subscription change.

CATALOG_SYNC_STATE

Indicates the last time a node on an Eon Mode database synchronized its catalog to communal storage.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The node name for which information is listed.

Column Name	Data Type	Description
SYNC_CATALOG_ VERSION	INTEGER	The version number of the catalog being synchronized.
SYNC_TRAILING_INTERVAL	INTEGER	The difference between the global catalog version and the synchronized catalog version for a node.
LAST_SYNC_AT	TIMESTAMPTZ	The date and time the last time the catalog was synchronized.

Example

```
=> SELECT * FROM CATALOG_SYNC_STATE;
-[ RECORD 1 ]----------+-----------------------------
node_name              | v_verticadb_node0002
sync_catalog_version   | 773
sync_trailing_interval | 0
last_sync_at           | 2018-02-07 16:18:32.968146+00
```

CATALOG_TRUNCATION_STATUS

Indicates how up to date the catalog is on communal storage. It is completely up to date when the current catalog version is the same as the catalog truncation version.

The catalog truncation version (CTV) is the version that a Vertica cluster revives to after a crash, shutdown, or hibernation. There is only one CTV for all nodes in a cluster.

Column Name	Data Type	Description
CURRENT_CATALOG_ VERSION	INTEGER	The version number of the catalog currently on the cluster.
TRUNCATION_ CATALOG_VERSION	INTEGER	The version number as of the last time the catalog was synced on communal storage.

Example

```
=> SELECT * FROM CATALOG_TRUNCATION_STATUS;
-[ RECORD 1 ]--------------+----
current_catalog_version    | 773
truncation_catalog_version | 0
```

CERTIFICATES

Stores certificates created by CREATE CERTIFICATE.

Column Name	Data Type	Description
OID	INTEGER	The object identifier.
NAME	VARCHAR	The name of the certificate.
OWNER	INTEGER	The owner of the object.
SIGNED_BY	INTEGER	The OID of the signing certificate.
PRIVATE_KEY	INTEGER	The OID of the certificate's private key.
START_DATE	TIMESTAMPTZ	When the certificate becomes valid.
EXPIRATION_ DATE	TIMESTAMPTZ	When the certificate expires.
ISSUER	VARCHAR	The signing CA.
SUBJECT	VARCHAR	The entity for which the certificate is issued.
SERIAL	VARCHAR	The certificate's serial number.
x509v3_ EXTENSIONS	VARCHAR	Lists additional attributes specified during the certificate's creation.

Column Name	Data Type	Description
		For more information on extensions, see the OpenSSL documentation.
CERTIFICATE_ TEXT	VARCHAR	The contents of the certificate.

Examples

See Generating TLS Certificates and Keys.

CLIENT_AUTH

Provides information about client authentication methods.

Higher values indicate higher priorities. Vertica tries to authenticate a user with an authentication method in order of priority from highest to lowest. For example:

- A priority of 10 is higher than a priority of 5.
- A priority 0 is the lowest possible value.

Column Name	Data Type	Description
AUTH_OID	INTEGER	Unique identifier for the authentication method.
AUTH_NAME	VARCHAR	User-given name of the authentication method.
IS_AUTH_ ENABLED	BOOLEAN	Indicates if the authentication method is enabled.
AUTH_HOST_ TYPE	VARCHAR	The authentication host type, one of the following: • LOCAL • HOST • HOSTSSL • HOSTNOSSL
AUTH_HOST_ ADDRESS	VARCHAR	If AUTH_HOST_TYPE is HOST, AUTH_HOST_ADDRESS is the IP address (or address range) of the remote host.

Column Name	Data Type	Description
AUTH_ METHOD	VARCHAR	Authentication method to be used. Valid values: • IDENT • GSS • HASH • LDAP • REJECT • TLS • TRUST
AUTH_ PARAMETERS	VARCHAR	The parameter names and values assigned to the authentication method.
AUTH_ PRIORITY	INTEGER	The priority specified for the authentication. Authentications with higher values are used first.
METHOD_ PRIORITY	INTEGER	The priority of this authentication based on the AUTH_ METHOD. Vertica only considers METHOD_PRIORITY when deciding between multiple authentication methods of equal AUTH_PRIORITY.
ADDRESS_ PRIORITY	INTEGER	The priority of this authentication based on the specificity of the AUTH_HOST_ADDRESS, if any. More specific IP addresses (fewer zeros) are used first. Vertica only considers ADDRESS_PRIORITY when deciding between multiple authentication methods of equal AUTH_PRIORITY and METHOD_PRIORITY.

Examples

This example shows how to get information about each client authentication method that you created:

```
=> SELECT * FROM client_auth;
       auth_oid   |  auth_name  | is_auth_enabled | auth_host_type | auth_host_address | auth_method |
auth_parameters | auth_priority | method_priority | address_priority
-------------------+-------------+-----------------+----------------+-------------------+------------
```

```
-+-----------------+---------------+-----------------+------------------
 45035996274059694 | v_gss       | True            | HOST           | 0.0.0.0/0         | GSS
|                  |             0 |               5 |                96
 45035996274059696 | v_trust     | True            | LOCAL          |                   | TRUST
|                  |             0 |               0 |                 0
 45035996274059698 | v_ldap      | True            | HOST           | 10.19.133.123/    | LDAP
|                  |             0 |               5 |               128
 45035996274059700 | RejectNoSSL | True            | HOSTNOSSL      | 0.0.0.0/0         | REJECT
|                  |             0 |              10 |                96
 45035996274059702 | v_hash      | True            | LOCAL          |                   | HASH
|                  |             0 |               2 |                 0
 45035996274059704 | v_tls       | True            | HOSTSSL        | 1.1.1.1/0         | TLS
|                  |             0 |               5 |                96
(6 rows)
```

- Client Authentication
- Priorities for Client Authentication Methods

CLIENT_AUTH_PARAMS

Provides information about client authentication methods that have parameter values assigned.

Column Name	Data Type	Description
AUTH_OID	INTEGER	A unique identifier for the authentication method.
AUTH_NAME	VARCHAR	Name that you defined for the authentication method.
AUTH_ PARAMETER_NAME	VARCHAR	Parameter name required by the authentication method. Some examples are: • system_users • binddn_prefix • host
AUTH_ PARAMETER_ VALUE	VARCHAR	Value of the specified parameter.

Examples

This example shows how to retrieve parameter names and values for all authentication methods that you created. The authentication methods that have parameters are:

- v_ident
- v_ldap
- v_ldap1

```
=> SELECT * FROM CLIENT_AUTH_PARAMS;
     auth_oid      |   auth_name   | auth_parameter_name |    auth_parameter_value
-------------------+---------------+---------------------+-----------------------------
 45035996273741304 | v_ident       | system_users        | root
 45035996273741332 | v_gss         |                     |
 45035996273741350 | v_password    |                     |
 45035996273741368 | v_trust       |                     |
 45035996273741388 | v_ldap        | host                | ldap://172.16.65.177
 45035996273741388 | v_ldap        | binddn_prefix       | cn=
 45035996273741388 | v_ldap        | binddn_suffix       | ,dc=qa_domain,dc=com

CLUSTER_LAYOUT

Shows the relative position of the actual arrangement of the nodes participating in the cluster and the fault groups (in an Enterprise Mode database) or subclusters (in an Eon Mode database) that affect them. Ephemeral nodes are not shown in the cluster layout ring because they hold no resident data.

Column Name	Data Type	Description
CLUSTER_ POSITION	INTEGER	Position of the node in the cluster ring, counting forward from 0. **Note:** An output value of 0 has no special meaning

Column Name	Data Type	Description
		other than there are no nodes in position before the node assigned 0.
NODE_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog that identifies the node.
NODE_NAME	VARCHAR	The name of the node in the cluster ring. Only permanent nodes participating in database activity appear in the cluster layout. Ephemeral nodes are not shown in the output.
FAULT_GROUP_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog that identifies the fault group. This column can only have a value in an Enterprise Mode database. **Note:** This value matches the `FAULT_GROUP.MEMBER_ID` value, but only if this node is in a fault group; otherwise the value is NULL.
FAULT_GROUP_NAME	VARCHAR	The name of the fault group for the node. This column can only have a value in an Enterprise Mode database.
FAULT_GROUP_TIER	INTEGER	The node's depth in the fault group tree hierarchy. For example if the node: • Is not in a fault group, output is null • Is in the top level fault group, output is 0 • Is in a fault group's child, output is 1 • Is a fault group's grandchild, output is 2 This column can only have a value in an Enterprise Mode database.
SUBCLUSTER_ID	INTEGER	Unique identifier for the subcluster. This column only has a value in an Eon Mode database.
SUBCLUSTER_NAME	VARCHAR	The name of the subcluster containing the node. This column only has a value in an Eon Mode database.

See Also

Large Cluster

COLUMNS

Provides table column information.

Column Name	Data Type	Description
TABLE_ID	INTEGER	Catalog-assigned numeric value that uniquely identifies the table.
TABLE_SCHEMA	VARCHAR	Schema name for which information is listed in the database.
TABLE_NAME	VARCHAR	Table name for which information is listed in the database.
IS_SYSTEM_TABLE	BOOLEAN	Specifies whether the table is a system table.
COLUMN_ID	VARCHAR	Catalog-assigned VARCHAR value that uniquely identifies a table column.
COLUMN_NAME	VARCHAR	The column name for which information is listed in the database.
DATA_TYPE	VARCHAR	Column's data type, for example VARCHAR(16), INTEGER, or FLOAT. Arrays of primitive types show the name "Array [*type*]. Other complex types show the inline name of the type, such as _ct_45035996273833610. These names match the type_name column in the COMPLEX_TYPES table.
DATA_TYPE_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog, which identifies the data type.
DATA_TYPE_LENGTH	INTEGER	Maximum allowable length of the data type.

Column Name	Data Type	Description
CHARACTER_MAXIMUM_LENGTH	VARCHAR	Maximum allowable length of the column.
NUMERIC_PRECISION	INTEGER	Number of significant decimal digits.
NUMERIC_SCALE	INTEGER	Number of fractional digits.
DATETIME_PRECISION	INTEGER	For TIMESTAMP data type, returns the declared precision; returns NULL if no precision was declared.
INTERVAL_PRECISION	INTEGER	Number of fractional digits retained in the seconds field.
ORDINAL_POSITION	INTEGER	Column position respective to other columns in the table.
IS_NULLABLE	BOOLEAN	Specifies whether the column can contain NULL values.
COLUMN_DEFAULT	VARCHAR	Expression set on a column with the constraint DEFAULT.
COLUMN_SET_USING	VARCHAR	Expression set on a column with the constraint SET USING.
IS_IDENTITY	BOOLEAN	Specifies whether the column is an IDENTITY column.

Examples

Retrieve table and column information from the COLUMNS table:

```
=> SELECT table_schema, table_name, column_name, data_type, is_nullable
   FROM columns WHERE table_schema = 'store'
   AND data_type = 'Date';
 table_schema |    table_name     |      column_name       | data_type | is_nullable
--------------+-------------------+------------------------+-----------+-------------
 store        | store_dimension   | first_open_date        | Date      | f
 store        | store_dimension   | last_remodel_date      | Date      | f
 store        | store_orders_fact | date_ordered           | Date      | f
 store        | store_orders_fact | date_shipped           | Date      | f
 store        | store_orders_fact | expected_delivery_date | Date      | f
 store        | store_orders_fact | date_delivered         | Date      | f
6 rows)
```

DATETIME_PRECISION is NULL because the table definition declares no precision:

```
=> CREATE TABLE c (c TIMESTAMP);
CREATE TABLE
=> SELECT table_name, column_name, datetime_precision FROM columns
   WHERE table_name = 'c';
 table_name | column_name | datetime_precision
------------+-------------+--------------------
 c          | c           |
(1 row)
```

DATETIME_PRECISION is 4 because the table definition declares precision as 4:

```
=> DROP TABLE c;
=> CREATE TABLE c (c TIMESTAMP(4));
CREATE TABLE
=> SELECT table_name, column_name, datetime_precision FROM columns
   WHERE table_name = 'c';
 table_name | column_name | datetime_precision
------------+-------------+--------------------
 c          | c           |                  4
```

An identity column is a sequence available only for numeric column types. To identify what column in a table, if any, is an identity column, search the COLUMNS table to find the identity column in a table testid:

```
=> CREATE TABLE testid (c1 IDENTITY(1, 1, 1000), c2 INT);
=> \x
Expanded display is on.
=> SELECT * FROM COLUMNS WHERE is_identity='t' AND table_name='testid';
-[ RECORD 1 ]------------+--------------------
table_id                 | 45035996273719486
table_schema             | public
table_name               | testid
is_system_table          | f
column_id                | 45035996273719486-1
column_name              | c1
data_type                | int
data_type_id             | 6
data_type_length         | 8
character_maximum_length |
numeric_precision        |
numeric_scale            |
datetime_precision       |
interval_precision       |
ordinal_position         | 1
is_nullable              | f
column_default           |
is_identity              | t
```

Use the SEQUENCES table to get detailed information about the sequence in testid:

```
=> SELECT * FROM sequences WHERE identity_table_name='testid';
-[ RECORD 1 ]-------+--------------------
sequence_schema     | public
sequence_name       | testid_c1_seq
owner_name          | dbadmin
```

```
identity_table_name | testid
session_cache_count | 1000
allow_cycle         | f
output_ordered      | f
increment_by        | 1
minimum             | 1
maximum             | 9223372036854775807
current_value       | 0
sequence_schema_id  | 45035996273704976
sequence_id         | 45035996273719488
owner_id            | 45035996273704962
identity_table_id   | 45035996273719486
```

For more information about sequences and identity columns, see Sequences.

COMMENTS

Returns information about comments associated with objects in the database.

Column Name	Data Type	Description
COMMENT_ID	INTEGER	The comment's internal ID number
OBJECT_ID	INTEGER	The internal ID number of the object associated with the comment
OBJECT_TYPE	VARCHAR	The type of object associated with the comment. Possible values are: • COLUMN • CONSTRAINT • FUNCTION • LIBRARY • NODE • PROJECTION • SCHEMA • SEQUENCE • TABLE • VIEW
OBJECT_SCHEMA	VARCHAR	The schema containing the object.
OBJECT_NAME	VARCHAR	The name of the object associated with the comment.

Column Name	Data Type	Description
OWNER_ID	VARCHAR	The internal ID of the owner of the object.
OWNER_NAME	VARCHAR	The object owner's name.
CREATION_TIME	TIMESTAMPTZ	When the comment was created.
LAST_MODIFIED_TIME	TIMESTAMPTZ	When the comment was last modified.
COMMENT	VARCHAR	The text of the comments.

COMPLEX_TYPES

Contains information about inlined complex types (Complex Types).

Each complex type in each external table has a unique type internally, even if the types are structurally the same (like two different ROW(int,int) cases). This inlined type is created when the table using it is created and is automatically dropped when the table is dropped. Inlined complex types cannot be shared or reused in other tables.

Each row in the COMPLEX_TYPES table represents one component (field) in one complex type. A ROW produces one row per field, an ARRAY produces one, and a MAP produces two.

Arrays of primitive types used in Vertica-managed (ROS) tables are not included in the COMPLEX_TYPES table. They are included instead in the TYPES table.

Column Name	Data Type	Description
TYPE_ID	INTEGER	A unique identifier for the inlined complex type.
TYPE_KIND	VARCHAR	The specific kind of complex type: row, array, or map.
TYPE_NAME	VARCHAR	The generated name of this type. All names begin with _ct_ followed by a number.
FIELD_ID	INTEGER	A unique identifier for the field.
FIELD_NAME	VARCHAR	The name of the field, if specified in the table definition, or a generated name beginning with "f".

Column Name	Data Type	Description
FIELD_TYPE_NAME	VARCHAR	The type of the field's value.
FIELD_POSITION	INTEGER	The field's position in its containing complex type (0-based).
FIELD_LENGTH	INTEGER	Number of bytes in the field value, or -1 if the value is not a scalar type.
CHARACTER_MAXIMUM_LENGTH	INTEGER	Maximum allowable length of the column.
NUMERIC_PRECISION	INTEGER	Number of significant decimal digits.
NUMERIC_SCALE	INTEGER	Number of fractional digits.
DATETIME_PRECISION	INTEGER	For TIMESTAMP data type, returns the declared precision; returns NULL if no precision was declared.
INTERVAL_PRECISION	INTEGER	Number of fractional digits retained in the seconds field.

Examples

The following example shows the type and field values after defining a single external table.

```
=> CREATE EXTERNAL TABLE warehouse(
       name VARCHAR, id_map MAP<INT,VARCHAR>,
       data row(record INT, total FLOAT, description VARCHAR(100)),
       prices ARRAY[INT], comment VARCHAR(200), sales_total FLOAT, storeID INT)
  AS COPY FROM ... PARQUET;

=> SELECT type_id,type_kind,type_name,field_id,field_name,field_type_name,field_position
       FROM COMPLEX_TYPES ORDER BY type_id,field_name;

      type_id      | type_kind |       type_name       | field_id | field_name  | field_type_name |
field_position
-------------------+-----------+-----------------------+----------+-------------+-----------------+--
--------------
 45035996274278280 | Map       | _ct_45035996274278280 |        6 | key         | int             |
           0
 45035996274278280 | Map       | _ct_45035996274278280 |        9 | value       | varchar(80)     |
           1
 45035996274278282 | Row       | _ct_45035996274278282 |        9 | description | varchar(80)     |
           2
 45035996274278282 | Row       | _ct_45035996274278282 |        6 | record      | int             |
           0
```

```
 45035996274278282 | Row       | _ct_45035996274278282 |        7 | total       | float           |
           1
 45035996274278284 | Array     | _ct_45035996274278284 |        6 |             | int             |
           0
(6 rows)
```

CONSTRAINT_COLUMNS

Records information about table column constraints.

Column Name	Data Type	Description
CONSTRAINT_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog that identifies the constraint.
TABLE_SCHEMA	VARCHAR	Name of the schema that contains this table.
TABLE_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog that identifies the table.
TABLE_NAME	VARCHAR	Name of the table in which the column resides.
COLUMN_NAME	VARCHAR	Name of the column that is constrained. For check constraints, if more than one column is referenced, each appears as a separate row.
CONSTRAINT_NAME	VARCHAR	Constraint name for which information is listed.
CONSTRAINT_TYPE	CHAR	The constraint type, one of the following: • c: check • f: foreign • n: not null • p: primary • u: unique
IS_ENABLED	BOOLEAN	Indicates whether a constraint for a primary key, unique key, or check constraint is currently enabled.
REFERENCE_TABLE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the referenced table

Column Name	Data Type	Description
REFERENCE_TABLE_SCHEMA	VARCHAR	Schema name for which information is listed.
REFERENCE_TABLE_NAME	VARCHAR	References the TABLE_NAME column in the PRIMARY_KEY table.
REFERENCE_COLUMN_NAME	VARCHAR	References the COLUMN_NAME column in the PRIMARY_KEY table.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

CRYPTOGRAPHIC_KEYS

Stores private keys created by CREATE KEY.

Column Name	Data Type	Description
OID	INTEGER	The object identifier.
NAME	VARCHAR	Name of the key.
OWNER	INTEGER	The owner of the object.
TYPE	INTEGER	The type of key. • 0 = AES • 1 = RSA
LENGTH	INTEGER	The size of the key in bits.
HAS_PASSWORD	BOOLEAN	Whether the key has a password.
KEY	VARCHAR	The private key.

Examples

See Generating TLS Certificates and Keys.

DATABASES

Provides information about the databases in this Vertica installation.

Column Name	Data Type	Description
DATABASE_ID	INTEGER	The database's internal ID number
DATABASE_NAME	VARCHAR	The database's name
OWNER_ID	INTEGER	The database owner's ID
OWNER_NAME	INTEGER	The database owner's name
START_TIME	TIMESTAMPTZ	The date and time the database last started
COMPLIANCE_MESSAGE	VARCHAR	Message describing the current state of the database's license compliance
EXPORT_SUBNET	VARCHAR	Can be either of the following: • The subnet (on the public network) used by the database for import/export • The public address of the subnet that the Vertica native load balancing uses for load balancing
LOAD_BALANCE_POLICY	VARCHAR	The current native connection load balance policy, which controls whether client connection requests are redirected to other hosts in the database. See About Native Connection Load Balancing in the Administrator's Guide.
BACKEND_ ADDRESS_FAMILY	VARCHAR	The Internet Protocol (IP) addressing standard used for internode communications. Use Internet Protocol version 4 (IPv4).

Example

This example queries the databases table from a master database.

```
=> SELECT * FROM DATABASES;
-[ RECORD 1 ]----------+-------------------------------------------------------------
database_id            | 45035996273704976
database_name          | VMart
owner_id               | 45035996273704962
owner_name             | dbadmin
start_time             | 2017-10-22 05:16:22.066961-04
compliance_message     | The database is in compliance with respect to raw data size.
export_subnet          | 0
load_balance_policy    | none
backend_address_family | ipv4
```

DIRECTED_QUERIES

Returns information about directed queries.

Column Name	Data Type	Description
QUERY_NAME	VARCHAR	This directed query's unique identifier, used by statements such as ACTIVATE DIRECTED QUERY.
IS_ACTIVE	BOOLEAN	Specifies whether the directed query is active.
VERTICA_VERSION	VARCHAR	The Vertica version used when this directed query was created.
COMMENT	VARCHAR	A user-supplied comment specified on creation of the directed query, up to 128 characters.
CREATION_DATE	TIMESTAMPTZ	Specifies when the directed query was created.
INPUT_QUERY	VARCHAR	The input query that is associated with this directed query. Multiple directed queries can map to the same input query.
ANNOTATED_QUERY	VARCHAR	The directed query that was saved with CREATE DIRECTED QUERY.

Privileges

Superuser

Truncated Query Results

Query results for the fields INPUT_QUERY and INPUT_QUERY are truncated after ~32K characters. You can get the full content of both fields in two ways:

- Use the statement GET DIRECTED QUERY.
- Use EXPORT_CATALOG to export directed queries.

DUAL

DUAL is a single-column "dummy" table with one record whose value is X; for example:

```
=> SELECT * FROM DUAL;
 dummy
-------
 X
(1 row)
```

You can write the following types of queries:

```
=> SELECT 1 FROM dual;
 ?column?
----------
        1
(1 row)
=> SELECT current_timestamp, current_user FROM dual;
           ?column?            | current_user
-------------------------------+--------------
 2010-03-08 12:57:32.065841-05 | release
(1 row)
=> CREATE TABLE t1(col1 VARCHAR(20), col2 VARCHAR(2));
=> INSERT INTO T1(SELECT 'hello' AS col1, 1 AS col2 FROM dual);)
=> SELECT * FROM t1;
 col1  | col2
-------+------
 hello | 1
(1 row
```

Restrictions

You cannot create **projections** for DUAL.

ELASTIC_CLUSTER

Returns information about cluster elasticity, such as whether Elastic Cluster is running.

Column Name	Data Type	Description
SCALING_FACTOR	INTEGER	This value is only meaningful when you enable local segments. SCALING_FACTOR influences the number of local segments on each node. Initially—before a rebalance runs—there are *scaling_factor* number of local segments per node. A large SCALING_FACTOR is good for rebalancing a potentially wide range of cluster configurations quickly. However, too large a value might lead to ROS pushback, particularly in a database with a table with a large number of partitions. See SET_SCALING_FACTOR for more details.
MAXIMUM_SKEW_PERCENT	INTEGER	This value is only meaningful when you enable local segments. MAXIMUM_SKEW_PERCENT is the maximum amount of skew a rebalance operation tolerates, which preferentially redistributes local segments; however, if after doing so the segment ranges of any two nodes differs by more than this amount, rebalance will separate and distribute storage to even the distribution.
SEGMENT_LAYOUT	VARCHAR	Current, offset=0, segment layout. New segmented projections will be created with this layout, with segments rotated by the corresponding offset. Existing segmented projections will be rebalanced into an offset of this layout.
LOCAL_SEGMENT_LAYOUT	VARCHAR	Similar to SEGMENT_LAYOUT but includes details that indicate the number of local segments, their relative size and node assignment.
VERSION	INTEGER	Number that gets incremented each time the

Column Name	Data Type	Description
		cluster topology changes (nodes added, marked ephemeral, marked permanent, etc). Useful for monitoring active and past rebalance operations.
IS_ENABLED	BOOLEAN	True if Elastic Cluster is enabled, otherwise false.
IS_LOCAL_SEGMENT_ENABLED	BOOLEAN	True if local segments are enabled, otherwise false.
IS_REBALANCE_RUNNING	BOOLEAN	True if rebalance is currently running, otherwise false.

Privileges

Superuser

- Elastic Cluster

EPOCHS

For the most recently closed epochs, lists the date and time of the close and the corresponding epoch number of the closed epoch. The EPOCHS table may return a varying number of rows depending on current commit activities.

Column Name	Data Type	Description
EPOCH_CLOSE_TIME	DATETIME	The date and time that the epoch closed.
EPOCH_NUMBER	INTEGER	The epoch number of the closed epoch.

Example

```
=> SELECT * FROM EPOCHS;
       epoch_close_time        | epoch_number
-------------------------------+--------------
 2018-11-12 16:05:15.552571-05 |           16
(1 row)
```

Querying for Historical Data

If you need historical data about epochs and corresponding date information, query the DC_TRANSACTION_ENDS table.

```
=> select dc.end_epoch,min(dc.time),max(dc.time) from dc_transaction_ends dc group by end_epoch;
 end_epoch |             min               | max
-----------+-------------------------------+-------------------------------
       214 |  2018-10-12 08:05:47.02075-04 | 2018-10-15 10:22:24.015292-04
       215 | 2018-10-15 10:22:47.015172-04 | 2018-10-15 13:00:44.888984-04
                         ...
       226 | 2018-10-15 15:03:47.015235-04 | 2018-10-15 20:37:34.346667-04
       227 | 2018-10-15 20:37:47.008137-04 | 2018-10-16 07:39:00.29917-04
       228 | 2018-10-16 07:39:47.012411-04 | 2018-10-16 08:16:01.470232-04
       229 | 2018-10-16 08:16:47.018899-04 | 2018-10-16 08:21:13.854348-04
       230 | 2018-10-16 08:21:47.013767-04 | 2018-10-17 12:21:09.224094-04
       231 |  2018-10-17 12:21:09.23193-04 | 2018-10-17 15:11:59.338777-04
```

FAULT_GROUPS

View the fault groups and their hierarchy in the cluster.

Column Name	Data Type	Description
MEMBER_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog that identifies the fault group.

Column Name	Data Type	Description
MEMBER_TYPE	VARCHAR	The type of fault group. Values can be either NODE or FAULT GROUP.
MEMBER_NAME	VARCHAR	Name associated with this fault group. Values will be the node name or the fault group name.
PARENT_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog that identifies the parent fault group. The parent fault group can contain: • Nodes • Other fault groups • Nodes and other fault groups
PARENT_TYPE	VARCHAR	The type of parent fault group, where the default/root parent is the DATABASE object. Can be one of the following objects: • FAULT GROUP • DATABASE
PARENT_NAME	VARCHAR	The name of the fault group that contains nodes or other fault groups or both nodes and fault groups.
IS_AUTOMATICALLY_GENERATED	BOOLEAN	If true, denotes whether Vertica Analytic Database created fault groups for you to manage the fault tolerance of control nodes in large cluster configurations. If false, denotes that you created fault groups manually. See Fault Groups for more information

Examples

Show the current hierarchy of fault groups in the cluster:

```
vmartdb=> SELECT member_type, member_name, parent_type, CASE
          WHEN parent_type = 'DATABASE' THEN ''
          ELSE parent_name END FROM fault_groups
          ORDER BY member_name;
 member_type | member_name           | parent_type | parent_name
-------------+-----------------------+-------------+-------------
```

```
 NODE        | v_vmart_node0001      | FAULT GROUP | two
 NODE        | v_vmart_node0002      | FAULT GROUP | two
 NODE        | v_vmart_node0003      | FAULT GROUP | three
 FAULT GROUP | one                   | DATABASE    |
 FAULT GROUP | three                 | DATABASE    |
 FAULT GROUP | two                   | FAULT GROUP | one
```

View the distribution of the segment layout:

```
vmartdb=> SELECT segment_layout from elastic_cluster;
                           segment_layout
-------------------------------------------------------------------------
 v_vmart_node0001[33.3%] v_vmart_node0003[33.3%] v_vmart_node0004[33.3%]
(1 row)
```

FOREIGN_KEYS

Provides foreign key information.

Column Name	Data Type	Description
CONSTRAINT_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies the constraint.
CONSTRAINT_NAME	VARCHAR	The constraint name for which information is listed.
COLUMN_NAME	VARCHAR	The name of the column that is constrained.
ORDINAL_POSITION	VARCHAR	The position of the column within the key. The numbering of columns starts at 1.
TABLE_NAME	VARCHAR	The table name for which information is listed.
REFERENCE_TABLE_NAME	VARCHAR	References the TABLE_NAME column in the PRIMARY_KEY table.
CONSTRAINT_TYPE	VARCHAR	The constraint type, `f`, for foreign key.
REFERENCE_COLUMN_NAME	VARCHAR	References the COLUMN_NAME column in the

Column Name	Data Type	Description
		PRIMARY_KEY table.
TABLE_SCHEMA	VARCHAR	The schema name for which information is listed.
REFERENCE_TABLE_SCHEMA	VARCHAR	References the TABLE_SCHEMA column in the PRIMARY_KEY table.

Example

```
mydb=> SELECT
          constraint_name,
          table_name,
          ordinal_position,
          reference_table_name
       FROM foreign_keys ORDER BY 3;
      constraint_name      |    table_name     | ordinal_position | reference_table_name
---------------------------+-------------------+------------------+----------------------
 fk_store_sales_date       | store_sales_fact  |                1 | date_dimension
 fk_online_sales_saledate  | online_sales_fact |                1 | date_dimension
 fk_store_orders_product   | store_orders_fact |                1 | product_dimension
 fk_inventory_date         | inventory_fact    |                1 | date_dimension
 fk_inventory_product      | inventory_fact    |                2 | product_dimension
 fk_store_sales_product    | store_sales_fact  |                2 | product_dimension
 fk_online_sales_shipdate  | online_sales_fact |                2 | date_dimension
 fk_store_orders_product   | store_orders_fact |                2 | product_dimension
 fk_inventory_product      | inventory_fact    |                3 | product_dimension
 fk_store_sales_product    | store_sales_fact  |                3 | product_dimension
 fk_online_sales_product   | online_sales_fact |                3 | product_dimension
 fk_store_orders_store     | store_orders_fact |                3 | store_dimension
 fk_online_sales_product   | online_sales_fact |                4 | product_dimension
 fk_inventory_warehouse    | inventory_fact    |                4 | warehouse_dimension
 fk_store_orders_vendor    | store_orders_fact |                4 | vendor_dimension
 fk_store_sales_store      | store_sales_fact  |                4 | store_dimension
 fk_store_orders_employee  | store_orders_fact |                5 | employee_dimension
 fk_store_sales_promotion  | store_sales_fact  |                5 | promotion_dimension
 fk_online_sales_customer  | online_sales_fact |                5 | customer_dimension
 fk_store_sales_customer   | store_sales_fact  |                6 | customer_dimension
 fk_online_sales_cc        | online_sales_fact |                6 | call_center_dimension
 fk_store_sales_employee   | store_sales_fact  |                7 | employee_dimension
 fk_online_sales_op        | online_sales_fact |                7 | online_page_dimension
 fk_online_sales_shipping  | online_sales_fact |                8 | shipping_dimension
 fk_online_sales_warehouse | online_sales_fact |                9 | warehouse_dimension

```

GRANTS

Returns information about privileges that are explicitly granted on database objects. Information about inherited privileges is not included.

Note:
While an ADMIN OPTION granted to users through roles is not viewable directly from this table, you can view it and a summary of privileges data with vsql meta-commands \z and \dp.

Column Name	Data Type	Description
GRANTEE	VARCHAR	The user being granted permission.
GRANTEE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the user granted permissions.
GRANT_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the grant operation.
GRANTOR	VARCHAR	The user granting the permission.
GRANTOR_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the user who performed the grant operation.
OBJECT_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the object granted.
OBJECT_NAME	VARCHAR	The name of the object that is being granted privileges. Note that for schema privileges, the schema name appears in the OBJECT_NAME column instead of the OBJECT_SCHEMA column.
OBJECT_ SCHEMA	VARCHAR	The name of the schema that is being granted privileges.
OBJECT_TYPE	VARCHAR	The object type on which the grant was applied—for example, ROLE, SCHEMA, DATABASE, RESOURCEPOOL.
PRIVILEGES_ DESCRIPTION	VARCHAR	Lists the privileges granted on an object—for example INSERT, SELECT. An asterisk in PRIVILEGES_

Column Name	Data Type	Description
		DESCRIPTION output shows that the privilege grant included WITH GRANT OPTION.

Examples

The following query shows the privileges that are granted to user Rob or role R1. An asterisk (*) appended to a privilege indicates that the user can grant the privilege to other users:

```
=> SELECT grantor,privileges_description,object_name,object_type,grantee FROM grants WHERE
grantee='Rob' OR grantee='R1';
 grantor |  privileges_description   | object_name | object_type  | grantee
 --------+--------------------------+-------------+--------------+---------
 dbadmin | USAGE                    | general     | RESOURCEPOOL | Rob
 dbadmin | USAGE, CREATE            | s1          | SCHEMA       | Rob
 dbadmin | INSERT*, SELECT*, UPDATE* | t1          | TABLE        | Rob
 dbadmin | SELECT                   | t1          | TABLE        | R1
 dbadmin | USAGE                    | s1          | SCHEMA       | R1
 dbadmin |                          | R1          | ROLE         | Rob
 (6 rows)
```

HCATALOG_COLUMNS

Describes the columns of all tables available through the HCatalog Connector. Each row in this table corresponds to to a column in a table accessible through the HCatalog Connector. See Using the HCatalog Connector in Integrating with Apache Hadoop for more information.

Column Name	Data Type	Description
TABLE_SCHEMA	VARCHAR (128)	The name of the Vertica Analytic Database schema that contains the table containing this column

Column Name	Data Type	Description
HCATALOG_SCHEMA	VARCHAR (128)	The name of the Hive schema or database that contains the table containing this column
TABLE_NAME	VARCHAR (128)	The name of the table that contains the column
IS_PARTITION_COLUMN	BOOLEAN	Whether the table is partitioned on this column
COLUMN_NAME	VARCHAR (128)	The name of the column
HCATALOG_DATA_TYPE	VARCHAR (128)	The Hive data type of this column
DATA_TYPE	VARCHAR (128)	The Vertica Analytic Database data type of this column
DATA_TYPE_ID	INTEGER	Numeric ID of the column's Vertica Analytic Database data type
DATA_TYPE_LENGTH	INTEGER	The number of bytes used to store this data type
CHARACTER_MAXIMUM_LENGTH	INTEGER	For string data types, the maximum number of characters it can hold
NUMERIC_PRECISION	INTEGER	For numeric types, the precision of the values in the column
NUMERIC_SCALE	INTEGER	For numeric data types, the scale of the values in the column
DATETIME_PRECISION	INTEGER	For datetime data types, the precision of the values in the column
INTERVAL_PRECISION	INTEGER	For interval data types, the precision of the values in the column
ORDINAL_POSITION	INTEGER	The position of the column within the table

Privileges

No explicit permissions are required; however, users see only the records that correspond to schemas they have permissions to access.

Notes

If you are using WebHCat instead of HiveServer2, querying this table results in one web service call to the WebHCat server for each table in each HCatalog schema. If you need to perform multiple queries on this table in a short period of time, consider creating a copy of the table using a CREATE TABLE AS statement to improve performance. The copy does not reflect any changes made to the schema of the Hive tables after it was created, but it is much faster to query.

Example

The following example demonstrates finding the column information for a specific table:

```
=> SELECT * FROM HCATALOG_COLUMNS WHERE table_name = 'hcatalogtypes'
-> ORDER BY ordinal_position;
-[ RECORD 1 ]------------+-----------------
table_schema             | hcat
hcatalog_schema          | default
table_name               | hcatalogtypes
is_partition_column      | f
column_name              | intcol
hcatalog_data_type       | int
data_type                | int

HCATALOG_SCHEMATA

Lists all of the schemas defined using the HCatalog Connector. See Using the HCatalog Connector in Integrating with Apache Hadoop.

Unlike other HCatalog Connector-related system tables, this table makes no calls to Hive, so querying incurs very little overhead.

Column Name	Data Type	Description
SCHEMA_ID	INTEGER	The Vertica Analytic Database ID number for the schema
SCHEMA_NAME	VARCHAR(128)	The name of the schema defined in the Vertica Analytic Database catalog
SCHEMA_OWNER_ID	INTEGER	The ID number of the user who owns the Vertica Analytic Database schema
SCHEMA_OWNER	VARCHAR(128)	The username of the Vertica Analytic Database schema's owner
CREATE_TIME	TIMESTAMPTZ	The date and time the schema as created
HOSTNAME	VARCHAR(128)	The host name or IP address of the database server that holds the Hive metadata
PORT	INTEGER	The port number on which the metastore database listens for connections
HIVESERVER2_HOSTNAME	VARCHAR(128)	The host name or IP address of the HiveServer2 server for the Hive database
WEBSERVICE_HOSTNAME	VARCHAR(128)	The host name or IP address of the WebHCat server for the Hive database, if used

Column Name	Data Type	Description
WEBSERVICE_PORT	INTEGER	The port number on which the WebHCat server listens for connections
WEBHDFS_ADDRESS	VARCHAR (128)	The host and port ("host:port") for the WebHDFS service, used for reading ORC and Parquet files
HCATALOG_SCHEMA_NAME	VARCHAR(128)	The name of the schema or database in Hive to which the Vertica Analytic Database schema is mapped/
HCATALOG_USER_NAME	VARCHAR(128)	The username the HCatalog Connector uses to authenticate itself to the Hive database.
HCATALOG_CONNECTION_TIMEOUT	INTEGER	The number of seconds the HCatalog Connector waits for a successful connection to the HiveServer or WebHCat server. A value of 0 means wait indefinitely.
HCATALOG_SLOW_TRANSFER_LIMIT	INTEGER	The lowest data transfer rate (in bytes per second) from the HiveServer2 or WebHCat server that the HCatalog Connector accepts.
HCATALOG_SLOW_TRANSFER_TIME	INTEGER	The number of seconds the HCatalog Connector waits before enforcing the data transfer rate lower limit by breaking the connection and terminating the query.
SSL_CONFIG	VARCHAR(128)	The path of the Hadoop ssl-client.xml configuration file, if using HiveServer2 with SSL wire encryption.
CUSTOM_PARTITIONS	BOOLEAN	Whether the Hive schema uses custom partition locations.

Privileges

No explicit permissions are required; however, users see only the records that correspond to schemas they have permissions to access.

See Also

- HCATALOG_COLUMNS
- HCATALOG_TABLE_LIST
- HCATALOG_TABLES

HCATALOG_TABLES

Returns a detailed list of all tables made available through the HCatalog Connector. See Using the HCatalog Connector in Integrating with Apache Hadoop.

Column Name	Data Type	Description
TABLE_SCHEMA_ID	INTEGER	ID number of the schema
TABLE_SCHEMA	VARCHAR(128)	The name of the Vertica Analytic Database schema through which the table is available
HCATALOG_SCHEMA	VARCHAR(128)	The name of the Hive schema or database that contains the table
TABLE_NAME	VARCHAR(128)	The name of the table
HCATALOG_USER_NAME	VARCHAR(128)	The name of the HCatalog user whose credentials are used to access the table's data
MIN_FILE_SIZE_BYTES	INTEGER	The file size of the table's smallest data file, if using WebHCat; null if using HiveServer2
TOTAL_NUMBER_FILES	INTEGER	The number of files used to store this table's data in HDFS
LOCATION	VARCHAR(8192)	The URI for the directory containing this table's data, normally an HDFS URI
LAST_UPDATE_TIME	TIMESTAMPTZ	The last time data in this table was updated, if using WebHCat; null if using HiveServer2
OUTPUT_FORMAT	VARCHAR(128)	The Hive SerDe class used to output data from this table

Column Name	Data Type	Description
LAST_ACCESS_TIME	TIMESTAMPTZ	The last time data in this table was accessed, if using WebHCat; null if using HiveServer2
MAX_FILE_SIZE_BYTES	INTEGER	The size of the largest data file for this table, if using WebHCat; null if using HiveServer2
IS_PARTITIONED	BOOLEAN	Whether this table is partitioned
PARTITION_EXPRESSION	VARCHAR(128)	The expression used to partition this table
TABLE_OWNER	VARCHAR(128)	The Hive user that owns this table in the Hive database, if using WebHCat; null if using HiveServer2
INPUT_FORMAT	VARCHAR(128)	The SerDe class used to read the data from this table
TOTAL_FILE_SIZE_BYTES	INTEGER	Total number of bytes used by all of this table's data files
HCATALOG_GROUP	VARCHAR(128)	The permission group assigned to this table, if using WebHCat; null if using HiveServer2
PERMISSION	VARCHAR(128)	The Unix file permissions for this group, as shown by the `ls -l` command, if using WebHCat; null if using HiveServer2

Privileges

No explicit permissions are required; however, users see only the records that correspond to schemas they have permissions to access.

See Also

- HCATALOG_SCHEMATA
- HCATALOG_COLUMNS
- HCATALOG_TABLE_LIST

HCATALOG_TABLE_LIST

A concise list of all tables contained in all Hive schemas and databases available through the HCatalog Connector. See Using the HCatalog Connector in Integrating with Apache Hadoop.

Column Name	Data Type	Description
TABLE_SCHEMA_ID	INTEGER	Internal ID number for the schema containing the table
TABLE_SCHEMA	VARCHAR (128)	Name of the Vertica Analytic Database schema through which the table is available
HCATALOG_SCHEMA	VARCHAR (128)	Name of the Hive schema or database containing the table
TABLE_NAME	VARCHAR (128)	The name of the table
HCATALOG_USER_NAME	VARCHAR (128)	Name of Hive user used to access the table

Privileges

No explicit permissions are required; however, users see only the records that correspond to schemas they have permissions to access.

Notes

- Querying this table results in one call to HiveServer2 for each Hive schema defined using the HCatalog Connector. This means that the query usually takes longer than querying other system tables.
- Querying this table is faster than querying HCATALOG_TABLES. Querying HCATALOG_TABLE_LIST only makes one HiveServer2 call per HCatalog schema versus one call per table for HCATALOG_TABLES.

Example

The following example demonstrates defining a new HCatalog schema then querying HCATALOG_TABLE_LIST. Note that one table defined in a different HCatalog schema also appears. HCATALOG_TABLE_LIST lists all of the tables available in any of the HCatalog schemas:

```
=> CREATE HCATALOG SCHEMA hcat WITH hostname='hcathost'
-> HCATALOG_SCHEMA='default' HCATALOG_DB='default' HCATALOG_USER='hcatuser';
CREATE SCHEMA
=> \x
Expanded display is on.
=> SELECT * FROM v_catalog.hcatalog_table_list;
-[ RECORD 1 ]------+------------------
table_schema_id    | 45035996273748980
table_schema       | hcat
hcatalog_schema    | default
table_name         | weblogs
hcatalog_user_name | hcatuser
-[ RECORD 2 ]------+------------------
table_schema_id    | 45035996273748980
table_schema       | hcat
hcatalog_schema    | default
table_name         | tweets
hcatalog_user_name | hcatuser
-[ RECORD 3 ]------+------------------
table_schema_id    | 45035996273748980
table_schema       | hcat
hcatalog_schema    | default
table_name         | messages
hcatalog_user_name | hcatuser
-[ RECORD 4 ]------+------------------
table_schema_id    | 45035996273864948
table_schema       | hiveschema
hcatalog_schema    | default
table_name         | weblogs
hcatalog_user_name | hcatuser
```

INHERITING_OBJECTS

Provides information about which tables and views inherit privileges from which schemas.

For information about the specific privileges inherited from schemas and their associated GRANT statements, see the INHERITED_PRIVILEGES table.

Column Name	Data Type	Description
OBJECT_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the object inheriting the privileges.
SCHEMA_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the parent schema.
OBJECT_ SCHEMA	VARCHAR	Name of the parent schema of a table or view.
OBJECT_ NAME	VARCHAR	Name of the table or view.
OBJECT_ TYPE	VARCHAR	Table or view.

Example

The following query returns the tables and views that inherit their privileges from their parent schema, customers.

```
=> SELECT * FROM inheriting_objects WHERE object_schema='customers';
     object_id     |     schema_id     | object_schema |  object_name  | object_type
 ------------------+-------------------+---------------+---------------+-------------
 45035996273980908 | 45035996273980902 | customers     | cust_info     | table
 45035996273980984 | 45035996273980902 | customers     | shipping_info | table
 45035996273980980 | 45035996273980902 | customers     | cust_set      | view
 (3 rows)
```

INHERITED_PRIVILEGES

Provides summary information about privileges inherited by tables and views from GRANT statements on parent schemas, excluding inherited grant options.

For information about explicitly granted permissions, see system table GRANTS.

Note:
Inherited privileges are not displayed if privilege inheritance is disabled at the database level.

Column Name	Data Type	Description
OBJECT_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the object inheriting the privileges.
SCHEMA_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the parent schema.
OBJECT_ SCHEMA	VARCHAR	Name of the parent schema of a table or view.
OBJECT_NAME	VARCHAR	Name of the table or view.
OBJECT_TYPE	VARCHAR	Table or view.
PRIVILEGES_ DESCRIPTION	VARCHAR	Lists the privileges inherited on an object. An asterisk (*) appended to a privilege indicates that the user can grant the privilege to other users by granting the privilege on the parent schema.
PRINCIPAL	VARCHAR	Name of the role or user inheriting the privileges in the row.
PRINCIPAL_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the user inheriting the privileges.
GRANTOR	VARCHAR	User that granted the privileges on the parent schema to the principal.
GRANTOR_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the user who performed the grant operation.

Column Name	Data Type	Description
GRANT_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the grant operation.

Example

The following query returns the privileges that the tables and views inherit from their parent schema, customers.

```
=> SELECT object_schema,object_name,object_type,privileges_description,principal,grantor FROM
inherited_privileges WHERE object_schema='customers';
 object_schema |  object_name  | object_type |                          privileges_description
                  | principal | grantor
 --------------+---------------+-------------+---------------------------------------------------------
-------------------+-----------+---------
 customers     | cust_info     | Table       | INSERT, SELECT, UPDATE, DELETE, ALTER, REFERENCES,
DROP, TRUNCATE         | dbadmin   | dbadmin
 customers     | shipping_info | Table       | INSERT, SELECT, UPDATE, DELETE, ALTER, REFERENCES,
DROP, TRUNCATE         | dbadmin   | dbadmin
 customers     | cust_set      | View        | SELECT, ALTER, DROP
                  | dbadmin   | dbadmin
 customers     | cust_info     | Table       | SELECT
                  | Val       | dbadmin
 customers     | shipping_info | Table       | SELECT
                  | Val       | dbadmin
 customers     | cust_set      | View        | SELECT
                  | Val       | dbadmin
 customers     | cust_info     | Table       | INSERT
                  | Pooja     | dbadmin
 customers     | shipping_info | Table       | INSERT
                  | Pooja     | dbadmin
 (8 rows)
```

KEYWORDS

Identifies Vertica reserved and non-reserved keywords.

Column Name	Data Type	Description
KEYWORD	VARCHAR	Vertica-reserved or non-reserved keyword.
RESERVED	VARCHAR	Indicates whether a keyword is reserved or non-reserved: • R: reserved • N: non-reserved

Examples

The following query gets all reserved keywords that begin with B:

```
=> SELECT * FROM keywords WHERE reserved = 'R' AND keyword ilike 'B%';
 keyword | reserved
---------+----------
 BETWEEN | R
 BIGINT  | R
 BINARY  | R
 BIT     | R
 BOOLEAN | R
 BOTH    | R
(6 rows)
```

See Also

Keywords

LARGE_CLUSTER_CONFIGURATION_STATUS

Shows the current cluster nodes and control node (spread hosts) designations in the Catalog so you can see if they match.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The name of the node in the cluster.
SPREAD_HOST_NAME	VARCHAR	The host name of the control node (the host that manages control message responsibilities)

Column Name	Data Type	Description
CONTROL_NODE_NAME	VARCHAR	The name of the control node

See Also

Large Cluster in the Administrator's Guide

LICENSE_AUDITS

Lists the results of Vertica's license automatic compliance audits. See How Vertica Calculates Database Size in the Administrator's Guide.

Column Name	Data Type	Description
DATABASE_SIZE_BYTES	INTEGER	The estimated raw data size of the database
LICENSE_SIZE_BYTES	INTEGER	The licensed data allowance
USAGE_PERCENT	FLOAT	Percentage of the licensed allowance used
AUDIT_START_TIMESTAMP	TIMESTAMPTZ	When the audit started
AUDIT_END_TIMESTAMP	TIMESTAMPTZ	When the audit finished
CONFIDENCE_LEVEL_PERCENT	FLOAT	The confidence level of the size estimate
ERROR_TOLERANCE_PERCENT	FLOAT	The error tolerance used for the size estimate
USED_SAMPLING	BOOLEAN	Whether data was randomly sampled (if false, all of the data was analyzed)
CONFIDENCE_INTERVAL_LOWER_BOUND_BYTES	INTEGER	The lower bound of the data size estimate within the confidence level
CONFIDENCE_INTERVAL_UPPER_BOUND_BYTES	INTEGER	The upper bound of the data size estimate within the confidence level

Column Name	Data Type	Description
SAMPLE_COUNT	INTEGER	The number of data samples used to generate the estimate
CELL_COUNT	INTEGER	The number of cells in the database
AUDITED_DATA	VARCHAR	The type of data audited, which includes regular (non-flex), flex, external, and total data

LICENSES

For all licenses, provides information on license types, the dates for which licenses are valid, and the limits the licenses impose.

Column Name	Data Type	Description
LICENSE_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog, which identifies the license.
NAME	VARCHAR	The license's name. (The license name in this column could be represented by a long license key.)
LICENSEE	VARCHAR	The entity to which the product is licensed.
START_DATE	VARCHAR	The start date for which the license is valid.
END_DATE	VARCHAR	The end date until which the license is valid (or "Perpetual" if the license has no expiration).
LICENSETYPE	VARCHAR	The type of the license (for example, Premium Edition).
PARENT	VARCHAR	The parent license (field is blank if there is no parent).
SIZE	VARCHAR	The size limit for data on the license.
IS_SIZE_LIMIT_ENFORCED	BOOLEAN	Indicates whether the license includes enforcement of data and node limits, where t is

Column Name	Data Type	Description
		true and f is false.
NODE_RESTRICTION	VARCHAR	The node limit the license imposes.
CONFIGURED_ID	INTEGER	A long license key.

LOAD_BALANCE_GROUPS

Lists the objects contained by all load balance groups. Each row in this table represents a single object that is a member of a load balance group. If a load balance group does not contain any objects, it appears once in this table with its type column set to 'Empty Group.'

NAME	VARCHAR	The name of the load balance group
POLICY	VARCHAR	The policy that sets how the group chooses the node for a connection. Contains one of the following: • ROUNDROBIN • RANDOM • NONE
FILTER	VARCHAR	The IP address range in CIDR format to select the members of a fault group that are included in the load balance group. This coliumn only has a value if the TYPE column is 'Fault Group.'
TYPE	VARCHAR	The type of object contained in the load balance group. This value is one of: • 'Fault Group' • 'Network Address Group' • 'Empty Group'
OBJECT_ NAME	VARCHAR	The name of the fault group or network address included in the load balance group. This column is NULL if the groupcontains no objects.

Example

```
=> SELECT * FROM LOAD_BALANCE_GROUPS;
     name      |   policy   |  filter   |         type          | object_name
---------------+------------+-----------+-----------------------+-------------
 group_1       | ROUNDROBIN |           | Network Address Group | node01
 group_1       | ROUNDROBIN |           | Network Address Group | node02
 group_2       | ROUNDROBIN |           | Empty Group           |
 group_all     | ROUNDROBIN |           | Network Address Group | node01
 group_all     | ROUNDROBIN |           | Network Address Group | node02
 group_all     | ROUNDROBIN |           | Network Address Group | node03
 group_fault_1 | RANDOM     | 0.0.0.0/0 | Fault Group           | fault_1
(7 rows)
```

LOG_PARAMS

Provides summary information about changes to configuration parameters related to authentication and security run in your database.

Column Name	Data Type	Description
ISSUED_TIME	VARCHAR	The time at which the query was executed.
USER_NAME	VARCHAR	Name of the user who issued the query at the time Vertica recorded the session.
USER_ID	INTEGER	Numeric representation of the user who ran the query.
HOSTNAME	VARCHAR	The hostname, IP address, or URL of the database server.
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
AUDIT_TYPE	VARCHAR	The type of operation for the audit, in this case, Parameter.
AUDIT_TAG_NAME	VARCHAR	The tag for the specific parameter.

Column Name	Data Type	Description
REQUEST_ TYPE	VARCHAR	The type of query request.
REQUEST_ID	INTEGER	Unique identifier of the query request in the user session.
SUBJECT	VARCHAR	The new value of the parameter.
REQUEST	VARCHAR	Lists the query request.
SUCCESS	VARCHAR	Indicates whether or not the operation was successful.
CATEGORY	VARCHAR	The audit parent category, such as Authentication.

Example

The following example queries the LOG_PARAMS system table and shows only the most recent configuration parameter for this user under the Authentication category:

```
=> SELECT * FROM log_params limit 1;

-------------------------------------------------------------------------------------------------------
---
issued_time   | 2018-02-12 13:41:20.837452-05
user_name     | dbadmin
user_id       | 45035996273704962
hostname      | ::1:50690
session_id    | v_vmart_node0001-341751:0x13878
audit_type    | Param
audit_tag_name| SecurityAlgorithm
request_type  | UTILITY
request_id    | 8
subject       | MD5
request       | select set_config_parameter('SecurityAlgorithm','MD5',null);
success       | t
category      | Authentication
(1 row)
```

LOG_QUERIES

Provides summary information about some queries related to authentication and security run in your database.

Column Name	Data Type	Description
ISSUED_TIME	VARCHAR	The time at which the query was executed.
USER_NAME	VARCHAR	Name of the user who issued the query at the time Vertica recorded the session.
USER_ID	INTEGER	Numeric representation of the user who ran the query.
HOSTNAME	VARCHAR	The hostname, IP address, or URL of the database server.
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
AUDIT_TYPE	VARCHAR	The type of operation for the audit, in this case, Query.
AUDIT_TAG_NAME	VARCHAR	The tag for the specific query.
REQUEST_TYPE	VARCHAR	The type of query request. Examples include, but are not limited to: • QUERY • DDL • LOAD • UTILITY • TRANSACTION • PREPARE • EXECUTE • SET • SHOW
REQUEST_ID	INTEGER	The ID of the query request.
SUBJECT	VARCHAR	The subject of the query.
REQUEST	VARCHAR	Lists the query request.
SUCCESS	VARCHAR	Indicates whether or not the operation was successful.
CATEGORY	VARCHAR	The audit parent category, such as Managing_Users_Privileges.

Example

The following example queries the LOG_QUERIES system table and shows only the most recent query for this user under the Managing_Users_Privileges category:

```
=> SELECT * FROM log_queries limit 1;
-------------------------------------------------------------------------------

issued_time   | 2018-01-22 10:36:55.634349-05
user_name     | dbadmin
user_id       | 45035996273704962
hostname      |
session_id    | v_vmart_node0001-237210:0x37e1d
audit_type    | Query
audit_tag_name| REVOKE ROLE
request_type  | DDL
request_id    | 2
subject       |
request       | revoke all privileges from Joe;
success       | f
category      | Managing_Users_Privileges
(1 row)
```

LOG_TABLES

Provides summary information about queries on system tables.

Column Name	Data Type	Description
ISSUED_TIME	VARCHAR	Time of query execution.
USER_NAME	VARCHAR	Name of user who issued the query at the time Vertica recorded the session.
USER_ID	INTEGER	Numeric representation of the user who ran the query.
HOSTNAME	VARCHAR	The hostname, IP address, or URL of the database server.
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
AUDIT_TYPE	VARCHAR	The type of operation for the audit, in this case, Table.

Column Name	Data Type	Description
AUDIT_TAG_NAME	VARCHAR	The tag for the specific table.
REQUEST_TYPE	VARCHAR	The type of query request. In this case, QUERY.
REQUEST_ID	INTEGER	Unique identifier of the query request in the user session.
SUBJECT	VARCHAR	The name of the table that was queried.
REQUEST	VARCHAR	Lists the query request.
SUCCESS	VARCHAR	Indicates whether or not the operation was successful.
CATEGORY	VARCHAR	The audit parent category—for example, `Views`, `Security`, and `Managing_Users_Privileges`.

Example

The following example shows recent queries on configuration parameters:

```
dbadmin=> SELECT issued_time, audit_type, request_type, subject, request, category FROM log_tables
   WHERE category ilike '%Managing_Config_Parameters%' ORDER BY issued_time DESC LIMIT 4;
-[ RECORD 1 ]+-----------------------------------------------------------------------------------------
issued_time  | 2020-05-14 14:14:53.453552-04
audit_type   | Table
request_type | QUERY
subject      | vs_nodes
request      | SELECT * from vs_nodes order by name  limit 1;
category     | Managing_Config_Parameters
-[ RECORD 2 ]+-----------------------------------------------------------------------------------------
issued_time  | 2020-05-14 14:14:27.546474-04
audit_type   | Table
request_type | QUERY
subject      | vs_nodes
request      | SELECT * from vs_nodes order by name ;
category     | Managing_Config_Parameters
-[ RECORD 3 ]+-----------------------------------------------------------------------------------------
issued_time  | 2020-05-14 08:54:32.86881-04
audit_type   | Table
request_type | QUERY
subject      | vs_parameters_mismatch
request      | select * from configuration_parameters where parameter_name = 'MaxDepotSizePercent';
category     | Managing_Config_Parameters
-[ RECORD 4 ]+-----------------------------------------------------------------------------------------
issued_time  | 2020-05-14 08:54:32.86881-04
```

```
audit_type   | Table
request_type | QUERY
subject      | vs_nodes
request      | select * from configuration_parameters where parameter_name = 'MaxDepotSizePercent';
category     | Managing_Config_Parameters
```

MATERIALIZE_FLEXTABLE_COLUMNS_RESULTS

Contains the results of running the MATERIALIZE_FLEXTABLE_COLUMNS function. The table contains information about keys that the function evaluated. It does not contain information about all keys.

Column Name	Data Type	Description
TABLE_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog, which identifies the table.
TABLE_SCHEMA	VARCHAR	The schema name for which information is listed.
TABLE_NAME	VARCHAR	The table name for which information is listed.
CREATION_TIME	VARCHAR	Timestamp when the key was materialized.
KEY_NAME	VARCHAR	Name of the key from the VMap column that was materialized.
STATUS	VARCHAR	Status of the materialized column, one of the following: • ADDED • EXISTS • ERROR
MESSAGE	BOOLEAN	Message associated with the status in the previous column, one of the following: • Added successfully • Column of same name already exists in table definition • Add operation failed • No data type guess provided to add

Column Name	Data Type	Description
		column

Examples

```
=> \x
Expanded display is on.
=> SELECT table_id, table_schema, table_name, key_name, status, message FROM MATERIALIZE_FLEXTABLE_
COLUMNS_RESULTS
WHERE table_name = 'mountains_hybrid';
-[ RECORD 1 ]+-----------------------------------------------------
table_id     | 45035996273708192
table_schema | public
table_name   | mountains_hybrid
key_name     | type
status       | ADDED
message      | Added successfully
-[ RECORD 2 ]+-----------------------------------------------------
table_id     | 45035996273708192
table_schema | public
table_name   | mountains_hybrid
key_name     | height
status       | ADDED
message      | Added successfully
-[ RECORD 3 ]+-----------------------------------------------------
table_id     | 45035996273708192
table_schema | public
table_name   | mountains_hybrid
key_name     | name
status       | EXISTS
message      | Column of same name already exists in table definition
```

MODELS

Lists details about the machine-learning models in the database.

Column Name	Data Type	Description
MODEL_ID	INTEGER	The model's internal ID.
MODEL_NAME	VARCHAR(128)	The name of the model.
SCHEMA_ID	INTEGER	The schema's internal ID.
SCHEMA_NAME	VARCHAR(128)	The name of the schema.

Column Name	Data Type	Description
OWNER_ID	INTEGER	The model owner's ID.
OWNER_NAME	VARCHAR(128)	The user who created the model.
CATEGORY	VARCHAR(128)	The type of model. By default, models created in Vertica are assigned to the Vertica_Models category.
MODEL_TYPE	VARCHAR(128)	The type of algorithm used to create the model.
IS_COMPLETE	VARCHAR(128)	Denotes whether the model is complete and ready for use in machine learning functions. This field is usually false when the model is being trained. Once the training is complete, the field is set to true.
CREATE_TIME	TIMESTAMPTZ	The time the model was created.
SIZE	INTEGER	The size of the model in bytes.

Example

```
=> SELECT * FROM models;
-[ RECORD 1 ]------------------------------
model_id    | 45035996273714020
model_name  | myLinearRegModel
schema_id   | 45035996273704980
schema_name | public
owner_id    | 45035996273704962
owner_name  | dbadmin
category    | VERTICA_MODELS
model_type  | LINEAR_REGRESSION
is_complete | t
create_time | 2018-01-22 11:13:35.018412-05
size        | 1671
```

NETWORK_ADDRESSES

Lists information about the network addresses defined in your database using the CREATE NETWORK ADDRESS statement.

Column	Data Type	Description

Name		
NAME	VARCHAR	The name of the network address.
NODE	VARCHAR	The name of the node that owns the network address.
ADDRESS	VARCHAR	The network address's IP address. This address can be either in IPv4 or IPv6 format.
PORT	INT	The network address's port number.
ADDRESS_ FAMILY	VARCHAR	The format of the network address's IP address. This values is either 'ipv4' or 'ipv6'.
IS_ENABLED	BOOLEAN	Whether the network address is enabled. You can disable network addresses to prevent their use. If the address is disabled, the value in this column is False.
IS_AUTO_ DETECTED	BOOLEAN	Whether Vertica created the network address automatically.

Example

```
=> \x
Expanded display is on.

=> SELECT * FROM v_catalog.network_addresses;
-[ RECORD 1 ]----+-----------------
name             | node01
node             | v_vmart_node0001
address          | 10.20.100.247
port             | 5433
address_family   | ipv4
is_enabled       | t
is_auto_detected | f
-[ RECORD 2 ]----+-----------------
name             | node02
node             | v_vmart_node0002
address          | 10.20.100.248
port             | 5433
address_family   | ipv4
is_enabled       | t
is_auto_detected | f
-[ RECORD 3 ]----+-----------------
name             | node03
node             | v_vmart_node0003
address          | 10.20.100.249
port             | 5433
address_family   | ipv4
is_enabled       | t
```

```
is_auto_detected | f
```

See Also

NODES

Lists details about the nodes in the database.

Column Name	Data Type	Description
NODE_NAME	VARCHAR(128)	The name of the node.
NODE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the node.
NODE_STATE	VARCHAR(128)	The node's current state, one of the following: • UP • DOWN • READY • UNSAFE • SHUTDOWN • SHUTDOWN ERROR • RECOVERING • RECOVERY ERROR • RECOVERED • INITIALIZING • STAND BY • NEEDS CATCH UP
IS_PRIMARY	BOOLEAN	Whether the node is a primary or secondary node. Primary nodes are the only ones Vertica considers when determining the K-Safety of an Eon Mode database. The node inherits this property from the subcluster that contains it.
NODE_ ADDRESS	VARCHAR(80)	The host address of the node.

Column Name	Data Type	Description
NODE_ ADDRESS_ FAMILY	VARCHAR(10)	The IP Version of the `node_address`. For example, `ipv4`.
EXPORT_ ADDRESS	VARCHAR(8192)	The IP address of the node (on the public network) used for import/export operations and native load-balancing.
EXPORT_ ADDRESS_ FAMILY	VARCHAR(10)	The IP Version of the `export_address`. For example, `ipv4`.
CATALOG_PATH	VARCHAR(8192)	The absolute path to the catalog on the node.
NODE_TYPE	VARCHAR(9)	The type of the node. For more information on the types of nodes, refer to Setting Node Type.
IS_EPHEMERAL	BOOLEAN	(Deprecated) True if this node has been marked as ephemeral. (in preparation for removing it from the cluster).
STANDING_IN_ FOR	VARCHAR(128)	The name of the node that this node is currently replacing.
SUBCLUSTER_ NAME	VARCHAR(128)	The name of the subcluster that contains the node. Nodes belong to exactly one subcluster.
LAST_MSG_ FROM_NODE_ AT	TIMESTAMPTZ	The date and time the last message was received from this node.
NODE_DOWN_ SINCE	TIMESTAMPTZ	The amount of time that the replaced node has been unavailable.

NODE_SUBSCRIPTION_CHANGE_PHASES

In an Eon Mode database, stores information about changes to node's shard subscriptions.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node
SUBSCRIPTION_CHANGE_TYPE	VARCHAR	The change being made to the subscription
SESSION_ID	INTEGER	ID of the session in which the change was initiated
TRANSACTION_ID	INTEGER	ID of the transaction in which the change was initiated
USER_ID	INTEGER	ID of user that initiated the change
USER_NAME	VARCHAR	Name of user that initiated the change
SUBSCRIPTION_OID	INTEGER	Session object ID
SUBSCRIBER_NODE_OID	INTEGER	Object ID of node that requested the subscription
SUBSCRIBER_NODE_NAME	VARCHAR	Name of the node that requested the subscription
SHARD_OID	INTEGER	Object ID of the shard to which the node is subscribed
SHARD_NAME	VARCHAR	Name of the shard to which the node is subscribed
MIN_TIME	TIMESTAMPTZ	Start time of the subscription change
MAX_TIME	TIMESTAMPTZ	Completion time of the subscription change
SOURCE_NODE_OID	INTEGER	Object ID of the node from which catalog objects were fetched
SOURCE_NODE_NAME	VARCHAR	Name of the node from which catalog objects were fetched
NUM_OBJS_AFFECTED	INTEGER	Number of catalog objects affected by the subscription change
ACTION	VARCHAR	Description of the action taken
NEW_CONTENT_SIZE	INTEGER	Total size of the catalog objects that were fetched

Column Name	Data Type	Description
		for the subscription change
PHASE_LIMIT_ REACHED	BOOLEAN	Reached maximum number of retries?
START_TIME	TIMESTAMPTZ	When the subscription change started
END_TIME	TIMESTAMPTZ	When the subscription change was finished
RETRIED	BOOLEAN	Retry of subscription phase?
PHASE_RESULT	VARCHAR	Outcome of the subscription change, one of the following: • Success • Failure

Example

```
=> SELECT NODE_NAME, SUBSCRIPTION_CHANGE_TYPE, SHARD_NAME,
   ACTION  FROM node_subscription_change_phases
   ORDER BY start_time ASC LIMIT 10;

      NODE_NAME       | SUBSCRIPTION_CHANGE_TYPE | SHARD_NAME  |         ACTION
----------------------+--------------------------+-------------+-----------------------
 v_verticadb_node0001 | CREATE SUBSCRIPTION      | segment0007 | COLLECT SHARD METADATA
 v_verticadb_node0001 | CREATE SUBSCRIPTION      | segment0010 | COLLECT SHARD METADATA
 v_verticadb_node0001 | CREATE SUBSCRIPTION      | segment0004 | COLLECT SHARD METADATA
 v_verticadb_node0001 | CREATE SUBSCRIPTION      | segment0005 | COLLECT SHARD METADATA
 v_verticadb_node0001 | CREATE SUBSCRIPTION      | replica     | COLLECT SHARD METADATA
 v_verticadb_node0001 | CREATE SUBSCRIPTION      | segment0005 | COLLECT SHARD METADATA
 v_verticadb_node0001 | CREATE SUBSCRIPTION      | segment0006 | COLLECT SHARD METADATA
 v_verticadb_node0001 | CREATE SUBSCRIPTION      | segment0008 | COLLECT SHARD METADATA
 v_verticadb_node0001 | CREATE SUBSCRIPTION      | segment0011 | COLLECT SHARD METADATA
 v_verticadb_node0001 | CREATE SUBSCRIPTION      | segment0002 | COLLECT SHARD METADATA
```

NODE_SUBSCRIPTIONS

Eon Mode only

Lists information about database node subscriptions to shards.

Column Name	Data Type	Description
SUBSCRIPTION_OID	INTEGER	Subscription OID
NODE_OID	INTEGER	Subscribed node OID
NODE_NAME	VARCHAR	Name of the node
SHARD_OID	INTEGER	OID of the shard to which the node is subscribed
SHARD_NAME	VARCHAR	Name of the shard to which the node is subscribed
SUBSCRIPTION_STATE	VARCHAR	Node's current subscription state
FROM _VERSION	INTEGER	Deprecated
IS_PRIMARY	BOOLEAN	Specifies whether the node is currently the **primary subscriber**.
IS_RESUBSCRIBING	BOOLEAN	Indicates whether a subscription is resubscribing to a node: • `t` (true): A subscription is resubscribing, only applies to PENDING subscriptions created during the cluster or node startup. • `f` (false): A subscription is not resubscribing, applies to PENDING subscriptions created with REBALANCE_SHARDS that transitioned to an ACTIVE state.
CREATOR_TID	INTEGER	ID of transaction that created this subscription
SUBSCRIBED_TO_METADATA_AT	INTEGER	Deprecated
IS_PARTICIPATING_PRIMARY	BOOLEAN	Whether this node is the participating primary subscriber for the shard. If true, the node listed in NODE_NAME is the only one that reads from and writes to communal storage for this shard in the subcluster. Other nodes in the subcluster that subscribe to the same shard receive data from this node via peer-to-peer transfers.

Example

The following example queries the NODE_SUBSCRIPTIONS table in a database with two three-node subclusters (a primary and a secondary) in a 12-shard database.

```
=> SELECT node_name, shard_name, subscription_state, is_primary,
          is_participating_primary AS is_p_primary
          FROM NODE_SUBSCRIPTIONS ORDER BY node_name, shard_name;

      node_name       | shard_name  | subscription_state | is_primary | is_p_primary
----------------------+-------------+--------------------+------------+--------------
 v_verticadb_node0001 | replica     | ACTIVE             | t          | t
 v_verticadb_node0001 | segment0001 | ACTIVE             | t          | t
 v_verticadb_node0001 | segment0003 | ACTIVE             | f          | f
 v_verticadb_node0001 | segment0004 | ACTIVE             | t          | t
 v_verticadb_node0001 | segment0006 | ACTIVE             | f          | f
 v_verticadb_node0001 | segment0007 | ACTIVE             | t          | t
 v_verticadb_node0001 | segment0009 | ACTIVE             | f          | f
 v_verticadb_node0001 | segment0010 | ACTIVE             | t          | t
 v_verticadb_node0001 | segment0012 | ACTIVE             | f          | f
 v_verticadb_node0002 | replica     | ACTIVE             | f          | t
 v_verticadb_node0002 | segment0001 | ACTIVE             | f          | f
 v_verticadb_node0002 | segment0002 | ACTIVE             | t          | t
 v_verticadb_node0002 | segment0004 | ACTIVE             | f          | f
 v_verticadb_node0002 | segment0005 | ACTIVE             | t          | t
 v_verticadb_node0002 | segment0007 | ACTIVE             | f          | f
 v_verticadb_node0002 | segment0008 | ACTIVE             | t          | t
 v_verticadb_node0002 | segment0010 | ACTIVE             | f          | f
 v_verticadb_node0002 | segment0011 | ACTIVE             | t          | t
 v_verticadb_node0003 | replica     | ACTIVE             | f          | t
 v_verticadb_node0003 | segment0002 | ACTIVE             | f          | f
 v_verticadb_node0003 | segment0003 | ACTIVE             | t          | t
 v_verticadb_node0003 | segment0005 | ACTIVE             | f          | f
 v_verticadb_node0003 | segment0006 | ACTIVE             | t          | t
 v_verticadb_node0003 | segment0008 | ACTIVE             | f          | f
 v_verticadb_node0003 | segment0009 | ACTIVE             | t          | t
 v_verticadb_node0003 | segment0011 | ACTIVE             | f          | f
 v_verticadb_node0003 | segment0012 | ACTIVE             | t          | t
 v_verticadb_node0004 | replica     | ACTIVE             | f          | t
 v_verticadb_node0004 | segment0001 | ACTIVE             | f          | t
 v_verticadb_node0004 | segment0003 | ACTIVE             | f          | f
 v_verticadb_node0004 | segment0004 | ACTIVE             | f          | t
 v_verticadb_node0004 | segment0006 | ACTIVE             | f          | f
 v_verticadb_node0004 | segment0007 | ACTIVE             | f          | t
 v_verticadb_node0004 | segment0009 | ACTIVE             | f          | f
 v_verticadb_node0004 | segment0010 | ACTIVE             | f          | t

ODBC_COLUMNS

Provides table column information. The format is defined by the ODBC standard for the ODBC SQLColumns metadata. Details on the ODBC SQLColumns format are available in the ODBC specification: http://msdn.microsoft.com/en-us/library/windows/desktop/ms711683%28v=vs.85%29.aspx.

Column Name	Data Type	Description
SCHEMA_NAME	VARCHAR	The name of the schema in which the column resides. If the column does not reside in a schema, this field is empty.
TABLE_NAME	VARCHAR	The name of the table in which the column resides.
COLUMN_NAME	VARCHAR	The name of the column.
DATA_TYPE	INTEGER	The data type of the column. This can be an ODBC SQL data type or a driver-specific SQL data type. This column corresponds to the ODBC_TYPE column in the TYPES table.
DATA_TYPE_NAME	VARCHAR	The driver-specific data type name.
COLUMN_SIZE	INTEGER	The ODBC-defined data size of the column.
BUFFER_LENGTH	INTEGER	The transfer octet length of a column is the maximum number of bytes returned to the application when data is transferred to its default C data type. See http://msdn.microsoft.com/en-us/library/windows/desktop/ms713979%28v=vs.85%29.aspx

DECIMAL_DIGITS	INTEGER	The total number of significant digits to the right of the decimal point. This value has no meaning for non-decimal data types.
NUM_PREC_RADIX	INTEGER	The radix Vertica reports decimal_digits and columns_size as. This value is always 10, because it refers to a number of decimal digits, rather than a number of bits.
NULLABLE	BOOLEAN	Indicates whether the column can contain null values. Values are 0 or 1.
REMARKS	VARCHAR	The textual remarks for the column.
COLUMN_DEFAULT	VARCHAR	The default value of the column.
SQL_TYPE_ID	INTEGER	The SQL data type of the column.
SQL_DATETIME_SUB	VARCHAR	The subtype for a datetime data type. This value has no meaning for non-datetime data types.
CHAR_OCTET_LENGTH	INTEGER	The maximum length of a string or binary data column.
ORDINAL_POSITION	INTEGER	Indicates the position of the column in the table definition.
IS_NULLABLE	VARCHAR	Values can be YES or NO, determined by the value of the NULLABLE column.
IS_IDENTITY	BOOLEAN	Indicates whether the column is a sequence, for example, an auto-increment column.

PASSWORD_AUDITOR

Stores information about individual users and their password information. This table also indicates if users are using hash authentication, which is the associated security algorithm.

Column Name	Data Type	Description
USER_ID	INTEGER	Unique ID for the user.

Column Name	Data Type	Description
USER_NAME	VARCHAR	Name of the user.
ACCTEXPIRED	BOOLEAN	Indicates if the user's password expires. 'f' indicates that it does not expire. 't' indicates that it does expire.
SECURITY_ALGORITHM	VARCHAR	User-level security algorithm for hash authentication. Valid values: • 'NONE' (Default. System-level security algorithm is used.) • 'MD5' • 'SHA512'
SYSTEM_SECURITY_ALGORITHM	VARCHAR	System-level security algorithm for hash authentication. Default value: 'NONE' (Uses MD5 algorithm.) Valid values: • 'MD5' • 'SHA512'
EFFECTIVE_SECURITY_ALGORITHM	VARCHAR	The resulting security algorithm, depending on the values of SECURTY_ALGORITHM and SYSTEM_SECURITY_ALGORITHM.
CURRENT_SECURITY_ALGORITHM	VARCHAR	The security algorithm used to hash the user's current password. This can differ from the EFFECTIVE_SECURITY_ALGORITHM if a user hasn't reset their password since a change in the EFFECTIVE_SECURITY_ALGORITHM. Valid values: • 'NONE' (Default. System-level security algorithm is used.) • 'SHA512' • 'MD5'

PASSWORDS

Contains user passwords information. This table stores current passwords and past passwords if any Profiles have PASSWORD_REUSE_TIME or PASSWORD_REUSE_MAX parameters set. See CREATE PROFILE for details.

Column Name	Data Type	Description
USER_ID	INTEGER	The ID of the user who owns the password.
USER_NAME	VARCHAR	The name of the user who owns the password.
PASSWORD	VARCHAR	The encrypted password.
PASSWORD_CREATE_TIME	DATETIME	The date and time when the password was created.
IS_CURRENT_PASSWORD	BOOLEAN	Denotes whether this is the user's current password. Non-current passwords are retained to enforce password reuse limitations.
PROFILE_ID	INTEGER	The ID number of the profile to which the user is assigned.
PROFILE_NAME	VARCHAR	The name of the profile to which the user is assigned.
PASSWORD_REUSE_MAX	VARCHAR	The number password changes that must take place before an old password can be reused.
PASSWORD_REUSE_TIME	VARCHAR	The amount of time that must pass before an old password can be reused.

PRIMARY_KEYS

Provides primary key information.

Column Name	Data Type	Description
CONSTRAINT_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies the constraint.

Column Name	Data Type	Description
CONSTRAINT_NAME	VARCHAR	The constraint name for which information is listed.
COLUMN_NAME	VARCHAR	The column name for which information is listed.
ORDINAL_POSITION	VARCHAR	The position of the column within the key. The numbering of columns starts at 1.
TABLE_NAME	VARCHAR	The table name for which information is listed.
CONSTRAINT_TYPE	VARCHAR	The constraint type, p, for primary key.
IS_ENABLED	BOOLEAN	Indicates if a table column constraint for a PRIMARY KEY is enabled by default. Can be t (True) or f (False).
TABLE_SCHEMA	VARCHAR	The schema name for which information is listed.

PROFILE_PARAMETERS

Defines what information is stored in profiles.

Column Name	Data Type	Description
PROFILE_ID	INTEGER	The ID of the profile to which this parameter belongs.
PROFILE_NAME	VARCHAR	The name of the profile to which this parameter belongs.
PARAMETER_TYPE	VARCHAR	The policy type of this parameter (`password_complexity`, `password_security`, etc.)
PARAMETER_NAME	VARCHAR	The name of the parameter.
PARAMETER_LIMIT	VARCHAR	The parameter's value.

PROFILES

Provides information about password policies that you set using the CREATE PROFILE statement.

Column Name	Data Type	Description
PROFILE_ID	INTEGER	Unique identifier for the profile.
PROFILE_NAME	VARCHAR	Profile name.
PASSWORD_LIFE_TIME	VARCHAR	Number of days before the user's password expires. After expiration, the user is forced to change passwords during login or warned that their password has expired if password_grace_time is set to a value other than zero or unlimited.
PASSWORD_GRACE_TIME	VARCHAR	Number of days users are allowed to log in after their passwords expire. During the grace time, users are warned about their expired passwords when they log in. After the grace period, the user is forced to change passwords if he or she hasn't already.
PASSWORD_REUSE_MAX	VARCHAR	Number of password changes that must occur before the current password can be reused.
PASSWORD_REUSE_TIME	VARCHAR	Number of days that must pass after setting a password before it can be used again.
FAILED_LOGIN_ATTEMPTS	VARCHAR	Number of consecutive failed login attempts that triggers Vertica to lock the account.
PASSWORD_LOCK_TIME	VARCHAR	Number of days an account is locked after being locked due to too many failed login attempts.
PASSWORD_MAX_LENGTH	VARCHAR	Maximum number of characters allowed in a password.
PASSWORD_MIN_LENGTH	VARCHAR	Minimum number of characters required in a password.
PASSWORD_MIN_LETTERS	VARCHAR	The minimum number of letters (either uppercase or lowercase) required in a password.

Column Name	Data Type	Description
PASSWORD_MIN_LOWERCASE_LETTERS	VARCHAR	The minimum number of lowercase.
PASSWORD_MIN_UPPERCASE_LETTERS	VARCHAR	The minimum number of uppercase letters required in a password.
PASSWORD_MIN_DIGITS	VARCHAR	The minimum number of digits required in a password.
PASSWORD_MIN_SYMBOLS	VARCHAR	The minimum of symbols (for example, !, #, $, etc.) required in a password.

Notes

Non-superusers querying this table see only the information for the profile to which they are assigned.

- ALTER PROFILE

PROJECTION_CHECKPOINT_EPOCHS

Provides details on checkpoint epochs, applies only to Enterprise Mode.

Column Name	Data Type	Description
NODE_ID	INTEGER	Unique numeric identifier of this projection's node.
NODE_NAME	VARCHAR	Name of this projection's node.
PROJECTION_SCHEMA_ID	INTEGER	Unique numeric identifier of the projection schema.
PROJECTION_SCHEMA	VARCHAR	Name of the projection schema.
PROJECTION_ID	INTEGER	Unique numeric identifier of this projection.

Column Name	Data Type	Description
PROJECTION_NAME	VARCHAR	Name of this projection.
IS_UP_TO_DATE	BOOLEAN	Specifies whether the projection is up to date and available to participate in query execution.
CHECKPOINT_EPOCH	INTEGER	Checkpoint epoch of the projection on the corresponding node. Data up to and including this epoch is in persistent storage, and can be recovered in the event of node failure.
WOULD_RECOVER	BOOLEAN	Determines whether data up to and including CHECKPOINT_EPOCH can be used to recover from an unclean shutdown: • t: CHECKPOINT_EPOCH is less than the cluster's Last Good Epoch, so data up to and including this epoch can be used during recovery. • f: Vertica must use Last Good Epoch to recover data for this projection. See also: GET_LAST_GOOD_EPOCH
IS_BEHIND_AHM	BOOLEAN	Specifies whether CHECKPOINT_EPOCH is less than the **AHM** (ancient history mark). If set to t (true), data for this projection cannot rolled back. See also: GET_AHM_EPOCH

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

Examples

```
=> SELECT node_name, projection_schema, projection_name, is_up_to_date, checkpoint_epoch FROM
projection_checkpoint_epochs
```

```
    WHERE projection_name ilike 't1_b%' ORDER BY projection_name, node_name;
    node_name     | projection_schema | projection_name | is_up_to_date | checkpoint_epoch
------------------+-------------------+-----------------+---------------+------------------
 v_vmart_node0001 | public            | t1_b1           | t             |              965
 v_vmart_node0002 | public            | t1_b1           | t             |              965
 v_vmart_node0003 | public            | t1_b1           | t             |              965
 v_vmart_node0001 | public            | t1_b0           | t             |              965
 v_vmart_node0002 | public            | t1_b0           | t             |              965
 v_vmart_node0003 | public            | t1_b0           | t             |              965

PROJECTION_COLUMNS

Provides information about projection columns, such as encoding type, sort order, type of statistics, and the time at which columns statistics were last updated.

Column Name	Data Type	Description
PROJECTION_ID	INTEGER	Catalog-assigned numeric value that uniquely identifies the projection.
PROJECTION_NAME	VARCHAR	The projection name for which information is listed.
PROJECTION_COLUMN_NAME	VARCHAR	The projection column name.

Column Name	Data Type	Description
COLUMN_POSITION	INTEGER	The ordinal position of a projection's column used in the CREATE PROJECTION statement.
SORT_POSITION	INTEGER	The projection's column sort specification, as specified in CREATE PROJECTION .. ORDER BY clause. If the column is not included in the projection's sort order, SORT_POSITION output is NULL.
COLUMN_ID	INTEGER	A unique numeric object ID (OID) that identifies the associated projection column object and is assigned by the Vertica catalog. This field is helpful as a key to other system tables.
DATA_TYPE	VARCHAR	Matches the corresponding table column data type (see V_CATALOG.COLUMNS). DATA_TYPE is provided as a complement to ENCODING_TYPE.
ENCODING_TYPE	VARCHAR	The encoding type defined on the projection column.
ACCESS_RANK	INTEGER	The access rank of the projection column. See the ACCESSRANK parameter in the CREATE PROJECTION statement for more information.

Column Name	Data Type	Description
GROUP_ID	INTEGER	A unique numeric ID (OID) that identifies the group and is assigned by the Vertica catalog.
TABLE_SCHEMA	VARCHAR	The name of the schema in which the projection is stored.
TABLE_ID	INTEGER	Catalog-assigned numeric value that uniquely identifies the table.
TABLE_NAME	VARCHAR	The table name that contains the projection.
TABLE_COLUMN_ID	VARCHAR	Catalog-assigned VARCHAR value that uniquely identifies a table column.
TABLE_COLUMN_NAME	VARCHAR	The projection's corresponding table column name.
STATISTICS_TYPE	VARCHAR	The type of statistics the column contains: • NONE: No statistics • ROWCOUNT: Set by ANALYZE_ROW_COUNT • FULL: Set by running ANALYZE_STATISTICS
STATISTICS_UPDATED_TIMESTAMP	TIMESTAMPTZ	The time at which the columns statistics were last updated by ANALYZE_STATISTICS. By querying this column, along with STATISTICS_TYPE and

Column Name	Data Type	Description
		PROJECTION_COLUMN_NAME, you can identify projection columns whose statistics need updating. See also system table PROJECTIONS.
IS_EXPRESSION	BOOLEAN	Indicates whether this projection column is calculated with an expression. For aggregate columns, IS_EXPRESSION is always true.
IS_AGGREGATE	BOOLEAN	Indicates whether the column is an aggregated column in a live aggregate projection. IS_AGGREGATE is always false for Top-K projection columns.
PARTITION_BY_POSITION	INTEGER	Position of that column in the PARTITION BY and GROUP BY clauses, if applicable.
ORDER_BY_POSITION	INTEGER	Set only for Top-K projections, specifies the column's position in the ORDER BY clause, as defined in the projection definition's window partition clause. If the column is omitted from the ORDER BY clause, ORDER_BY_POSITION output is NULL.
ORDER_BY_TYPE	INTEGER	Type of sort order: • ASC NULLS FIRST

Column Name	Data Type	Description
		• ASC NULLS LAST • DESC NULLS FIRST • DESC NULLS LAST
COLUMN_EXPRESSION	VARCHAR	Expression that calculates the column value.

Examples

See Statistics Data in PROJECTION_COLUMNS

- PROJECTIONS
- ANALYZE_STATISTICS
- CREATE PROJECTION

PROJECTION_DELETE_CONCERNS

Lists projections whose design may cause performance issues when deleting data. This table is generated by calling the EVALUATE_DELETE_PERFORMANCE function. See DELETE and UPDATE Optimization in the Administrator's Guide for more information.

Column Name	Data Type	Description
PROJECTION_ID	INTEGER	The ID number of the projection
PROJECTION_SCHEMA	VARCHAR	The schema containing the projection
PROJECTION_NAME	VARCHAR	The projection's name
CREATION_TIME	TIMESTAMPTZ	When the projection was created
LAST_MODIFIED_TIME	TIMESTAMPTZ	When the projection was last modified
COMMENT	VARCHAR	A comment describing the potential delete performance issue.

PROJECTIONS

Provides information about projections.

Column Name	Data Type	Description
PROJECTION_SCHEMA_ID	INTEGER	A unique numeric ID that identifies the specific schema that contains the projection and is assigned by the Vertica catalog.
PROJECTION_SCHEMA	VARCHAR	The name of the schema that contains the projection.
PROJECTION_ID	INTEGER	A unique numeric ID that identifies the projection and is assigned by the Vertica catalog.
PROJECTION_NAME	VARCHAR	The projection name for which information is listed.
PROJECTION_BASENAME	VARCHAR	The base name used for other projections: • For auto-created projections, identical to ANCHOR_TABLE_NAME . • For a manually-created projection, the name specified in the CREATE PROJECTION statement.
OWNER_ID	INTEGER	A unique numeric ID that identifies the projection owner and is assigned by the Vertica catalog.
OWNER_NAME	VARCHAR	The name of the projection's owner.
ANCHOR_TABLE_ID	INTEGER	The unique numeric identification (OID) of the projection's anchor table.
ANCHOR_TABLE_NAME	VARCHAR	The name of the projection's anchor table.
NODE_ID	INTEGER	A unique numeric ID (OID) for any nodes that contain any unsegmented projections.
NODE_NAME	VARCHAR	The names of any nodes that contain the projection. This column returns information for unsegmented

Column Name	Data Type	Description
		projections only.
IS_PREJOIN	BOOLEAN	Deprecated, always set to f (false).
CREATED_ EPOCH	INTEGER	The epoch in which the projection was created.
CREATE_TYPE	VARCHAR	The method in which the projection was created: • `CREATE PROJECTION`: A custom projection created using CREATE PROJECTION. • `CREATE TABLE`: A superprojection that was automatically created when its associated table was created using CREATE TABLE. • `ALTER TABLE`: The system automatically created the key projection in response to a non-empty table. • `CREATE TABLE WITH PROJ CLAUSE`: A superprojection that was automatically created using CREATE TABLE. • `DELAYED_CREATION`: A superprojection that was automatically created when data was loaded for the first time into a new table. • `DESIGNER`: A projection created by Database Designer. • `SYSTEM TABLE`: A projection that was automatically created for a system table. Rebalancing does not change the `CREATE_TYPE` value for a projection.
VERIFIED_ FAULT_ TOLERANCE	INTEGER	The projection K-safe value. This value can be greater than the database K-safety value (if more replications of a projection exist than are required to meet the database K-safety). This value cannot be less than the database K-safe setting.
IS_UP_TO_DATE	BOOLEAN	Specifies whether projection data is up to date. Only up-to-date projections are available to participate in query execution.
HAS_STATISTICS	BOOLEAN	Specifies whether there are statistics for any column in

Column Name	Data Type	Description
		the projection. HAS_STATISTICS returns true only when all non-epoch columns for a table or table partition have full statistics. For details, see Collecting Table Statistics and Collecting Partition Statistics. **Note:** Projections that have no data never have full statistics. Query system table PROJECTION_STORAGE to determine whether your projection contains data.
IS_SEGMENTED	BOOLEAN	Specifies whether the projection is segmented.

SEGMENT_EXRESSION	VARCHAR	The segmentation expression used for the projection. In the following example for the `clicks_agg` projection, the following values:
		
		`hash(clicks.user_id, (clicks.click_time)::date)`
		
		indicate that the projection was created with the following expression:
		
		`SEGMENTED BY HASH(clicks.user_id, (clicks.click_time)::date)`

SEGMENT_RANGE	VARCHAR	The percentage of projection data stored on each node, according to the segmentation expression. For example, segmenting a projection by the HASH function on all nodes results in a `SEGMENT_RANGE` value such as the following: `implicit range: v_vmart_node0002[33.3%] v_vmart_node0003 [33.3%] v_vmart_node0001[33.3%]`
IS_SUPER_PROJECTION	BOOLEAN	Specifies whether a projection is a superprojection.
IS_KEY_CONSTRAINT_PROJECTION	BOOLEAN	Indicates whether a projection is a key constraint projection: • `t`: A key constraint projection that validates a key

Column Name	Data Type	Description
		constraint. (Vertica uses the projection to efficiently enforce at least one enabled key constraint.) • `f`: Not a projection that validates a key constraint.
HAS_ EXPRESSIONS	BOOLEAN	Specifies whether this projection has expressions that define the column values. `HAS_EXPRESSIONS` is always true for live aggregate projections.
IS_AGGREGATE_ PROJECTION	BOOLEAN	Specifies whether this projection is a live aggregate projection.
AGGREGATE_ TYPE	VARCHAR	Specifies the type of live aggregate projection: • `GROUPBY` • `TOPK`
IS_SHARED	BOOLEAN	Indicates whether the projection is located on shared storage.

`PROJECTION_COLUMNS`

RESOURCE_POOL_DEFAULTS

Returns default parameter settings for built-in and user-defined resource pools. Use `ALTER RESOURCE POOL` to restore resource pool parameters to their default settings.

For information about valid parameters for built-in resource pools and their default settings, see Built-In Resource Pools Configuration.

To obtain a resource pool's current settings, query system table `RESOURCE_POOLS`.

Privileges

None

RESOURCE_POOLS

Displays settings for built-in and user-defined resource pools. For information about defining resource pools, see CREATE RESOURCE POOL and ALTER RESOURCE POOL.

Column Name	Data Type	Description
POOL_ID	INTEGER	Unique identifier for the resource pool
NAME	VARCHAR	The name of the resource pool.
SUBCLUSTER_OID	INTEGER	Unique identifier for a subcluster-specific resource pool. For global resource pools, 0 is returned.
SUBCLUSTER_NAME	VARCHAR	Specifies the subcluster that the subcluster-specific resource pool belongs to. If there are subcluster-specific resource pools with the same name on separate subclusters, multiple entries are returned. For global resource pools, this column is blank.
IS_INTERNAL	BOOLEAN	Specifies whether this pool is a built-in pool.
MEMORYSIZE	VARCHAR	The amount of memory allocated to this resource pool.
MAXMEMORYSIZE	VARCHAR	Value assigned as the maximum size this resource pool can grow by borrowing memory from the GENERAL pool.
MAXQUERYMEMORYSIZE	VARCHAR	The maximum amount of memory allocated by this pool to process any query.
EXECUTIONPARALLELISM	INTEGER	Limits the number of threads used to process any single query issued in this resource pool.

Column Name	Data Type	Description
PRIORITY	INTEGER	Specifies priority of queries in this pool when they compete for resources in the GENERAL pool.
RUNTIMEPRIORITY	VARCHAR	The run-time priority defined for this pool, indicates how many run-time resources (CPU, I/O bandwidth) the Resource Manager should dedicate to running queries in the resource pool. Valid values are: • HIGH • MEDIUM (default) • LOW These values are relative to each other. Queries with a HIGH run-time priority are given more CPU and I/O resources than those with a MEDIUM or LOW run-time priority.
RUNTIMEPRIORITYTHRESHOLD	INTEGER	Limits in seconds how soon a query must finish before the Resource Manager assigns to it the resource pool's RUNTIMEPRIORITY setting.
QUEUETIMEOUT	INTEGER INTERVAL	The maximum length of time requests can wait for resources to become available before being rejected, specified in seconds or as an interval. This value is set by the pool's QUEUETIMEOUT parameter.
PLANNEDCONCURRENCY	INTEGER	The preferred number of queries that execute concurrently in this resource pool, specified by the pool's PLANNEDCONCURRENCY parameter.
MAXCONCURRENCY	INTEGER	The maximum number of concurrent execution slots available to the resource pool, specified by the

Column Name	Data Type	Description
		poolMAXCONCURRENCY parameter.
RUNTIMECAP	INTERVAL	The maximum time a query in the pool can execute.
SINGLEINITIATOR	BOOLEAN	Set for backward compatibility.
CPUAFFINITYSET	VARCHAR	The set of CPUs on which queries associated with this pool are executed. For example: • `0, 2-4` : Specifies CPUs 0, 2, 3, and 4 • `25%`: A percentage of available CPUs, rounded down to whole CPUs.
CPUAFFINITYMODE	VARCHAR	Specifies whether to share usage of the CPUs assigned to this resource pool by CPUAFFINITYSET, one of the following: • SHARED: Queries that run in this pool share its CPUAFFINITYSET CPUs with other Vertica resource pools. • EXCLUSIVE: Dedicates CPUAFFINITYSET CPUs to this resource pool only, and excludes other Vertica resource pools. If CPUAFFINITYSET is set as a percentage, then that percentage of CPU resources available to Vertica is assigned solely for this resource pool. • ANY: Queries in this resource pool can run on any CPU.
CASCADETO	VARCHAR	A secondary resource pool for executing queries that exceed the RUNTIMECAP setting of this resource

Column Name	Data Type	Description
		pool.
CASCADETOSUBCLUSTERPOOL	BOOLEAN	Specifies whether this resource pool cascades to a subcluster-level resource pool.

ROLES

Contains the names of all roles the user can access, along with any roles that have been assigned to those roles.

Tip:
You can also use the function HAS_ROLE to see if a role is available to a user.

Column Name	Data Type	Description
ASSIGNED_ROLES	VARCHAR	The names of any roles that have been granted to this role. By enabling the role, the user also has access to the privileges of these additional roles. **Note:** An asterisk (*) appended to a role in this column indicates that the user can grant the role to other users.
NAME	VARCHAR	The name of a role that the user can access.
ROLE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the role.
LDAP_DN	VARCHAR	Indicates whether or not the Vertica Analytic Database role maps to an LDAP Link group. When the column is set to dn, the Vertica role maps to LDAP Link.
LDAP_URI_HASH	VARCHAR	The URI hash number for the LDAP role.
IS_ORPHANED_FROM_LDAP	VARCHAR	Indicates if the role is disconnected (orphaned) from LDAP, valid values are:

Column Name	Data Type	Description
		t - role is orphaned f - role is not orphaned For more information see Troubleshooting LDAP Link Issues

See Also

- GRANTS
- HAS_ROLE
- USERS

ROUTING_RULES

Lists the routing rules that map incoming IP addresses to a load balancing group.

Column Name	Data Type	Description
NAME	VARCHAR	The name of the routing rule.
SOURCE_ADDRESS	VARCHAR	The IP address range in CIDR format that this rule applies to.
DESTINATION_NAME	VARCHAR	The load balance group that handles connections for this rule.

Example

```
=> SELECT * FROM routing_rules;
-[ RECORD 1 ]----+-----------------
name             | internal_clients
source_address   | 192.168.1.0/24
destination_name | group_1
-[ RECORD 2 ]----+-----------------
name             | etl_rule

See Also

SCHEMATA

Provides information about schemas in the database.

Column Name	Data Type	Description
SCHEMA_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog, which identifies the specific schema.
SCHEMA_NAME	VARCHAR	Schema name for which information is listed.
SCHEMA_OWNER_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog, which identifies the owner who created the schema.
SCHEMA_OWNER	VARCHAR	Name of the owner who created the schema.
SYSTEM_SCHEMA_CREATOR	VARCHAR	Creator information for system schema or NULL for non-system schema
CREATE_TIME	TIMESTAMPTZ	Time when the schema was created.
IS_SYSTEM_SCHEMA	BOOLEAN	Indicates whether the schema was created for system use, where *t* is true and *f* is false.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

SEQUENCES

Displays information about sequences.

Column Name	Data Type	Description
SEQUENCE_SCHEMA	VARCHAR	Schema in which the sequence was created.
SEQUENCE_NAME	VARCHAR	Name of the sequence defined in the CREATE SEQUENCE statement.
OWNER_NAME	VARCHAR	Name of the owner.
IDENTITY_TABLE_NAME	VARCHAR	If created by an AUTO_INCREMENT or IDENTITY column, the name of its table.
SESSION_CACHE_COUNT	INTEGER	Count of values cached in a session.
ALLOW_CYCLE	BOOLEAN	Values allowed to cycle when a sequence reaches its minimum or maximum value. See CYCLE | NO CYCLE parameter in CREATE SEQUENCE.
OUTPUT_ORDERED	BOOLEAN	Values guaranteed to be ordered (always false).
INCREMENT_BY	INTEGER	Sequence values are incremented by this number (negative for reverse sequences).
MINIMUM	INTEGER	Minimum value the sequence can generate.
MAXIMUM	INTEGER	Maximum value the sequence can generate.
CURRENT_VALUE	INTEGER	Specifies how many sequence numbers Vertica has distributed to the nodes in your cluster. Includes all nodes.
SEQUENCE_SCHEMA_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies the schema.
SEQUENCE_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies the sequence.
OWNER_ID	INTEGER	A unique numeric ID assigned by the Vertica

Column Name	Data Type	Description
		catalog, which identifies the user who created the sequence.
IDENTITY_TABLE_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies the table to which the column belongs (if created by an auto_increment or identity column).

Examples

Create a simple sequence:

```
=> CREATE SEQUENCE my_seq MAXVALUE 5000 START 150;
CREATE SEQUENCE
```

Return information about the sequence you just created:

```
=> \x
Expanded display is on.
=> SELECT * FROM sequences;
-[ RECORD 1 ]-------+------------------
sequence_schema     | public
sequence_name       | my_seq
owner_name          | dbadmin
identity_table_name |
session_cache_count | 250000
allow_cycle         | f
output_ordered      | f
increment_by        | 1
minimum             | 1
maximum             | 5000
current_value       | 149
sequence_schema_id  | 45035996273704966
sequence_id         | 45035996273844996
owner_id            | 45035996273704962
identity_table_id   | 0
```

An identity column is a sequence available only for numeric column types. To identify what column in a table, if any, is an identity column, search the COLUMNS table to find the identity column in a table:

```
=> CREATE TABLE testid (c1 IDENTITY(1, 1, 1000), c2 INT);
=> \x
Expanded display is on.
=> SELECT * FROM COLUMNS WHERE is_identity='t' AND table_name='testid';
-[ RECORD 1 ]-----------+------------------
table_id                | 45035996274150730
```

```
table_schema             | public
table_name               | testid
is_system_table          | f
column_name              | c1
data_type                | int
data_type_id             | 6
data_type_length         | 8
character_maximum_length |
numeric_precision        |
numeric_scale            |
datetime_precision       |
interval_precision       |
ordinal_position         | 1
is_nullable              | f
column_default           |
is_identity              | t
```

Use the SEQUENCES table to get detailed information about the sequence in testid:

```
=> SELECT * FROM sequences WHERE identity_table_name='testid';
-[ RECORD 1 ]-------+--------------------
sequence_schema     | public
sequence_name       | testid_c1_seq
owner_name          | dbadmin
identity_table_name | testid
session_cache_count | 1000
allow_cycle         | f
output_ordered      | f
increment_by        | 1
minimum             | 1
maximum             | 9223372036854775807
current_value       | 0
sequence_schema_id  | 45035996273704976
sequence_id         | 45035996274150770
owner_id            | 45035996273704962
identity_table_id   | 45035996274150768
```

Use the vsql command \ds to return a list of sequences. The following results show the two sequences created in the preceding examples. If more sequences existed, the table would list them.

The CurrentValue of the new sequence is one less than the start number you specified in the CREATE SEQUENCE and IDENTITY commands, because you have not yet used NEXTVAL to instantiate the sequences to assign their cache or supply their first start values.

```
=> \ds
 List of Sequences
-[ RECORD 1 ]+--------------------
Schema       | public
Sequence     | my_seq
CurrentValue | 149
IncrementBy  | 1
Minimum      | 1
Maximum      | 5000
AllowCycle   | f
```

```
Comment      |
-[ RECORD 2 ]+--------------------
Schema       | public
Sequence     | testid_c1_seq
CurrentValue | 0
IncrementBy  | 1
Minimum      | 1
Maximum      | 9223372036854775807
AllowCycle   | f
Comment      |
```

SESSION_SUBSCRIPTIONS

In an Eon Mode database, lists the shard subscriptions for all nodes, and whether the subscriptions are used to resolve queries for the current session. Nodes that will participate in resolving queries in this session have TRUE in their IS_PARTICIPATING column.

Column Name	Data Type	Description
NODE_OID	INTEGER	The OID of the subscribing node.
NODE_NAME	VARCHAR	The name of the subscribing node.
SHARD_OID	INTEGER	The OID of the shard the node subscribes to.
SHARD_NAME	VARCHAR	The name of the shard the node subscribes to.
IS_PARTICIPATING	BOOLEAN	Whether this subscription is used when resolving queries in this session.
IS_ COLLABORATING	BOOLEAN	Whether this subscription is used to collaborate with a participating node when executing queries . This value is only true when queries are using elastic crunch scaling.

Example

The following example demonstrates listing the subscriptions that are either participating or collaborating in the current session:

```
=> SELECT node_name, shard_name, is_collaborating, is_participating
        FROM V_CATALOG.SESSION_SUBSCRIPTIONS
        WHERE is_participating = TRUE OR is_collaborating = TRUE
        ORDER BY shard_name, node_name;
```

```
      node_name       | shard_name  | is_collaborating | is_participating
----------------------+-------------+------------------+------------------
 v_verticadb_node0004 | replica     | f                | t
 v_verticadb_node0005 | replica     | f                | t
 v_verticadb_node0006 | replica     | t                | f
 v_verticadb_node0007 | replica     | f                | t
 v_verticadb_node0008 | replica     | t                | f
 v_verticadb_node0009 | replica     | t                | f
 v_verticadb_node0007 | segment0001 | f                | t
 v_verticadb_node0008 | segment0001 | t                | f
 v_verticadb_node0005 | segment0002 | f                | t
 v_verticadb_node0009 | segment0002 | t                | f
 v_verticadb_node0004 | segment0003 | f                | t
 v_verticadb_node0006 | segment0003 | t                | f
(12 rows)
```

SHARDS

Lists the shards in your database.

Column Name	Data Type	Description
SHARD_OID	INTEGER	The OID of the shard.
SHARD_NAME	VARCHAR	The name of the shard.
SHARD_TYPE	VARCHAR	The type of the shard.
LOWER_HASH_BOUND	VARCHAR	The lower hash bound of the shard.
UPPER_HASH_BOUND	VARCHAR	The upper hash bound of the shard.
IS_REPLICATED	BOOLEAN	Defines if the shard is replicated.
HAS_OBJECTS	BOOLEAN	Defines if the shard contains objects.

Example

```
=> SELECT * FROM SHARDS;
-[ RECORD 1 ]----+------------------
shard_oid        | 45035996273704980
shard_name       | replica
shard_type       | Replica
lower_hash_bound |
upper_hash_bound |
```

```
is_replicated    | t
has_objects      | t
...
```

STORAGE_LOCATIONS

Provides information about storage locations, their IDs labels, and status.

Column Name	Data Type	Description
LOCATION_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the storage location.
NODE_NAME	VARCHAR	The node name on which the storage location exists.
LOCATION_PATH	VARCHAR	The path where the storage location is mounted.
LOCATION_USAGE	VARCHAR	The type of information stored in the location: • DATA: Only data is stored in the location. • TEMP: Only temporary files that are created during loads or queries are stored in the location. • DATA,TEMP: Both types of files are stored in the location. • USER: The storage location can be used by non-dbadmin users, who are granted access to the storage location • **CATALOG**: The area is used for the Vertica catalog. This usage is set internally and cannot be removed or changed.
SHARING_TYPE	VARCHAR	How this location is shared among database nodes, if it is: • SHARED: The path used by the storage location is used by all nodes. See the SHARED parameter to CREATE LOCATION. • COMMUNAL: the location is used for communal storage in Eon Mode. • NONE: The location is not shared among nodes.
IS_RETIRED	BOOLEAN	Whether the storage location has been retired. This

Column Name	Data Type	Description
		column has a value of `t (true)` if the location is retired, or `f (false)` if it is not.
LOCATION_LABEL	VARCHAR	The label associated with a specific storage location, added with the ALTER_LOCATION_LABEL function.
RANK	INTEGER	The **Access Rank** value either assigned or supplied to the storage location, as described in Prioritizing Column Access Speed.
THROUGHPUT	INTEGER	The throughput performance of the storage location, measured in MB/sec. You can get location performance values using MEASURE_LOCATION_PERFORMANCE, and set them with the SET_LOCATION_PERFORMANCE function.
LATENCY	INTEGER	The measured latency of the storage location as number of data seeks per second. You can get location performance values using MEASURE_LOCATION_PERFORMANCE, and set them with the SET_LOCATION_PERFORMANCE function.
MAX_SIZE	INTEGER	Maximum size of the storage location in bytes.

Privileges

Must be a superuser.

Example

```
=> SELECT * FROM STORAGE_LOCATIONS;
-[ RECORD 1 ]--+-----------------------------------------
location_id    | 45035996273704984
node_name      | v_vmart_node0001
location_path  | /home/dbadmin/VMart/v_vmart_node0001_data
location_usage | DATA,TEMP
sharing_type   | NONE
is_retired     | f
location_label |
rank           | 0
throughput     | 0
latency        | 0
```

```
max_size       | 20G
-[ RECORD 2 ]--+-----------------------------------------
location_id    | 45035996273705108
node_name      | v_vmart_node0002
location_path  | /home/dbadmin/VMart/v_vmart_node0002_data
location_usage | DATA,TEMP
sharing_type   | NONE
is_retired     | f
location_label |
rank           | 0
throughput     | 0
latency        | 0
max_size       | 10G
...
```

SUBCLUSTERS

This table lists all of the subclusters defined in the database. It contains an entry for each node in the database listing which subcluster it belongs to. Any subcluster that does not contain a node has a single entry in this table with empty NODE_NAME and NODE_OID columns. This table is only populated if the database is running in Eon Mode.

Column Name	Data Type	Description
SUBCLUSTER_OID	INTEGER	Unique identifier for the subcluster.
SUBCLUSTER_NAME	VARCHAR	The name of the subcluster.
NODE_OID	INTEGER	The catalog-assigned ID of the node.
NODE_NAME	VARCHAR	The name of the node.

Column Name	Data Type	Description
PARENT_OID	INTEGER	The unique ID of the parent of the node (the database).
PARENT_NAME	VARCHAR	The name of the parent of the node (the database name).
IS_DEFAULT	BOOLEAN	Whether the subcluster is the **default cluster**.
IS_PRIMARY	BOOLEAN	Whether the subcluster is a **primary subcluster**.
CONTROL_SET_SIZE	INTEGER	The number of **control nodes** defined for this subcluster. This value is -1 when the large cluster feature is not enabled, or when every node in the subcluster must be a control node. See Large Cluster for more information.

Example

```
=> \x
Expanded display is on.
dbadmin=> SELECT * FROM SUBCLUSTERS;
-[ RECORD 1 ]----+--------------------
subcluster_oid   | 45035996273704978
subcluster_name  | default_subcluster
node_oid         | 45035996273704982
node_name        | v_verticadb_node0001
parent_oid       | 45035996273704976
parent_name      | verticadb
is_default       | t
is_primary       | t
control_set_size | -1
-[ RECORD 2 ]----+--------------------
subcluster_oid   | 45035996273704978
subcluster_name  | default_subcluster
node_oid         | 45035996273840970
node_name        | v_verticadb_node0002
parent_oid       | 45035996273704976
parent_name      | verticadb
is_default       | t
is_primary       | t
control_set_size | -1
-[ RECORD 3 ]----+--------------------
subcluster_oid   | 45035996273704978
subcluster_name  | default_subcluster
node_oid         | 45035996273840974
node_name        | v_verticadb_node0003
parent_oid       | 45035996273704976
parent_name      | verticadb
is_default       | t
is_primary       | t
control_set_size | -1
```

See Also

SUBCLUSTER_RESOURCE_POOL_OVERRIDES

Displays subcluster-level overrides of settings for built-in global resource pools.

Column Name	Data Type	Description
POOL_OID	INTEGER	Unique identifier for the resource pool with settings overrides.
NAME	VARCHAR	The name of the built-in resource pool.
SUBCLUSTER_OID	INTEGER	Unique identifier for the subcluster with settings that override the global resource pool settings.
SUBCLUSTER_NAME	VARCHAR	The name of the subcluster with settings that overrides the global resource pool settings.
MEMORYSIZE	VARCHAR	The amount of memory allocated to the global resource pool.
MAXMEMORYSIZE	VARCHAR	Value assigned as the maximum size this resource pool can grow by borrowing memory from the GENERAL pool.
MAXQUERYMEMORYSIZE	VARCHAR	The maximum amount of memory allocated by this pool to process any query.

SYSTEM_COLUMNS

Provides table column information for SYSTEM_TABLES.

Column Name	Data Type	Description
TABLE_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies the table.

Column Name	Data Type	Description
TABLE_SCHEMA	VARCHAR	The schema name for which information is listed.
TABLE_NAME	VARCHAR	The table name for which information is listed.
IS_SYSTEM_TABLE	BOOLEAN	Indicates whether the table is a system table, where *t* is true and *f* is false.
COLUMN_ID	VARCHAR	Catalog-assigned VARCHAR value that uniquely identifies a table column.
COLUMN_NAME	VARCHAR	The column name for which information is listed in the database.
DATA_TYPE	VARCHAR	The data type assigned to the column; for example VARCHAR(16).
DATA_TYPE_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies the data type.
DATA_TYPE_LENGTH	INTEGER	The maximum allowable length of the data type.
CHARACTER_MAXIMUM_LENGTH	INTEGER	The maximum allowable length of the column.
NUMERIC_PRECISION	INTEGER	The number of significant decimal digits.
NUMERIC_SCALE	INTEGER	The number of fractional digits.
DATETIME_PRECISION	INTEGER	For TIMESTAMP data type, returns the declared precision; returns null if no precision was declared.
INTERVAL_PRECISION	INTEGER	The number of fractional digits retained in the seconds field.
ORDINAL_POSITION	INTEGER	The position of the column respective to other columns in the table.
IS_NULLABLE	BOOLEAN	Indicates whether the column can contain null values, where *t* is true and *f* is false.
COLUMN_DEFAULT	VARCHAR	The default value of a column, such as empty or expression.

SYSTEM_TABLES

Returns a list of all system table names.

Column Name	Data Type	Description
TABLE_SCHEMA_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the schema.
TABLE_SCHEMA	VARCHAR	The schema name in which the system table resides, one of the following: • V_CATALOG • V_MONITOR
TABLE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the table.
TABLE_NAME	VARCHAR	The name of the system table.
TABLE_DESCRIPTION	VARCHAR	A description of the system table's purpose.
IS_SUPERUSER_ONLY	BOOLEAN	Specifies whether the table is accessible only by superusers.
IS_MONITORABLE	BOOLEAN	Specifies whether the table is accessible by a user with the SYSMONITOR role enabled.
IS_ACCESSIBLE_DURING_LOCKDOWN	BOOLEAN	Specifies whether non-superuser access to this system table is restricted after RESTRICT_SYSTEM_TABLES_ACCESS is called. By default, Vertica respects this setting and uses it to restrict system table access. To enable non-superuser access to all system tables, you must explicitly call RESTRICT_SYSTEM_TABLES_ACCESS. In general, this field is set to f (false) for system tables that contain information that is typically needed by most users, such as TYPES. Conversely, this field is set to t (true) for tables with data that should be

Column Name	Data Type	Description
		restricted, such as database settings and user-specific information.

TABLE_CONSTRAINTS

Provides information about table constraints.

Column Name	Data Type	Description
CONSTRAINT_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the constraint.
CONSTRAINT_NAME	VARCHAR	The name of the constraint, if specified as UNIQUE, FOREIGN KEY, NOT NULL, PRIMARY KEY, or CHECK.
CONSTRAINT_SCHEMA_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the schema containing the constraint.
CONSTRAINT_KEY_COUNT	INTEGER	The number of constraint keys.
FOREIGN_KEY_COUNT	INTEGER	The number of foreign keys.
TABLE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the table.
TABLE_NAME	VARCHAR	The name of the table that contains the UNIQUE, FOREIGN KEY, NOT NULL, or PRIMARY KEY constraint
FOREIGN_TABLE_ID	INTEGER	The unique object ID of the foreign table referenced in a foreign key constraint (zero if not a foreign key constraint).
CONSTRAINT_TYPE	CHAR	Indicates the constraint type. **Valid Values:** • c — check • f — foreign • p — primary • u — unique

Column Name	Data Type	Description
IS_ENABLED	BOOLEAN	Indicates if a constraint for a primary key, unique key, or check constraint is currently enabled. Can be t (True) or f (False).
PREDICATE	VARCHAR	For check constraints, the SQL expression.

See Also

ANALYZE_CONSTRAINTS

TABLES

Provides information about all tables in the database.

Tip:
Columns TABLE_SCHEMA and TABLE_NAME are case sensitive. To query TABLES on these columns, use the case-insensitive ILIKE predicate. For example:

```
SELECT table_schema, table_name FROM v_catalog.tables WHERE table_schema ILIKE 'Store%';
```

Column Name	Data Type	Description
TABLE_SCHEMA_ID	INTEGER	A unique numeric ID that identifies the schema and is assigned by the Vertica catalog.
TABLE_SCHEMA	VARCHAR	The schema name for which information is listed.
TABLE_ID	INTEGER	A unique numeric ID that identifies the table and is assigned by the Vertica catalog.
TABLE_NAME	VARCHAR	The table name for which information is listed.

Column Name	Data Type	Description
OWNER_ID	INTEGER	A unique numeric ID that identifies the owner and is assigned by the Vertica catalog.
OWNER_NAME	VARCHAR	The name of the user who created the table.
IS_TEMP_TABLE	BOOLEAN	Indicates whether this table is a temporary table.
IS_SYSTEM_TABLE	BOOLEAN	Indicates whether table is a system table.
FORCE_OUTER	INTEGER	Specifies whether this table is joined to another as an inner or outer input. For details, see Controlling Join Inputs in Analyzing Data.
IS_FLEXTABLE	BOOLEAN	Indicates whether the table is a Flex table.
IS_SHARED	BOOLEAN	Indicates whether the table is located on shared storage.  **Note:** In Eon Mode, temporary tables are never shared. If IS_TEMP_TABLE is set to true, Vertica ignores IS_SHARED settings.
TABLE_HAS_AGGREGATE_PROJECTION	BOOLEAN	Indicates whether the table has live aggregate projections.
SYSTEM_TABLE_CREATOR	VARCHAR	The name of the process that created the table, such as Designer.

Column Name	Data Type	Description
PARTITION_EXPRESSION	VARCHAR	The table's partition expression.
CREATE_TIME	TIMESTAMP	Returns the timestamp, indicating when the table was created.
TABLE_DEFINITION	VARCHAR	The COPY statement table definition. This column is applicable only to external tables.
RECOVER_PRIORITY	INTEGER	The priority rank for the table for a Recovery By Table.
STORAGE_MODE	INTEGER	Deprecated, always set to DIRECT.
PARTITION_GROUP_EXPRESSION	VARCHAR	The expression of a GROUP BY clause that qualifies a table's partition clause.
ACTIVE_PARTITION_COUNT	INTEGER	Specifies a table's active partition count as set by CREATE TABLE or ALTER TABLE. If null, the table gets its active partition count from configuration parameter ActivePartitionCount. For details, see Active and Inactive Partitions.

Examples

Find when tables were created:

```
=> SELECT table_schema, table_name, create_time FROM tables;
 table_schema |      table_name       |          create_time
--------------+-----------------------+-------------------------------
 public       | customer_dimension    | 2011-08-15 11:18:25.784203-04
 public       | product_dimension     | 2011-08-15 11:18:25.815653-04
```

```
 public       | promotion_dimension   | 2011-08-15 11:18:25.850592-04
 public       | date_dimension        | 2011-08-15 11:18:25.892347-04
 public       | vendor_dimension      | 2011-08-15 11:18:25.942805-04
 public       | employee_dimension    | 2011-08-15 11:18:25.966985-04
 public       | shipping_dimension    | 2011-08-15 11:18:25.999394-04
 public       | warehouse_dimension   | 2011-08-15 11:18:26.461297-04
 public       | inventory_fact        | 2011-08-15 11:18:26.513525-04
 store        | store_dimension       | 2011-08-15 11:18:26.657409-04
 store        | store_sales_fact      | 2011-08-15 11:18:26.737535-04
 store        | store_orders_fact     | 2011-08-15 11:18:26.825801-04
 online_sales | online_page_dimension | 2011-08-15 11:18:27.007329-04
 online_sales | call_center_dimension | 2011-08-15 11:18:27.476844-04
 online_sales | online_sales_fact     | 2011-08-15 11:18:27.49749-04
(15 rows)
```

Find out whether certain tables are temporary and flex tables:

```
=> SELECT distinct table_name, table_schema, is_temp_table, is_flextable FROM v_catalog.tables
   WHERE table_name ILIKE 't%';
  table_name  | table_schema | is_temp_table | is_flextable
--------------+--------------+---------------+-----------------
 t2_temp      | public       | t             | t
 tt_keys      | public       | f             | f
 t2_temp_keys | public       | f             | f
 t3           | public       | t             | f
 t1           | public       | f             | f
 t9_keys      | public       | f             | f
 t2_keys      | public       | f             | t
 t6           | public       | t             | f

TEXT_INDICES

Provides summary information about the text indices in Vertica.

Column Name	Data Type	Description
INDEX_ID	INTEGER	A unique numeric ID that identifies the index and is assigned by the Vertica catalog.
INDEX_NAME	VARCHAR	The name of the text index.
INDEX_SCHEMA_NAME	VARCHAR	The schema name of the text index.

Column Name	Data Type	Description
SOURCE_TABLE_ID	INTEGER	A unique numeric ID that identifies the table and is assigned by the Vertica catalog.
SOURCE_TABLE_NAME	VARCHAR	The name of the source table used to build the index.
SOURCE_TABLE_SCHEMA_NAME	VARCHAR	The schema name of the source table.
TOKENIZER_ID	INTEGER	A unique numeric ID that identifies the tokenizer and is assigned by the Vertica catalog.
TOKENIZER_NAME	VARCHAR	The name of the tokenizer used when building the index.
TOKENIZER_SCHEMA_NAME	VARCHAR	The schema name of the tokenizer.
STEMMER_ID	INTEGER	A unique numeric ID that identifies the stemmer and is assigned by the Vertica catalog.
STEMMER_NAME	VARCHAR	The name of the stemmer used when building the index.
STEMMER_SCHEMA_NAME	VARCHAR	The schema name of the stemmer.
TEXT_COL	VARCHAR	The text column used to build the index.

TYPES

Provides information about supported data types. This table does not include inlined complex types; see COMPLEX_TYPES instead. This table does include arrays and sets of primitive types.

Column Name	Data Type	Description
TYPE_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies the specific data type.
ODBC_TYPE	INTEGER	The numerical ODBC type.
ODBC_ SUBTYPE	INTEGER	The numerical ODBC subtype, used to differentiate types such as time and interval that have multiple subtypes.

Column Name	Data Type	Description
MIN_SCALE	INTEGER	The minimum number of digits supported to the right of the decimal point for the data type.
MAX_SCALE	INTEGER	The maximum number of digits supported to the right of the decimal point for the data type. A value of 0 is used for types that do not use decimal points.
COLUMN_SIZE	INTEGER	The number of characters required to display the type. See: http://msdn.microsoft.com/en-us/library/windows/desktop/ms711786%28v=VS.85%29.aspx for the details on COLUMN_SIZE for each type.
INTERVAL_MASK	INTEGER	For data types that are intervals, the bitmask to determine the range of the interval from the Vertica TYPE_ID. Details are available in the Vertica SDK.
TYPE_NAME	VARCHAR	The data type name associated with a particular data type ID.
CREATION_PARAMETERS	VARCHAR	A list of keywords, separated by commas, corresponding to each parameter that the application may specify in parentheses when using the name that is returned in the TYPE_NAME field. The keywords in the list can be any of the following: length, precision, or scale. They appear in the order that the syntax requires them to be used.

USER_AUDITS

Lists the results of database and object size audits generated by users calling the AUDIT function. See Monitoring Database Size for License Compliance in the Administrator's Guide for more information.

Column Name	Data Type	Description
SIZE_BYTES	INTEGER	The estimated raw data size of the database
USER_ID	INTEGER	The ID of the user who generated the audit

Column Name	Data Type	Description
USER_NAME	VARCHAR	The name of the user who generated the audit
OBJECT_ID	INTEGER	The ID of the object being audited
OBJECT_TYPE	VARCHAR	The type of object being audited (table, schema, etc.)
OBJECT_SCHEMA	VARCHAR	The schema containing the object being audited
OBJECT_NAME	VARCHAR	The name of the object being audited
AUDITED_SCHEMA_NAME	VARCHAR	The name of the schema on which you want to query HISTORICAL data. After running audit on a table, you can drop the table. In this case, object_schema becomes NULL.
AUDITED_OBJECT_NAME	VARCHAR	The name of the object on which you want to query HISTORICAL data. After running audit on a table, you can drop the table. In this case, object_name becomes NULL.
LICENSE_NAME	VARCHAR	The name of the license. After running a compliance audit, the value for this column is always `vertica`.
AUDIT_START_TIMESTAMP	TIMESTAMPTZ	When the audit started
AUDIT_END_TIMESTAMP	TIMESTAMPTZ	When the audit finished
CONFIDENCE_LEVEL_PERCENT	FLOAT	The confidence level of the size estimate

Column Name	Data Type	Description
ERROR_TOLERANCE_PERCENT	FLOAT	The error tolerance used for the size estimate
USED_SAMPLING	BOOLEAN	Whether data was randomly sampled (if false, all of the data was analyzed)
CONFIDENCE_INTERVAL_LOWER_BOUND_BYTES	INTEGER	The lower bound of the data size estimate within the confidence level
CONFIDENCE_INTERVAL_UPPER_BOUND_BYTES	INTEGER	The upper bound of the data size estimate within the confidence level
SAMPLE_COUNT	INTEGER	The number of data samples used to generate the estimate
CELL_COUNT	INTEGER	The number of cells in the database

USER_CLIENT_AUTH

Provides information about the client authentication methods that are associated with database users. You associate an authentication method with a user using GRANT (Authentication).

Column Name	Data Type	Description
USER_OID	INTEGER	A unique identifier for that user.
USER_NAME	VARCHAR	Name of the user.
AUTH_OID	INTEGER	A unique identifier for the authentication method you are using.
AUTH_NAME	VARCHAR	Name that you gave to the authentication method.
GRANTED_TO	BOOLEAN	Name of the user with whom you have associated the authentication method using GRANT (Authentication).

USER_FUNCTION_PARAMETERS

Provides information about the parameters of a C++ user-defined function (UDx). You can only view parameters that have the `Properties.visible` parameter set to `TRUE`.

Column Name	Data Type	Description
SCHEMA_NAME	VARCHAR (128)	The schema to which the function belongs.
FUNCTION_NAME	VARCHAR (128)	The name assigned by the user to the user-defined function.
FUNCTION_TYPE	VARCHAR (128)	The type of user-defined function. For example, 'User Defined Function'.
FUNCTION_ARGUMENT_TYPE	VARCHAR (8192)	The number and data types of input arguments for the function.
PARAMETER_NAME	VARCHAR (128)	The name of the parameter for the user-defined function.
DATA_TYPE	VARCHAR (128)	The data type of the parameter.
DATA_TYPE_ID	INTEGER	A number specifying the ID for the parameter's data type.
DATA_TYPE_LENGTH	INTEGER	The maximum length of the parameter's data type.
IS_REQUIRED	BOOLEAN	Indicates whether the parameter is required or not. If set to TRUE, and you don't provide the parameter, Vertica throws an error.
CAN_BE_NULL	BOOLEAN	Indicates whether the parameter can be passed as a NULL value. If set to FALSE, you pass the parameter with a NULL value, Vertica throws an error.
COMMENT	VARCHAR (128)	A user-supplied description of the parameter.

Privileges

Any user can query the USER_FUNCTION_PARAMETERS table. However, users can only see table information about those UDx functions which the user has permission to use.

See Also

- Developing User-Defined Extensions (UDxs)
- UDx Parameters

USER_FUNCTIONS

Returns metadata about user-defined SQL functions (which store commonly used SQL expressions as a function in the Vertica catalog) and user-defined functions.

Column Name	Data Type	Description
SCHEMA_NAME	VARCHAR	The name of the schema in which this function exists.
FUNCTION_NAME	VARCHAR	The name assigned by the user to the SQL function or user-defined function.
PROCEDURE_TYPE	VARCHAR	The type of user-defined function. For example, 'User Defined Function'.
FUNCTION_RETURN_TYPE	VARCHAR	The data type name that the SQL function returns.
FUNCTION_ARGUMENT_TYPE	VARCHAR	The number and data types of parameters for the function.
FUNCTION_DEFINITION	VARCHAR	The SQL expression that the user defined in the SQL function's function body.
VOLATILITY	VARCHAR	The SQL function's volatility (whether a function returns the same output given the same input). Can be **immutable**, **volatile**, or **stable**.
IS_STRICT	BOOLEAN	Indicates whether the SQL function is **strict**, where *t* is true and *f* is false.

Column Name	Data Type	Description
IS_FENCED	BOOLEAN	Indicates whether the function runs in Fenced and Unfenced Modes or not.
COMMENT	VARCHAR	A comment about this function provided by the function creator.

Notes

- The volatility and strictness of a SQL function are automatically inferred from the function definition in order that Vertica determine the correctness of usage, such as where an immutable function is expected but a volatile function is provided.
- The volatility and strictness of a UDx is defined by the UDx's developer.

Example

Create a SQL function called `myzeroifnull` in the public schema:

```
=> CREATE FUNCTION myzeroifnull(x INT) RETURN INT
   AS BEGIN
     RETURN (CASE WHEN (x IS NOT NULL) THEN x ELSE 0 END);
   END;
```

Now query the `USER_FUNCTIONS` table. The query returns just the `myzeroifnull` macro because it is the only one created in this schema:

```
=> SELECT * FROM user_functions;
-[ RECORD 1 ]----------+--------------------------------------------------
schema_name            | public
function_name          | myzeroifnull
procedure_type         | User Defined Function
function_return_type   | Integer
function_argument_type | x Integer
function_definition    | RETURN CASE WHEN (x IS NOT NULL) THEN x ELSE 0 END
volatility             | immutable
is_strict              | f
is_fenced              | f
comment                |
```

See Also

- CREATE FUNCTION (SQL)
- ALTER FUNCTION (Scalar)
- DROP FUNCTION

USER_PROCEDURES

Provides information about external procedures that have been defined for Vertica. User see only the procedures they can execute.

Column Name	Data Type	Description
PROCEDURE_NAME	VARCHAR	The name given to the external procedure through the CREATE PROCEDURE statement.
PROCEDURE_ARGUMENTS	VARCHAR	Lists arguments for the external procedure.
SCHEMA_NAME	VARCHAR	Indicates the schema in which the external procedure is defined.

Example

```
=> SELECT * FROM user_procedures;
 procedure_name | procedure_arguments | schema_name
----------------+---------------------+-------------
 helloplanet    | arg1 Varchar        | public
(1 row)
```

USER_TRANSFORMS

Lists the currently-defined user-defined transform functions (UDTFs).

Column Name	Data Type	Description
SCHEMA_NAME	VARCHAR (128)	The name of the schema containing the UDTF.

Column Name	Data Type	Description
FUNCTION_NAME	VARCHAR (128)	The SQL function name assigned by the user.
FUNCTION_RETURN_TYPE	VARCHAR (128)	The data types of the columns the UDTF returns.
FUNCTION_ARGUMENT_TYPE	VARCHAR (8192)	The data types of the columns that make up the input row.
FUNCTION_DEFINITION	VARCHAR (128)	A string containing the name of the factory class for the UDTF, and the name of the library that contains it.
IS_FENCED	BOOLEAN	Whether the UDTF runs in fenced mode.

Privileges

No explicit permissions are required; however, users see only UDTFs contained in schemas to which they have read access.

See Also

- Transform Functions (UDTFs)
- CREATE TRANSFORM FUNCTION

USERS

Provides information about all users in the database.

Tip:
To see if a role has been assigned to a user, call the function HAS_ROLE.

Column Name	Data Type	Description
USER_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies the user.

Column Name	Data Type	Description
USER_NAME	VARCHAR	The user name for which information is listed.
IS_SUPER_USER	BOOLEAN	A system flag, where *t* (true) identifies the superuser created at the time of installation. All other users are denoted by *f* (false).
PROFILE_NAME	VARCHAR	The name of the profile to which the user is assigned. The profile controls the user's password policy.
IS_LOCKED	BOOLEAN	Whether the user's account is locked. A locked user cannot log into the system.
LOCK_TIME	TIMESTAMPTZ	When the user's account was locked. Used to determine when to automatically unlock the account, if the user's profile has a PASSWORD_LOCK_TIME parameter set.
RESOURCE_POOL	VARCHAR	The **resource pool** to which the user is assigned.
MEMORY_CAP_KB	VARCHAR	The maximum amount of memory a query run by the user can consume, in kilobytes.
TEMP_SPACE_CAP_KB	VARCHAR	The maximum amount of temporary disk space a query run by the user can consume, in kilobytes.
RUN_TIME_CAP	VARCHAR	The maximum amount of time any of the user's queries are allowed to run.
MAX_CONNECTIONS	VARCHAR	The maximum number of connections allowed for this user.
CONNECTION_LIMIT_MODE	VARCHAR	Indicates whether the user sets connection limits through the node or in database mode.
IDLE_SESSION_TIMEOUT	VARCHAR	The time the system waits before timing out the user's idle session. Maximum value is 1 year. See Year-Month Subtype Units for valid intervals.
GRACE_PERIOD	VARCHAR	Specifies how long a user query can block on any session socket, while awaiting client input or

Column Name	Data Type	Description
		output. If the socket is blocked for a continuous period that exceeds the grace period setting, the server shuts down the socket and throws a fatal error. The session is then terminated.
ALL_ROLES	VARCHAR	Roles assigned to the user. An asterisk in ALL_ROLES output means role granted WITH ADMIN OPTION. See Database Roles in the Administrator's Guide.
DEFAULT_ROLES	VARCHAR	Default roles assigned to the user. An asterisk in DEFAULT_ROLES output means role granted WITH ADMIN OPTION. See Enabling Roles Automatically in the Administrator's Guide.
SEARCH_PATH	VARCHAR	Sets the default schema search path for the user. See Setting Search Paths in the Administrator's Guide.
LDAP_DN	VARCHAR	Indicates whether or not the Vertica Analytic Database user maps to an LDAP Link user. When the column is set to dn, the Vertica user maps to LDAP Link..
LDAP_URI_HASH	INTEGER	The URI hash number for the LDAP user.
IS_ORPHANED_FROM_LDAP	BOOLEAN	Indicates if the user is disconnected (orphaned) from LDAP, set to one of the following: • t: User is orphaned • f : User is not orphaned For more information see Troubleshooting LDAP Link Issues

- GRANTS
- HAS_ROLE

VIEW_COLUMNS

Provides view attribute information.

Note:
If you drop a table that is referenced by a view, Vertica does not drop the view. However, attempts to access information about it from VIEW_COLUMNS return an error that the view is invalid.

Column Name	Data Type	Description
TABLE_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog that identifies this view.
TABLE_SCHEMA	VARCHAR	The name of this view's schema.
TABLE_NAME	VARCHAR	The view name.
COLUMN_ID	VARCHAR	A unique VARCHAR ID, assigned by the Vertica catalog, that identifies a column in this view.
COLUMN_NAME	VARCHAR	The name of a column in this view.
DATA_TYPE	VARCHAR	The data type of a view column.
DATA_TYPE_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies a view column's data type.
DATA_TYPE_LENGTH	INTEGER	The data type's maximum length.
CHARACTER_MAXIMUM_LENGTH	INTEGER	The column's maximum length, valid only for character types.
NUMERIC_PRECISION	INTEGER	The column's number of significant decimal digits.
NUMERIC_SCALE	INTEGER	The column's number of fractional digits.
DATETIME_PRECISION	INTEGER	For TIMESTAMP data type, returns the declared precision; returns null if no precision was declared.

Column Name	Data Type	Description
INTERVAL_PRECISION	INTEGER	The number of fractional digits retained in the seconds field.
ORDINAL_POSITION	INTEGER	The position of the column relative to other columns in the view.

See Also

VIEWS

VIEW_TABLES

Shows details about view-related dependencies, including the table that reference a view, its schema, and owner.

Column Name	Data Type	Description
TABLE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the view.
TABLE_SCHEMA	VARCHAR	Name of the view schema.
TABLE_NAME	VARCHAR	Name of the view.
REFERENCE_TABLE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the view's source table.
REFERENCE_TABLE_SCHEMA	VARCHAR	Name of the view's source table schema.
REFERENCE_TABLE_NAME	VARCHAR	Name of the view's source table.
REFERENCE_TABLE_OWNER_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the view owner.

VIEWS

Provides information about all **views** within the system. See Views for more information.

Column Name	Data Type	Description
TABLE_SCHEMA_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the view schema.
TABLE_SCHEMA	VARCHAR	The name of the view schema.
TABLE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the view.
TABLE_NAME	VARCHAR	The view name.
OWNER_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the view owner.
OWNER_NAME	VARCHAR	View owner's user name
VIEW_DEFINITION	VARCHAR	The query that defines the view.
IS_SYSTEM_VIEW	BOOLEAN	Indicates whether the view is a system view.
SYSTEM_VIEW_CREATOR	VARCHAR	View creator's user name.
CREATE_TIME	TIMESTAMP	Specifies when this view was created.
IS_LOCAL_TEMP_VIEW	BOOLEAN	Indicates whether this view is a temporary view stored locally.
INHERIT_PRIVILEGES	BOOLEAN	Indicates whether inherited privileges are enabled for this view. For details, see Setting Privilege Inheritance on Tables and Views in the Administrator's Guide.

VIEW_COLUMNS

V_MONITOR Schema

The system tables in this section reside in the `v_monitor` schema. These tables provide information about the health of the Vertica database.

ACTIVE_EVENTS

Returns all active events in the cluster. See Monitoring Events.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The node name where the event occurred.
EVENT_CODE	INTEGER	A numeric ID that indicates the type of event. See Event Types for a list of event type codes.
EVENT_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies the specific event.
EVENT_SEVERITY	VARCHAR	The severity of the event from highest to lowest. These events are based on standard syslog severity types. • 0—Emergency • 1—Alert • 2—Critical • 3—Error • 4—Warning • 5—Notice • 6—Informational • 7—Debug
EVENT_POSTED_TIMESTAMP	TIMESTAMP	The year, month, day, and time the event was reported. The time is posted in military time.
EVENT_EXPIRATION	VARCHAR	The year, month, day, and time the event expire. The time is posted in military time. If the cause of the event is still active, the event

Column Name	Data Type	Description
		is posted again.
EVENT_CODE_DESCRIPTION	VARCHAR	A brief description of the event and details pertinent to the specific situation.
EVENT_PROBLEM_DESCRIPTION	VARCHAR	A generic description of the event.
REPORTING_NODE	VARCHAR	The name of the node within the cluster that reported the event.
EVENT_SENT_TO_CHANNELS	VARCHAR	The event logging mechanisms that are configured for Vertica. These can include `vertica.log`, (configured by default) syslog, and SNMP.
EVENT_POSTED_COUNT	INTEGER	Tracks the number of times an event occurs. Rather than posting the same event multiple times, Vertica posts the event once and then counts the number of additional instances in which the event occurs.

ALLOCATOR_USAGE

Provides real-time information on the allocation and reuse of memory pools for a Vertica node.

There are two memory pools in Vertica, global and SAL. The global memory pool is related to Vertica catalog objects. The SAL memory pool is related to the system storage layer. These memory pools are physical structures from which Vertica allocates and reuses portions of memory.

Within the memory pools, there are two allocation types. Both global and SAL memory pools include chunk and object memory allocation types.

- *Chunk* allocations are from tiered storage, and are grouped into sizes, in bytes, that are powers of 2.
- *Object* allocations are object types, for example, a table or projection. Each object assumes a set size.

The table provides detailed information on these memory pool allocations.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The name of the node from which Vertica has collected this allocator information.
POOL_NAME	VARCHAR	One of two memory pools: • global: Memory pool is related to Vertica catalog objects. • SAL: Memory pool is related to the system storage layer.
ALLOCATION_TYPE	VARCHAR	One of two memory allocation types: • chunk: Chunk allocations are grouped into sizes that are powers of 2. • object: Object allocations assume a set amount of memory based upon the specific object.
UNIT_SIZE	INTEGER	The size, in bytes, of the memory allocation. For example, if the allocation type is a table (an object type), then Vertica allots 8 bytes.
FREE_COUNT	INTEGER	Indicates the count of blocks of freed memory that Vertica has reserved for future memory needs. For example, if you delete a table, Vertica reserves the 8 bytes originally allotted for the table. The 8 bytes freed become 1 unit of memory that Vertica adds to this column.
FREE_BYTES	INTEGER	Indicates the number of freed memory bytes. For example, with a table deletion, Vertica adds 8 bytes to this column. **Note:** Vertica does not release memory after originally allocating it, unless the node or database is restarted.
USED_COUNT	INTEGER	Indicates the count of in-use blocks for this

Column Name	Data Type	Description
		allocation. For example, if your database includes two table objects, Vertica adds 2 to this column.
USED_BYTES	INTEGER	The number of bytes of in-use blocks of memory. For example, if your database includes two table objects, each of which assume 8 bytes, Vertica adds 16 to this column.
TOTAL_SIZE	INTEGER	Indicates the number of bytes that is the sum of all free and used memory.
CAPTURE_TIME	TIMESTAMPTZ	Indicates the current timestamp for when Vertica collected the for this table.
ALLOCATION_NAME	VARCHAR	Provides the name of the allocation type. • If the allocation is an object type, provides the name of the object. For example, `CAT::Schema`. Object types can also have the name `internal`, meaning that the object is an internal data structure. Those object types that are not internal are prefaced with either `CAT` or `SAL`. Those prefaced with `CAT` indicate memory from the global memory pool. `SAL` indicates memory from the system storage memory pool. • If the allocation type is chunk, indicates a power of 2 in this field to represent the number of bytes assumed by the chunk. For example, `2^5`.

Sample: How Memory Pool Memory is Allotted, Retained, and Freed

The following table shows sample column values based upon a hypothetical example. The sample illustrates how column values change based upon addition or deletion of a table object.

- When you add a table object (t1), Vertica assumes a UNIT_SIZE of 8 bytes, with a USED_COUNT of 1.
- When you add a second table object (t2), the USED_COUNT increases to 2. Since each object assumes 8 bytes, USED_BYTES increases to 16.
- When you delete one of the two table objects, Vertica USED_COUNT decreases to 1, and USED_BYTES decreases to 8. Since Vertica retains the memory for future use, FREE_BYTES increases to 8, and FREE_COUNT increases to 1.
- Finally, when you create a new table object (t3), Vertica frees the memory for reuse. FREE_COUNT and FREE_BYTES return to 0.

Column Names	Add One Table Object (t1)	Add a Second Table Object (t2)	Delete a Table Object (t2)	Create a New Table Object (t3)
NODE_NAME	v_vmart_node0001	v_vmart_node0001	v_vmart_node0001	v_vmart_node0001
POOL_NAME	global	global	global	global
ALLOCATION_TYPE	object	object	object	object
UNIT_SIZE	8	8	8	8
FREE_COUNT	0	0	1	0
FREE_BYTES	0	0	8	0
USED_COUNT	1	2	1	2
USED_BYTES	8	16	8	16
TOTAL_SIZE	8	16	16	16
CAPTURE_TIME	2017-05-24	2017-05-24	2017-05-24	2017-05-24

Column Names	Add One Table Object (t1)	Add a Second Table Object (t2)	Delete a Table Object (t2)	Create a New Table Object (t3)
	13:28:07.83855-04	14:16:04.480953-04	14:16:32.077322-04	14:17:07.320745-04
ALLOCATION_NAME	CAT::Table	CAT::Table	CAT::Table	CAT::Table

Example

The following example shows one sample record for a chunk allocation type, and one for an object type.

```
=> \x
Expanded display is on.

=> select * from allocator_usage;
-[ RECORD 1 ]---+----------------------------
node_name       | v_vmart_node0004
pool_name       | global

allocation_name | SAL::WOSAlloc
.
.
.
```

COLUMN_STORAGE

Returns the amount of disk storage used by each column of each projection on each node.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The node name for which information is listed.
COLUMN_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the column.
COLUMN_NAME	VARCHAR	The column name for which information is listed.
ROW_COUNT	INTEGER	The number of rows in the column.
USED_BYTES	INTEGER	The disk storage allocation of the column in bytes.
ENCODINGS	VARCHAR	The encoding type for the column.
COMPRESSION	VARCHAR	The compression type for the column. You can compare `ENCODINGS` and `COMPRESSION` columns to see how different encoding types affect column storage when optimizing for compression.
WOS_ROW_ COUNT	INTEGER	(Deprecated) The number of WOS rows in the column.
ROS_ROW_ COUNT	INTEGER	The number of ROS rows in the column.
ROS_USED_ BYTES	INTEGER	The number of ROS bytes in the column.
ROS_COUNT	INTEGER	The number of ROS containers.
PROJECTION_ID	INTEGER	Catalog-assigned numeric value that uniquely identifies the projection.
PROJECTION_ NAME	VARCHAR	The associated projection name for the column.

Column Name	Data Type	Description
PROJECTION_ SCHEMA	VARCHAR	The name of the schema associated with the projection.
ANCHOR_ TABLE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the anchor table.
ANCHOR_ TABLE_NAME	VARCHAR	The associated table name.
ANCHOR_ TABLE_SCHEMA	VARCHAR	The associated table's schema name.
ANCHOR_ TABLE_ COLUMN_ID	VARCHAR	Catalog-assigned VARCHAR value that uniquely identifies a table column.
ANCHOR_ TABLE_ COLUMN_NAME	VARCHAR	The name of the anchor table.

COMMUNAL_CLEANUP_RECORDS

Eon Mode only

This system table lists files that Vertica considers leaked on an Eon Mode communal storage. Leaked files are files that are detected as needing deletion but were missed by the normal cleanup mechanisms. This information helps you determine how much space on the communal storage you can reclaim or have reclaimed by cleaning up the leaked files.

Column Name	Data Type	Description
detection_ timestamp	TIMESTAMPTZ	Timestamp at which the file was detected as leaked.
location_ path	VARCHAR	The path of communal storage location.
file_name	VARCHAR	The name of the leaked file.

Column Name	Data Type	Description
size_in_bytes	INTEGER	The size of the leaked file in bytes.
queued_for_delete	BOOLEAN	Specifies whether the file was queued for deletion. Files queued for deletion might not be deleted right away. Also, a subsequent call to clean_communal_storage reports these files as leaked if the files hadn't already been deleted.

Example

```
=> SELECT clean_communal_storage('true');
                                                                                                clean_communal_storage

-----------------------------------------------------------------------------------------------------------------------
----------------------------------------
 CLEAN COMMUNAL STORAGE
Total leaked files: 10
Total size: 217088
Files have been queued for deletion.
Check communal_cleanup_records for more information.
(1 row)

=> SELECT * FROM communal_cleanup_records;
      detection_timestamp      | location_path     |                        file_name
     | size_in_bytes | queued_for_delete
-------------------------------+-------------------+-------------------------------------------------

CLEAN_COMMUNAL_STORAGE

COMMUNAL_TRUNCATION_STATUS

Eon Mode only

Stores information on the state of the cluster in the case of a catalog truncation event.

Column Name	Data Type	Description
CURRENT_CATALOG_VERSION	VARCHAR	Current value of the catalog truncation version (CTV).
CLUSTER_TRUNCATION_VERSION	VARCHAR	The value of the CTV from the `cluster_config.json` file.

Example

```
=> SELECT * FROM COMMUNAL_TRUNCATION_STATUS;
current_catalog_version  | cluster_truncation_version
-------------------------+---------------------------
                      35  |                         35
```

CONFIGURATION_CHANGES

Records the change history of system configuration parameters. This information is useful for identifying:

- Who changed the configuration parameter value
- When the configuration parameter was changed
- Whether nonstandard settings were in effect in the past

Column Name	Data Type	Description
EVENT_TIMESTAMP	TIMESTAMPTZ	Time when the row was recorded.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
USER_ID	INTEGER	Identifier of the user who changed configuration parameters.
USER_NAME	VARCHAR	Name of the user who changed configuration parameters at the time Vertica recorded the session.
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
PARAMETER	VARCHAR	Name of the changed parameter. See Configuration Parameters in the Administrator's Guide for a detailed list of supported parameters.
VALUE	VARCHAR	New value of the configuration parameter.

Privileges

Superuser

CONFIGURATION_PARAMETERS

Provides information about configuration parameters currently in use by the system that are configurable at the database, node, or session level.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The node names on the cluster for which information is listed. ALL indicates that all the nodes have the same value.
PARAMETER_NAME	VARCHAR	The name of the configurable parameter. For names of supported parameters, see

Column Name	Data Type	Description
		Configuration Parameter Categories in the Administrator's Guide.
CURRENT_VALUE	VARCHAR	The value of the current setting for the parameter.
RESTART_VALUE	VARCHAR	The value of the parameter after the next restart.
DATABASE_VALUE	VARCHAR	The value that is set at the database level. If no database-level value is set, the value reflects the default value.
DEFAULT_VALUE	VARCHAR	The default value for the parameter.
CURRENT_LEVEL	VARCHAR	Level at which CURRENT_VALUE is set. Valid values: Node, database, session, or default.
RESTART_LEVEL	VARCHAR	Level at which the parameter will be set after the next restart. Valid values: Node, database, or default.
IS_MISMATCH	BOOLEAN	A *t* (true) setting indicates CURRENT_VALUE and RESTART_VALUE do not match.
GROUPS	VARCHAR	Any group to which the parameter belongs (for example, Security Parameters).
ALLOWED_LEVELS	VARCHAR	Indicates level or levels at which the specified parameter can be set. Valid values: Node, database, or session.
SUPERUSER_ONLY	BOOLEAN	Indicates if the parameter settings are viewable by the superuser only. If true, the following columns will be masked if viewed by a non-superuser: • current_value • restart_value

Column Name	Data Type	Description
		• database_value • default_value
CHANGE_UNDER_SUPPORT_GUIDANCE	BOOLEAN	A *t* (true) setting indicates parameters intended for use only by Vertica.
CHANGE_REQUIRES_RESTART	BOOLEAN	Indicates whether the configuration change requires a restart, where *t* is true and *f* is false.
DESCRIPTION	VARCHAR	A description of the parameter's purpose.

Example

The following example shows a case where the parameter requires a restart for the new setting to take effect:

```
=> SELECT * FROM CONFIGURATION_PARAMETERS WHERE parameter_name = 'EnableSSL';
-[ RECORD 1 ]-----------------+-------------------------
node_name                     | ALL
parameter_name                | EnableSSL
current_value                 | 0
restart_value                 | 1
database_value                | 0
default_value                 | 0
current_level                 | DEFAULT
restart_level                 | NODE
is_mismatch                   | t
groups                        |
allowed_levels                | NODE, DATABASE
superuser_only                | f
change_under_support_guidance | f
change_requires_restart       | t
description                   | Enable SSL for the server
```

The following example shows a case where a non-superuser is viewing a parameter where superuser_only is true.

```
=> \c VMart nonSuperuser

You are now connected to database "VMart" as user "nonSuperuser".

=> SELECT * FROM CONFIGURATION_PARAMETERS WHERE where superuser_only = 't';

-[ RECORD 1 ]-----------------+-------------------------------------
node_name                     | ALL
parameter_name                | LDAPLinkDryRun
current_value                 | ********
restart_value                 | ********
```

```
database_value                | ********
default_value                 | ********
current_level                 | DEFAULT
restart_level                 | DEFAULT
is_mismatch                   | f
groups                        |
allowed_levels                | DATABASE
superuser_only                | t
change_under_support_guidance | t
change_requires_restart       | f
description                   | Just contact LDAP server and log the response. Don't perform any
changes
```

Configuration Parameters in the Administrator's Guide

CPU_USAGE

Records CPU usage history on the system.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
START_TIME	TIMESTAMP	Beginning of history interval.
END_TIME	TIMESTAMP	End of history interval.
AVERAGE_CPU_USAGE_PERCENT	FLOAT	Average CPU usage in percent of total CPU time (0-100) during history interval.

Privileges

Superuser

CRITICAL_HOSTS

Lists the critical hosts whose failure would cause the database to become unsafe and force a shutdown.

Column Name	Data Type	Description
HOST_NAME	VARCHAR	Name of a critical host

Privileges

None

CRITICAL_NODES

Lists the **critical nodes** whose failure would cause the database to become unsafe and force a shutdown.

Column Name	Data Type	Description
NODE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the node.
NODE_NAME	VARCHAR	Name of a critical node.

CRITICAL_SUBCLUSTERS

Lists the primary subclusters whose loss would cause the database to become unsafe and force it to shutdown. Vertica checks this table before stopping a subcluster to ensure it will not trigger a database shutdown. If you attempt to stop or remove a subcluster in this table, Vertica returns an error message. See Starting and Stopping Subclusters for more information.

This table only has contents when the database is in Eon Mode and when one or more subclusters are critical.

Column Name	Data Type	Description
SUBCLUSTER_OID	INTEGER	Unique identifier for the subcluster.
SUBCLUSTER_NAME	VARCHAR	The name of the subcluster in a critical state.

Example

```
=> SELECT * FROM critical_subclusters;
  subcluster_oid   |  subcluster_name
-------------------+-------------------
 45035996273704996 | default_subcluster
(1 row)
```

See Also

CURRENT_SESSION

Returns information about the current active session. Use this table to find out the current session's `sessionID` and get the duration of the previously-run query.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node for which information is listed
USER_NAME	VARCHAR	Name used to log into the database, NULL if the session is internal
CLIENT_HOSTNAME	VARCHAR	Host name and port of the TCP socket from which the client connection was made, NULL if the session is internal
TYPE	INTEGER	Identifies the session type, one of the following integer values: 1 Client, 8 Shutdown 2 DBD, 9 License audit 3 Merge out, 10 Timer service 4 Move out, 11 Connection

<table>
<tr><th>Column Name</th><th>Data Type</th><th>Description</th></tr>
<tr><td></td><td></td><td>
<table>
<tr><td>5</td><td>Rebalance cluster</td><td>12</td><td>VSpread</td></tr>
<tr><td>6</td><td>Recovery</td><td>13</td><td>Sub-session</td></tr>
<tr><td>7</td><td>Refresh</td><td>14</td><td>Repartition table</td></tr>
</table>
</td></tr>
<tr><td>CLIENT_PID</td><td>INTEGER</td><td>Process identifier of the client process that issued this connection. This process might be on a different machine than the server.</td></tr>
<tr><td>LOGIN_
TIMESTAMP</td><td>TIMESTAMP</td><td>When the user logged into the database or the internal session was created. This column can help identify open sessions that are idle.</td></tr>
<tr><td>SESSION_ID</td><td>VARCHAR</td><td>Identifier required to close or interrupt a session. This identifier is unique within the cluster at any point in time, but can be reused when the session closes.</td></tr>
<tr><td>CLIENT_LABEL</td><td>VARCHAR</td><td>User-specified label for the client connection that can be set when using ODBC. See Label in Data Source Name (DSN) Connection Properties in Connecting to Vertica.</td></tr>
<tr><td>TRANSACTION_
START</td><td>TIMESTAMP</td><td>When the current transaction started, NULL if no transaction is running</td></tr>
<tr><td>TRANSACTION_ID</td><td>VARCHAR</td><td>Hexadecimal identifier of the current transaction, NULL if no transaction is in progress</td></tr>
<tr><td>TRANSACTION_
DESCRIPTION</td><td>VARCHAR</td><td>Description of the current transaction</td></tr>
<tr><td>STATEMENT_
START</td><td>TIMESTAMP</td><td>When the current statement started execution, NULL if no statement is running</td></tr>
<tr><td>STATEMENT_ID</td><td>VARCHAR</td><td>Unique numeric ID for the currently-running statement, NULL if no statement is being processed. Combined, TRANSACTION_ID and STATEMENT_ID uniquely identify a statement within a session.</td></tr>
</table>

Column Name	Data Type	Description
LAST_STATEMENT_DURATION_US	INTEGER	Duration in microseconds of the last completed statement
CURRENT_STATEMENT	VARCHAR	The currently-running statement, if any. NULL indicates that no statement is currently being processed.
LAST_STATEMENT	VARCHAR	NULL if the user has just logged in, otherwise the currently running statement or most recently completed statement.
EXECUTION_ENGINE_PROFILING_CONFIGURATION	VARCHAR	See Profiling Settings below.
QUERY_PROFILING_CONFIGURATION	VARCHAR	See Profiling Settings below.
SESSION_PROFILING_CONFIGURATION	VARCHAR	See Profiling Settings below.
CLIENT_TYPE	VARCHAR	Type of client from which the connection was made, one of the following: • ADO.NET Driver • ODBC Driver • JDBC Driver • vsql
CLIENT_VERSION	VARCHAR	Client version
CLIENT_OS	VARCHAR	Client operating system
CLIENT_OS_USER_NAME	VARCHAR	Identifies the user that logged into the database, also set for unsuccessful login attempts.
REQUESTED_PROTOCOL	VARCHAR	Communication protocol version that the ODBC client driver sends to Vertica server, used to

Column Name	Data Type	Description
		support backward compatibility with earlier server versions.
EFFECTIVE_PROTOCOL	VARCHAR	Minimum protocol version supported by client and driver.

Profiling Settings

The following columns show settings for different profiling categories:

- EXECUTION_ENGINE_PROFILING_CONFIGURATION
- QUERY_PROFILING_CONFIGURATION
- SESSION_PROFILING_CONFIGURATION

These are set to one of the following:

Empty	No profiling is set
Session	On for current session
Global	On by default for all sessions
Session, Global	On by default for all sessions, including current session.

For information about controlling profiling settings, see Enabling Profiling in the Administrator's Guide.

DATA_COLLECTOR

Shows settings for all **Data Collector** components: their current retention policy properties and other data collection statistics.

Data Collector is on by default. To turn it off, set configuration parameter EnableDataCollector to 0.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Node name on which data is stored.

Column Name	Data Type	Description
COMPONENT	VARCHAR	Name of the component.
TABLE_NAME	VARCHAR	The data collector table name for which information is listed.
DESCRIPTION	VARCHAR	Short description about the component.
ACCESS_ RESTRICTED	BOOLEAN	Indicates whether access to the table is restricted to the DBADMIN, PSEUDOSUPERUSER, or SYSMONITOR roles.
MEMORY_ BUFFER_SIZE_ KB	INTEGER	Specifies in kilobytes the maximum amount of data that is buffered in memory before moving it to disk. You can modify this value with SET_DATA_COLLECTOR_ POLICY.
DISK_SIZE_KB	INTEGER	Specifies in kilobytes the maximum disk space allocated for this component's Data Collector table. If set to 0, the Data Collector retains only as much component data as it can buffer in memory, as specified by MEMORY_BUFFER_SIZE_KB. You can modify this value with SET_DATA_COLLECTOR_POLICY.
INTERVAL_SET	BOOLEAN	Boolean, specifies whether time-based retention is enabled (INTERVAL_TIME is ≥ 0).
INTERVAL_ TIME	INTERVAL	INTERVAL data type that specifies how long data of a given component is retained in that component's Data Collector table. You can modify this value with SET_ DATA_COLLECTOR_POLICY or SET_DATA_COLLECTOR_ TIME_POLICY. For example, if you specify component TupleMoverEvents and set interval-time to an interval of two days (`'2 days'::interval`), the Data Collector table `dc_tuple_mover_events` retains records of Tuple Mover activity over the last 48 hours. Older Tuple Mover data are automatically dropped from this table.

Column Name	Data Type	Description
		Note: Setting a component's policy's interval_time property has no effect on how much data storage the Data Collector retains on disk for that component. Maximum disk storage capacity is determined by the disk_size_kb property. Setting the interval_time property only affects how long data is retained by the component's Data Collector table. For details, see Configuring Data Retention Policies.
RECORD_TOO_BIG_ERRORS	INTEGER	Integer that increments by one each time an error is thrown because data did not fit in memory (based on the data collector retention policy).
LOST_BUFFERS	INTEGER	Number of buffers lost.
LOST_RECORDS	INTEGER	Number of records lost.
RETIRED_FILES	INTEGER	Number of retired files.
RETIRED_RECORDS	INTEGER	Number of retired records.
CURRENT_MEMORY_RECORDS	INTEGER	The current number of rows in memory.
CURRENT_DISK_RECORDS	INTEGER	The current number of rows stored on disk.
CURRENT_MEMORY_BYTES	INTEGER	Total current memory used in kilobytes.
CURRENT_DISK_BYTES	INTEGER	Total current disk space used in kilobytes.
FIRST_TIME	TIMESTAMP	Timestamp of the first record.

Column Name	Data Type	Description
LAST_TIME	TIMESTAMP	Timestamp of the last record
KB_PER_DAY	FLOAT	Total kilobytes used per day.

Examples

Get the current status of resource pools:

```
=> SELECT * FROM data_collector WHERE component = 'ResourcePoolStatus' ORDER BY node_name;
-[ RECORD 1 ]----------+---------------------------------
node_name              | v_vmart_node0001
component              | ResourcePoolStatus

DATA_READS

Eon Mode only

Lists each storage location that a query reads in Eon Mode. If the query fetches data from multiple locations, this table provides a row for each location per node that read data. For example, a query might run on three nodes and fetch data from the depot and communal storage. In this case, the table displays six rows for the query: three rows for each node's depot read, and three for each node's communal storage read.

Note:
This table is only populated in Eon Mode.

Column Name	Column Type	Description
START_TIME	TIMESTAMP	When Vertica started reading data from the location.

Column Name	Column Type	Description
NODE_NAME	VARCHAR	Name of the node that fetched the data
SESSION_ID	VARCHAR	Unique numeric ID assigned by the Vertica catalog, which identifies the session for which profiling information is captured. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
USER_ID	INT	Unique numeric ID assigned by the Vertica catalog, which identifies the user.
USER_NAME	VARCHAR	Name of the user running the query.
TRANSACTION_ID	INT	Identifier for the transaction within the session, if any. If a session is active but no transaction has begun, TRANSACTION_ID returns NULL.
STATEMENT_ID	INT	Unique numeric ID for the statement that read the data. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID and STATEMENT_ID uniquely identifies a statement within a session; these columns are useful for creating joins with other system tables.
REQUEST_ID	INT	ID of the data request.
LOCATION_ID	INT	ID of the storage location read.
LOCATION_PATH	VARCHAR	Path of the storage container read by the query.
BYTES_READ	INT	Number of bytes read by the query from this location.

Example

```
=> SELECT * FROM V_MONITOR.DATA_READS WHERE TRANSACTION_ID = 45035996273707457;
-[ RECORD 1 ]--+--------------------------------------------------
start_time     | 2019-02-13 19:43:43.840836+00
node_name      | v_verticadb_node0001
session_id     | v_verticadb_node0001-11828:0x6f3
user_id        | 45035996273704962
```

```
user_name      | dbadmin
transaction_id | 45035996273707457
statement_id   | 1
request_id     | 230
location_id    | 45035996273835000
location_path  | /vertica/data/verticadb/v_verticadb_node0001_depot
bytes_read     | 329460142
-[ RECORD 2 ]--+-------------------------------------------------
start_time     | 2019-02-13 19:43:43.8421+00
node_name      | v_verticadb_node0002
session_id     | v_verticadb_node0001-11828:0x6f3

```

DATABASE_BACKUPS

Lists historical information for each backup that successfully completed after running the `vbr` utility. This information is useful for determining whether to create a new backup before you advance the **AHM**. Because this system table displays historical information, its contents do not always reflect the current state of a backup repository. For example, if you delete a backup from a repository, the DATABASE_BACKUPS system table continues to display information about it.

To list existing backups, run `vbr` as described in Viewing Backups in the Administrator's Guide.

Column Name	Data Type	Description
BACKUP_TIMESTAMP	TIMESTAMP	The timestamp of the backup.
NODE_NAME	VARCHAR	The name of the initiator node that performed the

Column Name	Data Type	Description
		backup.
SNAPSHOT_NAME	VARCHAR	The name of the backup, as specified in the `snapshotName` parameter of the `vbr` configuration file.
BACKUP_EPOCH	INTEGER	The database epoch at which the backup was saved.
NODE_COUNT	INTEGER	The number of nodes backed up in the completed backup, and as listed in the `[Mapping`*n*`]` sections of the configuration file.
OBJECTS	VARCHAR	The name of the object(s) contained in an object-level backup. This column is empty if the record is for a full cluster backup.
FILE_SYSTEM_TYPE	VARCHAR	The type of file system, such as Linux.

Privileges

Superuser

DATABASE_CONNECTIONS

Lists the connections to other databases for importing and exporting data. See Copying Data Between Vertica Databases in the Administrator's Guide.

Column Name	Data Type	Description
DATABASE	VARCHAR	The name of the connected database
USERNAME	VARCHAR	The username used to create the connection
HOST	VARCHAR	The host name used to create the connection
PORT	VARCHAR	The port number used to create the connection
ISVALID	BOOLEAN	Whether the connection is still open and usable or not

Example

```
=> CONNECT TO VERTICA vmart USER dbadmin PASSWORD '' ON '10.10.20.150',5433;
CONNECT
=> SELECT * FROM DATABASE_CONNECTIONS;
 database | username |     host     | port | isvalid
----------+----------+--------------+------+---------
 vmart    | dbadmin  | 10.10.20.150 | 5433 | t
(1 row)
```

DATABASE_MIGRATION_STATUS

Provides real-time and historical data on Enterprise-to-Eon database migration attempts.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of a node in the source Enterprise database.
TRANSACTION_ID	VARCHAR	Hexadecimal identifier of the migration process transaction.
PHASE	VARCHAR	A stage of database migration on a given node, one of the following, listed in order of execution: • Catalog Conversion: Conversion of enterprise-mode catalog to Eon-compatible catalog. **Note:** No data is transferred during this phase, so BYTES_TO_TRANSFER and BYTES_TRANSFERED are always set to 0. • Data Transfer: Transfer of data files and library files to communal storage • Catalog Transfer: Includes transfer of checkpoint and transaction log files.
STATUS	VARCHAR	Specifies status of a given phase, one of the following: • RUNNING • COMPLETED

Column Name	Data Type	Description
		• ABORT ABORT indicates a given migration phase was unable to complete—for example, the client disconnected, or a network outage occurred—and the migration returned with an error. In this case, call MIGRATE_ENTERPRISE_TO_EON again to restart migration. For details, see Handling Interrupted Migration.
BYTES_TO_TRANSFER	INTEGER	For each migration phase, the size of data to transfer to communal storage, set when phase status is RUNNING: • Catalog Conversion: 0 • Data Transfer: Size of data files and library files • Catalog Transfer: Size of transaction logs
BYTES_TRANSFERED	INTEGER	For each migration phase, the size of data transfered to communal storage. This value is updated while phase status is RUNNING, and set to the total number of bytes transferred when status is COMPLETED: • Catalog Conversion: 0 • Data Transfer: Size of data files and library files • Catalog Transfer: Size of transaction logs
COMMUNAL_STORAGE_LOCATION	VARCHAR	URL of targeted communal storage location
START_TIME	TIMESTAMP	Demarcate the start and end of each PHASE-specified migration operation.
END_TIME		

Privileges

Superuser

Example

The following example shows data of a migration that is in progress:

```
=> SELECT node_name, phase, status, bytes_to_transfer, bytes_transfered, communal_storage_location
FROM database_migration_status ORDER BY node_name, start_time;
     node_name    |       phase        |  status   | bytes_to_transfer | bytes_transfered | communal_
storage_location
------------------+--------------------+-----------+-------------------+------------------+----------
-----------------
 v_vmart_node0001 | Catalog Conversion | COMPLETED |                 0 |                0 |
s3://verticadbbucket/
 v_vmart_node0001 | Data Transfer      | COMPLETED |              1134 |             1134 |
s3://verticadbbucket/
 v_vmart_node0001 | Catalog Transfer   | COMPLETED |              3765 |             3765 |
s3://verticadbbucket/
 v_vmart_node0002 | Catalog Conversion | COMPLETED |                 0 |                0 |
s3://verticadbbucket/
 v_vmart_node0002 | Data Transfer      | COMPLETED |              1140 |             1140 |
s3://verticadbbucket/
 v_vmart_node0002 | Catalog Transfer   | COMPLETED |              3766 |             3766 |
s3://verticadbbucket/
 v_vmart_node0003 | Catalog Conversion | COMPLETED |                 0 |                0 |
s3://verticadbbucket/
 v_vmart_node0003 | Data Transfer      | RUNNING   |           5272616 |           183955 |
s3://verticadbbucket/
```

DELETE_VECTORS

Holds information on deleted rows to speed up the delete process.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The name of the node storing the deleted rows.
SCHEMA_NAME	VARCHAR	The name of the schema where the deleted rows are located.
PROJECTION_NAME	VARCHAR	The name of the projection where the deleted rows are located.
STORAGE_TYPE	VARCHAR	(Deprecated) The type of storage containing the delete vector, DVROS only.
DV_OID	INTEGER	The unique numeric ID (OID) that identifies this delete vector.
STORAGE_OID	INTEGER	The unique numeric ID (OID) that identifies the storage container that holds the delete vector.
SAL_STORAGE_ID	VARCHAR	Unique hexadecimal numeric ID assigned by the Vertica catalog, which identifies the storage.

Column Name	Data Type	Description
DELETED_ ROW_COUNT	INTEGER	The number of rows deleted.
USED_BYTES	INTEGER	The number of bytes used to store the deletion.
START_EPOCH	INTEGER	The start epoch of the data in the delete vector.
END_EPOCH	INTEGER	The end epoch of the data in the delete vector.
IS_SORTED	BOOLEAN	(Deprecated) Whether WOS storage containe data is sorted.

Example

After you delete data from a Vertica table, that data is marked for deletion. To see the data that is marked for deletion, query the DELETE_VECTORS system table.

Run PURGE to remove the delete vectors from ROS containers.

```
=> SELECT * FROM test1;
 number
--------
      3
     12
     33
     87
     43
     99
(6 rows)

=> DELETE FROM test1 WHERE number > 50;
 OUTPUT
--------
      2
(1 row)

=> SELECT * FROM test1;
 number
--------
     43
      3
     12
     33
(4 rows)
=> SELECT node_name, projection_name, deleted_row_count FROM DELETE_VECTORS;
    node_name     | projection_name | deleted_row_count
------------------+-----------------+-------------------
 v_vmart_node0002 | test1_b1        |                 1
 v_vmart_node0001 | test1_b1        |                 1
 v_vmart_node0001 | test1_b0        |                 1
```

```
 v_vmart_node0003 | test1_b0       |               1
(4 rows)
=> SELECT PURGE();
...
(Table: public.test1) (Projection: public.test1_b0)
(Table: public.test1) (Projection: public.test1_b1)
...
(4 rows)
```

After the ancient history mark (AHM) advances:

```
=> SELECT * FROM DELETE_VECTORS;
 (No rows)
```

DEPLOY_STATUS

Records the history of deployed Database Designer designs and their deployment steps.

Column Name	Data Type	Description
EVENT_TIME	TIMESTAMP	Time when the row recorded the event.
USER_NAME	VARCHAR	Name of the user who deployed a design at the time Vertica recorded the session.
DEPLOY_NAME	VARCHAR	Name the deployment, same as the user-specified design name.
DEPLOY_STEP	VARCHAR	Steps in the design deployment.
DEPLOY_STEP_STATUS	VARCHAR	Textual status description of the current step in the deploy process.
DEPLOY_STEP_COMPLETE_PERCENT	FLOAT	Progress of current step in percentage (0–100).

Column Name	Data Type	Description
DEPLOY_COMPLETE_PERCENT	FLOAT	Progress of overall deployment in percentage (0–100).
ERROR_MESSAGE	VARCHAR	Error or warning message during deployment.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

DEPLOYMENT_PROJECTION_STATEMENTS

Contains information about `CREATE PROJECTION` statements used to deploy a database design. Each row contains information about a different `CREATE PROJECTION` statement. The function `DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY` populates this table.

Column Name	Column Type	Description
DEPLOYMENT_ID	INTEGER	Unique ID that Database Designer assigned to the deployment.
DESIGN_NAME	VARCHAR	Unique name that the user assigned to the design.
DEPLOYMENT_ PROJECTION_ID	INTEGER	Unique ID assigned to the output projection by Database Designer.
STATEMENT_ID	INTEGER	Unique ID assigned to the statement type that creates the projection.
STATEMENT	VARCHAR	Text for the statement that creates the projection.

DEPLOYMENT_PROJECTIONS

Contains information about projections created and dropped during the design. Each row contains information about a different projection. Database Designer populates this table

after the design is deployed.

Column Name	Column Type	Description
deployment_id	INTEGER	Unique ID that Database Designer assigned to the deployment.
deployment_projection_id	INTEGER	Unique ID that Database Designer assigned to the output projection.
design_name	VARCHAR	Name of the design being deployed.
deployment_projection_name	VARCHAR	Name that Database Designer assigned to the projection.
anchor_table_schema	VARCHAR	Name of the schema that contains the table the projection is based on.
anchor_table_name	VARCHAR	Name of the table the projection is based on.
deployment_operation	VARCHAR	Action being taken on the projection, for example, add or drop.
deployment_projection_type	VARCHAR	Indicates whether Database Designer has proposed new projections for this design (DBD) or is using the existing catalog design (CATALOG). The REENCODED suffix indicates that the projection sort order and segmentation are the same, but the projection columns have new encodings: • DBD • CATALOG • DBD_REENCODED • CATALOG_REENCODED
deploy_weight	INTEGER	Weight of this projection in creating the design. This field is always 0 for projections that have been dropped.
estimated_size_on_disk	INTEGER	Approximate size of the projection on disk, in MB.

DEPOT_EVICTIONS

Eon Mode only

Records data on eviction of objects from the depot.

Column Name	Data Type	Description
START_TIME	TIMESTAMP	Demarcate the start and end of each depot eviction operation.
END_TIME		
NODE_NAME	VARCHAR	Name of a node where the eviction occurred.
SESSION_ID	VARCHAR	Unique numeric ID assigned by the Vertica catalog, which identifies the session for which profiling information is captured. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
USER_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog, which identifies the user.
USER_NAME	VARCHAR	The user who made changes to the depot.
TRANSACTION_ID	INTEGER	Identifier for the transaction within the session, if any. If a session is active but no transaction has begun, TRANSACTION_ID returns NULL.
STATEMENT_ID	INTEGER	Unique numeric ID for the statement that caused the eviction. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID and STATEMENT_ID uniquely identifies a statement within a session; these columns are useful for creating joins with other system tables.
REQUEST_ID	INTEGER	Unique identifier of the query request in the user session.
STORAGE_ID	VARCHAR	Unique hexadecimal numeric ID assigned by the Vertica catalog, which identifies the storage.

Column Name	Data Type	Description
STORAGE_OID	INTEGER	Numeric ID assigned by the Vertica catalog, which identifies the storage.
FILE_SIZE_BYTES	INTEGER	The size of the file in bytes that was evicted.
NUMBER_HITS	INTEGER	The number of times the file was accessed.
LAST_ACCESS_TIME	TIMESTAMP	The last time the file was read.
REASON	VARCHAR	The reason the file was evicted, one of the following: • DROP SUBSCRIPTION • CLEAR DEPOT • EVICTION DUE TO NEW • DROP OBJECT • LOAD • QUERY • PEER TO PEER FILL • DEPOT FILL AT STARTUP • DEPOT SIZE CHANGE
IS_PINNED	BOOLEAN	Specifies whether the file is pinned to this depot.

Example

```
=> SELECT * FROM V_MONITOR.DEPOT_EVICTIONS LIMIT 2;
-[ RECORD 1 ]----+-------------------------------------------------
start_time       | 2019-02-20 15:32:26.765937+00

reason           | DROP OBJECT
is_pinned        | f
```

DEPOT_FETCH_QUEUE

Eon Mode only

Lists all pending depot requests for queried file data to fetch from communal storage.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node that requested the fetch.
SAL_STORAGE_ID	VARCHAR	Unique hexadecimal numeric ID assigned by the Vertica catalog, which identifies the storage.
TRANSACTION_ID	INTEGER	Identifies the transaction that contains the fetch-triggering query.
SOURCE_FILE_NAME	VARCHAR	Full path in communal storage of the file to fetch.
DESTINATION_FILE_NAME	VARCHAR	Destination path of the file to fetch.

Example

```
=> \x
Expanded display is on.
=> SELECT * FROM depot_fetch_queue;
-[ RECORD 1 ]----------+-----------------------------------------------------------------
node_name              | v_example_db_node0002

```

DEPOT_FETCHES

Eon Mode only

Records data of depot fetch requests.

Note:
Vertica reports all fetches to this table, including failed fetch attempts and their causes.

Column Name	Data Type	Description
START_TIME	TIMESTAMP	Demarcate the start and end of each depot fetch operation.
END_TIME		
NODE_NAME	VARCHAR	Identifies the node that initiated fetch request.
TRANSACTION_ID	INTEGER	Uniquely identifies the transaction of the query that required the fetched file.
STORAGE_ID	VARCHAR	Unique hexadecimal numeric ID assigned by the Vertica catalog, to identify the storage.
STORAGE_OID	INTEGER	Numeric ID assigned by the Vertica catalog, which identifies the storage.
FILE_SIZE_BYTES	INTEGER	Fetch size in bytes.
SOURCE_FILE	VARCHAR	Source file path used, set to null if the file was fetched from a peer.

Column Name	Data Type	Description
DESTINATION_FILE	VARCHAR	Destination file path
SOURCE_NODE	VARCHAR	Source node from which the file was fetched, set to one of the following: • Name of the source node if file was fetched from a peer • Null if file was fetched from communal storage
IS_SUCCESSFUL	BOOLEAN	Boolean, specifies whether this fetch succeeded.
REASON	VARCHAR	Reason why the fetch failed, null if IS_SUCCESSFUL is true.

Examples

```
=> \x
Expanded display is on.

=> SELECT * FROM DEPOT_FETCHES LIMIT 2;
-[ RECORD 1 ]----+-------------------------------------------------------------
start_time       | 2019-08-30 15:16:15.125962+00

DEPOT_FILES

Eon Mode only

Lists all objects contained in all database depots.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The name of the node this file is on.
SAL_STORAGE_ID	VARCHAR	Unique hexadecimal numeric ID assigned by the Vertica catalog, which identifies the storage.
STORAGE_OID	INTEGER	Numeric ID assigned by the Vertica catalog, which identifies the storage.
COMMUNAL_FILE_PATH	VARCHAR	The path to the original file in communal storage. On AWS, this is an S3 URI.
DEPOT_FILE_PATH	VARCHAR	The path to the file in the depot.
SHARD_NAME	VARCHAR	The name of the shard this file is a part of.
STORAGE_TYPE	VARCHAR	The type of system storing this file.
NUMBER_OF_	INTEGER	The number of times this file has been accessed.

ACCESSES		
FILE_SIZE_ BYTES	INTEGER	How large the file is in bytes.
LAST_ACCESS_ TIME	TIMESTAMPTZ	A timestamp of when the file was last accessed.
ARRIVAL_TIME	TIMESTAMPTZ	When Vertica loaded the file into the depot.
SOURCE	VARCHAR	Where the file came from. One of the following: • LOAD • QUERY • PEER TO PEER FILL • DEPOT FILL AT STARTUP
IS_PINNED	BOOLEAN	Specifies whether the file is pinned to this depot.

Example

```
=> \x
Expanded display is on.
=> SELECT * FROM depot_files LIMIT 2;

-[ RECORD 1 ]------+----------------------------------------------------------------

DEPOT_PIN_POLICIES

Eon Mode only

Lists all objects —tables and table partitions—that are pinned to database depots.

Column Name	Data Type	Description
SCHEMA_NAME	VARCHAR	Schema of the pinned object.
OBJECT_NAME	VARCHAR	Name of the pinned object.
POLICY_DETAILS	VARCHAR	Specifies the object type, one of the following: • Table • Partition
MIN_VAL	VARCHAR	If the pinned object is one or more contiguous table partitions, specifies the range of partition keys.
MAX_VAL		
LOCATION_LABEL		The depot's storage location label.

See Also

- SET_DEPOT_PIN_POLICY_PARTITION
- SET_DEPOT_PIN_POLICY_TABLE
- Managing Depot Caching

DEPOT_SIZES

Eon Mode only

Reports depot caching capacity on Vertica nodes.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The name of the node containing the depot.
LOCATION_OID	INTEGER	Catalog-assigned integer value that uniquely identifies the storage location storing the depot.
LOCATION_PATH	VARCHAR	The path where the depot is stored.
LOCATION_LABEL	VARCHAR	The label associated with the depot's storage location.
MAX_SIZE_BYTES	INTEGER	The maximum size the depot can contain, in bytes.
CURRENT_USAGE_BYTES	INTEGER	The current size of the depot, in bytes.

Example

```
=> \x
Expanded display is on.
=> SELECT * FROM Depot_Sizes;

-[ RECORD 1 ]-------+-------------------------------------------------

node_name           | v_verticadb_node0003
location_oid        | 45035996273823200
location_path       | /vertica/data/verticadb/v_verticadb_node0003_depot
location_label      | auto-data-depot
max_size_bytes      | 0
current_usage_bytes | 0

-[ RECORD 2 ]-------+-------------------------------------------------
node_name           | v_verticadb_node0001
location_oid        | 45035996273823196
location_path       | /vertica/data/verticadb/v_verticadb_node0001_depot
location_label      | auto-data-depot
max_size_bytes      | 33686316032
current_usage_bytes | 206801871

-[ RECORD 3 ]-------+-------------------------------------------------
node_name           | v_verticadb_node0002
location_oid        | 45035996273823198
location_path       | /vertica/data/verticadb/v_verticadb_node0002_depot
location_label      | auto-data-depot
max_size_bytes      | 0
current_usage_bytes | 0
```

DEPOT_UPLOADS

Eon Mode only

Lists details about depot uploads to communal storage.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The name of the node on which the depot resides.
PLAN_ID	VARCHAR	A unique node-specific numeric ID for each plan run by the Optimizer.
SUBMIT_TIME	TIMESTAMP	The time the task was submitted to the uploader.
START_TIME	TIMESTAMP	The time the upload started.
END_TIME	TIMESTAMP	The time the upload ended.
SOURCE_FILE	VARCHAR	The source file path used.
DESTINATION_FILE	VARCHAR	The destination file path.
FILE_SIZE_BYTES	INTEGER	The size of the uploaded file, in bytes.
MEMORY_USED_KB	INTEGER	The size of the uploader file buffer for the task. Valid for a task with a RUNNING or COMPLETED status. For a RUNNING status, this shows the current file buffer size, (whatever the uploader is using, which may grow over time for large uploads). For a COMPLETED status, this shows the largest size used in case the buffer grew during the upload.
STATUS	VARCHAR	The status of the task, valid values are: COMPLETED - the task has completed QUEUED - the task is still in the queue, but haven't been picked up by the uploader. RUNNING - the task is currently running and the corresponding file is uploading.

DESIGN_QUERIES

Contains info about design queries for a given design. The following functions populate this table:

- DESIGNER_ADD_DESIGN_QUERIES
- DESIGNER_ADD_DESIGN_QUERIES_FROM_RESULTS
- DESIGNER_ADD_DESIGN_QUERY

Column Name	Column Type	Description
DESIGN_ID	INTEGER	Unique id that Database Designer assigned to the design.
DESIGN_NAME	VARCHAR	Name that you specified for the design.
DESIGN_ QUERY_ID	INTEGER	Unique id that Database Designer assigned to the design query.
DESIGN_ QUERY_ID_ INDEX	INTEGER	Database Designer chunks the query text if it exceeds the maximum attribute size before storing it in this table. Database Designer stored all chunks stored under the same value of DESIGN_QUERY_ID. DESIGN_QUERY_ ID_INDEX keeps track of the order of the chunks, starting with 0 and ending in n, the index of the final chunk.
QUERY_TEXT	VARCHAR	Text of the query chunk, or the entire query text if it does not exceed the maximum attribute size.
WEIGHT	FLOAT	A value from 0 to 1 that indicates the importance of that query in creating the design. Assign a higher weight to queries that you run frequently so that Database Designer prioritizes those queries in creating the design. Default: 1.
DESIGN_ QUERY_ SEARCH_PATH	VARCHAR	The search path with which the query is to be parsed.
DESIGN_ QUERY_	INTEGER	Categorizes queries that affect the design that

Column Name	Column Type	Description
SIGNATURE		Database Designer creates in the same way. Database Designer assigns a signature to each query, weights one query for each signature group, depending on how many queries there are with that signature, and Database Designer considers that query when creating the design.

Example

Add queries to VMART_DESIGN and query the DESIGN_QUERIES table:

```
=> SELECT DESIGNER_ADD_DESIGN_QUERIES('VMART_DESIGN', '/tmp/examples/vmart_queries.sql','true');
 DESIGNER_ADD_DESIGN_QUERIES
-----------------------------
Number of accepted queries                      =9
Number of queries referencing non-design tables =0
Number of unsupported queries                   =0
Number of illegal queries                       =0
=> \x
Expanded display is on.
=> SELECT * FROM V_MONITOR.DESIGN.QUERIES
-[ RECORD 1 ]------------+-------------------
design_id                | 45035996273705090

-[ RECORD 3]-------------+-------------------
...
```

DESIGN_STATUS

Records the progress of a running Database Designer design or history of the last Database Designer design executed by the current user.

Column Name	Data Type	Description
EVENT_TIME	TIMESTAMP	Time when the row recorded the event.
USER_NAME	VARCHAR	Name of the user who ran a design at the time Vertica recorded the session.
DESIGN_NAME	VARCHAR	Name of the user-specified design.
DESIGN_PHASE	VARCHAR	Phase of the design.
PHASE_STEP	VARCHAR	Substep in each design phase
PHASE_STEP_ COMPLETE_PERCENT	FLOAT	Progress of current substep in percentage (0–100).
PHASE_COMPLETE_ PERCENT	FLOAT	Progress of current design phase in percentage (0–100).

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

Example

The following example shows the content of the DESIGN_STATUS table of a complete Database Designer run:

```
=> SELECT event_time, design_name, design_phase, phase_complete_percent
   FROM v_monitor.design_status;
event_time          | design_name | design_phase                                    | phase_complete_
percent

(24 rows)
```

DESIGN_TABLES

Contains information about all the design tables for all the designs for which you are the owner. Each row contains information about a different design table. Vertica creates this table when you run DESIGNER_CREATE_DESIGN.

Column Name	Column Type	Description
DESIGN_NAME	VARCHAR	Unique name that the user specified for the design.

Column Name	Column Type	Description
DESIGN_TABLE_ID	INTEGER	Unique ID that Database Designer assigned to the design table.
TABLE_SCHEMA	VARCHAR	Name of the schema that contains the design table.
TABLE_ID	INTEGER	System object identifier (OID) assigned to the design table.
TABLE_NAME	VARCHAR	Name of the design table.

Example

Add all the tables from the VMart database to the design VMART_DESIGN. This operation populates the DESIGN_TABLES table:

```
=> SELECT DESIGNER_ADD_DESIGN_TABLES('VMART_DESIGN','online_sales.*');
DESIGNER_ADD_DESIGN_TABLES
---------------------------
 3
(1 row)
=> SELECT DESIGNER_ADD_DESIGN_TABLES('VMART_DESIGN','public.*');
DESIGNER_ADD_DESIGN_TABLES
---------------------------
 9
(1 row)
=> SELECT DESIGNER_ADD_DESIGN_TABLES('VMART_DESIGN','store.*');
DESIGNER_ADD_DESIGN_TABLES
---------------------------
 3
(1 row)
=> SELECT * FROM DESIGN_TABLES;
design_name  | design_table_id | table_schema |     table_id      |      table_name
-------------+-----------------+--------------+-------------------+-----------------------
VMART_DESIGN |               1 | online_sales | 45035996373718754 | online_page_dimension
VMART_DESIGN |               2 | online_sales | 45035996373718758 | call_center_dimension
VMART_DESIGN |               3 | online_sales | 45035996373718762 | online_sales_fact
VMART_DESIGN |               4 | public       | 45035996373718766 | customer_dimension
VMART_DESIGN |               5 | public       | 45035996373718770 | product_dimension
VMART_DESIGN |               6 | public       | 45035996373718774 | promotion_dimension
VMART_DESIGN |               7 | public       | 45035996373718778 | date_dimension
VMART_DESIGN |               8 | public       | 45035996373718782 | vendor_dimension
VMART_DESIGN |               9 | public       | 45035996373718786 | employee_dimension
VMART_DESIGN |              10 | public       | 45035996373718822 | shipping_dimension
VMART_DESIGN |              11 | public       | 45035996373718826 | warehouse_dimension
VMART_DESIGN |              12 | public       | 45035996373718830 | inventory_face
VMART_DESIGN |              13 | store        | 45035996373718794 | store_dimension
VMART_DESIGN |              14 | store        | 45035996373718798 | store_sales_fact
VMART_DESIGN |              15 | store        | 45035996373718812 | store_orders_fact
        (15 rows)
```

DESIGNS

Contains information about a Database Designer design. After you create a design and specify certain parameters for Database Designer, DESIGNER_CREATE_DESIGN creates this table in the V_MONITOR schema.

Column Name	Column Type	Description
DESIGN_ID	INTEGER	Unique ID that Database Designer assigns to this design.
DESIGN_NAME	VARCHAR	Name that the user specifies for the design.
KSAFETY_LEVEL	INTEGER	K-safety level for the design. Database Designer assigns a K-safety value of 0 for clusters with 1 or 2 nodes, and assigns a value of 1 for clusters with 3 or more nodes.
OPTIMIZATION_OBJECTIVE	VARCHAR	Name of the optimization objective for the design. Valid values are: • QUERY • LOAD • BALANCED (default)
DESIGN_TYPE	VARCHAR	Name of the design type. Valid values are: • COMPREHENSIVE (default) • INCREMENTAL
PROPOSE_SUPER_FIRST	BOOLEAN	Specifies to propose superprojections before projections, by default f. If DESIGN_MODE is COMPREHENSIVE, this field has no impact.
DESIGN_AVAILABLE	BOOLEAN	t if the design is currently available, otherwise, f (default).
COLLECTED_STATISTICS	BOOLEAN	t if statistics are to be collected when creating the design, otherwise, f (default).
POPULATE_DESIGN_TABLES_	BOOLEAN	t if you want to populate the design tables from the design queries, otherwise, f (default).

Column Name	Column Type	Description
FROM_QUERIES		
ENCODING_DESIGN	BOOLEAN	t if the design is an encoding optimization design on pre-existing projections, otherwise, f (default).
DEPLOYMENT_PARALLELISM	INTEGER	Number of tables to be deployed in parallel when the design is complete. Default: 0
PROPOSE_UNSEGMENTED_PROJECTIONS	BOOLEAN	t if you specify unsegmented projections, otherwise, f (default).
ANALYZE_CORRELATIONS_MODE	INTEGER	Specifies how Database Designer should handle existing column correlations in a design and whether or not Database Designer should reanalyze existing column correlations. • 0—(default) Ignore column correlations when creating the design. • 1—Consider the existing correlations in the tables when creating the design. • 2—Analyze column correlations if not previously performed, and consider the column correlations when creating the design. • 3—Analyze all column correlations in the tables and consider them when creating the design, even if they have been analyzed previously.

DISK_RESOURCE_REJECTIONS

Returns requests for resources that are rejected due to disk space shortages. Output is aggregated by both RESOURCE_TYPE and REJECTED_REASON to provide more comprehensive information.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The node name for which information is listed.

Column Name	Data Type	Description
RESOURCE_TYPE	VARCHAR	The resource request requester (example: Temp files).
REJECTED_REASON	VARCHAR	One of the following: • `Insufficient disk space` • `Failed volume`
REJECTED_COUNT	INTEGER	Number of times this `REJECTED_REASON` has been given for this `RESOURCE_TYPE`.
FIRST_REJECTED_TIMESTAMP	TIMESTAMP	The time of the first rejection for this `REJECTED_REASON` and RESOURCE_TYPE.
LAST_REJECTED_TIMESTAMP	TIMESTAMP	The time of the most recent rejection for this `REJECTED_REASON` and `RESOURCE_TYPE`.
LAST_REJECTED_VALUE	INTEGER	The value of the most recent rejection for this `REJECTED_REASON` and `RESOURCE_TYPE`.

See Also

- RESOURCE_REJECTIONS
- CLEAR_RESOURCE_REJECTIONS

DISK_STORAGE

Returns the amount of disk storage used by the database on each node. Each node can have one or more storage locations, and the locations can be on different disks with separate properties, such as free space, used space, and block size. The information in this system table is useful in determining where data files reside.

All returned values for this system table are in the context of the file system of the host operating system, and are not specific to Vertica-specific space.

The storage usage annotation called CATALOG indicates that the location is used to store the catalog. Each CATALOG location is specified only when creating a new database. You cannot add a CATALOG location annotation using CREATE LOCATION, nor remove an existing CATALOG annotation.

Storage Location Performance

The performance of a storage location is measured with two values:

- Throughput in MB/sec
- Latency in seeks/sec

These two values are converted to a single number (Speed) with the following formula:

read-time = (1/*throughput*) + (1/*Latency*)

- *read-time*: Time to read 1MB of data
- 1/*throughput*: Time to read 1MB of data
- 1/*latency*: Time to seek to the data.

A disk is faster than another disk if its *read-time* is less.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Node name for which information is listed.
STORAGE_PATH	VARCHAR	Path where the storage location is mounted.
STORAGE_ USAGE	VARCHAR	Type of information stored in the location, one of the following: • DATA: Only data is stored in the location. • TEMP: Only temporary files that are created during loads or queries are stored in the location. • DATA,TEMP: Both types of files are stored in the location. • USER: The storage location can be used by non-dbadmin users, who are granted access to the storage location • CATALOG: The area is used for the Vertica catalog. This usage is set internally and cannot be removed or changed.
RANK	INTEGER	Integer rank assigned to the storage location based on its performance. Ranks are used to create a storage locations on which projections, columns, and partitions are stored on different disks based on predicted or measured access patterns. See Managing Storage Locations.

Column Name	Data Type	Description
THROUGHPUT	INTEGER	Integer that measures a storage location's performance in MB/sec. 1/*throughput* is the time taken to read 1MB of data.
LATENCY	INTEGER	Integer that measures a storage location's performance in seeks/sec. 1/*latency* is the time taken to seek to the data.
STORAGE_ STATUS	VARCHAR	Status of the storage location, one of the following: • active • retired
DISK_BLOCK_ SIZE_BYTES	INTEGER	Block size of the disk in bytes
DISK_SPACE_ USED_BLOCKS	INTEGER	Number of disk blocks in use
DISK_SPACE_ USED_MB	INTEGER	Number of megabytes of disk storage in use
DISK_SPACE_ FREE_BLOCKS	INTEGER	Number of free disk blocks available
DISK_SPACE_ FREE_MB	INTEGER	Number of megabytes of free storage available
DISK_SPACE_ FREE_PERCENT	VARCHAR	Percentage of free disk space remaining

ERROR_MESSAGES

Lists system error messages and warnings Vertica encounters while processing queries. Some errors occur when no transaction is in progress, so the transaction identifier or statement identifier columns might return NULL.

Column Name	Data Type	Description
EVENT_TIMESTAMP	TIMESTAMPTZ	Time when the row recorded the event

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information
USER_ID	INTEGER	Identifier of the user who received the error message
USER_NAME	VARCHAR	Name of the user who received the error message when Vertica recorded the session
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
REQUEST_ID	INTEGER	Unique identifier of the query request in the user session
TRANSACTION_ID	INTEGER	Identifier for the transaction within the session, if any; otherwise NULL
STATEMENT_ID	INTEGER	Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID, STATEMENT_ID, and REQUEST_ID uniquely identifies a statement within a session.
ERROR_LEVEL	VARCHAR	Severity of the error, one of the following: • LOG • INFO • NOTICE • WARNING • ERROR • ROLLBACK • INTERNAL • FATAL • PANIC
ERROR_CODE	INTEGER	Error code that Vertica reports
MESSAGE	VARCHAR	Textual output of the error message
DETAIL	VARCHAR	Additional information about the error message, in greater detail

Column Name	Data Type	Description
HINT	VARCHAR	Actionable hint about the error. For example: `HINT: Set the locale in this session to en_US@collation=binary using the command "\locale en_ US@collation=binary"`

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

EVENT_CONFIGURATIONS

Monitors the configuration of events.

Column Name	Data Type	Description
EVENT_ID	VARCHAR	The name of the event.
EVENT_DELIVERY_CHANNELS	VARCHAR	The delivery channel on which the event occurred.

EXECUTION_ENGINE_PROFILES

Provides profiling information about runtime query execution. The hierarchy of IDs, from highest level to actual execution is:

- PATH_ID
- BASEPLAN_ID
- LOCALPLAN_ID
- OPERATOR_ID

Counters (output from the COUNTER_NAME column) are collected for each actual Execution Engine (EE) operator instance.

The following columns combine to form a unique key:

- TRANSACTION_ID
- STATEMENT_ID
- NODE_NAME
- OPERATOR_ID
- COUNTER_NAME
- COUNTER_TAG

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Node name for which information is listed.
USER_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog, which identifies the user.
USER_NAME	VARCHAR	User name for which query profile information is listed.
SESSION_ID	VARCHAR	Identifier of the session for which profiling information is captured. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
TRANSACTION_ID	INTEGER	Identifier for the transaction within the session if any; otherwise NULL.
STATEMENT_ID	INTEGER	Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed.
OPERATOR_NAME	VARCHAR	Name of the Execution Engine (EE) component; for example, NetworkSend.
OPERATOR_ID	INTEGER	Identifier assigned by the EE operator instance that performs the work. OPERATOR_ID is different from LOCALPLAN_ID because each logical operator, such as Scan, may be executed by multiple threads concurrently. Each thread operates on a different operator instance, which has its own ID.
BASEPLAN_ID	INTEGER	Assigned by the optimizer on the initiator to EE operators in the original base (EXPLAIN) plan. Each EE operator in the base plan gets a unique ID.
PATH_ID	INTEGER	Identifier that Vertica assigns to a query operation or

Column Name	Data Type	Description
		path; for example to a logical grouping operation that might be performed by multiple execution engine operators. For each path, the same PATH ID is shared between the query plan (using EXPLAIN output) and in error messages that refer to joins.
LOCALPLAN_ID	INTEGER	Identifier assigned by each local executor while preparing for plan execution (local planning). Some operators in the base plan, such as the Root operator, which is connected to the client, do not run on all nodes. Similarly, certain operators, such as ExprEval, are added and removed during local planning due to implementation details.
ACTIVITY_ID	INTEGER	Identifier of the plan activity.
RESOURCE_ID	INTEGER	Identifier of the plan resource.
COUNTER_NAME	VARCHAR	Name of the counter. See the "COUNTER_NAME Values" section below this table. The counter counts events for one statement.
COUNTER_TAG	VARCHAR	String that uniquely identifies the counter for operators that might need to distinguish between different instances. For example, COUNTER_TAG is used to identify to which of the node bytes are being sent to or received from for the NetworkSend operator.
COUNTER_VALUE	INTEGER	Value of the counter.
IS_EXECUTING	BOOLEAN	Indicates whether the profile is active or completed, where *t* is active and *f* is completed.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

COUNTER_NAME Values

The value of COUNTER_NAME can be any of the following:

COUNTER_NAME	Description
active threads	A counter of the LoadUnion operator, which indicates the number of input threads (Load operators) that are currently processing input.
blocks analyzed by SIPs expression	The number of data blocks analyzed by SIPS expression from the Scan operator.
blocks filtered by SIPs expression	The number of data blocks filtered by SIPS expression from the Scan operator.
blocks filtered by SIPs value lists	The number of data blocks filtered by SIPS sorted value lists from the Scan operator.
buffers spilled	[NetworkSend] Buffers spilled to disk by NetworkSend.
bytes read from disk	[Scan] The amountof data read (locally or remotely) from ROS containers on disk.
bytes read from disk cache	[Scan] The amount of data read from cache.
bytes received	The number of bytes received over the network for query execution.
bytes sent	[NetworkSend Size of data after encoding and compression sent over the network (actual network bytes).
bytes spilled	[NetworkSend] Bytes spilled to disk by NetworkSend.
bytes total	[SendFiles] (recover-by-container plan): Total number of bytes to send/receive.
cached storages cumulative size (bytes)	[StorageMerge] Total amount of temp space used by operator for caching.

COUNTER_NAME	Description
cached storages current size (bytes)	[StorageMerge] Current amount of temp space used for caching.
cached storages peak size (bytes)	[StorageMerge] Peak amount of temp space an operator used for caching.
clock time (µs)	Real-time clock time spent processing the query, in microseconds.
clock time (µs) of UDChunker	Real-time clock time spent in the UDChunker phase of a load operation, in microseconds. Use the COUNTER_ TAG column to distinguish among load sources.
clock time (µs) of UDFilter(s)	Real-time clock time spent in all UDFilter phases of a load operation, in microseconds. Use the COUNTER_ TAG column to distinguish among load sources.
clock time (µs) of UDParser	Real-time clock time spent in the UDParser phase of a load operation, in microseconds. Use the COUNTER_ TAG column to distinguish among load sources.
clock time (µs) of UDSource	Real-time clock time spent in the UDSource phase of a load operation, in microseconds. Use the COUNTER_ TAG column to distinguish among load sources.
completed merge phases	Number of merge phases already completed by an LSort or DataTarget operator. Compare to the total merge phases. Variants on this value include join inner completed merge phases.
cumulative size of raw temp data (bytes)	Total amount of temporary data the operator has written to files. Compare to cumulative size of temp files (bytes) to understand impact of encoding and compression in an externalizing operator. Variants on this value include join inner cumulative size of raw temp files (bytes).
cumulative size of temp files (bytes)	For externalizing operators only, the total number of encoded and compressed temp data the operator has written to files. A sort operator might go through

COUNTER_NAME	Description
	multiple merge phases, where at each pass sorted chunks of data are merged into fewer chunks. This counter remembers the cumulative size of all temp files past and present. Variants on this value include `join inner cumulative size of temp files (bytes)`.
`current allocated rid memory (bytes)`	Per-rid memory tracking: current allocation amount under this rid.
`current file handles`	Number of files open.
`current memory allocations (count)`	Number of actual allocator calls made.
`current memory capacity (bytes)`	Amount of system memory held, which includes chunks that are only partially consumed.
`current memory overhead (bytes)`	Memory consumed, for example, by debug headers. (Normally no overhead.)
`current memory padding (bytes)`	Memory padding for free list tiers (2^n bytes).
`current memory requested (bytes)`	Memory actually requested by the caller.
`current size of temp files (bytes)`	For externalizing operators only, the current size of the encoded and compressed temp data that the operator has written to files. Variants on this value `include join inner current size of temp files (bytes)`.
`current threads`	Unused.
`current unbalanced memory allocations (count)`	Pooled version of "current memory XXX" counters.
`current unbalanced memory capacity (bytes)`	
`current unbalanced memory overhead (bytes)`	

COUNTER_NAME	Description
current unbalanced memory requested (bytes)	
distinct value estimation time (µs)	[Analyze Statistics] Time (in microcseconds) spent to estimate number of distinct values from the sample after data is read off disk and into the statistical sample.
encoded bytes received	[NetworkRecv] Size of received data after decompressed (but still encoded) received over the network.
encoded bytes sent	[NetworkSend] Size of data sent over the network after encoding.
end time	Time (timestamp) when Vertica stopped processing the operation
estimated rows produced	Number of rows that the optimizer estimated would be produced. See rows produced for the actual number of rows that are produced.
exceptions cumulative size of raw temp data (bytes)	Counters that store the total or current size of exception data.
exceptions rows cumulative size of temp files (bytes)	
exceptions rows current size of temp files (bytes)	
execution time (µs)	CPU clock time spent processing the query, in microseconds.
fast aggregated rows	The number of rows being processed by fast aggregations in the hash groupby operator (no group/aggregation).
files completed	Relevant only to SendFiles/RecvFiles operators (that is, recover-by-container plan) number of files

COUNTER_NAME	Description
	sent/received.
files total	Relevant only to SendFiles/RecvFiles operators (that is, recover-by-container plan) total number of files to send/receive.
Hadoop FS bytes read through native libhdfs++ client	[Scan, Load] The number of bytes read from an hdfs source (using libhdfs++).
Hadoop FS bytes read through webhdfs	[Scan, Load] The number of bytes read from a webhdfs source.
Hadoop FS bytes written through webhdfs	[DataTarget] The number of bytes written to webhdfs storage.
Hadoop FS hdfs:// operations that used native libhdfs++ calls	[Scan, Load, DataTarget] The number of times Vertica opened a file with an hdfs:// URL and used the native hdfs protocol
Hadoop FS hdfs:// operations that used webhdfs calls	[Scan, Load, DataTarget] The number of times Vertica opened a file with an hdfs:// URL and used the webhdfs protocol
Hadoop FS read operations through native libhdfs++ client failure count	[Scan, Load] The number of times a native libhdfs++ source encountered an error and gave up
Hadoop FS read operations through native libhdfs++ client retry count	[Scan, Load] The number of times a native libhdfs++ source encountered an error and retried
Hadoop FS read operations through webhdfs failure count	[Scan, Load] The number of times a webhdfs source encountered an error and gave up
Hadoop FS read operations through webhdfs retry count	[Scan, Load] The number of times a webhdfs source encountered an error and retried
Hadoop FS write operations through webhdfs failure count	[DataTarget] The number of times a webhdfs write encountered an error and gave up

COUNTER_NAME	Description
Hadoop FS write operations through webhdfs retry count	[DataTarget] The number of times a webhdfs write encountered an error and retried
histogram creation time (µs)	[Analyze Statistics] Time spent estimating the number of distinct values from the sample after data is read off disk and into the statistical sample.
initialization time (µs)	The time in microseconds spent initializing an operator during the CompilePlan step of query processing. For example, initialization time could include the time spent compiling expressions and gathering resources.
input queue wait (µs)	Time in microseconds that an operator spends waiting for upstream operators.
input rows	Actual number of rows that were read into the operator.
input size (bytes)	Total number of bytes of the Load operator's input source, where NULL is unknown (read from FIFO).
inputs processed	The number of sources processed by a Load operator.
intermediate rows to process	The number of rows to be processed in a phase as determined by a sort or GROUP BY (HASH).
join inner clock time (µs)	The real clock time spent on processing the inner input of the join operator.
join inner completed mergephases	See the completed merge phases counter.
join inner cumulative size of raw temp data (bytes)	
join inner cumulative size of temp files (bytes)	
join inner current size of temp files (bytes)	

COUNTER_NAME	Description
join inner execution time (µs)	The CPU clock time spent on processing the inner input of the join operator.
join inner hash table building time (µs)	The time spent for building the hash table for the inner input of the join operator.
join inner hash table collisions	The number of hash table collisions that occurred when building the hash table for the inner input of the join operator.
join inner hash table entries	The number of hash table entries for the inner input of the join operator.
join inner total merge phases	See the `completed merge phases` counter.
join outer clock time (µs)	The real clock time spent on processing the outer input of the join operator (including doing the join).
join outer execution time (µs)	The CPU clock time spent on processing the outer input of the join operator (including doing the join).
max sample size (rows)	[Analyze Statistics] Maximum number of rows that will be stored in the statistical sample.
memory reserved (bytes)	Memory reserved by this operator. Deprecated.
network wait (µs)	[`NetworkSend, NetworkRecv`] Time in microseconds spent waiting on the network.
number of cancel requests received	The number of cancel requests received (per operator) when cancelling a call to the execution engine.
number of invocations	The number of times a UDSF function was invoked.
number of storage containers opened	[`Scan`] The number of containers opened by the operator, at least 1. If the scan operator switches containers, this counter increases accordingly. See Local Caching of Storage Containers for details.
output queue wait (µs)	Time in microseconds that an operator spends waiting for the output buffer to be consumed by a downstream operator.

COUNTER_NAME	Description
peak allocated rid memory (bytes)	Per-rid memory tracking: peak allocation amount under this rid.
peak cooperating threads	Peak number of threads which parsed (in parallel) a single load source, using "cooperative parse." counter_tag indicates the source when joining with dc_load_events.
peak file handles	Peak value of the corresponding "current XXX" counters.
peak memory allocations (count)	
peak memory capacity (bytes)	
peak memory overhead (bytes)	
peak memory padding (bytes)	
peak memory requested (bytes)	
peak temp space	
peak threads	
peak unbalanced memory allocations (count)	
peak unbalanced memory capacity (bytes)	
peak unbalanced memory overhead (bytes)	
peak unbalanced memory padding (bytes)	
peak unbalanced memory requested (bytes)	
portion offset	Offset value of a portion descriptor in an apportioned

COUNTER_NAME	Description
	load. counter_tag indicates the source when joining with dc_load_events.
portion size	Size value of a portion descriptor in an apportioned load. counter_tag indicates the source when joining with dc_load_events.
producer stall (µs)	[NetworkSend] Time in microseconds spent by NetworkSend when stalled waiting for network buffers to clear.
producer wait (µs)	[NetworkSend] Time in microseconds spent by the input operator making rows to send.
read (bytes)	Number of bytes read from the input source by the Load operator.
receive time (µs)	Time in microseconds that a Recv operator spends reading data from its socket.
rejected data cumulative size of raw temp data (bytes)	Counters that store total or current size of rejected row numbers. Are variants of: • cumulative size of raw temp data (bytes) • cumulative size of temp files (bytes) • current size of temp files (bytes)
rejected data cumulative size of temp files (bytes)	
rejected data current size of temp files (bytes)	
rejected rows cumulative size of raw temp data (bytes)	
rejected rows cumulative size of temp files (bytes)	
rejected rows current size of temp files (bytes)	

COUNTER_NAME	Description
reserved rid memory (bytes)	Per-rid memory tracking: total memory reservation under this rid.
rle rows produced	Number of physical tuples produced by an operator. Complements the rows produced counter, which shows the number of logical rows produced by an operator. For example, if a value occurs 1000 rows consecutively and is RLE encoded, it counts as 1000 rows produced not only 1 rle rows produced.
ROS blocks bounded	[DataTarget] Number of ROS blocks created, due to boundary alignment with RLE prefix columns, when an EE DataTarget operator is writing to ROS containers.
ROS blocks encoded	[DataTarget] Number of ros blocks created when an EE DataTarget operator is writing to ROS containers.
ROS bytes written	[DataTarget] Number of bytes written to disk when an EE DataTarget operator is writing to ROS containers.
rows filtered by SIPs expression	The number of rows filtered by the SIPS expression from the Scan operator.
rows in sample	[Analyze Statistics] Actual number of rows that will be stored in the statistical sample.
rows output by sort	[DataTarget] Number of rows sorted when an EE DataTarget operator is writing to ROS containers.
rows processed	[DataSource] Number of rows processed when an EE DataSource operator is reading from ROS containers.
rows processed by SIPs expression	The number of rows processed by the SIPS expression in the Scan operator.
rows produced	Number of logical rows produced by an operator. See also the rle rows produced counter.

COUNTER_NAME	Description
rows pruned by valindex	[DataSource] Number of rows it skips direct scanning with help of valindex when an EE DataSource operator is writing to ROS containers. This counter's value is not greater than "rows processed" counter.
rows read in sort	See the counter, total rows read in sort.
rows received	[NetworkRecv] Number of received sent over the network.
rows rejected	The number of rows rejected by the Load operator.
rows sent	[NetworkSend] Number of rows sent over the network.
rows to process	The total number of rows to be processed in a phase, based upon the number of table accesses. Compare to the counter, rows processed. Divide the rows processed value by the rows to process value for percent completion.
rows written in join sort	The total number of rows being read out of the sort facility in Join.
rows written in sort	The number of rows read out of the sort by the SortManager. This counter and the counter total rows read from sort are typically equal.
send time (µs)	Time in microseconds that a Send operator spends writing data to its socket.
start time	Time (timestamp) when Vertica started to process the operation.
total merge phases	Number of merge phases an LSort or DataTarget operator must complete to finish sorting its data. NULL until the operator can compute this value (all data must first be ingested by the operator). Variants on this value include join inner total merge phases.

COUNTER_NAME	Description
total rows read in join sort	The total number of rows being put into the sort facility in Join.
total rows read in sort total	The total number of rows ingested into the sort by the SortManager. This counter and the counter rows written in sort are typically equal.
total rows written in sort	See the counter, rows written in sort.
total sources	Total number of distinct input sources processed in a load.
unpacked (bytes)	The number of bytes produced by a compressed source in a load (for example, for a gzip file, the size of the file when decompressed).
wait clock time (µs)	StorageUnion wait time in microseconds.
WOS bytes acquired	Number of bytes acquired from the WOS by a DataTarget operator. **Note:** This is usually more but can be less than WOS bytes written if an earlier statement in the transaction acquired some WOS memory.
WOS bytes written	Number of bytes written to the WOS by a DataTarget operator.
written rows	[DataTarget] Number of rows written when an EE DataTarget operator writes to ROS containers

Examples

The two queries below show the contents of the EXECUTION_ENGINE_PROFILES table:

```
=> SELECT operator_name, operator_id, counter_name, counter_value
    FROM EXECUTION_ENGINE_PROFILES WHERE operator_name = 'Scan'
    ORDER BY counter_value DESC;
 operator_name | operator_id | counter_name |  counter_value
---------------+-------------+--------------+------------------
 Scan          |          20 | end time     | 1559929719983785
 Scan          |          20 | start time   | 1559929719983737
```

```
 Scan          |          18 | end time     | 1559929719983358
 Scan          |          18 | start time   | 1559929718069860
 Scan          |          16 | end time     | 1559929718069319
 Scan          |          16 | start time   | 1559929718069188
 Scan          |          14 | end time     | 1559929718068611
 Scan          |          18 | end time     | 1559929717579145
 Scan          |          18 | start time   | 1559929717579083
 Scan          |          16 | end time     | 1559929717578509
 Scan          |          18 | end time     | 1559929717379346
 Scan          |          18 | start time   | 1559929717379307
