```

REGR_AVGY

Returns the DOUBLE PRECISION average of the dependent expression in an expression pair. The function eliminates expression pairs where either expression in the pair is NULL. If no rows remain, the function returns NULL.

Syntax

```sql
REGR_AVGY ( expression1, expression2 )
```
**Parameters**

<table>
<thead>
<tr>
<th>expression1</th>
<th>The dependent DOUBLE PRECISION expression</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression2</td>
<td>The independent DOUBLE PRECISION expression</td>
</tr>
</tbody>
</table>

**Example**

```sql
=> SELECT REGR_AVGY (Annual_salary, Employee_age) 
    FROM employee_dimension;
REGR_AVGY
---------
58354.4913
(1 row)
```

**REGR_COUNT**

Returns the count of all rows in an expression pair. The function eliminates expression pairs where either expression in the pair is NULL. If no rows remain, the function returns 0.

**Syntax**

```
SELECT REGR_COUNT ( expression1, expression2 )
```

**Parameters**

<table>
<thead>
<tr>
<th>expression1</th>
<th>The dependent DOUBLE PRECISION expression</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression2</td>
<td>The independent DOUBLE PRECISION expression</td>
</tr>
</tbody>
</table>

**Example**

```sql
=> SELECT REGR_COUNT (Annual_salary, Employee_age) FROM employee_dimension;
REGR_COUNT
-----------
10000
(1 row)
```
REGR_INTERCEPT

Returns the y-intercept of the regression line determined by a set of expression pairs. The return value is of type DOUBLE PRECISION. REGR_INTERCEPT eliminates expression pairs where either expression in the pair is NULL. If no rows remain, REGR_INTERCEPT returns NULL.

Syntax

SELECT REGR_INTERCEPT ( expression1, expression2 )

Parameters

<table>
<thead>
<tr>
<th>expression1</th>
<th>The dependent DOUBLE PRECISION expression</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression2</td>
<td>The independent DOUBLE PRECISION expression</td>
</tr>
</tbody>
</table>

Example

```sql
=> SELECT REGR_INTERCEPT (Annual_salary, Employee_age) FROM employee_dimension;
REGR_INTERCEPT
--------------
59929.5490163437
(1 row)
```

REGR_R2

Returns the square of the correlation coefficient of a set of expression pairs. The return value is of type DOUBLE PRECISION. REGR_R2 eliminates expression pairs where either expression in the pair is NULL. If no rows remain, REGR_R2 returns NULL.

Syntax

SELECT REGR_R2 ( expression1, expression2 )
Parameters

<table>
<thead>
<tr>
<th>expression1</th>
<th>The dependent DOUBLE PRECISION expression</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression2</td>
<td>The independent DOUBLE PRECISION expression</td>
</tr>
</tbody>
</table>

Example

```sql
=> SELECT REGR_R2(Annual_salary, Employee_age) FROM employee_dimension;
REGR_R2
------------------
5.17181631706311e-05
(1 row)
```

REGR_SLOPE

Returns the slope of the regression line, determined by a set of expression pairs. The return value is of type DOUBLE PRECISION. REGR_SLOPE eliminates expression pairs where either expression in the pair is NULL. If no rows remain, REGR_SLOPE returns NULL.

Syntax

```sql
SELECT REGR_SLOPE(expression1, expression2)
```

Parameters

<table>
<thead>
<tr>
<th>expression1</th>
<th>The dependent DOUBLE PRECISION expression</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression2</td>
<td>The independent DOUBLE PRECISION expression</td>
</tr>
</tbody>
</table>

Example

```sql
=> SELECT REGR_SLOPE(Annual_salary, Employee_age) FROM employee_dimension;
REGR_SLOPE
------------------
40.056400303749
```

Vertica Analytic Database (11.0.x)
REGR_SXX

Returns the sum of squares of the difference between the independent expression (expression2) and its average.

That is, REGR_SXX returns: \( \sum [(expression2 - \text{average}(expression2))(expression2 - \text{average}(expression2))] \)

The return value is of type DOUBLE PRECISION. REGR_SXX eliminates expression pairs where either expression in the pair is NULL. If no rows remain, REGR_SXX returns NULL.

Syntax

```
SELECT REGR_SXX (expression1, expression2)
```

Parameters

<table>
<thead>
<tr>
<th>expression1</th>
<th>The dependent DOUBLE PRECISION expression</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression2</td>
<td>The independent DOUBLE PRECISION expression</td>
</tr>
</tbody>
</table>

Example

```
=> SELECT REGR_SXX (Annual_salary, Employee_age) FROM employee_dimension;
REGR_SXX
-------------
2254907.59
(1 row)
```

REGR_SXY

Returns the sum of products of the difference between the dependent expression (expression1) and its average and the difference between the independent expression (expression2) and its average.
That is, \( \text{REGR} \_SXY \) returns:
\[
\sum \left( \left( \text{expression}1 - \text{average(\text{expression}1)} \right) \left( \text{expression}2 - \text{average(\text{expression}2)} \right) \right)
\]

The return value is of type DOUBLE PRECISION. \( \text{REGR} \_SXY \) eliminates expression pairs where either expression in the pair is NULL. If no rows remain, \( \text{REGR} \_SXY \) returns NULL.

**Syntax**

```sql
SELECT \text{REGR} \_SXY \left( \text{expression}1, \text{expression}2 \right)
```

**Parameters**

<table>
<thead>
<tr>
<th>expression1</th>
<th>The dependent DOUBLE PRECISION expression</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression2</td>
<td>The independent DOUBLE PRECISION expression</td>
</tr>
</tbody>
</table>

**Example**

```sql
=> SELECT \text{REGR} \_SXY \left( \text{Annual} \_\text{salary}, \text{Employee} \_\text{age} \right) \text{FROM employee} \_\text{dimension};
\text{REGR} \_\text{SXY}
------------------------
-90323481.0730019
(1 row)
```

**REGR\_SYY**

Returns the sum of squares of the difference between the dependent expression \((\text{expression}1)\) and its average.

That is, \( \text{REGR} \_\text{SY}Y \) returns:
\[
\sum \left( \left( \text{expression}1 - \text{average(\text{expression}1)} \right) \left( \text{expression}1 - \text{average(\text{expression}1)} \right) \right)
\]

The return value is of type DOUBLE PRECISION. \( \text{REGR} \_\text{SY}Y \) eliminates expression pairs where either expression in the pair is NULL. If no rows remain, \( \text{REGR} \_\text{SY}Y \) returns NULL.

**Syntax**

```sql
SELECT \text{REGR} \_\text{SY}Y \left( \text{expression}1, \text{expression}2 \right)
```
Parameters

<table>
<thead>
<tr>
<th>expression1</th>
<th>The dependent DOUBLE PRECISION expression</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression2</td>
<td>The independent DOUBLE PRECISION expression</td>
</tr>
</tbody>
</table>

Example

```sql
=> SELECT REGR_SYY (Annual_salary, Employee_age) FROM employee_dimension;

REGR_SYY
-------------
69956728794707.2
(1 row)
```

STDDEV [Aggregate]

Evaluates the statistical sample standard deviation for each member of the group. The return value is the same as the square root of `VAR_SAMP`:

\[
\text{STDDEV(expression)} = \sqrt{\text{VAR}_\text{SAMP}(\text{expression})}
\]

Behavior Type

Immutable

Syntax

`STDDEV ( expression )`

Parameters

| expression | Any NUMERIC data type or any non-numeric data type that can be implicitly converted to a numeric data type. STDDEV returns the same data type as expression. |
Related Functions

- Nonstandard function STDDEV is provided for compatibility with other databases. It is semantically identical to STDDEV_SAMP.
- This aggregate function differs from analytic function STDDEV, which computes the statistical sample standard deviation of the current row with respect to the group of rows within a window.
- When VAR_SAMP returns NULL, STDDEV returns NULL.

Examples

The following example returns the statistical sample standard deviation for each household ID from the customer_dimension table of the VMart example database:

```
=> SELECT STDDEV(household_id) FROM customer_dimension;
STDDEV
-----------------
8651.5084240071
```

STDDEV_POP [Aggregate]

Evaluates the statistical population standard deviation for each member of the group.

Behavior Type

Immutable

Syntax

STDDEV_POP ( expression )

Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>Any NUMERIC data type or any non-numeric data type that can be implicitly converted to a numeric data type. STDDEV_POP returns the same data type as expression.</th>
</tr>
</thead>
</table>
Related Functions

- This function differs from the analytic function `STDDEV_POP`, which evaluates the statistical population standard deviation for each member of the group of rows within a window.
- `STDDEV_POP` returns the same value as the square root of `VAR_POP`:
  \[
  \text{STDDEV\_POP}(\text{expression}) = \sqrt{\text{VAR\_POP(\text{expression})}}
  \]
- When `VAR_SAMP` returns NULL, this function returns NULL.

Examples

The following example returns the statistical population standard deviation for each household ID in the `customer` table.

```sql
=> SELECT STDDEV_POP(household_id) FROM customer_dimension;

STDDEV_POP
-------------------
 8651.41895973367

(1 row)
```

See Also

- Analytic Functions
- SQL Analytics

`STDDEV_SAMP` [Aggregate]

Evaluates the statistical sample standard deviation for each member of the group. The return value is the same as the square root of `VAR_SAMP`:

\[
\text{STDDEV\_SAMP}(\text{expression}) = \sqrt{\text{VAR\_SAMP(\text{expression})}}
\]

Behavior Type

Immutable
**Syntax**

`STDDEV_SAMP ( expression )`

**Parameters**

| expression  | Any NUMERIC data type or any non-numeric data type that can be implicitly converted to a numeric data type. STDDEV_SAMP returns the same data type as expression. |

**Related Functions**

- STDDEV_SAMP is semantically identical to nonstandard function `STDDEV`, which is provided for compatibility with other databases.
- This aggregate function differs from analytic function `STDDEV_SAMP`, which computes the statistical sample standard deviation of the current row with respect to the group of rows within a window.
- When `VAR_SAMP` returns NULL, STDDEV_SAMP returns NULL.

**Examples**

The following example returns the statistical sample standard deviation for each household ID from the customer dimension table.

```
=> SELECT STDDEV_SAMP(household_id) FROM customer_dimension;
            stddev_samp
-------------------
   8651.50842400771
(1 row)
```

**SUM [Aggregate]**

Computes the sum of an expression over a group of rows. SUM returns a DOUBLE PRECISION value for a floating-point expression. Otherwise, the return value is the same as the expression data type.
The SUM aggregate function differs from the SUM analytic function, which computes the sum of an expression over a group of rows within a window.

**Behavior Type**

*Immutable*

**Syntax**

```
SUM ( [ ALL | DISTINCT ] expression )
```

**Parameters**

<table>
<thead>
<tr>
<th>ALL</th>
<th>Invokes the aggregate function for all rows in the group (default)</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISTINCT</td>
<td>Invokes the aggregate function for all distinct non-null values of the expression found in the group</td>
</tr>
<tr>
<td>expression</td>
<td>Any NUMERIC data type or any non-numeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.</td>
</tr>
</tbody>
</table>

**Overflow Handling**

If you encounter data overflow when using SUM(), use `SUM_FLOAT` which converts the data to a floating point. By default, Vertica allows silent numeric overflow when you call this function on numeric data types. For more information on this behavior and how to change it, see Numeric Data Type Overflow with SUM, SUM_FLOAT, and AVG.

**Example**

The following query returns the total sum of the product_cost column.

```
=> SELECT SUM(product_cost) AS cost FROM product_dimension;
    cost
  -------
  9042850
(1 row)
```
See Also

- AVG [Aggregate]
- COUNT [Aggregate]

SUM_FLOAT [Aggregate]

Computes the sum of an expression over a group of rows and returns a DOUBLE PRECISION value.

Behavior Type

Immutable

Syntax

SUM_FLOAT ( [ ALL | DISTINCT ] expression )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL</td>
<td>Invokes the aggregate function for all rows in the group (default).</td>
</tr>
<tr>
<td>DISTINCT</td>
<td>Invokes the aggregate function for all distinct non-null values of the</td>
</tr>
<tr>
<td>expression</td>
<td>expression found in the group.</td>
</tr>
<tr>
<td>expression</td>
<td>Any expression whose result is type DOUBLE PRECISION.</td>
</tr>
</tbody>
</table>

Overflow Handling

By default, Vertica allows silent numeric overflow when you call this function on numeric data types. For more information on this behavior and how to change it, see Numeric Data Type Overflow with SUM, SUM_FLOAT, and AVG.
Example

The following query returns the floating-point sum of the average price from the product table:

```sql
=> SELECT SUM_FLOAT(average_competitor_price) AS cost FROM product_dimension;

<table>
<thead>
<tr>
<th>cost</th>
</tr>
</thead>
<tbody>
<tr>
<td>18181102</td>
</tr>
</tbody>
</table>
(1 row)
```

VAR_POP [Aggregate]

Evaluates the population variance for each member of the group. This is defined as the sum of squares of the difference of `expression` from the mean of `expression`, divided by the number of remaining rows:

\[
\frac{\text{SUM}(\text{expression}^2) - \text{SUM}(\text{expression})^2}{\text{COUNT}(\text{expression})} / \text{COUNT}(\text{expression})
\]

Behavior Type

Immutable

Syntax

```sql
VAR_POP ( expression )
```

Parameters

| expression | Any NUMERIC data type or any non-numeric data type that can be implicitly converted to a numeric data type. VAR_POP returns the same data type as `expression`. |

Related Functions

This aggregate function differs from analytic function VAR_POP, which computes the population variance of the current row with respect to the group of rows within a window.
Examples

The following example returns the population variance for each household ID in the customer table.

```sql
=> SELECT VAR_POP(household_id) FROM customer_dimension;
   var_pop
---------------------
 74847050.0168393
(1 row)
```

VAR_SAMP [Aggregate]

Evaluates the sample variance for each row of the group. This is defined as the sum of squares of the difference of expression from the mean of expression divided by the number of remaining rows minus 1:

\[
\frac{\left(\text{SUM}(\text{expression} \times \text{expression}) - \text{SUM}(\text{expression}) \times \text{SUM}(\text{expression}) / \text{COUNT}(\text{expression})\right)}{\text{COUNT}(\text{expression}) - 1}
\]

Behavior Type

Immutable

Syntax

VAR_SAMP ( expression )

Parameters

| expression | Any NUMERIC data type or any non-numeric data type that can be implicitly converted to a numeric data type. VAR_SAMP returns the same data type as expression. |
Related Functions

- VAR_SAMP is semantically identical to nonstandard function VARIANCE, which is provided for compatibility with other databases.
- This aggregate function differs from analytic function VAR_SAMP, which computes the sample variance of the current row with respect to the group of rows within a window.

Examples

The following example returns the sample variance for each household ID in the customer table.

```sql
=> SELECT VAR_SAMP(household_id) FROM customer_dimension;
    var_samp
--------------------
   74848598.0106764
(1 row)
```

See Also

VARIANCE [Aggregate]

VARIANCE [Aggregate]

Evaluates the sample variance for each row of the group. This is defined as the sum of squares of the difference of expression from the mean of expression divided by the number of remaining rows minus 1.

```
(SUM(expression*expression) - SUM(expression) *SUM(expression) /COUNT(expression)) / (COUNT (expression) -1)
```

Behavior Type

Immutable
Syntax

VARIANCE ( expression )

Parameters

| expression | Any NUMERIC data type or any non-numeric data type that can be implicitly converted to a numeric data type. VARIANCE returns the same data type as expression. |

Related Functions

The nonstandard function VARIANCE is provided for compatibility with other databases. It is semantically identical to VAR_SAMP.

This aggregate function differs from analytic function VARIANCE, which computes the sample variance of the current row with respect to the group of rows within a window.

Examples

The following example returns the sample variance for each household ID in the customer table.

```sql
=> SELECT VARIANCE(household_id) FROM customer_dimension;

variance
-----------------
74848598.0106764
(1 row)
```

Analytic Functions

**Note:**
All analytic functions in this section with an aggregate counterpart are appended with [Analytics] in the heading to avoid confusion between the two function types.

Vertica analytics are SQL functions based on the ANSI 99 standard. These functions handle complex analysis and reporting tasks—for example:

- Rank the longest-standing customers in a particular state.
- Calculate the moving average of retail volume over a specified time.
- Find the highest score among all students in the same grade.
- Compare the current sales bonus that salespersons received against their previous bonus.

Analytic functions return aggregate results but they do not group the result set. They return the group value multiple times, once per record. You can sort group values, or partitions, using a window ORDER BY clause, but the order affects only the function result set, not the entire query result set.

**Syntax**

**General**

```
analytic-function(arguments) OVER(
    [ window-partition-clause ]
    [ window-order-clause [ window-frame-clause ] ]
)
```

**With named window**

```
analytic-function(arguments) OVER(
    [ named-window [ window-frame-clause ] ]
)
```

**Parameters**

| analytic-function(arguments) | A Vertica analytic function and its arguments. |
| **OVER**          | Specifies how to partition, sort, and window frame function input with respect to the current row. The input data is the result set that the query returns after it evaluates FROM, WHERE, GROUP BY, and HAVING clauses.
|                 | An empty OVER clause provides the best performance for single threaded queries on a single node. |
| **window-partition-clause** | Groups input rows according to one or more columns or expressions. If you omit this clause, no grouping occurs and the analytic function processes all input rows as a single partition. |
| **window-order-clause** | Optionally specifies how to sort rows that are supplied to the analytic function. If the OVER clause also includes a partition clause, rows are sorted within each partition. |
| **window-frame-clause** | Only valid for some analytic functions, specifies as input a set of rows relative to the row that is currently being evaluated by the analytic function. After the function processes that row and its window, Vertica advances the current row and adjusts the window boundaries accordingly. |
| **named-window** | The name of a window that you define in the same query with a window name clause. This definition encapsulates window partitioning and sorting. Named windows are useful when the query invokes multiple analytic functions with similar OVER clauses. A window name clause cannot specify a window frame clause. However, you can qualify the named window in an OVER clause with a window frame clause. |
Requirements

The following requirements apply to analytic functions:

- All require an OVER clause. Each function has its own OVER clause requirements. For example, you can supply an empty OVER clause for some analytic aggregate functions such as `SUM`. For other functions, window frame and order clauses might be required, or might be invalid.
- Analytic functions can be invoked only in a query's SELECT and ORDER BY clauses.
- Analytic functions cannot be nested. For example, the following query is not allowed:

  ```sql
  => SELECT MEDIAN(RANK() OVER(ORDER BY sal)) OVER().
  ```

- WHERE, GROUP BY and HAVING operators are technically not part of the analytic function. However, they determine input to that function.

See Also

- SQL Analytics
- GROUP BY Queries

Window Partition Clause

When specified, a window partition clause divides the rows of the function input based on user-provided expressions. If no expression is provided, the partition clause can improve query performance by using parallelism.

Window partitioning is similar to the GROUP BY clause except that it returns only one result row per input row. If you omit specifying a window partition clause, all input rows are treated as a single partition.

When used with analytic functions, results are computed per partition and start over again (reset) at the beginning of each subsequent partition.

Syntax

```sql
{ PARTITION BY expression[,...] | PARTITION BEST | PARTITION NODES }
```
## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>PARTITION BY</strong> (\text{expression})</td>
<td>Expression on which to sort the partition, where \text{expression} can be a column, constant, or an arbitrary expression formed on columns. Use <strong>PARTITION BY</strong> for analytic functions with specific partitioning requirements.</td>
</tr>
<tr>
<td><strong>PARTITION BEST</strong></td>
<td>Use parallelism to improve performance for multi-threaded queries across multiple nodes.</td>
</tr>
<tr>
<td></td>
<td>(\text{OVER(PARTITION BEST)}) provides the best performance on multi-threaded queries across multiple nodes.</td>
</tr>
<tr>
<td></td>
<td>The following considerations apply to using <strong>PARTITION BEST</strong>:</td>
</tr>
<tr>
<td></td>
<td>1. Use <strong>PARTITION BEST</strong> for analytic functions that have no partitioning requirements and are thread-safe—for example, a one-to-many transform.</td>
</tr>
<tr>
<td></td>
<td>2. Do not use <strong>PARTITION BEST</strong> on user-defined transform functions (UDTFs) that are not thread-safe. Doing so can produce an error or incorrect results. If a UDTF is not thread safe, use <strong>PARTITION NODES</strong>.</td>
</tr>
<tr>
<td><strong>PARTITION NODES</strong></td>
<td>Use parallelism to improve performance for single-threaded queries across multiple nodes.</td>
</tr>
<tr>
<td></td>
<td>(\text{OVER(PARTITION NODES)}) provides the best performance on single-threaded queries across multiple nodes.</td>
</tr>
</tbody>
</table>

## Examples

See [Window Partitioning](#).
Window Order Clause

Specifies how to sort rows that are supplied to the analytic function. If the OVER clause also includes a window partition clause, rows are sorted within each partition.

The window order clause only specifies order within a window result set. The query can have its own ORDER BY clause outside the OVER clause. This has precedence over the window order clause and orders the final result set.

An window order clause also creates a default window frame if none is explicitly specified.

Syntax

ORDER BY { expression[ sort-qualifiers ] } [,..]

sort-qualifiers:

{ ASC | DESC [ NULLS { FIRST | LAST | AUTO } ] }

Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>A column, constant, or arbitrary expression formed on columns, on which to sort input rows.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASC</td>
<td>DESC</td>
</tr>
<tr>
<td>NULLS {FIRST</td>
<td>LAST</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If you specify NULLS AUTO, Vertica chooses the positioning that is most efficient for this query, either NULLS FIRST or NULLS LAST.

If you omit all sort qualifiers, Vertica uses ASC NULLS LAST.

For more information, see:
Examples

See Window Ordering.

Window Frame Clause

Specifies a window frame, which comprises a set of rows relative to the row that is currently being evaluated by the analytic function. After the function processes that row and its window, Vertica advances the current row and adjusts the window boundaries accordingly. If the OVER clause also specifies a partition, Vertica also checks that window boundaries do not cross partition boundaries. This process repeats until the function evaluates the last row of the last partition.

Syntax

```
{ ROWS | RANGE }
{ BETWEEN start-point AND end-point } | start-point
start-point / end-point =
{ UNBOUNDED { PRECEDING | FOLLOWING }
| CURRENT ROW
| constant-value { PRECEDING | FOLLOWING }
}
```

Parameters

<table>
<thead>
<tr>
<th>ROWS</th>
<th>RANGE</th>
<th>Specifies whether Vertica determines window frame dimensions as physical or logical offsets from the current row. See ROWS versus RANGE below for details.</th>
</tr>
</thead>
<tbody>
<tr>
<td>BETWEEN</td>
<td>start-point AND end-point</td>
<td>Specifies the window's first and last rows, where start-point and end-point can be one of the following (discussed in detail below):</td>
</tr>
<tr>
<td>Start-point</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
<td></td>
</tr>
<tr>
<td>UNBOUNDED {PRECEDING</td>
<td>FOLLOWING}</td>
<td>Specifies that the window frame extends to the current partition's first row.</td>
</tr>
<tr>
<td>CURRENT ROW</td>
<td>Specifies the current row or value as the window's start or end point.</td>
<td></td>
</tr>
<tr>
<td>constant-value {PRECEDING</td>
<td>FOLLOWING}</td>
<td>Specifies a constant value or expression that evaluates to a constant value. The value specifies a physical or logical offset from the current row, depending on whether you specify ROWS or RANGE. Other dependencies also pertain, depending whether you specify ROWS and RANGE. See ROWS versus RANGE below for details.</td>
</tr>
<tr>
<td>start-point</td>
<td>If ROWS or RANGE specifies only a start point, Vertica uses the current row as the end point and creates the window frame accordingly. In this case, start-point must resolve to a row that is less than or equal to the current row.</td>
<td></td>
</tr>
</tbody>
</table>

**Requirements**

In order to specify a window frame, the OVER must also specify a window order (ORDER BY) clause. If the OVER clause omits specifying a window frame, the function creates a default window that extends from the current row to the first row in the current partition. This is equivalent to the following clause:

```
RANGE UNBOUNDED PRECEDING AND CURRENT ROW
```
ROWS versus RANGE

The window frame's offset from the current row can be physical or logical:

- **ROWS** specifies the window's *start-point* and *end-point* as a number of rows relative to the current row. If *start-point* and *end-point* are expressed as constant values, the value must evaluate to a positive integer.
- **RANGE** specifies the window as a logical offset such as time. The range value must match the [window order (ORDER BY) clause](#) data type: NUMERIC, DATE/TIME, FLOAT or INTEGER.

Use of **ROWS** or **RANGE** imposes specific requirements on setting the window's start and end points as constant values:

**Setting constant values for ROWS**
The constant must evaluate to a positive INTEGER.

**Setting constant values for RANGE**
The following requirements apply:

- The constant must evaluate to a positive numeric value or INTERVAL literal.
- If the constant evaluates to a NUMERIC value, the ORDER BY column type must be a NUMERIC data type.
- If the constant evaluates to an INTERVAL DAY TO SECOND subtype, the ORDER BY column type must be one of the following: TIMESTAMP, TIME, DATE, or INTERVAL DAY TO SECOND.
- If the constant evaluates to an INTERVAL YEAR TO MONTH, the ORDER BY column type must be one of the following: TIMESTAMP, DATE, or INTERVAL YEAR TO MONTH.
- The [window order clause](#) can specify only one expression.

Examples

See [Window Framing](#) in Analyzing Data

Window Name Clause

Defines a named window that specifies window partition and order clauses for an analytic function. This window is specified in the function's OVER clause. Named windows can be
useful when you write queries that invoke multiple analytic functions with similar OVER clauses—for example, they use the same partition (PARTITION BY) clauses.

**Syntax**

```sql
WINDOW window-name AS ( window-partition-clause [window-order-clause] )
```

**Parameters**

<table>
<thead>
<tr>
<th>WINDOW window-name</th>
<th>Specifies the window name. All window names must be unique within the same query.</th>
</tr>
</thead>
<tbody>
<tr>
<td>window-partition-clause</td>
<td>Clauses to invoke when an OVER clause references this window. If the window definition omits a window order clause, the OVER clause can specify its own order clause.</td>
</tr>
</tbody>
</table>

**Requirements**

- A WINDOW clause cannot include a **window frame clause**.
- Each WINDOW clause within the same query must have a unique name.
- A WINDOW clause can reference another window that is already named. For example, the following query names window w1 before w2. Thus, the WINDOW clause that defines w2 can reference w1:

```sql
=> SELECT RANK() OVER(w1 ORDER BY sal DESC), RANK() OVER w2
FROM EMP WINDOW w1 AS (PARTITION BY deptno), w2 AS (w1 ORDER BY sal);
```

**Examples**

See Named Windows in Analyzing Data.

**See Also**

Analytic Functions
**ARGMAX [Analytic]**

This function is patterned after the mathematical function $\text{argmax}(f(x))$, which returns the value of $x$ that maximizes $f(x)$. Similarly, ARGMAX takes two arguments `target` and `arg`, where both are columns or column expressions in the queried dataset. ARGMAX finds the row with the largest non-null value in `target` and returns the value of `arg` in that row. If multiple rows contain the largest `target` value, ARGMAX returns `arg` from the first row that it finds.

**Behavior Type**

*Immutable*

**Syntax**

```
ARGMAX ( target, arg ) OVER ( [ PARTITION BY expression[,…] ] [ window-order-clause ] )
```

**Arguments**

<table>
<thead>
<tr>
<th><code>target, arg</code></th>
<th>Columns in the queried dataset.</th>
</tr>
</thead>
<tbody>
<tr>
<td>OVER( )</td>
<td>Specifies the following window clauses:</td>
</tr>
</tbody>
</table>

- **PARTITION BY `expression`:** Groups (partitions) input rows according to the values in `expression`, which resolves to one or more columns in the queried dataset. If you omit this clause, ARGMAX processes all input rows as a single partition.
- **`window-order-clause`:** Specifies how to sort input rows. If the OVER clause also includes a partition clause, rows are sorted separately within each partition.

**Important:** To ensure consistent results when multiple rows contain the largest `target` value, include a window order clause that sorts on `arg`.

For details, see [Analytic Functions](#).
Examples

Create and populate table service_info, which contains information on various services, their respective development groups, and their userbase. A NULL in the users column indicates that the service has not been released, and so it cannot have users.

```sql
=> CREATE TABLE service_info(dev_group VARCHAR(10), product_name VARCHAR(30), users INT);
=> COPY t FROM stdin NULL AS 'null';
>> iris|chat|48193
>> aspen|trading|3000
>> orchid|cloud|990322
>> daffodil|streaming|44123
>> hydrangea|password manager|null
>> hydrangea|totp|1837363
>> daffodil|clip share|3000
>> hydrangea|e2e sms|null
>> rose|crypto|null
>> iris|forum|48193
>> .
```

ARGMAX returns the value in the product_name column that maximizes the value in the users column. In this case, ARGMAX returns totp, which indicates that the totp service has the largest user base:

```sql
=> SELECT dev_group, product_name, users, ARGMAX(users, product_name) OVER (ORDER BY dev_group ASC) FROM service_info;
  dev_group | product_name   | users | ARGMAX
----------+----------------+-------+-------
  aspen    | trading        | 3000  | totp  
  daffodil | clip share     | 3000  | totp  
  daffodil | streaming      | 44123 | totp  
  hydrangea| e2e sms        |       | totp  
  hydrangea| password manager|     |       
  hydrangea| totp           | 1837363 | totp 
  iris     | chat           | 48193 | totp  
  iris     | forum          | 48193 | totp  
  iris     | video call     | 10203 | totp  
  orchid   | cloud          | 990322 | totp 
  rose     | crypto         |       | totp  
(11 rows)
```

The next query partitions the data on dev_group to identify the most popular service created by each development group. ARGMAX returns NULL if the partition's users column contains only NULL values and breaks ties using the first value in product_name from the top of the partition.

```sql
=> SELECT dev_group, product_name, users, ARGMAX(users, product_name) OVER (PARTITION BY dev_group ORDER BY product_name ASC) FROM service_info;
  dev_group | product_name   | users | ARGMAX
----------+----------------+-------+-------
  (11 rows)
```
ARGMIN [Analytic]

This function is patterned after the mathematical function $\text{argmin}(f(x))$, which returns the value of $x$ that minimizes $f(x)$. Similarly, ARGMIN takes two arguments $\text{target}$ and $\text{arg}$, where both are columns or column expressions in the queried dataset. ARGMIN finds the row with the smallest non-null value in $\text{target}$ and returns the value of $\text{arg}$ in that row. If multiple rows contain the smallest $\text{target}$ value, ARGMIN returns $\text{arg}$ from the first row that it finds.

Behavior Type

Immutable

Syntax

ARGMIN ( $\text{target}$, $\text{arg}$ ) OVER ( [ PARTITION BY expression[,..] ] [ $\text{window-order-clause}$ ] )

Arguments

<table>
<thead>
<tr>
<th>$\text{target}$, $\text{arg}$</th>
<th>Columns in the queried dataset.</th>
</tr>
</thead>
<tbody>
<tr>
<td>OVER()</td>
<td>Specifies the following window clauses:</td>
</tr>
</tbody>
</table>
PARTITION BY expression: Groups (partitions) input rows according to the values in expression, which resolves to one or more columns in the queried dataset. If you omit this clause, ARGMIN processes all input rows as a single partition.

window-order-clause: Specifies how to sort input rows. If the OVER clause also includes a partition clause, rows are sorted separately within each partition.

Important:
To ensure consistent results when multiple rows contain the smallest target value, include a window order clause that sorts on arg.

For details, see Analytic Functions.

Examples

Create and populate table service_info, which contains information on various services, their respective development groups, and their userbase. A NULL in the users column indicates that the service has not been released, and so it cannot have users.

```
=> CREATE TABLE service_info(dev_group VARCHAR(10), product_name VARCHAR(30), users INT);
=> COPY t FROM stdin NULL AS 'null';
>> iris|chat|48193
>> aspen|trading|3000
>> orchid|cloud|990322
>> iris|video call| 10203
>> daffodil|streaming|44123
>> hydrangea|password manager|null
>> hydrangea|totp|1837363
>> daffodil|clip share|3000
>> hydrangea|e2e sms|null
>> rose|crypto|null
>> iris|forum|48193
>> .
```

ARGMIN returns the value in the product_name column that minimizes the value in the users column. In this case, ARGMIN returns totp, which indicates that the totp service has the smallest user base:

```
=> SELECT dev_group, product_name, users, ARGMIN(users, product_name) OVER (ORDER BY dev_group ASC) FROM service_info;
    dev_group |    product_name | users | ARGMIN
---------------------------|----------------|-------|----------------
        aspen |       trading |    3000 |     trading
       daffodil |   clip share |    3000 |     trading
       daffodil |   streaming |    44123 |     trading
```
The next query partitions the data on `dev_group` to identify the least popular service created by each development group. `ARGMIN` returns NULL if the partition's `users` column contains only NULL values and breaks ties using the first value in `product_name` from the top of the partition.

```
=> SELECT dev_group, product_name, users, ARGMIN(users, product_name) OVER (PARTITION BY dev_group ORDER BY product_name ASC) FROM service_info;
```

<table>
<thead>
<tr>
<th>dev_group</th>
<th>product_name</th>
<th>users</th>
<th>ARGMIN</th>

ARGMAX [Analytic]

AVG [Analytic]

Computes an average of an expression in a group within a `window`. AVG returns the same data type as the expression's numeric data type.

The AVG analytic function differs from the AVG aggregate function, which computes the average of an expression over a group of rows.

Behavior Type

Immutable
Syntax

`AVG ( expression ) OVER ( [ window-partition-clause ] [ window-order-clause ] [ window-frame-clause ] )`

Parameters

<table>
<thead>
<tr>
<th><code>expression</code></th>
<th>Any data that can be implicitly converted to a numeric data type.</th>
</tr>
</thead>
<tbody>
<tr>
<td>OVER()</td>
<td>See Analytic Functions.</td>
</tr>
</tbody>
</table>

Overflow Handling

By default, Vertica allows silent numeric overflow when you call this function on numeric data types. For more information on this behavior and how to change it, see Numeric Data Type Overflow with SUM, SUM_FLOAT, and AVG.

Examples

The following query finds the sales for that calendar month and returns a running/cumulative average (sometimes called a moving average) using the default window of RANGE UNBOUNDED PRECEDING AND CURRENT ROW:

```sql
=> SELECT calendar_month_number_in_year Mo, SUM(product_price) Sales, 
   AVG(SUM(product_price)) OVER (ORDER BY calendar_month_number_in_year)::INTEGER Average 
   FROM product_dimension pd, date_dimension dm, inventory_fact if 
   WHERE dm.date_key = if.date_key AND pd.product_key = if.product_key GROUP BY Mo;
```

<table>
<thead>
<tr>
<th>Mo</th>
<th>Sales</th>
<th>Average</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>23869547</td>
<td>23869547</td>
</tr>
<tr>
<td>2</td>
<td>19684661</td>
<td>21737104</td>
</tr>
<tr>
<td>3</td>
<td>22877913</td>
<td>22117374</td>
</tr>
<tr>
<td>4</td>
<td>22901263</td>
<td>22313346</td>
</tr>
<tr>
<td>5</td>
<td>23670676</td>
<td>22584812</td>
</tr>
<tr>
<td>6</td>
<td>22507600</td>
<td>22571943</td>
</tr>
<tr>
<td>7</td>
<td>21514089</td>
<td>22420821</td>
</tr>
<tr>
<td>8</td>
<td>24860684</td>
<td>22725804</td>
</tr>
<tr>
<td>9</td>
<td>21687795</td>
<td>22618470</td>
</tr>
<tr>
<td>10</td>
<td>23648921</td>
<td>22714315</td>
</tr>
<tr>
<td>11</td>
<td>21115910</td>
<td>22569005</td>
</tr>
<tr>
<td>12</td>
<td>24708317</td>
<td>22747281</td>
</tr>
</tbody>
</table>

(12 rows)
To return a moving average that is not a running (cumulative) average, the window can specify ROWS BETWEEN 2 PRECEDING AND 2 FOLLOWING:

```sql
=> SELECT calendar_month_number_in_year Mo, SUM(product_price) Sales,
    AVG(SUM(product_price)) OVER (ORDER BY calendar_month_number_in_year
    ROWS BETWEEN 2 PRECEDING AND 2 FOLLOWING)::INTEGER Average
FROM product_dimension pd, date_dimension dm, inventory_fact if
WHERE dm.date_key = if.date_key AND pd.product_key = if.product_key GROUP BY Mo;
```

<table>
<thead>
<tr>
<th>Mo</th>
<th>Sales</th>
<th>Average</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>23869547</td>
<td>22117374</td>
</tr>
<tr>
<td>2</td>
<td>19604661</td>
<td>22313346</td>
</tr>
<tr>
<td>3</td>
<td>22877913</td>
<td>22584812</td>
</tr>
<tr>
<td>4</td>
<td>22901263</td>
<td>22312423</td>
</tr>
<tr>
<td>5</td>
<td>23670676</td>
<td>22694308</td>
</tr>
<tr>
<td>6</td>
<td>22507600</td>
<td>23090862</td>
</tr>
<tr>
<td>7</td>
<td>21514089</td>
<td>22848169</td>
</tr>
<tr>
<td>8</td>
<td>24860684</td>
<td>22843818</td>
</tr>
<tr>
<td>9</td>
<td>21687795</td>
<td>22565480</td>
</tr>
<tr>
<td>10</td>
<td>2364921</td>
<td>23204325</td>
</tr>
<tr>
<td>11</td>
<td>21115910</td>
<td>22790236</td>
</tr>
<tr>
<td>12</td>
<td>24708317</td>
<td>23157716</td>
</tr>
</tbody>
</table>

**BOOL_AND [Analytic]**

Returns the Boolean value of an expression within a window. If all input values are true, BOOL_AND returns t. Otherwise, it returns f.

**Behavior Type**

Immutable

**Syntax**

```sql
BOOL_AND ( expression ) OVER ( [ window-partition-clause ] [ window-order-clause ] [ window-frame-clause ] )
```
Parameters

| expression | A Boolean Data Type or any non-Boolean data type that can be implicitly converted to a Boolean data type. The function returns a Boolean value. |
| OVER()     | See Analytic Functions. |

Examples

The following example illustrates how you can use the BOOL_AND, BOOL_OR, and BOOL_XOR analytic functions. The sample table, employee, includes a column for type of employee and years paid.

```sql
=> CREATE TABLE employee(emptype VARCHAR, yearspaid VARCHAR);
CREATE TABLE

Insert sample data into the table to show years paid. In more than one case, an employee could be paid more than once within one year.

```sql
=> INSERT INTO employee
SELECT 'contractor1', '2014'
UNION ALL
SELECT 'contractor2', '2015'
UNION ALL
SELECT 'contractor3', '2014'
UNION ALL
SELECT 'contractor1', '2014'
UNION ALL
SELECT 'contractor2', '2014'
UNION ALL
SELECT 'contractor3', '2015'
UNION ALL
SELECT 'contractor4', '2014'
UNION ALL
SELECT 'contractor4', '2014'
UNION ALL
SELECT 'contractor5', '2015'
UNION ALL
SELECT 'contractor5', '2016';
OUTPUT
10
(1 row)
```

Query the table. The result shows employees that were paid twice in 2014 (BOOL_AND), once or twice in 2014 (BOOL_OR), and specifically not more than once in 2014 (BOOL_XOR).
=) SELECT DISTINCT emptype,  
BOOL_AND(yearspaid='2014') OVER (PARTITION BY emptype) AS paidtwicein2014,  
BOOL_OR(yearspaid='2014') OVER (PARTITION BY emptype) AS paidonceortwicein2014,  
BOOL_XOR(yearspaid='2014') OVER (PARTITION BY emptype) AS paidjustoncein2014  
FROM employee;  

 emptype | paidtwicein2014 | paidonceortwicein2014 | paidjustoncein2014  
---------|----------------|------------------------|---------------------  
 contractor1 | t | t | f  
 contractor2 | f | t | t  
 contractor3 | f | t | t  
 contractor4 | t | t | f  
 contractor5 | f | f | f  
 (5 rows)

- Boolean Data Type

BOOL_OR [Analytic]

Returns the Boolean value of an expression within a window. If at least one input value is true, BOOL_OR returns t. Otherwise, it returns f.

Behavior Type

Immutable

Syntax

BOOL_OR ( expression ) OVER (  
[ window-partition-clause ]  
[ window-order-clause ]  
[ window-frame-clause ] )
Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>A Boolean Data Type or any non-Boolean data type that can be implicitly converted to a Boolean data type. The function returns a Boolean value.</th>
</tr>
</thead>
<tbody>
<tr>
<td>OVER()</td>
<td>See Analytic Functions.</td>
</tr>
</tbody>
</table>

Examples

The following example illustrates how you can use the BOOL_AND, BOOL_OR, and BOOL_XOR analytic functions. The sample table, employee, includes a column for type of employee and years paid.

```sql
=> CREATE TABLE employee(emptype VARCHAR, yearspaid VARCHAR);
CREATE TABLE

INSERT sample data into the table to show years paid. In more than one case, an employee could be paid more than once within one year.

```sql
=> INSERT INTO employee
SELECT 'contractor1', '2014'
UNION ALL
SELECT 'contractor2', '2015'
UNION ALL
SELECT 'contractor3', '2014'
UNION ALL
SELECT 'contractor1', '2014'
UNION ALL
SELECT 'contractor2', '2014'
UNION ALL
SELECT 'contractor3', '2015'
UNION ALL
SELECT 'contractor4', '2014'
UNION ALL
SELECT 'contractor4', '2014'
UNION ALL
SELECT 'contractor5', '2015'
UNION ALL
SELECT 'contractor5', '2016';
OUTPUT
-------
10
(1 row)
```

Query the table. The result shows employees that were paid twice in 2014 (BOOL_AND), once or twice in 2014 (BOOL_OR), and specifically not more than once in 2014 (BOOL_XOR).
=> SELECT DISTINCT emptype,
    BOOL_AND(yearspaid='2014') OVER (PARTITION BY emptype) AS paidtwicein2014,
    BOOL_OR(yearspaid='2014') OVER (PARTITION BY emptype) AS paidonceortwicein2014,
    BOOL_XOR(yearspaid='2014') OVER (PARTITION BY emptype) AS paidjustoncein2014
FROM employee;

<table>
<thead>
<tr>
<th>emptype</th>
<th>paidtwicein2014</th>
<th>paidonceortwicein2014</th>
<th>paidjustoncein2014</th>
</tr>
</thead>
<tbody>
<tr>

- BOOL_XOR [Analytic]
- Boolean Data Type

BOOL_XOR [Analytic]

Returns the Boolean value of an expression within a window. If only one input value is true, BOOL_XOR returns t. Otherwise, it returns f.

Behavior Type

Immutable

Syntax

BOOL_XOR ( expression ) OVER (  
    [ window-partition-clause ]  
    [ window-order-clause ]  
    [ window-frame-clause ] )
Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>A <strong>Boolean Data Type</strong> or any non-Boolean data type that can be implicitly converted to a Boolean data type. The function returns a Boolean value.</th>
</tr>
</thead>
<tbody>
<tr>
<td>OVER()</td>
<td>See <a href="#">Analytic Functions</a>.</td>
</tr>
</tbody>
</table>

Examples

The following example illustrates how you can use the `BOOL_AND`, `BOOL_OR`, and `BOOL_XOR` analytic functions. The sample table, `employee`, includes a column for type of employee and years paid.

```
=> CREATE TABLE employee(emptype VARCHAR, yearspaid VARCHAR);
CREATE TABLE
```

Insert sample data into the table to show years paid. In more than one case, an employee could be paid more than once within one year.

```
=> INSERT INTO employee
SELECT 'contractor1', '2014'
UNION ALL
SELECT 'contractor2', '2015'
UNION ALL
SELECT 'contractor3', '2014'
UNION ALL
SELECT 'contractor1', '2014'
UNION ALL
SELECT 'contractor2', '2014'
UNION ALL
SELECT 'contractor3', '2015'
UNION ALL
SELECT 'contractor4', '2014'
UNION ALL
SELECT 'contractor4', '2014'
UNION ALL
SELECT 'contractor5', '2015'
UNION ALL
SELECT 'contractor5', '2016';
OUTPUT
-------
10
(1 row)
```

Query the table. The result shows employees that were paid twice in 2014 (`BOOL_AND`), once or twice in 2014 (`BOOL_OR`), and specifically not more than once in 2014 (`BOOL_XOR`).
=> SELECT DISTINCT emptype,
    BOOL_AND(yearspaid='2014') OVER (PARTITION BY emptype) AS paidtwicein2014,
    BOOL_OR(yearspaid='2014') OVER (PARTITION BY emptype) AS paidonceortwicein2014,
    BOOL_XOR(yearspaid='2014') OVER (PARTITION BY emptype) AS paidjustoncein2014
FROM employee;

<table>
<thead>
<tr>
<th>emptype</th>
<th>paidtwicein2014</th>
<th>paidonceortwicein2014</th>
<th>paidjustoncein2014</th>
</tr>
</thead>
<tbody>
<tr>

**CONDITIONAL_CHANGE_EVENT [Analytic]**

Assigns an event window number to each row, starting from 0, and increments by 1 when the result of evaluating the argument expression on the current row differs from that on the previous row.

**Behavior Type**

Immutable

**Syntax**

CONDITIONAL_CHANGE_EVENT (expression) OVER (window-partition-clause window-order-clause)
Parameters

| expression | SQL scalar expression that is evaluated on an input record. The result of `expression` can be of any data type. |
| OVER()     | See Analytic Functions. |

Notes

The analytic `window-order-clause` is required but the `window-partition-clause` is optional.

Example

```sql
=> SELECT CONDITIONAL_CHANGE_EVENT(bid)
  OVER (PARTITION BY symbol ORDER BY ts) AS cce
FROM TickStore;
```

The system returns an error when no `ORDER BY` clause is present:

```sql
=> SELECT CONDITIONAL_CHANGE_EVENT(bid)
  OVER (PARTITION BY symbol) AS cce
FROM TickStore;
```

ERROR: conditional_change_event must contain an ORDER BY clause within its analytic clause

For more examples, see Event-Based Windows in Analyzing Data.

See Also

- CONDITIONAL_TRUE_EVENT [Analytic]
- ROW_NUMBER [Analytic]
- Time Series Analytics
- Event-Based Windows
CONDITIONAL_TRUE_EVENT [Analytic]

Assigns an event window number to each row, starting from 0, and increments the number by 1 when the result of the boolean argument expression evaluates true. For example, given a sequence of values for column a, as follows:

\[(1, 2, 3, 4, 5, 6)\]

CONDITIONAL_TRUE_EVENT(a > 3) returns 0, 0, 0, 1, 2, 3.

**Behavior Type**

Immutable

**Syntax**

```
CONDITIONAL_TRUE_EVENT ( boolean-expression ) OVER ( 
  [ window-partition-clause ]
  window-order-clause )
```

**Parameters**

<table>
<thead>
<tr>
<th>boolean-expression</th>
<th>SQL scalar expression that is evaluated on an input record, type BOOLEAN.</th>
</tr>
</thead>
<tbody>
<tr>
<td>OVER()</td>
<td>See Analytic Functions.</td>
</tr>
</tbody>
</table>

**Notes**

The analytic `window-order-clause` is required but the `window-partition-clause` is optional.

**Example**

```
> SELECT CONDITIONAL_TRUE_EVENT(bid > 10.6)
  OVER(PARTITION BY bid ORDER BY ts) AS cte
```
FROM Tickstore;

The system returns an error if the ORDER BY clause is omitted:

```sql
> SELECT CONDITIONAL_TRUE_EVENT(bid > 10.6)
    OVER(PARTITION BY bid) AS cte
FROM Tickstore;
ERROR: conditional_true_event must contain an ORDER BY clause within its analytic clause
```

For more examples, see Event-Based Windows in Analyzing Data.

- CONDITIONAL_CHANGE_EVENT [Analytic]
- Time Series Analytics
- Event-Based Windows

COUNT [Analytic]

Counts occurrences within a group within a window. If you specify * or some non-null constant, COUNT() counts all rows.

Behavior Type

Immutable

Syntax

```sql
COUNT ( expression ) OVER (  
    [ window-partition-clause ]  
    [ window-order-clause ]  
    [ window-frame-clause ]  )
```

Parameters

| expression | Returns the number of rows in each group for which the expression is not null. Can be any expression resulting in BIGINT. |
OVER() See Analytic Functions.

Example

Using the schema defined in Window Framing in Analyzing Data, the following COUNT function omits window order and window frame clauses; otherwise Vertica would treat it as a window aggregate. Think of the window of reporting aggregates as UNBOUNDED PRECEDING and UNBOUNDED FOLLOWING.

```sql
=> SELECT deptno, sal, empno, COUNT(sal)
    OVER (PARTITION BY deptno) AS count FROM emp;
```  

<table>
<thead>
<tr>
<th>deptno</th>
<th>sal</th>
<th>empno</th>
<th>count</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>101</td>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>10</td>
<td>104</td>
<td>4</td>
<td>2</td>
</tr>
<tr>
<td>20</td>
<td>110</td>
<td>10</td>
<td>6</td>
</tr>
<tr>
<td>20</td>
<td>110</td>
<td>9</td>
<td>6</td>
</tr>
<tr>
<td>20</td>
<td>109</td>
<td>7</td>
<td>6</td>
</tr>
<tr>
<td>20</td>
<td>109</td>
<td>6</td>
<td>6</td>
</tr>
<tr>
<td>20</td>
<td>109</td>
<td>8</td>
<td>6</td>
</tr>
<tr>
<td>20</td>
<td>109</td>
<td>11</td>
<td>6</td>
</tr>
<tr>
<td>30</td>
<td>105</td>
<td>5</td>
<td>3</td>
</tr>
<tr>
<td>30</td>
<td>103</td>
<td>3</td>
<td>3</td>
</tr>
<tr>
<td>30</td>
<td>102</td>
<td>2</td>
<td>3</td>
</tr>
</tbody>
</table>

Using ORDER BY sal creates a moving window query with default window: RANGE BETWEEN UNBOUNDED PRECEDING AND CURRENT ROW.

```sql
=> SELECT deptno, sal, empno, COUNT(sal)
    OVER (PARTITION BY deptno ORDER BY sal) AS count
    FROM emp;
```  

<table>
<thead>
<tr>
<th>deptno</th>
<th>sal</th>
<th>empno</th>
<th>count</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>101</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>10</td>
<td>104</td>
<td>4</td>
<td>2</td>
</tr>
<tr>
<td>20</td>
<td>100</td>
<td>11</td>
<td>1</td>
</tr>
<tr>
<td>20</td>
<td>109</td>
<td>7</td>
<td>4</td>
</tr>
<tr>
<td>20</td>
<td>109</td>
<td>6</td>
<td>4</td>
</tr>
<tr>
<td>20</td>
<td>109</td>
<td>8</td>
<td>4</td>
</tr>

Using the VMart schema, the following query finds the number of employees who make less than or equivalent to the hourly rate of the current employee. The query returns a running/cumulative average (sometimes called a moving average) using the default window of RANGE UNBOUNDED PRECEDING AND CURRENT ROW:

```sql
To return a moving average that is not also a running (cumulative) average, the window should specify ROWS BETWEEN 2 PRECEDING AND 2 FOLLOWING:

```sql
=> SELECT employee_last_name AS "last_name", hourly_rate, COUNT(*)
   OVER (ORDER BY hourly_rate ROWS BETWEEN 2 PRECEDING AND 2 FOLLOWING)
   AS moving_count from employee_dimension;
```

<table>

**CUME_DIST [Analytic]**

Calculates the cumulative distribution, or relative rank, of the current row with regard to other rows in the same partition within a window.

CUME_DIST() returns a number greater then 0 and less then or equal to 1, where the number represents the relative position of the specified row within a group of \( n \) rows. For a row \( x \) (assuming ASC ordering), the CUME_DIST of \( x \) is the number of rows with values lower than or equal to the value of \( x \), divided by the number of rows in the partition. For example, in a group of three rows, the cumulative distribution values returned would be 1/3, 2/3, and 3/3.
Note:
Because the result for a given row depends on the number of rows preceding that row in the same partition, you should always specify a window-order-clause when you call this function.

Behavior Type
Immutable

Syntax
CUME_DIST ( ) OVER (  
[ window-partition-clause ]  
window-order-clause )

Parameters
OVER() See Analytic Functions.

Examples
The following example returns the cumulative distribution of sales for different transaction types within each month of the first quarter.

```sql
=> SELECT calendar_month_name AS month, tender_type, SUM(sales_quantity),
    CUME_DIST()
    OVER (PARTITION BY calendar_month_name ORDER BY SUM(sales_quantity)) AS CUME_DIST
FROM store.store_sales_fact JOIN date_dimension
USING(date_key) WHERE calendar_month_name IN ('January', 'February', 'March')
AND tender_type NOT LIKE 'Other'
GROUP BY calendar_month_name, tender_type;
```

<table>
<thead>
<tr>
<th>month</th>
<th>tender_type</th>
<th>SUM</th>
<th>CUME_DIST</th>
</tr>
</thead>
<tbody>
<tr>
<td>March</td>
<td>Credit</td>
<td>469858</td>
<td>0.25</td>
</tr>

- PERCENTILE_DISC [Analytic]
- SQL Analytics

**DENSE_RANK [Analytic]**

Within each window partition, ranks all rows in the query results set according to the order specified by the window's ORDER BY clause. A DENSE_RANK function returns a sequence of ranking numbers without any gaps.

DENSE_RANK executes as follows:

1. Sorts partition rows as specified by the ORDER BY clause.
2. Compares the ORDER BY values of the preceding row and current row and ranks the current row as follows:
   - If ORDER BY values are the same, the current row gets the same ranking as the preceding row.
   - If the ORDER BY values are different, DENSE_RANK increments or decrements the current row's ranking by 1, depending whether sort order is ascending or descending.

**Note:**

Null values are considered equal. For detailed information on how null values are sorted, see NULL Sort Order.

DENSE_RANK always changes the ranking by 1, so no gaps appear in the ranking sequence. The largest rank value is the number of unique ORDER BY values returned by the query.

**Behavior Type**

Immutable
Syntax

DENSE_RANK() OVER (  
[ window-partition-clause ]  
window-order-clause )

Parameters

OVER() | See Analytic Functions.

See Analytic Functions

Compared with RANK

RANK leaves gaps in the ranking sequence, while DENSE_RANK does not. The example below compares the behavior of the two functions.

Example

The following query invokes RANK and DENSE_RANK to rank customers by annual income. The two functions return different rankings, as follows:

- If annual_salary contains duplicate values, RANK() inserts duplicate rankings and then skips one or more values—for example, from 4 to 6 and 7 to 9.
- In the parallel column Dense Rank, DENSE_RANK() also inserts duplicate rankings, but leaves no gaps in the rankings sequence:

```sql
=> SELECT employee_region region, employee_key, annual_salary,  
RANK() OVER (PARTITION BY employee_region ORDER BY annual_salary) Rank,  
DENSE_RANK() OVER (PARTITION BY employee_region ORDER BY annual_salary) "Dense Rank"  
FROM employee_dimension;
```

<table>
<thead>
<tr>
<th>region</th>
<th>employee_key</th>

</tbody>
</table>
EXPONENTIAL_MOVING_AVERAGE [Analytic]

Calculates the exponential moving average (EMA) of expression E with smoothing factor X. An EMA differs from a simple moving average in that it provides a more stable picture of changes to data over time.

The EMA is calculated by adding the previous EMA value to the current data point scaled by the smoothing factor, as in the following formula:

\[ EMА = EMА_0 + (X \times (E - EMА_0)) \]

where:

- E is the current data point
- EMА_0 is the previous row's EMA value.
- X is the smoothing factor.

This function also works at the row level. For example, EMA assumes the data in a given column is sampled at uniform intervals. If the users' data points are sampled at non-uniform intervals, they should run the time series gap filling and interpolation (GFI) operations before EMA().

See Also

SQL Analytics
Behavior Type

Immutable

Syntax

\[
\text{EXPONENTIAL\_MOVING\_AVERAGE} \ (E, X) \ \text{OVER} \ (\ \text{window-partition-clause} \ \text{window-order-clause} \ )
\]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(E)</td>
<td>The value whose average is calculated over a set of rows. Can be INTEGER, FLOAT or NUMERIC type and must be a constant.</td>
</tr>
<tr>
<td>(X)</td>
<td>A positive FLOAT value between 0 and 1 that is used as the smoothing factor.</td>
</tr>
<tr>
<td>OVER ()</td>
<td>See <a href="#">Analytic Functions</a>.</td>
</tr>
</tbody>
</table>

Examples

The following example uses time series [gap filling and interpolation](#) (GFI) first in a subquery, and then performs an EXPONENTIAL\_MOVING\_AVERAGE operation on the subquery result.

Create a simple four-column table:

```sql
=> CREATE TABLE ticker(
    time TIMESTAMP,
    symbol VARCHAR(8),
    bid1 FLOAT,
    bid2 FLOAT);
```

Insert some data, including nulls, so GFI can do its interpolation and gap filling:

```sql
=> INSERT INTO ticker VALUES ('2009-07-12 03:00:00', 'ABC', 60.45, 60.44);
=> INSERT INTO ticker VALUES ('2009-07-12 03:00:01', 'ABC', 60.49, 65.12);
=> INSERT INTO ticker VALUES ('2009-07-12 03:00:02', 'ABC', 57.78, 59.25);
=> INSERT INTO ticker VALUES ('2009-07-12 03:00:03', 'ABC', null, 65.12);
=> INSERT INTO ticker VALUES ('2009-07-12 03:00:04', 'ABC', 67.88, null);
=> INSERT INTO ticker VALUES ('2009-07-12 03:00:00', 'XYZ', 47.55, 40.15);
```
```sql
=> INSERT INTO ticker VALUES ('2009-07-12 03:00:01', 'XYZ', 44.35, 46.78);
=> INSERT INTO ticker VALUES ('2009-07-12 03:00:02', 'XYZ', 71.56, 75.78);
=> INSERT INTO ticker VALUES ('2009-07-12 03:00:03', 'XYZ', 85.55, 70.21);
=> INSERT INTO ticker VALUES ('2009-07-12 03:00:04', 'XYZ', 45.55, 58.65);
=> COMMIT;
```

**Note:**

During gap filling and interpolation, Vertica takes the closest non null value on either side of the time slice and uses that value. For example, if you use a linear interpolation scheme and you do not specify \texttt{IGNORE NULLS}, and your data has one real value and one null, the result is null. If the value on either side is null, the result is null. See \texttt{When Time Series Data Contains Nulls} in Analyzing Data for details.

Query the table that you just created to you can see the output:

```sql
=> SELECT * FROM ticker;
  time     | symbol | bid1 | bid2
---------------------+--------+------+------
2009-07-12 03:00:00  | ABC    | 60.45| 60.44|
2009-07-12 03:00:01  | ABC    | 60.49| 65.12|
2009-07-12 03:00:02  | ABC    | 57.78| 59.25|
2009-07-12 03:00:03  | ABC    | 65.12|
2009-07-12 03:00:04  | ABC    | 67.88|
2009-07-12 03:00:00  | XYZ    | 47.55| 40.15|
2009-07-12 03:00:01  | XYZ    | 44.35| 46.78|
2009-07-12 03:00:02  | XYZ    | 71.56| 75.78|
2009-07-12 03:00:03  | XYZ    | 85.55| 70.21|
2009-07-12 03:00:04  | XYZ    | 45.55| 58.65|
(10 rows)
```

The following query processes the first and last values that belong to each 2-second time slice in table \texttt{trades}' column \texttt{a}. The query then calculates the exponential moving average of expression \texttt{fv} and \texttt{lv} with a smoothing factor of 50%:

```sql
=> SELECT symbol, slice_time, fv, lv,
       EXPONENTIAL_MOVING_AVERAGE(fv, 0.5)
       OVER (PARTITION BY symbol ORDER BY slice_time) AS ema_first,
       EXPONENTIAL_MOVING_AVERAGE(lv, 0.5)
       OVER (PARTITION BY symbol ORDER BY slice_time) AS ema_last
FROM (SELECT symbol, slice_time,
       TS_FIRST_VALUE(bid1 IGNORE NULLS) as fv,
       TS_LAST_VALUE(bid2 IGNORE NULLS) AS lv
       FROM ticker TIMESERIES slice_time AS '2 seconds'
       OVER (PARTITION BY symbol ORDER BY time) ) AS sq;

symbol | slice_time     | fv  | lv  | ema_first | ema_last
-------------------+----------------+-----+-----+----------+----------
ABC     | 2009-07-12 03:00:00 | 60.45| 65.12| 60.45    | 65.12    
```

### FIRST_VALUE [Analytic]

Lets you select the first value of a table or partition (determined by the `window-order-clause`) without having to use a self join. This function is useful when you want to use the first value as a baseline in calculations.

Use `FIRST_VALUE()` with the `window-order-clause` to produce deterministic results. If no `window` is specified for the current row, the default window is `UNBOUNDED PRECEDING AND CURRENT ROW`.

### Behavior Type

**Immutable**

### Syntax

```
FIRST_VALUE ( expression [ IGNORE NULLS ] ) OVER ( 
    [ window-partition-clause ]
    [ window-order-clause ]
    [ window-frame-clause ]
)
```

### Parameters

| `expression`     | Expression to evaluate—or example, a constant, column, nonanalytic function, function expression, or expressions involving any of these. |
**Examples**

The following query asks for the first value in the partitioned day of week, and illustrates the potential nondeterministic nature of `FIRST_VALUE()`:

```
=> SELECT calendar_year, date_key, day_of_week, full_date_description,
    FIRST_VALUE(full_date_description)
    OVER(PARTITION BY calendar_month_number_in_year ORDER BY day_of_week)
    AS "first_value"
FROM date_dimension
WHERE calendar_year=2003 AND calendar_month_number_in_year=1;
```

The first value returned is January 31, 2003; however, the next time the same query is run, the first value might be January 24 or January 3, or the 10th or 17th. This is because the analytic `ORDER BY` column `day_of_week` returns rows that contain ties (multiple Fridays). These repeated values make the `ORDER BY` evaluation result nondeterministic, because rows that contain ties can be ordered in any way, and any one of those rows qualifies as being the first value of `day_of_week`.

<table>
<thead>
<tr>
<th>calendar_year</th>
<th>date_key</th>
<th>day_of_week</th>
<th>full_date_description</th>
<th>first_value</th>
</tr>
</thead>
<tbody>
<tr>
<td>calendar_year</td>
<td>date_key</td>
<td>day_of_week</td>
<td>full_date_description</td>
<td>first_value</td>
</tr>
<tr>
<td>---------------</td>
<td>----------</td>
<td>-------------</td>
<td>-----------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>2003</td>
<td>1</td>
<td>Wednesday</td>
<td>January 1, 2003</td>
<td>January 1, 2003</td>
</tr>
<tr>
<td>2003</td>
<td>8</td>
<td>Wednesday</td>
<td>January 8, 2003</td>
<td>January 1, 2003</td>
</tr>
<tr>
<td>2003</td>
<td>10</td>
<td>Friday</td>
<td>January 10, 2003</td>
<td>January 1, 2003</td>
</tr>
<tr>
<td>2003</td>
<td>17</td>
<td>Friday</td>
<td>January 17, 2003</td>
<td>January 1, 2003</td>
</tr>
<tr>
<td>2003</td>
<td>22</td>
<td>Wednesday</td>
<td>January 22, 2003</td>
<td>January 1, 2003</td>
</tr>
</tbody>
</table>

Note:
The day_of_week results are returned in alphabetical order because of lexical rules. The fact that each day does not appear ordered by the 7-day week cycle (for example, starting with Sunday followed by Monday, Tuesday, and so on) has no affect on results.

To return deterministic results, modify the query so that it performs its analytic ORDER BY operations on a unique field, such as date_key:

```sql
=> SELECT calendar_year, date_key, day_of_week, full_date_description,
    FIRST_VALUE(full_date_description) OVER
    (PARTITION BY calendar_month_number_in_year ORDER BY date_key) AS "first_value"
FROM date_dimension WHERE calendar_year=2003;
```

FIRST_VALUE() returns a first value of January 1 for the January partition and the first value of February 1 for the February partition. Also, the full_date_description column contains no ties:
See Also

- LAST_VALUE [Analytic]
- TIME_SLICE
- SQL Analytics

LAG [Analytic]

Returns the value of the input expression at the given offset before the current row within a window. This function lets you access more than one row in a table at the same time. This is useful for comparing values when the relative positions of rows can be reliably known. It also lets you avoid the more costly self join, which enhances query processing speed.

For information on getting the rows that follow, see LLEAD.

Behavior Type

Immutable

Syntax

```
```
Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>The expression to evaluate—for example, a constant, column, non-analytic function, function expression, or expressions involving any of these.</th>
</tr>
</thead>
<tbody>
<tr>
<td>offset</td>
<td>Indicates how great is the lag. The default value is 1 (the previous row). This parameter must evaluate to a constant positive integer.</td>
</tr>
<tr>
<td>default</td>
<td>The value returned if offset falls outside the bounds of the table or partition. This value must be a constant value or an expression that can be evaluated to a constant; its data type is coercible to that of the first argument.</td>
</tr>
</tbody>
</table>

Examples

This example sums the current balance by date in a table and also sums the previous balance from the last day. Given the inputs that follow, the data satisfies the following conditions:

- For each some_id, there is exactly 1 row for each date represented by month_date.
- For each some_id, the set of dates is consecutive; that is, if there is a row for February 24 and a row for February 26, there would also be a row for February 25.
- Each some_id has the same set of dates.

```sql
=> CREATE TABLE balances (  
  month_date DATE,  
  current_bal INT,  
  some_id INT);
=> INSERT INTO balances values ('2009-02-24', 10, 1);
=> INSERT INTO balances values ('2009-02-25', 10, 1);
=> INSERT INTO balances values ('2009-02-26', 10, 1);
=> INSERT INTO balances values ('2009-02-24', 20, 2);
=> INSERT INTO balances values ('2009-02-25', 20, 2);
=> INSERT INTO balances values ('2009-02-26', 20, 2);
=> INSERT INTO balances values ('2009-02-24', 30, 3);
=> INSERT INTO balances values ('2009-02-25', 30, 3);
=> INSERT INTO balances values ('2009-02-26', 30, 3);
```

Now run LAG to sum the current balance for each date and sum the previous balance from the last day:
Using the same example data, the following query would not be allowed because LAG is nested inside an aggregate function:

```sql
=> SELECT month_date,
    SUM(current_bal) as current_bal_sum,
    SUM(LAG(current_bal, 1, 0) OVER (PARTITION BY some_id ORDER BY month_date)) AS previous_bal_sum
FROM some_table GROUP BY month_date ORDER BY month_date;
```

The following example uses the **VMart database**. LAG first returns the annual income from the previous row, and then it calculates the difference between the income in the current row from the income in the previous row:

```sql
=> SELECT occupation, customer_key, customer_name, annual_income,
    LAG(annual_income, 1, 0) OVER (PARTITION BY occupation ORDER BY annual_income) AS prev_income,
    annual_income - LAG(annual_income, 1, 0) OVER (PARTITION BY occupation ORDER BY annual_income) AS difference
FROM customer_dimension ORDER BY occupation, customer_key LIMIT 20;
```
The next example uses **LEAD** and **LAG** to return the third row after the salary in the current row and fifth salary before the salary in the current row:

```sql
=> SELECT hire_date, employee_key, employee_last_name,
   LEAD (hire_date, 1) OVER (ORDER BY hire_date) AS "next_hired",
   LAG (hire_date, 1) OVER (ORDER BY hire_date) AS "last_hired"
FROM employee_dimension ORDER BY hire_date, employee_key;
```

<table>
<thead>
<tr>
<th>hire_date</th>
<th>employee_key</th>
<th>employee_last_name</th>
<th>next_hired</th>
<th>last_hired</th>
</tr>
</thead>
<tbody>
<tr>
<td>1956-04-11</td>
<td>2694</td>
<td>Farmer</td>
<td>1956-05-12</td>
<td></td>
</tr>
<tr>
<td>1956-05-12</td>
<td>5486</td>
<td>Winkler</td>
<td>1956-09-18</td>
<td>1956-04-11</td>
</tr>
<tr>
<td>1956-09-18</td>
<td>5525</td>
<td>McCabe</td>
<td>1957-01-15</td>
<td>1956-05-12</td>
</tr>
<tr>
<td>1957-01-15</td>
<td>568</td>
<td>Greenwood</td>
<td>1957-02-06</td>
<td>1956-09-18</td>
</tr>
<tr>
<td>1957-02-06</td>
<td>9781</td>
<td>Bauer</td>
<td>1957-05-25</td>
<td>1957-01-15</td>

- **LEAD [Analytic]**
- **SQL Analytics**

**LAST_VALUE [Analytic]**

Lets you select the last value of a table or partition (determined by the `window-order-clause`) without having to use a self join. **LAST_VALUE** takes the last record from the partition after the window order clause. The function then computes the expression against the last record, and returns the results. This function is useful when you want to use the last value as a baseline in calculations.

Use **LAST_VALUE()** with the `window-order-clause` to produce deterministic results. If no `window` is specified for the current row, the default window is UNBOUNDED PRECEDING AND CURRENT ROW.

**Tip:**

Due to default window semantics, **LAST_VALUE** does not always return the last value of a partition. If you omit **Window Frame Clause** from the analytic clause, **LAST_VALUE** operates on this default window.
Although results can seem non-intuitive by not returning the bottom of the current partition, it returns the bottom of the window, which continues to change along with the current input row being processed. If you want to return the last value of a partition, use UNBOUNDED PRECEDING AND UNBOUNDED FOLLOWING. See examples below.

**Behavior Type**

Immutable

**Syntax**

```
LAST_VALUE ( expression [ IGNORE NULLS ] ) OVER ( 
   [ window-partition-clause ]
   [ window-order-clause ]
   [ window-frame-clause ]
)
```

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>Expression to evaluate—for example, a constant, column, nonanalytic function, function expression, or expressions involving any of these.</td>
</tr>
<tr>
<td>IGNORE NULLS</td>
<td>Specifies to return the last non-null value in the set, or NULL if all values are NULL. If you omit this option and the last value in the set is null, the function returns NULL.</td>
</tr>
<tr>
<td>OVER()</td>
<td>See Analytic Functions.</td>
</tr>
</tbody>
</table>

**Example**

Using the schema defined in Window Framing in Analyzing Data, the following query does not show the highest salary value by department; instead it shows the highest salary value by department by salary.

```sql
=> SELECT deptno, sal, empno, LAST_VALUE(sal) OVER (PARTITION BY deptno ORDER BY sal) AS lv
FROM emp;
```

```
deptno | sal | empno | lv
-------|-----|-------|-----
10     | 101 | 1     | 101 |
10     | 104 | 4     | 104 |
```
If you include the window frame clause `ROWS BETWEEN UNBOUNDED PRECEDING AND UNBOUNDED FOLLOWING`, `LAST_VALUE()` returns the highest salary by department, an accurate representation of the information:

```sql
=> SELECT deptno, sal, empno, LAST_VALUE(sal)
    OVER (PARTITION BY deptno ORDER BY sal
        ROWS BETWEEN UNBOUNDED PRECEDING AND UNBOUNDED FOLLOWING)
    AS lv
    FROM emp;
```

<table>
<thead>
<tr>
<th>deptno</th>
<th>sal</th>
<th>empno</th>
<th>lv</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>101</td>
<td>1</td>
<td>104</td>
</tr>
<tr>
<td>10</td>
<td>104</td>
<td>4</td>
<td>104</td>
</tr>
<tr>
<td>10</td>
<td>100</td>
<td>11</td>
<td>110</td>
</tr>
<tr>
<td>20</td>
<td>109</td>
<td>7</td>
<td>110</td>
</tr>
<tr>

- `FIRST_VALUE [Analytic]`
- `TIME_SLICE`
- `SQL Analytics`

**LEAD [Analytic]**

Returns values from the row after the current row within a `window`, letting you access more than one row in a table at the same time. This is useful for comparing values when the relative positions of rows can be reliably known. It also lets you avoid the more costly self join, which enhances query processing speed.
Behavior Type

Immutable

Syntax

LEAD ( expression[, offset ] [, default ] ) OVER ( 
    [ window-partition-clause ]
    window-order-clause )

Parameters

expression  
The expression to evaluate—for example, a constant, column, non-analytic function, function expression, or expressions involving any of these.

offset  
Is an optional parameter that defaults to 1 (the next row). This parameter must evaluate to a constant positive integer.

default  
The value returned if offset falls outside the bounds of the table or partition. This value must be a constant value or an expression that can be evaluated to a constant; its data type is coercible to that of the first argument.

Examples

LEAD finds the hire date of the employee hired just after the current row:

```sql
=> SELECT employee_region, hire_date, employee_key, employee_last_name, 
    LEAD(hire_date, 1) OVER (PARTITION BY employee_region ORDER BY hire_date) AS "next_hired"
FROM employee_dimension ORDER BY employee_region, hire_date, employee_key;
```

<table>
<thead>
<tr>
<th>employee_region</th>
<th>hire_date</th>
<th>employee_key</th>
<th>employee_last_name</th>
<th>next_hired</th>
</tr>
</thead>
<tbody>
<tr>
<td>East</td>
<td>1956-04-08</td>
<td>9218</td>
<td>Harris</td>
<td>1957-02-06</td>
</tr>
<tr>
<td>East</td>
<td>1957-02-06</td>
<td>7799</td>
<td>Stein</td>
<td>1957-05-25</td>
</tr>
<tr>

</tr>
</tbody>
</table>

(10 rows)

The next example returns, for each assistant director in the employees table, the hire date of the director hired just after the director on the current row. For example, Jackson was hired on 2016-12-28, and the next director hired was Bauer:

```sql
>= SELECT employee_last_name, hire_date,
    LEAD(hire_date, 1) OVER (ORDER BY hire_date DESC) as "NextHired"
FROM employee_dimension WHERE job_title = 'Assistant Director';
```

<table>
<thead>
<tr>
<th>employee_last_name</th>
<th>hire_date</th>
<th>NextHired</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bauer</td>
<td>2016-12-28</td>
<td>Bauer</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
<td>...</td>
</tr>
</tbody>
</table>

(10 rows)

MAX [Analytic]

Returns the maximum value of an expression within a window. The return value has the same type as the expression data type.

The analytic functions MIN() and MAX() can operate with Boolean values. The MAX() function acts upon a Boolean Data Type or a value that can be implicitly converted to a Boolean value. If at least one input value is true, MAX() returns t (true). Otherwise, it returns f (false). In the same scenario, the MIN() function returns t (true) if all input values are true. Otherwise, it returns f.

Behavior Type

Immutable

Syntax

MAX (expression) OVER (  
  [ window-partition-clause ]  
  [ window-order-clause ]  
  [ window-frame-clause ] )

Parameters

| expression | Any expression for which the maximum value is calculated, typically a |
Examples

The following query computes the deviation between the employees' annual salary and the maximum annual salary in Massachusetts:

```sql
=> SELECT employee_state, annual_salary,
      MAX(annual_salary) OVER(PARTITION BY employee_state ORDER BY employee_key) max,
      annual_salary- MAX(annual_salary) OVER(PARTITION BY employee_state ORDER BY employee_key) diff
FROM employee_dimension
WHERE employee_state = 'MA';
```

<table>
<thead>
<tr>
<th>employee_state</th>
<th>annual_salary</th>
<th>max</th>
<th>diff</th>
</tr>
</thead>
<tbody>
<tr>
<td>MA</td>
<td>1918</td>
<td>995533</td>
<td>-993615</td>
</tr>
<tr>
<td>MA</td>
<td>2058</td>
<td>995533</td>
<td>-993475</td>
</tr>
<tr>
<td>MA</td>
<td>2586</td>
<td>995533</td>
<td>-992947</td>
</tr>
<tr>
<td>MA</td>
<td>2500</td>
<td>995533</td>
<td>-993033</td>
</tr>
<tr>
<td>MA</td>
<td>1318</td>
<td>995533</td>
<td>-994215</td>
</tr>
<tr>
<td>MA</td>
<td>2072</td>
<td>995533</td>
<td>-993461</td>
</tr>
<tr>
<td>MA</td>
<td>2566</td>
<td>995533</td>
<td>-992877</td>
</tr>
<tr>
<td>MA</td>
<td>2656</td>
<td>995533</td>
<td>-992869</td>
</tr>
</tbody>
</table>

(10 rows)

The following example shows you the difference between the MIN and MAX analytic functions when you use them with a Boolean value. The sample creates a table with two columns, adds two rows of data, and shows sample output for MIN and MAX.

```sql
CREATE TABLE min_max_functions (emp VARCHAR, torf BOOL);

INSERT INTO min_max_functions VALUES ('emp1', 1);
INSERT INTO min_max_functions VALUES ('emp1', 0);

SELECT DISTINCT emp,
      min(torf) OVER (PARTITION BY emp) AS worksasbooleanand,
      Max(torf) OVER (PARTITION BY emp) AS worksasbooleanoar
FROM min_max_functions;
```

<table>
<thead>
<tr>
<th>emp</th>
<th>worksasbooleanand</th>
<th>worksasbooleanoar</th>
</tr>
</thead>
<tbody>
<tr>
<td>emp1</td>
<td>f</td>
<td>t</td>
</tr>
</tbody>
</table>

(1 row)

- MIN [Analytic]

MEDIAN [Analytic]

For each row, returns the median value of a value set within each partition. MEDIAN determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

MEDIAN is an alias of PERCENTILE_CONT [Analytic] with an argument of 0.5 (50%).

Behavior Type

Immutable

Syntax

MEDIAN ( expression ) OVER ( [ window-partition-clause ] )

Parameters

| expression | Any NUMERIC data type or any non-numeric data type that can be implicitly converted to a numeric data type. The function returns the middle value or an interpolated value that would be the middle value once the values are sorted. Null values are ignored in the calculation. |
| OVER() | If the OVER clause specifies window-partition-clause, MEDIAN groups input rows according to one or more columns or expressions. If this clause is omitted, no grouping occurs and MEDIAN processes all input rows as a single partition. |
Examples

See Calculating a Median Value

See Also

- PERCENTILE_CONT [Analytic]
- SQL Analytics

MIN [Analytic]

Returns the minimum value of an expression within a window. The return value has the same type as the expression data type.

The analytic functions MIN( ) and MAX( ) can operate with Boolean values. The MAX( ) function acts upon a Boolean Data Type or a value that can be implicitly converted to a Boolean value. If at least one input value is true, MAX( ) returns t (true). Otherwise, it returns f (false). In the same scenario, the MIN( ) function returns t (true) if all input values are true. Otherwise, it returns f.

Behavior Type

Immutable

Syntax

MAX ( expression ) OVER ( [ window-partition-clause ] [ window-order-clause ] [ window-frame-clause ] )

Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>Any expression for which the minimum value is calculated, typically a column reference.</th>
</tr>
</thead>
<tbody>
<tr>
<td>OVER()</td>
<td>See Analytic Functions.</td>
</tr>
</tbody>
</table>
Examples

The following example shows how you can query to determine the deviation between the employees' annual salary and the minimum annual salary in Massachusetts:

```sql
=> SELECT employee_state, annual_salary,
       MIN(annual_salary)
       OVER(PARTITION BY employee_state ORDER BY employee_key) min,
       annual_salary - MIN(annual_salary)
       OVER(PARTITION BY employee_state ORDER BY employee_key) diff
FROM employee_dimension
WHERE employee_state = 'MA';
```

<table>
<thead>
<tr>
<th>employee_state</th>
<th>annual_salary</th>
<th>min</th>
<th>diff</th>
</tr>
</thead>
<tbody>
<tr>
<td>MA</td>
<td>1918</td>
<td>1204</td>
<td>714</td>
</tr>
<tr>
<td>MA</td>
<td>2058</td>
<td>1204</td>
<td>854</td>
</tr>
<tr>
<td>MA</td>
<td>2586</td>
<td>1204</td>
<td>1382</td>
</tr>
<tr>
<td>MA</td>
<td>2500</td>
<td>1204</td>
<td>1296</td>
</tr>
<tr>
<td>MA</td>
<td>1318</td>
<td>1204</td>
<td>114</td>
</tr>
<tr>
<td>MA</td>
<td>2072</td>
<td>1204</td>
<td>868</td>
</tr>
<tr>
<td>MA</td>
<td>2656</td>
<td>1204</td>
<td>1452</td>
</tr>

NTILE [Analytic]

Equally divides an ordered data set (partition) into a \{value\} number of subsets within a *window*, where the subsets are numbered 1 through the value in parameter *constant-value*. For example, if *constant-value* = 4 and the partition contains 20 rows, NTILE divides the partition rows into four equal subsets of five rows. NTILE assigns each row to a subset by giving row a number from 1 to 4. The rows in the first subset are assigned 1, the next five are assigned 2, and so on.

If the number of partition rows is not evenly divisible by the number of subsets, the rows are distributed so no subset is more than one row larger than any other subset, and the lowest subsets have extra rows. For example, if *constant-value* = 4 and the number of rows = 21, the first subset has six rows, the second subset has five rows, and so on.

If the number of subsets is greater than the number of rows, then a number of subsets equal to the number of rows is filled, and the remaining subsets are empty.

Behavior Type

Immutable

Syntax

```
NTILE ( constant-value ) OVER ( 
    [ window-partition-clause ] 
    window-order-clause )
```

Parameters

| *constant-value* | Specifies the number of subsets, where *constant-value* must |
resolve to a positive constant for each partition.

OVER() | See Analytic Functions.

## Examples

The following query assigns each month's sales total into one of four subsets:

```sql
=> SELECT calendar_month_name AS MONTH, SUM(sales_quantity),
    NTILE(4) OVER (ORDER BY SUM(sales_quantity)) AS NTILE
FROM store.store_sales_fact JOIN date_dimension
USING(date_key)
GROUP BY calendar_month_name
ORDER BY NTILE;
```

<table>
<thead>
<tr>
<th>MONTH</th>
<th>SUM</th>
<th>NTILE</th>
</tr>
</thead>
<tbody>
<tr>
<td>November</td>
<td>2040726</td>
<td>1</td>
</tr>
<tr>
<td>June</td>
<td>2088528</td>
<td>1</td>
</tr>
<tr>
<td>February</td>
<td>2134708</td>
<td>1</td>
</tr>
<tr>
<td>April</td>
<td>2181767</td>
<td>2</td>
</tr>

- WIDTH_BUCKET
- SQL Analytics

## NTH_VALUE [Analytic]

Returns the value evaluated at the row that is the \( n \)th row of the window (counting from 1). If the specified row does not exist, NTH_VALUE returns NULL.

## Behavior Type

**Immutable**
Syntax

```
NTH_VALUE ( expression, row-number [ IGNORE NULLS ] ) OVER ( 
[ window-frame-clause ]
[ window-order-clause ]
[ window-frame-clause ]
)
```

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>Expression to evaluate. The expression can be a constant, column name, nonanalytic function, function expression, or expressions that include any of these.</td>
</tr>
<tr>
<td>row-number</td>
<td>Specifies the row to evaluate, where row-number evaluates to an integer ≥ 1.</td>
</tr>
<tr>
<td>IGNORE NULLS</td>
<td>Specifies to return the first non-NULL value in the set, or NULL if all values are NULL.</td>
</tr>
<tr>
<td>OVER()</td>
<td>See Analytic Functions.</td>
</tr>
</tbody>
</table>

Example

In the following example, for each tuple (current row) in table t1, the window frame clause defines the window as follows:

```
ORDER BY b ROWS BETWEEN 3 PRECEDING AND CURRENT ROW
```

For each window, n for nth value is a+1. a is the value of column a in the tuple.

NTH_VALUE returns the result of the expression b+1, where b is the value of column b in the nth row, which is the a+1 row within the window.

```
=> SELECT * FROM t1 ORDER BY a;
   a | b
   ---+---
    1 | 10
    2 | 20
    2 | 21
    3 | 30
    4 | 40
    5 | 50
    6 | 60
(7 rows)
```
=> SELECT NTH_VALUE(b+1, a+1) OVER
    (ORDER BY b ROWS BETWEEN 3 PRECEDING AND CURRENT ROW) FROM t1;

(7 rows)

**PERCENT_RANK [Analytic]**

Calculates the relative rank of a row for a given row in a group within a *window* by dividing that row’s rank less 1 by the number of rows in the partition, also less 1. PERCENT_RANK always returns values from 0 to 1 inclusive. The first row in any set has a PERCENT_RANK of 0. The return value is NUMBER.

\[
\frac{\text{rank} - 1}{\text{rows} - 1}
\]

In the preceding formula, \( \text{rank} \) is the rank position of a row in the group and \( \text{rows} \) is the total number of rows in the partition defined by the \( \text{OVER()} \) clause.

**Behavior Type**

*Immutable*

**Syntax**

\[
\text{PERCENT_RANK ( ) OVER (}
\begin{tabular}{l}
\text{[window-partition-clause ]} \\
\text{window-order-clause }
\end{tabular}
\text{)}
\]

**Parameters**

<table>
<thead>
<tr>
<th>OVER( )</th>
<th>See Analytic Functions</th>
</tr>
</thead>
</table>
Examples

The following example finds the percent rank of gross profit for different states within each month of the first quarter:

```sql
=> SELECT calendar_month_name AS MONTH, store_state,
    SUM(gross_profit_dollar_amount),
    PERCENT_RANK() OVER (PARTITION BY calendar_month_name
    ORDER BY SUM(gross_profit_dollar_amount)) AS PERCENT_RANK
FROM store.store_sales_fact JOIN date_dimension
USING(date_key)
JOIN store.store_dimension
USING (store_key)
WHERE calendar_month_name IN ('January','February','March')
AND store_state IN ('OR','IA','DC','NV','WI')
GROUP BY calendar_month_name, store_state
ORDER BY calendar_month_name, PERCENT_RANK;
```

```
<table>
<thead>
<tr>
<th>MONTH</th>

PERCENTILE_CONT [Analytic]

An inverse distribution function where, for each row, PERCENTILE_CONT returns the value that would fall into the specified percentile among a set of values in each partition within a window. For example, if the argument to the function is 0.5, the result of the function is the median of the data set (50th percentile). PERCENTILE_CONT assumes a continuous distribution data model. NULL values are ignored.

PERCENTILE_CONT computes the percentile by first computing the row number where the percentile row would exist. For example:

\[
\text{row-number} = 1 + \text{percentile-value} \times (\text{num-partition-rows} - 1)
\]

If \text{row-number} is a whole number (within an error of 0.00001), the percentile is the value of row \text{row-number}. 
Otherwise, Vertica interpolates the percentile value between the value of the CEILING (row-number) row and the value of the FLOOR(row-number) row. In other words, the percentile is calculated as follows:

\[
(\text{CEILING}(\text{row-number}) - \text{row-number}) \times (\text{Value of FLOOR(row-number) row}) \\
+ (\text{row-number} - \text{FLOOR(row-number)}) \times (\text{Value of CEILING(row-number) row})
\]

**Note:**
If the percentile value is 0.5, PERCENTILE_CONT returns the same result set as the function MEDIAN.

**Behavior Type**

**Immutable**

**Syntax**

PERCENTILE_CONT ( percentile ) WITHIN GROUP ( ORDER BY expression [ ASC | DESC ] ) OVER ( [ window-partition-clause ] )

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>percentile</td>
<td>Percentile value, a FLOAT constant that ranges from 0 to 1 (inclusive).</td>
</tr>
<tr>
<td>WITHIN GROUP (ORDER BY expression)</td>
<td>Specifies how to sort data within each group. ORDER BY takes only one column/expression that must be INTEGER, FLOAT, INTERVAL, or NUMERIC data type. NULL values are discarded. The WITHIN GROUP(ORDER BY) clause does not guarantee the order of the SQL result. To order the final result, use the SQL ORDER BY clause set.</td>
</tr>
<tr>
<td>ASC</td>
<td>DESC</td>
</tr>
<tr>
<td>OVER()</td>
<td>See Analytic Functions</td>
</tr>
</tbody>
</table>
Examples

This query computes the median annual income per group for the first 300 customers in Wisconsin and the District of Columbia.

```sql
=> SELECT customer_state, customer_key, annual_income,
       PERCENTILE_CONT(0.5) WITHIN GROUP(ORDER BY annual_income)
       OVER (PARTITION BY customer_state) AS PERCENTILE_CONT
FROM customer_dimension
WHERE customer_state IN ('DC', 'WI')
AND customer_key < 300
ORDER BY customer_state, customer_key;
```

(1353 rows)
PERCENTILE_DISC [Analytic]

An inverse distribution function where, for each row, PERCENTILE_DISC returns the value that would fall into the specified percentile among a set of values in each partition within a window. PERCENTILE_DISC() assumes a discrete distribution data model. NULL values are ignored.

PERCENTILE_DISC examines the cumulative distribution values in each group until it finds one that is greater than or equal to the specified percentile. Vertica computes the percentile where, for each row, PERCENTILE_DISC outputs the first value of the WITHIN GROUP (ORDER BY) column whose CUME_DIST (cumulative distribution) value is >= the argument FLOAT value—for example, 0.4:

```sql
PERCENTILE_DISC(0.4) WITHIN GROUP (ORDER BY salary) OVER(PARTITION BY deptno)...
```

Given the following query:

```sql
SELECT CUME_DIST() OVER(ORDER BY salary) FROM table-name;
```

The smallest CUME_DIST value that is greater than 0.4 is also the PERCENTILE_DISC.

Behavior Type

Immutable

Syntax

```
PERCENTILE_DISC ( percentile ) WITHIN GROUP ( 
   ORDER BY expression [ ASC | DESC ] ) OVER ( 
   [ window-partition-clause ] )
```
Parameters

<table>
<thead>
<tr>
<th><strong>percentile</strong></th>
<th>Percentile value, a FLOAT constant that ranges from 0 to 1 (inclusive).</th>
</tr>
</thead>
</table>
| **WITHIN GROUP (ORDER BY expression)** | Specifies how to sort data within each group. ORDER BY takes only one column/expression that must be INTEGER, FLOAT, INTERVAL, or NUMERIC data type. NULL values are discarded.  
The WITHIN GROUP(ORDER BY) clause does not guarantee the order of the SQL result. To order the final result, use the SQL ORDER BY clause set. |
| **ASC | DESC** | Specifies the ordering sequence as ascending (default) or descending. |
| **OVER()** | See Analytic Functions |

Example

This query computes the 20th percentile annual income by group for first 300 customers in Wisconsin and the District of Columbia.

```sql
=> SELECT customer_state, customer_key, annual_income,  
   PERCENTILE_DISC(.2) WITHIN GROUP(ORDER BY annual_income)  
   OVER (PARTITION BY customer_state) AS PERCENTILE_DISC  
FROM customer_dimension  
WHERE customer_state IN ('DC','WI')  
AND customer_key < 300  
ORDER BY customer_state, customer_key;
```

<table>
<thead>
<tr>
<th>customer_state</th>
<th>customer_key</th>
<th>annual_income</th>
<th>PERCENTILE_DISC</th>
</tr>
</thead>
<tbody>
<tr>
<td>DC</td>
<td>104</td>
<td>658383</td>
<td>417092</td>
</tr>
<tr>
<td>DC</td>
<td>168</td>
<td>417092</td>
<td>417092</td>
</tr>
<tr>
<td>DC</td>
<td>245</td>
<td>670205</td>
<td>417092</td>
</tr>
<tr>
<td>WI</td>

**RANK** [Analytic]

Within each window partition, ranks all rows in the query results set according to the order specified by the window's ORDER BY clause.

RANK executes as follows:

1. Sorts partition rows as specified by the ORDER BY clause.
2. Compares the ORDER BY values of the preceding row and current row and ranks the current row as follows:
   - If ORDER BY values are the same, the current row gets the same ranking as the preceding row.
   - If the ORDER BY values are different, DENSE_RANK increments or decrements the current row's ranking by 1, plus the number of consecutive duplicate values in the rows that precede it.

The largest rank value is the equal to the total number of rows returned by the query.

**Behavior Type**

**Immutable**

**Syntax**

```
RANK() OVER ( 
  [ window-partition-clause ]
  window-order-clause )
```

**Parameters**

| OVER() | See Analytic Functions |

Vertica Analytic Database (11.0.x) Page 2702 of 6730
Compared with DENSE_RANK

RANK can leave gaps in the ranking sequence, while DENSE_RANK does not.

Examples

The following query ranks by state all company customers that have been customers since 2007. In rows where the customer_since dates are the same, RANK assigns the rows equal ranking. When the customer_since date changes, RANK skips one or more rankings—for example, within CA, from 12 to 14, and from 17 to 19.

```sql
=> SELECT customer_state, customer_name, customer_since,
    RANK() OVER (PARTITION BY customer_state ORDER BY customer_since) AS rank
FROM customer_dimension WHERE customer_type='Company' AND customer_since > '01/01/2007'
ORDER BY customer_state;
```

<table>
<thead>
<tr>
<th>customer_state</th>
<th>customer_name</th>
<th>customer_since</th>
<th>rank</th>

SQL Analytics

ROW_NUMBER [Analytic]

Assigns a sequence of unique numbers to each row in a window partition, starting with 1. ROW_NUMBER and RANK are generally interchangeable, with the following differences:
- **ROW_NUMBER** assigns a unique ordinal number to each row in the ordered set, starting with 1.
- **ROW_NUMBER()** is a Vertica extension, while RANK conforms to the SQL-99 standard.

## Behavior Type

**Immutable**

## Syntax

```
ROW_NUMBER () OVER (
[  window-partition-clause  ]
[  window-order-clause  ]
)
```

## Parameters

- `OVER()` | See [Analytic Functions](#)

## Examples

The following **ROW_NUMBER** query partitions customers in the VMart table `customer_dimension` by `customer_region`. Within each partition, the function ranks those customers in order of seniority, as specified by its window order clause:

```sql
-> SELECT * FROM
   (SELECT ROW_NUMBER() OVER (PARTITION BY customer_region ORDER BY customer_since) AS most_senior,
    customer_region, customer_name, customer_since FROM public.customer_dimension WHERE customer_type = 'Individual') sq
WHERE most_senior <= 5;
```

<table>
<thead>
<tr>
<th>most_senior</th>
<th>customer_region</th>
<th>customer_name</th>
<th>customer_since</th>
</tr>
</thead>

STDDEV [Analytic]

Computes the statistical sample standard deviation of the current row with respect to the group within a window. STDDEV_SAMP returns the same value as the square root of the variance defined for the VAR_SAMP function:

\[
\text{STDDEV}( \text{expression} ) = \sqrt{ \text{VAR}_\text{SAMP}( \text{expression} )}
\]

When VAR_SAMP returns NULL, this function returns NULL.

Note:
The nonstandard function STDDEV is provided for compatibility with other databases. It is semantically identical to STDDEV_SAMP.

Behavior Type

Immutable
**Syntax**

STDDEV (expression) OVER (  
    [window-partition-clause]  
    [window-order-clause]  
    [window-frame-clause]  
)

**Parameters**

<table>
<thead>
<tr>
<th>expression</th>
<th>Any NUMERIC data type or any non-numeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.</th>
</tr>
</thead>
<tbody>
<tr>
<td>OVER()</td>
<td>See Analytic Functions</td>
</tr>
</tbody>
</table>

**Example**

The following example returns the standard deviations of salaries in the employee dimension table by job title Assistant Director:

```sql
=> SELECT employee_last_name, annual_salary,  
   STDDEV(annual_salary) OVER (ORDER BY hire_date) as "stddev"  
   FROM employee_dimension  
   WHERE job_title = 'Assistant Director';
```

<table>

...
STDDEV_POP [Analytic]

Computes the statistical population standard deviation and returns the square root of the population variance within a window. The STDDEV_POP() return value is the same as the square root of the VAR_POP() function:

\[
\text{STDDEV_POP}( \text{expression} ) = \sqrt{\text{VAR_POP}( \text{expression} )}
\]

When VAR_POP returns null, STDDEV_POP returns null.

Behavior Type

Immutable

Syntax

STDDEV_POP( expression ) OVER ( [ window-partition-clause ] [ window-order-clause ] [ window-frame-clause ] )

Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>Any NUMERIC data type or any non-numeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.</th>
</tr>
</thead>
<tbody>
<tr>
<td>OVER()</td>
<td>See Analytic Functions.</td>
</tr>
</tbody>
</table>
Examples

The following example returns the population standard deviations of salaries in the employee dimension table by job title Assistant Director:

```sql
=> SELECT employee_last_name, annual_salary,
     STDDEV_POP(annual_salary) OVER (ORDER BY hire_date) as "stddev_pop"
FROM employee_dimension WHERE job_title = 'Assistant Director';
```

<table>
<thead>
<tr>
<th>employee_last_name</th>
<th>annual_salary</th>
<th>stddev_pop</th>

STDDEV_SAMP [Analytic]

Computes the statistical sample standard deviation of the current row with respect to the group within a window. STDDEV_SAMP's return value is the same as the square root of the variance defined for the VAR_SAMP function:

```
STDDEV( expression ) = SQRT(VAR_SAMP( expression ))
```

When VAR_SAMP returns NULL, STDDEV_SAMP returns NULL.

Note:
STDDEV_SAMP() is semantically identical to the nonstandard function, STDDEV().
Behavior Type

Immutable

Syntax

```
STDDEV_SAMP ( expression ) OVER (  
    [ window-partition-clause ]  
    [ window-order-clause ]  
    [ window-frame-clause ] 
)
```

Parameters

<table>
<thead>
<tr>
<th><code>expression</code></th>
<th>Any NUMERIC data type or any non-numeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.</th>
</tr>
</thead>
<tbody>
<tr>
<td>OVER()</td>
<td>See Analytic Functions</td>
</tr>
</tbody>
</table>

Examples

The following example returns the sample standard deviations of salaries in the employee dimension table by job title Assistant Director:

```
=> SELECT employee_last_name, annual_salary,
  STDDEV(annual_salary) OVER (ORDER BY hire_date) as "stddev_samp"
FROM employee_dimension WHERE job_title = 'Assistant Director';
```

- STDDEV [Aggregate]
- STDDEV_SAMP [Aggregate]
- SQL Analytics

SUM [Analytic]

Computes the sum of an expression over a group of rows within a window. It returns a DOUBLE PRECISION value for a floating-point expression. Otherwise, the return value is the same as the expression data type.

Behavior Type

Immutable

Syntax

SUM ( expression ) OVER ( [ window-partition-clause ] [ window-order-clause ] [ window-frame-clause ] )

Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>Any NUMERIC data type or any non-numeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.</th>
</tr>
</thead>
<tbody>
<tr>
<td>OVER()</td>
<td>See Analytic Functions</td>
</tr>
</tbody>
</table>
Overflow Handling

If you encounter data overflow when using SUM, use `SUM_FLOAT` which converts data to a floating point. By default, Vertica allows silent numeric overflow when you call this function on numeric data types. For more information on this behavior and how to change it, see Numeric Data Type Overflow with SUM, SUM_FLOAT, and AVG.

Examples

The following query returns the cumulative sum all of the returns made to stores in January:

```sql
=> SELECT calendar_month_name AS month, transaction_type, sales_quantity,
    SUM(sales_quantity)
    OVER (PARTITION BY calendar_month_name ORDER BY date_dimension.date_key) AS SUM
FROM store.store_sales_fact
JOIN date_dimension USING(date_key)
WHERE calendar_month_name IN ('January')
    AND transaction_type= 'return';
```

<table>
<thead>
<tr>
<th>month</th>
<th>transaction_type</th>
<th>sales_quantity</th>
<th>SUM</th>
</tr>
</thead>
<tbody>
<tr>
<td>January</td>
<td>return</td>
<td>7</td>
<td>651</td>

VAR_POP [Analytic]

Returns the statistical population variance of a non-null set of numbers (nulls are ignored) in a group within a window. Results are calculated by the sum of squares of the difference of expression from the mean of expression, divided by the number of rows remaining:

\[
\frac{(\text{SUM}(\text{expression} \times \text{expression}) - \text{SUM}(\text{expression}) \times \text{SUM}(\text{expression}))}{\text{COUNT}(\text{expression})}
\]

Behavior Type

Immutable

Syntax

VAR_POP ( expression ) OVER ( 
[ window-partition-clause ]
[ window-order-clause ]
[ window-frame-clause ]
)

Parameters

| expression | Any NUMERIC data type or any non-numeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument |
| OVER()     | See Analytic Functions |
Examples

The following example calculates the cumulative population in the store orders fact table of sales in January 2007:

```sql
=> SELECT date_ordered,
    VAR_POP(SUM(total_order_cost))
    OVER (ORDER BY date_ordered) "var_pop"
FROM store.store_orders_fact
WHERE date_ordered BETWEEN '2007-01-01' AND '2007-01-31'
GROUP BY s.date_ordered;
```

<table>
<thead>
<tr>
<th>date_ordered</th>
<th>var_pop</th>
</tr>
</thead>
<tbody>
<tr>
<td>2007-01-01</td>
<td>0</td>
</tr>
<tr>
<td>2007-01-02</td>
<td>89870400</td>
</tr>
<tr>
<td>2007-01-03</td>
<td>3478302472</td>
</tr>
<tr>
<td>2007-01-04</td>
<td>4466355450.6875</td>
</tr>
<tr>
<td>2007-01-05</td>
<td>3816904780.80078</td>
</tr>
<tr>
<td>2007-01-06</td>
<td>25438212385.25</td>
</tr>
<tr>
<td>2007-01-07</td>
<td>22168747513.1016</td>
</tr>
<tr>
<td>2007-01-08</td>
<td>23445191012.7344</td>
</tr>
<tr>
<td>2007-01-09</td>
<td>39292879603.1113</td>
</tr>
<tr>
<td>2007-01-10</td>
<td>48080574326.9609</td>
</tr>
</tbody>
</table>

(10 rows)

See Also

- VAR_POP [Aggregate]
- SQL Analytics

VAR_SAMP [Analytic]

Returns the sample variance of a non-NULL set of numbers (NULL values in the set are ignored) for each row of the group within a window. Results are calculated as follows:

$$
\frac{(\text{SUM}( \text{expression}^2) - \text{SUM}( \text{expression}) \times \text{SUM}( \text{expression}) / \text{COUNT}( \text{expression})))}{(\text{COUNT}( \text{expression}) - 1)}
$$

This function and VARIANCE differ in one way: given an input set of one element, VARIANCE returns 0 and VAR_SAMP returns NULL.

Behavior Type

Immutable
### Syntax

\[
\text{VAR\_SAMP}(\text{expression}) \text{ OVER (}
\begin{array}{c}
\text{[window-partition-clause]}
\text{[window-order-clause]}
\text{[window-frame-clause]}
\end{array}
\text{)}
\]

### Parameters

| expression | Any NUMERIC data type or any non-numeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument |
| OVER()     | See Analytic Functions |

### Null Handling

- \text{VAR\_SAMP} returns the sample variance of a set of numbers after it discards the NULL values in the set.
- If the function is applied to an empty set, then it returns NULL.

### Examples

The following example calculates the sample variance in the store orders fact table of sales in December 2007:

```sql
=> SELECT date_ordered,
          VAR\_SAMP(SUM(total_order_cost))
    OVER (ORDER BY date_ordered) "var\_samp"
FROM store.store_orders_fact s
WHERE date_ordered BETWEEN '2007-12-01' AND '2007-12-31'
GROUP BY s.date_ordered;
```

<table>
<thead>
<tr>
<th>date_ordered</th>
<th>var_samp</th>
</tr>
</thead>
<tbody>
<tr>
<td>2007-12-01</td>
<td>NaN</td>
</tr>
<tr>
<td>2007-12-02</td>
<td>90642601088</td>
</tr>
<tr>
<td>2007-12-03</td>
<td>48030548449.3359</td>
</tr>
<tr>
<td>2007-12-04</td>
<td>32740062504.2461</td>
</tr>
<tr>
<td>2007-12-05</td>
<td>32100319112.6992</td>
</tr>
<tr>
<td>2007-12-06</td>
<td>26274166814.668</td>
</tr>
<tr>
<td>2007-12-07</td>
<td>23017490251.9062</td>
</tr>
<tr>

- SQL Analytics

**VARIANCE [Analytic]**

Returns the sample variance of a non-NULL set of numbers (NULL values in the set are ignored) for each row of the group within a window. Results are calculated as follows:

\[
\frac{( \text{SUM}(expression * expression) - \text{SUM}(expression) * \text{SUM}(expression) / \text{COUNT}(expression))}{(\text{COUNT}(expression) - 1)}
\]

VARIANCE returns the variance of expression, which is calculated as follows:

- 0 if the number of rows in expression = 1
- VAR_SAMP if the number of rows in expression > 1

**Note:**

The nonstandard function VARIANCE is provided for compatibility with other databases. It is semantically identical to VAR_SAMP.

**Behavior Type**

**Immutable**

**Syntax**

\[
\text{VAR_SAMP} (expression) \over \{ \text{window-partition-clause} \} \} \]

\[
\text{window-partition-clause} \}
\text{window-order-clause} \}
\text{window-frame-clause} \}
\]
Parameters

| expression | Any NUMERIC data type or any non-numeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument. |
| OVER()    | See Analytic Functions |

Examples

The following example calculates the cumulative variance in the store orders fact table of sales in December 2007:

```sql
=> SELECT date_ordered,
       VARIANCE(SUM(total_order_cost))
       OVER (ORDER BY date_ordered) "variance"
FROM store.store_orders_fact s
WHERE date_ordered BETWEEN '2007-12-01' AND '2007-12-31'
GROUP BY s.date_ordered;
```

Collection Functions

The functions in this section apply to collection types (arrays and sets).

Some functions apply aggregation operations (such as sum) to collections. These function names all begin with APPLY.

Other functions in this section operate specifically on arrays or sets, as indicated on the individual reference pages. Array functions operate on both native array values and array values in external tables.

Notes

- Arrays are 0-indexed. The first element's ordinal position is 0, second is 1, and so on. Indexes are not meaningful for sets.
- Unless otherwise stated, functions operate on one-dimensional (1D) collections only. To use multidimensional arrays, you must first dereference to a 1D array type. Sets can only be one-dimensional.

APPLY_AVG

Returns the average of all elements in a collection (array or set) with numeric values.

Behavior Type

Immutable

Syntax

APPLY_AVG(collection)
**Arguments**

<table>
<thead>
<tr>
<th>collection</th>
<th>Target collection</th>
</tr>
</thead>
</table>

**Supported Data Types**

1D collections of:

- INTEGER
- INTERVAL
- INTERVALYM
- FLOAT
- NUMERIC

**Null-Handling**

The following cases return NULL:

- if the input collection is NULL
- if the input collection contains only null values
- if the input collection is empty

If the input collection contains a mix of null and non-null elements, only the non-null values are considered in the calculation of the average.

**Example**

```sql
=> SELECT apply_avg(ARRAY[1,2.4,5,6]);
apply_avg
---------
 3.6
(1 row)
```

**See also**

- APPLY_SUM
APPLY_COUNT

Returns the total number of non-null elements in a collection. To count all elements including nulls, use APPLY_COUNT_ELEMENTS.

Behavior Type

Immutable

Syntax

APPLY_COUNT(collection)

Arguments

collection Target collection

Supported Data Types

Arrays of any dimensionality and element type.

Null-Handling

Null values are not included in the count.

Example

=> SELECT apply_count(ARRAY[1.2,NULL,3,7.6,8,5]);
apply_count
-----------
5
(1 row)
**APPLY_COUNT_ELEMENTS**

Returns the total number of elements in a collection (array or set), including NULLs. To count only non-null values, use `APPLY_COUNT`.

*Behavior Type*

Immutable

*Syntax*

`APPLY_COUNT_ELEMENTS(collection)`

*Arguments*

`collection` | Target collection

*Supported Data Types*

Arrays of any dimensionality and element type.

*Null-Handling*

This function counts all members, including nulls.

An empty collection (ARRAY[] or SET[]) has a length of 0. A collection containing a single null (ARRAY[null] or SET[null]) has a length of 1.

*Examples*

```sql
=> SELECT apply_count_elements(ARRAY[1.2,NULL,3,7.6,8,5]);
```
apply_count_elements
-----------------------
(1 row)
6

=> SELECT apply_count_elements(ARRAY[null]);
apply_count_elements
-----------------------
(1 row)
1

=> SELECT apply_count_elements(NULL);
apply_count_elements
-----------------------
(1 row)
NULL

**APPLY_MAX**

Returns the largest non-null element in a collection (array or set). This function is similar to the `MAX [Aggregate]` function; APPLY_MAX operates on elements of a collection and MAX operates on an expression such as a column selection.

**Behavior Type**

Immutable

**Syntax**

`APPLY_MAX(collection)`

**Arguments**

<table>
<thead>
<tr>
<th>collection</th>
<th>Target collection</th>
</tr>
</thead>
</table>

**Supported Data Types**

1D collections of any primitive type.
**Null-Handling**

This function ignores null elements. If all elements are null or the collection is empty, this function returns null.

**Example**

```
=> SELECT apply_max(ARRAY[1,3.4,15]);
apply_max
---------
 15.0
(1 row)
```

**APPLY_MIN**

Returns the smallest non-null element in a collection (array or set). This function is similar to the MIN [Aggregate] function; APPLY_MIN operates on elements of a collection and MIN operates on an expression such as a column selection.

**Behavior Type**

*Immutable*

**Syntax**

```
APPLY_MIN(collection)
```

**Arguments**

<table>
<thead>
<tr>
<th>collection</th>
<th>Target collection</th>
</tr>
</thead>
</table>
**Supported Data Types**

1D collections of any primitive type.

**Null-Handling**

This function ignores null elements. If all elements are null or the collection is empty, this function returns null.

**Example**

```sql
=> SELECT apply_min(ARRAY[1,3.4,15]);
apply_min
---------
  1.0
(1 row)
```

**APPLY_SUM**

Computes the sum of all elements in a collection (array or set).

**Behavior Type**

Immutable

**Syntax**

```
APPLY_SUM(collection)
```

**Arguments**

<table>
<thead>
<tr>
<th>collection</th>
<th>Target collection</th>
</tr>
</thead>
</table>
Supported Data Types

1D collections of:

- INTEGER
- FLOAT
- NUMERIC
- INTERVAL

Null-Handling

The following cases return NULL:

- if the input collection is NULL
- if the input collection contains only null values
- if the input collection is empty

Example

```sql
=> SELECT apply_sum(ARRAY[12.5,3,4,1]);
apply_sum
----------
  20.5
(1 row)
```

See also

- APPLY_AVG

ARRAY_CAT

Concatenates two arrays of the same element type.

If the inputs are both bounded, the bound for the result is the sum of the bounds of the inputs.
If any input is unbounded, the result is unbounded with a binary size that is the sum of the sizes of the inputs.

**Behavior Type**

Immutable

**Syntax**

`ARRAY_CAT(array1, array2)`

**Arguments**

| array1, array2 | Arrays of matching dimensionality and element type |

**Supported Data Types**

Arrays of any dimensionality and element type, so long as dimensionality and element types are the same for both inputs. For example, ROW elements must have the same fields.

**Null-Handling**

If either input is NULL, the function returns NULL.

**Examples**

Types are coerced if necessary, as shown in the second example.

```sql
=> SELECT array_cat(ARRAY[1,2], ARRAY[3,4,5]);
array_cat
------------------
[1,2,3,4,5]
(1 row)
=> SELECT array_cat(ARRAY[1,2], ARRAY[3,4,5.0]);
```
array_cat

-------------------
["1.0","2.0","3.0","4.0","5.0"]
(1 row)

**ARRAY_CONTAINS**

Returns true if the specified element is found in the array and false if not. Both arguments must be non-null, but the array may be empty.

⚠️ **Deprecated:**
This function has been renamed to `CONTAINS`.

**ARRAY_COUNT**

Returns the total number of non-null elements in an array.

⚠️ **Deprecated:**
This function has been renamed to `APPLY_COUNT`.

**ARRAY_DIMS**

Returns the dimensionality of the input array.

**Behavior Type**

*Immutable*

**Syntax**

```
ARRAY_DIMS(array)
```
Arguments

array | Target array

Supported Data Types

- BOOLEAN
- INTEGER
- FLOAT
- NUMERIC
- STRING/VARCHAR
- TIMESTAMP
- TIMESTAMPTZ
- DATE
- UUID
- INTERVAL

Example

```sql
=> SELECT array_dims(ARRAY[[1,2],[2,3]]);
array_dims
----------
   2
(1 row)
```

ARRAY_FIND

Returns the ordinal position of a specified element in an array, or -1 if not found. The array may be empty but must not be NULL.

Behavior Type

Immutable
Syntax

ARRAY_FIND(array, val_to_find)

Arguments

<table>
<thead>
<tr>
<th>array</th>
<th>Target array</th>
</tr>
</thead>
<tbody>
<tr>
<td>val_to_find</td>
<td>Value to search for; type must match or be coercible to the element type of the array</td>
</tr>
</tbody>
</table>

Supported Data Types

1D arrays of any primitive type.

Example

=> SELECT array_find(array[1,2,3],2);
array_find
----------
   1
(1 row)

The function returns the first occurrence of the specified element. However, nothing ensures that value is unique in the array.

=> SELECT array_find(ARRAY[1,2,7,5,7],7);
array_find
----------
   2
(1 row)

The function returns -1 if the specified element is not found.

=> SELECT array_find(ARRAY[1,3,5,7],4);
array_find
----------
  -1
(1 row)
See Also

- CONTAINS

ARRAY_LENGTH

Returns the total number of elements in an array, including NULLs.

**Deprecated:**
This function has been renamed to APPLY_COUNT_ELEMENTS.

CONTAINS

Returns true if the specified element is found in the collection and false if not. The collection may be empty but must not be NULL.

*Behavior Type*

Immutable

*Syntax*

CONTAINS(collection, val_to_test)

*Arguments*

<table>
<thead>
<tr>
<th>collection</th>
<th>Target collection</th>
</tr>
</thead>
<tbody>
<tr>
<td>val_to_test</td>
<td>Value to search for; type must match or be coercible to the element type of the collection</td>
</tr>
</tbody>
</table>
**Supported Data Types**

1D collections of any primitive type.

**Examples**

```sql
=> SELECT CONTAINS SET[1,2,3,4],2;
contains
--------
t
(1 row)

=> SELECT CONTAINS ARRAY[]::ARRAY[INT],1;
contains
--------
f
(1 row)

=> SELECT CONTAINS ARRAY[1,null,2],null;
contains
--------
t
(1 row)
```

**See Also**

- [ARRAY_FIND](#)

**EXPLODE**

Expands one or more columns in a collection (ARRAY or SET) into individual table rows, one row per element, with any other columns specified in the query. For each exploded collection, the results include two columns, one for the element index, and one for the value at that position. If the function explodes a single collection, these columns are named `position` and `value` by default. If the function explodes two or more collections, the columns for each collection are named `pos_column-name` and `val_column-name`. You can use an AS clause in the SELECT to change these column names.

This function requires an OVER() clause.
Behavior Type

Immutable

Syntax

EXPLODE (column[,...] [USING PARAMETERS explode_count=number_of_arrays_to_explode])
OVER ( [window-partition-clause] )

Arguments

| column  | Column in the table being queried. You must specify at least as many collection columns as the value of the explode_count parameter. Columns that are not collections are passed through without modification. |

Parameters

| explode_count | The number of collection columns to explode (default 1). The function checks each column, up to this value, and either explodes it if it is a collection or passes it through if it is not a collection or if this limit has been reached. If the value of explode_count is greater than the number of collection columns specified, the function returns an error. |

Supported Data Types

Columns to be exploded must be arrays or sets of any element type.

Other columns may be of any type.

Null-Handling

This function expands each element in a collection into a row, including nulls. If the column to be exploded is NULL (not empty), the function produces no rows for that collection.
**Examples**

The following examples illustrate using EXPLODE() with the OVER(PARTITION BEST) clause.

Consider an orders table with columns for order keys, customer keys, product keys, order prices, and email addresses, with some containing arrays. A basic query in Vertica results in the following:

```sql
=> SELECT orderkey, custkey, prodkey, orderprices, email_addrs FROM orders LIMIT 5;
```

<table>
<thead>
<tr>
<th>orderkey</th>
<th>custkey</th>
<th>prodkey</th>
<th>orderprices</th>
<th>email_addrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>113-341987</td>
<td>342799</td>
<td>[&quot;MG-7190 &quot;,&quot;VA-4028 &quot;,&quot;EH-1247 &quot;,&quot;MS-7018 &quot;]</td>
<td>[&quot;60.00&quot;,&quot;67.00&quot;,&quot;22.00&quot;,&quot;14.99&quot;]</td>
<td>[&quot;<a href="mailto:bob@example.com">bob@example.com</a>&quot;,&quot;<a href="mailto:robert.jones@example.com">robert.jones@example.com</a>&quot;]</td>
</tr>
<tr>
<td>111-952000</td>
<td>342845</td>
<td>[&quot;ID-2586 &quot;,&quot;IC-9010 &quot;,&quot;MH-2401 &quot;,&quot;JC-1905 &quot;]</td>
<td>[&quot;22.00&quot;,&quot;35.00&quot;,null,&quot;12.00&quot;]</td>
<td>[&quot;<a href="mailto:br92@cs.example.edu">br92@cs.example.edu</a>&quot;]</td>
</tr>
<tr>
<td>111-345634</td>
<td>342536</td>
<td>[&quot;RS-0731 &quot;,&quot;SJ-2021 &quot;]</td>
<td>[&quot;50.00&quot;,null]</td>
<td>[null]</td>
</tr>
<tr>
<td>113-965086</td>
<td>342176</td>
<td>[&quot;GW-1808 &quot;]</td>
<td>[&quot;108.00&quot;]</td>
<td>[&quot;<a href="mailto:joe.smith@example.com">joe.smith@example.com</a>&quot;]</td>
</tr>
<tr>
<td>111-335121</td>
<td>342321</td>
<td>[&quot;TF-3556 &quot;]</td>
<td>[&quot;50.00&quot;]</td>
<td>[&quot;<a href="mailto:789123@example-isp.com">789123@example-isp.com</a>&quot;,&quot;<a href="mailto:alexjohnson@example.com">alexjohnson@example.com</a>&quot;,&quot;<a href="mailto:monica@eng.example.com">monica@eng.example.com</a>&quot;,&quot;<a href="mailto:sara@johnson.example.name">sara@johnson.example.name</a>&quot;,null]</td>
</tr>
</tbody>
</table>

This example expands the orderprices column for a specified customer, in ascending order. The custkey and email_addrs columns are repeated for each array element.

```sql
=> SELECT EXPLODE(orderprices, custkey, email_addrs) OVER(PARTITION BEST) AS (position, orderprices, custkey, email_addrs)
FROM orders WHERE custkey='342845' ORDER BY orderprices;
```

<table>
<thead>
<tr>
<th>position</th>
<th>orderprices</th>
<th>custkey</th>
<th>email_addrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>342845</td>
<td>&quot;<a href="mailto:br92@cs.example.edu">br92@cs.example.edu</a>&quot;,null</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>12.00</td>
<td>342845</td>
<td>&quot;<a href="mailto:br92@cs.example.edu">br92@cs.example.edu</a>&quot;,null</td>
</tr>
<tr>
<td>0</td>
<td>22.00</td>
<td>342845</td>
<td>&quot;<a href="mailto:br92@cs.example.edu">br92@cs.example.edu</a>&quot;,null</td>
</tr>
<tr>
<td>1</td>
<td>35.00</td>
<td>342845</td>
<td>&quot;<a href="mailto:br92@cs.example.edu">br92@cs.example.edu</a>&quot;,null</td>
</tr>
</tbody>
</table>

When you explode a column that contains null values, the null values are displayed as empty.

You can explode more than one column by specifying the explode_count parameter.

```sql
=> SELECT EXPLODE(orderkey, prodkey, orderprices USING PARAMETERS explode_count=2)
OVER(PARTITION BEST)
```
AS (orderkey,pk_idx,pk_val,ord_idx,ord_val)
FROM orders
WHERE orderkey='113-341987';
orderkey | pk_idx | pk_val | ord_idx | ord_val
----------+--------+--------+----------+--------
113-341987 | 0      | MG-7190 | 0       | 60.00
113-341987 | 0      | MG-7190 | 1       | 67.00
113-341987 | 0      | MG-7190 | 2       | 22.00
113-341987 | 0      | MG-7190 | 3       | 14.99
113-341987 | 1      | VA-4028 | 0       | 60.00
113-341987 | 1      | VA-4028 | 1       | 67.00
113-341987 | 1      | VA-4028 | 2       | 22.00
113-341987 | 1      | VA-4028 | 3       | 14.99
113-341987 | 2      | EH-1247 | 0       | 60.00
113-341987 | 2      | EH-1247 | 1       | 67.00
113-341987 | 2      | EH-1247 | 2       | 22.00
113-341987 | 2      | EH-1247 | 3       | 14.99
113-341987 | 3      | MS-7018 | 0       | 60.00
113-341987 | 3      | MS-7018 | 1       | 67.00
113-341987 | 3      | MS-7018 | 2       | 22.00
113-341987 | 3      | MS-7018 | 3       | 14.99
(16 rows)

The following example uses a multi-dimensional array:

=> SELECT name, pingtimes FROM network_tests;
name | pingtimes
----------+-------------------
eng1 | [[24.24,25.27,27.16,24.97],[23.97,25.01,28.12,29.5]]
eng2 | [[27.12,27.91,28.11,26.95],[29.01,28.99,30.11,31.56]]
qa1  | [[23.15,25.11,24.63,23.91],[22.85,22.86,23.91,31.52]]
(3 rows)

=> SELECT EXPLODE(name, pingtimes USING PARAMETERS explode_count=1) OVER() FROM network_tests;
name | position | value
----------+----------+-------------------
eng1 | 0        | [24.24,25.27,27.16,24.97]
eng1 | 1        | [23.97,25.01,28.12,29.5]
eng2 | 0        | [27.12,27.91,28.11,26.95]
eng2 | 1        | [29.01,28.99,30.11,31.56]
qa1  | 0        | [23.15,25.11,24.63,23.91]
qa1  | 1        | [22.85,22.86,23.91,31.52]
(6 rows)

**IMPLODE**

Takes a column of any scalar type and returns an unbounded array. Combined with GROUP BY, this function can be used to reverse an EXPLODE operation.
**Behavior Type**

*Volatile* because IMPLODE is not commutative.

**Syntax**

 IMPLODE (input_column [USING PARAMETERS param=value [...]] )

**Arguments**

| input_column | Column of a scalar type from which to create the array |

**Parameters**

| allow_truncate | Boolean, whether to truncate results if the output length exceeds the column size. If false (the default), the function returns an error if the output array is too large. Even if this parameter is set to true, if any element of the array is, by itself, too large, the function returns an error. Truncation removes elements from the output array but does not alter individual elements. |
| max_binary_size | The maximum binary size, in bytes, for the returned array. If not specified, the function uses the value of the DefaultArrayBinarySize configuration parameter. |

**Supported Data Types**

The input column may be of any scalar type.

**Examples**

Consider a table with the following contents:
The IMPLODE function can assemble the prices into arrays (grouped by keys):

```sql
=> SELECT itemkey AS key, IMPLODE(itemprice) AS prices
FROM filtered
GROUP BY itemkey ORDER BY itemkey;
```

<table>
<thead>
<tr>
<th>key</th>
<th>prices</th>
</tr>
</thead>
<tbody>
<tr>
<td>123</td>
<td>[14.99]</td>
</tr>
<tr>
<td>345</td>
<td>[14.99, 35.99]</td>
</tr>
<tr>
<td>567</td>
<td>[27.99, 18.99]</td>
</tr>
</tbody>
</table>

(3 rows)

See Arrays and Sets (Collections) for a fuller example.

## SET_UNION

Returns a SET containing all elements of two input sets.

If the inputs are both bounded, the bound for the result is the sum of the bounds of the inputs.

If any input is unbounded, the result is unbounded with a binary size that is the sum of the sizes of the inputs.

### Behavior Type

**Immutable**

### Syntax

```
SET_UNION(set1, set2)
```
Arguments

| set1, set2 | Sets of matching element type |

Null-Handling

- Null arguments are ignored. If one of the inputs is null, the function returns the non-null input. In other words, an argument of NULL is equivalent to SET[].
- If both inputs are null, the function returns null.

Example

=> SELECT SET_UNION(SET[1,2,4], SET[2,3,4,5.9]);
set_union
---------------------
["1.0","2.0","3.0","4.0","5.9"]
(1 row)

STRING_TO_ARRAY

Splits a string containing array values and returns a native one-dimensional array. The output does not include the "ARRAY" keyword. This function does not support nested (multi-dimensional) arrays.

This function returns array elements as strings by default. You can cast to other types, as in the following example:

=> SELECT STRING_TO_ARRAY('[1,2,3]')::ARRAY[INT];

Behavior

Immutable
Syntax

STRING_TO_ARRAY(string [USING PARAMETERS param=value[,...]])

The following syntax is deprecated:

STRING_TO_ARRAY(string, delimiter)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>string</strong></td>
<td>String representation of a one-dimensional array; can be a VARCHAR column,</td>
</tr>
<tr>
<td></td>
<td>a literal string, or the string output of an expression.</td>
</tr>
<tr>
<td></td>
<td>Spaces in the string are removed unless elements are individually quoted.</td>
</tr>
<tr>
<td></td>
<td>For example, 'a,b,c' is equivalent to 'a,b,c'. To preserve the space, use</td>
</tr>
<tr>
<td></td>
<td>&quot;a&quot;, &quot;b&quot;, &quot;c&quot;.</td>
</tr>
</tbody>
</table>

Parameters

These parameters behave the same way as the corresponding options when loading delimited data (see DELIMITED (Parser)).

No parameter may have the same value as any other parameter.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>collection_delimiter</strong></td>
<td>The character or character sequence used to separate array elements (VARCHAR(8)). You can use any ASCII values in the range E'\000' to E'\177', inclusive.</td>
</tr>
<tr>
<td><strong>collection_open</strong>, <strong>collection_close</strong></td>
<td>The characters that mark the beginning and end of the array (VARCHAR(8)). It is an error to use these characters elsewhere within the list of elements without escaping them. These characters can be omitted from the input string.</td>
</tr>
<tr>
<td><strong>collection_null_element</strong></td>
<td>The string representing a null element value (VARCHAR(65000)). You can specify a null value using any ASCII values in the range E'\001' to E'\177' inclusive (any ASCII value except NULL: E'\000').</td>
</tr>
</tbody>
</table>

Default: Comma (',').

Default: Square brackets ([' and ']).

Default: 'null'
| collection_enclose | An optional quote character within which to enclose individual elements, allowing delimiter characters to be embedded in string values. You can choose any ASCII value in the range E'\001' to E'\177' inclusive (any ASCII character except NULL: E'\000'). Elements do not need to be enclosed by this value.

**Default:** double quote (""") |

**Supported Data Types**

- VARCHAR

**Examples**

The function uses comma as the default delimiter. You can specify a different value:

```sql
=> SELECT STRING_TO_ARRAY('[1,3,5]');
STRING_TO_ARRAY
------------------
["1","3","5"]
(1 row)
```

```sql
=> SELECT STRING_TO_ARRAY('[t|t|f|t]' USING PARAMETERS collection_delimiter = '|');
STRING_TO_ARRAY
------------------
["t","t","f","t"]
(1 row)
```

The bounding brackets are optional:

```sql
=> SELECT STRING_TO_ARRAY('t|t|f|t' USING PARAMETERS collection_delimiter = '|');
STRING_TO_ARRAY
------------------
["t","t","f","t"]
(1 row)
```

The input can use other characters for open and close:

```sql
=> SELECT STRING_TO_ARRAY('{NASA-1683,NASA-7867,SPX-76}' USING PARAMETERS collection_open = '{', collection_close = '}');
STRING_TO_ARRAY
------------------
["NASA-1683","NASA-7867","SPX-76"]
(1 row)
```

By default the string 'null' in input is treated as a null value:
In the following example, the input comes from a column.

```
=> SELECT STRING_TO_ARRAY('"us-1672",null,"darpa-1963"') USING PARAMETERS collection_open = '{',
collection_close = '}');
STRING_TO_ARRAY
-----------------------------------------
["us-1672",null,"darpa-1963"]
(1 row)
```

**TO_JSON**

Returns the JSON representation of a complex-type argument, including mixed and nested complex types. This is the same format that queries of complex-type columns return.

**Behavior**

Immutable

**Syntax**

`TO_JSON(value)`

**Arguments**

| value | Column or literal of a complex type |

**Supported Data Types**

- ROW
- ARRAY
Examples

These examples query the following table:

<table>
<thead>
<tr>
<th>name</th>
<th>contact</th>
</tr>
</thead>
<tbody>
<tr>
<td>Missy Cooper</td>
<td>{&quot;street&quot;:&quot;911 San Marcos St&quot;,&quot;city&quot;:&quot;Austin&quot;,&quot;zipcode&quot;:73344,&quot;email&quot;: [&quot;<a href="mailto:missy@mit.edu">missy@mit.edu</a>&quot;,&quot;<a href="mailto:mcooper@cern.gov">mcooper@cern.gov</a>&quot;]}</td>
</tr>
<tr>
<td>Sheldon Cooper</td>
<td>{&quot;street&quot;:&quot;100 Main St Apt 4B&quot;,&quot;city&quot;:&quot;Pasadena&quot;,&quot;zipcode&quot;:91001,&quot;email&quot;: [&quot;<a href="mailto:shelly@meemaw.name">shelly@meemaw.name</a>&quot;,&quot;<a href="mailto:cooper@caltech.edu">cooper@caltech.edu</a>&quot;]}</td>
</tr>
<tr>
<td>Leonard Hofstadter</td>
<td>{&quot;street&quot;:&quot;100 Main St Apt 4A&quot;,&quot;city&quot;:&quot;Pasadena&quot;,&quot;zipcode&quot;:91001,&quot;email&quot;: [&quot;<a href="mailto:hofstadter@caltech.edu">hofstadter@caltech.edu</a>&quot;]}</td>
</tr>
<tr>
<td>Leslie Winkle</td>
<td>{&quot;street&quot;:&quot;23 Fifth Ave Apt 8C&quot;,&quot;city&quot;:&quot;Pasadena&quot;,&quot;zipcode&quot;:91001,&quot;email&quot;: [&quot;<a href="mailto:raj@available.com">raj@available.com</a>&quot;]}</td>
</tr>
<tr>
<td>Raj Koothrappali</td>
<td>{&quot;street&quot;:null,&quot;city&quot;:&quot;Pasadena&quot;,&quot;zipcode&quot;:91001,&quot;email&quot;: [&quot;<a href="mailto:raj@available.com">raj@available.com</a>&quot;]}</td>
</tr>
<tr>
<td>Stuart Bloom</td>
<td>{&quot;street&quot;:null,&quot;city&quot;:null,&quot;zipcode&quot;:null,&quot;email&quot;: [&quot;<a href="mailto:raj@available.com">raj@available.com</a>&quot;]}</td>
</tr>
</tbody>
</table>

You can call TO_JSON on a column or on specific fields or array elements:

<table>
<thead>
<tr>
<th>name</th>
<th>contact</th>
</tr>
</thead>
<tbody>
<tr>
<td>Missy Cooper</td>
<td>{&quot;street&quot;:&quot;911 San Marcos St&quot;,&quot;city&quot;:&quot;Austin&quot;,&quot;zipcode&quot;:73344,&quot;email&quot;: [&quot;<a href="mailto:missy@mit.edu">missy@mit.edu</a>&quot;,&quot;<a href="mailto:mcooper@cern.gov">mcooper@cern.gov</a>&quot;]}</td>
</tr>
<tr>
<td>Sheldon Cooper</td>
<td>{&quot;street&quot;:&quot;100 Main St Apt 4B&quot;,&quot;city&quot;:&quot;Pasadena&quot;,&quot;zipcode&quot;:91001,&quot;email&quot;: [&quot;<a href="mailto:shelly@meemaw.name">shelly@meemaw.name</a>&quot;,&quot;<a href="mailto:cooper@caltech.edu">cooper@caltech.edu</a>&quot;]}</td>
</tr>
<tr>
<td>Leonard Hofstadter</td>
<td>{&quot;street&quot;:&quot;100 Main St Apt 4A&quot;,&quot;city&quot;:&quot;Pasadena&quot;,&quot;zipcode&quot;:91001,&quot;email&quot;: [&quot;<a href="mailto:hofstadter@caltech.edu">hofstadter@caltech.edu</a>&quot;]}</td>
</tr>
<tr>
<td>Leslie Winkle</td>
<td>{&quot;street&quot;:&quot;23 Fifth Ave Apt 8C&quot;,&quot;city&quot;:&quot;Pasadena&quot;,&quot;zipcode&quot;:91001,&quot;email&quot;: [&quot;<a href="mailto:raj@available.com">raj@available.com</a>&quot;]}</td>
</tr>
<tr>
<td>Raj Koothrappali</td>
<td>{&quot;street&quot;:null,&quot;city&quot;:null,&quot;zipcode&quot;:null,&quot;email&quot;: [&quot;<a href="mailto:raj@available.com">raj@available.com</a>&quot;]}</td>
</tr>
</tbody>
</table>

When calling TO_JSON with a SET, note that duplicates are removed and elements can be reordered:
> SELECT TO_JSON_SET(1683,7867,76,76);
> TO_JSON
> 16837867
> [-76,1683,7867]
> (1 row)

## Current Load Source

The current load source function returns the source file name.

### CURRENT_LOAD_SOURCE

When called within the scope of a COPY statement, returns the file name used for the load. The following exceptions apply:

- If the function is called outside of the context of a COPY statement, it returns NULL.
- If the function is called by a UDL that does not set the source, it returns the string `<unknown>`.

This function is not supported for COPY LOCAL.

### Behavior Type

Stable

### Syntax

CURRENT_LOAD_SOURCE()

### Examples

Create a table and populate one of its columns c3 with the names of two separate files as they are loaded:

> CREATE TABLE t (c1 integer, c2 varchar(50), c3 varchar(200));
> CREATE TABLE
=> COPY t (c1, c2, c3 AS CURRENT_LOAD_SOURCE()) FROM '/home/load_file_1' ON exampledb_node02, 
'/home/load_file_2' ON exampledb_node03 DELIMITER ',';
Rows Loaded
-------------
5
(1 row)

=> SELECT * FROM t;
c1 | c2 | c3
---+----+----
 2 | dogs | /home/load_file_1
 1 | cats | /home/load_file_1
 4 | superheroes | /home/load_file_2
 3 | birds | /home/load_file_1
 5 | whales | /home/load_file_2
(5 rows)
Date/Time Functions

Date and time functions perform conversion, extraction, or manipulation operations on date and time data types and can return date and time information.

Usage

Functions that take TIME or TIMESTAMP inputs come in two variants:

- TIME WITH TIME ZONE or TIMESTAMP WITH TIME ZONE
- TIME WITHOUT TIME ZONE or TIMESTAMP WITHOUT TIME ZONE

For brevity, these variants are not shown separately.

The + and * operators come in commutative pairs; for example, both DATE + INTEGER and INTEGER + DATE. We show only one of each such pair.

Daylight Savings Time Considerations

When adding an INTERVAL value to (or subtracting an INTERVAL value from) a TIMESTAMP WITH TIME ZONE value, the days component advances (or decrements) the date of the TIMESTAMP WITH TIME ZONE by the indicated number of days. Across daylight saving time changes (with the session time zone set to a time zone that recognizes DST), this means INTERVAL '1 day' does not necessarily equal INTERVAL '24 hours'.

For example, with the session time zone set to CST7CDT:

```
TIMESTAMP WITH TIME ZONE '2014-04-02 12:00-07' + INTERVAL '1 day'
```

produces

```
TIMESTAMP WITH TIME ZONE '2014-04-03 12:00-06'
```

Adding INTERVAL '24 hours' to the same initial TIMESTAMP WITH TIME ZONE produces

```
TIMESTAMP WITH TIME ZONE '2014-04-03 13:00-06',
```
This result occurs because there is a change in daylight saving time at 2014-04-03 02:00 in time zone CST7CDT.

**Date/Time Functions in Transactions**

Certain date/time functions such as `CURRENT_TIMESTAMP` and `NOW` return the start time of the current transaction; for the duration of that transaction, they return the same value. Other date/time functions such as `TIMEOFDAY` always return the current time.

**See Also**

*Template Patterns for Date/Time Formatting*

**ADD_MONTHS**

Adds the specified number of months to a date and returns the sum as a DATE. In general, `ADD_MONTHS` returns a date with the same day component as the start date. For example:

```sql
=> SELECT ADD_MONTHS ('2015-09-15':date, -2) "2 Months Ago";
       2 Months Ago
----------
   2015-07-15
(1 row)
```

Two exceptions apply:

- If the start date's day component is greater than the last day of the result month, `ADD_MONTHS` returns the last day of the result month. For example:

  ```sql
  => SELECT ADD_MONTHS ('31-Jan-2016':TIMESTAMP, 1) "Leap Month";
        Leap Month
             -------
       2016-02-29
(1 row)
  ```

- If the start date's day component is the last day of that month, and the result month has more days than the start date month, `ADD_MONTHS` returns the last day of the result month. For example:

  ```sql
  => SELECT ADD_MONTHS ('2015-09-30':date,-1) "1 Month Ago";
         1 Month Ago
              -------
  ```
**Behavior Type**

- **Immutable** if the `start-date` argument is a TIMESTAMP or DATE
- **Stable** if the `start-date` argument is a TIMESTAMPTZ

**Syntax**

```
ADD_MONTHS ( start-date, num-months );
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>start-date</code></td>
<td>The date to process, an expression that evaluates to one of the following data types:</td>
</tr>
<tr>
<td></td>
<td>- DATE</td>
</tr>
<tr>
<td></td>
<td>- TIMESTAMP</td>
</tr>
<tr>
<td></td>
<td>- TIMESTAMPTZ</td>
</tr>
<tr>
<td><code>num-months</code></td>
<td>An integer expression that specifies the number of months to add to or subtract from <code>start-date</code>.</td>
</tr>
</tbody>
</table>

**Examples**

Add one month to the current date:

```sql
=> SELECT CURRENT_DATE Today;
   Today
   --------
   2016-05-05
   (1 row)

VMart=> SELECT ADD_MONTHS(CURRENT_TIMESTAMP,1);
   ADD_MONTHS
   2016-06-05
   (1 row)
```

Subtract four months from the current date:

```sql
```
Add one month to January 31 2016:

```sql
=> SELECT ADD_MONTHS(CURRENT_TIMESTAMP, -4);
ADD_MONTHS
-----------
2016-01-05
(1 row)
```

The following example sets the timezone to EST; it then adds 24 months to a TIMESTAMPTZ that specifies a PST time zone, so ADD_MONTHS takes into account the time change:

```sql
=> SET TIME ZONE 'America/New_York';
SET
=> VMart=> SELECT ADD_MONTHS('2008-02-29 23:30 PST':::TIMESTAMPTZ, 24);
ADD_MONTHS
-----------
2010-03-01
(1 row)
```

**AGE_IN_MONTHS**

Returns the difference in months between two dates, expressed as an integer.

**Behavior Type**

- **Immutable** if both date arguments are of data type TIMESTAMP
- **Stable** if either date is a TIMESTAMPTZ or only one argument is supplied

**Syntax**

```
AGE_IN_MONTHS ( [ date1,] date2 )
```

**Parameters**

- `date1` Specify the boundaries of the period to measure. If you supply only one argument, Vertica sets `date2` to the current date. Both parameters must
evaluate to one of the following data types:

- DATE
- TIMESTAMP
- TIMESTAMPTZ

If \( date1 < date2 \), \text{AGE\_IN\_MONTHS} returns a negative value.

### Examples

Get the age in months of someone born March 2 1972, as of June 21 1990:

```sql
=> SELECT \text{AGE\_IN\_MONTHS}('1990-06-21'::\text{TIMESTAMP}, '1972-03-02'::\text{TIMESTAMP});

AGE\_IN\_MONTHS
219
(1 row)
```

If the first date is less than the second date, \text{AGE\_IN\_MONTHS} returns a negative value:

```sql
=> SELECT \text{AGE\_IN\_MONTHS}('1972-03-02'::\text{TIMESTAMP}, '1990-06-21'::\text{TIMESTAMP});

AGE\_IN\_MONTHS
-220
(1 row)
```

Get the age in months of someone who was born November 21 1939, as of today:

```sql
=> SELECT \text{AGE\_IN\_MONTHS}('1939-11-21'::\text{DATE});

AGE\_IN\_MONTHS
930
(1 row)
```

### \text{AGE\_IN\_YEARS}

Returns the difference in years between two dates, expressed as an integer.

### Behavior Type

- **Immutable** if both date arguments are of data type \text{TIMESTAMP}
- **Stable** if either date is a \text{TIMESTAMPTZ} or only one argument is supplied
**Syntax**

`AGE_IN_YEARS([ date1, ] date2)`

**Parameters**

`date1`, `date2`  
Specify the boundaries of the period to measure. If you supply only one argument, Vertica sets `date1` to the current date. Both parameters must evaluate to one of the following data types:

- `DATE`
- `TIMESTAMP`
- `TIMESTAMPTZ`

If `date1 < date2`, `AGE_IN_YEARS` returns a negative value.

**Examples**

Get the age of someone born March 2 1972, as of June 21 1990:

```
=> SELECT AGE_IN_YEARS('1990-06-21':'TIMESTAMP', '1972-03-02':'TIMESTAMP');
AGE_IN_YEARS
-----------
   18
(1 row)
```

If the first date is earlier than the second date, `AGE_IN_YEARS` returns a negative number:

```
=> SELECT AGE_IN_YEARS('1972-03-02':'TIMESTAMP', '1990-06-21':'TIMESTAMP');
AGE_IN_YEARS
-----------
  -19
(1 row)
```

Get the age of someone who was born November 21 1939, as of today:

```
=> SELECT AGE_IN_YEARS('1939-11-21':'DATE');
AGE_IN_YEARS
-----------
    77
(1 row)
```
CLOCK_TIMESTAMP

Returns a value of type TIMESTAMP WITH TIMEZONE that represents the current system-clock time.

CLOCK_TIMESTAMP uses the date and time supplied by the operating system on the server to which you are connected, which should be the same across all servers. The value changes each time you call it.

Behavior Type

Volatile

Syntax

CLOCK_TIMESTAMP()

Examples

The following command returns the current time on your system:

```
SELECT CLOCK_TIMESTAMP() "Current Time";
Current Time
-----------------------
2010-09-23 11:41:23.33772-04
(1 row)
```

Each time you call the function, you get a different result. The difference in this example is in microseconds:

```
SELECT CLOCK_TIMESTAMP() "Time 1", CLOCK_TIMESTAMP() "Time 2";
<table>
<thead>
<tr>
<th>Time 1</th>
<th>Time 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>2010-09-23 11:41:55.369201-04</td>
<td>2010-09-23 11:41:55.369202-04</td>
</tr>
</tbody>
</table>
(1 row)
```

See Also

- STATEMENT_TIMESTAMP
- TRANSACTION_TIMESTAMP
**CURRENT_DATE**

Returns the date (date-type value) on which the current transaction started.

**Behavior Type**

*Stable*

**Syntax**

```plaintext
CURRENT_DATE()
```

**Note:**
You can call this function without parentheses.

**Examples**

```sql
SELECT CURRENT_DATE;
?column?
-------------
2010-09-23
(1 row)
```

**CURRENT_TIME**

Returns a value of type `TIME WITH TIMEZONE` that represents the start of the current transaction.

The return value does not change during the transaction. Thus, multiple calls to `CURRENT_TIME` within the same transaction return the same timestamp.

**Behavior Type**

*Stable*
Syntax

`CURRENT_TIME [ ( precision ) ]`

**Note:**
If you specify a column label without precision, you must also omit parentheses.

**Parameters**

| precision | An integer value between 0-6, specifies to round the seconds fraction field result to the specified number of digits. |

**Examples**

```sql
=> SELECT CURRENT_TIME(1) AS Time;
   Time
   06:51:45.2-07
   (1 row)
=> SELECT CURRENT_TIME(5) AS Time;
   Time
   06:51:45.18435-07
   (1 row)
```

**CURRENT_TIMESTAMP**

Returns a value of type `TIME` WITH `TIMEZONE` that represents the start of the current transaction.

The return value does not change during the transaction. Thus, multiple calls to `CURRENT_TIMESTAMP` within the same transaction return the same timestamp.

**Behavior Type**

*Stable*
Syntax

CURRENT_TIMESTAMP ( precision )

Parameters

| precision | An integer value between 0-6, specifies to round the seconds fraction field result to the specified number of digits. |

Examples

```sql
=> SELECT CURRENT_TIMESTAMP(1) AS time;
  time
  2017-03-27 06:50:49.7-07
(1 row)
=> SELECT CURRENT_TIMESTAMP(5) AS time;
  time
  2017-03-27 06:50:49.69967-07
(1 row)
```

DATE_PART

Extracts a sub-field such as year or hour from a date/time expression, equivalent to the SQL-standard function `EXTRACT`.

Behavior Type

- **Immutable** if the specified date is a `TIMESTAMP`, `DATE`, or `INTERVAL`
- **Stable** if the specified date is a `TIMESTAMPTZ`

Syntax

DATE_PART ( 'field', date )
## Parameters

<table>
<thead>
<tr>
<th>field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>The date to process, an expression that evaluates to one of the following data types:</td>
</tr>
<tr>
<td></td>
<td>- <strong>DATE</strong> (cast to <strong>TIMESTAMP</strong>)</td>
</tr>
<tr>
<td></td>
<td>- <strong>TIMESTAMP/TIMESTAMPZ</strong></td>
</tr>
<tr>
<td></td>
<td>- <strong>INTERVAL</strong></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>century</td>
<td>The century number. The first century starts at 0001-01-01 00:00:00 AD. This definition applies to all Gregorian calendar countries. There is no century number 0, you go from -1 to 1.</td>
</tr>
<tr>
<td>day</td>
<td>The day (of the month) field (1–31).</td>
</tr>
<tr>
<td>decade</td>
<td>The year field divided by 10.</td>
</tr>
<tr>
<td>doq</td>
<td>The day within the current quarter. DOQ recognizes leap year days.</td>
</tr>
<tr>
<td>dow</td>
<td>Zero-based day of the week, where Sunday=0. <strong>Note:</strong> EXTRACT's day of week numbering differs from the function TO_CHAR.</td>
</tr>
<tr>
<td>doy</td>
<td>The day of the year (1–365/366)</td>
</tr>
<tr>
<td>epoch</td>
<td>Specifies to return one of the following:</td>
</tr>
<tr>
<td></td>
<td>- For <strong>DATE</strong> and <strong>TIMESTAMP</strong> values: the number of seconds before or since 1970-01-01 00:00:00-00 (if before, a negative number).</td>
</tr>
<tr>
<td></td>
<td>- For <strong>INTERVAL</strong> values, the total number of seconds in the interval.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>HOUR</td>
<td>The hour field (0–23).</td>
</tr>
<tr>
<td>ISODOW</td>
<td>The ISO day of the week, an integer between 1 and 7 where Monday is 1.</td>
</tr>
<tr>
<td>ISOWEEK</td>
<td>The ISO week of the year, an integer between 1 and 53.</td>
</tr>
<tr>
<td>ISOYEAR</td>
<td>The ISO year.</td>
</tr>
<tr>
<td>MICROSECONDS</td>
<td>The seconds field, including fractional parts, multiplied by 1,000,000. This includes full seconds.</td>
</tr>
<tr>
<td>MILLENNIUM</td>
<td>The millennium number, where the first millennium is 1 and each millenium starts on 01-01-y001. For example, millennium 2 starts on 01-01-1001.</td>
</tr>
<tr>
<td>MILLISECONDS</td>
<td>The seconds field, including fractional parts, multiplied by 1000. This includes full seconds.</td>
</tr>
<tr>
<td>MINUTE</td>
<td>The minutes field (0 - 59).</td>
</tr>
<tr>
<td>MONTH</td>
<td>For TIMESTAMP values, the number of the month within the year (1 - 12); for interval values the number of months, modulo 12 (0 - 11).</td>
</tr>
<tr>
<td>QUARTER</td>
<td>The calendar quarter of the specified date as an integer, where the January-March quarter is 1, valid only for TIMESTAMP values.</td>
</tr>
<tr>
<td>SECOND</td>
<td>The seconds field, including fractional parts, 0–59, or 0-60 if the operating system implements leap seconds.</td>
</tr>
<tr>
<td>TIME_ZONE</td>
<td>The time zone offset from UTC, in seconds. Positive values correspond to time zones east of UTC, negative values to zones west of UTC.</td>
</tr>
<tr>
<td>TIMEZONE_HOUR</td>
<td>The hour component of the time zone offset.</td>
</tr>
<tr>
<td>TIMEZONE_MINUTE</td>
<td>The minute component of the time zone offset.</td>
</tr>
<tr>
<td>WEEK</td>
<td>The number of the week of the calendar year that the day is in.</td>
</tr>
<tr>
<td>YEAR</td>
<td>The year field. There is no 0 AD, so subtract BC years from AD years accordingly.</td>
</tr>
</tbody>
</table>
Notes

According to the ISO-8601 standard, the week starts on Monday, and the first week of a year contains January 4. Thus, an early January date can sometimes be in the week 52 or 53 of the previous calendar year. For example:

```sql
=> SELECT YEAR_ISO('01-01-2016':DATE), WEEK_ISO('01-01-2016'), DAYOFWEEK_ISO('01-01-2016');

<table>
<thead>
<tr>
<th>YEAR_ISO</th>
<th>WEEK_ISO</th>
<th>DAYOFWEEK_ISO</th>
</tr>
</thead>
<tbody>
<tr>
<td>2015</td>
<td>53</td>
<td>5</td>
</tr>
</tbody>
</table>

(1 row)
```

Examples

Extract the day value:

```sql
SELECT DATE_PART('DAY', TIMESTAMP '2009-02-24 20:38:40') "Day";
```

Day

```
24
```

(1 row)

Extract the month value:

```sql
SELECT DATE_PART('MONTH', '2009-02-24 20:38:40':TIMESTAMP) "Month";
```

Month

```
2
```

(1 row)

Extract the year value:

```sql
SELECT DATE_PART('YEAR', '2009-02-24 20:38:40':TIMESTAMP) "Year";
```

Year

```
2009
```

(1 row)

Extract the hours:

```sql
SELECT DATE_PART('HOUR', '2009-02-24 20:38:40':TIMESTAMP) "Hour";
```

Hour

```
20
```

(1 row)

Extract the minutes:
SELECT DATE_PART('MINUTES', '2009-02-24 20:38:40'::TIMESTAMP) "Minutes";

Minutes
----------
 38
(1 row)

Extract the day of quarter (DOQ):

SELECT DATE_PART('DOQ', '2009-02-24 20:38:40'::TIMESTAMP) "DOQ";

DOQ
-----
 55
(1 row)

See Also

TO_CHAR

DATE

Converts the input value to a DATE data type.

Behavior Type

- **Immutable** if the input value is a TIMESTAMP, DATE, VARCHAR, or integer
- **Stable** if the input value is a TIMESTAMPTZ

Syntax

`DATE ( value )`

Parameters

<table>
<thead>
<tr>
<th>value</th>
<th>The value to convert, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• TIMESTAMP, TIMESTAMPTZ, VARCHAR, or another DATE.</td>
</tr>
<tr>
<td></td>
<td>• Integer: Vertica treats the integer as the number of days since 01/01/0001 and returns the date.</td>
</tr>
</tbody>
</table>
Examples

=> SELECT DATE (1);
   DATE
   ---------------
   0001-01-01
(1 row)

=> SELECT DATE (734260);
   DATE
   ---------------
   2011-05-03
(1 row)

=> SELECT DATE('TODAY');
   DATE
   ---------------
   2016-12-07
(1 row)

See Also

- TO_DATE
- TO_TIMESTAMP
- TO_TIMESTAMP_TZ

DATE_TRUNC

Truncates date and time values to the specified precision. The return value is the same data type as the input value. All fields that are less than the specified precision are set to 0, or to 1 for day and month.

Behavior Type

Stable

Syntax

DATE_TRUNC( precision, trunc-target )
**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>precision</td>
<td>A string constant that specifies precision for the truncated value. See Precision Field Values below. The precision must be valid for the \texttt{trunc-target} date or time.</td>
</tr>
<tr>
<td>\texttt{trunc-target}</td>
<td>Valid date/time expression.</td>
</tr>
</tbody>
</table>

**Precision Field Values**

<table>
<thead>
<tr>
<th>field</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{MILLENNIUM}</td>
<td>The millennium number.</td>
</tr>
<tr>
<td>\texttt{CENTURY}</td>
<td>The century number.</td>
</tr>
</tbody>
</table>

The first century starts at 0001-01-01 00:00:00 AD. This definition applies to all Gregorian calendar countries.

| \texttt{DECADE} | The year field divided by 10.                                               |
| \texttt{YEAR}    | The year field. Keep in mind there is no 0 AD, so subtract BC years from AD years with care. |

| \texttt{QUARTER} | The calendar quarter of the specified date as an integer, where the January-March quarter is 1. |
| \texttt{MONTH}   | For timestamp values, the number of the month within the year (1–12); for interval values the number of months, modulo 12 (0–11). |
| \texttt{WEEK}    | The number of the week of the year that the day is in.                       |

According to the ISO-8601 standard, the week starts on Monday, and the first week of a year contains January 4. Thus, an early January date can sometimes be in the week 52 or 53 of the previous calendar year. For example:

```
=> SELECT YEAR_ISO('01-01-2016'::DATE), WEEK_ISO('01-01-2016'), DAYOFWEEK_ISO('01-01-2016');

<table>
<thead>
<tr>
<th>YEAR_ISO</th>
<th>WEEK_ISO</th>
<th>DAYOFWEEK_ISO</th>
</tr>
</thead>
<tbody>
<tr>
<td>2015</td>
<td>53</td>
<td>5</td>
</tr>
</tbody>
</table>
```

(1 row)
### Examples

The following example sets the field value as hour and returns the hour, truncating the minutes and seconds:

```sql
=> SELECT DATE_TRUNC('HOUR', TIMESTAMP '2012-02-24 13:38:40') AS HOUR;
          HOUR
   -----------------------
      2012-02-24 13:00:00
   (1 row)
```

The following example returns the year from the input `TIMESTAMPZ '2012-02-24 13:38:40'`. The function also defaults the month and day to January 1, truncates the `hour:minute:second` of the timestamp, and appends the time zone (-05):

```sql
=> SELECT DATE_TRUNC('YEAR', TIMESTAMPTZ '2012-02-24 13:38:40') AS YEAR;
           YEAR
   -----------------------
    2012-01-01 00:00:00-05
   (1 row)
```

The following example returns the year and month and defaults day of month to 1, truncating the rest of the string:

```sql
=> SELECT DATE_TRUNC('MONTH', TIMESTAMPTZ '2012-02-24 13:38:40') AS MONTH;
         MONTH
   -----------------------
    2012-02-01 00:00:00
   (1 row)
```
**DATEDIFF**

Returns the time span between two dates, in the intervals specified. DATEDIFF excludes the start date in its calculation.

**Behavior Type**

- **Immutable** if start and end dates are TIMESTAMP, DATE, TIME, or INTERVAL
- **Stable** if start and end dates are TIMESTAMPTZ

**Syntax**

DATEDIFF (datepart, start, end);

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `datepart` | Specifies the type of date or time intervals that DATEDIFF returns. If `datepart` is an expression, it must be enclosed in parentheses:  
DATEDIFF((expression), start, end);  
`datepart` must evaluate to one of the following string literals, either quoted or unquoted:  
- `year` | `yy` | `yyyy`  
- `quarter` | `qq` | `q`  
- `month` | `mm` | `m`  
- `day` | `dayofyear` | `dd` | `d` | `dy` | `y`  
- `week` | `wk` | `ww`  
- `hour` | `hh`  
- `minute` | `mi` | `n`  
- `second` | `ss` | `s`  
- `millisecond` | `mcs`  
- `microsecond` | `ms` |
| `start` \ `,` `end` | Specify the start and end dates, where `start` and `end` evaluate to one of the following data types:  
- **TIMESTAMP/TIMESTAMPTZ** |
Compatible Start and End Date Data Types

The following table shows which data types can be matched as start and end dates:

<table>
<thead>
<tr>
<th></th>
<th>DATE</th>
<th>TIMESTAMP</th>
<th>TIMESTAMPTZ</th>
<th>TIME</th>
<th>INTERVAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATE</td>
<td>●</td>
<td>●</td>
<td>●</td>
<td></td>
<td></td>
</tr>
<tr>
<td>TIMESTAMP</td>
<td>●</td>
<td>●</td>
<td>●</td>
<td></td>
<td></td>
</tr>
<tr>
<td>TIMESTAMPTZ</td>
<td>●</td>
<td>●</td>
<td>●</td>
<td></td>
<td></td>
</tr>
<tr>
<td>TIME</td>
<td></td>
<td></td>
<td></td>
<td>●</td>
<td></td>
</tr>
<tr>
<td>INTERVAL</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>●</td>
</tr>
</tbody>
</table>

For example, if you set the start date to an INTERVAL data type, the end date must also be an INTERVAL, otherwise Vertica returns an error:

```sql
SELECT DATEDIFF(day, INTERVAL '26 days', INTERVAL '1 month');
```

```
4
(1 row)
```

Date Part Intervals

DATEDIFF uses the datepart argument to calculate the number of intervals between two dates, rather than the actual amount of time between them. DATEDIFF uses the following
cutoff points to calculate those intervals:

- **year**: January 1
- **quarter**: January 1, April 1, July 1, October 1
- **month**: the first day of the month
- **week**: Sunday at midnight (24:00)

For example, if `datepart` is set to `year`, `DATEDIFF` uses January 01 to calculate the number of years between two dates. The following `DATEDIFF` statement sets `datepart` to `year`, and specifies a time span 01/01/2005 - 06/15/2008:

```sql
SELECT DATEDIFF(year, '01-01-2005':date, '12-31-2008':date);
```

```
datediff
-------
 3
(1 row)
```

DATEDIFF always excludes the start date when it calculates intervals—in this case, 01/01/2005. DATEDIFF considers only calendar year starts in its calculation, so in this case it only counts years 2006, 2007, and 2008. The function returns 3, although the actual time span is nearly four years.

If you change the start and end dates to 12/31/2004 and 01/01/2009, respectively, `DATEDIFF` also counts years 2005 and 2009. This time, it returns 5, although the actual time span is just over four years:

```sql
=> SELECT DATEDIFF(year, '12-31-2004':date, '01-01-2009':date);
```

```
datediff
-------
 5
(1 row)
```

Similarly, `DATEDIFF` uses month start dates when it calculates the number of months between two dates. Thus, given the following statement, `DATEDIFF` counts months February through September and returns 8:

```sql
=> SELECT DATEDIFF(month, '01-31-2005':date, '09-30-2005':date);
```

```
datediff
-------
 8
(1 row)
```

**See Also**

`TIMESTAMPDIFF`
DAY

Returns as an integer the day of the month from the input value.

Behavior Type

- **Immutable** if the input value is a TIMESTAMP, DATE, VARCHAR, or INTEGER
- **Stable** if the specified date is a TIMESTAMPTZ

Syntax

```
DAY ( value )
```

Parameters

| value | The value to convert, one of the following: TIMESTAMP, TIMESTAMPTZ, INTERVAL, VARCHAR, or INTEGER. |

Examples

```
=> SELECT DAY (6);
  DAY
-----
   6
(1 row)

=> SELECT DAY(TIMESTAMP 'sep 22, 2011 12:34');
  DAY
-----
   22
(1 row)

=> SELECT DAY('sep 22, 2011 12:34');
  DAY
-----
   22
(1 row)

=> SELECT DAY(INTERVAL '35 12:34');
  DAY
-----
   35
```
DAYOFMONTH

Returns the day of the month as an integer.

**Behavior Type**

- **Immutable** if the target date is a TIMESTAMP, DATE, or VARCHAR
- **Stable** if the target date is a TIMESTAMPTZ

**Syntax**

```sql
DAYOFMONTH (date)
```

**Parameters**

<table>
<thead>
<tr>
<th>date</th>
<th>The date to process, one of the following data types:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• VARCHAR</td>
</tr>
<tr>
<td></td>
<td>• DATE</td>
</tr>
<tr>
<td></td>
<td>• TIMESTAMP</td>
</tr>
<tr>
<td></td>
<td>• TIMESTAMPTZ</td>
</tr>
</tbody>
</table>

**Example**

```sql
=> SELECT DAYOFMONTH (TIMESTAMP 'sep 22, 2011 12:34');
DAYOFMONTH
----------
22
(1 row)
```

DAYOFWEEK

Returns the day of the week as an integer, where Sunday is day 1.
Behavior Type

- **Immutable** if the target date is a TIMESTAMP, DATE, or VARCHAR
- **Stable** if the target date is a TIMESTAMPTZ

Syntax

```sql
DAYOFWEEK ( date )
```

Parameters

- **date**: The date to process, one of the following data types:
  - VARCHAR
  - DATE
  - TIMESTAMP
  - TIMESTAMPTZ

Example

```sql
=> SELECT DAYOFWEEK (TIMESTAMP 'sep 17, 2011 12:34');
DAYOFWEEK
--------
7
(1 row)
```

DAYOFWEEK_ISO

Returns the ISO 8061 day of the week as an integer, where Monday is day 1.

Behavior Type

- **Immutable** if the target date is a TIMESTAMP, DATE, or VARCHAR
- **Stable** if the target date is a TIMESTAMPTZ
Syntax

```sql
DAYOFWEEK_ISO ( date )
```

Parameters

<table>
<thead>
<tr>
<th>date</th>
<th>The date to process, one of the following data types:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• VARCHAR</td>
</tr>
<tr>
<td></td>
<td>• DATE</td>
</tr>
<tr>
<td></td>
<td>• TIMESTAMP</td>
</tr>
<tr>
<td></td>
<td>• TIMESTAMPTZ</td>
</tr>
</tbody>
</table>

Examples

```sql
=> SELECT DAYOFWEEK_ISO(TIMESTAMP 'Sep 22, 2011 12:34');
DAYOFWEEK_ISO
------------------
        4
(1 row)
```

The following example shows how to combine the DAYOFWEEK_ISO, WEEK_ISO, and YEAR_ISO functions to find the ISO day of the week, week, and year:

```sql
=> SELECT DAYOFWEEK_ISO('Jan 1, 2000'), WEEK_ISO('Jan 1, 2000'), YEAR_ISO('Jan1,2000');
DAYOFWEEK_ISO | WEEK_ISO | YEAR_ISO
----------------|----------|----------
            6 |        52 |     1999
(1 row)
```

See Also

- WEEK_ISO
- DAYOFWEEK_ISO

DAYOFYEAR

Returns the day of the year as an integer, where January 1 is day 1.
Behavior Type

- **Immutable** if the specified date is a `TIMESTAMP`, `DATE`, or `VARCHAR`
- **Stable** if the specified date is a `TIMESTAMPTZ`

Syntax

```
DAYOFYEAR ( date )
```

Parameters

<table>
<thead>
<tr>
<th><strong>date</strong></th>
<th>The date to process, one of the following data types:</th>
</tr>
</thead>
</table>
|          | - `VARCHAR`
|          | - `DATE`
|          | - `TIMESTAMP`
|          | - `TIMESTAMPTZ`

Example

```sql
=> SELECT DAYOFYEAR (TIMESTAMP 'SEPT 22, 2011 12:34');
DAYOFYEAR
--------
  265
(1 row)
```

DAYS

Returns the integer value of the specified date, where 1 AD is 1. If the date precedes 1 AD, DAYS returns a negative integer.

Behavior Type

- **Immutable** if the specified date is a `TIMESTAMP`, `DATE`, or `VARCHAR`
- **Stable** if the specified date is a `TIMESTAMPTZ`
Syntax

DAYS (date)

Parameters

<table>
<thead>
<tr>
<th>date</th>
<th>The date to process, one of the following data types:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• VARCHAR</td>
</tr>
<tr>
<td></td>
<td>• DATE</td>
</tr>
<tr>
<td></td>
<td>• TIMESTAMP</td>
</tr>
<tr>
<td></td>
<td>• TIMESTAMPTZ</td>
</tr>
</tbody>
</table>

Example

=> SELECT DAYS (DATE '2011-01-22');
   DAYS
   -------
   734159
(1 row)

=> SELECT DAYS (DATE 'March 15, 0044 BC');
   DAYS
   -------
   -15997
(1 row)

EXTRACT

Retrieves sub-fields such as year or hour from date/time values and returns values of type NUMERIC. EXTRACT is intended for computational processing, rather than for formatting date/time values for display.

Behavior Type

- **Immutable** if the specified date is a TIMESTAMP, DATE, or INTERVAL
- **Stable** if the specified date is a TIMESTAMPTZ
Syntax

```
EXTRACT ( field FROM date )
```

## Parameters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>field</strong></td>
<td>A constant value that specifies the sub-field to extract from <code>date</code> (see Field Values below).</td>
</tr>
<tr>
<td><strong>date</strong></td>
<td>The date to process, an expression that evaluates to one of the following data types:</td>
</tr>
<tr>
<td></td>
<td>- <code>DATE</code> (cast to <code>TIMESTAMP</code>)</td>
</tr>
<tr>
<td></td>
<td>- <code>TIMESTAMP/TIMESTAMPZ</code></td>
</tr>
<tr>
<td></td>
<td>- <code>INTERVAL</code></td>
</tr>
</tbody>
</table>

## Field Values

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CENTURY</strong></td>
<td>The century number. The first century starts at 0001-01-01 00:00:00 AD. This definition applies to all Gregorian calendar countries. There is no century number 0, you go from –1 to 1.</td>
</tr>
<tr>
<td><strong>DAY</strong></td>
<td>The day (of the month) field (1–31).</td>
</tr>
<tr>
<td><strong>DECADE</strong></td>
<td>The year field divided by 10.</td>
</tr>
<tr>
<td><strong>DOQ</strong></td>
<td>The day within the current quarter. DOQ recognizes leap year days.</td>
</tr>
<tr>
<td><strong>DOW</strong></td>
<td>Zero-based day of the week, where Sunday=0. <strong>Note:</strong> <code>EXTRACT</code>’s day of week numbering differs from the function <code>TO_CHAR</code>.</td>
</tr>
<tr>
<td><strong>DOY</strong></td>
<td>The day of the year (1–365/366)</td>
</tr>
<tr>
<td><strong>EPOCH</strong></td>
<td>Specifies to return one of the following:</td>
</tr>
<tr>
<td></td>
<td>- For <code>DATE</code> and <code>TIMESTAMP</code> values: the number of seconds</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>HOUR</td>
<td>The hour field (0–23).</td>
</tr>
<tr>
<td>ISODOW</td>
<td>The ISO day of the week, an integer between 1 and 7 where Monday is 1.</td>
</tr>
<tr>
<td>ISOWEEK</td>
<td>The ISO week of the year, an integer between 1 and 53.</td>
</tr>
<tr>
<td>ISOYEAR</td>
<td>The ISO year.</td>
</tr>
<tr>
<td>MICROSECONDS</td>
<td>The seconds field, including fractional parts, multiplied by 1,000,000.</td>
</tr>
<tr>
<td></td>
<td>This includes full seconds.</td>
</tr>
<tr>
<td>MILLENNIUM</td>
<td>The millennium number, where the first millennium is 1 and each millenium starts on 01-01-1001. For example, millennium 2 starts on 01-01-1001.</td>
</tr>
<tr>
<td>MILLISECONDS</td>
<td>The seconds field, including fractional parts, multiplied by 1000. This includes full seconds.</td>
</tr>
<tr>
<td>MINUTE</td>
<td>The minutes field (0 - 59).</td>
</tr>
<tr>
<td>MONTH</td>
<td>For TIMESTAMP values, the number of the month within the year (1 - 12); for interval values the number of months, modulo 12 (0 - 11).</td>
</tr>
<tr>
<td>QUARTER</td>
<td>The calendar quarter of the specified date as an integer, where the January-March quarter is 1, valid only for TIMESTAMP values.</td>
</tr>
<tr>
<td>SECOND</td>
<td>The seconds field, including fractional parts, 0–59, or 0-60 if the operating system implements leap seconds.</td>
</tr>
<tr>
<td>TIME_ZONE</td>
<td>The time zone offset from UTC, in seconds. Positive values correspond to time zones east of UTC, negative values to zones west of UTC.</td>
</tr>
<tr>
<td>TIMEZONE_HOUR</td>
<td>The hour component of the time zone offset.</td>
</tr>
<tr>
<td>TIMEZONE_MINUTE</td>
<td>The minute component of the time zone offset.</td>
</tr>
<tr>
<td>WEEK</td>
<td>The number of the week of the calendar year that the day is in.</td>
</tr>
<tr>
<td>YEAR</td>
<td>The year field. There is no 0 AD, so subtract BC years from AD years.</td>
</tr>
</tbody>
</table>
Examples

Extract the day of the week and day in quarter from the current TIMESTAMP:

=> SELECT CURRENT_TIMESTAMP AS NOW;

-------------------
2016-05-03 11:36:08.829004-04
(1 row)

=> SELECT EXTRACT (DAY FROM CURRENT_TIMESTAMP);

date_part
--------
3
(1 row)

=> SELECT EXTRACT (DOQ FROM CURRENT_TIMESTAMP);

date_part
--------
33
(1 row)

Extract the timezone hour from the current time:

=> SELECT CURRENT_TIMESTAMP;

-------------------
2016-05-03 11:36:08.829004-04
(1 row)

=> SELECT EXTRACT (TIMEZONE_HOUR FROM CURRENT_TIMESTAMP);

date_part
--------
-4
(1 row)

Extract the number of seconds since 01-01-1970 00:00:

=> SELECT EXTRACT (EPOCH FROM '2001-02-16 20:38:40-08'::TIMESTAMPTZ);

date_part
-------------------
982384720.000000
(1 row)

Extract the number of seconds between 01-01-1970 00:00 and 5 days 3 hours before:

=> SELECT EXTRACT (EPOCH FROM '-5 days 3 hours'::INTERVAL);

date_part
-------------------
-442800.000000
(1 row)
Convert the results from the last example to a TIMESTAMP:

```sql
=> SELECT 'EPOCH'::TIMESTAMPTZ -442800 * '1 second'::INTERVAL;
----
1969-12-26 16:00:00.000000
(1 row)
```

## GETDATE

Returns the current statement's start date and time as a TIMESTAMP value. This function is identical to `SYSDATE`.

`GETDATE` uses the date and time supplied by the operating system on the server to which you are connected, which is the same across all servers. Internally, `GETDATE` converts `STATEMENT_TIMESTAMP` from `TIMESTAMPTZ` to `TIMESTAMP`.

### Behavior Type

**Stable**

### Syntax

`GETDATE()`

### Example

```sql
=> SELECT GETDATE();
-----
GETDATE

2011-03-07 13:21:29.497742
(1 row)
```

### See Also

Date/Time Expressions
GETUTCDATE

Returns the current statement's start date and time as a TIMESTAMP value.

GETUTCDATE uses the date and time supplied by the operating system on the server to which you are connected, which is the same across all servers. Internally, GETUTCDATE converts STATEMENT_TIMESTAMP at TIME ZONE 'UTC'.

Behavior Type

Stable

Syntax

GETUTCDATE()

Example

```
=> SELECT GETUTCDATE();
    GETUTCDATE
-----------------------------
2011-03-07 20:20:26.193052
(1 row)
```

See Also

- Date/Time Expressions

HOUR

Returns the hour portion of the specified date as an integer, where 0 is 00:00 to 00:59.
Behavior Type

- **Immutable** if the specified date is a TIMESTAMP
- **Stable** if the specified date is a TIMESTAMPTZ

Syntax

HOUR( date )

Parameters

<table>
<thead>
<tr>
<th>date</th>
<th>The date to process, one of the following data types:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• VARCHAR</td>
</tr>
<tr>
<td></td>
<td>• DATE</td>
</tr>
<tr>
<td></td>
<td>• TIMESTAMP</td>
</tr>
<tr>
<td></td>
<td>• TIMESTAMPTZ</td>
</tr>
<tr>
<td></td>
<td>• INTERVAL</td>
</tr>
</tbody>
</table>

Examples

=> SELECT HOUR (TIMESTAMP 'sep 22, 2011 12:34');
   HOUR
   ------
   12
   (1 row)
=> SELECT HOUR (INTERVAL '35 12:34');
   HOUR
   ------
   12
   (1 row)
=> SELECT HOUR ('12:34');
   HOUR
   ------
   12
   (1 row)
**ISFINITE**

Tests for the special TIMESTAMP constant INFINITY and returns a value of type BOOLEAN.

**Behavior Type**

*Immutable*

**Syntax**

\[
\text{ISFINITE (timestamp)}
\]

**Parameters**

<table>
<thead>
<tr>
<th>timestamp</th>
<th>Expression of type TIMESTAMP</th>
</tr>
</thead>
</table>

**Examples**

```
SELECT ISFINITE(TIMESTAMP '2009-02-16 21:28:30');
ISFINITE
---------
t
(1 row)
```

```
SELECT ISFINITE(TIMESTAMP 'INFINITY');
ISFINITE
---------
f
(1 row)
```

**JULIAN_DAY**

Returns the integer value of the specified day according to the Julian calendar, where day 1 is the first day of the Julian period, January 1, 4713 BC (on the Gregorian calendar, November 24, 4714 BC).
Behavior Type

- **Immutable** if the specified date is a TIMESTAMP, DATE, or VARCHAR
- **Stable** if the specified date is a TIMESTAMPTZ

Syntax

```
JULIAN_DAY ( date )
```

Parameters

<table>
<thead>
<tr>
<th><strong>date</strong></th>
<th>The date to process, one of the following data types:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>VARCHAR</strong></td>
</tr>
<tr>
<td></td>
<td><strong>DATE</strong></td>
</tr>
<tr>
<td></td>
<td><strong>TIMESTAMP</strong></td>
</tr>
<tr>
<td></td>
<td><strong>TIMESTAMPTZ</strong></td>
</tr>
</tbody>
</table>

Example

```sql
=> SELECT JULIAN_DAY (DATE 'MARCH 15, 0044 BC');
JULIAN_DAY
----------
 1705428
(1 row)

=> SELECT JULIAN_DAY (DATE '2001-01-01');
JULIAN_DAY
----------
 2451911
(1 row)
```

**LAST_DAY**

Returns the last day of the month in the specified date.
Behavior Type

- **Immutable** if the specified is a TIMESTAMP or DATE
- **Stable** if the specified date is a TIMESTAMPTZ

Syntax

```
LAST_DAY ( date )
```

Parameters

<table>
<thead>
<tr>
<th>Date</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>The date to process, one of the following data types:</td>
</tr>
<tr>
<td></td>
<td>DATE</td>
</tr>
<tr>
<td></td>
<td>TIMESTAMP</td>
</tr>
<tr>
<td></td>
<td>TIMESTAMPTZ</td>
</tr>
</tbody>
</table>

Examples

The following example returns the last day of February as 29 because 2016 is a leap year:

```
=> SELECT LAST_DAY('2016-02-28 23:30 PST') "Last Day";
Last Day
--------
2016-02-29
(1 row)
```

The following example returns the last day of February in a non-leap year:

```
> SELECT LAST_DAY('2017/02/03') "Last";
Last
--------
2017-02-28
(1 row)
```

The following example returns the last day of March, after converting the string value to the specified DATE type:

```
=> SELECT LAST_DAY('2003/03/15') "Last";
Last
--------
2012-03-31
```
LOCALTIME

Returns a value of type TIME that represents the start of the current transaction.

The return value does not change during the transaction. Thus, multiple calls to LOCALTIME within the same transaction return the same timestamp.

**Behavior Type**

**Stable**

**Syntax**

LOCALTIME [ ( precision ) ]

**Parameters**

| precision | Rounds the result to the specified number of fractional digits in the seconds field. |

**Example**

```
=> CREATE TABLE t1 (a int, b int);
CREATE TABLE

=> INSERT INTO t1 VALUES (1,2);
OUTPUT
--------
 1
(1 row)

=> SELECT LOCALTIME time;
time
----------------
15:03:14.595296
(1 row)

=> INSERT INTO t1 VALUES (3,4);
OUTPUT
```
LOCALTIMESTAMP

Returns a value of type `TIMESTAMP/TIMESTAMPPTZ` that represents the start of the current transaction, and remains unchanged until the transaction is closed. Thus, multiple calls to `LOCALTIMESTAMP` within a given transaction return the same timestamp.

**Behavior Type**

Stable

**Syntax**

```
LOCALTIMESTAMP [ ( precision ) ]
```

**Parameters**

<table>
<thead>
<tr>
<th><code>precision</code></th>
<th>Rounds the result to the specified number of fractional digits in the seconds field.</th>
</tr>
</thead>
</table>

**Example**

```
=> CREATE TABLE t1 (a int, b int);
CREATE TABLE
```
MICROSECOND

Returns the microsecond portion of the specified date as an integer.

Behavior Type

- **Immutable** if the specified date is a TIMESTAMP, INTERVAL, or VARCHAR
- **Stable** if the specified date is a TIMESTAMPTZ

Syntax

```
MICROSECOND ( date )
```
Parameters

<table>
<thead>
<tr>
<th>date</th>
<th>The date to process, one of the following data types:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• VARCHAR</td>
</tr>
<tr>
<td></td>
<td>• TIMESTAMP</td>
</tr>
<tr>
<td></td>
<td>• TIMESTAMPTZ</td>
</tr>
<tr>
<td></td>
<td>• INTERVAL</td>
</tr>
</tbody>
</table>

Example

```sql
=> SELECT MICROSECOND (TIMESTAMP 'Sep 22, 2011 12:34:01.123456');

MICROSECOND
-------------
123456
(1 row)
```

MIDNIGHT SECONDS

Within the specified date, returns the number of seconds between midnight and the date's time portion.

Behavior Type

- **Immutable** if the specified date is a TIMESTAMP, DATE, or VARCHAR
- **Stable** if the specified date is a TIMESTAMPTZ

Syntax

MIDNIGHT SECONDS ( date )

Parameters

<table>
<thead>
<tr>
<th>date</th>
<th>The date to process, one of the following data types:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• VARCHAR</td>
</tr>
</tbody>
</table>
Examples

Get the number of seconds since midnight:

```sql
=> SELECT MIDNIGHT_SECONDS(CURRENT_TIMESTAMP);
MIDNIGHT_SECONDS
-----------------
36480
(1 row)
```

Get the number of seconds between midnight and noon on March 3 2016:

```sql
=> SELECT MIDNIGHT_SECONDS('3-3-2016 12:00':::TIMESTAMP);
MIDNIGHT_SECONDS
-----------------
43200
(1 row)
```

MINUTE

Returns the minute portion of the specified date as an integer.

Behavior Type

- **Immutable** if the specified date is a TIMESTAMP, DATE, VARCHAR or INTERVAL
- **Stable** if the specified date is a TIMESTAMPTZ

Syntax

MINUTE ( date )

Parameters

<table>
<thead>
<tr>
<th>date</th>
<th>The date to process, one of the following data types:</th>
</tr>
</thead>
</table>
Example

```sql
=> SELECT MINUTE('12:34:03.456789');

  MINUTE
-------------
     34
(1 row)

=> SELECT MINUTE(TIMESTAMP 'sep 22, 2011 12:34');

  MINUTE
-------------
     34
(1 row)

=> SELECT MINUTE(INTERVAL '35 12:34:03.456789');

  MINUTE
-------------
     34
(1 row)
```

MONTH

Returns the month portion of the specified date as an integer.

Behavior Type

- **Immutable** if the specified date is a TIMESTAMP, DATE, VARCHAR or INTERVAL
- **Stable** if the specified date is a TIMESTAMPTZ

Syntax

```sql
MONTH ( date )
```
Parameters

<table>
<thead>
<tr>
<th>date</th>
<th>The date to process, one of the following data types:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• VARCHAR</td>
</tr>
<tr>
<td></td>
<td>• DATE</td>
</tr>
<tr>
<td></td>
<td>• TIMESTAMP</td>
</tr>
<tr>
<td></td>
<td>• TIMESTAMPTZ</td>
</tr>
<tr>
<td></td>
<td>• INTERVAL</td>
</tr>
</tbody>
</table>

Examples

In the following examples, Vertica returns the month portion of the specified string. For example, '6-9' represent September 6.

```sql
=> SELECT MONTH('6-9');
  MONTH
  -------
  9
  (1 row)
=> SELECT MONTH(TIMESTAMP 'sep 22, 2011 12:34');
  MONTH
  -------
  9
  (1 row)
=> SELECT MONTH(INTEGER '2-35' year to month);
  MONTH
  -------
  11
  (1 row)
```

MONTHS_BETWEEN

Returns the number of months between two dates. MONTHS_BETWEEN can return an integer or a FLOAT:

- Integer: The day portions of date1 and date2 are the same, and neither date is the last day of the month. MONTHS_BETWEEN also returns an integer if both dates in date1 and date2 are the last days of their respective months. For example, MONTHS_BETWEEN calculates the difference between April 30 and March 31 as 1 month.
FLOAT: The day portions of \( date1 \) and \( date2 \) are different and one or both dates are not the last day of their respective months. For example, the difference between April 2 and March 1 is \( 1.03225806451613 \). To calculate month fractions, MONTHS\_BETWEEN assumes all months contain 31 days.

MONTHS\_BETWEEN disregards timestamp time portions.

**Behavior Type**

- **Immutable** if both date arguments are of data type TIMESTAMP or DATE
- **Stable** if either date is a TIMESTAMPTZ

**Syntax**

MONTHS\_BETWEEN ( \( date1 \), \( date2 \) );

**Parameters**

<table>
<thead>
<tr>
<th>( date1 )</th>
<th>( date2 )</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specify the dates to evaluate where ( date1 ) and ( date2 ) evaluate to one of the following data types:</td>
<td></td>
</tr>
<tr>
<td>DATE</td>
<td></td>
</tr>
<tr>
<td>TIMESTAMP</td>
<td></td>
</tr>
<tr>
<td>TIMESTAMPTZ</td>
<td></td>
</tr>
</tbody>
</table>

If \( date1 < date2 \), MONTHS\_BETWEEN returns a negative value.

**Examples**

Return the number of months between April 7 2016 and January 7 2015:

\[
\text{=> SELECT MONTHS\_BETWEEN ('04-07-16'::TIMESTAMP, '01-07-15'::TIMESTAMP);}
\]

MONTHS\_BETWEEN

-------------
15

(1 row)

Return the number of months between March 31 2016 and February 28 2016 (MONTHS\_BETWEEN assumes both months contain 31 days):

\[
\text{=> SELECT MONTHS\_BETWEEN ('03-31-16'::TIMESTAMP, '02-28-16'::TIMESTAMP);}
\]
Return the number of months between March 31 2016 and February 29 2016:

```sql
=> SELECT MONTHS_BETWEEN ('03-31-16':TIMESTAMP, '02-29-16':TIMESTAMP);
MONTHS_BETWEEN
----------
1.09677419354839
(1 row)
```

NEW_TIME

Converts a timestamp value from one time zone to another and returns a TIMESTAMP.

**Behavior Type**

*Immutable*

**Syntax**

```
NEW_TIME( 'timestamp' , 'timezone1' , 'timezone2')
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>timestamp</code></td>
<td>The timestamp to convert, conforms to one of the following formats:</td>
</tr>
<tr>
<td></td>
<td>• <code>TIMESTAMP/TIMESTAMPTZ</code></td>
</tr>
<tr>
<td></td>
<td>• <code>DATE</code></td>
</tr>
<tr>
<td></td>
<td>• Character string that can be converted to a <code>TIMESTAMP</code>—for example, May 24, 2012 10:00.</td>
</tr>
<tr>
<td><code>timezone1</code></td>
<td>Specify the source and target timezones, one of the strings defined in</td>
</tr>
<tr>
<td><code>timezone2</code></td>
<td><code>/opt/vertica/share/timezonesets</code>. For example:</td>
</tr>
<tr>
<td></td>
<td>• GMT: Greenwich Mean Time</td>
</tr>
<tr>
<td></td>
<td>• AST / ADT: Atlantic Standard/Daylight Time</td>
</tr>
<tr>
<td></td>
<td>• EST / EDT: Eastern Standard/Daylight Time</td>
</tr>
<tr>
<td></td>
<td>• CST / CDT: Central Standard/Daylight Time</td>
</tr>
</tbody>
</table>
Examples

Convert the specified time from Eastern Standard Time (EST) to Pacific Standard Time (PST):

```
=> SELECT NEW_TIME('05-24-12 13:48:00', 'EST', 'PST');
NEW_TIME
-----------------------
2012-05-24 10:48:00
(1 row)
```

Convert 1:00 AM January 2012 from EST to PST:

```
=> SELECT NEW_TIME('01-01-12 01:00:00', 'EST', 'PST');
NEW_TIME
-----------------------
2011-12-31 22:00:00
(1 row)
```

Convert the current time EST to PST:

```
=> SELECT NOW();
NOW
-----------------------
2016-12-09 10:30:36.727307-05
(1 row)

=> SELECT NEW_TIME('NOW', 'EDT', 'CDT');
NEW_TIME
-----------------------
2016-12-09 09:30:36.727307
(1 row)
```

The following example returns the year 45 before the Common Era in Greenwich Mean Time and converts it to Newfoundland Standard Time:

```
=> SELECT NEW_TIME('April 1, 45 BC', 'GMT', 'NST')::DATE;
NEW_TIME
-----------------------
0045-03-31 BC
(1 row)
```
**NEXT_DAY**

Returns the date of the first instance of a particular day of the week that follows the specified date.

**Behavior Type**

- **Immutable** if the specified date is a TIMESTAMP, DATE, or VARCHAR
- **Stable** if the specified date is a TIMESTAMPTZ

**Syntax**

```
NEXT_DAY( 'date', 'day-string' )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>date</code></td>
<td>The date to process, one of the following data types:</td>
</tr>
<tr>
<td></td>
<td>- VARCHAR</td>
</tr>
<tr>
<td></td>
<td>- DATE</td>
</tr>
<tr>
<td></td>
<td>- TIMESTAMP</td>
</tr>
<tr>
<td></td>
<td>- TIMESTAMPTZ</td>
</tr>
<tr>
<td><code>day-string</code></td>
<td>The day of the week to process, a CHAR or VARCHAR string or character constant. Supply the full English name such as Tuesday, or any conventional abbreviation, such as Tue or Tues. <code>day-string</code> is not case sensitive and trailing spaces are ignored.</td>
</tr>
</tbody>
</table>

**Examples**

Get the date of the first Monday that follows April 29 2016:

```
=> SELECT NEXT_DAY( '4-29-2016'::TIMESTAMP,'Monday') "NEXT DAY";
NEXT_DAY
----------
2016-05-02
(1 row)
```

Get the first Tuesday that follows today:
NOW [Date/Time]

Returns a value of type TIMESTAMP WITH TIME ZONE representing the start of the current transaction. NOW is equivalent to CURRENT_TIMESTAMP except that it does not accept a precision parameter.

The return value does not change during the transaction. Thus, multiple calls to CURRENT_TIMESTAMP within the same transaction return the same timestamp.

Behavior Type

Stable

Syntax

NOW()

Example

```sql
=> CREATE TABLE t1 (a int, b int);
CREATE TABLE
=> INSERT INTO t1 VALUES (1,2);
  OUTPUT
    -------
    1
  (1 row)
=> SELECT NOW();
  NOW
  --------------
  2016-12-09 13:00:08.74685-05
(1 row)
=> INSERT INTO t1 VALUES (3,4);
  OUTPUT
    -------
    1
  (1 row)
```
=> SELECT NOW();
    NOW
-----------------------------
2016-12-09 13:00:08.74685-05
(1 row)
=> COMMIT;
COMMIT
dbadmin=> SELECT NOW();
    NOW
-----------------------------
2016-12-09 13:01:31.420624-05
(1 row)

OVERLAPS

Evaluates two time periods and returns true when they overlap, false otherwise.

Behavior Type

- **Stable** when TIMESTAMP and TIMESTAMPTZ are both used, or when TIMESTAMPTZ is used with INTERVAL
- **Immutable** otherwise

Syntax

\[(\text{start, end}) \text{ OVERLAPS} (\text{start, end})\]  
\[(\text{start, interval}) \text{ OVERLAPS} (\text{start, interval})\]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start</td>
<td>DATE, TIME, or TIMESTAMP/TIMESTAMPTZ value that specifies the beginning of a time period.</td>
</tr>
<tr>
<td>end</td>
<td>DATE, TIME, or TIMESTAMP/TIMESTAMPTZ value that specifies the end of a time period.</td>
</tr>
<tr>
<td>interval</td>
<td>Value that specifies the length of the time period.</td>
</tr>
</tbody>
</table>
Examples

Evaluate whether date ranges Feb 16 - Dec 21, 2016 and Oct 10 2008 - Oct 3 2016 overlap:

```
=> SELECT (DATE '2016-02-16', DATE '2016-12-21') OVERLAPS (DATE '2008-10-30', DATE '2016-10-30');
overlaps
---------
t
(1 row)
```

Evaluate whether date ranges Feb 16 - Dec 21, 2016 and Jan 01 - Oct 30 2008 - Oct 3, 2016 overlap:

```
=> SELECT (DATE '2016-02-16', DATE '2016-12-21') OVERLAPS (DATE '2008-01-30', DATE '2008-10-30');
overlaps
---------
f
(1 row)
```

Evaluate whether date range Feb 02 2016 + 1 week overlaps with date range Oct 16 2016 - 8 months:

```
=> SELECT (DATE '2016-02-16', INTERVAL '1 week') OVERLAPS (DATE '2016-10-16', INTERVAL '-8 months');
overlaps
---------
t
(1 row)
```

QUARTER

Returns calendar quarter of the specified date as an integer, where the January-March quarter is 1.

Syntax

```
QUARTER ( date )
```

Behavior Type

- **Immutable** if the specified date is a TIMESTAMP, DATE, or VARCHAR.
- **Stable** if the specified date is a TIMESTAMPTZ
Parameters

<table>
<thead>
<tr>
<th>date</th>
<th>The date to process, one of the following data types:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- VARCHAR</td>
</tr>
<tr>
<td></td>
<td>- DATE</td>
</tr>
<tr>
<td></td>
<td>- TIMESTAMP</td>
</tr>
<tr>
<td></td>
<td>- TIMESTAMPTZ</td>
</tr>
</tbody>
</table>

Examples

```sql
=> SELECT QUARTER (TIMESTAMP 'sep 22, 2011 12:34');
QUARTER
--------
3
(1 row)
```

ROUND

Rounds the specified date or time. If you omit the precision argument, ROUND rounds to day (DD) precision.

Behavior Type

- **Immutable** if the target date is a TIMESTAMP or DATE
- **Stable** if the target date is a TIMESTAMPTZ

Syntax

```
ROUND( rounding-target[, 'precision'] )
```

Parameters

```
rounding-target | An expression that evaluates to one of the following data types:
```
### precision

A string constant that specifies precision for the rounded value, one of the following:

- **Century**: CC | SCC
- **Year**: SYYY | YYYY | YEAR | YYY | YY | Y
- **ISO Year**: IYYY | IYY | IY | I
- **Quarter**: Q
- **Month**: MONTH | MON | MM | RM
- **Same weekday as first day of year**: WW
- **Same weekday as first day of ISO year**: IW
- **Same weekday as first day of month**: W
- **Day** (default): DDD | DD | J
- **First weekday**: DAY | DY | D
- **Hour**: HH | HH12 | HH24
- **Minute**: MI
- **Second**: SS

**Note:**

Hour, minute, and second rounding is not supported by DATE expressions.

### Examples

Round to the nearest hour:

```sql
=> SELECT ROUND(CURRENT_TIMESTAMP, 'HH');

ROUND
---------------------
2016-04-28 15:00:00
(1 row)
```

Round to the nearest month:

```sql
=> SELECT ROUND('9-22-2011 12:34:00'::TIMESTAMP, 'MM');

ROUND
---------------------
2011-10-01 00:00:00
(1 row)
```
See Also
TIMESTAMP_ROUND

SECOND

Returns the seconds portion of the specified date as an integer.

Syntax
SECOND ( date )

Behavior Type
Immutable, except for TIMESTAMPTZ arguments where it is stable.

Parameters

<table>
<thead>
<tr>
<th>date</th>
<th>The date to process, one of the following data types:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• VARCHAR</td>
</tr>
<tr>
<td></td>
<td>• TIMESTAMP</td>
</tr>
<tr>
<td></td>
<td>• TIMESTAMPTZ</td>
</tr>
<tr>
<td></td>
<td>• INTERVAL</td>
</tr>
</tbody>
</table>

Examples

=> SELECT SECOND ('23:34:03.456789');
SECOND
-------
  3 (1 row)
=> SELECT SECOND (TIMESTAMP 'sep 22, 2011 12:34');
SECOND
-------
  0 (1 row)
=> SELECT SECOND (INTERVAL '35 12:34:03.456789');
STATEMENT_TIMESTAMP

Similar to TRANSACTION_TIMESTAMP, returns a value of type TIMESTAMP WITH TIME ZONE that represents the start of the current statement.

The return value does not change during statement execution. Thus, different stages of statement execution always have the same timestamp.

Behavior Type

Stable

Syntax

STATEMENT_TIMESTAMP()

Example

```sql
=> SELECT foo, bar FROM (SELECT STATEMENT_TIMESTAMP() AS foo)foo, (SELECT STATEMENT_TIMESTAMP() as bar)bar;

 foo | bar
-----------------------+-----------------------

(1 row)
```

See Also

- CLOCK_TIMESTAMP
- TRANSACTION_TIMESTAMP
SYSDATE

Returns the current statement's start date and time as a TIMESTAMP value. This function is identical to GETDATE.

SYSDATE uses the date and time supplied by the operating system on the server to which you are connected, which is the same across all servers. Internally, GETDATE converts STATEMENT_TIMESTAMP from TIMESTAMPTZ to TIMESTAMP.

Behavior Type

Stable

Syntax

SYSDATE()

Note:
You can call this function with no parentheses.

Example

```sql
=> SELECT SYSDATE;
sysdate
-------------------
2016-12-12 06:11:10.699642
(1 row)
```

See Also

Date/Time Expressions

TIME_SLICE

Aggregates data by different fixed-time intervals and returns a rounded-up input TIMESTAMP value to a value that corresponds with the start or end of the time slice interval.
Given an input TIMESTAMP value such as 2000-10-28 00:00:01, the start time of a 3-second time slice interval is 2000-10-28 00:00:00, and the end time of the same time slice is 2000-10-28 00:00:03.

### Behavior Type

Immutable

### Syntax

```sql
TIME_SLICE( expression, slice-length [, 'time-unit' [, 'start-or-end' ] ] )
```

### Parameters

<table>
<thead>
<tr>
<th><code>expression</code></th>
<th>One of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Column of type TIMESTAMP</td>
</tr>
<tr>
<td></td>
<td>• String constant that can be parsed into a TIMESTAMP value. For example:</td>
</tr>
<tr>
<td></td>
<td>'2004-10-19 10:23:54'</td>
</tr>
<tr>
<td>Vertica evaluates <code>expression</code> on each row.</td>
<td></td>
</tr>
</tbody>
</table>

| `slice-length` | A positive integer that specifies the slice length. |

<table>
<thead>
<tr>
<th><code>time-unit</code></th>
<th>Time unit of the slice, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• HOUR</td>
</tr>
<tr>
<td></td>
<td>• MINUTE</td>
</tr>
<tr>
<td></td>
<td>• SECOND (default)</td>
</tr>
<tr>
<td></td>
<td>• MILLISECOND</td>
</tr>
<tr>
<td></td>
<td>• MICROSECOND</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><code>start-or-end</code></th>
<th>Specifies whether the returned value corresponds to the start or end time with one of the following strings:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• START (default)</td>
</tr>
<tr>
<td></td>
<td>• END</td>
</tr>
</tbody>
</table>

**Note:**

This parameter can be included only if you also supply a non-
Null Argument Handling

TIME_SLICE handles null arguments as follows:

- TIME_SLICE returns an error when any one of slice-length, time-unit, or start-or-end parameters is null.
- If expression is null and slice-length, time-unit, or start-or-end contain legal values, TIME_SLICE returns a NULL value instead of an error.

Usage

The following command returns the (default) start time of a 3-second time slice:

```
=> SELECT TIME_SLICE('2009-09-19 00:00:01', 3);
   TIME_SLICE
---------------
  2009-09-19 00:00:00
(1 row)
```

The following command returns the end time of a 3-second time slice:

```
=> SELECT TIME_SLICE('2009-09-19 00:00:01', 3, 'SECOND', 'END');
   TIME_SLICE
---------------
  2009-09-19 00:00:03
(1 row)
```

This command returns results in milliseconds, using a 3-second time slice:

```
=> SELECT TIME_SLICE('2009-09-19 00:00:01', 3, 'ms');
   TIME_SLICE
---------------
  2009-09-19 00:00:00.999
(1 row)
```

This command returns results in microseconds, using a 9-second time slice:

```
=> SELECT TIME_SLICE('2009-09-19 00:00:01', 3, 'us');
   TIME_SLICE
---------------
  2009-09-19 00:00:00.999999
(1 row)
```
The next example uses a 3-second interval with an input value of '00:00:01'. To focus specifically on seconds, the example omits date, though all values are implied as being part of the timestamp with a given input of '00:00:01':

- '00:00:00' is the start of the 3-second time slice
- '00:00:03' is the end of the 3-second time slice.
- '00:00:03' is also the start of the second 3-second time slice. In time slice boundaries, the end value of a time slice does not belong to that time slice; it starts the next one.

When the time slice interval is not a factor of 60 seconds, such as a given slice length of 9 in the following example, the slice does not always start or end on 00 seconds:

```sql
=> SELECT TIME_SLICE('2009-02-14 20:13:01', 9);
TIME_SLICE
-----------------
2009-02-14 20:12:54
(1 row)
```

This is expected behavior, as the following properties are true for all time slices:

- Equal in length
- Consecutive (no gaps between them)
- Non-overlapping

To force the above example ('2009-02-14 20:13:01') to start at '2009-02-14 20:13:00', adjust the output timestamp values so that the remainder of 54 counts up to 60:

```sql
=> SELECT TIME_SLICE('2009-02-14 20:13:01', 9) + '6 seconds'::INTERVAL AS time;
-----------------
2009-02-14 20:13:06
(1 row)
```
Alternatively, you could use a different slice length, which is divisible by 60, such as 5:

```sql
=> SELECT TIME_SLICE('2009-02-14 20:13:01', 5);
   TIME_SLICE
  ===============
     2009-02-14 20:13:00
(1 row)
```

A TIMESTAMPTZ value is implicitly cast to TIMESTAMP. For example, the following two statements have the same effect.

```sql
=> SELECT TIME_SLICE('2009-09-23 11:12:01':timestamptz, 3);
   TIME_SLICE
  ===============
     2009-09-23 11:12:00
(1 row)
```

```sql
=> SELECT TIME_SLICE('2009-09-23 11:12:01':timestamptz::timestamp, 3);
   TIME_SLICE
  ===============
     2009-09-23 11:12:00
(1 row)
```

**Examples**

You can use the SQL analytic functions `FIRST_VALUE` and `LAST_VALUE` to find the first/last price within each time slice group (set of rows belonging to the same time slice). This structure can be useful if you want to sample input data by choosing one row from each time slice group.

```sql
=> SELECT date_key, transaction_time, sales_dollar_amount, TIME_SLICE(DATE '2000-01-01' + date_key + transaction_time, 3),
   FIRST_VALUE(sales_dollar_amount)
OVER (PARTITION BY TIME_SLICE(DATE '2000-01-01' + date_key + transaction_time, 3)
   ORDER BY DATE '2000-01-01' + date_key + transaction_time) AS first_value
FROM store.store_sales_fact
LIMIT 20;
```

<table>
<thead>
<tr>
<th>date_key</th>
<th>transaction_time</th>
<th>sales_dollar_amount</th>
<th>time_slice</th>
<th>first_value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>00:41:16</td>
<td>164</td>
<td>2000-01-02 00:41:15</td>
<td>164</td>
</tr>
<tr>
<td>1</td>
<td>00:41:33</td>
<td>310</td>
<td>2000-01-02 00:41:33</td>
<td>310</td>
</tr>
<tr>
<td>1</td>
<td>15:33:15</td>
<td>419</td>
<td>2000-01-02 15:33:15</td>
<td>419</td>
</tr>
<tr>
<td>1</td>
<td>15:33:44</td>
<td>193</td>
<td>2000-01-02 15:33:42</td>
<td>193</td>
</tr>
<tr>
<td>1</td>
<td>16:36:29</td>
<td>466</td>
<td>2000-01-02 16:36:27</td>
<td>466</td>
</tr>
</tbody>
</table>
TIME_SLICE rounds the transaction time to the 3-second slice length.

The following example uses the analytic (window) OVER clause to return the last trading price (the last row ordered by TickTime) in each 3-second time slice partition:

```sql
=> SELECT DISTINCT TIME_SLICE(TickTime, 3), LAST_VALUE(price)OVER (PARTITION BY TIME_SLICE (TickTime, 3) ORDER BY TickTime ROWS BETWEEN UNBOUNDED PRECEDING AND UNBOUNDED FOLLOWING);
```

**Note:**
If you omit the windowing clause from an analytic clause, LAST_VALUE defaults to RANGE BETWEEN UNBOUNDED PRECEDING AND CURRENT ROW. Results can seem non-intuitive, because instead of returning the value from the bottom of the current partition, the function returns the bottom of the window, which continues to change along with the current input row that is being processed. For more information, see Time Series Analytics and SQL Analytics in Analyzing Data.

In the next example, FIRST_VALUE is evaluated once for each input record and the data is sorted by ascending values. Use SELECT DISTINCT to remove the duplicates and return only one output record per TIME_SLICE:

```sql
=> SELECT DISTINCT TIME_SLICE(TickTime, 3), FIRST_VALUE(price)OVER (PARTITION BY TIME_SLICE (TickTime, 3) ORDER BY TickTime ASC) FROM tick_store;
```

<table>
<thead>
<tr>
<th>TIME_SLICE</th>
<th>?column?</th>
</tr>
</thead>
<tbody>
<tr>
<td>2009-09-21 00:00:06</td>
<td>20.00</td>
</tr>
<tr>
<td>2009-09-21 00:00:09</td>
<td>30.00</td>
</tr>
<tr>
<td>2009-09-21 00:00:00</td>
<td>10.00</td>
</tr>
</tbody>
</table>

(3 rows)
The information output by the above query can also return MIN, MAX, and AVG of the trading prices within each time slice.

```sql
=> SELECT DISTINCT TIME_SLICE(TickTime, 3), FIRST_VALUE(Price) OVER (PARTITION BY TIME_SLICE (TickTime, 3))
    ORDER BY TickTime ASC,
    MIN(price) OVER (PARTITION BY TIME_SLICE(TickTime, 3)),
    MAX(price) OVER (PARTITION BY TIME_SLICE(TickTime, 3)),
    AVG(price) OVER (PARTITION BY TIME_SLICE(TickTime, 3))
FROM tick_store;
```

- TS_LAST_VALUE
- Using Time Zones With Vertica

### TIMEOFDAY

Returns the wall-clock time as a text string. Function results advance during transactions.

### Behavior Type

**Volatile**

### Syntax

```
TIMEOFDAY()
```

### Example

```sql
=> SELECT TIMEOFDAY();
   TIMEOFDAY
--------------------------
Mon Dec 12 08:18:01.022710 2016 EST
(1 row)
```
**TIMESTAMPADD**

Adds the specified number of intervals to a TIMESTAMP or TIMESTAMPTZ value and returns a result of the same data type.

**Behavior Type**

- **Immutable** if the input date is a TIMESTAMP
- **Stable** if the input date is a TIMESTAMPTZ

**Syntax**

```
TIMESTAMPADD ( datepart, count, start-date );
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| datepart  | Specifies the type of time intervals that TIMESTAMPADD adds to the specified start date. If `datepart` is an expression, it must be enclosed in parentheses: `TIMESTAMPADD( (expression), interval, start);`
| count     | Integer or integer expression that specifies the number of `datepart` intervals to add to `start-date`. |
| start-date| TIMESTAMP or TIMESTAMPTZ value. |
Examples

Add two months to the current date:

```sql
=> SELECT CURRENT_TIMESTAMP AS Today;
   Today
   -----------------------------
   2016-05-02 06:56:57.923045-04
   (1 row)

=> SELECT TIMESTAMPADD(MONTH, 2, (CURRENT_TIMESTAMP)) AS TodayPlusTwoMonths;
   TodayPlusTwoMonths
   -----------------------------
   2016-07-02 06:56:57.923045-04
   (1 row)
```

Add 14 days to the beginning of the current month:

```sql
=> SELECT TIMESTAMPADD(DAY, 14, (SELECT TRUNC((CURRENT_TIMESTAMP), 'MM')));
   timestampadd
   -----------------------------
   2016-05-15 00:00:00
   (1 row)
```

TIMESTAMPDIFF

Returns the time span between two TIMESTAMP or TIMESTAMPTZ values, in the intervals specified. TIMESTAMPDIFF excludes the start date in its calculation.

Behavior Type

- **Immutable** if start and end dates are TIMESTAMP
- **Stable** if start and end dates are TIMESTAMPTZ

Syntax

```
TIMESTAMPDIFF ( datepart, start, end );
```

Parameters

| datepart  | Specifies the type of date or time intervals that TIMESTAMPDIFF returns. If |
**Date Part Intervals**

TIMESTAMPDIFF uses the `datepart` argument to calculate the number of intervals between two dates, rather than the actual amount of time between them. For detailed information, see [DATEDIFF](#).

### Examples

```sql
=> SELECT TIMESTAMPDIFF(YEAR,'1-1-2006 12:34:00', '1-1-2008 12:34:00');
timestampdiff
--------------
    2
(1 row)
```

### See Also

[DATEDIFF](#)
TIMESTAMP_ROUND

Rounds the specified TIMESTAMP. If you omit the precision argument, TIMESTAMP_ROUND rounds to day (DD) precision.

Behavior Type

- **Immutable** if the target date is a TIMESTAMP
- **Stable** if the target date is a TIMESTAMPTZ

Syntax

TIMESTAMP_ROUND ( rounding-target[, 'precision'] )

Parameters

<table>
<thead>
<tr>
<th>rounding-target</th>
<th>An expression that evaluates to one of the following data types:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>TIMESTAMP/TIMESTAMPTZ</td>
</tr>
<tr>
<td></td>
<td>TIMESTAMPTZ</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>precision</th>
<th>A string constant that specifies precision for the rounded value, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Century: CC</td>
</tr>
<tr>
<td></td>
<td>Year: SYYY</td>
</tr>
<tr>
<td></td>
<td>ISO Year: IYYYY</td>
</tr>
<tr>
<td></td>
<td>Quarter: Q</td>
</tr>
<tr>
<td></td>
<td>Month: MONTH</td>
</tr>
<tr>
<td></td>
<td>Same weekday as first day of year: WW</td>
</tr>
<tr>
<td></td>
<td>Same weekday as first day of ISO year: IW</td>
</tr>
<tr>
<td></td>
<td>Same weekday as first day of month: W</td>
</tr>
<tr>
<td></td>
<td>Day (default): DDD</td>
</tr>
<tr>
<td></td>
<td>First weekday: DAY</td>
</tr>
<tr>
<td></td>
<td>Hour: HH</td>
</tr>
<tr>
<td></td>
<td>Minute: MI</td>
</tr>
<tr>
<td></td>
<td>Second: SS</td>
</tr>
</tbody>
</table>
**Note:**
Hour, minute, and second rounding is not supported by DATE expressions.

## Examples

### Round to the nearest hour:

```sql
=> SELECT TIMESTAMP_ROUND(CURRENT_TIMESTAMP, 'HH');
```

```
2016-04-28 15:00:00
(1 row)
```

### Round to the nearest month:

```sql
=> SELECT TIMESTAMP_ROUND('9-22-2011 12:34:00':TIMESTAMP, 'MM');
```

```
2011-10-01 00:00:00
(1 row)
```

## See Also

ROUND

TIMESTAMP_TRUNC

Truncates the specified TIMESTAMP. If you omit the precision argument, TIMESTAMP_TRUNC truncates to day (DD) precision.

### Behavior Type

- **Immutable** if the target date is a TIMESTAMP
- **Stable** if the target date is a TIMESTAMPTZ

### Syntax

```sql
TIMESTAMP_TRUNC( trunc-target[, 'precision'] )
```
Parameters

<table>
<thead>
<tr>
<th>trunc-target</th>
<th>An expression that evaluates to one of the following data types:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• TIMESTAMP/TIMESTAMPTZ</td>
</tr>
<tr>
<td></td>
<td>• TIMESTAMPTZ</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>precision</th>
<th>A string constant that specifies precision for the truncated value, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Century: CC</td>
</tr>
<tr>
<td></td>
<td>• Year: SYYY</td>
</tr>
<tr>
<td></td>
<td>• ISO Year: IYYY</td>
</tr>
<tr>
<td></td>
<td>• Quarter: Q</td>
</tr>
<tr>
<td></td>
<td>• Month: MONTH</td>
</tr>
<tr>
<td></td>
<td>• Same weekday as first day of year: WW</td>
</tr>
<tr>
<td></td>
<td>• Same weekday as first day of ISO year: IW</td>
</tr>
<tr>
<td></td>
<td>• Same weekday as first day of month: W</td>
</tr>
<tr>
<td></td>
<td>• Day: DDD</td>
</tr>
<tr>
<td></td>
<td>• First weekday: DAY</td>
</tr>
<tr>
<td></td>
<td>• Hour: HH</td>
</tr>
<tr>
<td></td>
<td>• Minute: MI</td>
</tr>
<tr>
<td></td>
<td>• Second: SS</td>
</tr>
</tbody>
</table>

Note: Hour, minute, and second truncating is not supported by DATE expressions.

Examples

Truncate to the current hour:

```sql
=> SELECT TIMESTAMP_TRUNC(CURRENT_TIMESTAMP, 'HH');
TIMESTAMP_TRUNC
-----------------------
2016-04-29 08:00:00
(1 row)
```

Truncate to the month:

```sql
=> SELECT TIMESTAMP_TRUNC('9-22-2011 12:34:00'::TIMESTAMP, 'MM');
TIMESTAMP_TRUNC
```

Note: Hour, minute, and second truncating is not supported by DATE expressions.
See Also

TRUNC

TRANSACTION_TIMESTAMP

Returns a value of type TIME WITH TIMEZONE that represents the start of the current transaction.

The return value does not change during the transaction. Thus, multiple calls to TRANSACTION_TIMESTAMP within the same transaction return the same timestamp.

TRANSACTION_TIMESTAMP is equivalent to CURRENT_TIMESTAMP, except it does not accept a precision parameter.

Behavior Type

Stable

Syntax

TRANSACTION_TIMESTAMP()

Example

```sql
=> SELECT foo, bar FROM (SELECT TRANSACTION_TIMESTAMP() AS foo) foo, (SELECT TRANSACTION_TIMESTAMP() as bar) bar;

<table>
<thead>
<tr>
<th>foo</th>
<th>bar</th>
</tr>
</thead>
<tbody>
<tr>
<td>foo</td>
<td>bar</td>
</tr>
<tr>
<td>2016-12-12 08:18:00.988528-05</td>
<td>2016-12-12 08:18:00.988528-05</td>
</tr>
</tbody>
</table>

(1 row)
```
See Also

- CLOCK_TIMESTAMP
- STATEMENT_TIMESTAMP

TRUNC

Truncates the specified date or time. If you omit the precision argument, TRUNC truncates to day (DD) precision.

Behavior Type

- **Immutable** if the target date is a TIMESTAMP or DATE
- **Stable** if the target date is a TIMESTAMPTZ

Syntax

```
TRUNC( trunc-target[, 'precision'] )
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>trunc-target</strong></td>
<td>An expression that evaluates to one of the following data types:</td>
</tr>
<tr>
<td></td>
<td>- DATE</td>
</tr>
<tr>
<td></td>
<td>- TIMESTAMP/TIMESTAMPTZ</td>
</tr>
<tr>
<td></td>
<td>- TIMESTAMPTZ</td>
</tr>
<tr>
<td><strong>precision</strong></td>
<td>A string constant that specifies precision for the truncated value, one of</td>
</tr>
<tr>
<td></td>
<td>the following:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Century</strong>: CC</td>
</tr>
<tr>
<td></td>
<td>- <strong>Year</strong>: SYYY</td>
</tr>
<tr>
<td></td>
<td>- <strong>ISO Year</strong>: IYYYY</td>
</tr>
<tr>
<td></td>
<td>- <strong>Quarter</strong>: Q</td>
</tr>
<tr>
<td></td>
<td>- <strong>Month</strong>: MONTH</td>
</tr>
<tr>
<td></td>
<td>- <strong>Same weekday as first day of year</strong>: WW</td>
</tr>
</tbody>
</table>
### Examples

Truncate to the current hour:

```sql
=> SELECT TRUNC(CURRENT_TIMESTAMP, 'HH');
TRUNC
-------------------
2016-04-29 10:00:00
(1 row)
```

Truncate to the month:

```sql
=> SELECT TRUNC('9-22-2011 12:34:00'::TIMESTAMP, 'MM');
TIMESTAMP TRUNC
-------------------
2011-09-01 00:00:00
(1 row)
```

### See Also

**TIMESTAMP_TRUNC**

**WEEK**

Returns the week of the year for the specified date as an integer, where the first week begins on the first Sunday on or preceding January 1.
**Syntax**

\[ \text{WEEK} \left( \text{date} \right) \]

**Behavior Type**

- **Immutable** if the specified date is a `TIMESTAMP`, `DATE`, or `VARCHAR`
- **Stable** if the specified date is a `TIMESTAMPTZ`

**Parameters**

<table>
<thead>
<tr>
<th>date</th>
<th>The date to process, one of the following data types:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- <code>VARCHAR</code></td>
</tr>
<tr>
<td></td>
<td>- <code>DATE</code></td>
</tr>
<tr>
<td></td>
<td>- <code>TIMESTAMP</code></td>
</tr>
<tr>
<td></td>
<td>- <code>TIMESTAMPTZ</code></td>
</tr>
</tbody>
</table>

**Examples**

January 2 is on Saturday, so \text{WEEK} returns 1:

```
=> SELECT \text{WEEK} ('1-2-2016'::DATE);
\text{WEEK} \\
----- \\
1 \\
(1 row)
```

January 3 is the second Sunday in 2016, so \text{WEEK} returns 2:

```
=> SELECT \text{WEEK} ('1-3-2016'::DATE);
\text{WEEK} \\
----- \\
2 \\
(1 row)
```
WEEK_ISO

Returns the week of the year for the specified date as an integer, where the first week starts on Monday and contains January 4. This function conforms with the ISO 8061 standard.

Syntax

WEEK_ISO ( date )

Behavior Type

- **Immutable** if the specified date is a TIMESTAMP, DATE, or VARCHAR
- **Stable** if the specified date is a TIMESTAMPTZ

Parameters

<table>
<thead>
<tr>
<th>date</th>
<th>The date to process, one of the following data types:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• VARCHAR</td>
</tr>
<tr>
<td></td>
<td>• DATE</td>
</tr>
<tr>
<td></td>
<td>• TIMESTAMP</td>
</tr>
<tr>
<td></td>
<td>• TIMESTAMPTZ</td>
</tr>
</tbody>
</table>

Examples

The first week of 2016 begins on Monday January 4:

```
=> SELECT WEEK_ISO ('1-4-2016':DATE);
WEEK_ISO
--------
   1
(1 row)
```

January 3 2016 returns week 53 of the previous year (2015):

```
=> SELECT WEEK_ISO ('1-3-2016':DATE);
WEEK_ISO
--------
    1
(1 row)
```
In 2015, January 4 is on Sunday, so the first week of 2015 begins on the preceding Monday (December 29 2014):

```
=> SELECT WEEK_ISO ('12-29-2014'::DATE);
WEEK_ISO
--------
1
(1 row)
```

### YEAR

Returns an integer that represents the year portion of the specified date.

**Syntax**

```
YEAR( date )
```

**Behavior Type**

- **Immutable** if the specified date is a TIMESTAMP, DATE, VARCHAR, or INTERVAL
- **Stable** if the specified date is a TIMESTAMPTZ

**Parameters**

<table>
<thead>
<tr>
<th>date</th>
<th>The date to process, one of the following data types:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- VARCHAR</td>
</tr>
<tr>
<td></td>
<td>- DATE</td>
</tr>
<tr>
<td></td>
<td>- TIMESTAMP</td>
</tr>
<tr>
<td></td>
<td>- TIMESTAMPTZ</td>
</tr>
<tr>
<td></td>
<td>- INTERVAL</td>
</tr>
</tbody>
</table>
Examples

```sql
=> SELECT YEAR(CURRENT_DATE::DATE);
YEAR
-----
2016
(1 row)
```

See Also

YEAR_ISO

YEAR_ISO

Returns an integer that represents the year portion of the specified date. The return value is based on the ISO 8061 standard.

The first week of the ISO year is the week that contains January 4.

Syntax

```sql
YEAR_ISO ( date )
```

Behavior Type

- **Immutable** if the specified date is a TIMESTAMP, DATE, or VARCHAR
- **Stable** if the specified date is a TIMESTAMPTZ

Parameters

<table>
<thead>
<tr>
<th><code>date</code></th>
<th>The date to process, one of the following data types:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>VARCHAR</strong></td>
</tr>
<tr>
<td></td>
<td><strong>DATE</strong></td>
</tr>
<tr>
<td></td>
<td><strong>TIMESTAMP</strong></td>
</tr>
<tr>
<td></td>
<td><strong>TIMESTAMPTZ</strong></td>
</tr>
</tbody>
</table>
Examples

```sql
> SELECT YEAR_ISO(CURRENT_DATE::DATE);
YEAR_ISO
--------
 2016
(1 row)
```

See Also

YEAR

Error-handling Functions

Error-handling functions take a string and return the string when the query is executed.

THROW_ERROR

Returns a user-defined error message.

In a multi-node cluster, race conditions might cause the order of error messages to differ.

Behavior Type

Immutable

Syntax

`THROW_ERROR ( message )`

Parameters

| message | The VARCHAR string to return. |
Examples

Return an error message when a CASE statement is met:

```sql
=> CREATE TABLE pitcher_err (some_text varchar);
CREATE TABLE
=> COPY pitcher_err FROM STDIN;
Enter data to be copied followed by a newline.
> big foo value
> bigger foo other value
> bar another foo value
> .
=> SELECT (CASE WHEN true THEN THROW_ERROR('Failure!!!') ELSE some_text END) FROM pitcher_err;
ERROR 7137: USER GENERATED ERROR: Failure!!!
```

Return an error message when a CASE statement using REGEXP_LIKE is met:

```sql
=> SELECT (CASE WHEN REGEXP_LIKE(some_text, 'other') THEN THROW_ERROR('Failure at "'|| some_text
|| ''"') ELSE some_text END) FROM pitcher_err;
ERROR 4566: USER GENERATED ERROR: Failure at "bar another foo value"
```
Formatting Functions

Formatting functions provide a powerful tool set for converting various data types (DATE/TIME, INTEGER, FLOATING POINT) to formatted strings and for converting from formatted strings to specific data types.

TO_BITSTRING

Returns a VARCHAR that represents the given VARBINARY value in bitstring format. This function is the inverse of BITSTRING_TO_BINARY.

Behavior Type

Immutable

Syntax

TO_BITSTRING (expression)

Parameters

| expression | The VARCHAR string to process. |

Examples

```sql
=> SELECT TO_BITSTRING('ab':BINARY(2));
    to_bitstring
------------------------
   0110000101100010
(1 row)

=> SELECT TO_BITSTRING(HEX_TO_BINARY('0x10'));
    to_bitstring
------------------------
    00010000
(1 row)
```
SELECT TO_BITSTRING(HEX_TO_BINARY('0xF0'));

```plaintext
to_bitstring
-----------------
11110000
(1 row)
```

See Also

BITCOUNT

TO_CHAR

Converts date/time and numeric values into text strings.

Behavior Type

Stable

Syntax

TO_CHAR ( expression [, pattern ] )

Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>Specifies the value to convert, one of the following data types:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• DOUBLE PRECISION</td>
</tr>
<tr>
<td></td>
<td>• INTEGER</td>
</tr>
<tr>
<td></td>
<td>• INTERVAL</td>
</tr>
<tr>
<td></td>
<td>• TIME/TIMETZ</td>
</tr>
<tr>
<td></td>
<td>• TIMESTAMP/TIMESTAMPTZ</td>
</tr>
</tbody>
</table>

The following restrictions apply:

- TO_CHAR does not support binary data types BINARY and VARBINARY
- TO_CHAR does not support the use of V combined with a decimal point—for example, 99.9V99
**Notes**

- Vertica pads TO_CHAR output with a leading space, so positive and negative values have the same length. To suppress padding, use the FM prefix.

- TO_CHAR accepts TIME and TIMETZ data types as inputs if you explicitly cast TIME to TIMESTAMP and TIMETZ to TIMESTAMPTZ.

  ```sql
  => SELECT TO_CHAR(TIME '14:34:06.4','HH12:MI am'), TO_CHAR(TIMETZ '14:34:06.4+6','HH12:MI am');
  TO_CHAR | TO_CHAR
  ---------------
  02:34 pm | 04:34 am
  (1 row)
  ```

- You can extract the timezone hour from TIMETZ:

  ```sql
  => SELECT EXTRACT(timezone_hour FROM TIMETZ '10:30+13:30');
  date_part
  ------------
  13
  (1 row)
  ```

- Ordinary text is allowed in TO_CHAR templates and is output literally. You can put a substring in double quotes to force it to be interpreted as literal text even if it contains pattern key words. In the following example, YYYY is replaced by the year data, but the Y in Year is not:

  ```sql
  => SELECT to_char(CURRENT_TIMESTAMP, '"Hello Year " YYYY');
  to_char
  ------------
  Hello Year 2021
  (1 row)
  ```

- TO_CHAR uses different day-of-the-week numbering (see the D template pattern) than EXTRACT.

- Given an INTERVAL type, TO_CHAR formats HH and HH12 as hours in a single day, while HH24 can output hours exceeding a single day—for example, >24.

- To include a double quote (";) character in output, precede it with a double backslash
This is necessary because the backslash already has a special meaning in a string constant. For example:

```
"YYYY Month"
```

- When rounding, the last digit of the rounded representation is selected to be even if the number is exactly half way between the two.

## Examples

<table>
<thead>
<tr>
<th>TO_CHAR expression and pattern argument</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>CURRENT_TIMESTAMP, 'Day, DD HH12:MI:SS'</td>
<td>Tuesday, 06 05:39:18</td>
</tr>
<tr>
<td>CURRENT_TIMESTAMP, 'FMDay, FMDD HH12:MI:SS'</td>
<td>Tuesday, 6 05:39:18</td>
</tr>
<tr>
<td>TIMETZ '14:34:06.4+6','HH12:MI am'</td>
<td>04:34 am</td>
</tr>
<tr>
<td>-0.1, '99.99'</td>
<td>-.10</td>
</tr>
<tr>
<td>-0.1, 'FM9.99'</td>
<td>-.1</td>
</tr>

<td>3 days 00:16:40.333</td>
</tr>
</tbody>
</table>
See Also

DATE_PART

TO_DATE

Converts a string value to a DATE type.

Behavior Type

Stable

Syntax

TO_DATE ( expression, pattern )

Parameters

| expression | Specifies the string value to convert, either CHAR or VARCHAR. |
| pattern    | A CHAR or VARCHAR that specifies an output pattern string. See: |
|            | - Template Patterns for Date/Time Formatting |
|            | - Template Patterns for Numeric Formatting |

Input Value Considerations

TO_DATE requires a CHAR or VARCHAR expression. For other input types, use TO_CHAR to perform an explicit cast to a CHAR or VARCHAR before using this function.
Notes

- To use a double quote character in the output, precede it with a double backslash. This is necessary because the backslash already has a special meaning in a string constant. For example: '\"YYYY Month\"'

- TO_TIMESTAMP, TO_TIMESTAMP_TZ, and TO_DATE skip multiple blank spaces in the input string if the FX option is not used. FX must be specified as the first item in the template. For example:
  - TO_TIMESTAMP('2000 JAN', 'YYYY MON') is correct.
  - TO_TIMESTAMP('2000 JAN', 'FXYYYY MON') returns an error, because TO_TIMESTAMP expects one space only.

- The YYYY conversion from string to TIMESTAMP or DATE has a restriction if you use a year with more than four digits. You must use a non-digit character or template after YYYY, otherwise the year is always interpreted as four digits. For example, given the following arguments, TO_DATE interprets the five-digit year 20000 as a four-digit year:

  ```sql
  => SELECT TO_DATE('200001131','YYYYMMDD');
  TO_DATE
  2000-01-13
  (1 row)
  ```

  Instead, use a non-digit separator after the year. For example:

  ```sql
  => SELECT TO_DATE('20000-131','YYYY-MMDD');
  TO_DATE
  20000-12-01
  (1 row)
  ```

- In conversions from string to TIMESTAMP or DATE, the CC field is ignored if there is a YYY, YYYY or Y,YYY field. If CC is used with YY or Y, then the year is computed as (CC–1)*100+YY.

Examples

```sql
=> SELECT TO_DATE('13 Feb 2000', 'DD Mon YYYY');
  TO_DATE
  2000-02-13
  (1 row)
```
**See Also**

Date/Time Functions

**TO_HEX**

Returns a VARCHAR or VARBINARY representing the hexadecimal equivalent of a number. This function is the inverse of [HEX_TO_BINARY](#).

**Behavior Type**

Immutable

**Syntax**

```sql
TO_HEX ( number )
```

**Parameters**

<table>
<thead>
<tr>
<th><code>number</code></th>
<th>An INTEGER or VARBINARY value to convert to hexadecimal. If you supply a VARBINARY argument, the function's return value is not preceded by 0x.</th>
</tr>
</thead>
</table>

**Examples**

```sql
=> SELECT TO_HEX(123456789);
    TO_HEX
----------
    75bcd15
(1 row)
```

For VARBINARY inputs, the returned value is not preceded by 0x. For example:

```sql
=> SELECT TO_HEX('ab':binary(2));
    TO_HEX
----------
    6162
(1 row)
```
TO_TIMESTAMP

Converts a string value or a UNIX/POSIX epoch value to a TIMESTAMP type.

Behavior Type

Stable

Syntax

TO_TIMESTAMP ( { expression, pattern } | unix-epoch )

Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>Specifies the string value to convert, of type CHAR or VARCHAR.</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern</td>
<td>A CHAR or VARCHAR that specifies an output pattern string. See:</td>
</tr>
<tr>
<td></td>
<td>• Template Patterns for Date/Time Formatting</td>
</tr>
<tr>
<td></td>
<td>• Template Patterns for Numeric Formatting</td>
</tr>
<tr>
<td>unix-epoch</td>
<td>DOUBLE PRECISION value that specifies some number of seconds elapsed since midnight UTC of January 1, 1970, excluding leap seconds. INTEGER values are implicitly cast to DOUBLE PRECISION.</td>
</tr>
</tbody>
</table>

Notes

- Millisecond (MS) and microsecond (US) values in a conversion from string to TIMESTAMP are used as part of the seconds after the decimal point. For example TO_TIMESTAMP('12:3', 'SS:MS') is not 3 milliseconds, but 300, because the conversion counts it as 12 + 0.3 seconds. This means for the format SS:MS, the input values 12:3, 12:30, and 12:300 specify the same number of milliseconds. To get three milliseconds, use 12:003, which the conversion counts as 12 + 0.003 = 12.003 seconds.
Here is a more complex example: \( \text{TO\_TIMESTAMP('15:12:02.020.001230', 'HH:MI:SS.MS.US')} \) is 15 hours, 12 minutes, and 2 seconds + 20 milliseconds + 1230 microseconds = 2.021230 seconds.

- To use a double quote character in the output, precede it with a double backslash. This is necessary because the backslash already has a special meaning in a string constant. For example: ' \\"YYYY\ Month\" '  

TO\_TIMESTAMP, TO\_TIMESTAMP\_TZ, and TO\_DATE skip multiple blank spaces in the input string if the FX option is not used. FX must be specified as the first item in the template. For example:

- \( \text{TO\_TIMESTAMP('2000 JUN', 'YYYY MON')} \) is correct.  
- \( \text{TO\_TIMESTAMP('2000 JUN', 'FXYYYY MON')} \) returns an error, because TO\_TIMESTAMP expects one space only.

- The YYYY conversion from string to TIMESTAMP or DATE has a restriction if you use a year with more than four digits. You must use a non-digit character or template after YYYY, otherwise the year is always interpreted as four digits. For example, given the following arguments, TO\_DATE interprets the five-digit year 20000 as a four-digit year:

  => SELECT TO\_DATE('200001131','YYYYMMDD');  
<table>
<thead>
<tr>
<th>TO_DATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>2000-01-13</td>
</tr>
<tr>
<td>(1 row)</td>
</tr>
</tbody>
</table>

Instead, use a non-digit separator after the year. For example:

  => SELECT TO\_DATE('20000-1131', 'YYYY-MMDD');  
<table>
<thead>
<tr>
<th>TO_DATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>20000-12-01</td>
</tr>
<tr>
<td>(1 row)</td>
</tr>
</tbody>
</table>

- In conversions from string to TIMESTAMP or DATE, the CC field is ignored if there is a YYY, YYYY or Y,YYY field. If CC is used with YY or Y, then the year is computed as (CC–1)*100+YY.

**Examples**

  => SELECT TO\_TIMESTAMP('13 Feb 2009', 'DD Mon YYYY');  
<table>
<thead>
<tr>
<th>TO_TIMESTAMP</th>
</tr>
</thead>
<tbody>
<tr>
<td>1200-02-13 00:00:00</td>
</tr>
</tbody>
</table>
See Also

Date/Time Functions

TO_TIMESTAMP_TZ

Converts a string value or a UNIX/POSIX epoch value to a TIMESTAMP WITH TIME ZONE type.

Behavior Type

Immutable if single argument form, Stable otherwise.

Syntax

TO_TIMESTAMP_TZ ( { expression, pattern } | unix-epoch )

Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>Specifies the string value to convert, of type CHAR or VARCHAR.</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern</td>
<td>A CHAR or VARCHAR that specifies an output pattern string. See:</td>
</tr>
<tr>
<td></td>
<td>* Template Patterns for Date/Time Formatting</td>
</tr>
<tr>
<td></td>
<td>* Template Patterns for Numeric Formatting</td>
</tr>
<tr>
<td>unix-epoch</td>
<td>A DOUBLE PRECISION value that specifies some number of seconds</td>
</tr>
<tr>
<td></td>
<td>elapsed since midnight UTC of January 1, 1970, excluding leap</td>
</tr>
<tr>
<td></td>
<td>seconds. INTEGER values are implicitly cast to DOUBLE PRECISION.</td>
</tr>
</tbody>
</table>

(1 row)

=> SELECT TO_TIMESTAMP(200120400);
   TO_TIMESTAMP
   ------------------------
   1976-05-05 01:00:00
(1 row)
Notes

- Millisecond (MS) and microsecond (US) values in a conversion from string to TIMESTAMP are used as part of the seconds after the decimal point. For example TO_TIMESTAMP('12:3', 'SS:MS') is not 3 milliseconds, but 300, because the conversion counts it as 12 + 0.3 seconds. This means for the format SS:MS, the input values 12:3, 12:30, and 12:300 specify the same number of milliseconds. To get three milliseconds, use 12:003, which the conversion counts as 12 + 0.003 = 12.003 seconds.

Here is a more complex example: TO_TIMESTAMP('15:12:02.020.001230', 'HH:MI:SS.MS.US') is 15 hours, 12 minutes, and 2 seconds + 20 milliseconds + 1230 microseconds = 2.021230 seconds.

- To use a double quote character in the output, precede it with a double backslash. This is necessary because the backslash already has a special meaning in a string constant. For example: "\\"YYYY Month\\""

- TO_TIMESTAMP, TO_TIMESTAMP_TZ, and TO_DATE skip multiple blank spaces in the input string if the FX option is not used. FX must be specified as the first item in the template. For example:
  - TO_TIMESTAMP('2000 JUN', 'YYYY MON') is correct.
  - TO_TIMESTAMP('2000 JUN', 'FXYYYY MON') returns an error, because TO_TIMESTAMP expects one space only.

- The YYYY conversion from string to TIMESTAMP or DATE has a restriction if you use a year with more than four digits. You must use a non-digit character or template after YYYY, otherwise the year is always interpreted as four digits. For example, given the following arguments, TO_DATE interprets the five-digit year 20000 as a four-digit year:

  => SELECT TO_DATE('200001131','YYYYMMDD');
  TO_DATE
  --------------
  2000-01-13
  (1 row)

  Instead, use a non-digit separator after the year. For example:

  => SELECT TO_DATE('20000-1131', 'YYYY-MMDD');
  TO_DATE
  --------------
  20000-12-01
In conversions from string to TIMESTAMP or DATE, the CC field is ignored if there is a YYY, YYYY or Y,YYY field. If CC is used with YY or Y, then the year is computed as (CC-1)*100+YY.

**Examples**

```sql
=> SELECT TO_TIMESTAMP_TZ('13 Feb 2009', 'DD Mon YYYY');
 TO_TIMESTAMP_TZ
----------------------
 1200-02-13 00:00:00-05
(1 row)
```

```sql
=> SELECT TO_TIMESTAMP_TZ(200120400);
 TO_TIMESTAMP_TZ
----------------------
 1976-05-05 01:00:00-04
(1 row)
```

**See Also**

Date/Time Functions

**TO_NUMBER**

Converts a string value to DOUBLE PRECISION.

**Behavior Type**

Stable

**Syntax**

`TO_NUMBER ( expression, [ pattern ] )`
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>Specifies the string value to convert, either CHAR or VARCHAR.</td>
</tr>
<tr>
<td>pattern</td>
<td>A string value, either CHAR or VARCHAR, that specifies an output pattern string using one of the supported Template Patterns for Numeric Formatting. If you omit this parameter, TO_NUMBER returns a floating point.</td>
</tr>
</tbody>
</table>

Notes

To use a double quote character in the output, precede it with a double backslash. This is necessary because the backslash already has a special meaning in a string constant. For example: \\
```
'"YYYY  Month"'```

**Note:**
To convert a date string to a numeric value, use the appropriate date/time function, such as EXTRACT.

Examples

```sql
=> SELECT TO_NUMBER('MCML', 'rn');
TO_NUMBER
-------
1950
(1 row)
```

If the pattern parameter is omitted, the function returns a floating point. For example:

```sql
=> SELECT TO_NUMBER('-123.456e-01');
TO_NUMBER
---------
-12.3456
```
Template Patterns for Date/Time Formatting

In an output template string (for TO_CHAR), certain patterns are recognized and replaced with appropriately formatted data from the value to format. Any text that is not a template pattern is copied verbatim. Similarly, in an input template string (for anything other than TO_CHAR), template patterns identify the parts of the input data string to look at and the values to find there.

Note:
Vertica uses the ISO 8601:2004 style for date/time fields in Vertica log files. For example:

```
2020-03-25 05:04:22.372 Init Session:0x7f8fcefec700-a00000013dcd4 [Txn] <INFO> Begin Txn: a00000013dcd4 'read role info'
```

Certain modifiers can be applied to any template pattern to alter its behavior, as described in Template Pattern Modifiers for Date/Time Formatting.

<tr>
<td>Dy</td>
<td>Abbreviated mixed-case day name (3 chars)</td>
</tr>
<tr>
<td>dy</td>
<td>Abbreviated lowercase day name (3 chars)</td>
</tr>
<tr>
<td>DDD</td>
<td>Day of year (001-366)</td>
</tr>
<tr>
<td>DD</td>
<td>Day of month (01-31) for TIMESTAMP</td>
</tr>
</tbody>
</table>

**Note:**
For INTERVAL, DD is day of year (001-366) because day of month is undefined.

<table>
<thead>
<tr>
<th>Pattern</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>D</td>
<td>Day of week (1-7; Sunday is 1)</td>
</tr>
<tr>
<td>W</td>
<td>Week of month (1-5) (The first week starts on the first day of the month.)</td>
</tr>
<tr>
<td>WW</td>
<td>Week number of year (1-53) (The first week starts on the first day of the year.)</td>
</tr>
<tr>
<td>IW</td>
<td>ISO week number of year (The first Thursday of the new year is in week 1.)</td>
</tr>
<tr>
<td>CC</td>
<td>Century (2 digits)</td>
</tr>
<tr>
<td>J</td>
<td>Julian Day (days since January 1, 4712 BC)</td>
</tr>
<tr>
<td>Q</td>
<td>Quarter</td>
</tr>
<tr>
<td>RM</td>
<td>Month in Roman numerals (I-XII; I=January)</td>
</tr>
<tr>
<td>Pattern</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>

<td>Month in Roman numerals (i-xii; i=January) (lowercase)</td>
</tr>
<tr>
<td>TZ</td>
<td>Time-zone name (uppercase)</td>
</tr>
<tr>
<td>tz</td>
<td>Time-zone name (lowercase)</td>
</tr>
</tbody>
</table>

**Examples**

Use `TO_TIMESTAMP` to convert an expression using the pattern `'YYY MON'`:

```sql
=> SELECT TO_TIMESTAMP('2017 JUN', 'YYYY MON');
TO_TIMESTAMP
-------------
2017-06-01 00:00:00
(1 row)
```

Use `TO_DATE` to convert an expression using the pattern `'YYY-MMDD'`:

```sql
=> SELECT TO_DATE('2017-1231', 'YYYY-MMDD');
TO_DATE
--------
2017-12-31
(1 row)
```

**Template Pattern Modifiers for Date/Time Formatting**

Certain modifiers can be applied to any template pattern to alter its behavior. For example, FMMonth is the Month pattern with the FM modifier.

<table>
<thead>
<tr>
<th>Modifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AM</td>
<td>Time is before 12:00</td>
</tr>
<tr>
<td>AT</td>
<td>Ignored</td>
</tr>
<tr>
<td>JULIAN, JD, J</td>
<td>Next field is Julian Day</td>
</tr>
</tbody>
</table>
### Modifier | Description
--- | ---
**FM prefix** | Fill mode (suppress padding blanks and zeros)  
For example: FMMonth

**Note:** The FM modifier suppresses leading zeros and trailing blanks that would otherwise be added to make the output of a pattern fixed width.

**FX prefix** | Fixed format global option  
For example: FX Month DD Day

**ON** | Ignored

**PM** | Time is on or after 12:00

**T** | Next field is time

**TH suffix** | Uppercase ordinal number suffix  
For example: DDTH

**th suffix** | Lowercase ordinal number suffix  
For example: DDth

**TM prefix** | Translation mode (print localized day and month names based on lc_ messages). For example: TMMonth

### Template Patterns for Numeric Formatting

<table>
<thead>
<tr>
<th>Pattern</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9</td>
<td>Value with the specified number of digits</td>
</tr>
<tr>
<td>0</td>
<td>Value with leading zeros</td>
</tr>
<tr>
<td>.</td>
<td>Decimal point</td>
</tr>
<tr>
<td>,</td>
<td>Group (thousand) separator</td>
</tr>
<tr>
<td>PR</td>
<td>Negative value in angle brackets</td>
</tr>
<tr>
<td>Pattern</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------------------------------------------</td>
</tr>
<tr>
<td>S</td>
<td>Sign anchored to number (uses locale)</td>
</tr>
<tr>
<td>L</td>
<td>Currency symbol (uses locale)</td>
</tr>
<tr>
<td>D</td>
<td>Decimal point (uses locale)</td>
</tr>
<tr>
<td>G</td>
<td>Group separator (uses locale)</td>
</tr>
<tr>
<td>MI</td>
<td>Minus sign in specified position (if number &lt; 0)</td>
</tr>
<tr>
<td>PL</td>
<td>Plus sign in specified position (if number &gt; 0)</td>
</tr>
<tr>
<td>SG</td>
<td>Plus/minus sign in specified position</td>
</tr>
<tr>
<td>RN</td>
<td>Roman numeral (input between 1 and 3999)</td>
</tr>
<tr>
<td>TH/th</td>
<td>Ordinal number suffix</td>
</tr>
<tr>
<td>V</td>
<td>Shift specified number of digits</td>
</tr>
</tbody>
</table>

### Usage

- A sign formatted using SG, PL, or MI is not anchored to the number. For example:

  ```sql
  => SELECT to_char(-12, 'S9999'), to_char(-12, 'MI9999');
  to_char | to_char
  ---------------
  -12 | -12
  (1 row)
  ```

  - TO_CHAR(-12, 'S9999') produces ' -12'
  - TO_CHAR(-12, 'MI9999') produces '- 12'

- 9 results in a value with the same number of digits as there are 9s. If a digit is not available it outputs a space.
- TH does not convert values less than zero and does not convert fractional numbers.
- V effectively multiplies the input values by 10^n, where n is the number of digits following V. TO_CHAR does not support the use of V combined with a decimal point—for example: 99.9V99.
Geospatial Functions

The following topics describe the Vertica geospatial functions.

Function-Naming Conventions

The geospatial functions use the following naming conventions:

- The ST_function-name functions are compliant with the latest Open Geospatial Consortium standard OGC SFA-SQL version 1.2.1 (reference number is OGC 06-104r4, date: 2010-08-04). Currently, some ST_function-name > functions may not support all data types. Each function page contains details about the supported data types.

  **Note:**
  
  Some functions, such as ST_GeomFromText, are based on previous versions of the standard.

- The STV_function-name > functions are unique to Vertica and not compliant with OGC standards. Each function page explains its functionality in detail.

Verifying Spatial Objects Validity

Many spatial functions do not verify the validity of the parameters. If you pass an invalid spatial object to an ST_ or STV_ function, the function may return an error or produce incorrect results.

To avoid this issue, Micro Focus recommends that you first run ST_IsValid on all spatial objects to verify their validity. If your object is not valid, run STV_IsValidReason to get information about the location of the invalidity.

  **Note:**
  
  If you pass a valid polygon to STV_IsValidReason, it returns NULL.
ST_AsText

Creates the Well-Known Text (WKT) representation of a spatial object. Use this function when you need to specify a spatial object in ASCII form.

The Open Geospatial Consortium (OGC) defines the format of a WKT string in the Simple Feature Access Part 1 - Common Architecture specification.

**Behavior Type**

Immutable

**Syntax**

```sql
ST_AsText( g )
```

**Arguments**

| g | Spatial object for which you want the WKT string, type GEOMETRY or GEOGRAPHY |

**Returns**

LONG VARCHAR

**Supported Data Types**

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Example

The following example shows how to use ST_AsText.

Retrieve WKB and WKT representations:

```sql
=> CREATE TABLE locations (id INTEGER, name VARCHAR(100), geom1 GEOMETRY(800), geom2 GEOGRAPHY);
=> CREATE TABLE
   => COPY locations
      (id, geom1x FILLER LONG VARCHAR(800), geom1 AS ST_GeomFromText(geom1x), geom2x FILLER LONG VARCHAR(800), geom2 AS ST_GeographyFromText(geom2x)) FROM stdin;
=> Enter data to be copied followed by a newline.
   End with a backslash and a period on a line by itself.
 => 1|POINT (2 3) |
 => 2|LINESTRING (2 4, 1 5)|
 => 3|POLYGON ((-70.96 43.27, -70.67 42.95, -66.90 44.74, -67.81 46.08, -67.81 47.20, -69.22 47.43, -71.09 45.25, -70.96 43.27))
 => 
 => SELECT id, ST_AsText(geom1), ST_AsText(geom2) FROM locations ORDER BY id ASC;
 id | ST_AsText | ST_AsText
-------------------------
 1 | POINT (2 3) | |
 2 | LINESTRING (2 4, 1 5) | |
 3 | POLYGON ((-70.96 43.27, -70.67 42.95, -66.90 44.74, -67.81 46.08, -67.81 47.20, -69.22 47.43, -71.09 45.25, -70.96 43.27))
(3 rows)
```

Calculate the length of a WKT using the Vertica SQL function `LENGTH`:

```sql
=> SELECT LENGTH(ST_AsText(ST_GeomFromText('POLYGON ((-1 2, 0 3, 1 2, 0 1, -1 2)'))));

LENGTH
--------
 37
(1 row)
```

See Also

- `ST_AsBinary`
**ST_Area**

Calculates the area of a spatial object.

The units are:

- GEOMETRY objects: spatial reference system identifier (SRID) units
- GEOGRAPHY objects: square meters

**Behavior Type**

*Immutable*

**Syntax**

```
ST_Area( g )
```

**Arguments**

| g   | Spatial object for which you want to calculate the area, type GEOMETRY or GEOGRAPHY |

**Returns**

FLOAT

**Supported Data Types**

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
### Examples

The following examples show how to use ST_Area.

Calculate the area of a polygon:

```sql
=> SELECT ST_Area(ST_GeomFromText('POLYGON((0 0, 1 1, 0, 0))'));
ST_Area
--------
  1
(1 row)
```

Calculate the area of a multipolygon:

```sql
=> SELECT ST_Area(ST_GeomFromText('MultiPolygon(((0 0, 1 0, 1, 0, 0)),
   ((2 2, 2 3, 3, 2, 2))')));
ST_Area
--------
   3
(1 row)
```

Suppose the polygon has a hole, as in the following figure.

![Polygon with a hole](image)

Calculate the area, excluding the area of the hole:

```sql
=> SELECT ST_Area(ST_GeomFromText('POLYGON((2 2, 5, 8, 2, 2, 2),
   (4 3 5, 4 3, 4 3))'));
```
ST_Area
--------
8
(1 row)

Calculate the area of a geometry collection:

```sql
=> SELECT ST_Area(ST_GeomFromText('GEOMETRYCOLLECTION(POLYGON((20.5 20.45, 20.51 20.52,20.69 20.32,20.5 20.45)),POLYGON((10 20,30 40,25 50,10 20)))'));
ST_Area
--------
 150.0073
(1 row)
```

Calculate the area of a geography object:

```sql
=> SELECT ST_Area(ST_GeographyFromText('POLYGON((20.5 20.45,20.51 20.52,20.69 20.32,20.5 20.45))'));
ST_Area
--------
84627437.116037
(1 row)
```

**ST_AsBinary**

Creates the Well-Known Binary (WKB) representation of a spatial object. Use this function when you need to convert an object to binary form for porting spatial data to or from other applications.

The Open Geospatial Consortium (OGC) defines the format of a WKB representation in the Simple Feature Access Part 1 - Common Architecture specification.

**Behavior Type**

Immutable

**Syntax**

`ST_AsBinary( g )`

**Arguments**

| g | Spatial object for which you want the WKB, type GEOMETRY or GEOGRAPHY |
Returns
LONG VARBINARY

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Example
The following example shows how to use ST_AsBinary.

Retrieve WKB and WKT representations:

```
=> CREATE TABLE locations (id INTEGER, name VARCHAR(100), geom1 GEOMETRY(800), geom2 GEOGRAPHY);  
CREATE TABLE  
=> COPY locations  
  (id, geom1x FILLER LONG VARCHAR(800), geom1 AS ST_GeomFromText(geom1x), geom2x FILLER LONG VARCHAR(800),  
    geom2 AS ST_GeographyFromText(geom2x))  
FROM stdin;  
Enter data to be copied followed by a newline.  
End with a backslash and a period on a line by itself.  
=> 1|POINT(2 3)|  
=> 2|LINESTRING(2 4,1 5)|  
=> 3|POLYGON((-70.96 43.27,-70.67 42.95,-66.90 44.74,-67.81 46.08,-67.81 47.20,-69.22 47.43,-71.09 45.25,-70.96 43.27))|  
=> \.  
=> SELECT id, ST_AsText(geom1),ST_AsText(geom2) FROM locations ORDER BY id ASC;  
id | ST_AsText | ST_AsText  
--+---------------------------------+----------------------------------
```
Calculate the length of a WKB using the Vertica SQL function `LENGTH`:

```sql
=> SELECT LENGTH(ST_AsBinary(St_GeomFromText('POLYGON ((-1 2, 0 3, 1 2, 0 1, -1 2))')));

LENGTH
-------
93
(1 row)
```

### See Also

- **ST_AsText**

### ST_Boundary

Calculates the boundary of the specified GEOMETRY object. An object's boundary is the set of points that define the limit of the object.

For a linestring, the boundary is the start and end points. For a polygon, the boundary is a linestring that begins and ends at the same point.

### Behavior Type

**Immutable**

### Syntax

```sql
ST_Boundary( g )
```

### Arguments

- `g` Spatial object for which you want the boundary, type GEOMETRY
Returns

GEOMETRY

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>No</td>
</tr>
</tbody>
</table>

Examples

The following examples show how to use ST_Boundary.

Returns a linestring that represents the boundary:

```sql
=> SELECT ST_AsText(ST_Boundary(ST_GeomFromText('POLYGON((-1 -1, 2, 0 1, -1 -1))')));
     ST_AsText
---------------------
LINESTRING(-1 -1, 2 2, 0 1, -1 -1)
(1 row)
```

Returns a multilinestring that contains the boundaries of both polygons:

```sql
=> SELECT ST_AsText(ST_Boundary(ST_GeomFromText('POLYGON((2 2, 5 5, 8 2, 2 2), (4 3, 5 4, 6 3, 4 3))')));
    ST_AsText
-----------------------------------------------
MULTILINESTRING ((2 2, 5 5, 8 2, 2 2), (4 3, 5 4, 6 3, 4 3))
(1 row)
```

The boundary of a linestring is its start and end points:
A closed linestring has no boundary because it has no start and end points:

```sql
=> SELECT ST_AsText(ST_Boundary(ST_GeomFromText('LINESTRING(1 1, 2, 3, 4 4)')));
          ST_AsText
---------------------
MULTIPOINT (1 1, 4 4)
(1 row)
```

ST_Buffer

Creates a GEOMETRY object greater than or equal to a specified distance from the boundary of a spatial object. The distance is measured in Cartesian coordinate units. ST_Buffer does not accept a distance size greater than $+1e15$ or less than $-1e15$.

Behavior Type

Immutable

Syntax

```
ST_Buffer( g, d )
```

Arguments

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>$g$</td>
<td>Spatial object for which you want to calculate the buffer, type GEOMETRY</td>
</tr>
<tr>
<td>$d$</td>
<td>Distance from the object in Cartesian coordinate units, type FLOAT</td>
</tr>
</tbody>
</table>

Returns

GEOMETRY
Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
</tr>
</tbody>
</table>
**ST_Centroid**

Calculates the geometric center—the centroid—of a spatial object. If points or linestrings or both are present in a geometry with polygons, only the polygons contribute to the calculation of the centroid. Similarly, if points are present with linestrings, the points do not contribute to the calculation of the centroid.

To calculate the centroid of a GEOGRAPHY object, see the examples for `STV_Geometry` and `STV_Geography`.

**Behavior Type**

*Immutable*

**Syntax**

```
ST_Centroid( g )
```

**Arguments**

| g  | Spatial object for which you want to calculate the centroid, type GEOMETRY |

**Returns**

GEOMETRY (POINT only)

**Supported Data Types**

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
</tr>
</tbody>
</table>
### Examples

The following examples show how to use `ST_Centroid`.

Calculate the centroid for a polygon:

```sql
=> SELECT ST_AsText(ST_Centroid(ST_GeomFromText('POLYGON((-1 -1 2, -1 -1))')));
ST_AsText
------------------
POINT (-0 1)
(1 row)
```

Calculate the centroid for a multipolygon:

```sql
=> SELECT ST_AsText(ST_Centroid(ST_GeomFromText('MULTIPOLYGON(((1 0 2 2, 1 0)),((-1 -1 2, -1 -1))'))));
ST_AsText
--------------------------
POINT (0.166666666667 0.933333333333)
(1 row)
```

This figure shows the centroid for the multipolygon.
ST_Contains

Determines if a spatial object is entirely inside another spatial object without existing only on its boundary. Both arguments must be the same spatial data type. Either specify two GEOMETRY objects or two GEOGRAPHY objects.

If an object such as a point or linestring only exists along a spatial object's boundary, then ST_Contains returns false. The interior of a linestring is all the points on the linestring except the start and end points.

ST_Contains\((g1, g2)\) is functionally equivalent to ST_Within\((g2, g1)\).

GEOGRAPHY Polygons with a vertex or border on the International Date Line (IDL) or the North or South pole are not supported.

Behavior Type

Immutable

Syntax

\[
\text{ST}_{-}\text{Contains}(g1, g2) \quad \text{[USING PARAMETERS spheroid=\{true | false\} ]}
\]
Arguments

<table>
<thead>
<tr>
<th>g1</th>
<th>Spatial object, type GEOMETRY or GEOGRAPHY</th>
</tr>
</thead>
<tbody>
<tr>
<td>g2</td>
<td>Spatial object, type GEOMETRY or GEOGRAPHY</td>
</tr>
</tbody>
</table>

Parameters

spheroid = {true | false} (Optional) BOOLEAN that specifies whether to use a perfect sphere or WGS84.

Default: False

Returns

BOOLEAN

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Compatible GEOGRAPHY pairs:

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Geometry 1</td>
<td>Geometry 2</td>
<td>Result</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------</td>
<td>--------</td>
</tr>
<tr>
<td>Point-Point</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Linestring-Point</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Polygon-Point</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon-Point</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### Examples

The following examples show how to use `ST_Contains`.

The first polygon does not completely contain the second polygon:

```sql
=> SELECT ST_Contains(ST_GeomFromText('POLYGON((0 2,1 1,0 -1,0 2))'),
                       ST_GeomFromText('POLYGON((-1 3,2 1,0 -3,-1 3))'));
```

```
 ST_Contains
----------
t
(1 row)
```

If a point is on a linestring, but not on an end point:

```sql
=> SELECT ST_Contains(ST_GeomFromText('LINESTRING(20 20,30 30)'),
                       ST_GeomFromText('POINT(25 25)'));
```

```
 ST_Contains
----------
t
(1 row)
```
If a point is on the boundary of a polygon:

```sql
=> SELECT ST_Contains(ST_GeographyFromText('POLYGON((20 20, 30 30, 30 25, 20 20))'),
                       ST_GeographyFromText('POINT(20 20)'));
                      ST_Contains
-----------------------
   ∅
(1 row)
```

Two spatially equivalent polygons:

```sql
=> SELECT ST_Contains (ST_GeometryFromText('POLYGON((-1 2, 0 3, 0 1, -1 2))'),
                       ST_GeometryFromText('POLYGON((0 3, -1 2, 0 1, 0 3))'));
                      ST_Contains
-----------------------
   t
(1 row)
```
See Also

- ST_Overlaps
- ST_Within

**ST_ConvexHull**

Calculates the smallest convex GEOMETRY object that contains a GEOMETRY object.

**Behavior Type**

*Immutable*

**Syntax**

```
ST_ConvexHull( g )
```

**Arguments**

| $g$ | Spatial object for which you want the convex hull, type GEOMETRY |

**Returns**

GEOMETRY
## Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
</tr>
</tbody>
</table>

## Examples

The following examples show how to use `ST_ConvexHull`.

For a pair of points in a geometry collection:

```sql
=> SELECT ST_AsText(ST_ConvexHull(ST_GeomFromText('GEOMETRYCOLLECTION(POINT(1 1),POINT(0 0))')));
```

```
ST_AsText
--------------
LINESTRING (1 1, 0 0)
(1 row)
```

For a geometry collection:

```sql
=> SELECT ST_AsText(ST_ConvexHull(ST_GeomFromText('GEOMETRYCOLLECTION(LINESTRING(2.5 3,-2 1.5), POLYGON((0 1,1 3,-2,0 1)))));
```

```
ST_AsText
--------------
POLYGON ((1 -2, -2 1.5, 1 3, 2.5 3, 1 -2))
(1 row)
```

The solid lines represent the original geometry collection and the dashed lines represent the convex hull.
**ST_Crosses**

Determines if one GEOMETRY object spatially crosses another GEOMETRY object. If two objects touch only at a border, ST_Crosses returns FALSE.

Two objects spatially cross when both of the following are true:

- The two objects have some, but not all, interior points in common.
- The dimension of the result of their intersection is less than the maximum dimension of the two objects.

**Behavior Type**

*Immutable*

**Syntax**

`ST_Crosses( g1, g2 )`

**Arguments**

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>g1</td>
<td>Spatial object, type GEOMETRY</td>
</tr>
<tr>
<td>g2</td>
<td>Spatial object, type GEOMETRY</td>
</tr>
</tbody>
</table>
Returns

BOOLEAN

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Examples

The following examples show how to use ST_Crosses.

```sql
=> SELECT ST_Crosses(ST_GeomFromText('LINESTRING(-1 3,1 4)'),
                      ST_GeomFromText('LINESTRING(-1 4,1 3)'));
ST_Crosses
--------
t
(1 row)
```
ST_Crosses

SELECT ST_Crosses(ST_GeomFromText('LINESTRING(-1 1,1 2)'), ST_GeomFromText('POLYGON((1 1,0 -1,1 3 -1,1,1 1))'));

f
(1 row)

SELECT ST_Crosses(ST_GeomFromText('POINT(-1 4)'), ST_GeomFromText('LINESTRING(-1 4,1 3)'));

f
(1 row)

ST_Difference

Calculates the part of a spatial object that does not intersect with another spatial object.

Behavior Type

Immutable

Syntax

ST_Difference( g1, g2 )
Arguments

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>(g^1)</td>
<td>Spatial object, type GEOMETRY</td>
</tr>
<tr>
<td>(g^2)</td>
<td>Spatial object, type GEOMETRY</td>
</tr>
</tbody>
</table>

Returns

GEOMETRY

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Examples

The following examples show how to use `ST_Difference`.

Two overlapping linestrings:

```
=> SELECT ST_AsText(ST_Difference(ST_GeomFromText('LINESTRING(0 0,0 2)'),
     ST_GeomFromText('LINESTRING(0 1,0 2)')));
     ST_AsText
--------------
LINESTRING (0 0, 0 1)
(1 row)
```

```
=> SELECT ST_AsText(ST_Difference(ST_GeomFromText('LINESTRING(0 0,0 3)'),
     ST_GeomFromText('LINESTRING(0 1,0 2)')));
--------------
```

```
Two overlapping polygons:

(0,0)  (2,0)

A

(0,3)  (2,3)

B

ST_Difference(A,B)

ST_Difference(B,A)

=> SELECT ST_AsText(ST_Difference(ST_GeomFromText('POLYGON((0 1,0 3,2 3,2 1,0 1))'),
               ST_GeomFromText('POLYGON((0 0,0 2,2 2,2 0,0 0))')));
               ST_AsText
               ----------------------------------------------------------------------
               POLYGON ((0 2, 0 3, 2 3, 2 2, 0 2))
               (1 row)

Two non-intersecting polygons:

(1 row)

ST_Disjoint

Determines if two GEOMETRY objects do not intersect or touch.
If ST_Disjoint returns TRUE for a pair of GEOMETRY objects, ST_Intersects returns FALSE for the same two objects.

GEOGRAPHY Polygons with a vertex or border on the International Date Line (IDL) or the North or South pole are not supported.

**Behavior Type**

**Immutable**

**Syntax**

```
ST_Disjoint( g1, g2 ) [USING PARAMETERS spheroid={true | false}] )
```

**Arguments**

<table>
<thead>
<tr>
<th>g1</th>
<th>Spatial object, type GEOMETRY</th>
</tr>
</thead>
<tbody>
<tr>
<td>g2</td>
<td>Spatial object, type GEOMETRY</td>
</tr>
</tbody>
</table>

**Parameters**

| spheroid = {true | false} | (Optional) BOOLEAN that specifies whether to use a perfect sphere or WGS84. |
|---------------------------|--------------------------------------------------------------------------------|
|                           | Default: False                                                                   |

**Returns**

BOOLEAN

**Supported Data Types**

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
### Examples

The following examples show how to use `ST_Disjoint`.

#### Two non-intersecting or touching polygons:

```sql
=> SELECT ST_Disjoint (ST_GeomFromText('POLYGON((-1 2,0 3,0 1,-1 2))'),
                      ST_GeomFromText('POLYGON((1 0, 1 1, 2 2, 1 0)')));

ST_Disjoint
----------
t
(1 row)
```

#### Two intersecting linestrings:

```sql
=> SELECT ST_Disjoint(ST_GeomFromText('LINESTRING(-1 2,0 3)'),
                      ST_GeomFromText('LINESTRING(0 2,-1 3)'));

ST_Disjoint
----------
f
(1 row)
```

#### Two polygons touching at a single point:

```sql
SELECT ST_Disjoint (ST_GeomFromText('POLYGON((-1 2, 0 3, 0 1, -1 2))'),
    ST_GeomFromText('POLYGON((0 2, 1 1, 1 2, 0 2))'));

See Also

- ST_Intersects

ST_Distance

Calculates the shortest distance between two spatial objects. For GEOMETRY objects, the
distance is measured in Cartesian coordinate units. For GEOGRAPHY objects, the distance is
measured in meters.

Parameters \( g1 \) and \( g2 \) must be both GEOMETRY objects or both GEOGRAPHY objects.

Behavior Type

Immutable

Syntax

\[
\text{ST_Distance}( \text{g1}, \text{g2} \\
\quad \text{[USING PARAMETERS spheroid={ true | false } ]})
\]

Arguments

| \( g1 \) | Spatial object, type GEOMETRY or GEOGRAPHY |
| \( g2 \) | Spatial object, type GEOMETRY or GEOGRAPHY |

Parameters

| spheroid = { true | false } | (Optional) BOOLEAN that specifies whether to use a |
false }

perfect sphere or WGS84.

**Default**: False

## Returns

**FLOAT**

### Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>

<tr>
<td>Multipoint-Point</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint-Multilinestring</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Multipolygon-Point</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>
Recommendations

Vertica recommends pruning invalid data before using ST_Distance. Invalid geography values could return non-guaranteed results.

Examples

The following examples show how to use ST_Distance.

Distance between two polygons:

```sql
=> SELECT ST_Distance(ST_GeomFromText('POLYGON((-1 -1,2,0 1,-1 -1))'),
                       ST_GeomFromText('POLYGON((5 2,7 4,5 5 2))'));
ST_Distance
-----------
     3
(1 row)
```

Distance between a point and a linestring in meters:

```sql
=> SELECT ST_Distance(ST_GeographyFromText('POINT(31.75 31.25)'),
                       ST_GeographyFromText('LINESTRING(32 32,32 35,40.5 35,32 35,32 32)'));
ST_Distance
-----------
86690.3950562969
(1 row)
```

ST_Envelope

Calculates the minimum bounding rectangle that contains the specified GEOMETRY object.

Behavior Type

Immutable

Syntax

```
ST_Envelope( g )
```
**Arguments**

| g | Spatial object for which you want to find the minimum bounding rectangle, type GEOMETRY |

**Returns**

GEOMETRY

**Supported Data Types**

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Example**

The following example shows how to use ST_Envelope.

Returns the minimum bounding rectangle:

```sql
=> SELECT ST_AsText(ST_Envelope(ST_GeomFromText('POLYGON((0 0,1 1,1 2, 2 1,3 0,1.5 -1.5,0 0))')));
ST_AsText
---------------------------
POLYGON ((0 -1.5, 3 -1.5, 3 2, 0 2, 0 -1.5))
(1 row)
```
ST_Equals

Determines if two spatial objects are spatially equivalent. The coordinates of the two objects and their WKT/WKB representations must match exactly for ST_Equals to return TRUE.

The order of the points do not matter in determining spatial equivalence:

- LINESTRING(1 2, 4 3) equals LINESTRING(4 3, 1 2).
- POLYGON ((0 0, 1 1, 1 2, 2 2, 2 1, 3 0, 1.5 -1.5, 0 0)) equals POLYGON((1 1, 1 2, 2 2, 2 1, 3 0, 1.5 -1.5, 0 0, 1 1)).
- MULTILINESTRING((1 2, 4 3),(0 0, -1 -4)) equals MULTILINESTRING((0 0, -1 -4),(1 2, 4 3)).

Coordinates are stored as FLOAT types. Thus, rounding errors are expected when importing Well-Known Text (WKT) values because the limitations of floating-point number representation.

$g1$ and $g2$ must both be GEOMETRY objects or both be GEOGRAPHY objects. Also, $g1$ and $g2$ cannot both be of type GeometryCollection.

**Behavior Type**

Immutable

**Syntax**

```sql
ST_Equals( $g1$, $g2$ )
```
Arguments

<table>
<thead>
<tr>
<th></th>
<th>Spatial object to compare to ( g2 ), type GEOMETRY or GEOGRAPHY</th>
</tr>
</thead>
<tbody>
<tr>
<td>( g1 )</td>
<td></td>
</tr>
<tr>
<td>( g2 )</td>
<td>Spatial object to compare to ( g1 ), type GEOMETRY or GEOGRAPHY</td>
</tr>
</tbody>
</table>

Returns

BOOLEAN

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Examples

The following examples show how to use ST_Equals.

Two linestrings:

```sql
=> SELECT ST_Equals (ST_GeomFromText('LINESTRING(-1 2, 0 3)'),
  ST_GeomFromText('LINESTRING(0 3, -1 2)'));
  ST_Equals
--------------
t
(1 row)
```

Two polygons:
```sql
=> SELECT ST_Equals (ST_GeographyFromText('POLYGON((43.22 42.21,40.3 39.88,42.1 50.03,43.22 42.21))'),ST_GeographyFromText('POLYGON((43.22 42.21,40.3 39.88,42.1 50.31,43.22 42.21))'));
ST_Equals
--------------
f
(1 row)
```

## ST_GeographyFromText

Converts a Well-Known Text (WKT) string into its corresponding GEOGRAPHY object. Use this function to convert a WKT string into the format expected by the Vertica Place functions.

A GEOGRAPHY object is a spatial object with coordinates (longitude, latitude) defined on the surface of the earth. Coordinates are expressed in degrees (longitude, latitude) from reference planes dividing the earth.

The maximum size of a GEOGRAPHY object is 10 MB. If you pass a WKT to ST_GeographyFromText, the result is a spatial object whose size is greater than 10 MB, ST_GeographyFromText returns an error.

The Open Geospatial Consortium (OGC) defines the format of a WKT string in Section 7 in the Simple Feature Access Part 1 - Common Architecture specification.

## Behavior Type

Immutable

## Syntax

```sql
ST_GeographyFromText( wkt [ USING PARAMETERS ignore_errors=('y'|'n') ] )
```

## Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>wkt</code></td>
<td>Well-Known Text (WKT) string of a GEOGRAPHY object, type LONG VARCHAR</td>
</tr>
<tr>
<td><code>ignore_errors</code></td>
<td>(Optional) ST_GeographyFromText returns the following, based on the parameters supplied:</td>
</tr>
</tbody>
</table>
If `wkt` is invalid and `ignore_errors`='y'.
Error—If `wkt` is invalid and `ignore_errors`='n' or is unspecified.

Returns
GEOGRAPHY

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Example
The following example shows how to use ST_GeographyFromText.

Convert WKT into a GEOGRAPHY object:

```sql
=> CREATE TABLE wkt_ex (g GEOGRAPHY);
CREATE TABLE
=> INSERT INTO wkt_ex VALUES(ST_GeographyFromText('POLYGON((1 2,3 4,2,1 2))'));
OUTPUT
--------
 1
(1 row)
```
ST_GeographyFromWKB

Converts a Well-Known Binary (WKB) value into its corresponding GEOGRAPHY object. Use this function to convert a WKB into the format expected by Vertica Place functions.

A GEOGRAPHY object is a spatial object defined on the surface of the earth. Coordinates are expressed in degrees (longitude, latitude) from reference planes dividing the earth. All calculations are in meters.

The maximum size of a GEOGRAPHY object is 10 MB. If you pass a WKB to ST_GeographyFromWKB that results in a spatial object whose size is greater than 10 MB, ST_GeographyFromWKB returns an error.

The Open Geospatial Consortium (OGC) defines the format of a WKB representation in Section 8 in the Simple Feature Access Part 1 - Common Architecture specification.

**Behavior Type**

Immutable

**Syntax**

```
ST_GeographyFromWKB( wkb  [ USING PARAMETERS ignore_errors={"y"|"n"} ] )
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>wkb</code></td>
<td>Well-Known Binary (WKB) value of a GEOGRAPHY object, type LONG VARBINARY</td>
</tr>
<tr>
<td><code>ignore_errors</code></td>
<td>(Optional) ST_GeographyFromWKB returns the following, based on the parameters supplied:</td>
</tr>
<tr>
<td></td>
<td>• NULL—If <code>wkb</code> is invalid and <code>ignore_errors='y'</code>.</td>
</tr>
<tr>
<td></td>
<td>• Error—If <code>wkb</code> is invalid and <code>ignore_errors='n'</code> or is unspecified.</td>
</tr>
</tbody>
</table>

**Returns**

GEOGRAPHY
## Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Example

The following example shows how to use `ST_GeographyFromWKB`.

Convert WKB into a GEOGRAPHY object:

```sql
=> CREATE TABLE wkb_ex (g GEOGRAPHY);
CREATE TABLE
=> INSERT INTO wkb_ex VALUES(ST_GeographyFromWKB(X'010300000010000001000000 ... '));
OUTPUT
---------
   1
(1 row)
```

### ST_GeoHash

Returns a GeoHash in the shape of the specified geometry.

### Behavior Type

**Immutable**
Syntax

ST_GeoHash( SpatialObject [ USING PARAMETERS numchars=n ] )

Arguments

<table>
<thead>
<tr>
<th>Spatial object</th>
<th>A GEOMETRY or GEOGRAPHY spatial object. Inputs must be in polar coordinates (-180 &lt;= x &lt;= 180 and -90 &lt;= y &lt;= 90) for all points inside the given geometry.</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>Specifies the length, in characters, of the returned GeoHash.</td>
</tr>
</tbody>
</table>

Returns

GEOHASH

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Examples

The following examples show how to use ST_PointFromGeoHash.

Generate a full precision GeoHash for the specified geometry:
Generate a GeoHash based on the first five characters of the specified geometry:

```sql
=> select ST_GeoHash(ST_GeographyFromText('POINT(3.14 -1.34)') USING PARAMETERS numchars=5);
ST_GeoHash
--------------
kp0r
(1 row)
```

**ST_GeometryN**

Returns the $n^{th}$ geometry within a geometry object.

If $n$ is out of range of the index, then NULL is returned.

**Behavior Type**

*Immutable*

**Syntax**

```sql
ST_GeometryN( g , n )
```

**Arguments**

<table>
<thead>
<tr>
<th>$g$</th>
<th>Spatial object of type GEOMETRY.</th>
</tr>
</thead>
<tbody>
<tr>
<td>$n$</td>
<td>The geometry's index number, 1-based.</td>
</tr>
</tbody>
</table>

**Returns**

GEOMETRY
### Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Examples

The following examples show how to use `ST_GeometryN`.

#### Return the second geometry in a multipolygon:

```sql
=> CREATE TABLE multipolygon_geom (gid int, geom GEOMETRY(1000));
CREATE TABLE
=> COPY multipolygon_geom(gid, gx FILLER LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM stdin delimiter '|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>>>9|MULTIPOLYGON(((2 6, 2 9, 6 9, 7 7, 4 6, 2 6)),((0 0, 0 5, 1 0, 0 0)),((0 2, 2 5, 4 5, 0 2)))
>>>.
=> SELECT gid, ST_AsText(ST_GeometryN(geom, 2)) FROM multipolygon_geom;
gid | ST_AsText
-----------------------------
 9 | POLYGON ((0 0, 0 5, 1 0, 0 0))
(1 row)
```

#### Return all the geometries within a multipolygon:

```sql
=> CREATE TABLE multipolygon_geom (gid int, geom GEOMETRY(1000));
CREATE TABLE
=> COPY multipolygon_geom(gid, gx FILLER LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM stdin delimiter '|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>>>9|MULTIPOLYGON(((2 6, 2 9, 6 9, 7 7, 4 6, 2 6)),((0 0, 0 5, 1 0, 0 0)),((0 2, 2 5, 4 5, 0 2)))
```
CREATE TABLE series_numbers (numbs int);

CREATE TABLE series_numbers FROM STDIN;
Enter data to be copied followed by a newline. End with a backslash and a period on a line by itself.

>> 1
>> 2
>> 3
>> 4
>> 5

=> SELECT numbs, ST_AsText(ST_GeometryN(geom, numbs))
   FROM multipolygon_geom, series_numbers
   WHERE ST_AsText(ST_GeometryN(geom, numbs)) IS NOT NULL
   ORDER BY numbs ASC;

<table>
<thead>
<tr>
<th>numbs</th>
<th>ST_AsText</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>POLYGON ((2 6, 2 9, 6 9, 7 7, 4 6, 2 6))</td>
</tr>
<tr>
<td>2</td>
<td>POLYGON ((0 0, 0 5, 1 0, 0 0))</td>
</tr>
<tr>
<td>3</td>
<td>POLYGON ((0 2, 2 5, 4 5, 0 2))</td>
</tr>
</tbody>
</table>

(3 rows)

See Also

ST_NumGeometries

ST_GeometryType

Determines the class of a spatial object.

Behavior Type

Immutable

Syntax

ST_GeometryType( g )

Arguments

| g    | Spatial object for which you want the class, type GEOMETRY or GEOGRAPHY |
Returns

VARCHAR

Supported Data Types

</tbody>
</table>

Example

The following example shows how to use ST_GeometryType.

Returns spatial class:

```
=> SELECT ST_GeometryType(ST_GeomFromText('GEOMETRYCOLLECTION(LINestring(1 1, 2 2), POLYGON((1 3,4 5,2 1 3)))')));
ST_GeometryType
-------------------------
ST_GeometryCollection
(1 row)
```

ST_GeomFromGeoHash

Returns a polygon in the shape of the specified GeoHash.
Behavior Type

Immutable

Syntax

ST_GeomFromGeoHash(GeoHash)

Arguments

| GeoHash | A valid GeoHash string of arbitrary length. |

Returns

GEOGRAPHY

Examples

The following examples show how to use ST_GeomFromGeoHash.

Converts a GeoHash string to a Geography object and back to a GeoHash

=> SELECT ST_GeomHash(ST_GeomFromGeoHash('vert1c9'));
ST_GeomHash

vert1c9

(1 row)

Returns a polygon of the specified GeoHash and uses ST_AsText to convert the polygon, rectangle map tile, into Well-Known Text:

=> SELECT ST_AsText(ST_GeomFromGeoHash('drt3jj9n4dpbcdef'));
ST_AsText

POLYGON ((-71.1459699298 42.3945346513, -71.1459699297 42.3945346513, -71.1459699297 42.3945346513, -71.1459699298 42.3945346513, -71.1459699298 42.3945346513))

(1 row)
Returns multiple polygons and their areas for the specified GeoHashes. The polygon for the high level GeoHash (1234) has a significant area, while the low level GeoHash (1234567890bcdefhjkmn) has an area of zero.

```sql
=> SELECT ST_Area(short) short_area, ST_AsText(short) short_WKT, ST_Area(long) long_area, ST_AsText(long) long_WKT from (SELECT ST_GeomFromGeoHash('1234') short, ST_GeomFromGeoHash('1234567890bcdefhjkmn') long) as foo;
```

<table>
<thead>
<tr>
<th>short_area</th>
<th>long_area</th>
</tr>
</thead>
<tbody>
<tr>
<td>24609762.8991876</td>
<td>0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>short_WKT</th>
<th>long_WKT</th>
</tr>
</thead>
<tbody>
<tr>
<td>POLYGON ((-122.34375 -88.2421875, -121.9921875 -88.2421875, -121.9921875 -88.06640625, -122.34375 -88.06640625, -122.34375 -88.2421875))</td>
<td>POLYGON ((-122.196077187 -88.2297377551, -122.196077187 -88.2297377551, -122.196077187 -88.06640625, -122.196077187 -88.06640625, -122.196077187 -88.06640625))</td>
</tr>
</tbody>
</table>

### ST_GeomFromText

Converts a Well-Known Text (WKT) string into its corresponding GEOMETRY object. Use this function to convert a WKT string into the format expected by the Vertica Place functions.

A GEOMETRY object is a spatial object defined by the coordinates of a plane. Coordinates are expressed as points on a Cartesian plane \((x,y)\). SRID values of 0 to \(2^{32}-1\) are valid. SRID values outside of this range will generate an error.

The maximum size of a GEOMETRY object is 10 MB. If you pass a WKT to ST_GeomFromText and the result is a spatial object whose size is greater than 10 MB, ST_GeomFromText returns an error.

### Behavior Type

**Immutable**

### Syntax

```
ST_GeomFromText( wkt [, srid] [ USING PARAMETERS ignore_errors={'y'|'n'} ])
```
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>wkt</code></td>
<td>Well-Known Text (WKT) string of a GEOMETRY object, type LONG VARCHAR.</td>
</tr>
<tr>
<td><code>srid</code></td>
<td>(Optional when not performing operations) Spatial reference system identifier (SRID) of the GEOMETRY object, type INTEGER. The SRID is stored in the GEOMETRY object, but does not influence the results of spatial computations.</td>
</tr>
</tbody>
</table>
| `ignore_errors` | (Optional) ST_GeomFromText returns the following, based on parameters supplied:  
  - NULL—If `wkt` is invalid and `ignore_errors='y'`.  
  - Error—If `wkt` is invalid and `ignore_errors='n'` or is unspecified. |

Returns

GEOMETRY

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>No</td>
</tr>
</tbody>
</table>
Example

The following example shows how to use `ST_GeomFromText`.

Convert WKT into a GEOMETRY object:

```sql
=> SELECT ST_Area(ST_GeomFromText('POLYGON((1 1,2 3,3 5,0 5,1 -2,0 0,1 1))'));
  ST_Area
--------
     6
(1 row)
```

**ST_GeomFromWKB**

Converts the Well-Known Binary (WKB) value to its corresponding GEOMETRY object. Use this function to convert a WKB into the format expected by many of the Vertica Place functions.

A GEOMETRY object is a spatial object with coordinates \((x,y)\) defined in the Cartesian plane.

The maximum size of a GEOMETRY object is 10 MB. If you pass a WKB to `ST_GeomFromWKB` and the result is a spatial object whose size is greater than 10 MB, `ST_GeomFromWKB` returns an error.

**Behavior Type**

*Immutable*

**Syntax**

```
ST_GeomFromWKB( wkb[, srid] [ USING PARAMETERS ignore_errors='y' | 'n' ] )
```

**Arguments**

| wkb          | Well-Known Binary (WKB) value of a GEOMETRY object, type LONG VARBINARY |
| sr id  | (Optional) Spatial reference system identifier (SRID) of the GEOMETRY object, type INTEGER. The SRID is stored in the GEOMETRY object, but does not influence the results of spatial computations. |
| ignore_errors | (Optional) ST_GeomFromWKB returns the following, based on the parameters supplied: |
| | • NULL—If wkb is invalid and ignore_errors='y'. |
| | • Error—If wkb is invalid and ignore_errors='n' or is unspecified. |

**Returns**

GEOMETRY

**Supported Data Types**

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Example**

The following example shows how to use ST_GeomFromWKB.

Convert GEOMETRY into WKT:

```sql
=> CREATE TABLE t(g GEOMETRY);
```
Vertica Documentation
SQL Reference Manual

CREATE TABLE
=> INSERT INTO t VALUES(
ST_GeomFromWKB(X'0103000000010000000400000000000000000000000000000000000000000000000000f
03f0000000000000000f64ae1c7022db544000000000000f03f00000000000000000000000000000000'));
OUTPUT
-------1
(1 row)
=> SELECT ST_AsText(g) from t;
ST_AsText
-----------------------------------POLYGON ((0 0, 1 0, 1e+23 1, 0 0))
(1 row)

ST_Intersection
Calculates the set of points shared by two GEOMETRY objects.

Behavior Type
Immutable

Syntax
ST_Intersection( g1, g2 )

Arguments
g1

Spatial object, type GEOMETRY

g2

Spatial object, type GEOMETRY

Returns
GEOMETRY

Vertica Analytic Database (11.0.x)

Page 2884 of 6730


Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
</tr>

<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Examples

The following examples show how to use `ST_Intersection`.

Two polygons intersect at a single point:

```sql
=> SELECT ST_AsText(ST_Intersection(ST_GeomFromText('POLYGON((0 2,1,0 -1, 0 2))'), ST_GeomFromText('POLYGON((1 2,0 0,-2 0,-1 2))')));
ST_AsText
--------------
POINT(0 0)
(1 row)
```
Two polygons:

```sql
=> SELECT ST_AsText(ST_Intersection(ST_GeomFromText('POLYGON((1 2,1 5,4 5, 4 2,1 2))'), ST_GeomFromText('POLYGON((3 1,3 3,5 3,5 1,3 1))')));

POLYGON ((4 3, 4 2, 3 2, 3 3, 4 3))
(1 row)
```

Two non-intersecting linestrings:

```sql
=> SELECT ST_AsText(ST_Intersection(ST_GeomFromText('LINESTRING(1 1,1 3,3 3)'), ST_GeomFromText('LINESTRING(1 5,1 7,-1 7)')));

GEOMETRYCOLLECTION EMPTY
(1 row)
```
ST_Intersects

Determines if two GEOMETRY or GEOGRAPHY objects intersect or touch at a single point. If ST_Disjoint returns TRUE, ST_Intersects returns FALSE for the same GEOMETRY or GEOGRAPHY objects.

GEOGRAPHY Polygons with a vertex or border on the International Date Line (IDL) or the North or South pole are not supported.

Behavior Type

Immutable

Syntax

ST_Intersects( g1, g2
[USING PARAMETERS bbox={true | false}, spheroid={true | false}])

Arguments

<table>
<thead>
<tr>
<th>g1</th>
<th>Spatial object, type GEOMETRY</th>
</tr>
</thead>
<tbody>
<tr>
<td>g2</td>
<td>Spatial object, type GEOMETRY</td>
</tr>
</tbody>
</table>

Parameters

| bbox = {true | false} | Boolean. Intersects the bounding box of g1 and g2. |
|----------------------|--------------------------------------------------|
|                      | Default: False                                   |
| spheroid = {true | false} | (Optional) BOOLEAN that specifies whether to use a perfect sphere or WGS84. |
|                      | Default: False                                   |
**Returns**

BOOLEAN

**Supported Data Types**

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>No</td>

<tr>
<td>Polygon</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Compatible GEOGRAPHY pairs:

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point-Point</td>
<td>No</td>
</tr>
<tr>
<td>Linestring-Point</td>
<td>No</td>
</tr>
<tr>
<td>Polygon-Point</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon-Point</td>
<td>No</td>
</tr>
</tbody>
</table>

**Examples**

The following examples show how to use ST_Intersects.

Two polygons do not intersect or touch:
```sql
=> SELECT ST_Intersects (ST_GeomFromText('POLYGON((-1 2,0 3,0 1,-1 2))'),
    ST_GeomFromText('POLYGON((1 0,1 2 1 0,0)')));
ST_Intersects  -----------------
false
(1 row)
```

Two polygons touch at a single point:

```sql
=> SELECT ST_Intersects (ST_GeomFromText('POLYGON((-1 2,0 3,0 1,-1 2))'),
    ST_GeomFromText('POLYGON((1 0,1 2 1 0,0)')));
ST_Intersects  -----------------
true
(1 row)
```

Two polygons intersect:
SELECT ST_Intersects(ST_GeomFromText('POLYGON((-1 2, 0 3, 0 1, -1 2))'),
                    ST_GeomFromText('POLYGON((0 2, -1 3, -2 0, 0 2))'));

See Also

ST_Disjoint

ST_IsEmpty

Determines if a spatial object represents the empty set. An empty object has no dimension.

Behavior Type

Immutable

Syntax

ST_IsEmpty( g )
Arguments

| g | Spatial object, type GEOMETRY or GEOGRAPHY |

Returns

BOOLEAN

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>

</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Example

The following example shows how to use ST_IsEmpty.

An empty polygon:

```
=> SELECT ST_IsEmpty(ST_GeomFromText('GeometryCollection EMPTY'));
  ST_IsEmpty
------------
  t
(1 row)
```
**ST_IsSimple**

Determines if a spatial object does not intersect itself or touch its own boundary at any point.

**Behavior Type**

*Immutable*

**Syntax**

`ST_IsSimple( g )`

**Arguments**

| g   | Spatial object, type GEOMETRY or GEOGRAPHY |

**Returns**

BOOLEAN

**Supported Data Types**

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>
GeometryCollection | No  | No

**Examples**

The following examples show how to use `ST_IsSimple`.

**Polygon does not intersect itself:**

![Polygon diagram]

```sql
=> SELECT ST_IsSimple(ST_GeomFromText('POLYGON((-1 2,0 3,1 2,1 -2,-1 2))'));
ST_IsSimple
------------
t
(1 row)
```

**Linestring intersects itself:**

![Linestring diagram]

```sql
=> SELECT ST_IsSimple(ST_GeographyFromText('LINESTRING(10 10,25 26 34.5,
10 30,10 20,20 10)'));
ST_IsSimple
```

```sql
St_I...
```
Linestring touches its interior at one or more locations:

```sql
=> SELECT ST_IsSimple(ST_GeomFromText('LINESTRING(0 0,1 1,1 2,0 0)'));
ST_IsSimple
--------------
f
(1 row)
```

**ST_IsValid**

Determines if a spatial object is well formed or valid. If the object is valid, ST_IsValid returns TRUE; otherwise, it returns FALSE. Use STV_IsValidReason to identify the location of the invalidity.

Spatial validity applies only to polygons and multipolygons. A polygon or multipolygon is valid if all of the following are true:

- The polygon is closed; its start point is the same as its end point.
- Its boundary is a set of linestrings.
- The boundary does not touch or cross itself.
- Any polygons in the interior do not touch the boundary of the exterior polygon except at a vertex.

If you are not sure if a polygon is valid, run ST_IsValid first. If you pass an invalid spatial object to a Vertica Place function, the function fails or returns incorrect results.

**Behavior Type**

*Immutable*

**Syntax**

```sql
ST_IsValid( g )
```

**Arguments**

<table>
<thead>
<tr>
<th>g</th>
<th>Geospatial object to test for validity, value of type GEOMETRY or GEOGRAPHY (WGS84).</th>
</tr>
</thead>
</table>

**Returns**

*BOOLEAN*

**Supported Data Types**

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>
Examples

The following examples show how to use ST_IsValid.

Valid polygon:

```
=> SELECT ST_IsValid(ST_GeomFromText('POLYGON((1 1,1 3,3 3,3 1,1 1))'));
ST_IsValid
----------
t
(1 row)
```

Invalid polygon:

```
=> SELECT ST_IsValid(ST_GeomFromText('POLYGON((1 3,3 2,1 3 0,0,1 3))'));
ST_IsValid
----------
f
(1 row)
```

Invalid polygon:
SELECT ST_IsValid(ST_GeomFromText('POLYGON((0 0, 2 0, 2 2, 0 2, 0 0))'));
ST_IsValid
---------
f
(1 row)

Invalid multipolygon:

=> SELECT ST_IsValid(ST_GeomFromText('MULTIPOLYGON(((0 0, 0 1, 1 1, 0 0),
   ((0.5 0.5, 0.7 0.5, 0.7 0.7, 0.5 0.7, 0.5 0.5))')));
ST_IsValid
---------
f
(1 row)

Valid polygon with hole:

=> SELECT ST_IsValid(ST_GeomFromText('MULTIPOLYGON(((0 0, 0 1, 1 1, 0 0),
   ((0.5 0.5, 0.7 0.5, 0.7 0.7, 0.5 0.7, 0.5 0.5))')));
ST_IsValid
---------
f
(1 row)
Invalid polygon with hole:

```sql
=> SELECT ST_IsValid(ST_GeomFromText('POLYGON((1 1,3 6,3,-1,0.5 -1,1 1),
(1 1,3,1,2,0,1 1))'));
ST_IsValid
----------
t
(1 row)
```

```sql
=> SELECT ST_IsValid(ST_GeomFromText('POLYGON((1 1,3,6,-1,0.5 -1,1 1),
(1 1,3,1,2,0,1 1))'));
ST_IsValid
----------	f
(1 row)
```

**ST_Length**

Calculates the length of a spatial object. For GEOMETRY objects, the length is measured in Cartesian coordinate units. For GEOGRAPHY objects, the length is measured in meters.

Calculates the length as follows:
The length of a point or multipoint object is 0.
The length of a linestring is the sum of the lengths of each line segment. The length of a line segment is the distance from the start point to the end point.
The length of a polygon is the sum of the lengths of the exterior boundary and any interior boundaries.
The length of a multilinestring, multipolygon, or geometrycollection is the sum of the lengths of all the objects it contains.

**Note:**
ST_Length does not calculate the length of WKTs or WKBs. To calculate the lengths of those objects, use the Vertica LENGTH SQL function with ST_AsBinary or ST_AsText.

**Behavior Type**

**Immutable**

**Syntax**

```
ST_Length( g )
```

**Arguments**

| $g$ | Spatial object for which you want to calculate the length, type GEOMETRY or GEOGRAPHY |

**Returns**

FLOAT

**Supported Data Types**

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
### Examples

The following examples show how to use ST_Length.

#### Returns length in Cartesian coordinate units:

```sql
=> SELECT ST_Length(ST_GeomFromText('LINESTRING(-1 -1,2,4,5,6,7)'));
  ST_Length
----------
10.6766190873295
(1 row)
```

#### Returns length in meters:

```sql
=> SELECT ST_Length(ST_GeographyFromText('LINESTRING(-56.12 38.26,-57.51 39.78,-56.37 45.24)'));
  ST_Length
----------
821580.025733461
(1 row)
```

### ST_NumGeometries

Returns the number of geometries contained within a spatial object. Single GEOMETRY or GEOGRAPHY objects return 1 and empty objects return NULL.

### Behavior Type

**Immutable**
**Syntax**

`ST_NumGeometries( g )`

**Arguments**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>g</strong></td>
<td>Spatial object of type GEOMETRY or GEOGRAPHY</td>
</tr>
</tbody>
</table>

**Returns**

INTEGER

**Supported Data Types**

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to use `ST_NumGeometries`.

Return the number of geometries:

```sql
=> SELECT ST_NumGeometries(ST_GeomFromText('MULTILINESTRING ((1 5, 2 4, 5 3, 6 6), (3 5, 3 7)))');
ST_NumGeometries
```
See Also

ST_GeometryN

**ST_NumPoints**

Calculates the number of vertices of a spatial object, empty objects return NULL. The first and last vertex of polygons and multipolygons are counted separately.

**Behavior Type**

Immutable

**Syntax**

```sql
ST_NumPoints( g )
```

**Arguments**

| g | Spatial object for which you want to count the vertices, type GEOMETRY or GEOGRAPHY |

**Returns**

INTEGER

**Supported Data Types**

| Data Type | GEOMETRY | GEOGRAPHY (Perfect Sphere) | GEOGRAPHY (WGS84) |
### Examples

The following examples show how to use ST_NumPoints.

Returns the number of vertices in a linestring:

```sql
=> SELECT ST_NumPoints(ST_GeomFromText('LINESTRING(1.33 1.56, 2.31 3.4, 2.78 5.82, 3.76 3.9, 4.11 3.27, 5.85 4.34, 6.9 4.231, 7.61 5.77)'));

ST_NumPoints
----------
8
(1 row)
```

Use ST_Boundary and ST_NumPoints to return the number of vertices of a polygon:

```sql
=> SELECT ST_NumPoints(ST_Boundary(ST_GeomFromText('POLYGON((1 2, 1 4, 2 5, 3 6, 4 6, 5 4, 3 1 2))')));

ST_NumPoints
----------
9
(1 row)
```

### ST_Overlaps

Determines if a GEOMETRY object shares space with another GEOMETRY object, but is not completely contained within that object. They must overlap at their interiors. If two objects touch at a single point or intersect only along a boundary, they do not overlap. Both parameters must have the same dimension; otherwise, ST_Overlaps returns FALSE.
Behavior Type

Immutable

Syntax

ST_Overlaps ( g1, g2 )

Arguments

<table>
<thead>
<tr>
<th>g1</th>
<th>Spatial object, type GEOMETRY</th>
</tr>
</thead>
<tbody>
<tr>
<td>g2</td>
<td>Spatial object, type GEOMETRY</td>
</tr>
</tbody>
</table>

Returns

BOOLEAN

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Examples

The following examples show how to use ST_Overlaps.

Polygon_1 overlaps but does not completely contain Polygon_2:

```sql
=> SELECT ST_Overlaps(ST_GeomFromText('POLYGON((0 0, 0 1, 1 1, 0 0))'),
                        ST_GeomFromText('POLYGON((0.5 0.5, 0.7 0.5, 0.7 0.7, 0.5 0.7, 0.5 0.5))'));
ST_Overlaps
----------
t
(1 row)
```

Two objects with different dimensions:

```sql
=> SELECT ST_Overlaps(ST_GeomFromText('LINESTRING(2 2,4 4)'),
                        ST_GeomFromText('POINT(3 3)'));
ST_Overlaps
----------
f
(1 row)
```

ST_PointFromGeoHash

Returns the center point of the specified GeoHash.

Behavior Type

Immutable

Syntax

```
ST_PointFromGeoHash(GeoHash)
```

Arguments

| GeoHash | A valid GeoHash string of arbitrary length. |

Returns

GEOGRAPHY POINT

Examples

The following examples show how to use ST_PointFromGeoHash.

Returns the geography point of a high-level GeoHash and uses ST_AsText to convert that point into Well-Known Text:

```sql
=> SELECT ST_AsText(ST_PointFromGeoHash('dr'));
ST_AsText
---------------
POINT (-73.125 42.1875)
(1 row)
```

Returns the geography point of a detailed GeoHash and uses ST_AsText to convert that point into Well-Known Text:

```sql
=> SELECT ST_AsText(ST_PointFromGeoHash('1234567890bcdefhjkmn'));
ST_AsText
---------------
POINT (-122.196077187 -88.2297377551)
(1 row)
```

ST_PointN

Finds the $n$th point of a spatial object. If you pass a negative number, zero, or a number larger than the total number of points on the linestring, ST_PointN returns NULL.

The vertex order is based on the Well-Known Text (WKT) representation of the spatial object.
Behavior Type

Immutable

Syntax

ST_PointN( g, n )

Arguments

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>g</td>
<td>Spatial object to search, type GEOMETRY or GEOGRAPHY</td>
</tr>
<tr>
<td>n</td>
<td>Point in the spatial object to be returned. The index is one-based, type INTEGER</td>
</tr>
</tbody>
</table>

Returns

GEOMETRY or GEOGRAPHY

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>
**Examples**

The following examples show how to use ST_PointN.

Returns the fifth point:

```sql
=> SELECT ST_AsText(ST_PointN(ST_GeomFromText('POLYGON(( 2 6, 2 9, 6 9, 7 7, 4 6, 2 6))'), 5));
ST_AsText
----------
POINT (4 6)
(1 row)
```

Returns the second point:

```sql
=> SELECT ST_AsText(ST_PointN(ST_GeographyFromText('LINESTRING(23.41 24.93,34.2 32.98,40.7 41.19)'), 2));
ST_AsText
----------
POINT (34.2 32.98)
(1 row)
```

**ST_Relate**

Determines if a given GEOMETRY object is spatially related to another GEOMETRY object, based on the specified DE-9IM pattern matrix string.

The DE-9IM standard identifies how two objects are spatially related to each other.

**Behavior Type**

*Immutable*

**Syntax**

`ST_Relate( g1, g2, matrix )`

**Arguments**

| g1       | Spatial object, type GEOMETRY |
Spatial object, type GEOMETRY

DE-9IM pattern matrix string, type CHAR(9). This string represents a 3 x 3 matrix of restrictions on the dimensions of the respective intersections of the interior, boundary, and exterior of the two geometries. Must contain exactly 9 of the following characters:

- T
- F
- 0
- 1
- 2
- *

Returns

BOOLEAN

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Examples

The following examples show how to use ST_Relate.

The DE-9IM pattern for "equals" is 'T*F***FF2':
The DE-9IM pattern for "overlaps" is 'T*T***T**':

=> SELECT ST_Relate(ST_GeomFromText('POLYGON((-1 -1,0 1,1 2,-1 -1))'),
                  ST_GeomFromText('POLYGON((0 1,1 -1,1 0 1))'), 'T*T***T**');
                  
ST_Relate
----------
t   (1 row)

**ST_SRID**

Identifies the spatial reference system identifier (SRID) stored with a spatial object.

The SRID of a GEOMETRY object can only be determined when passing an SRID to either ST_GeomFromText or ST_GeomFromWKB. ST_SRID returns this stored value. SRID values of 0 to $2^{32}-1$ are valid.

**Behavior Type**

Immutable

**Syntax**

ST_SRID( $g$ )

**Arguments**

| $g$  | Spatial object for which you want the SRID, type GEOMETRY or GEOGRAPHY |

**Returns**

INTEGER
Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Examples

The following examples show how to use ST_SRID.

The default SRID of a GEOMETRY object is 0:

```
=> SELECT ST_SRID(ST_GeomFromText(
    'POLYGON((-1 -1,2,0,1,-1))'));
ST_SRID
-------
0
(1 row)
```

The default SRID of a GEOGRAPHY object is 4326:

```
=> SELECT ST_SRID(ST_GeographyFromText(
    'POLYGON((22 35,24 35,26 32,22 35))'));
ST_SRID
-------
4326
(1 row)
```
**ST_SymDifference**

Calculates all the points in two GEOMETRY objects except for the points they have in common, but including the boundaries of both objects.

This result is called the symmetric difference and is represented mathematically as:

\[ \text{Closure} (g1 – g2) \cup \text{Closure} (g2 – g1) \]

**Behavior Type**

*Immutable*

**Syntax**

`ST_SymDifference( g1, g2 )`

**Arguments**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>g1</code></td>
<td>Spatial object, type GEOMETRY</td>
</tr>
<tr>
<td><code>g2</code></td>
<td>Spatial object, type GEOMETRY</td>
</tr>
</tbody>
</table>

**Returns**

GEOMETRY

**Supported Data Types**

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Examples

The following examples show how to use ST_SymDifference.

Returns the two linestrings:

```
=> SELECT ST_AsText(ST_SymDifference(ST_GeomFromText('LINESTRING(30 40, 30 55)'), ST_GeomFromText('LINESTRING(30 32.5, 30 47.5)')));
ST_AsText
---------------------
MULTILINESTRING ((30 47.5, 30 55), (30 32.5, 30 40))
(1 row)
```

Returns four squares:
ST_Touches

Determines if two GEOMETRY objects touch at a single point or along a boundary, but do not have interiors that intersect.

GEOGRAPHY Polygons with a vertex or border on the International Date Line (IDL) or the North or South pole are not supported.

Behavior Type

Immutable

Syntax

```
ST_Touches( g1, g2
            [USING PARAMETERS spheroid={true | false} ]
```

Arguments

<table>
<thead>
<tr>
<th>g1</th>
<th>Spatial object, value of type GEOMETRY</th>
</tr>
</thead>
<tbody>
<tr>
<td>g2</td>
<td>Spatial object, value of type GEOMETRY</td>
</tr>
</tbody>
</table>
Parameters

\[
\text{spheroid} = \{\text{true} \mid \text{false}\}
\]
(Optional) BOOLEAN that specifies whether to use a perfect sphere or WGS84.

Default: False

Returns

BOOLEAN

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Compatible GEOGRAPHY pairs:

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point-Point</td>
<td>No</td>
</tr>
<tr>
<td>Linestring-Point</td>
<td>No</td>
</tr>
<tr>
<td>Polygon-Point</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon-Point</td>
<td>No</td>
</tr>
</tbody>
</table>
Examples

The following examples show how to use ST_Touches.

Two polygons touch at a single point:

```
=> SELECT ST_Touches(ST_GeomFromText('POLYGON((-1 2,0 3,0 1,-1 2))'),
                             ST_GeomFromText('POLYGON((1 3,0 3,1 2,1 3)')));
ST_Touches
-------
t
(1 row)
```

Two polygons touch only along part of the boundary:

```
=> SELECT ST_Touches(ST_GeomFromText('POLYGON((-1 2,0 3,0 1,-1 2))'),
                             ST_GeomFromText('POLYGON((1 2,0 3,0 1,1 2)')));
ST_Touches
-------
t
(1 row)
```

Two polygons do not touch at any point:

```
=> SELECT ST_Touches(ST_GeomFromText('POLYGON((-1 2,0 3,0 1,-1 2))'),
                             ST_GeomFromText('POLYGON((0 2,-1 3,-2 0,0 2)')));
ST_Touches
-------
f
(1 row)
```

ST_Transform

Returns a new GEOMETRY with its coordinates converted to the spatial reference system identifier (SRID) used by the sríd argument.

This function supports the following transformations:

- EPSG 4326 (WGS84) to EPSG 3857 (Web Mercator)
- EPSG 3857 (Web Mercator) to EPSG 4326 (WGS84)

For EPSG 4326 (WGS84), unless the coordinates fall within the following ranges, conversion results in failure:
- Longitude limits: -572 to +572
- Latitude limits: -89.9999999 to +89.9999999

**Behavior Type**

**Immutable**

**Syntax**

`ST_Transform( g1, srid )`

**Arguments**

| \( g1 \) | Spatial object of type GEOMETRY. |
| \( srid \) | Spatial reference system identifier (SRID) to which you want to convert your spatial object, of type INTEGER. |

**Returns**

GEOMETRY

**Supported Data Types**

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>
Examples

The following example shows how you can transform data from Web Mercator (3857) to WGS84 (4326):

```sql
=> SELECT ST_AsText(ST_Transform(STV_GeometryPoint(7910240.56433, 5215074.23966, 3857), 4326));
ST_AsText
------------------------
POINT (71.0589 42.3601)  
(1 row)
```

The following example shows how you can transform linestring data in a table from WGS84 (4326) to Web Mercator (3857):

```sql
=> CREATE TABLE transform_line_example (g GEOMETRY);
CREATE TABLE
=> COPY transform_line_example (gx FILLER LONG VARCHAR, g AS ST_GeomFromText(gx, 4326)) FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> LINESTRING(0 0, 1 1, 2 2, 3 4)
>> \,
=> SELECT ST_AsText(ST_Transform(g, 3857)) FROM transform_line_example;
ST_AsText
-------------------------------------------------------------
-------------------------------------------------------------
LINESTRING (0 -7.08115455161e-10, 111319.490793 111325.142866, 222638.981587 222684.208506, 333958.47238 445640.109656)
(1 row)
```

The following example shows how you can transform point data in a table from WGS84 (4326) to Web Mercator (3857):

```sql
=> CREATE TABLE transform_example (x FLOAT, y FLOAT, srid INT);
CREATE TABLE
=> COPY transform_example FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 42.3601|71.0589|4326
>> 122.4194|37.7749|4326
>> 94.5786|39.0997|4326
>> \,
=> SELECT ST_AsText(ST_Transform(STV_GeometryPoint(x, y, srid), 3857)) FROM transform_example;
ST_AsText
------------------------
------------------------
POINT (4715504.76195 11422441.5961)  
POINT (13627665.2712 4547675.35434)  
POINT (10528441.5919 4735962.8206)  
(3 rows)
```
**ST_Union**

Calculates the union of all points in two spatial objects.

This result is represented mathematically by: \( g1 \cup g2 \)

**Behavior Type**

Immutable

**Syntax**

\[ \text{ST}_{\text{Union}} (g1, g2) \]

**Arguments**

| \( g1 \) | Spatial object, type GEOMETRY |
| \( g2 \) | Spatial object, type GEOMETRY |

**Returns**

GEOMETRY

**Supported Data Types**

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Example

The following example shows how to use ST_Union.

Returns a polygon that represents all the points contained in these two polygons:

=> SELECT ST_AsText(ST_Union(ST_GeomFromText('POLYGON((0 2,1 1,0 -1,-1 1,0 2)'), ST_GeomFromText('POLYGON((-1 2, 0 0, -2 0, -1 2))')));

POLYGON ((0 2, 1 1, 0 -1, -0.5 0, -2 0, -1 2, -0.666666666667 1.33333333333, 0 2))

(1 row)

ST_Within

If spatial object g1 is completely inside of spatial object g2, then ST_Within returns true. Both parameters must be the same spatial data type. Either specify two GEOMETRY objects or two GEOGRAPHY objects.
If an object such as a point or linestring only exists along a polygon's boundary, then ST_Within returns false. The interior of a linestring is all the points along the linestring except the start and end points.

ST_Within(\texttt{g1}, \texttt{g2}) is functionally equivalent to ST_Contains(\texttt{g2}, \texttt{g1}).

GEOGRAPHY Polygons with a vertex or border on the International Date Line (IDL) or the North or South pole are not supported.

**Behavior Type**

*Immutable*

**Syntax**

\[
\text{ST}_\text{Within}(\texttt{g1}, \texttt{g2} \ [\text{USING PARAMETERS spheroid=\{true | false\}}])
\]

**Arguments**

- \texttt{g1}: Spatial object, type GEOMETRY or GEOGRAPHY
- \texttt{g2}: Spatial object, type GEOMETRY or GEOGRAPHY

**Parameters**

- \texttt{spheroid=\{true | false\}}: (Optional) BOOLEAN that specifies whether to use a perfect sphere or WGS84.
  - **Default**: False

**Returns**

BOOLEAN
# Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>

<td>No</td>
</tr>
<tr>
<td>Point-Polygon</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Point-Multipolygon</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

## Examples

The following examples show how to use `ST_Within`.

The first polygon is completely contained within the second polygon:

```sql
=> SELECT ST_Within(ST_GeomFromText('POLYGON((0 2,1 1,-1,0 2))'),
                     ST_GeomFromText('POLYGON((-1 3,2 1,0 -3,-1 3))'));
```

```
t
(1 row)
```

The point is on a vertex of the polygon, but not in its interior:
SELECT ST_Within (ST_GeographyFromText('POINT(30 25)'),
  ST_GeographyFromText('POLYGON((25 25,25 35,32.2 35,30 25,25 25)')));
ST_Within
-------------
f
(1 row)

Two polygons are spatially equivalent:

=> SELECT ST_Within (ST_GeomFromText('POLYGON((-1 2, 0 3, 0 1, -1 2))'),
  ST_GeomFromText('POLYGON((0 3, -1 2, 0 1, 0 3))'));
ST_Within
-------------
t
(1 row)

See Also

- ST_Contains
- ST_Overlaps

ST_X

Determines the x-coordinate for a GEOMETRY point or the longitude value for a GEOGRAPHY point.

Behavior Type

 Immutable

Syntax

ST_X( g )

Arguments

| g  | Point of type GEOMETRY or GEOGRAPHY |
**Returns**

FLOAT

**Supported Data Types**

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Linestring</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Polygon</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Examples**

The following examples show how to use ST_X.

Returns the x-coordinate:

```sql
=> SELECT ST_X(ST_GeomFromText('POINT(3.4 1.25)'));
   ST_X
  -----
   3.4
(1 row)
```

Returns the longitude value:

```sql
=> SELECT ST_X(ST_GeographyFromText('POINT(25.34 45.67)'));
   ST_X
  -----  
  25.34
(1 row)
```
**ST_XMax**

Returns the maximum x-coordinate of the minimum bounding rectangle of the GEOMETRY or GEOGRAPHY object.

For GEOGRAPHY types, Vertica Place computes maximum coordinates by calculating the maximum longitude of the great circle arc from (MAX(longitude), ST_YMin(GEOGRAPHY)) to (MAX(longitude), ST_YMax(GEOGRAPHY)). In this case, MAX(longitude) is the maximum longitude value of the geography object.

If either latitude or longitude is out of range, ST_XMax returns the maximum plain value of the geography object.

**Behavior Type**

*Immutable*

**Syntax**

```sql
ST_XMax( g )
```

**Arguments**

| g | Spatial object for which you want to find the maximum x-coordinate, type GEOMETRY or GEOGRAPHY. |

**Returns**

FLOAT

**Supported Data Types**

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>ST_XMax</td>
<td>ST_YMax</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Examples**

The following examples show how to use ST_XMax.

*Returns the maximum x-coordinate within a rectangle:*

```sql
=> SELECT ST_XMax(ST_GeomFromText('POLYGON((0 1, 0 2, 1 2, 1 1, 0 1))'));
ST_XMax
---------
1
(1 row)
```

*Returns the maximum longitude value within a rectangle:*

```sql
=> SELECT ST_XMax(ST_GeographyFromText('POLYGON((-71.50 42.35, -71.00 42.35, -71.00 42.38, -71.50 42.38, -71.50 42.35))'));
ST_XMax
---------
-71
(1 row)
```

**ST_XMin**

Returns the minimum x-coordinate of the minimum bounding rectangle of the GEOMETRY or GEOGRAPHY object.

For GEOGRAPHY types, Vertica Place computes minimum coordinates by calculating the minimum longitude of the great circle arc from (MIN(longitude), ST_YMin(GEOGRAPHY)) to (MIN(longitude), ST_YMax(GEOGRAPHY)). In this case, MIN(latitude) represents the minimum longitude value of the geography object.
If either latitude or longitude is out of range, ST_XMin returns the minimum plain value of the geography object.

**Behavior Type**

*Immutable*

**Syntax**

```
ST_XMin( g )
```

**Arguments**

| g | Spatial object for which you want to find the minimum x-coordinate, type GEOMETRY or GEOGRAPHY. |

**Returns**

FLOAT

**Supported Data Types**

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>
Examples

The following examples show how to use ST_XMin.

Returns the minimum x-coordinate within a rectangle:

```sql
=> SELECT ST_XMin(ST_GeomFromText('POLYGON((0 0 2,2,1 1,0 1))'));
ST_XMin
--------
0
(1 row)
```

Returns the minimum longitude value within a rectangle:

```sql
=> SELECT ST_XMin(ST_GeographyFromText('POLYGON((-71.50 42.35, -71.00 42.35, -71.00 42.38, -71.50 42.38, -71.50 42.35))'));
ST_XMin
--------
-71.5
(1 row)
```

ST_YMax

Returns the maximum y-coordinate of the minimum bounding rectangle of the GEOMETRY or GEOGRAPHY object.

For GEOGRAPHY types, Vertica Place computes maximum coordinates by calculating the maximum latitude of the great circle arc from (ST_XMin(GEOGRAPHY), MAX(latitude)) to (ST_XMax(GEOGRAPHY), MAX(latitude)). In this case, MAX(latitude) is the maximum latitude value of the geography object.

If either latitude or longitude is out of range, ST_YMax returns the maximum plain value of the geography object.

Behavior Type

Immutable

Syntax

```
ST_YMax( g )
```
Arguments

| g | Spatial object for which you want to find the maximum y-coordinate, type GEOMETRY or GEOGRAPHY. |

Returns

FLOAT

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>Yes</td>
</tr>

<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Examples

The following examples show how to use ST_YMax.

Returns the maximum y-coordinate within a rectangle:

```sql
=> SELECT ST_YMax(ST_GeomFromText('POLYGON((0 1,0 4,1 4,1 0 1))'));
ST_YMax
--------
4
(1 row)
```

Returns the maximum latitude value within a rectangle:
ST_YMin

Returns the minimum y-coordinate of the minimum bounding rectangle of the GEOMETRY or GEOGRAPHY object.

For GEOGRAPHY types, Vertica Place computes minimum coordinates by calculating the minimum latitude of the great circle arc from (ST_XMin(GEOGRAPHY), MIN(latitude)) to (ST_XMax(GEOGRAPHY), MIN(latitude)). In this case, MIN(latitude) represents the minimum latitude value of the geography object.

If either latitude or longitude is out of range, ST_YMin returns the minimum plain value of the geography object.

Behavior Type

Immutable

Syntax

ST_YMin( g )

Arguments

| g | Spatial object for which you want to find the minimum y-coordinate, type GEOMETRY or GEOGRAPHY. |

Returns

FLOAT
**Supported Data Types**

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>

<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Examples**

The following examples show how to use ST_YMin.

Returns the minimum y-coordinate within a rectangle:

```
=> SELECT ST_YMin(ST_GeomFromText('POLYGON((0 1,0 4,1 4,1 0,1 1))'));
   ST_YMin
------------
     1
(1 row)
```

Returns the minimum latitude value within a rectangle:

```
=> SELECT ST_YMin(ST_GeographyFromText(
                  'POLYGON((-71.50 42.35, -71.00 42.35, -71.00 42.38, -71.50 42.38, -71.50 42.35))'));
   ST_YMin
------------------
   42.35
(1 row)
```

**ST_Y**

Determines the y-coordinate for a GEOMETRY point or the latitude value for a GEOGRAPHY point.
Behavior Type

Immutable

Syntax

ST_Y( g )

Arguments

<table>
<thead>
<tr>
<th>g</th>
<th>Point of type GEOMETRY or GEOGRAPHY</th>
</tr>
</thead>
</table>

Returns

FLOAT

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>

<td>Polygon</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Examples

The following examples show how to use ST_Y.
Returns the y-coordinate:

```sql
=> SELECT ST_Y(ST_GeomFromText('POINT(3 5.25)'));
   ST_Y
------
  5.25
(1 row)
```

Returns the latitude value:

```sql
=> SELECT ST_Y(ST_GeographyFromText('POINT(35.44 51.04)'));
   ST_Y
------
  51.04
(1 row)
```

---

**STV_AsGeoJSON**

Returns the geometry or geography argument as a Geometry Javascript Object Notation (GeoJSON) object.

---

**Behavior Type**

*Immutable*

**Syntax**

```sql
STV_AsGeoJSON( g, [USING PARAMETERS maxdecimals=[dec_value]])
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>g</td>
<td>Spatial object of type GEOMETRY or GEOGRAPHY</td>
</tr>
<tr>
<td>maxdecimals = dec_value</td>
<td>(Optional) Integer value. Determines the maximum number of digits to output after the decimal of floating point coordinates.</td>
</tr>
<tr>
<td></td>
<td>Valid values: Between 0 and 15.</td>
</tr>
<tr>
<td></td>
<td>Default value: 6</td>
</tr>
</tbody>
</table>

Examples
The following examples show how you can use STV_AsGeoJSON.
Convert a geometry polygon to GeoJSON:
=> SELECT STV_AsGeoJSON(ST_GeomFromText('POLYGON((3 2, 4 3, 5 1, 3 2), (3.5 2, 4 2.5, 4.5 1.5, 3.5
2))'));
STV_AsGeoJSON
-------------------------------------------------------------------------------------------------{"type":"Polygon","coordinates":[[[3,2],[4,3],[5,1],[3,2]],[[3.5,2],[4,2.5],[4.5,1.5],[3.5,2]]]}
(1 row)

Convert a geography point to GeoJSON:
=> SELECT STV_AsGeoJSON(ST_GeographyFromText('POINT(42.36011 71.05899)') USING PARAMETERS
maxdecimals=4);
STV_AsGeoJSON
------------------------------------------------{"type":"Point","coordinates":[42.3601,71.059]}
(1 row)

Vertica Analytic Database (11.0.x)

Page 2934 of 6730


**STV_Create_Index**

Creates a spatial index on a set of polygons to speed up spatial intersection with a set of points.

A spatial index is created from an input polygon set, which can be the result of a query. Spatial indexes are created in a global name space. Vertica uses a distributed plan whenever the input table or projection is segmented across nodes of the cluster.

The OVER() clause must be empty.

**Important:**
You cannot access spatial indexes on newly added nodes without rebalancing your cluster. For more information, see `REBALANCE_CLUSTER`.

**Behavior Type**

**Immutable**

**Note:**
Indexes are not connected to any specific table. Subsequent DML commands on the underlying table or tables of the input data source do not modify the index.

**Syntax**

```
STV_Create_Index( gid, g
   USING PARAMETERS
   index='index_name'
   [, overwrite={true | false}] 
   [, max_mem_mb=maxmem_value]
   [, skip_nonindexable_polygons={true | false}])

OVER()
   [ AS (polygons, srid, min_x, min_y, max_x, max_y, info) ]
```

**Arguments**

| **gid** | Name of an integer column that uniquely identifies the polygon. The gid cannot be NULL. |
Name of a geometry or geography (WGS84) column or expression that contains polygons and multipolygons. Only polygon and multipolygon can be indexed. Other shape types are excluded from the index.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>index = 'index_name'</code></td>
<td>Name of the index, type VARCHAR. Index names cannot exceed 110 characters. The slash, backslash, and tab characters are not allowed in index names.</td>
</tr>
<tr>
<td>`overwrite = [ true</td>
<td>false ]`</td>
</tr>
<tr>
<td><code>max_mem_mb = maxmem_value</code></td>
<td>A positive integer that assigns a limit to the amount of memory in megabytes that STV_Create_Index can allocate during index construction. On a multi-node database this is the memory limit per node. The default value is 256. Do not assign a value higher than the amount of memory in the GENERAL resource pool. For more information about this pool, see Querying Resource Pool Data. Setting a value for max_mem_mb that is at or near the maximum memory available on the node can negatively affect your system’s performance. For example, it could cause other queries to time out waiting for memory resources during index construction.</td>
</tr>
<tr>
<td>`skip_nonindexable_polygons = [ true</td>
<td>false ]`</td>
</tr>
</tbody>
</table>
creation to fail. When set to True, index creation can succeed by excluding non-indexable polygons from the index.

To review the polygons that were not able to be indexed, use STV_Describe_Index with the parameter list_polygon.

Default: False

## Returns

<table>
<thead>
<tr>
<th></th>
<th>Number of polygons indexed.</th>
</tr>
</thead>
<tbody>
<tr>
<td>polygons</td>
<td>SRID</td>
</tr>
<tr>
<td></td>
<td>min_x, min_y, max_x, max_y</td>
</tr>
<tr>
<td></td>
<td>info</td>
</tr>
</tbody>
</table>

## Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>No</td>
<td>No</td>
</tr>

<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>
**Privileges**

Any user with access to the STV_*_Index functions can describe, rename, or drop indexes created by any other user.

**Recommendations**

- Segment large polygon tables across multiple nodes. Table segmentation causes index creation to run in parallel, leveraging the Massively Parallel Processing (MPP) architecture in Vertica. This significantly reduces execution time on large tables.

  Vertica recommends that you segment the table from which you are building the index when the total number of polygons is large.

- STV_Create_Index can consume large amounts of processing time and memory.

  Vertica recommends that when indexing new data for the first time, you monitor memory usage to be sure it stays within safe limits. Memory usage depends on number of polygons, number of vertices, and the amount of overlap among polygons.

- STV_Create_Index tries to allocate memory before it starts creating the index. If it cannot allocate enough memory, the function fails. If not enough memory is available, try the following:
  
  - Create the index at a time of less load on the system.
  - Avoid concurrent index creation.
  - Try segmenting the input table across the nodes of the cluster.

- Ensure that all of the polygons you plan to index are valid polygons. STV_Create_Index and STV_Refresh_Index do not check polygon validity when building an index.

  For more information, see [Ensuring Polygon Validity Before Creating or Refreshing an Index](#).

**Limitations**

- Any indexes created prior to 11.0.x need to re-created.
- Index creation fails if there are WGS84 polygons with vertices on the International Date Line (IDL) or the North and South Poles.

- The backslash or tab characters are not allowed in index names.
- Indexes cannot have names greater than 110 characters.
The following geometries are excluded from the index:
  - Non-polygons
  - Geometries with NULL identifiers
  - NULL (multi) polygon
  - EMPTY (multi) polygon
  - Invalid (multi) polygon

The following geographies are excluded from the index:
  - Polygons with holes
  - Polygons crossing the International Date Line
  - Polygons covering the north or south pole
  - Antipodal polygons

**Usage Tips**

- To cancel an STV_Create_Index run, use **Ctrl + C**.
- If there are no valid polygons in the geom column, STV_Create_Index reports an error in vertica.log and stops index creation.
- If index creation uses a large amount of memory, consider segmenting your data to utilize parallel index creation.

**Examples**

The following examples show how to use STV_Create_Index.

Create an index with a single literal argument:

```sql
=> SELECT STV_Create_Index(1, ST_GeomFromText('POLYGON((0 0 15.2 3.9 15.2 3.9 0 0 0))')
    USING PARAMETERS index='my_polygon') OVER();
```

<table>
<thead>
<tr>
<th>polygons</th>
<th>SRID</th>
<th>min_x</th>
<th>min_y</th>
<th>max_x</th>
<th>max_y</th>
<th>info</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>3.9</td>
<td>15.2</td>
<td></td>
</tr>
<tr>
<td>1 row</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Create an index from a table:

```sql
=> CREATE TABLE pols (gid INT, geom GEOMETRY(1000));
CREATE TABLE
=> COPY pols(gid, gx filler LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM stdin delimiter '|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 1|POLYGON((-31 74,8 70,8 50,-36 53,-31 74))
>> 2|POLYGON((-38 50,4 13,11 45,0 65,-38 50))
```
Create an index in parallel from a partitioned table:

```
=> CREATE TABLE pols (p INT, gid INT, geom GEOMETRY(1000)) SEGMENTED BY HASH(p) ALL NODES;
CREATE TABLE
=> COPY pols (p, gid, gx filler LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM stdin delimiter ' |
Enter data to be copied followed by a newline. End with a backslash and a period on a line by itself.
=> 1|10|POLYGON((-31 74,8 70,8 50,-36 53,-31 74))
=> 1|11|POLYGON((-38 50,4 13,11 45,0 65,-38 50))
=> 3|12|POLYGON((-12 42,-12 42,27 48,14 26,-12 42))
=> 
=> SELECT STV_Create_Index(gid, geom USING PARAMETERS index='my_polygons', overwrite=true, max_mem_mb=256) OVER() FROM pols;
polygons | SRID | min_x | min_y | max_x | max_y | info
------------+------------+--------+--------+--------+--------+--------
3 | 0 | -38 | 13 | 27 | 74
```

**STV_Describe_Index**

Retrieves information about an index that contains a set of polygons. If you do not pass any parameters, STV_Describe_Index returns all of the defined indexes.

The `OVER()` clause must be empty.
Behavior Type

Immutable

Syntax

STV_Describe_Index ( [ USING PARAMETERS [index='index_name']
    [, list_polygons={true | false} ]] ) OVER ()

Arguments

<table>
<thead>
<tr>
<th>index = 'index_name'</th>
<th>Name of the index, type VARCHAR. Index names cannot exceed 110 characters. The slash, backslash, and tab characters are not allowed in index names.</th>
</tr>
</thead>
<tbody>
<tr>
<td>list_polygon</td>
<td>(Optional) BOOLEAN that specifies whether to list the polygons in the index. The index argument must be used with this argument.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>polygons</th>
<th>Number of polygons indexed.</th>
</tr>
</thead>
<tbody>
<tr>
<td>SRID</td>
<td>Spatial reference system identifier.</td>
</tr>
<tr>
<td>min_x, min_y, max_x, max_y</td>
<td>Coordinates of the minimum bounding rectangle (MBR) of the indexed geometries. (min_x, min_y) are the south-west coordinates, and (max_x, max_y) are the north-east coordinates.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the spatial index(es).</td>
</tr>
<tr>
<td>gid</td>
<td>Name of an integer column that uniquely identifies the polygon. The gid cannot be NULL.</td>
</tr>
<tr>
<td>state</td>
<td>The spatial object's state in the index. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• INDEXED - The spatial object was successfully indexed.</td>
</tr>
<tr>
<td></td>
<td>• SELF_INTERSECT - (WGS84 Only) The spatial object was not indexed because one of its edges intersects with</td>
</tr>
</tbody>
</table>
another of its edges.
- **EDGE_CROSS_IDL** - (WGS84 Only) The spatial object was not indexed because one of its edges crosses the International Date Line.
- **EDGE_HALF_CIRCLE** - (WGS84 Only) The spatial object was not indexed because it contains two adjacent vertices that are antipodal.
- **NON_INDEXABLE** - The spatial object was not able to be indexed.

| **geography** | The Well-Known Binary (WKB) representation of the spatial object. |
| **geometry** | The Well-Known Binary (WKB) representation of the spatial object. |

## Privileges

Any user with access to the STV_*Index functions can describe, rename, or drop indexes created by any other user.

## Limitations

Some functionality will require the index to be rebuilt if the index was created with 11.0.x or earlier.

## Examples

The following examples show how to use STV_Describe_Index.

Retrieve information about the index:

```sql
=> SELECT STV_Describe_Index (USING PARAMETERS index='my_polygons') OVER ();

<table>
<thead>
<tr>
<th>type</th>
<th>polygons</th>
<th>SRID</th>
<th>min_x</th>
<th>min_y</th>
<th>max_x</th>
<th>max_y</th>
</tr>
</thead>
<tbody>
<tr>
<td>GEOMETRY</td>
<td>4</td>
<td>0</td>
<td>-1</td>
<td>-1</td>
<td>12</td>
<td>12</td>
</tr>
</tbody>
</table>
```

(1 row)

Return the names of all the defined indexes:

```sql
=> SELECT STV_Describe_Index() OVER ();
```
Return the polygons included in an index:

```sql
=> SELECT STV_Describe_Index(USING PARAMETERS index='my_polygons', list_polygons=TRUE) OVER ();
```

<table>
<thead>
<tr>
<th>gid</th>
<th>state</th>
<th>geometry</th>
</tr>
</thead>
</table>
| 12  | INDEXED   | \260\000\000\000\000\000 \ ...
| 14  | INDEXED   | \200\000\000\000\000\000 \ ...
| 10  | NON_INDEXABLE | \274\000\000\000\000\000 \ ...
| 11  | INDEXED   | \260\000\000\000\000\000 \ ...

(4 rows)

See Also

- Spatial Joins with ST_Intersects and STV_Intersect
- STV_Intersect Scalar Function

- STV_Drop_Index
- STV_Rename_Index

### STV_Drop_Index

Deletes a spatial index. If STV_Drop_Index cannot find the specified spatial index, it returns an error.

The OVER clause must be empty.

### Behavior Type

**Immutable**

### Syntax

```sql
STV_Drop_Index( USING PARAMETERS index = 'index_name' ) OVER ()
```
Arguments

| index = 'index_name' | Name of the index, type VARCHAR. Index names cannot exceed 110 characters. The slash, backslash, and tab characters are not allowed in index names. |

Example

The following example shows how to use STV_Drop_Index.

Drop an index:

```sql
=> SELECT STV_Drop_Index(USING PARAMETERS index = 'my_polygons') OVER ();
```

Index dropped
(1 row)

STV_DWithin

Determines if the shortest distance from the boundary of one spatial object to the boundary of another object is within a specified distance.

Parameters $g1$ and $g2$ must be both GEOMETRY objects or both GEOGRAPHY objects.

Behavior Type

Immutable
Syntax

STV_DWithin( g1, g2, d )

Arguments

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>g1</td>
<td>Spatial object of type GEOMETRY or GEOGRAPHY</td>
</tr>
<tr>
<td>g2</td>
<td>Spatial object of type GEOMETRY or GEOGRAPHY</td>
</tr>
<tr>
<td>d</td>
<td>Value of type FLOAT indicating a distance. For GEOMETRY objects, the distance is measured in Cartesian coordinate units. For GEOGRAPHY objects, the distance is measured in meters.</td>
</tr>
</tbody>
</table>

Returns

BOOLEAN

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Compatible GEOGRAPHY pairs:

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Geometry</td>
<td>Result</td>
</tr>
<tr>
<td>--------------------</td>
<td>--------</td>
</tr>
<tr>
<td>Point-Point</td>
<td>Yes</td>
</tr>
<tr>
<td>Point-Linestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Point-Polygon</td>
<td>Yes</td>
</tr>
<tr>
<td>Point-Multilinestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Point-Multipolygon</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Examples

The following examples show how to use `STV_DWithin`.

Two geometries are one Cartesian coordinate unit from each other at their closest points:

```sql
=> SELECT STV_DWithin(ST_GeomFromText('POLYGON((-1 -1,2,0 1,-1))'),
                      ST_GeomFromText('POLYGON((4 3,2 3,4 3))'),1);
STV_DWithin
-----------
t
(1 row)
```

If you reduce the distance to 0.99 units:

```sql
=> SELECT STV_DWithin(ST_GeomFromText('POLYGON((-1 -1,2,0 1,-1))'),
                      ST_GeomFromText('POLYGON((4 3,2 3,4 3))'),0.99);
STV_DWithin
-----------
f
(1 row)
```

The first polygon touches the second polygon:

```sql
=> SELECT STV_DWithin(ST_GeomFromText('POLYGON((-1 -1,2,0 1,-1))'),
                      ST_GeomFromText('POLYGON((1 1,2 3,4 3,1))'),0.00001);
STV_DWithin
-----------
t
(1 row)
```

The first polygon is not within 1000 meters from the second polygon:

```sql
=> SELECT STV_DWithin(ST_GeomFromText('POLYGON((45.2 40,50.65 51.29,
                                             55.67 47.6,50 47.6,45.2 40))'),ST_GeomFromText('POLYGON((25 25,25 30,
                                             30 30,30 25,25 25))'), 1000);
STV_DWithin
-----------
t
(1 row)
```
**STV_Export2Shapefile**

Exports GEOGRAPHY or GEOMETRY data from a database table or a subquery to a shapefile. Writes the output to the directory specified using `STV_SetExportShapefileDirectory`.

**Behavior Type**

*Immutable*

**Syntax**

```
STV_Export2Shapefile( columns
                 USING PARAMETERS shapefile = 'name_of_shapefile'
                             [, overwrite = { TRUE | FALSE } ]
                             [, shape = ' { Point | Polygon | Linestring | Multipoint | Multipolygon | Multilinestring }' ]
                 )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>shapefile = 'name_of_shapefile'</code></td>
<td>Prefix of the component names of the shapefile, type VARCHAR. Must end with the file extension .shp. Limited to 128 octets in length. For example, city-data.shp. If you want to save the shapefile to a subdirectory you can do so by concatenating the subdirectory to <code>name_of_shapefile</code>. For</td>
</tr>
</tbody>
</table>
Example, visualizations/city-data.shp.

You can also export a shapefile to a mounted S3 directory where you have read and write permissions. Use the syntax `<bucketname>/path/filename`.

| overwrite | (Optional) BOOLEAN value that specifies whether to overwrite the index, if an index exists. This parameter cannot be NULL. Default: False
|           | Overwriting may corrupt the existing files.

| shape     | Must be one of the following spatial classes: Point, Polygon, Linestring, Multipoint, Multipolygon, Multilinestring. Polygons and multipolygons always have a clockwise orientation. Default: Polygon
|           | `{'Point | Polygon | Linestring | Multipoint | Multipolygon | Multilinestring'`
Arguments

| columns | The columns to export to the shapefile. A value of asterisk (*) is the equivalent to listing all columns of the FROM clause. |

Returns

Three files in the shapefile export directory with the extensions .shp, .shx, and .dbf.

Limitations

- If a multipolygon, multilinestring, or multipoint contains only one element, then it is written as a polygon, line, or point, respectively.
- Column names longer than 10 characters are truncated.
- Empty POINTS cannot be exported.
- All rows with NULL geometry or geography data are skipped.
- Unsupported or invalid dates are replaced with NULLs.
- Numeric values may lose precision when they are exported. This loss occurs because the target field in the .dbf file is a 64-bit FLOAT column, which can only represent about 15 significant digits.
- Shapefiles cannot exceed 4GB in size. If your shapefile is too large, try splitting the data and exporting to multiple shapefiles.

Examples

The following example shows how you can use STV_Export2Shapefile to export all columns from the table geo_data to a shapefile named city-data.shp:

```sql
=> SELECT STV_Export2Shapefile(
    *
    USING PARAMETERS shapefile = 'visualizations/city-data.shp',
    overwrite = true, shape = 'Point')
OVER()
FROM geo_data
WHERE REVENUE > 25000;
```
STV_Extent

Returns a bounding box containing all of the input data.

Use STV_Extent inside of a nested query for best results. The OVER clause must be empty.

Important: STV_Extent does not return a valid polygon when the input is a single point.

Behavior Type

Immutable

Syntax

STV_Extent( g )

Arguments

| g | Spatial object, type GEOMETRY. |

Returns

GEOMETRY

Supported Data Types

<p>| Data Type | GEOMETRY |</p>
<table>
<thead>
<tr>
<th>Geometry Type</th>
<th>Valid</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Examples**

The following examples show how you can use STV_Extent.

Return the bounding box of a linestring, and verify that it is a valid polygon:

```sql
=> SELECT ST_AsText(geom) AS bounding_box, ST_IsValid(geom)
    FROM (SELECT STV_Extent(ST_GeomFromText('LineString(0 0, 1 1)')) OVER() AS geom) AS g;
---+----------------------------------+
POLYGON ((0 0, 1 0, 1 1, 0 1, 0 0)) | t
(1 row)
```

Return the bounding box of spatial objects in a table:

```sql
=> CREATE TABLE misc_geo_shapes (id IDENTITY, geom GEOMETRY);
CREATE TABLE
=> COPY misc_geo_shapes (gx FILLER LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
=> POINT(-71.03 42.37)
=> LINESTRING(-71.058849 42.367501, -71.062240 42.371276, -71.067938 42.371246)
=> POLYGON((-71.066030 42.380617, -71.055827 42.376734, -71.060811 42.376011, -71.066030
  42.380617))
=> \.
=> SELECT ST_AsText(geom_col) AS bounding_box
    FROM (SELECT STV_Extent(geom) OVER() AS geom_col FROM misc_geo_shapes) AS g;
-----------+----------------------------------+
POLYGON ((-71.067938 42.367501, -71.03 42.367501, -71.03 42.380617, -71.067938 42.380617, -
  71.067938 42.367501))
(1 row)
```
**STV_ForceLHR**

Alters the order of the vertices of a spatial object to follow the left-hand-rule.

**Behavior Type**

Immutable

**Syntax**

```sql
STV_ForceLHR( g, [USING PARAMETERS skip_nonreorientable_polygons=(true | false) ])
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>g</code></td>
<td>Spatial object, type GEOGRAPHY.</td>
</tr>
<tr>
<td><code>skip_nonreorientable_polygons</code></td>
<td>(Optional) Boolean</td>
</tr>
<tr>
<td></td>
<td>When set to False, non-orientable polygons generate an error. For example, if use STV_ForceLHR or STV_Reverse with skip_nonreorientable_polygons set to False, a geography polygon containing a hole generates an error. When set to True, the result returned is the polygon, as passed to the API, without alteration.</td>
</tr>
<tr>
<td></td>
<td>This argument can help you when you are creating an index from a table containing polygons that cannot be re-oriented.</td>
</tr>
<tr>
<td></td>
<td>Vertica Place considers these polygons non-orientable:</td>
</tr>
<tr>
<td></td>
<td>- Polygons with a hole</td>
</tr>
<tr>
<td></td>
<td>- Multipolygons</td>
</tr>
<tr>
<td></td>
<td>- Multipolygons with a hole</td>
</tr>
</tbody>
</table>

**Default value**: False
Returns
GEOGRAPHY

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Multipoint</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Linestring</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Polygon</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Examples

The following example shows how you can use STV_ForceLHR.

Re-orient a geography polygon to left-hand orientation:

```sql
=> SELECT ST_AsText(STV_ForceLHR(ST_GeographyFromText('Polygon((1 1, 3 1, 2 2, 1 1))')));
ST_AsText
-------------------------
POLYGON ((1 1, 3 1, 2 2, 1 1))
(1 row)
```

Reverse the orientation of a geography polygon by forcing left-hand orientation:

```sql
=> SELECT ST_AsText(STV_ForceLHR(ST_GeographyFromText('Polygon((1 1, 2 2, 3 1, 1 1))')));
ST_AsText
-------------------------
POLYGON ((1 1, 3 1, 2 2, 1 1))
(1 row)
```
See Also

STV_Reverse

STV_Geography

Casts a GEOMETRY object into a GEOGRAPHY object. The SRID value does not affect the results of Vertica Place queries.

When STV_Geography converts a GEOMETRY object to a GEOGRAPHY object, it sets its SRID to 4326.

Behavior Type

Immutable

Syntax

STV_Geography( geom )

Arguments

| geom  | Spatial object that you want to cast into a GEOGRAPHY object, type GEOMETRY |

Returns

GEOGRAPHY

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Example

The following example shows how to use STV_Geography.

To calculate the centroid of the GEOGRAPHY object, convert it to a GEOMETRY object, then convert it back to a GEOGRAPHY object:

```sql
=> CREATE TABLE geogs(g GEOGRAPHY);
CREATE TABLE
=> COPY geogs(gx filler LONG VARCHAR, geo AS ST_GeographyFromText(gx)) FROM stdin delimiter '|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
=> MULTIPOINT(-108.619726 45.000284,-107.866813 45.00107,-106.363711 44.994223,-70.847746 41.205814)
=> \.
=> SELECT ST_AsText(STV_Geography(ST_Centroid(STV_Geometry(g)))) FROM geogs;
   ST_AsText
-----------------------------
   POINT (-98.424499 44.05034775)
(1 row)
```

STV_GeographyPoint

Returns a GEOGRAPHY point based on the input values.

This is the optimal way to convert raw coordinates to GEOGRAPHY points.

Behavior Type

Immutable
Syntax

STV_GeographyPoint( x, y )

Arguments

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>x-coordinate or longitude, FLOAT.</td>
</tr>
<tr>
<td>y</td>
<td>y-coordinate or latitude, FLOAT.</td>
</tr>
</tbody>
</table>

Returns

GEOGRAPHY

Examples

The following examples show how to use STV_GeographyPoint.

Return a GEOGRAPHY point:

```
=> SELECT ST_AsText(STV_GeographyPoint(-114.101588, 47.909677));
                                  ST_AsText
-------------------------------
           POINT (-114.101588 47.909677)  
(1 row)
```

Return GEOGRAPHY points using two columns:

```
=> CREATE TABLE geog_data (id IDENTITY, x FLOAT, y FLOAT);
CREATE TABLE
=> COPY geog_data FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
> -114.101588|47.909677
> -111.532377|46.430753
> 
=> SELECT id, ST_AsText(STV_GeographyPoint(x, y)) FROM geog_data;
     id |     ST_AsText
----------|-------------------
     1 | POINT (-114.101588 47.909677)  
     2 | POINT (-111.532377 46.430753)  
(2 rows)
```

Create GEOGRAPHY points by manipulating data source columns during load:
=> CREATE TABLE geog_data_load (id IDENTITY, geog GEOGRAPHY);
CREATE TABLE
=> COPY geog_data_load (lon FILLER FLOAT,
   lat FILLER FLOAT,
   geog AS STV_GeographyPoint(lon, lat))
   FROM 'test_coords.csv' DELIMITER ',';
Rows Loaded
------------------
   2
(1 row)
=> SELECT id, ST_AsText(geog) FROM geog_data_load;
 id | ST_AsText
------------------
 1 | POINT (-75.101654451 43.363830536)
 2 | POINT (-75.106444487 43.367093798)
(2 rows)

See Also

STV_GeometryPoint

STV_Geometry

Casts a GEOGRAPHY object into a GEOMETRY object.

The SRID value does not affect the results of Vertica Place queries.

Behavior Type

Immutable

Syntax

STV_Geometry( geog )

Arguments

| geog   | Spatial object that you want to cast into a GEOMETRY object, type GEOGRAPHY |
Returns

GEOMETRY

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Example

The following example shows how to use STV_Geometry.

Convert the GEOGRAPHY values to GEOMETRY values, then convert the result back to a GEOGRAPHY type:

```sql
=> CREATE TABLE geogs(g GEOGRAPHY);
CREATE TABLE
=> COPY geogs(gx filler LONG VARCHAR, geog AS ST_GeographyFromText(gx)) FROM stdin delimiter '|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> MULTIPOLY(-108.619726 45.000284,-107.866813 45.00107,-106.363711 44.994223,-70.847746 41.205814)
>> \
=> SELECT ST_AsText(STV_Geography(ST_Centroid(STV_Geometry(g))))) FROM geogs;
   ST_AsText
-----------------------------
POINT (-98.424499 44.05034775)
```
**STV_GeometryPoint**

Returns a GEOMETRY point, based on the input values.

This approach is the most-optimal way to convert raw coordinates to GEOMETRY points.

**Behavior Type**

Immutable

**Syntax**

`STV_GeometryPoint( x, y [, srID] )`

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>x-coordinate or longitude, FLOAT.</td>
</tr>
<tr>
<td>y</td>
<td>y-coordinate or latitude, FLOAT.</td>
</tr>
<tr>
<td>srID</td>
<td>(Optional) Spatial Reference Identifier (SRID) assigned to the point, INTEGER.</td>
</tr>
</tbody>
</table>

**Returns**

GEOMETRY

**Examples**

The following examples show how to use STV_GeometryPoint.

Return a GEOMETRY point with an SRID:

```sql
=> SELECT STAsText(STV_GeometryPoint(71.148562, 42.989374, 4326));
STAsText
-------------------------
POINT (-71.148562 42.989374)
(1 row)
```

Return GEOMETRY points using two columns:
CREATE TABLE geom_data (id IDENTITY, x FLOAT, y FLOAT, SRID int);

CREATE TABLE geom_data LOAD (lon FILLER FLOAT,
    lat FILLER FLOAT,
    geom AS STV_GeometryPoint(lon, lat))
FROM 'test_coords.csv' DELIMITER ',';

See Also
STV_GeographyPoint
STV_GetExportShapefileDirectory

Returns the path of the export directory.

Behavior Type
Immutable
Syntax

STV_GetExportShapefileDirectory()

Returns

The path of the shapefile export directory.

Examples

The following example shows how you can use STV_GetExportShapefileDirectory to query the path of the shapefile export directory:

```
=> SELECT STV_GetExportShapefileDirectory();
STV_GetExportShapefileDirectory
---------------------------
Shapefile export directory: [/home/user/temp]
(1 row)
```

STV_Intersect Scalar Function

Spatially intersects a point or points with a set of polygons. The STV_Intersect scalar function returns the identifier associated with an intersecting polygon.

Behavior Type

Immutable

Syntax

STV_Intersect( { g | x, y } USING PARAMETERS index= 'index_name')

Arguments

| g | A geometry or geography (WGS84) column that contains points. The g column can |
contain only point geometries or geographies. If the column contains a different geometry or geography type, STV_Intersect terminates with an error.

| x  | x-coordinate or longitude, FLOAT. |
| y  | y-coordinate or latitude, FLOAT. |

### Parameters

- **index = 'index_name'**: Name of the spatial index, of type VARCHAR.

### Returns

The identifier of a matching polygon. If the point does not intersect any of the index's polygons, then the STV_Intersect scalar function returns NULL.

### Examples

The following examples show how you can use STV_Intersect scalar.

#### Using two floats, return the gid of a matching polygon or NULL:

```sql
=> CREATE TABLE pols (gid INT, geom GEOMETRY(1000));
CREATE TABLE
copy pols(gid, gx filler LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
=> 1|POLYGON((31 74,8 70,8 50,36 31 74))
=> \.
=> SELECT STV_Create_Index(gid, geom USING PARAMETERS index='my_polygons_1', overwrite=true, max_mem_mb=256) OVER() FROM pols;
    type | polygons | SRID | min_x | min_y | max_x | max_y | info
---------+----------+-------+-------+-------+-------+-------+-----
    GEOMETRY | 1 | 0 | 8 | 50 | 36 | 74 |
(1 row)
=> SELECT STV_Intersect(12.5683, 55.6761 USING PARAMETERS index = 'my_polygons_1');
STV_Intersect
--------
 1
(1 row)
```

#### Using a GEOMETRY column, return the gid of a matching polygon or NULL:

```sql
=> CREATE TABLE polygons (gid INT, geom GEOMETRY(700));
```
CREATE TABLE
=> COPY polygons (gid, gx filler LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM stdin delimiter '|
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 1|POLYGON((-31 74,8 70,8 50,-36 53,-31 74))
>> 2|POLYGON((-38 50,4 13,11 45,0 65,-38 50))
>> 3|POLYGON((-18 42,-10 65,27 48,14 26,-18 42))
>> \.
=> SELECT STV_Create_Index(gid, geom USING PARAMETERS index='my_polygons', overwrite=true,
    max_mem_mb=256) OVER() FROM polygons;

<table>
<thead>
<tr>
<th>type</th>
<th>polygons</th>
<th>SRID</th>
<th>min_x</th>
<th>min_y</th>
<th>max_x</th>
<th>max_y</th>
<th>info</th>
</tr>
</thead>
<tbody>
<tr>
<td>GEOMETRY</td>
<td>3</td>
<td>0</td>
<td>-38</td>
<td>13</td>
<td>27</td>
<td>74</td>
<td></td>
</tr>
</tbody>
</table>
(1 row)

CREATE TABLE points (gid INT, geom GEOMETRY(700));
CREATE TABLE
=> COPY points (gid, gx filler LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM stdin delimiter '|
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 100|POINT(-1 52)
>> 101|POINT(-20 0)
>> 102|POINT(-8 25)
>> 103|POINT(0 0)
>> 104|POINT(1 5)

**STV_Intersect Transform Function**

Spatially intersects points and polygons. The STV_Intersect transform function returns a tuple with matching point/polygon pairs. For every point, Vertica returns either one or many matching polygons.

You can improve performance when you parallelize the computation of the STV_Intersect transform function over multiple nodes. To parallelize the computation, use an OVER (PARTITION BEST) clause.

**Behavior Type**

*Immutable*

**Syntax**

```
STV_Intersect ( { gid | i }, { g | x, y }
    USING PARAMETERS index='index_name')
OVER() AS (pt_gid, pol_gid)
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`gid</td>
<td>i`</td>
</tr>
<tr>
<td><code>g</code></td>
<td>A geometry or geography (WGS84) column that contains points. The <code>g</code> column can contain only point geometries or geographies. If the column contains a different geometry or geography type, STV_Intersect terminates with an error.</td>
</tr>
<tr>
<td><code>x</code></td>
<td>x-coordinate or longitude, FLOAT.</td>
</tr>
<tr>
<td><code>y</code></td>
<td>y-coordinate or latitude, FLOAT.</td>
</tr>
</tbody>
</table>

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>index = 'index_name'</code></td>
<td>Name of the spatial index, of type VARCHAR.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>pt_gid</th>
<th>Unique identifier of the point geometry or geography, of type INTEGER.</th>
</tr>
</thead>
<tbody>
<tr>
<td>pol_gid</td>
<td>Unique identifier of the polygon geometry or geography, of type INTEGER.</td>
</tr>
</tbody>
</table>

Examples

The following examples show how you can use STV_Intersect transform.

Using two floats, return the matching point-polygon pairs.

```sql
=> CREATE TABLE pols (gid INT, geom GEOMETRY(1000));
CREATE TABLE
=> COPY pols(gid, gx filler LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM STDIN;
End with a backslash and a period on a line by itself.
=> 1|POLYGON((31 74,8 70,8 50,36 53,31 74))
=> \.
=> SELECT STV_Create_Index(gid, geom USING PARAMETERS index='my_polygons_1', overwrite=true,
  max_mem_mb=256) OVER() FROM pols;
  type | polygons | SRID | min_x | min_y | max_x | max_y | info
----------+----------+-------+-------+-------+-------+-------+-------
  GEOMETRY | 1 | 0 | 8 | 50 | 36 | 74 |
(1 row)
=> SELECT STV_Intersect(56, 12.5683, 55.6761 USING PARAMETERS index = 'my_polygons_1') OVER();
  pt_gid | pol_gid
----------+----------
    56 | 1
(1 row)
```

Using a GEOMETRY column, return the matching point-polygon pairs.

```sql
=> CREATE TABLE polygons (gid int, geom GEOMETRY(700));
CREATE TABLE
=> COPY polygons (gid, gx filler LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM stdin;
End with a backslash and a period on a line by itself.
=> 10|POLYGON((5 5, 5 10, 10 10, 10 5, 5 5))
=> 11|POLYGON((0 0, 0 2, 2 2, 2 0, 0 0))
=> 12|POLYGON((1 1, 1 3, 3 3, 3 1, 1 1))
=> 14|POLYGON((-1 -1, -1 12, 12 12, 12 -1, -1 -1))
=> \.
=> SELECT STV_Create_Index(gid, geom USING PARAMETERS index='my_polygons', overwrite=true, max_mem_mb=256)
  OVER() FROM polygons;
  type | polygons | SRID | min_x | min_y | max_x | max_y | info
----------+----------+-------+-------+-------+-------+-------+-------
  GEOMETRY | 4 | 0 | -1 | -1 | 12 | 12 |
```
CREATE TABLE points (gid INT, geom GEOMETRY(700));

CREATE TABLE points (gid, gx filler LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM stdin delimiter '|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.

1|POINT(9 9)
2|POINT(0 1)
3|POINT(2.5 2.5)
4|POINT(0 0)
5|POINT(1 5)
6|POINT(1.5 1.5)

SELECT STV_Intersect(gid, geom USING PARAMETERS index='my_polygons') OVER (PARTITION BEST)
AS (point_id, polygon_gid)
FROM points;

<table>
<thead>
<tr>
<th>point_id</th>
<th>polygon_gid</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>14</td>
</tr>
<tr>
<td>1</td>
<td>14</td>
</tr>
<tr>
<td>4</td>
<td>14</td>
</tr>
<tr>
<td>4</td>
<td>11</td>
</tr>
<tr>
<td>6</td>
<td>12</td>
</tr>
<tr>
<td>6</td>
<td>14</td>
</tr>
<tr>
<td>6</td>
<td>11</td>
</tr>
<tr>
<td>2</td>
<td>14</td>
</tr>
<tr>
<td>2</td>
<td>11</td>
</tr>
<tr>
<td>3</td>
<td>12</td>
</tr>
<tr>
<td>3</td>
<td>14</td>
</tr>
</tbody>
</table>

You can improve query performance by using the STV_Intersect transform function in a WHERE clause. Performance improves because this syntax eliminates all points that do not intersect polygons in the index.

Return the count of points that intersect with the polygon, where gid = 14:

SELECT COUNT(pt_id) FROM
(SELECT STV_Intersect(gid, geom USING PARAMETERS index='my_polygons')
OVER (PARTITION BEST) AS (pt_id, polygon_gid)
FROM points)
AS T WHERE polygon_gid = 14;

<table>
<thead>
<tr>
<th>COUNT</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
</tr>
</tbody>
</table>

- STV_Create_Index
**STV_IsValidReason**

Determines if a spatial object is well formed or valid. If the object is not valid, STV_IsValidReason returns a string that explains where the invalidity occurs.

A polygon or multipolygon is valid if all of the following are true:

- The polygon is closed; its start point is the same as its end point.
- Its boundary is a set of linestrings.
- The boundary does not touch or cross itself.
- Any polygons in the interior that do not have more than one point touching the boundary of the exterior polygon.

If you pass an invalid object to a Vertica Place function, the function fails or returns incorrect results. To determine if a polygon is valid, first run `STIsValid`. `STIsValid` returns `TRUE` if the polygon is valid, `FALSE` otherwise.

**Important:**
STV_IsValidReason supports only polygon and multipolygon GEOMETRY data types.

**Behavior Type**

Immutable

**Syntax**

`STV_IsValidReason( g )`

**Arguments**

| g  | Geospatial object to test for validity, value of type GEOMETRY or GEOGRAPHY (WGS84). |
Returns
LONG VARCHAR

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>GeometryCollection</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Example

The following example shows how to use STV_IsValidReason.

Returns a string describing where the polygon is invalid:

```sql
=> SELECT STV_IsValidReason(ST_GeomFromText('POLYGON((1 3,3 2,1 1, 3 0,1 0,1 3))'));
STV_IsValidReason
-------------------------------
Ring Self-intersection at or near POINT (1 1)
(1 row)
```

See Also

ST_IsValid
STV_LineStringPoint

Retrieves the vertices of a linestring or multilinestring. The values returned are points of either GEOMETRY or GEOGRAPHY type depending on the input object's type. GEOMETRY points inherit the SRID of the input object.

STV_LineStringPoint is an analytic function. For more information, see Analytic Functions.

Behavior Type

Immutable

Syntax

```
STV_LineStringPoint( g )
OVER( [PARTITION NODES] ) AS
```

Arguments

```
g | Linestring or multilinestring, value of type GEOMETRY or GEOGRAPHY
```

Returns

GEOMETRY or GEOGRAPHY

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Multipoint</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Examples

The following examples show how to use STV_LinestringPoint.

Returns the vertices of the geometry linestring and their SRID:

```sql
=> SELECT ST_AsText(Point), ST_SRID(Point)
FROM (SELECT STV_LinestringPoint(
    ST_GeomFromText('MULTILINESTRING((1 2, 2 3, 3 1, 4 2),
    (10 20, 20 30, 30 10, 40 20))', 4269)) OVER () AS Point) AS foo;
```

<table>
<thead>
<tr>
<th>ST_AsText</th>
<th>ST_SRID</th>
</tr>
</thead>
<tbody>
<tr>
<td>POINT (1 2)</td>
<td>4269</td>
</tr>
<tr>
<td>POINT (2 3)</td>
<td>4269</td>
</tr>
<tr>
<td>POINT (3 1)</td>
<td>4269</td>
</tr>
<tr>
<td>POINT (4 2)</td>
<td>4269</td>
</tr>
<tr>
<td>POINT (10 20)</td>
<td>4269</td>
</tr>
<tr>
<td>POINT (20 30)</td>
<td>4269</td>
</tr>
<tr>
<td>POINT (30 10)</td>
<td>4269</td>
</tr>
<tr>
<td>POINT (40 20)</td>
<td>4269</td>
</tr>
</tbody>
</table>

(8 rows)

Returns the vertices of the geography linestring:

```sql
=> SELECT ST_AsText(g)
FROM (SELECT STV_LinestringPoint(
    ST_GeographyFromText('MULTILINESTRING ((42.1 71.0, 41.4 70.0, 41.3 72.9),
    (42.99 74.16, 44.47 73.21))', 4269)) OVER () AS g) AS line_geog_points;
```

<table>
<thead>
<tr>
<th>ST_AsText</th>
</tr>
</thead>
<tbody>
<tr>
<td>POINT (42.1 71.0)</td>
</tr>
<tr>
<td>POINT (41.4 70.0)</td>
</tr>
<tr>
<td>POINT (41.3 72.9)</td>
</tr>
<tr>
<td>POINT (42.99 74.16)</td>
</tr>
<tr>
<td>POINT (44.47 73.21)</td>
</tr>
</tbody>
</table>

(5 rows)

See Also

STV_PolygonPoint
**STV_MemSize**

Returns the length of the spatial object in bytes as an INTEGER.

Use this function to determine the optimal column width for your spatial data.

**Behavior Type**

**Immutable**

**Syntax**

```
STV_MemSize( g )
```

**Arguments**

| `g`  | Spatial object, value of type GEOMETRY or GEOGRAPHY |

**Returns**

INTEGER

**Examples**

The following example shows how you can optimize your table by sizing the GEOMETRY or GEOGRAPHY column to the maximum value returned by STV_MemSize:

```sql
=> CREATE TABLE mem_size_table (id int, geom geometry(800));
CREATE TABLE
=> COPY mem_size_table (id, gx filler LONG VARCHAR, geom as ST_GeomFromText(gx)) FROM STDIN
DELIMITER '|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>>1|POINT(3 5)
>>2|MULTILINestring((1 5, 2 4, 5 3, 6 6),(3 5, 3 7))
>>3|MULTIPOLYGON(((2 6, 2 9, 6 9, 7 7, 4 6, 2 6)),((0 0, 0 5, 1 0, 0 0)),((0 2, 2 5, 4 5, 0 2)))
>>\.
=> SELECT max(STV_MemSize(geom)) FROM mem_size_table;
max
```
CREATE TABLE production_table(id int, geom geometry(336));
CREATE TABLE =>
INSERT INTO production_table SELECT * FROM mem_size_table;
OUTPUT
3
(1 row)
=> DROP mem_size_table;
DROP TABLE

STV_NN

Calculates the distance of spatial objects from a reference object and returns (object, distance) pairs in ascending order by distance from the reference object.

Parameters $g1$ and $g2$ must be both GEOMETRY objects or both GEOGRAPHY objects.

STV_NN is an analytic function. For more information, see Analytic Functions.

Behavior Type

Immutable

Syntax

$STV_{NN}(\ g, \ ref\_obj, \ k\ )\ OVER()$

Arguments

<table>
<thead>
<tr>
<th>$g$</th>
<th>Spatial object, value of type GEOMETRY or GEOGRAPHY</th>
</tr>
</thead>
<tbody>
<tr>
<td>$ref_obj$</td>
<td>Reference object, type GEOMETRY or GEOGRAPHY</td>
</tr>
<tr>
<td>$k$</td>
<td>Number of rows to return, type INTEGER</td>
</tr>
</tbody>
</table>
Returns

(Object, distance) pairs, in ascending order by distance. If a parameter is EMPTY or NULL, then 0 rows are returned.

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipoint</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Linestring</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Example

The following example shows how to use STV_NN.

Create a table and insert nine GEOGRAPHY points:

```sql
=> CREATE TABLE points (g geography);
CREATE TABLE
=> COPY points (gx filler LONG VARCHAR, g AS ST_GeographyFromText(gx)) FROM stdin delimiter '|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> POINT (21.5 18.4)
>> POINT (21.5 19.2)
>> POINT (21.5 20.7)
>> POINT (22.5 16.4)
>> POINT (22.5 17.15)
>> POINT (22.5 18.33)
>> POINT (23.5 13.68)
>> POINT (23.5 15.9)
>> POINT (23.5 18.4)
>> \.```
Calculate the distances (in meters) of objects in table points from the GEOGRAPHY point (23.5, 20).

Returns the five objects that are closest to that point:

```sql
=> SELECT ST_AsText(nn), dist FROM (SELECT STV_PolygonPoint(g),
   ST_GeographyFromText('POINT(23.5 20)'),5) OVER() AS (nn,dist) FROM points) AS example;
```

<table>
<thead>
<tr>
<th>ST_AsText</th>
<th>dist</th>
</tr>
</thead>
<tbody>
<tr>
<td>POINT (23.5 18.4)</td>
<td>177912.12757541</td>
</tr>
<tr>
<td>POINT (22.5 18.33)</td>
<td>213339.210738322</td>
</tr>
<tr>
<td>POINT (21.5 20.7)</td>
<td>222561.43679943</td>
</tr>
<tr>
<td>POINT (21.5 19.2)</td>
<td>227604.371833335</td>
</tr>
<tr>
<td>POINT (21.5 18.4)</td>
<td>275239.416790128</td>
</tr>
</tbody>
</table>

(STV_PolygonPoint)

Retrieves the vertices of a polygon as individual points. The values returned are points of either GEOMETRY or GEOGRAPHY type depending on the input object’s type. GEOMETRY points inherit the SRID of the input object.

STV_PolygonPoint is an analytic function. For more information, see Analytic Functions.

Behavior Type

Immutable

Syntax

```
STV_PolygonPoint( g )
   OVER( [PARTITION NODES] ) AS
```

Arguments

| g   | Polygon, value of type GEOMETRY or GEOGRAPHY |

Returns

GEOMETRY or GEOGRAPHY
## Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Multipoint</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Linestring</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

## Examples

The following examples show how to use STV_PolygonPoint.

### Returns the vertices of the geometry polygon:

```
=> SELECT ST_AsText(g) FROM (SELECT STV_PolygonPoint(ST_GeomFromText('POLYGON((1 2, 2 3, 3 1, 1 2)'))) 
    OVER (PARTITION NODES) AS g) AS poly_points;
  ST_AsText
-------------
POINT (1 2)
POINT (2 3)
POINT (3 1)
POINT (1 2)
(4 rows)
```

### Returns the vertices of the geography polygon:

```
=> SELECT ST_AsText(g) FROM (SELECT STV_PolygonPoint(ST_GeographyFromText('POLYGON((25.5 28.76, 28.83 29.13, 27.2 30.99, 25.5 28.76)'))) 
    OVER (PARTITION NODES) AS g) AS poly_points;
  ST_AsText
-------------
POINT (25.5 28.76)
POINT (28.83 29.13)
POINT (27.2 30.99)
POINT (25.5 28.76)
(4 rows)
```
See Also

STV_LineStringPoint

STV_Reverse

Reverses the order of the vertices of a spatial object.

Behavior Type

Immutable

Syntax

STV_Reverse( g, [USING PARAMETERS skip_nonreorientable_polygons={true | false} ])

Arguments

<table>
<thead>
<tr>
<th>g</th>
<th>Spatial object, type GEOGRAPHY.</th>
</tr>
</thead>
<tbody>
<tr>
<td>skip_nonreorientable_polygons = { true</td>
<td>(Optional) Boolean</td>
</tr>
<tr>
<td></td>
<td>false }</td>
</tr>
</tbody>
</table>

When set to False, non-orientable polygons generate an error. For example, if you use STV_ForceLHR or STV_Reverse with skip_nonreorientable_polygons set to False, a geography polygon containing a hole generates an error. When set to True, the result returned is the polygon, as passed to the API, without alteration.

This argument can help you when you are creating an index from a table containing polygons that cannot be re-oriented.

Vertica Place considers these polygons non-orientable:
Returns

GEOGRAPHY

Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (Perfect Sphere)</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Multipoint</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Linestring</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Polygon</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Examples

The following examples show how you can use STV_Reverse.

Reverse vertices of a geography polygon:

```sql
=> SELECT ST_AsText(STV_Reverse(ST_GeographyFromText('Polygon((1 1, 3 1, 2 2, 1 1))')));

POLYGON (((1 1, 2 2, 3 1, 1 1))
(1 row)
```

Force the polygon to reverse orientation:

```sql
=> SELECT ST_AsText(STV_Reverse(ST_GeographyFromText('Polygon((1 1, 2 2, 3 1, 1 1))')));
```
**ST_AsText**

```
POLYGON ((1 1, 3 1, 2 2, 1 1))
(1 row)
```

**See Also**

STV_ForceLHR

**STV_Rename_Index**

Renames a spatial index. If the index format is out of date, you cannot rename the index.

A spatial index is created from an input polygon set, which can be the result of a query. Spatial indexes are created in a global name space. Vertica uses a distributed plan whenever the input table or projection is segmented across nodes of the cluster.

The `OVER()` clause must be empty.

**Behavior Type**

**Immutable**

**Syntax**

```
STV_Rename_Index( USING PARAMETERS
    source = 'old_index_name',
    dest = 'new_index_name',
    overwrite = [ 'true' | 'false' ]
)
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>source</code></td>
<td>Current name of the spatial index, type VARCHAR.</td>
</tr>
<tr>
<td><code>dest</code></td>
<td>New name of the spatial index, type VARCHAR.</td>
</tr>
<tr>
<td><code>overwrite</code></td>
<td>(Optional) BOOLEAN value that specifies whether to overwrite the index, if an index exists. This parameter</td>
</tr>
</tbody>
</table>
Privileges

Any user with access to the STV_*_Index functions can describe, rename, or drop indexes created by any other user.

Limitations

- Index names cannot exceed 110 characters.
- The backslash or tab characters are not allowed in index names.

Example

The following example shows how to use STV_Rename_Index.

Rename an index:

```sql
=> SELECT STV_Rename_Index (  
    USING PARAMETERS  
    source = 'my_polygons',  
    dest = 'US_states',  
    overwrite = 'false'  
)  
OVER ();
rename_index  
--------------  
Index renamed  
(1 Row)
```

STV_Refresh_Index

Appends newly added or updated polygons and removes deleted polygons from an existing spatial index.

The OVER() clause must be empty.
Behavior Type

Mutable

Syntax

STV.Refresh_Index( gid, g
    USING PARAMETERS index='index_name'
        [, skip_nonindexable_polygons={ true | false } ]
    )

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gid</td>
<td>Name of an integer column that uniquely identifies the polygon. The gid cannot be NULL.</td>
</tr>
<tr>
<td>g</td>
<td>Name of a geometry or geography (WGS84) column or expression that contains polygons and multipolygons. Only polygon and multipolygon can be indexed. Other shape types are excluded from the index.</td>
</tr>
</tbody>
</table>

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>index = 'index_name'</td>
<td>Name of the index, type VARCHAR. Index names cannot exceed 110 characters. The slash, backslash, and tab characters are not allowed in index names.</td>
</tr>
</tbody>
</table>
| skip_nonindexable_polygons = { true | false }                        | (Optional) BOOLEAN

In rare cases, intricate polygons (for instance, with too high resolution or anomalous spikes) cannot be indexed. These polygons are considered non-indexable. When set to False, non-indexable polygons cause the index creation to fail. When set to True, index creation can succeed by excluding non-indexable polygons from the index.
To review the polygons that were not able to be indexed, use STV_Describe_Index with the parameter list_polygon.
Default: False

## Returns

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Spatial object type of the index.</td>
</tr>
<tr>
<td>polygons</td>
<td>Number of polygons indexed.</td>
</tr>
<tr>
<td>SRID</td>
<td>Spatial reference system identifier.</td>
</tr>
<tr>
<td>min_x, min_y, max_x, max_y</td>
<td>Coordinates of the minimum bounding rectangle (MBR) of the indexed geometries. $(min_x, min_y)$ are the south-west coordinates, and $(max_x, max_y)$ are the north-east coordinates.</td>
</tr>
<tr>
<td>info</td>
<td>Lists the number of excluded spatial objects as well as their type that were excluded from the index.</td>
</tr>
<tr>
<td>indexed</td>
<td>Number of polygons indexed during the operation.</td>
</tr>
<tr>
<td>appended</td>
<td>Number of appended polygons.</td>
</tr>
<tr>
<td>updated</td>
<td>Number of updated polygons.</td>
</tr>
<tr>
<td>deleted</td>
<td>Number of deleted polygons.</td>
</tr>
</tbody>
</table>

## Supported Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>GEOMETRY</th>
<th>GEOGRAPHY (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Multipoint</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Linestring</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Multilinestring</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Polygon</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----</td>
<td>-----</td>
</tr>
<tr>
<td>Multipolygon</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>GeometryCollection</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Privileges

Any user with access to the STV_*_Index functions can describe, rename, or drop indexes created by any other user.

Limitations

- In rare cases, intricate polygons (such as those with too-high a resolution or anomalous spikes) cannot be indexed. See the parameter `skip_nonindexable_polygons`.
- If you replace a valid polygon in the source table with an invalid polygon, STV_Refresh_Index ignores the invalid polygon. As a result, the polygon originally indexed persists in the index.
- The following geometries cannot be indexed:
  - Non-polygons
  - NULL gid
  - NULL (multi) polygon
  - EMPTY (multi) polygon
  - Invalid (multi) polygon
- The following geographies are excluded from the index:
  - Polygons with holes
  - Polygons crossing the International Date Line
  - Polygons covering the north or south pole
  - Antipodal polygons

Usage Tips

- To cancel an STV_Refresh_Index run, use Ctrl + C.
- If you use source data not previously associated with the index, then the index will be overwritten.
- If STV_Refresh_Index has insufficient memory to process the query, then rebuild the index using STV_Create_Index.
• If there are no valid polygons in the geom column, STV_Refresh_Index reports an error in vertica.log and stops the index refresh.
• Ensure that all of the polygons you plan to index are valid polygons. STV_Create_Index and STV_Refresh_Index do not check polygon validity when building an index.

For more information, see Ensuring Polygon Validity Before Creating or Refreshing an Index.

Examples

The following examples show how to use STV_Refresh_Index.

Refresh an index with a single literal argument:

```
=> SELECT STV_Create_Index(1, ST_GeomFromText('POLYGON((0 0, 15.2, 3.9 15.2, 3.9 0, 0))')
    USING PARAMETERS index='my_polygon' OVER();
type  | polygons | SRID | min_x  | min_y  | max_x  | max_y  | info
----------|----------|------|--------|--------|--------|--------|------
GEOMETRY | 1 | 0 | 0 | 0 | 3.9 | 15.2 | (1 row)
```

```
=> SELECT STV_Refresh_Index(2, ST_GeomFromText('POLYGON((0 0, 13.2, 3.9 18.2, 3.9 0, 0))')
    USING PARAMETERS index='my_polygon' OVER();
type  | polygons | SRID | min_x  | min_y  | max_x  | max_y  | info | indexed | appended | updated | deleted
----------|----------|------|--------|--------|--------|--------|------|---------|----------|---------|----------
+----------
GEOMETRY | 1 | 0 | 0 | 0 | 3.9 | 18.2 | 1 | 1 | 0 | (1 row)
```

Refresh an index from a table:

```
=> CREATE TABLE pols (gid INT, geom GEOMETRY);
CREATE TABLE
=> COPY pols(gid, gx filler LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM stdin delimiter '|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 1|POLYGON((-31 74,8 70,8 50,-36 53,-31 74))
>> 2|POLYGON((5 20,9 30,20 45,36 35,5 20))
>> 3|POLYGON((12 23,9 30,20 45,36 35,37 67,45 80,50 20,12 23))
>> .
=> SELECT STV_Create_Index(gid, geom USING PARAMETERS index='my_polygons_1', overwrite=true)
    OVER() FROM pols;
type  | polygons | SRID | min_x  | min_y  | max_x  | max_y  | info
----------|----------|------|--------|--------|--------|--------|------
GEOMETRY | 3 | 0 | -36 | 20 | 50 | 80 | (1 row)
```

```
=> COPY pols(gid, gx filler LONG VARCHAR, geom AS ST_GeomFromText(gx)) FROM stdin delimiter '|';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
```
POLYGON((-32 74, 80, 850, -36 53, -32 74))

SELECT STV_Refresh_Index(gid, geom USING PARAMETERS index='my_polygons_1') OVER() FROM pols;

<table>
<thead>
<tr>
<th>type</th>
<th>polygons</th>
<th>SRID</th>
<th>min_x</th>
<th>min_y</th>
<th>max_x</th>
<th>max_y</th>
<th>info</th>
<th>indexed</th>
<th>appended</th>

- STV_Describe_Index
- STV_Drop_Index
- STV_Rename_Index
- Ensuring Polygon Validity Before Creating or Refreshing an Index

STV_SetExportShapefileDirectory

Specifies the directory to export GEOMETRY or GEOGRAPHY data to a shapefile. The validity of the path is not checked, and the path cannot be empty.

Behavior Type

Immutable

Syntax

STV_SetExportShapefileDirectory( USING PARAMETERS path='shapefile_path' )

Arguments

| path = ' shapefile_path ' | The path where you want the shapefile exported. For example, '/home/user/temp'. You can also export to a mounted S3 directory where you have read and write permissions using the convention '<bucketname>/path'. |
Returns

The path of the shapefile export directory.

Privileges

Only a superuser can use this function.

Examples

The following example shows how you can use STV_SetExportShapefileDirectory to set the shapefile export directory to /home/user/temp:

```sql
=> SELECT STV_SetExportShapefileDirectory(USING PARAMETERS path = '/home/user/temp');
STV_SetExportShapefileDirectory
SUCCESS. Set shapefile export directory: [/home/user/temp] (1 row)
```

STV_ShpSource and STV_ShpParser

These two functions work with COPY to parse and load geometries and attributes from a shapefile into a Vertica table, and convert them to the appropriate GEOMETRY data type. You must use these two functions together.

The following restrictions apply:

- An empty multipoint or an invalid multipolygon can not be loaded from a shapefile.
- If the .dbf component of a shapefile contains a numeric attribute, this field's values might lose precision when the Vertica Place shapefile loader loads it into a table. The target field is a 64-bit FLOAT column, which can only represent about 15 significant digits; in a .dbf file, Numeric fields can be up to 30 digits.

Rejected records are saved to CopyErrorLogs subdirectory, under the Vertica catalog directory.

Behavior Type

Immutable
**Syntax**

COPY table(columnslist) 
WITH SOURCE STV_ShpSource 
  ( file = 'filename'[, SRID=spatial-reference-identifier] [, flatten_2d={true | false}] ) 
PARSER STV_ShpParser()

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table</td>
<td>Name of the table in which to load the geometry data.</td>
</tr>
<tr>
<td>columnslist</td>
<td>Comma-delimited list of column names in the table that match fields in the external file. Run the CREATE TABLE command that STV_ShpCreateTable creates. When you do so, these columns correspond to the second through the second-to-last columns.</td>
</tr>
<tr>
<td>file = 'pathname'</td>
<td>Specifies the fully qualified path of a .dbf, .shp, or .shx file. You can also load from a shapefile that is stored on a mounted S3 directory where you have read and write permissions. In this case, use the following syntax: bucketname/path/filename</td>
</tr>
<tr>
<td>SRID=spatial-reference-identifier</td>
<td>Specifies an integer spatial reference identifier (SRID) associated with the shape file.</td>
</tr>
</tbody>
</table>
| flatten_2d | Specifies a BOOLEAN argument that excludes 3D or 4D coordinates during COPY commands:  
  - true: Excludes geometries with 3D or 4D coordinates before a COPY command.  
  - false: Causes the load to fail if a geometry with 3D or 4D coordinate |
is found.

**Default:** `false`

## Privileges

- Source shapefile: Read
- Shapefile directory: Execute

## COPY Errors

The `COPY` command fails under one of the following conditions:

- The shapefile cannot be located or opened.
- The number of columns or the data types of the columns that `STV_ShpParser` creates do not match the columns in the destination table. Use `STV_ShpCreateTable` to generate the appropriate `CREATE TABLE` command.
- One of the mandatory files is missing or cannot be opened. When opening a shapefile, you must have three files: `.dbf`, `.shp`, and `.shx`.

## STV_ShpSource File Corruption Handling

- If the `.shp` and `.shx` files are corrupt, `STV_ShpSource` returns an error.
- If the `.shp` and `.shx` files are valid, but the `.dbf` file is corrupt, `STV_ShpSource` ignores the `.dbf` file and does not create columns for that data.

## Example

```sql
=> COPY tl_2010_us_state10 WITH SOURCE
    STV_ShpSource(file='/shapefiles/tl_2010_us_state10.shp', SRID=4269) PARSER STV_ShpParser();
Rows loaded
-----------------
  52
```
STV_ShpCreateTable

Returns a CREATE TABLE statement with the columns and types of the attributes found in the specified shapefile.

The column types are sized according to the shapefile metadata. The size of the column is based on the largest geometry found in the shapefile. The first column in the table is gid, which is an auto-increment IDENTITY primary key column. The cache value is set to 64 by default. The last column is a GEOMETRY data type for storing the actual geometry data.

Behavior Type

Immutable

Syntax

```
STV_ShpCreateTable (USING PARAMETERS file='filename') OVER()
```

Arguments

| file = 'filename' | Fully qualified path of the .dbf, .shp, or .shx file (file extension optional).
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>You can also create a table using a shapefile stored on a mounted S3 directory where you have read and write permissions. Use the following syntax: bucketname/path/filename</td>
</tr>
</tbody>
</table>

Returns

CREATE TABLE statement that matches the specified shapefile
Usage Tips

- STV_ShpCreateTable returns a CREATE TABLE statement; but it does not create the table. Modify the CREATE TABLE statement as needed, and then create the table before loading the shapefile into the table.
- To create a table with characters other than alphanumeric and underscore (_) characters, you must specify the table name enclosed in double quotes, such as "counties%NY".
- The name of the table is the same as the name of the shapefile, without the directory name or extension.
- The shapefile must be accessible from the initiator node.
- If the .shp and .shx files are corrupt, STV_ShpCreateTable returns an error. If the .shp and .shx files are valid, but the .dbf file is corrupt, STV_ShpCreateTable ignores the .dbf file and does not create columns for that data.
- All the mandatory files (.dbf, .shp, .shx) must be in the same directory. If not, STV_ShpCreateTable returns an error.
- If the .dbf component of a shapefile contains a Numeric attribute, this field's values may lose precision when the Vertica shapefile loader loads it into a table. The target field is a 64-bit FLOAT column, which can only represent about 15 significant digits. In a .dbf file, numeric fields can be up to 30 digits.

Vertica records all instances of shapefile values that are too long in the vertica.log file.

Example

The following example shows how to use STV_ShpCreateTable.

Returns a CREATE TABLE statement:

```sql
=> SELECT STV_ShpCreateTable
    (USING PARAMETERS file='/shapefiles/tl_2010_us_state10.shp')
OVER() as create_table_states;
create_table_states
--------------
CREATE TABLE tl_2010_us_state10(  
gid IDENTITY(64) PRIMARY KEY,  
REGION10 VARCHAR(2),  
DIVISION10 VARCHAR(2),  
STATEFP10 VARCHAR(2),  
STATENS10 VARCHAR(8),  
GEOID10 VARCHAR(2),  
STUSPS10 VARCHAR(2),
```
NAME VARCHAR(100),
LSAD VARCHAR(2),
MTFCC VARCHAR(5),
FUNCSTAT VARCHAR(1),
ALAND INT8,
AWATER INT8,
INTPTLAT VARCHAR(11),
INTPTLON VARCHAR(12),
geom GEOMETRY(940845)
);
(18 rows)

IP Conversion Functions

IP functions perform conversion, calculation, and manipulation operations on IP, network, and subnet addresses.

INET_ATON

Returns an integer that represents the value of the address in host byte order, given the dotted-quad representation of a network address as a string.

Behavior Type

Immutable

Syntax

INET_ATON ( expression )

Parameters

expression (VARCHAR) is the string to convert.

Notes

The following syntax converts an IPv4 address represented as the string A to an integer I. INET_ATON trims any spaces from the right of A, calls the Linux function inet_pton, and converts the result from network byte order to host byte order using ntohl.

=> INET_ATON(VARCHAR A) -> INT8 I

If A is NULL, too long, or inet_pton returns an error, the result is NULL.
Examples

The generated number is always in host byte order. In the following example, the number is calculated as $209 \times 256^3 + 207 \times 256^2 + 224 \times 256 + 40$.

```sql
=> SELECT INET_ATON('209.207.224.40');
inet_aton
-------------
3520061480
(1 row)

=> SELECT INET_ATON('1.2.3.4');
innet_aton
-------------
16909060
(1 row)

=> SELECT TO_HEX(INET_ATON('1.2.3.4'));
to_hex
-------------
1020304
(1 row)
```

See Also

- INET_NTOA

INET_NTOA

Returns the dotted-quad representation of the address as a VARCHAR, given a network address as an integer in network byte order.

Behavior Type

Immutable

Syntax

INET_NTOA ( expression )
**Parameters**

| expression | (INTEGER) is the network address to convert. |

**Notes**

The following syntax converts an IPv4 address represented as integer I to a string A.

INET_NTOA converts I from host byte order to network byte order using htonl, and calls the Linux function inet_ntop.

```sql
=> INET_NTOA(INT8 I) -> VARCHAR A
```

If I is NULL, greater than $2^{32}$ or negative, the result is NULL.

**Examples**

```sql
=> SELECT INET_NTOA(16909060);
  inet_ntoa
     -----------
     1.2.3.4
(1 row)

=> SELECT INET_NTOA(03021962);
  inet_ntoa
     -----------
     0.46.28.138
(1 row)
```

**See Also**

- INET_ATON
- V6_ATON

**V6_ATON**

Converts an IPv6 address represented as a character string to a binary string.
**Behavior Type**

*Immutable*

**Syntax**

\[ \text{V6\_ATON ( expression )} \]

**Parameters**

(expression) (VARCHAR) is the string to convert.

**Notes**

The following syntax converts an IPv6 address represented as the character string \(A\) to a binary string \(B\).

\[ \text{V6\_ATON trims any spaces from the right of \(A\) and calls the Linux function inet\_pton.} \]

\[ => \text{V6\_ATON(VARCHAR \(A\)) \to VARBINARY(16) \(B\)} \]

If \(A\) has no colons it is prepended with ':ffff'. If \(A\) is NULL, too long, or if \(\text{inet\_pton}\) returns an error, the result is NULL.

**Examples**

\[ => \text{SELECT V6\_ATON('2001:DB8::8:800:200C:417A');} \]

\[ \begin{align*}
\text{v6\_aton} \\
\backslash001\backslash015\backslash270\backslash000\backslash000\backslash000\backslash000\backslash000\backslash010\backslash010\backslash000 \backslash014Az
\end{align*} \]

(1 row)

\[ => \text{SELECT V6\_ATON('1.2.3.4');} \]

\[ \begin{align*}
\text{v6\_aton} \\
\backslash000\backslash000\backslash000\backslash000\backslash000\backslash000\backslash000\backslash377\backslash377\backslash001\backslash002\backslash003\backslash004
\end{align*} \]

(1 row)

\[ \text{SELECT TO\_HEX(V6\_ATON('2001:DB8::8:800:200C:417A'));} \]

\[ \begin{align*}
\text{to\_hex} \\
20010db8000000000800000200c417a
\end{align*} \]

(1 row)
=> SELECT V6_ATON('::1.2.3.4');

v6_aton
-----------------------------------------------
\000\000\000\000\000\000\000\000\000\000\000\001\002\003\004
(1 row)

See Also

- V6_NTOA

V6_NTOA

Converts an IPv6 address represented as varbinary to a character string.

Behavior Type

Immutable

Syntax

V6_NTOA( expression )

Parameters

| expression | (VARBINARY) is the binary string to convert. |

Notes

The following syntax converts an IPv6 address represented as VARBINARY B to a string A.

V6_NTOA right-pads B to 16 bytes with zeros, if necessary, and calls the Linux function inet_ntop.

=> V6_NTOA(VARBINARY B) -> VARCHAR A

If B is NULL or longer than 16 bytes, the result is NULL.

Vertica automatically converts the form '::ffff:1.2.3.4' to '1.2.3.4'.
Examples

```sql
=> SELECT V6_NTOA('00101527000000000000001010000014Az');
---
v6_ntoa
2001:db8::8:000:200c:417a
(1 row)
```

```sql
=> SELECT V6_NTOA(V6_ATON('1.2.3.4'));
---
v6_ntoa
1.2.3.4
(1 row)
```

```sql
=> SELECT V6_NTOA(V6_ATON('::1.2.3.4'));
---
v6_ntoa
::1.2.3.4
(1 row)
```

See Also

- V6_ATON

V6_SUBNETA

Calculates a subnet address in CIDR (Classless Inter-Domain Routing) format from a binary or alphanumeric IPv6 address.

Behavior Type

Immutable

Syntax

`V6_SUBNETA ( expression1, expression2 )`

Parameters

| expression1 | (VARBINARY or VARCHAR) is the string to calculate. |
expression2 (INTEGER) is the size of the subnet.

Notes

The following syntax calculates a subnet address in CIDR format from a binary or varchar IPv6 address.

V6_SUBNETA masks a binary IPv6 address B so that the N leftmost bits form a subnet address, while the remaining rightmost bits are cleared. It then converts to an alphanumeric IPv6 address, appending a slash and N.

```
=> V6_SUBNETA(BINARY B, INT8 N) -> VARCHAR C
```

The following syntax calculates a subnet address in CIDR format from an alphanumeric IPv6 address.

```
=> V6_SUBNETA(VARCHAR A, INT8 N) -> V6_SUBNETA(V6_ATON(A), N) -> VARCHAR C
```

Examples

```
=> SELECT V6_SUBNETA(V6_ATON('2001:db8::8:800:200c:417a'), 28);
  V6_subneta
------------------------
  2001:db0::/28
(1 row)
```

See Also

- **V6_SUBNETN**

V6_SUBNETN

Calculates a subnet address in CIDR (Classless Inter-Domain Routing) format from a varbinary or alphanumeric IPv6 address.

Behavior Type

**Immutable**
Syntax

V6_SUBNETN ( expression1, expression2 )

Parameters

<table>
<thead>
<tr>
<th>expression1</th>
<th>(VARBINARY or VARCHAR) is the string to calculate.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notes:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• V6_SUBNETN(&lt;VARBINARY&gt;, &lt;INTEGER&gt;) returns VARBINARY.</td>
</tr>
<tr>
<td></td>
<td>OR</td>
</tr>
<tr>
<td></td>
<td>• V6_SUBNETN(&lt;VARCHAR&gt;, &lt;INTEGER&gt;) returns VARBINARY, after using V6_ATON to convert the &lt;VARCHAR&gt; string to &lt;VARBINARY&gt;.</td>
</tr>
</tbody>
</table>

| expression2 | (INTEGER) is the size of the subnet. |

Notes

The following syntax masks a BINARY IPv6 address B so that the N left-most bits of S form a subnet address, while the remaining right-most bits are cleared.

V6_SUBNETN right-pads B to 16 bytes with zeros, if necessary and masks B, preserving its N-bit subnet prefix.

=> V6_SUBNETN(VARBINARY B, INT8 N) -> VARBINARY(16) S

If B is NULL or longer than 16 bytes, or if N is not between 0 and 128 inclusive, the result is NULL.

S = [B]/N in [Classless Inter-Domain Routing](https://en.wikipedia.org/wiki/Classless_inter-domain_routing) notation (CIDR notation).

The following syntax masks an alphanumeric IPv6 address A so that the N leftmost bits form a subnet address, while the remaining rightmost bits are cleared.

=> V6_SUBNETN(VARCHAR A, INT8 N) -> V6_SUBNETN(V6_ATON(A), N) -> VARBINARY(16) S
Example

This example returns VARBINARY, after using V6_ATON to convert the VARCHAR string to VARBINARY:

```sql
=> SELECT V6_SUBNETN(V6_ATON('2001:db8::8:800:200c:417a'), 28);
```

See Also

- V6_ATON
- V6_SUBNETA

V6_TYPE

Characterizes a binary or alphanumeric IPv6 address B as an integer type.

Behavior Type

Immutable

Syntax

```sql
V6_TYPE ( expression )
```

Parameters

| expression | (VARBINARY or VARCHAR) is the type to convert. |

Notes

V6_TYPE(VARBINARY B) returns INT8 T.
The IPv6 types are defined in the Network Working Group's IP Version 6 Addressing Architecture memo.

<table>
<thead>
<tr>
<th>V6_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>GLOBAL</td>
<td>0 Global unicast addresses</td>
</tr>
<tr>
<td>LINKLOCAL</td>
<td>1 Link-Local unicast (and Private-Use) addresses</td>
</tr>
<tr>
<td>LOOPBACK</td>
<td>2 Loopback</td>
</tr>
<tr>
<td>UNSPECIFIED</td>
<td>3 Unspecified</td>
</tr>
<tr>
<td>MULTICAST</td>
<td>4 Multicast</td>
</tr>
</tbody>
</table>

IPv4-mapped and IPv4-compatible IPv6 addresses are also interpreted, as specified in IPv4 Global Unicast Address Assignments.

- For IPv4, Private-Use is grouped with Link-Local.
- If B is VARBINARY, it is right-padded to 16 bytes with zeros, if necessary.
- If B is NULL or longer than 16 bytes, the result is NULL.

**Details**

IPv4 (either kind):

<table>
<thead>
<tr>
<th></th>
<th>V6_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0.0.0/8</td>
<td>UNSPECIFIED</td>
<td>10.0.0.0/8</td>
</tr>
<tr>
<td>127.0.0.0/8</td>
<td>LOOPBACK</td>
<td>LINKLOCAL</td>
</tr>
<tr>
<td>169.254.0.0/16</td>
<td>LINKLOCAL</td>
<td></td>
</tr>
<tr>
<td>172.16.0.0/12</td>
<td>LINKLOCAL</td>
<td></td>
</tr>
<tr>
<td>192.168.0.0/16</td>
<td>LINKLOCAL</td>
<td></td>
</tr>
<tr>
<td>224.0.0.0/4</td>
<td>MULTICAST</td>
<td>GLOBAL</td>
</tr>
<tr>
<td>others</td>
<td>GLOBAL</td>
<td></td>
</tr>
</tbody>
</table>

IPv6:

<table>
<thead>
<tr>
<th></th>
<th>V6_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>::/128</td>
<td>UNSPECIFIED</td>
<td>::/128</td>
</tr>
<tr>
<td>fe00::/10</td>
<td>LINKLOCAL</td>
<td>LOOPBACK</td>
</tr>
<tr>
<td>ff00::/8</td>
<td>MULTICAST</td>
<td></td>
</tr>
<tr>
<td>others</td>
<td>GLOBAL</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

```sql
=> SELECT V6_TYPE(V6_ATON('192.168.2.10'));
  v6_type
  --------
   1
  (1 row)
```

```sql
=> SELECT V6_TYPE(V6_ATON('2001:db8::8:800:200c:417a'));
  v6_type
  --------
   1
  (1 row)
```

Machine Learning Functions

Machine learning functions let you work with your data set in different stages of the data analysis process:

- Preparing models
- Training models
- Evaluating models
- Applying models
- Managing models

Some Vertica machine learning functions are implemented as Vertica UDx functions, while others are implemented as meta-functions:

- A UDx function accepts an input relation name from a FROM clause. The SELECT statement that calls the functions is composable—it can be used as a sub-query in another SELECT statement.
- A meta-function accepts the input relation name as a single-quoted string passed to it as an argument or a named parameter. The data that the SELECT statement returns cannot be used in a sub-query. Machine learning meta-functions do not support temporary tables.

All machine learning functions automatically cast NUMERIC arguments to FLOAT.

Important:
Before using a machine learning function, be aware that any open transaction on the current session might be committed.
Data Preparation

Vertica supports machine learning functions that prepare data as needed before subjecting it to analysis.

**BALANCE**

Returns a view with an equal distribution of the input data based on the response_column.

**Syntax**

```
BALANCE ( 'output-view', 'input-relation', 'response-column', 'balance-method'
    [ USING PARAMETERS sampling_ratio=ratio ] )
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>output-view</code></td>
<td>The name of the view where Vertica saves the balanced data from the input relation.</td>
</tr>
<tr>
<td><code>input-relation</code></td>
<td>The table or view that contains the data the function uses to create a more balanced data set. If the input relation is defined in Hive, use <code>SYNC_WITH_HCATALOG_SCHEMA</code> to sync the hcatalog schema, and then run the machine learning function.</td>
</tr>
<tr>
<td><code>response-column</code></td>
<td>Name of the input column that represents the dependent variable, of type VARCHAR or INTEGER.</td>
</tr>
<tr>
<td><code>balance-method</code></td>
<td>Specifies a method to select data from the minority and majority classes, one of the following.</td>
</tr>
</tbody>
</table>
hybrid_sampling: Performs over-sampling and under-sampling on different classes so each class is equally represented.

over_sampling: Over-samples on all classes, with the exception of the most majority class, towards the most majority class's cardinality.

under_sampling: Under-samples on all classes, with the exception of the most minority class, towards the most minority class's cardinality.

weighted_sampling: An alias of under_sampling.

Parameters

<table>
<thead>
<tr>
<th>ratio</th>
<th>The desired ratio between the majority class and the minority class. This value has no effect when used with balance method hybrid_sampling.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Default:</strong> 1.0</td>
</tr>
</tbody>
</table>

Privileges

Non-superusers:

- SELECT privileges on the input relation
- CREATE privileges on the output view schema

Examples

```sql
=> CREATE TABLE backyard_bugs (id identity, bug_type int, finder varchar(20));
CREATE TABLE

=> COPY backyard_bugs FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 1|Ants
>> 1|Beetles
>> 3|Ladybugs
>> 3|Ants
>> 3|Beetles
>> 3|Caterpillars
>> 2|Ladybugs
```
>> 3|Ants
>> 3|Beetles
>> 1|Ladybugs
>> 3|Ladybugs
>> 

```sql
=> SELECT bug_type, COUNT(bug_type) FROM backyard_bugs GROUP BY bug_type;

<table>
<thead>
<tr>
<th>bug_type</th>
<th>COUNT</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>3</td>
</tr>
<tr>
<td>3</td>
<td>7</td>
</tr>
</tbody>
</table>
```

(3 rows)

```sql
=> SELECT BALANCE('backyard_bugs_balanced', 'backyard_bugs', 'bug_type', 'under_sampling');

BALANCE

Finished in 1 iteration

(1 row)

```sql
=> SELECT bug_type, COUNT(bug_type) FROM backyard_bugs_balanced GROUP BY bug_type;

<table>
<thead>
<tr>
<th>bug_type</th>
<th>COUNT</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>1</td>
</tr>
</tbody>
</table>
```

(3 rows)

- Balancing Imbalanced Data

**CORR_MATRIX**

Takes an input relation with numeric columns, and calculates the *Pearson Correlation Coefficient* between each pair of its input columns. The function is implemented as a Multi-Phase Transform function.

**Syntax**

```
CORR_MATRIX ( input-columns ) OVER()
```
Arguments

| input-columns | A comma-separated list of the columns in the input table. The input columns can be of any numeric type or BOOL, but they will be converted internally to FLOAT. The number of input columns must be more than 1 and not more than 1600. |

Return

CORR_MATRIX returns the correlation matrix in triplet format. That is, each pair-wise correlation is identified by three returned columns: name of the first variable, name of the second variable, and the correlation value of the pair. The function also returns two extra columns: number_of_ignored_input_rows and number_of_processed_input_rows. The value of the fourth/fifth column indicates the number of rows from the input which are ignored/used to calculate the corresponding correlation value. Any input pair with NULL, Inf, or NaN is ignored.

The correlation matrix is symmetric with a value of 1 on all diagonal elements; therefore, it can return only the value of elements above the diagonals—that is, the upper triangle. Nevertheless, the function returns the entire matrix to simplify any later operations. Then, the number of output rows is:

$$(\#\text{input-columns})^2$$

The first two output columns are of type VARCHAR(128), the third one is of type FLOAT, and the last two are of type INT.

Notes

- The contents of the OVER clause must be empty.
- The function returns no rows when the input table is empty.
- When any of $X_i$ and $Y_i$ is NULL, Inf, or NaN, the pair will not be included in the calculation of CORR($X$, $Y$). That is, any input pair with NULL, Inf, or NaN is ignored.
- For the pair of ($X$,$X$), regardless of the contents of $X$: CORR($X$,$X$) = 1, number_of_ignored_input_rows = 0, and number_of_processed_input_rows = #input_rows.
• When (N*SUMX2 == SUMX*SUMX) or (N*SUMY2 == SUMY*SUMY) then value of CORR(X, Y) will be NULL. In theory it can happen in case of a column with constant values; nevertheless, it may not be always observed because of rounding error.
• In the special case where all pair values of (X_i,Y_i) contain NULL, inf, or NaN, and X != Y: CORR(X,Y)=NULL.

Example

The following example uses the iris dataset.*

```
```

<table>
<thead>
<tr>
<th>variable_name_1</th>
<th>variable_name_2</th>
<th>corr_value</th>
<th>number_of_ignored_input_rows</th>
<th>number_ of_processed_input_rows</th>
</tr>
</thead>

(16 rows)

**DETECT_OUTLIERS**

Returns the outliers in a data set based on the outlier threshold. The output is a table that contains the outliers. DETECT_OUTLIERS uses the detection method robust_zscore to normalize each input column. The function then identifies as outliers all rows that contain a normalized value greater than the default or specified threshold.
Note:
You can calculate normalized column values with Vertica functions
NORMALIZE and NORMALIZE_FIT.

Syntax

```
DETECT_OUTLIERS ( 'output-table', 'input-relation','input-columns', 'detection-method'
 [ USING PARAMETERS
   [outlier_threshold = threshold]
   [, exclude_columns = 'excluded-columns']
   [, partition_columns = 'partition-columns'] ] )
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>output-table</code></td>
<td>The name of the table where Vertica saves rows that are outliers along the chosen <code>input-columns</code>. All columns are present in this table.</td>
</tr>
<tr>
<td><code>input-relation</code></td>
<td>The table or view that contains outlier data. If the input relation is defined in Hive, use <code>SYNC_WITH_HCATALOG_SCHEMA</code> to sync the hcatalog schema, and then run the machine learning function.</td>
</tr>
<tr>
<td><code>input-columns</code></td>
<td>Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. Input columns must be of type numeric.</td>
</tr>
<tr>
<td><code>detection-method</code></td>
<td>The outlier detection method to use, set to <code>robust_zscore</code>.</td>
</tr>
</tbody>
</table>

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>outlier_threshold</code></td>
<td>The minimum normalized value in a row that is used to identify that row as an outlier.</td>
</tr>
<tr>
<td><strong>Default:</strong> 3.0</td>
<td></td>
</tr>
<tr>
<td><code>exclude_columns</code></td>
<td>Comma-separated list of column names from <code>input-columns</code> to exclude from processing.</td>
</tr>
</tbody>
</table>
partition_columns | Comma-separated list of column names from the input table or view that defines the partitions. DETECT_OUTLIERS detects outliers among each partition separately.  
**Default**: empty list

Privileges

Non-superusers:

- SELECT privileges on the input relation
- CREATE privileges on the output table

Examples

The following example shows how to use DETECT_OUTLIERS:

```sql
=> CREATE TABLE baseball_roster (id identity, last_name varchar(30), hr int, avg float);
CREATE TABLE

=> COPY baseball_roster FROM STDIN;
Enter data to be copied followed by a newline.  
End with a backslash and a period on a line by itself.
>
> Polo|7|0.233
> Gloss|45|0.170
> Gus|12|0.345

<tr>
<td>5</td>
<td>Laus</td>
<td>3</td>
<td>0.095</td>
</tr>
</tbody>
</table>
```
IMPUTE

Imputes missing values in a data set with either the mean or the mode, based on observed values for a variable in each column. This function supports numeric and categorical data types.

Syntax

IMPUTE( 'output-view', 'input-relation', 'input-columns', 'method'
          [ USING PARAMETERS [exclude_columns = 'excluded-columns'] [, partition_columns = 'partition-columns'] ] )

Arguments

| output-view | Name of the view that shows the input table with imputed values in place of missing values. In this view, rows without missing values are kept intact while the rows with missing values are modified according to the specified method. |
| input-relation | The table or view that contains the data for missing-value imputation. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_SCHEMA to sync the hcatalog schema, and then run the machine learning function. |
**input-columns**  
Comma-separated list of input columns where missing values will be replaced, or asterisk (*) to specify all columns. All columns must be of type `numeric` or `BOOLEAN`.

**method**  
The method to compute the missing value replacements, one of the following:

- `mean`: The missing values in each column will be replaced by the mean of that column. This method can be used for `numeric` data only.
- `mode`: The missing values in each column will be replaced by the most frequent value in that column. This method can be used for categorical data only.

**Parameters**

<table>
<thead>
<tr>
<th>exclude_columns</th>
<th>Comma-separated list of column names from <code>input-columns</code> to exclude from processing.</th>
</tr>
</thead>
<tbody>
<tr>
<td>partition_columns</td>
<td>Comma-separated list of column names from the input relation that defines the partitions.</td>
</tr>
</tbody>
</table>

**Privileges**

Non-superusers:

- SELECT privileges on the input relation
- CREATE privileges on the output view schema

**Examples**

Execute **IMPUTE** on the `small_input_impute` table, specifying the mean method:

```sql
=> SELECT impute('output_view','small_input_impute', 'pid, x1,x2,x3,x4','mean'
USING PARAMETERS exclude_columns='pid');
impute
------------------------------------------------------
Finished in 1 iteration
```
Execute `IMPUTE`, specifying the mode method:

```sql
=> SELECT impute('output_view3','small_input_impute', 'pid, x5,x6', 'mode' USING PARAMETERS exclude_columns='pid');
impute
----------------------
Finished in 1 iteration
(1 row)
```

**See Also**

*Imputing Missing Values*

**NORMALIZE**

Runs a normalization algorithm on an input relation. The output is a view with the normalized data.

**Note**: This function differs from `NORMALIZE_FIT`, which creates and stores a model rather than creating a view definition. This can lead to different performance characteristics between the two functions.

**Syntax**

```
NORMALIZE ( 'output-view', 'input-relation', 'input-columns', 'normalization-method'
    [ USING PARAMETERS exclude_columns = 'excluded-columns' ] )
```

**Arguments**

| `output-view` | The name of the view showing the input relation with normalized data replacing the specified input columns. |
The table or view that contains the data to normalize. If the input relation is defined in Hive, use `SYNC_WITH_HCATALOG_SCHEMA` to sync the hcatalog schema, and then run the machine learning function.

**input-columns**

Comma-separated list of numeric input columns that contain the values to normalize, or asterisk (*) to select all columns.

**normalization-method**

The normalization method to use, one of the following:

- minmax
- zscore
- robust_zscore

If infinity values appear in the table, the method ignores those values.

### Parameters

**exclude_columns**

Comma-separated list of column names from **input-columns** to exclude from processing.

### Privileges

**Non-superusers:**

- SELECT privileges on the input relation
- CREATE privileges on the output view schema

### Examples

These examples show how you can use the NORMALIZE function on the wt and hp columns in the mtcars table.

Execute the NORMALIZE function, and specify the minmax method:

```
=> SELECT NORMALIZE('mtcars_norm', 'mtcars',
```
Execute the NORMALIZE function, and specify the zscore method:

```sql
=> SELECT NORMALIZE('mtcars_normz','mtcars',
   'wt, hp', 'zscore');
```

NORMALIZE

Finished in 1 iteration

(1 row)

Execute the NORMALIZE function, and specify the robust_zscore method:

```sql
=> SELECT NORMALIZE('mtcars_normz', 'mtcars',
   'wt, hp', 'robust_zscore');
```

NORMALIZE

Finished in 1 iteration

(1 row)

See Also

Normalizing Data

**NORMALIZE_FIT**

**Note:**

This function differs from NORMALIZE, which directly outputs a view with normalized results, rather than storing normalization parameters into a model for later operation.

NORMALIZE_FIT computes normalization parameters for each of the specified columns in an input relation. The resulting model stores the normalization parameters. For example, for MinMax normalization, the minimum and maximum value of each column are stored in the model. The generated model serves as input to functions APPLY_NORMALIZE and REVERSE_NORMALIZE.
Syntax

```
NORMALIZE_FIT ( 'model-name', 'input-relation', 'input-columns', 'normalization-method'
                [ USING PARAMETERS [exclude_columns = 'excluded-columns'] [, output_view = 'output-view'] ] )
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>model-name</code></td>
<td>Identifies the model to create, where <code>model-name</code> conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.</td>
</tr>
<tr>
<td><code>input-relation</code></td>
<td>The table or view that contains the data to normalize. If the input relation is defined in Hive, use <code>SYNC_WITH_HCATALOG_SCHEMA</code> to sync the hcatalog schema, and then run the machine learning function.</td>
</tr>
<tr>
<td><code>input-columns</code></td>
<td>Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. Input columns must be of data type <code>numeric</code>.</td>
</tr>
</tbody>
</table>
| `normalization-method` | The normalization method to use, one of the following:  
|                     |   - minmax  
|                     |   - zscore  
|                     |   - robust_zscore  
|                     | If you specify `robust_zscore`, `NORMALIZE_FIT` uses the function `APPROXIMATE_MEDIAN [Aggregate]`.  
|                     | All normalization methods ignore infinity, negative infinity, or NULL values in the input relation. |

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>exclude_columns</code></td>
<td>Comma-separated list of column names from <code>input-columns</code> to exclude from processing.</td>
</tr>
</tbody>
</table>
output_view | Name of the view that contains all columns from the input relation, with the specified input columns normalized.

**Model Attributes**

<table>
<thead>
<tr>
<th>data</th>
<th>Normalization method set to minmax:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <code>colNames</code>: Model column names</td>
</tr>
<tr>
<td></td>
<td>• <code>mins</code>: Minimum value of each column</td>
</tr>
<tr>
<td></td>
<td>• <code>maxes</code>: Maximum value of each column</td>
</tr>
</tbody>
</table>

Normalization method set to `zscore`:

<table>
<thead>
<tr>
<th></th>
<th><code>colNames</code>: Model column names</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <code>avgs</code>: Average value of each column</td>
</tr>
<tr>
<td></td>
<td>• <code>stddev</code>: Standard deviation of each column</td>
</tr>
</tbody>
</table>

Normalization method set to `robust_zscore`:

<table>
<thead>
<tr>
<th></th>
<th><code>colNames</code>: Model column names</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <code>meds</code>: Approximate median value of each column</td>
</tr>
<tr>
<td></td>
<td>• <code>mads</code>: Median absolute deviation (MAD) from the median of each column</td>
</tr>
</tbody>
</table>

**Privileges**

Non-superusers:

- CREATE privileges on the schema where the model is created
- SELECT privileges on the input relation
- CREATE privileges on the output view schema

**Examples**

The following example creates a model with `NORMALIZE_FIT` using the `wt` and `hp` columns in table `mtcars`, and then uses this model in successive calls to `APPLY_NORMALIZE` and `REVERSE_NORMALIZE`.
The following call to APPLY_NORMALIZE specifies the hp and cyl columns in table mtcars, where hp is in the normalization model and cyl is not in the normalization model:

```sql
=> SELECT NORMALIZE_FIT('mtcars_normfit', 'mtcars', 'wt,hp', 'minmax');

Success (1 row)
```

```sql
=> CREATE TABLE mtcars_normalized AS SELECT APPLY_NORMALIZE(hp, cyl USING PARAMETERS model_name = 'mtcars_normfit') FROM mtcars;
CREATE TABLE
=> SELECT * FROM mtcars_normalized;

<table>
<thead>
<tr>
<th>hp</th>
<th>cyl</th>
</tr>
</thead>
<tbody>
<tr>

Normalizing Data

**ONE_HOT_ENCODER_FIT**

Generates a sorted list of each of the category levels for each feature to be encoded, and stores the model.

**Syntax**

```
ONE_HOT_ENCODER_FIT ( 'model-name', 'input-relation', 'input-columns'
  [ USING PARAMETERS
    [exclude_columns = 'excluded-columns']
    [, output_view = 'output-view'
      [, extra_levels = 'category-levels'] ] )
```

**Arguments**

<table>
<thead>
<tr>
<th><strong>model-name</strong></th>
<th>Identifies the model to create, where model-name conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>input-relation</strong></td>
<td>The table or view that contains the data for one hot encoding. If the</td>
</tr>
</tbody>
</table>
input relation is defined in Hive, use `SYNC_WITH_HCATALOG_SCHEMA` to sync the hcatalog schema, and then run the machine learning function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>input-columns</code></td>
<td>Comma-separated list of columns to use from the input relation, or an asterisk (*) to select all columns. Input columns must be INTEGER, BOOLEAN, VARCHAR, or dates.</td>
</tr>
<tr>
<td><code>exclude_columns</code></td>
<td>Comma-separated list of column names from <code>input-columns</code> to exclude from processing.</td>
</tr>
<tr>
<td><code>output_view</code></td>
<td>The name of the view that stores the input relation and the one hot encodings. Columns are returned in the order they appear in the input relation, with the one-hot encoded columns appended after the original columns.</td>
</tr>
<tr>
<td><code>extra_levels</code></td>
<td>Additional levels in each category that are not in the input relation. This parameter should be passed as a string that conforms with the JSON standard, with category names as keys, and lists of extra levels in each category as values.</td>
</tr>
</tbody>
</table>

**Model Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>call_string</code></td>
<td>The value of all input arguments that were specified at the time the function was called.</td>
</tr>
</tbody>
</table>
| `varchar_categories` | Settings for all:  
  * `category_name`: Column name  
  * `category_level`: Levels of the category, sorted for each category  
  * `category_level_index`: Index of this categorical level in the sorted list of levels for the category. |
Privileges

Non-superusers:

- CREATE privileges on the schema where the model is created
- SELECT privileges on the input relation
- CREATE privileges on the output view schema

Examples

```sql
=> SELECT ONE_HOT_ENCODER_FIT ('one_hot_encoder_model','mtcars','**'
USING PARAMETERS exclude_columns='mpg,disp,drat,wt,qsec,vs,am');
ONE_HOT_ENCODER_FIT
-----------------------
Success
(1 row)
```

See Also

- APPLY_ONE_HOT_ENCODER
- Encoding Categorical Columns

**PCA**

Computes principal components from the input table/view. The results are saved in a PCA model. Internally, PCA finds the components by using SVD on the co-variance matrix built from the input data. The singular values of this decomposition are also saved as part of the PCA model. The signs of all elements of a principal component could be flipped all together on different runs.

Syntax

```sql
PCA ( 'model-name', 'input-relation', 'input-columns'
[ USING PARAMETERS
  [exclude_columns = 'excluded-columns']]
```
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model-name</td>
<td>Identifies the model to create, where model-name conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.</td>
</tr>
<tr>
<td>input-relation</td>
<td>The table or view that contains the input data for PCA.</td>
</tr>
<tr>
<td>input-columns</td>
<td>Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. All input columns must be a numeric data type.</td>
</tr>
</tbody>
</table>

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exclude_columns</td>
<td>Comma-separated list of column names from input-columns to exclude from processing.</td>
</tr>
<tr>
<td>num_components</td>
<td>The number of components to keep in the model. If this value is not provided, all components are kept. The maximum number of components is the number of non-zero singular values returned by the internal call to SVD. This number is less than or equal to SVD (number of columns, number of rows).</td>
</tr>
</tbody>
</table>
| scale              | A Boolean value that specifies whether to standardize the columns during the preparation step:  
  - True: Use a correlation matrix instead of a covariance matrix.  
  - False (default)  |
| method             | The method used to calculate PCA, can be set to LAPACK.                                                                                                                                                       |

SUMMARIZE_CATCOL

Returns a statistical summary of categorical data input, in three columns:

- CATEGORY: Categorical levels, of the same SQL data type as the summarized column
- COUNT: The number of category levels, of type INTEGER
- PERCENT: Represents category percentage, of type FLOAT

Syntax

SUMMARIZE_CATCOL (target-column
    [ USING PARAMETERS TOPK = topk-value [, WITH_TOTALCOUNT = show-total] ] )
OVER()

Arguments

<table>
<thead>
<tr>
<th>target-column</th>
<th>The name of the input column to summarize, one of the following data types:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- BOOLEAN</td>
</tr>
<tr>
<td></td>
<td>- FLOAT</td>
</tr>
<tr>
<td></td>
<td>- INTEGER</td>
</tr>
<tr>
<td></td>
<td>- DATE</td>
</tr>
<tr>
<td></td>
<td>- CHAR/VARCHAR</td>
</tr>
</tbody>
</table>

Parameters

| TOPK          | Integer, specifies how many of the most frequent rows to include in the output. |
WITH TOTALCOUNT

A Boolean value that specifies whether the table contains a heading row that displays the total number of rows displayed in the target column, and a percent equal to 100.

Default: true

Examples

This example shows the categorical summary for the current_salary column in the salary_data table. The output of the query shows the column category, count, and percent. The first column gives the categorical levels, with the same SQL data type as the input column, the second column gives a count of that value, and the third column gives a percentage.

```sql
=> SELECT SUMMARIZE_CATCOL (current_salary USING PARAMETERS TOPK = 5) OVER() FROM salary_data;

<table>
<thead>
<tr>
<th>CATEGORY</th>
<th>COUNT</th>
<th>PERCENT</th>
</tr>
</thead>
<tbody>
<tr>
<td>1000</td>
<td>100</td>
<td></td>
</tr>
<tr>
<td>39004</td>
<td>2</td>
<td>0.2</td>
</tr>
<tr>
<td>35321</td>
<td>1</td>
<td>0.1</td>
</tr>
<tr>
<td>36313</td>
<td>1</td>
<td>0.1</td>
</tr>
<tr>
<td>36538</td>
<td>1</td>
<td>0.1</td>
</tr>
<tr>
<td>36562</td>
<td>1</td>
<td>0.1</td>
</tr>
</tbody>
</table>
```

(SUMMARIZE_NUMCOL)

Returns a statistical summary of columns in a Vertica table:

- Count
- Mean
- Standard deviation
- Min/max values
- Percentile information
- Median

All summary values are FLOAT data types, except INTEGER for count.

Syntax

```
SUMMARIZE_NUMCOL (input-columns [ USING PARAMETERS exclude_columns = 'excluded-columns'] ) OVER()
```
Arguments

| input-columns | Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. All columns must be a numeric data type. If you select all columns, SUMMARIZE_NUMCOL normalizes all columns in the model |

Parameters

| exclude_columns | Comma-separated list of column names from input-columns to exclude from processing. |

Examples

Show the statistical summary for the age and salary columns in the employee table:

```sql
=> SELECT SUMMARIZE_NUMCOL( * USING PARAMETERS exclude_columns='id,name,gender,title' ) OVER() FROM employee;

<table>
<thead>
<tr>
<th>COLUMN</th>
<th>COUNT</th>
<th>MEAN</th>
<th>STDDEV</th>
<th>MIN</th>
<th>PERC25</th>
<th>MEDIAN</th>
<th>PERC75</th>
<th>MAX</th>
<th>MIN</th>
<th>PERC25</th>
<th>MEDIAN</th>
<th>PERC75</th>
<th>MAX</th>
<th>MIN</th>
<th>PERC25</th>
<th>MEDIAN</th>
<th>PERC75</th>
<th>MAX</th>
</tr>
</thead>
<tbody>
<tr>
<td>age</td>
<td>5</td>
<td>63.4</td>
<td>19.3209730603818</td>
<td>44</td>
<td>45</td>
<td>67</td>
<td>71</td>
<td>90</td>
<td>44</td>
<td>45</td>
<td>67</td>
<td>71</td>
<td>90</td>
<td>44</td>
<td>45</td>
<td>67</td>
<td>71</td>
<td>90</td>
</tr>
<tr>
<td>salary</td>
<td>5</td>
<td>3456.76</td>
<td>1756.78754308285</td>
<td>1234.56</td>
<td>2345.67</td>
<td>3456.78</td>
<td>4567.89</td>
<td>5678.9</td>
<td>1234.56</td>
<td>2345.67</td>
<td>3456.78</td>
<td>4567.89</td>
<td>5678.9</td>
<td>1234.56</td>
<td>2345.67</td>
<td>3456.78</td>
<td>4567.89</td>
<td>5678.9</td>
</tr>
</tbody>
</table>

(2 rows)
```

SVD

Computes singular values (the diagonal of the S matrix) and right singular vectors (the V matrix) of an SVD decomposition of the input relation. The results are saved as an SVD model. The signs of all elements of a singular vector in SVD could be flipped all together on different runs.
Syntax

SVD ( 'model-name', 'input-relation', 'input-columns'
    [ USING PARAMETERS
      [exclude_columns = 'excluded-columns']
      [, num_components = num-components]
      [, method = 'method'] ] )

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model-name</td>
<td>Identifies the model to create, where model-name conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.</td>
</tr>
<tr>
<td>input-relation</td>
<td>The table or view that contains the input data for SVD.</td>
</tr>
<tr>
<td>input-columns</td>
<td>Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. Input columns must be a numeric data type.</td>
</tr>
</tbody>
</table>

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exclude_columns</td>
<td>Comma-separated list of column names from input-columns to exclude from processing.</td>
</tr>
<tr>
<td>num_components</td>
<td>The number of components to keep in the model. The maximum number of components is the number of non-zero singular values computed, which is less than or equal to min (number of columns, number of rows). If you omit this parameter, all components are kept.</td>
</tr>
<tr>
<td>method</td>
<td>The method used to calculate SVD, can be set to LAPACK.</td>
</tr>
</tbody>
</table>
## Model Attributes

<table>
<thead>
<tr>
<th><strong>columns</strong></th>
<th>The information about columns from the input relation used for creating the SVD model:</th>
</tr>
</thead>
</table>
|             | - index  
|             | - name |

<table>
<thead>
<tr>
<th><strong>singular_values</strong></th>
<th>The information about singular values found. They are sorted in descending order:</th>
</tr>
</thead>
</table>
|                     | - index  
|                     | - value  
|                     | - explained_variance : percentage of the variance in data that can be attributed to this singular value  
|                     | - accumulated_explained_variance : percentage of the variance in data that can be retained if we drop all singular values after this current one |

<table>
<thead>
<tr>
<th><strong>right_singular_vectors</strong></th>
<th>The right singular vectors corresponding to the singular values mentioned above:</th>
</tr>
</thead>
</table>
|                             | - index: indices of the elements in each vector  
|                             | - vector1  
|                             | - vector2  
|                             | - ... |

<table>
<thead>
<tr>
<th><strong>counters</strong></th>
<th>The information collected during training the model, stored as name-value pairs:</th>
</tr>
</thead>
</table>
|              | - counter_name  
|              |   - accepted_row_count: number of valid rows in the data  
|              |   - rejected_row_count: number of invalid rows (having NULL, INF or NaN) in the data  
|              |   - iteration_count: number of iterations, always 1 for the current implementation of SVD  
|              |   - counter_value  

| **call_string** | The function call that created the model. |
Privileges

Non-superusers:

- CREATE privileges on the schema where the model is created
- SELECT privileges on the input relation

Examples

```sql
=> SELECT SVD ('svdmodel', 'small_svd', 'x1,x2,x3,x4');
SVD

Finished in 1 iterations.
Accepted Rows: 0 Rejected Rows: 0
(1 row)

=> CREATE TABLE transform_svd AS SELECT
   APPLY_SVD (id, x1, x2, x3, x4 USING PARAMETERS model_name='svdmodel', exclude_columns='id',
   key_columns='id')
OVER () FROM small_svd;
CREATE TABLE

=> SELECT * FROM transform_svd;

Machine Learning Algorithms

Vertica supports a full range of machine learning functions that train a model on a set of data, and return a model that can be saved for later execution.

These functions require the following privileges for non-superusers:

- CREATE privileges on the schema where the model is created
- SELECT privileges on the input relation

Note:

Machine learning algorithms contain a subset of four classification functions:

- LOGISTIC_REG
- NAIVE_BAYES
- RF_CLASSIFIER
- SVM_CLASSIFIER

**AUTOREGRESSOR**

Creates an autoregressive (AR) model from a stationary time series with consistent timesteps that can then be used for prediction via PREDICT_AUTOREGRESSOR.

Autoregressive models predict future values of a time series based on the preceding values. More specifically, the user-specified lag determines how many previous timesteps it takes into account during computation, and predicted values are linear combinations of the values at each lag.

Since its input data must be sorted by timestamp, this algorithm is single-threaded.
Syntax

AUTOREGRESSOR ("model-name", "input-relation", "data-column", "timestamp-column"
    [ USING PARAMETERS
        [ p = lags ]
        [, missing = "imputation-method" ]
        [, regularization = "regularization-method" ]
        [, lambda = regularization-value ]
        [, compute_mse = boolean ]
    ]
)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model-name</td>
<td>Identifies the model to create, where model-name conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.</td>
</tr>
<tr>
<td>input-relation</td>
<td>The table or view containing the timestamp-column. This algorithm expects a stationary time series as input; using a time series with a mean that shifts over time may lead to weaker results.</td>
</tr>
<tr>
<td>data-column</td>
<td>An input column of type NUMERIC that contains the dependent variables or outcomes.</td>
</tr>
<tr>
<td>timestamp-column</td>
<td>One INTEGER, FLOAT, or TIMESTAMP column that represents the timestamp variable. Timesteps must be consistent.</td>
</tr>
</tbody>
</table>

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>INTEGER in the range [1, 1999], the number of lags to consider in the computation. Larger values for p weaken the correlation.</td>
</tr>
<tr>
<td></td>
<td><strong>Default</strong>: 3</td>
</tr>
<tr>
<td>missing</td>
<td>One of the following methods for handling missing values:</td>
</tr>
<tr>
<td></td>
<td>- drop: Missing values are ignored.</td>
</tr>
</tbody>
</table>
error: Missing values raise an error.
zero: Missing values are replaced with 0.
linear_interpolation: Missing values are replaced by linearly-interpolated values based on the nearest valid entries before and after the missing value. This means that in cases where the first or last values in a dataset are missing, they will simply be dropped.

Default: linear_interpolation

regularization

One of the following regularization methods used when fitting the data:

- None
- L2: weight regularization term which penalizes the squared weight value

Default: None

lambda

FLOAT in the range [0, 100000], the regularization value, lambda.

Default: 1.0

compute_mse

BOOLEAN, whether to calculate and output the mean squared error (MSE).

This parameter only accepts "true" or "false" rather than the standard literal equivalents for BOOLEANs like 1 or 0.

Default: False

Examples

See Autoregressive Model Example.

See Also

- PREDICT_AUTOREGRESSOR
- GET_MODEL_SUMMARY
**BISECTING_KMEANS**

Executes the bisecting k-means algorithm on an input relation. The result is a trained model with a hierarchy of cluster centers, with a range of $k$ values, each of which can be used for prediction.

**Syntax**

```
BISECTING_KMEANS('model-name', 'input-relation', 'input-columns', 'num-clusters'
  [ USING PARAMETERS
    [exclude_columns = 'exclude-columns']
    [, bisection_iterations = bisection-iterations]
    [, split_method = 'split-method']
    [, min_divisible_cluster_size = min-cluster-size]
    [, kmeans_max_iterations = kmeans-max-iterations]
    [, kmeans_epsilon = kmeans-epsilon]
    [, kmeans_center_init_method = 'kmeans-init-method']
    [, distance_method = 'distance-method']
    [, output_view = 'output-view']
    [, key_columns = 'key-columns'] ] )
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>model-name</strong></td>
<td>Identifies the model to create, where <em>model-name</em> conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.</td>
</tr>
<tr>
<td><strong>input-relation</strong></td>
<td>Table or view that contains the input data for k-means. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_SCHEMA to sync the hcatalog schema, and then run the machine learning function.</td>
</tr>
<tr>
<td><strong>input-columns</strong></td>
<td>Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. Input columns must be of data type numeric.</td>
</tr>
<tr>
<td><strong>num-clusters</strong></td>
<td>Number of clusters to create, an integer $\leq$ 10,000. This argument represents the $k$ in k-means.</td>
</tr>
</tbody>
</table>
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exclude_columns</td>
<td>Comma-separated list of column names from <code>input-columns</code> to exclude from processing.</td>
</tr>
<tr>
<td>bisection_iterations</td>
<td>Integer between 1 - 1MM inclusive, specifies number of iterations the bisecting k-means algorithm performs for each bisection step. This corresponds to how many times a standalone k-means algorithm runs in each bisection step. A setting &gt;1 allows the algorithm to run and choose the best k-means run within each bisection step. If you use kmeanspp, the value of bisection_iterations is always 1, because kmeanspp is more costly to run but also better than the alternatives, so it does not require multiple runs. <strong>Default: 1</strong></td>
</tr>
</tbody>
</table>
| split_method                  | The method used to choose a cluster to bisect/split, one of:  
  - `size`: Choose the largest cluster to bisect.  
  - `sum_squares`: Choose the cluster with the largest within-cluster sum of squares to bisect. **Default: sum_squares** |
| min_divisible_cluster_size    | Integer $\geq 2$, specifies minimum number of points of a divisible cluster. **Default: 2**                                                                                                                   |
| kmeans_max_iterations         | Integer between 1 and 1MM inclusive, specifies the maximum number of iterations the k-means algorithm performs. If you set this value to a number lower than the number of iterations needed for convergence, the algorithm might not converge. **Default: 10** |
**kmeans_epsilon**

Integer between 1 and 1MM inclusive, determines whether the k-means algorithm has converged. The algorithm is considered converged after no center has moved more than a distance of \textit{epsilon} from the previous iteration.

\textbf{Default:} 1e-4

**kmeans_center_init_method**

The method used to find the initial cluster centers in k-means, one of:

- \textit{kmeanspp} (default): kmeans++ algorithm
- \textit{pseudo}: Uses "pseudo center" approach used by Spark, bisects given center without iterating over points

**distance_method**

The measure for distance between two data points. Only Euclidean distance is supported at this time.

\textbf{Default:} euclidean

**output_view**

Name of the view where you save the assignment of each point to its cluster. You must have CREATE privileges on the view schema.

**key_columns**

Comma-separated list of column names that identify the output rows. Columns must be in the \textit{input-columns} argument list. To exclude these and other input columns from being used by the algorithm, list them in parameter \textit{exclude_columns}.

---

**Model Attributes**

<table>
<thead>
<tr>
<th>centers</th>
<th>A list of centers of the K centroids.</th>
</tr>
</thead>
<tbody>
<tr>
<td>hierarchy</td>
<td>The hierarchy of K clusters, including:</td>
</tr>
<tr>
<td></td>
<td>- ParentCluster: Parent cluster centroid of each centroid—that is, the centroid of the cluster from which a cluster is obtained by bisection.</td>
</tr>
<tr>
<td></td>
<td>- LeftChildCluster: Left child cluster centroid of each centroid—that is, the centroid of the first sub-cluster obtained by bisecting a cluster.</td>
</tr>
</tbody>
</table>
- **RightChildCluster**: the right child cluster centroid of each centroid—that is, the centroid of the second sub-cluster obtained by bisecting a cluster.
- **BisectionLevel**: Specifies which bisection step a cluster is obtained from.
- **WithinSS**: Within-cluster sum of squares for the current cluster
- **TotalWithinSS**: Total within-cluster sum of squares of leaf clusters thus far obtained.

### metrics

Several metrics related to the quality of the clustering, including

- Total sum of squares
- Total within-cluster sum of squares
- Between-cluster sum of squares
- Between-cluster sum of squares / Total sum of squares
- Sum of squares for cluster x, center_id y [...]

### Examples

```sql
SELECT BISECTING_KMEANS('myModel', 'iris1', '*', '5'
    USING PARAMETERS exclude_columns = 'Species,id', split_method = 'sum_squares', output_view = 'myBKmeansView');
```

### See Also

- Clustering Data Hierarchically Using Bisecting k-means
- APPLY_BISECTING_KMEANS

### KMEANS

Executes the k-means algorithm on an input relation. The result is a model with a list of cluster centers.

You can export the resulting k-means model in VERTICA_MODELS or PMML format to apply it on data outside Vertica. You can also train a k-means model elsewhere, then import it to Vertica in PMML format to predict on data in Vertica.
Syntax

KMEANS ( 'model-name', 'input-relation', 'input-columns', 'num-clusters'
[ USING PARAMETERS
  [exclude_columns = 'excluded-columns']
  [, max_iterations = max-iterations]
  [, epsilon = epsilon-value]
  [, { init_method = 'init-method' } | { initial_centers_table = 'init-table' } ]
  [, output_view = 'output-view']
  [, key_columns = 'key-columns' ] ] )

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model-name</td>
<td>Identifies the model to create, where model-name conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.</td>
</tr>
<tr>
<td>input-relation</td>
<td>The table or view that contains the input data for k-means. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_SCHEMA to sync the hcatalog schema, and then run the machine learning function.</td>
</tr>
<tr>
<td>input-columns</td>
<td>Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. Input columns must be of data type numeric.</td>
</tr>
<tr>
<td>num-clusters</td>
<td>The number of clusters to create, an integer ( \leq 10,000 ). This argument represents the ( k ) in k-means.</td>
</tr>
</tbody>
</table>

Parameters

Important:
Parameters init_method and initial_centers_table are mutually exclusive. If you set both, the function returns an error.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exclude_columns</td>
<td>Comma-separated list of column names from input-columns to exclude from processing.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| `max_iterations`   | The maximum number of iterations the algorithm performs. If you set this value to a number lower than the number of iterations needed for convergence, the algorithm may not converge.  
**Default:** 10                                                                                      |
| `epsilon`          | Determines whether the algorithm has converged. The algorithm is considered converged after no center has moved more than a distance of 'epsilon' from the previous iteration.  
**Default:** 1e-4                                                                                   |
| `init_method`      | The method used to find the initial cluster centers, one of the following:  
- `random`  
- `kmeanspp` (default): kmeans++ algorithm  
This value can be memory intensive for high k. If the function returns an error that not enough memory is available, decrease the value of k or use the `random` method. |
| `initial_centers_table` | The table with the initial cluster centers to use. Supply this value if you know the initial centers to use and do not want Vertica to find the initial cluster centers for you.                                      |
| `output_view`      | The name of the view where you save the assignments of each point to its cluster. You must have CREATE privileges on the schema where the view is saved.                                                         |
| `key_columns`      | Comma-separated list of column names that identify the output rows. Columns must be in the `input-columns` argument list. To exclude these and other input columns from being used by the algorithm, list them in parameter `exclude_columns`. |
Model Attributes

<table>
<thead>
<tr>
<th>centers</th>
<th>A list that contains the center of each cluster.</th>
</tr>
</thead>
<tbody>
<tr>
<td>metrics</td>
<td>A string summary of several metrics related to the quality of the clustering.</td>
</tr>
</tbody>
</table>

Examples

The following example creates k-means model `myKmeansModel` and applies it to input table `iris1`. The call to `APPLY_KMEANS` mixes column names and constants. When a constant is passed in place of a column name, the constant is substituted for the value of the column in all rows:

```sql
=> SELECT KMEANS('myKmeansModel', 'iris1', '*', 5
USING PARAMETERS max_iterations=20, output_view='myKmeansView', key_columns='id', exclude_columns='Species, id');

Finished in 12 iterations
(1 row)
```

```sql
=> SELECT id, APPLY_KMEANS(Sepal_Length, 2.2, 1.3, Petal_Width
USING PARAMETERS model_name='myKmeansModel', match_by_pos='true') FROM iris2;
```

```
id | APPLY_KMEANS
--- | -------
5  | 1
10 | 1
14 | 1
15 | 1
21 | 1
22 | 1
24 | 1
25 | 1
32 | 1
33 | 1
34 | 1
35 | 1
38 | 1
39 | 1
42 | 1
...
(60 rows)
```

**LINEAR_REG**

Executes linear regression on an input relation, and returns a linear regression model.

You can export the resulting linear regression model in VERTICA_MODELS or PMML format to apply it on data outside Vertica. You can also train a linear regression model elsewhere, then import it to Vertica in PMML format to predict on data in Vertica.

**Syntax**

```
LINEAR_REG ( 'model-name', 'input-relation', 'response-column', 'predictor-columns'
[ USING PARAMETERS
    [exclude_columns = 'excluded-columns']
    [, optimizer = 'optimizer-method']
    [, regularization = 'regularization-method']
    [, epsilon = epsilon-value]
    [, max_iterations = iterations]
    [, lambda = lambda-value]
    [, alpha = alpha-value] ] )
```

**Arguments**

<table>
<thead>
<tr>
<th>model-name</th>
<th>Identifies the model to create, where model-name conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.</th>
</tr>
</thead>
<tbody>
<tr>
<td>input-relation</td>
<td>The table or view that contains the training data for building the model. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_SCHEMA to sync the hcatalog schema, and then</td>
</tr>
</tbody>
</table>
run the machine learning function.

**response-column**  
Name of the input column that represents the dependent variable or outcome. All values in this column must be numeric, otherwise the model is invalid.

**predictor-columns**  
Comma-separated list of columns in the input relation that represent independent variables for the model, or asterisk (*) to select all columns. If you select all columns, the argument list for parameter exclude_columns must include **response-column**, and any columns that are invalid as predictor columns.

All predictor columns must be of type numeric or BOOLEAN; otherwise the model is invalid.

**Note:**  
All BOOLEAN predictor values are converted to FLOAT values before training: 0 for false, 1 for true. No type checking occurs during prediction, so you can use a BOOLEAN predictor column in training, and during prediction provide a FLOAT column of the same name. In this case, all FLOAT values must be either 0 or 1.

**Parameters**

<table>
<thead>
<tr>
<th>exclude_columns</th>
<th>Comma-separated list of columns from <strong>predictor-columns</strong> to exclude from processing.</th>
</tr>
</thead>
<tbody>
<tr>
<td>optimizer</td>
<td>The optimizer method used to train the model, one of the following:</td>
</tr>
</tbody>
</table>
|                 | - **Newton**  
|                 | - **BFGS**  
|                 | - **CGD** |

**Important:**  
If you select CGD, **regularization-method** must be set to L1 or ENet, otherwise the function returns an error.
<table>
<thead>
<tr>
<th></th>
<th>Default: CGD if <code>regularization-method</code> is set to L1 or ENet, otherwise Newton.</th>
</tr>

EXECUTES MODELS

EXPORT_MODELS

LOGISTIC_REG

Executes logistic regression on an input relation. The result is a logistic regression model.

You can export the resulting logistic regression model in VERTICA_MODELS or PMML format to apply it on data outside Vertica. You can also train a logistic regression model elsewhere, then import it to Vertica in PMML format to predict on data in Vertica.

Syntax

LOGISTIC_REG ( 'model-name', 'input-relation', 'response-column', 'predictor-columns'
[ USING PARAMETERS [exclude_columns = 'excluded-columns']
 [, optimizer = 'optimizer-method']
 [, regularization = 'regularization-method']
 [, epsilon = epsilon-value]  
 [, max_iterations = iterations]  
 [, lambda = lambda-value]  
 [, alpha = alpha-value] ] )

Arguments

<table>
<thead>

</tbody>
</table>
| **ENet** | Specifies whether the algorithm has reached the specified accuracy result.

**Default**: 1 e-6 |
| --- | --- |
| **epsilon** | Specifies whether the algorithm has reached the specified accuracy result.

**Default**: 1 e-6 |
| **max_iterations** | Maximum number of iterations the algorithm performs before achieving the specified accuracy result.

**Default**: 100 |
| **lambda** | Integer ≥ 0, specifies the value of the ENET regularization parameter, which defines how much L1 versus L2 regularization to provide. A value of 1 is equivalent to L1 and a value of 0 is equivalent to L2.

**Default**: 1 |
| **alpha** | ENet mixture parameter that specifies how much regularization to provide.

**Value range**: [0,1]

**Default**: 0.5 |

### Model Attributes

| **data** | The data for the function, including:

- **coeffNames**: Name of the coefficients. This starts with intercept and then follows with the names of the predictors in the same order specified in the call.
- **coeff**: Vector of estimated coefficients, with the same order as coeffNames
- **stdErr**: Vector of the standard error of the coefficients, with the same order as coeffNames
- **zValue** (for logistic regression): Vector of z-values of the coefficients, in the same order as coeffNames
- **tValue** (for linear regression): Vector of t-values of the coefficients, in the same order as coeffNames
- **pValue**: Vector of p-values of the coefficients, in the same order as coeffNames |
<table>
<thead>
<tr>
<th>order as coeffNames</th>
</tr>
</thead>
<tbody>
<tr>
<td>regularization Type of regularization to use when training the model.</td>
</tr>
<tr>
<td>lambda Regularization parameter. Higher values enforce stronger regularization. This value must be nonnegative.</td>
</tr>
<tr>
<td>alpha Elastic net mixture parameter.</td>
</tr>
<tr>
<td>iterations Number of iterations that actually occur for the convergence before exceeding max_iterations.</td>
</tr>
<tr>
<td>skippedRows Number of rows of the input relation that were skipped because they contained an invalid value.</td>
</tr>
<tr>
<td>processedRows Total number of input relation rows minus skippedRows.</td>
</tr>
<tr>
<td>callStr Value of all input arguments specified when the function was called.</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser, or SELECT privileges on the input relation

**Examples**

```sql
=> SELECT LOGISTIC_REG('myLogisticRegModel', 'mtcars', 'am',
                       'mpg, cyl, disp, hp, drat, wt, qsec, vs, gear, carb'
                       USING PARAMETERS exclude_columns='hp', optimizer='BFGS');

LOGISTIC_REG

Finished in 20 iterations

(1 row)
```

**See Also**

- Building a Logistic Regression Model
- PREDICT_LOGISTIC_REG
- PREDICT_PMML
- IMPORT_MODELS
- EXPORT_MODELS
**MOVING_AVERAGE**

Creates a moving-average (MA) model from a stationary time series with consistent timesteps that can then be used for prediction via `PREDICT_MOVING_AVERAGE`.

Moving average models use the errors of previous predictions to make future predictions. More specifically, the user-specified lag determines how many previous predictions and errors it takes into account during computation.

Since its input data must be sorted by timestamp, this algorithm is single-threaded.

**Syntax**

```sql
MOVING_AVERAGE ('model-name', 'input-relation', 'data-column', 'timestamp-column'
    [ USING PARAMETERS
        [ q = lags ]
        [, missing = "imputation-method" ]
        [, regularization = "regularization-method" ]
        [, lambda = regularization-value ]
        [, compute_mse = boolean ]
    ]
)
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>model-name</code></td>
<td>Identifies the model to create, where <code>model-name</code> conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.</td>
</tr>
<tr>
<td><code>input-relation</code></td>
<td>The table or view containing the <code>timestamp-column</code>. This algorithm expects a stationary time series as input; using a time series with a mean that shifts over time may lead to weaker results.</td>
</tr>
<tr>
<td><code>data-column</code></td>
<td>An input column of type NUMERIC that contains the dependent variables or outcomes.</td>
</tr>
<tr>
<td><code>timestamp-column</code></td>
<td>One INTEGER, FLOAT, or TIMESTAMP column that represent the timestamp variable. Timesteps must be consistent.</td>
</tr>
</tbody>
</table>
## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| q | INTEGER in the range \([1, 67]\), the number of lags to consider in the computation.  
**Default**: 1 |
| missing | One of the following methods for handling missing values:  
- **drop**: Missing values are ignored.  
- **error**: Missing values raise an error.  
- **zero**: Missing values are replaced with 0.  
- **linear_interpolation**: Missing values are replaced by linearly interpolated values based on the nearest valid entries before and after the missing value. This means that in cases where the first or last values in a dataset are missing, they will simply be dropped.  
**Default**: linear_interpolation |
| regularization | One of the following regularization methods used when fitting the data:  
- **None**  
- **L2**: weight regularization term which penalizes the squared weight value  
**Default**: None |
| lambda | FLOAT in the range \([0, 100000]\), the regularization value, lambda.  
**Default**: 1.0 |
| compute_mse | BOOLEAN, whether to calculate and output the mean squared error (MSE).  
This parameter only accepts "true" or "false" rather than the standard literal equivalents for BOOLEANs like 1 or 0.  
**Default**: False |
Examples

See Moving-average Model Example.

See Also

- `PREDICT_MOVING_AVERAGE`
- `GET_MODEL_SUMMARY`

**NAIVE_BAYES**

Executes the Naive Bayes algorithm on an input relation and returns a Naive Bayes model.

Columns are treated according to data type:

- FLOAT: Values are assumed to follow some Gaussian distribution.
- INTEGER: Values are assumed to belong to one multinomial distribution.
- CHAR/VARCHAR: Values are assumed to follow some categorical distribution. The string values stored in these columns must not be greater than 128 characters.
- BOOLEAN: Values are treated as categorical with two values.

Syntax

```
NAIVE_BAYES ( 'model-name', 'input-relation', 'response-column', 'predictor-columns'
          [ USING PARAMETERS [exclude_columns = 'excluded-columns'] [, alpha = alpha-value] ] )
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>model-name</code></td>
<td>Identifies the model to create, where <code>model-name</code> conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.</td>
</tr>
<tr>
<td><code>input-relation</code></td>
<td>The table or view that contains the training data for building the</td>
</tr>
</tbody>
</table>
model. If the input relation is defined in Hive, use `SYNC_WITH_HCATALOG_SCHEMA` to sync the hcatalog schema, and then run the machine learning function.

**response-column**
Name of the input column that represents the dependent variable, or outcome. This column must contain discrete labels that represent different class labels.

The response column must be of type **numeric**, CHAR/VARCHAR, or BOOLEAN; otherwise the model is invalid.

**Note:**
Vertica automatically casts **numeric** response column values to VARCHAR.

**predictor-columns**
Comma-separated list of columns in the input relation that represent independent variables for the model, or asterisk (*) to select all columns. If you select all columns, the argument list for parameter `exclude_columns` must include `response-column`, and any columns that are invalid as predictor columns.

All predictor columns must be of type **numeric**, CHAR/VARCHAR, or BOOLEAN; otherwise the model is invalid. BOOLEAN column values are converted to FLOAT values before training: 0 for false, 1 for true.

**Parameters**

<table>
<thead>
<tr>
<th>exclude_columns</th>
<th>Comma-separated list of columns from <strong>predictor-columns</strong> to exclude from processing.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>alpha</strong></td>
<td>Float, specifies use of Laplace smoothing if the event model is categorical, multinomial, or Bernoulli.</td>

### Privileges

Superuser, or SELECT privileges on the input relation.

### Examples

```sql
g=> SELECT NAIVE_BAYES('naive_house84_model', 'house84_train', 'party', '*'
    USING PARAMETERS exclude_columns='party, id');
NAIVE_BAYES
```

Finished. Accepted Rows: 324 Rejected Rows: 0

(1 row)

### RF_CLASSIFIER

Trains a random forest model for classification on an input relation.

### Syntax

```sql
RF_CLASSIFIER ( 'model-name', input-relation, 'response-column', 'predictor-columns'
    [ USING PARAMETERS
```
Arguments

**model-name**
Identifies the model stored as a result of the training, where `model-name` conforms to conventions described in `Identifiers`. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.

**input-relation**
The table or view that contains the training samples. If the input relation is defined in Hive, use `SYNC_WITH_HCATALOG_SCHEMA` to sync the hcatalog schema, and then run the machine learning function.

**response-column**
An input column of type `numeric`, CHAR/VARCHAR, or BOOLEAN that represents the dependent variable.

*Note:*
Vertica automatically casts `numeric` response column values to VARCHAR.

**predictor-columns**
Comma-separated list of columns in the input relation that represent independent variables for the model, or asterisk (*) to select all columns. If you select all columns, the argument list for parameter `exclude_columns` must include `response-column`, and any columns that are invalid as predictor columns.

All predictor columns must be of type `numeric`, CHAR/VARCHAR, or BOOLEAN; otherwise the model is invalid.

Vertica XGBoost and Random Forest algorithms offer native support for categorical columns (BOOL/VARCHAR). Simply pass the categorical columns as predictors to the models and the algorithm will automatically treat the columns as categorical and will not attempt to split them into bins in the same manner.
as numerical columns; Vertica treats these columns as true categorical values and does not simply cast them to continuous values under-the-hood.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>exclude_columns</strong></td>
<td>Comma-separated list of column names from <code>input-columns</code> to exclude from processing.</td>
</tr>
</tbody>
</table>
| **ntree**          | Integer between 0 and 1000 inclusive, specifies the number of trees in the forest.  
  **Default:** 20 |
| **mtry**           | Integer ≤ `number-predictors`, specifies the number of randomly chosen features from which to pick the best feature to split on a given tree node.  
  **Default:** Square root of the total number of predictors |
| **sampling_size**  | Float between 0.0 and 1.0 inclusive, specifies the portion of the input data set that is randomly picked for training each tree.  
  **Default:** 0.632 |
| **max_depth**      | Integer between 1 and 100 inclusive, specifies the maximum depth for growing each tree.  
  **Default:** 5 |
| **max_breadth**    | Integer between 1 and 1e9 inclusive, specifies the maximum number of leaf nodes a tree in the forest can have.  
  **Default:** 32 |
| **min_leaf_size**  | Integer between 1 and 1e6 inclusive, specifies the minimum number of samples each branch must have after splitting a node. A split that causes fewer remaining samples is discarded.  
  **Default:** 1 |
| **min_info_gain**  | Float between 0.0 and 1.0 inclusive, specifies the minimum threshold for including a split. A split with information gain less
than this threshold is discarded.  
**Default:** 0.0

| nbins | Integer between 2 and 1000 inclusive, specifies the number of bins to use for continuous features.  
**Default:** 32 |

**Model Attributes**

**RF_REGRESSOR**

Trains a random forest model for regression on an input relation.

**Syntax**

```sql
RF_REGRESSOR ( 'model-name', input-relation, 'response-column', 'predictor-columns'

[ USING PARAMETERS
  [exclude_columns = 'excluded-columns']
  [, ntree = num-trees]
  [, mtry = num-features]
  [, sampling_size = sampling-size]
  [, max_depth = depth]
  [, max_breadth = breadth]
  [, min_leaf_size = leaf-size]
  [, min_info_gain = threshold]
  [, nbins = num-bins] ] )
```

**Arguments**

| **model-name** | The model that is stored as a result of training, where model-name conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema. |
| **input-relation** | The table or view that contains the training samples. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_SCHEMA to sync the hcatalog schema, and then run the machine learning function. |
| **response-column** | A numeric input column that represents the dependent variable. |
**predictor-columns**  
Comma-separated list of columns in the input relation that represent independent variables for the model, or asterisk (*) to select all columns. If you select all columns, the argument list for parameter `exclude_columns` must include `response-column`, and any columns that are invalid as predictor columns.

All predictor columns must be of type `numeric`, `CHAR/VARCHAR`, or `BOOLEAN`; otherwise the model is invalid.

Vertica XGBoost and Random Forest algorithms offer native support for categorical columns (BOOL/VARCHAR). Simply pass the categorical columns as predictors to the models and the algorithm will automatically treat the columns as categorical and will not attempt to split them into bins in the same manner as numerical columns; Vertica treats these columns as true categorical values and does not simply cast them to continuous values under-the-hood.

### SVM_CLASSIFIER

Trains the SVM model on an input relation.

#### Syntax

```
SVM_CLASSIFIER ( 'model-name', input-relation, 'response-column', 'predictor-columns'
    [ USING PARAMETERS
        [exclude_columns = 'excluded-columns']
        [, C = 'cost']
        [, epsilon = 'epsilon-value']
        [, max_iterations = 'max-iterations']
        [, class_weights = 'weight']
        [, intercept_mode = 'intercept-mode']
        [, intercept_scaling = 'scale'] ] )
```
## Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>model-name</strong></td>
<td>Identifies the model to create, where <em>model-name</em> conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.</td>
</tr>
<tr>
<td><strong>input-relation</strong></td>
<td>The table or view that contains the training data. If the input relation is defined in Hive, use <code>SYNC_WITH_HCATALOG_SCHEMA</code> to sync the hcatalog schema, and then run the machine learning function.</td>
</tr>
<tr>
<td><strong>response-column</strong></td>
<td>The input column that represents the dependent variable or outcome. The column value must be 0 or 1, and of type numeric or BOOLEAN, otherwise the function returns with an error.</td>
</tr>
<tr>
<td><strong>predictor-columns</strong></td>
<td>Comma-separated list of columns in the input relation that represent independent variables for the model, or asterisk (*) to select all columns. If you select all columns, the argument list for parameter exclude_columns must include response-column, and any columns that are invalid as predictor columns. All predictor columns must be of type numeric or BOOLEAN; otherwise the model is invalid.</td>
</tr>
</tbody>
</table>

**Note:**

All BOOLEAN predictor values are converted to FLOAT values before training: 0 for false, 1 for true. No type checking occurs during prediction, so you can use a BOOLEAN predictor column in training, and during prediction provide a FLOAT column of the same name. In this case, all FLOAT values must be either 0 or 1.

## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exclude_columns</td>
<td>Comma-separated list of columns from predictor-columns to editable by columns</td>
</tr>
</tbody>
</table>
exclude from processing.

| C       | Weight for misclassification cost. The algorithm minimizes the regularization cost and the misclassification cost.  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>1.0</td>
</tr>
<tr>
<td>epsilon</td>
<td>Used to control accuracy.</td>
</tr>
<tr>
<td>Default</td>

</tr>
<tr>
<td>max_iterations</td>
<td>Maximum number of iterations that the algorithm performs.</td>
</tr>
<tr>
<td>Default</td>
<td>100</td>
</tr>
</tbody>
</table>
| class_weights | Specifies how to determine weights of the two classes, one of the following:  
|            | - None (default): No weights are used  
|            | - value0, value1: Two comma-delimited strings that specify two positive FLOAT values, where value0 assigns a weight to class 0, and value1 assigns a weight to class 1.  
|            | - auto: Weights each class according to the number of samples.                                                    |
| intercept_mode | Specifies how to treat the intercept, one of the following:  
|                | - regularized (default): Fits the intercept and applies a regularization on it.  
|                | - unregularized: Fits the intercept but does not include it in regularization.                                   |
| intercept_scaling | Float value that serves as the value of a dummy feature whose coefficient Vertica uses to calculate the model intercept.  
|                    | Because the dummy feature is not in the training data, its values are set to a constant, by default 1.            |

**Model Attributes**

| coeff | Coefficients in the model: |
Examples

The following example uses SVM_CLASSIFIER on the mtcars table:

```sql
=> SELECT SVM_CLASSIFIER(
   'mySvmClassModel', 'mtcars', 'am', 'mpg,cyl,disp,hp,drat,wt,qsec,vs,gear,carb'
   USING PARAMETERS exclude_columns = 'hp,drat');
```

SVM_CLASSIFIER
-----------------------------------------------
Finished in 15 iterations.
Accepted Rows: 32  Rejected Rows: 0
(1 row)

**SVM_REGRESSOR**

Trains the SVM model on an input relation.

Syntax

```sql
SVM_REGRESSOR ( 'model-name', input-relation, 'response-column', 'predictor-columns'
[ USING PARAMETERS
    [exclude_columns = 'excluded-columns']
    [, error_tolerance = error-tolerance]
    [, C = cost]
)```
[, epsilon = epsilon-value]
[, max_iterations = max-iterations]
[, intercept_mode = 'mode']
[, intercept_scaling = 'scale'] ] })

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model-name</td>
<td>Identifies the model to create, where model-name conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.</td>
</tr>
<tr>
<td>input-relation</td>
<td>The table or view that contains the training data. If the input relation is defined in Hive, use SYNC_WITH_HCATALOG_SCHEMA to sync the hcatalog schema, and then run the machine learning function.</td>
</tr>
<tr>
<td>response-column</td>
<td>An input column that represents the dependent variable or outcome. The column must be a numeric data type.</td>
</tr>
<tr>
<td>predictor-columns</td>
<td>Comma-separated list of columns in the input relation that represent independent variables for the model, or asterisk (*) to select all columns. If you select all columns, the argument list for parameter exclude_columns must include response-column, and any columns that are invalid as predictor columns. All predictor columns must be of type numeric or BOOLEAN; otherwise the model is invalid.</td>
</tr>
</tbody>
</table>

**Note:**

All BOOLEAN predictor values are converted to FLOAT values before training: 0 for false, 1 for true. No type checking occurs during prediction, so you can use a BOOLEAN predictor column in training, and during prediction provide a FLOAT column of the same name. In this case, all FLOAT values must be either 0 or 1.

**XGB_CLASSIFIER**

Trains an XGBoost model for classification on an input relation, using cross-entropy for optimization.
Syntax

```
XGB_CLASSIFIER('model-name', 'input-relation', 'response-column', 'predictor-columns'
[ USING PARAMETERS
    [ exclude_columns = 'excluded-columns' ]
    [, max_ntree = max-trees ]
    [, max_depth = max-depth ]
    [, learning_rate = learning-rate ]
    [, min_split_loss = minimum ]
    [, weight_reg = regularization ]
    [, nbins = num-bins ]
    [, sampling_size = fraction-of-rows ]
    [, col_sample_by_tree = sample-ratio-per-tree ]
    [, col_sample_by_node = sample-ratio-per-node ]
    ]
)
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>model-name</strong></td>
<td>Name of the model (case-insensitive).</td>
</tr>
<tr>
<td><strong>input-relation</strong></td>
<td>The table or view that contains the training samples. If the input relation is defined in Hive, use <code>SYNC_WITH_HCATALOG_SCHEMA</code> to sync the hcatalog schema, and then run the machine learning function.</td>
</tr>
<tr>
<td><strong>response-column</strong></td>
<td>An input column of type CHAR or VARCHAR that represents the dependent variable or outcome.</td>
</tr>
<tr>
<td><strong>predictor-columns</strong></td>
<td>Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. Columns must be of data types CHAR, VARCHAR, BOOL, INT, or FLOAT.</td>
</tr>
</tbody>
</table>

Columns of type CHAR, VARCHAR, and BOOL are treated as categorical features; all others are treated as numeric features.

Vertica XGBoost and Random Forest algorithms offer native support for categorical columns (BOOL/VARCHAR). Simply pass the categorical columns as predictors to the models and the algorithm will automatically treat the columns as categorical and will not attempt to split them into bins in the same manner as numerical columns; Vertica treats these columns as true categorical values and does not simply cast them to continuous values under-the-hood.
## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exclude_columns</td>
<td>Comma-separated list of column names from input-columns to exclude from processing.</td>
</tr>
<tr>
<td>max_ntree</td>
<td>Integer in the range $[1,1000]$ that sets the maximum number of trees to create.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> 10</td>
</tr>
<tr>
<td>max_depth</td>
<td>Integer in the range $[1,20]$ that specifies the maximum depth of each tree.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> 6</td>
</tr>
<tr>
<td>learning_rate</td>
<td>Float in the range $(0,1]$ that specifies the weight for each tree's prediction. Setting this parameter can reduce each tree's impact and thereby prevent earlier trees from monopolizing improvements at the expense of contributions from later trees.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> 0.3</td>
</tr>
<tr>
<td>min_split_loss</td>
<td>Float in the range $[0,1000]$ that specifies the minimum amount of improvement each split must achieve on the model's objective function value to avoid being pruned.</td>
</tr>
<tr>
<td></td>
<td>If set to 0 or omitted, no minimum is set. In this case, trees are pruned according to positive or negative objective function values.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> 0.0 (disable)</td>
</tr>
<tr>
<td>weight_reg</td>
<td>Float in the range $[0,1000]$ that specifies the regularization term applied to the weights of classification tree leaves. The higher the setting, the sparser or smoother the weights are, which can help prevent over-fitting.</td>
</tr>
<tr>
<td>nbins</td>
<td>Integer in the range $(1,1000]$ that specifies the number of bins to use for finding splits in each column. More bins leads to longer runtime but more fine-grained and possibly better</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>

</tbody>
</table>
Examples

See XGBoost for Classification.

**XGB_REGRESSOR**

Trains an XGBoost model for regression on an input relation, using squared error for optimization.

Syntax

```
XGB_REGRESSOR ('model-name', 'input-relation', 'response-column', 'predictor-columns'
[ USING PARAMETERS
   [ exclude_columns = 'excluded-columns' ]
   [, max_ntree = max-trees ]
   [, max_depth = max-depth ]
   [, learning_rate = learning-rate ]
   [, min_split_loss = minimum ]
   [, weight_reg = regularization ]
   [, nbins = num-bins ]
   [, sampling_size = fraction-of-rows ]
   [, col_sample_by_tree = sample-ratio-per-tree ]
   [, col_sample_by_node = sample-ratio-per-node ]
 ] )
```

Arguments

<table>
<thead>
<tr>
<th><strong>model-name</strong></th>
<th>Name of the model (case-insensitive).</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>input-relation</strong></td>
<td>The table or view that contains the training samples. If the input relation is defined in Hive, use <code>SYNC_WITH_HCATALOG_SCHEMA</code> to sync the hcatalog schema, and then run the machine learning function.</td>
</tr>
<tr>
<td><strong>response-column</strong></td>
<td>An input column of type INTEGER or FLOAT that represents the dependent variable or outcome.</td>
</tr>
<tr>
<td><strong>predictor-columns</strong></td>
<td>Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. Columns must be of data type INTEGER or FLOAT.</td>
</tr>
</tbody>
</table>
types CHAR, VARCHAR, BOOL, INT, or FLOAT.

Columns of type CHAR, VARCHAR, and BOOL are treated as categorical features; all others are treated as numeric features.

Vertica XGBoost and Random Forest algorithms offer native support for categorical columns (BOOL/VARCHAR). Simply pass the categorical columns as predictors to the models and the algorithm will automatically treat the columns as categorical and will not attempt to split them into bins in the same manner as numerical columns; Vertica treats these columns as true categorical values and does not simply cast them to continuous values under-the-hood.

Parameters

<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exclude_columns</td>
<td>Comma-separated list of column names from input-columns to exclude from processing.</td>
</tr>
<tr>
<td>max_ntree</td>
<td>Integer in the range [1,1000] that sets the maximum number of trees to create.</td>
</tr>
<tr>
<td></td>
<td><strong>Default</strong>: 10</td>
</tr>
<tr>
<td>max_depth</td>
<td>Integer in the range [1,20] that specifies the maximum depth of each tree.</td>
</tr>
<tr>
<td></td>
<td><strong>Default</strong>: 6</td>
</tr>
<tr>
<td>learning_rate</td>
<td>Float in the range (0,1] that specifies the weight for each tree's prediction. Setting this parameter can reduce each tree's impact and thereby prevent earlier trees from monopolizing improvements at the expense of contributions from later trees.</td>
</tr>
<tr>
<td></td>
<td><strong>Default</strong>: 0.3</td>
</tr>
<tr>
<td>min_split_loss</td>
<td>Float in the range [0,1000] that specifies the minimum amount of improvement each split must achieve on the model's objective function value to avoid being pruned.</td>
</tr>
<tr>
<td></td>
<td>If set to 0 or omitted, no minimum is set. In this case, trees are pruned according to positive or negative objective function.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>values.</td>
<td></td>
</tr>
<tr>
<td>weight_reg</td>
<td>Float in the range [0,1000] that specifies the regularization term applied to the weights of classification tree leaves. The higher the setting, the sparser or smoother the weights are, which can help prevent over-fitting.</td>
</tr>
<tr>
<td>nbins</td>
<td>Integer in the range (1,1000] that specifies the number of bins to use for finding splits in each column. More bins leads to longer runtime but more fine-grained and possibly better splits.</td>
</tr>
<tr>
<td>sampling_size</td>
<td>Float in the range (0,1] that specifies the fraction of rows to use in each training iteration.</td>
</tr>
<tr>
<td>col_sample_by_tree</td>
<td>Float in the range (0,1] that specifies the fraction of columns (features), chosen at random, to use when building each tree.</td>
</tr>
<tr>
<td>col_sample_by_node</td>
<td>Float in the range (0,1] that specifies the fraction of columns (features), chosen at random, to use when evaluating each split.</td>
</tr>
</tbody>
</table>
A value of 1 indicates that all columns are used.

col_sample_by parameters "stack" on top of each other if several are specified. That is, given a set of 24 columns, for col_sample_by_tree=0.5 and col_sample_by_node=0.5, col_sample_by_tree samples 12 columns, reducing the available, unsampled column pool to 12. col_sample_by_node then samples half of the remaining pool, so each node samples 6 columns.

This algorithm will always sample at least one column.

Default: 1

Examples

See XGBoost for Regression.

Transformation Functions

The machine learning API includes a set of UDx functions that transform the columns of each input row to one or more corresponding output columns. These transformations follow rules that are defined in models that were created earlier. For example, APPLY_SVD uses an SVD model to transform input data.

Unless otherwise indicated, these functions require the following privileges for non-superusers:

- USAGE privileges on the model
- SELECT privileges on the input relation

In general, given an invalid input row, the return value for these functions is NULL.

**APPLY_BISECTING_KMEANS**

Applies a trained bisecting k-means model to an input relation, and assigns each new data point to the closest matching cluster in the trained model.
**Note:**
If the input relation is defined in Hive, use `SYNC_WITH_HCATALOG_SCHEMA` to sync the hcatalog schema, and then run the machine learning function.

## Syntax

```sql
SELECT APPLY_BISECTING_KMEANS( 'input-columns'
    USING PARAMETERS model_name = 'model-name'
    [, num_clusters = 'num-clusters']
    [, match_by_pos = match-by-position] )
```

## Arguments

**input-columns**
Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. Input columns must be of data type numeric.

## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model (case-insensitive).</td>
</tr>
<tr>
<td>num_clusters</td>
<td>Integer between 1 and $k$ inclusive, where $k$ is the number of centers in the model, specifies the number of clusters to use for prediction. Default: Value that the model specifies for $k$</td>
</tr>
<tr>
<td>match_by_pos</td>
<td>Boolean value that specifies how input columns are matched to model features:</td>
</tr>
<tr>
<td></td>
<td>- false (default): Match by name.</td>
</tr>
<tr>
<td></td>
<td>- true: Match by the position of columns in the input columns list.</td>
</tr>
</tbody>
</table>

## Privileges

Non-superusers: model owner, or USAGE privileges on the model
**APPLY_INVERSE_PCA**

Inverts the APPLY_PCA-generated transform back to the original coordinate system.

**Syntax**

```
APPLY_INVERSE_PCA ( input-columns
    USING PARAMETERS model_name = 'model-name'
    [, exclude_columns = 'excluded-columns']
    [, key_columns = 'key-columns'] )
```

**Arguments**

<table>
<thead>
<tr>
<th><strong>input-columns</strong></th>
<th>Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. The following requirements apply:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• All columns must be a <strong>numeric</strong> data type.</td>
</tr>
<tr>
<td></td>
<td>• Enclose the column name in double quotes if it contains special characters.</td>
</tr>
</tbody>
</table>

**Parameters**

<table>
<thead>
<tr>
<th><strong>model_name</strong></th>
<th>Name of the model (case-insensitive).</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>exclude_columns</strong></td>
<td>Comma-separated list of column names from <strong>input-columns</strong> to exclude from processing.</td>
</tr>
<tr>
<td><strong>key_columns</strong></td>
<td>Comma-separated list of column names from <strong>input-columns</strong> that identify its data rows. These columns are included in the output table.</td>
</tr>
</tbody>
</table>
Examples

The following example shows how to use the APPLY_INVERSE_PCA function. It shows the output for the first record.

```sql
=> SELECT PCA ('pcamodel',

PCA
Finished in 1 iterations.
Accepted Rows: 96  Rejected Rows: 0
(1 row)
=> CREATE TABLE worldPCA AS SELECT
gdp2009,gdp2010 USING PARAMETERS model_name='pcamodel', exclude_columns='HDI,country', key_columns='HDI,country',cutoff=.3)OVER () FROM world;

CREATE TABLE
=> SELECT * FROM worldPCA;

- **APPLY_PCA**
- **PCA**
**APPLY_INVERSE_SVD**

Transforms the data back to the original domain. This essentially computes the approximated version of the original data by multiplying three matrices: matrix U (input to this function), matrices S and V (stored in the model).

**Syntax**

```
APPLY_INVERSE_SVD ( 'input-columns'
    USING PARAMETERS model_name = 'model-name'
    [, match_by_pos = match-by-position]
    [, exclude_columns = 'excluded-columns']
    [, key_columns = 'key-columns']
)
```

**Arguments**

<table>
<thead>
<tr>
<th>input-columns</th>
<th>Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. The following requirements apply:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- All columns must be a numeric data type.</td>
</tr>
<tr>
<td></td>
<td>- Enclose the column name in double quotes if it contains special characters.</td>
</tr>
</tbody>
</table>

**Parameters**

<table>
<thead>
<tr>
<th>model_name</th>
<th>Name of the model (case-insensitive).</th>
</tr>
</thead>
<tbody>
<tr>
<td>match_by_pos</td>
<td>Boolean value that specifies how input columns are matched to model features:</td>
</tr>
<tr>
<td></td>
<td>- false (default): Match by name.</td>
</tr>
<tr>
<td></td>
<td>- true: Match by the position of columns in the input columns list.</td>
</tr>
<tr>
<td>exclude_columns</td>
<td>Comma-separated list of column names from input-columns to exclude from processing.</td>
</tr>
</tbody>
</table>
key_columns | Comma-separated list of column names from *input-columns* that identify its data rows. These columns are included in the output table.

**Examples**

```sql
=> SELECT SVD ('svdmodel', 'small_svd', 'x1,x2,x3,x4');

SVD

Finished in 1 iterations.
Accepted Rows: 8  Rejected Rows: 0
(1 row)

=> CREATE TABLE transform_svd AS SELECT
   APPLY_SVD (id, x1, x2, x3, x4 USING PARAMETERS model_name='svdmodel', exclude_columns='id',
   key_columns='id')
   OVER () FROM small_svd;

```

**See Also**

- APPLY_SVD
- SVD
**APPLY_KMEANS**

Assigns each row of an input relation to a cluster center from an existing k-means model.

**Syntax**

\[
\text{APPLY\_KMEANS}(\text{input-columns}) \quad \text{USING PARAMETERS model\_name = 'model-name' [, match\_by\_pos = match-by-position]} \]

**Arguments**

| input-columns | Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. |

**Parameters**

| model_name | Name of the model (case-insensitive). |
| match_by_pos | Boolean value that specifies how input columns are matched to model features: |
|             | - **false** (default): Match by name. |
|             | - **true**: Match by the position of columns in the input columns list. |

**Privileges**

Non-superusers: model owner, or USAGE privileges on the model

**Examples**

The following example creates k-means model myKmeansModel and applies it to input table iris1. The call to APPLY_KMEANS mixes column names and constants. When a
constant is passed in place of a column name, the constant is substituted for the value of
the column in all rows:

```sql
=> SELECT kmeans('myKmeansModel', 'iris1', '*', 5
USING PARAMETERS max_iterations=20, output_view='myKmeansView', key_columns='id', exclude_
columns='Species, id');

KMEANS
Finished in 12 iterations

(1 row)
=> SELECT id, APPLY_KMEANS(Sepal.Length, 2.2, 1.3, Petal.Width
USING PARAMETERS model_name='myKmeansModel', match_by_pos='true') FROM iris2;

<table>
<thead>
<tr>
<th>id</th>
<th>APPLY_KMEANS</th>

**APPLY_NORMALIZE**

A UDTF function that applies the normalization parameters saved in a model to a set of
specified input columns. If any column specified in the function is not in the model, its data
passes through unchanged to APPLY_NORMALIZE.

**Note:** If a column contains only one distinct value, APPLY_NORMALIZE
returns NaN for values in that column.
Syntax

APPLY_NORMALIZE (input-columns USING PARAMETERS model_name = 'model-name');

Arguments

| input-columns | Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. If you supply an asterisk, APPLY_NORMALIZE normalizes all columns in the model. |

Parameters

| model_name | Name of the model (case-insensitive). |

Examples

The following example creates a model with NORMALIZE_FIT using the wt and hp columns in table mtcars, and then uses this model in successive calls to APPLY_NORMALIZE and REVERSE_NORMALIZE.

```sql
=> SELECT NORMALIZE_FIT('mtcars_normfit', 'mtcars', 'wt,hp', 'minmax');
NORMALIZE_FIT
Success
(1 row)
```

The following call to APPLY_NORMALIZE specifies the hp and cyl columns in table mtcars, where hp is in the normalization model and cyl is not in the normalization model:

```sql
=> CREATE TABLE mtcars_normalized AS SELECT APPLY_NORMALIZE (hp, cyl USING PARAMETERS model_name = 'mtcars_normfit') FROM mtcars;
CREATE TABLE
=> SELECT * FROM mtcars_normalized;
    hp     | cyl
----------+-------

```sql
=> SELECT REVERSE_NORMALIZE (hp, cyl USING PARAMETERS model_name='mtcars_normfit') FROM mtcars_normalized;

<table>
<thead>
<tr>
<th>hp</th>
<th>cyl</th>
</tr>
</thead>
<tbody>
<tr>
<td>175</td>
<td>8</td>
</tr>
<tr>
<td>245</td>
<td>8</td>
</tr>
<tr>
<td>175</td>
<td>6</td>
</tr>
<tr>
<td>335</td>
<td>8</td>
</tr>
<tr>
<td>205</td>
<td>8</td>
</tr>
<tr>
<td>52</td>
<td>4</td>
</tr>
<tr>
<td>245</td>
<td>8</td>
</tr>
<tr>
<td>65</td>
<td>4</td>
</tr>
<tr>
<td>175</td>
<td>8</td>
</tr>
<tr>
<td>110</td>
<td>6</td>
</tr>
<tr>
<td>123</td>
<td>6</td>
</tr>
<tr>
<td>66</td>
<td>4</td>
</tr>
<tr>
<td>110</td>
<td>6</td>
</tr>
<tr>
<td>109</td>
<td>4</td>
</tr>
<tr>
<td>110</td>
<td>6</td>
</tr>
<tr>
<td>123</td>
<td>6</td>
</tr>
<tr>
<td>66</td>
<td>4</td>
</tr>
<tr>
<td>113</td>
<td>4</td>
</tr>
<tr>
<td>62</td>
<td>4</td>
</tr>
<tr>
<td>105</td>
<td>6</td>
</tr>
<tr>
<td>180</td>
<td>8</td>
</tr>
<tr>
<td>230</td>
<td>8</td>
</tr>
</tbody>
</table>
```
The following call to REVERSE_NORMALIZE also specifies the hp and cyl columns in table mtcars, where hp is in normalization model mtcars_normfit, and cyl is not in the normalization model.

```sql
=> SELECT REVERSE_NORMALIZE (hp, cyl USING PARAMETERS model_name='mtcars_normfit') FROM mtcars_normalized;
```

```

**APPLY_ONE_HOT_ENCODER**

A user-defined transform function (UDTF) that loads the one hot encoder model and writes out a table that contains the encoded columns.

Syntax

```
APPLY_ONE_HOT_ENCODER( input-columns 
    USING PARAMETERS model_name = 'model-name'
    [, drop_first = 'is-first']
    [, ignore_null = 'ignore']
    [, separator = 'separator-character']
    [, columnNaming = 'name-output']
    [, null_column_name = 'null-column-name'] )
```

Arguments

| input-columns | Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. |

Parameters

| model_name | Name of the model (case-insensitive). stores the categories and their corresponding levels. |
| drop_first | Boolean value, one of the following:  
  - true (default): Treat the first level of the categorical |
| **variable** | as the reference level. |
| **false** | Every level of the categorical variable has a corresponding column in the output view |

| **ignore_null** | Boolean value, one of the following: |
| **true** (default) | Null values set all corresponding one-hot binary columns to null. |
| **false** | Null values in *input-columns* are treated as a categorical level |

| **separator** | The character that separates the input variable name and the indicator variable level in the output table. To avoid using any separator, set this parameter to null value. |
| **Default**: Underscore (_) |

| **column_naming** | Appends categorical levels to column names according to the specified method: |
| **indices** (default) | Uses integer indices to represent categorical levels. |
| **values/values_relaxed**: Both methods use categorical level names. If duplicate column names occur, the function attempts to disambiguate them by appending _n, where n is a zero-based integer index (_0, _1,...). |

If the function cannot produce unique column names, it handles this according to the chosen method:

| **values** returns an error. |
| **values_relaxed** reverts to using indices. |

**Important:**
The following column naming rules apply if column_naming is set to values or values_relaxed:

- Input column names with more than 128 characters are truncated.
- Column names can contain special characters.
- If parameter ignore_null is set to true, APPLY_ONE_HOT_ENCODER constructs the column name from the value set in parameter null_column_name. If this parameter is omitted, the string null...
null_column_name is used.

null_column_name

The string used in naming the indicator column for null values, used only if ignore_null is set to false and column_naming is set to values or values_relaxed.

Default: null

Note: If an input row contains a level not stored in the model, the output row columns corresponding to that categorical level are returned as null values.

Examples

```sql
=> SELECT APPLY_ONE_HOT_ENCODER(cyl USING PARAMETERS model_name='one_hot_encoder_model',
                               drop_first='true', ignore_null='false')
    FROM mtcars;
```

**APPLY_PCA**

Transforms the data using a PCA model. This returns new coordinates of each data point.

**Syntax**

```
APPLY_PCA (input-columns
    USING PARAMETERS model_name = 'model-name'
    [, num_components = num-components]
    [, cutoff = cutoff-value]
    [, match_by_pos = match-by-position]
    [, exclude_columns = 'excluded-columns']
    [, key_columns = 'key-columns'] )
```

**Arguments**

| input-columns | Comma-separated list of columns that contain the data matrix, or asterisk (*) to select all columns. The following requirements apply:
|               | - All columns must be a numeric data type.
|               | - Enclose the column name in double quotes if it contains special characters. |

**Parameters**

<table>
<thead>
<tr>
<th>model_name</th>
<th>Name of the model (case-insensitive).</th>
</tr>
</thead>
<tbody>
<tr>
<td>num_components</td>
<td>The number of components to keep in the model. This is the number of output columns that will be generated. If you omit this parameter and the cutoff parameter, all model components are</td>
</tr>
</tbody>
</table>
### Examples

```sql

**APPLY_SVD**

Transforms the data using an SVD model. This computes the matrix U of the SVD decomposition.

**Syntax**

```sql
APPLY_SVD ( input-columns
              USING PARAMETERS model_name = 'model-name'
              [, num_components = num-components]
              [, cutoff = cutoff-value]
              [, match_by_pos = match-by-position]
              [, exclude_columns = 'excluded-columns']
              [, key_columns = 'key-columns'] )
```

**Arguments**

<table>
<thead>
<tr>
<th>input-columns</th>
<th>Comma-separated list of columns that contain the data matrix, or asterisk (*) to select all columns. The following requirements apply:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• All columns must be a numeric data type.</td>
</tr>
<tr>
<td></td>
<td>• Enclose the column name in double quotes if it contains special characters.</td>
</tr>
</tbody>
</table>
Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model (case-insensitive).</td>
</tr>
<tr>
<td>num_components</td>
<td>The number of components to keep in the model. This is the number of output columns that will be generated. If neither this parameter nor the cutoff parameter is provided, all components from the model are kept.</td>
</tr>
<tr>
<td>cutoff</td>
<td>Set to 1, specifies the minimum accumulated explained variance. Components are taken until the accumulated explained variance reaches this value. If you omit this parameter and the num_components parameter, all model components are kept.</td>
</tr>
</tbody>
</table>
| match_by_pos       | Boolean value that specifies how input columns are matched to model columns:  

- false (default): Match by name.
- true: Match by the position of columns in the input columns list. |
| exclude_columns    | Comma-separated list of column names from input-columns to exclude from processing.                                                                                                          |
| key_columns        | Comma-separated list of column names from input-columns that identify its data rows. These columns are included in the output table.                                                                 |

Examples

=> SELECT SVD ('svdmodel', 'small_svd', 'x1,x2,x3,x4');

SVD

Finished in 1 iterations.
Accepted Rows: 8  Rejected Rows: 0
(1 row)

=> CREATE TABLE transform_svd AS SELECT
  APPLY_SVD (id, x1, x2, x3, x4 USING PARAMETERS model_name='svdmodel', exclude_columns='id', key_columns='id')

**PREDICT_AUTOREGRESSOR**

Applies an autoregressor (AR) model to an input relation.

Autoregressive models use previous values to make predictions. More specifically, the user-specified "lag" determines how many previous timesteps it takes into account during computation, and predicted values are linear combinations of those lags.

**Syntax**

```
PREDICT_AUTOREGRESSOR ( 'timeseries-column'  
   USING PARAMETERS  
   model-name = 'model-name'  
   [, start = starting-index]  
```

```sql
-> SELECT * FROM transform_svd;
id   | col1        | col2        | col3        | col4
-----|-------------|-------------|-------------|-------------
4    | 0.44849949240820 | -0.34726095631326 | 0.186958376368345 | 0.378561270493651

8    | 91.4856627665577 | 44.7629617207482 | 83.1704961993117 | 38.9274292265543

(8 rows)
```
```
[, npredictions = npredictions]
OVER (ORDER BY 'timestamp-column')
FROM input-relation
```

**Note:**
The following argument, as written, is required and cannot be omitted nor substituted with another type of clause.

```
OVER (ORDER BY 'timestamp-column')
```

## Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>timeseries-column</code></td>
<td>The timeseries column used to make the prediction (only the last ( p ) values, specified during model creation, are used).</td>
</tr>
<tr>
<td><code>timestamp-column</code></td>
<td>The timestamp column, with consistent timesteps, used to make the prediction.</td>
</tr>
<tr>
<td><code>input-relation</code></td>
<td>The input relation containing the <code>timeseries-column</code> and <code>timestamp-column</code>.</td>
</tr>
<tr>
<td></td>
<td>Note that <code>input-relation</code> cannot have missing values in any of the ( p ) (set during training) rows preceding <code>start</code>. To handle missing values, see IMPUTE or Linear Interpolation.</td>
</tr>
</tbody>
</table>

## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>model_name</code></td>
<td>Name of the model (case-insensitive).</td>
</tr>
<tr>
<td><code>start</code></td>
<td>INTEGER ( &gt;0 ) or ( \leq 0 ), the index (row) of the <code>input-relation</code> at which to start the prediction. If omitted, the prediction starts at the end of the <code>input-relation</code>.</td>
</tr>
<tr>
<td></td>
<td>If the <code>start</code> index is greater than the number of rows ( N ) in <code>timeseries-column</code>, then the values between ( N ) and <code>start</code> are predicted and used for the prediction.</td>
</tr>
<tr>
<td></td>
<td>If negative, the <code>start</code> index is identified by counting backwards from the end of the <code>input-relation</code>.</td>
</tr>
</tbody>
</table>
For an input-relation of N rows, negative values have a lower limit of either -1000 or -(N-p), whichever is greater.

Default: the end of input-relation

npredictions  INTEGER ≥1, the number of predicted timesteps.

Default: 10

Examples

**PREDICT_LINEAR_REG**

Applies a linear regression model on an input relation and returns the predicted value as a FLOAT.

Syntax

```
PREDICT_LINEAR_REG ( input-columns
                        USING PARAMETERS model_name = 'model-name' [, match_by_pos = match-by-position] )
```

Arguments

| input-columns | Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. |
Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model (case-insensitive).</td>
</tr>
<tr>
<td>match_by_pos</td>
<td>Boolean value that specifies how input columns are matched to model features:</td>
</tr>
<tr>
<td></td>
<td>- false (default): Match by name.</td>
</tr>
<tr>
<td></td>
<td>- true: Match by the position of columns in the input columns list.</td>
</tr>
</tbody>
</table>

Examples

```sql
=> SELECT PREDICT_LINEAR_REG(waiting USING PARAMETERS model_name='myLinearRegModel')FROM faithful ORDER BY id;

The following example shows how to use the PREDICT_LINEAR_REG function on an input table, using the match_by_pos parameter. Note that you can replace the column argument with a constant that does not match an input column:

```sql
=> SELECT PREDICT_LINEAR_REG(55 USING PARAMETERS model_name='linear_reg_faithful',
                          match_by_pos='true')FROM faithful ORDER BY id;

PREDICT_LINEAR_REG
------------------
2.285521159094171
2.285521159094171
2.285521159094171
2.285521159094171
2.285521159094171
2.285521159094171
2.285521159094171
```
**PREDICT_LOGISTIC_REG**

Applies a logistic regression model on an input relation.

PREDICT_LOGISTIC_REG returns as a FLOAT the predicted class or the probability of the predicted class, depending on how the `type` parameter is set. You can cast the return value to INTEGER or another numeric type when the return is in the probability of the predicted class.

**Syntax**

```
PREDICT_LOGISTIC_REG ( input-columns USING PARAMETERS model_name = 'model-name'
  [, type = 'prediction-type']
  [, cutoff = probability-cutoff]
  [, match_by_pos = match-by-position] )
```

**Arguments**

<table>
<thead>
<tr>
<th>input-columns</th>
<th>Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns.</th>
</tr>
</thead>
</table>

**Parameters**

<table>
<thead>
<tr>
<th>model_name</th>
<th>Name of the model (case-insensitive).</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Type of prediction for logistic regression, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- response (default): Predicted values are 0 or 1.</td>
</tr>
<tr>
<td></td>
<td>- probability: Output is the probability of the predicted category to be 1.</td>
</tr>
<tr>
<td>cutoff</td>
<td>Used in conjunction with the type parameter, a FLOAT between 0 and</td>
</tr>
</tbody>
</table>
When type is set to response, the returned value of prediction is 1 if its corresponding probability is greater than or equal to the value of cutoff; otherwise, it is 0.

Default: 0.5

**match_by_pos**

Boolean value that specifies how input columns are matched to model features:

- **false** (default): Match by name.
- **true**: Match by the position of columns in the input columns list.

### Examples

```sql
=> SELECT car_model,
       PREDICT_LOGISTIC_REG(mpg, cyl, disp, drat, wt, qsec, vs, gear, carb
                          USING PARAMETERS model_name='myLogisticRegModel')
FROM mtcars;
```

<table>
<thead>
<tr>
<th>car_model</th>
<th>PREDICT_LOGISTIC_REG</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camaro Z28</td>
<td></td>
</tr>
<tr>
<td>Fiat 128</td>
<td></td>
</tr>
<tr>
<td>Fiat X1-9</td>

</tr>
</tbody>
</table>
The following example shows how to use PREDICT_LOGISTIC_REG on an input table, using the match_by_pos parameter. Note that you can replace any of the column inputs with a constant that does not match an input column. In this example, column mpg was replaced with the constant 20:

```sql
=> SELECT car_model,
       PREDICT_LOGISTIC_REG(20, cyl, disp, drat, wt, qsec, vs, gear, carb
                       USING PARAMETERS model_name='myLogisticRegModel', match_by_pos='true')
FROM mtcars;
```

<table>
<thead>
<tr>
<th>car_model</th>
<th>PREDICT_LOGISTIC_REG</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

**PREDICT_MOVING_AVERAGE**

Applies a moving-average (MA) model, created by MOVING_AVERAGE, to an input relation.
Moving average models use the errors of previous predictions to make future predictions. More specifically, the user-specified "lag" determines how many previous predictions and errors it takes into account during computation.

Syntax

```
PREDICT_MOVING_AVERAGE ('timeseries-column')
USING PARAMETERS
  model_name = 'model-name'
  [, start = starting-index]
  [, npredictions = npredictions] )
OVER (ORDER BY 'timestamp-column')
FROM input-relation
```

Note:
The following argument, as written, is required and cannot be omitted nor substituted with another type of clause.

Arguments

<table>
<thead>
<tr>
<th>timeseries-column</th>
<th>The timeseries column used to make the prediction (only the last q values, specified during model creation, are used).</th>
</tr>
</thead>
<tbody>
<tr>
<td>timestamp-column</td>
<td>The timestamp column, with consistent timesteps, used to make the prediction.</td>
</tr>
<tr>
<td>input-relation</td>
<td>The input relation containing the timeseries-column and timestamp-column.</td>
</tr>
<tr>
<td></td>
<td>Note that input-relation cannot have missing values in any of the q (set during training) rows preceding start. To handle missing values, see IMPUTE or Linear Interpolation.</td>
</tr>
</tbody>
</table>

Parameters

| model_name | Name of the model (case-insensitive). |
### start

*INTEGER > q or ≤ 0, the index (row) of the `input-relation` at which to start the prediction. If omitted, the prediction starts at the end of the `input-relation`.*

If the start index is greater than the number of rows N in `timeseries-column`, then the values between N and start are predicted and used for the prediction.

If negative, the start index is identified by counting backwards from the end of the `input-relation`.

For an `input-relation` of N rows, negative values have a lower limit of either -1000 or -(N-q), whichever is greater.

**Default:** the end of `input-relation`

### npredictions

*INTEGER ≥ 1, the number of predicted timesteps.*

**Default:** 10

### Examples

See [Moving-average Model Example](#).

### PREDICT_NAIVE_BAYES

Applies a Naive Bayes model on an input relation.

Depending on how the type parameter is set, PREDICT_NAIVE_BAYES returns a VARCHAR that specifies either the predicted class or probability of the predicted class. If the function returns probability, you can cast the return value to an INTEGER or another numeric data type.
Syntax

PREDICT_NAIVE_BAYES ( \textit{input-columns} \\
\texttt{USING PARAMETERS} model\_name = \textquote{model-name}\texttt{\}} \\
[, type = \textquote{return-type}\} \\
[,] class = \textquote{user-input-class}\} \\
[,] match\_by\_pos = \textquote{match-by-position}\} )

Arguments

| \textit{input-columns} | Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. |

Parameters

| model\_name | Name of the model (case-insensitive). |
| type | One of the following: |
| \textbullet \ response (default): Returns the class with the highest probability. |
| \textbullet \ probability: Valid only if class parameter is set, returns the probability of belonging to the specified class argument. |
| class | Required if type parameter is set to probability. If you omit this parameter, PREDICT_NAIVE_BAYES returns the class that it predicts as having the highest probability. |
| match\_by\_pos | Boolean value that specifies how input columns are matched to model features: |
| \textbullet \ false (default): Match by name. |
| \textbullet \ true: Match by the position of columns in the input columns list. |
Examples

```sql
=> SELECT party, PREDICT_NAIVE_BAYES (vote1, vote2, vote3
    USING PARAMETERS model_name='naive_house84_model',
    type='response')
    AS Predicted_Party
FROM house84_test;
```

<table>
<thead>
<tr>

- PREDICT_NAIVE_BAYES_CLASSES

**PREDICT_NAIVE_BAYES_CLASSES**

Applies a Naive Bayes model on an input relation and returns the probabilities of classes:

- VARCHAR predicted column contains the class label with the highest probability.
- Multiple FLOAT columns, where the first probability column contains the probability for the class specified in the predicted column. Other columns contain the probability of belonging to each class specified in the classes parameter.
Syntax

```sql
PREDICT_NAIVE_BAYES_CLASSES ( predictor-columns
    USING PARAMETERS model_name = 'model-name'
    [, key_columns = 'key-columns']
    [, exclude_columns = 'excluded-columns']
    [, classes = 'classes']
    [, match_by_pos = match-by-position] )
OVER( [window-partition-clause] )
```

Arguments

| `predictor-columns` | Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. |

Parameters

<table>
<thead>
<tr>
<th><code>model_name</code></th>
<th>Name of the model (case-insensitive).</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>key_columns</code></td>
<td>Comma-separated list of predictor column names that identify the output rows. To exclude these and other predictor columns from being used for prediction, include them in the argument list for parameter exclude_columns.</td>
</tr>
<tr>
<td><code>exclude_columns</code></td>
<td>Comma-separated list of columns from <code>predictor-columns</code> to exclude from processing.</td>
</tr>
<tr>
<td><code>classes</code></td>
<td>Comma-separated list of class labels in the model. The probability of belonging to this given class as predicted by the classifier. The values are case sensitive.</td>
</tr>
<tr>
<td><code>match_by_pos</code></td>
<td>Boolean value that specifies how predictor columns are matched to model features:</td>
</tr>
<tr>
<td></td>
<td>* <code>false</code> (default): Match by name.</td>
</tr>
<tr>
<td></td>
<td>* <code>true</code>: Match by the position of columns in the predictor columns list.</td>
</tr>
</tbody>
</table>
Examples

```sql
=> SELECT PREDICT_NAIVE_BAYES_CLASSES (id, vote1, vote2 USING PARAMETERS
model_name='naive_house84_model',key_columns='id',exclude_columns='id',
classes='democrat, republican', match_by_pos='false')
OVER() FROM house84_test;

- [NAIVE_BAYES](#)

**PREDICT_PMML**

Applies an imported PMML model on an input relation. The function returns the result that would be expected for the model type encoded in the PMML model.

PREDICT_PMML returns NULL in the following cases:

- the predictor is an invalid or NULL value
- the categorical predictor is of an unknown class

**Note:**

PREDICT_PMML returns values of complex type `ROW` for models that use the Output tag. Vertica does not currently support directly inserting this data into a table.
You can work around this limitation by changing the output to JSON with TO_JSON before inserting it into a table:

```sql
=> CREATE TABLE predicted_output AS SELECT TO_JSON(PREDICT_PMML(X1,X2,X3 USING PARAMETERS model_name='pmml_imported_model')) AS predicted_value FROM input_table;
```

**Syntax**

```
PREDICT_PMML ( input-columns
    USING PARAMETERS model_name = 'model-name' [, match_by_pos = match-by-position] )
```

**Arguments**

<table>
<thead>
<tr>
<th><code>input-columns</code></th>
<th>Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns.</th>
</tr>
</thead>
</table>

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>model_name</code></td>
<td>Name of the model (case-insensitive). The function supports PMML models that encode the following model types:</td>
</tr>
<tr>
<td></td>
<td>- K-means</td>
</tr>
<tr>
<td></td>
<td>- Linear regression</td>
</tr>
<tr>
<td></td>
<td>- Logistic regression</td>
</tr>
<tr>
<td><code>match_by_pos</code></td>
<td>Boolean value that specifies how input columns are matched to model features:</td>
</tr>
<tr>
<td></td>
<td>- <code>false</code> (default): Match by name.</td>
</tr>
<tr>
<td></td>
<td>- <code>true</code>: Match by the position of columns in the input columns list.</td>
</tr>
</tbody>
</table>
Examples

In this example, the function call uses all the columns from the table as predictors and predicts the value using the 'my_kmeans' model in PMML format:

```sql
SELECT PREDICT_PMML(* USING PARAMETERS model_name='my_kmeans') AS predicted_label FROM table;
```

In this example, the function call takes only columns col1, col2 as predictors, and predicts the value for each row using the 'my_kmeans' model from schema 'my_schema':

```sql
SELECT PREDICT_PMML(col1, col2 USING PARAMETERS model_name='my_schema.my_kmeans') AS predicted_label FROM table;
```

In this example, the function call returns an error as neither schema nor model-name can accept * as a value:

```sql
SELECT PREDICT_PMML(* USING PARAMETERS model_name='*.*') AS predicted_label FROM table;
SELECT PREDICT_PMML(* USING PARAMETERS model_name='*') AS predicted_label FROM table;
SELECT PREDICT_PMML(* USING PARAMETERS model_name='models.*') AS predicted_label FROM table;
```

- IMPORT_MODELS
- EXPORT_MODELS

**PREDICT_RF_CLASSIFIER**

Applies a random forest model on an input relation. PREDICT_RF_CLASSIFIER returns a VARCHAR data type that specifies one of the following, as determined by how the type parameter is set:

- The predicted class (based on popular votes)
- Probability of a class for each input instance.
Note:
The predicted class is selected only based on the popular vote of the decision trees in the forest. Therefore, in special cases the calculated probability of the predicted class may not be the highest.

Syntax

```
PREDICT_RF_CLASSIFIER ( input-columns
  USING PARAMETERS model_name = 'model-name'
  [, type = 'prediction-type']
  [, class = 'user-input-class']
  [, match_by_pos = match-by-position] )
```

Arguments

| input-columns | Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. |

Parameters

| model_name | Name of the model (case-insensitive). |
| type | Type of prediction to return, one of the following: |
| response (default): The class with the highest probability among all possible classes. |
| probability: Valid only if the class parameter is set, returns the probability of the specified class. |
| class | Class to use when the type parameter is set to probability. If you omit this parameter, the function uses the predicted class—the one with the popular vote. Thus, the predict function returns the probability that the input instance belongs to its predicted class. |
| match_by_pos | Boolean value that specifies how input columns are matched to model features: |
| false (default): Match by name. |
| true: Match by the position of columns in the input columns list. |
Examples

```sql
=> SELECT PREDICT_RF_CLASSIFIER (Sepal_Length, Sepal_Width, Petal_Length, Petal_Width
   USING PARAMETERS model_name='myRFModel') FROM iris;
PREDICT_RF_CLASSIFIER
-------------------------
setosa
setosa
setosa
...
versicolor
versicolor
versicolor
...
virginica
virginica
virginica
...
(150 rows)
```

This example shows how you can use the PREDICT_RF_CLASSIFIER function, using the `match_by_pos` parameter:

```sql
=> SELECT PREDICT_RF_CLASSIFIER (Sepal_Length, Sepal_Width, Petal_Length, Petal_Width
   USING PARAMETERS model_name='myRFModel', match_by_pos='true') FROM iris;
PREDICT_RF_CLASSIFIER
-------------------------
setosa
setosa
setosa
...
versicolor
versicolor
versicolor
...
virginica
virginica
virginica
...
(150 rows)
```

- GET_MODEL_SUMMARY
**PREDICT_RF_CLASSIFIER_CLASSES**

Applies a random forest model on an input relation and returns the probabilities of classes:

- VARCHAR predicted column contains the class label with the highest vote (popular vote).
- Multiple FLOAT columns, where the first probability column contains the probability for the class reported in the predicted column. Other columns contain the probability of each class specified in the classes parameter.
- Key columns with the same value and data type as matching input columns specified in parameter key_columns.

**Note:**
Selection of the predicted class is based on the popular vote of decision trees in the forest. Thus, in special cases the calculated probability of the predicted class might not be the highest.

**Syntax**

```sql
PREDICT_RF_CLASSIFIER_CLASSES ( predictor-columns
    USING PARAMETERS model_name = 'model-name'
    [, key_columns = 'key-columns']
    [, exclude_columns = 'excluded-columns']
    [, classes = 'classes']
    [, match_by_pos = match-by-position]
)
OVER( [window-partition-clause] )
```

**Arguments**

| predictor-columns | Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. |

**Parameters**

| model_name | Name of the model (case-insensitive). |
key_columns | Comma-separated list of predictor column names that identify the output rows. To exclude these and other predictor columns from being used for prediction, include them in the argument list for parameter exclude_columns.

exclude_columns | Comma-separated list of columns from predictor-columns to exclude from processing.

classes | Comma-separated list of class labels in the model. The probability of belonging to this given class is predicted by the classifier. Values are case sensitive.

match_by_pos | Boolean value that specifies how predictor columns are matched to model features:

- false (default): Match by name.
- true: Match by the position of columns in the predictor columns list.

### Examples

```sql
=> SELECT PREDICT_RF_CLASSIFIER_CLASSES(Sepal_Length, Sepal_Width, Petal_Length, Petal_Width
USING PARAMETERS model_name='myRFModel') OVER () FROM iris;
```

<table>
<thead>
<tr>
<th>predicted</th>
<th>probability</th>
</tr>
</thead>
<tbody>
<tr>
<td>setosa</td>
<td>1</td>
</tr>
<tr>
<td>setosa</td>
<td>0.99</td>
</tr>
<tr>
<td>setosa</td>
<td>1</td>
</tr>
<tr>
<td>setosa</td>
<td>1</td>
</tr>
<tr>
<td>setosa</td>
<td>0.97</td>
</tr>
<tr>
<td>setosa</td>
<td>1</td>
</tr>
<tr>
<td>setosa</td>
<td>1</td>
</tr>
<tr>
<td>setosa</td>
<td>1</td>
</tr>
<tr>
<td>setosa</td>
<td>1</td>
</tr>
<tr>
<td>setosa</td>
<td>0.99</td>
</tr>
<tr>
<td>...</td>
<td></td>
</tr>
</tbody>
</table>

(150 rows)

This example shows how to use function PREDICT_RF_CLASSIFIER_CLASSES, using the match_by_pos parameter:

```sql
=> SELECT PREDICT_RF_CLASSIFIER_CLASSES(Sepal_Length, Sepal_Width, Petal_Length, Petal_Width
USING PARAMETERS model_name='myRFModel', match_by_pos='true') OVER () FROM iris;
```

<table>
<thead>
<tr>
<th>predicted</th>
<th>probability</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

...

**PREDICT_RF_REGRESSOR**

Applies a random forest model on an input relation, and returns with a FLOAT data type that specifies the predicted value of the random forest model—the average of the prediction of the trees in the forest.

**Syntax**

PREDICT_RF_REGRESSOR ( input-columns 
  USING PARAMETERS model_name = 'model-name' [, match_by_pos = match-by-position] )

**Arguments**

| **input-columns** | Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. |
**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model (case-insensitive).</td>
</tr>
<tr>
<td>match_by_pos</td>
<td>Boolean value that specifies how input columns are matched to model features:</td>
</tr>
<tr>

**PREDICT_SVM_CLASSIFIER**

Uses an SVM model to predict class labels for samples in an input relation, and returns the predicted value as a FLOAT data type.

Syntax

```sql
PREDICT_SVM_CLASSIFIER (input-columns
    USING PARAMETERS model_name = 'model-name'
    [, match_by_pos = match-by-position]
    [, type = 'return-type']
    [, cutoff = 'cutoff-value']
)
```

Arguments

| input-columns | Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. |

Parameters

<table>
<thead>
<tr>
<th>model_name</th>
<th>Name of the model (case-insensitive).</th>
</tr>
</thead>
<tbody>
<tr>
<td>match_by_pos</td>
<td>Boolean value that specifies how input columns are matched to model features:</td>
</tr>
<tr>
<td></td>
<td>- <code>false</code> (default): Match by name.</td>
</tr>
<tr>
<td></td>
<td>- <code>true</code>: Match by the position of columns in the input columns list.</td>
</tr>
<tr>
<td>type</td>
<td>A string that specifies the output to return for each input row, one of</td>
</tr>
</tbody>
</table>
the following:

- **response**: Outputs the predicted class of 0 or 1.
- **probability**: Outputs a value in the range (0,1), the prediction score transformed using the logistic function.

| cutoff | Valid only if the type parameter is set to probability, a FLOAT value that is compared to the transformed prediction score to determine the predicted class.

**Default**: 0

**Examples**

```sql
=> SELECT PREDICT_SVM_CLASSIFIER (mpg,cyl,disp,wt,qsec,vs,gear,carb
USING PARAMETERS model_name='mySvmClassModel') FROM mtcars;
```

```
PREDICT_SVM_CLASSIFIER
0 0 1 0 1 1 1 1 1 0 0 1 0 0 0 0 0 0 0 0 1 1 0 0 1 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0
(32 rows)
```
This example shows how to use PREDICT_SVM_CLASSIFIER on the mtcars table, using the match_by_pos parameter. In this example, column mpg was replaced with the constant 40:

```sql
=> SELECT PREDICT_SVM_CLASSIFIER (40,cyl,disp,wt,qsec,vs,gear,carb
USING PARAMETERS model_name='mySvmClassModel', match_by_pos = 'true') FROM mtcars;
```

```
PREDICT_SVM_CLASSIFIER
----------------------
0 0 0 1 0 0 1 1 1 1 0 0 0 1 1 1 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 1 1 1 1 1 1 1 1 1 0 0 0
(32 rows)
```

**PREDICT_SVM_REGRESSOR**

Uses an SVM model to perform regression on samples in an input relation, and returns the predicted value as a FLOAT data type.

**Syntax**

```
PREDICT_SVM_REGRESSOR(input-columns
    USING PARAMETERS model_name = 'model-name' [, match_by_pos = match-by-position] )
```

**Arguments**

<table>
<thead>
<tr>
<th>input-columns</th>
<th>Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns.</th>
</tr>
</thead>
</table>

**Parameters**

<table>
<thead>
<tr>
<th>model_name</th>
<th>Name of the model (case-insensitive).</th>
</tr>
</thead>
<tbody>
<tr>
<td>match_by_pos</td>
<td>Boolean value that specifies how input columns are matched to model features:</td>
</tr>
<tr>
<td></td>
<td>• false (default): Match by name.</td>
</tr>
<tr>
<td></td>
<td>• true: Match by the position of columns in the input columns list.</td>
</tr>
</tbody>
</table>

**Examples**

```sql
=> SELECT PREDICT_SVM_REGRESSOR(waiting USING PARAMETERS model_name='mySvmRegModel')
    FROM faithful ORDER BY id;
```

```
PREDICT_SVM_REGRESSOR
----------------------
 4.06488248694445
 2.30392277646291
 3.71269054484815
 2.867429883817
```
This example shows how you can use the PREDICT_SVM_REGRESSOR function on the faithful table, using the match_by_pos parameter. In this example, the waiting column was replaced with the constant 40:

```sql
-> SELECT PREDICT_SVM_REGRESSOR(40 USING PARAMETERS model_name='mySvmRegModel', match_by_pos='true')
    FROM faithful ORDER BY id;
```

<table>
<thead>
<tr>
<th>Predict_SVM_REGRESSOR</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.31778533859324</td>

**PREDICT_TENSORFLOW**

Applies a TensorFlow model on an input relation, and returns with the result expected for the encoded model type.

**Syntax**

```
PREDICT_TENSORFLOW ( input-columns
    USING PARAMETERS model_name = 'model-name' [, num_passthru_cols = 'n-first-columns-to-ignore']
```

Vertica Analytic Database (11.0.x) Page 3122 of 6730

Arguments

| `input-columns` | Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. |

Parameters

<table>
<thead>
<tr>
<th><code>model_name</code></th>
<th>Name of the model (case-insensitive).</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>num_passthru_cols</code></td>
<td>Integer that specifies the number of input columns to skip.</td>
</tr>
</tbody>
</table>

Examples

Use `PREDICT_TENSORFLOW` with the `num_passthru_cols` parameter to skip the first two input columns:

```
SELECT PREDICT_TENSORFLOW ( pid,label,x1,x2
    USING PARAMETERS model_name='spiral_demo', num_passthru_cols=2 )
OVER(PARTITION BEST) as predicted_class FROM points;
```

-- example output, the skipped columns are displayed as the first columns of the output
<table>
<thead>
<tr>
<th>pid</th>
<th>label</th>
<th>col0</th>
<th>col1</th>
</tr>
</thead>
<tbody>
<tr>

**PREDICT_XGB_CLASSIFIER**

Applies an XGBoost classifier model on an input relation. PREDICT_XGB_CLASSIFIER returns a VARCHAR data type that specifies one of the following, as determined by how the type parameter is set:

- The predicted class (based on probability scores)
- Probability of a class for each input instance.

**Syntax**

```
PREDICT_XGB_CLASSIFIER ( input-columns USING PARAMETERS model_name = 'model-name' [, type = 'prediction-type' ] [, class = 'user-input-class' ] [, match_by_pos = 'match-by-position' ] )
```

**Arguments**

| input-columns | Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. |

**Parameters**

| model_name | Name of the model (case-insensitive). |
| type | Type of prediction to return, one of the following:  
- **response** (default): The class with the highest probability among all possible classes.  
- **probability**: Valid only if the class parameter is set, returns for each input instance the probability of the specified class or predicted class. |
| class | Class to use when the type parameter is set to probability. If you omit this parameter, the function uses the predicted class—the one with
the highest probability score. Thus, the predict function returns the probability that the input instance belongs to the specified or predicted class.

<table>
<thead>
<tr>
<th>match_by_pos</th>
<th>Boolean value that specifies how input columns are matched to model features:</th>
</tr>
</thead>
<tbody>
<tr>
<td>false (default): Match by name.</td>
<td></td>
</tr>
<tr>
<td>true: Match by the position of columns in the input columns list.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

See XGBoost for Classification.

**PREDICT_XGB_CLASSIFIER_CLASSES**

Applies an XGBoost classifier model on an input relation and returns the probabilities of classes:

- VARCHAR predicted column contains the class label with the highest probability.
- Multiple FLOAT columns, where the first probability column contains the probability for the class reported in the predicted column. Other columns contain the probability of each class specified in the classes parameter.
- Key columns with the same value and data type as matching input columns specified in parameter key_columns.

All trees contribute to a predicted probability for each response class, and the highest probability class is chosen.

**Syntax**

```
PREDICT_XGB_CLASSIFIER_CLASSES ( predictor-columns)
   USING PARAMETERS model_name = 'model-name'
   [, key_columns = 'key-columns']
   [, exclude_columns = 'excluded-columns']
   [, classes = 'classes']
   [, match_by_pos = match-by-position] 
OVER( [window-partition-clause] )
```
Arguments

| input-columns | Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. |

Parameters

<table>
<thead>
<tr>
<th>model_name</th>
<th>Name of the model (case-insensitive).</th>
</tr>
</thead>
<tbody>
<tr>
<td>key_columns</td>
<td>Comma-separated list of predictor column names that identify the output rows. To exclude these and other predictor columns from being used for prediction, include them in the argument list for parameter exclude_columns.</td>
</tr>
<tr>
<td>exclude_columns</td>
<td>Comma-separated list of columns from predictor-columns to exclude from processing.</td>
</tr>
<tr>
<td>classes</td>
<td>Comma-separated list of class labels in the model. The probability of belonging to each given class is predicted by the classifier. Values are case sensitive.</td>
</tr>
<tr>
<td>match_by_pos</td>
<td>Boolean value that specifies how predictor columns are matched to model features:</td>
</tr>
<tr>
<td></td>
<td>• false (default): Match by name.</td>
</tr>
<tr>
<td></td>
<td>• true: Match by the position of columns in the predictor columns list.</td>
</tr>
</tbody>
</table>

Examples

After creating an XGBoost classifier model with XGB_CLASSIFIER, you can use PREDICT_XGB_CLASSIFIER.Classes to view the probability of each classification. In this example, the XGBoost classifier model "xgb_iris" is used to predict the probability that a given flower belongs to a species of iris:

```sql
=> SELECT PREDICT_XGB_CLASSIFIER.CLASSES(Sepal_Length, Sepal_Width, Petal_Length, Petal_Width)
```
You can also specify additional classes. In this example, `PREDICT_XGB_CLASSIFIER_CLASSES` makes the same prediction as the previous example, but also returns the probability that a flower belongs to the specified classes "virginica" and "versicolor":

```sql
=> SELECT PREDICT_XGB_CLASSIFIER_CLASSES(Sepal_Length, Sepal_Width, Petal_Length, Petal_Width
USING PARAMETERS model_name='xgb_iris', classes='virginica,versicolor') OVER (PARTITION BEST)
FROM iris1;
```
Syntax

PREDICT_XGB_REGRESSOR ( input-columns 
    USING PARAMETERS model_name = 'model-name' [, match_by_pos = match-by-position] )

Arguments

| input-columns | Comma-separated list of columns to use from the input relation, or asterisk (*) to select all columns. |

Parameters

| model_name | Name of the model (case-insensitive). |
| match_by_pos | Boolean value that specifies how input columns are matched to model features: |
|             |   | false (default): Match by name. |
|             |   | true: Match by the position of columns in the input columns list. |

Examples

See XGBoost for Regression.

**REVERSE_NORMALIZE**

Reverses the normalization transformation on normalized data, thereby de-normalizing the normalized data. If you specify a column that is not in the specified model, REVERSE_NORMALIZE returns that column unchanged.
Syntax

REVERSE_NORMALIZE ( input-columns USING PARAMETERS model_name = 'model-name');

Arguments

<table>
<thead>
<tr>
<th>input-columns</th>
<th>The columns to use from the input relation, or asterisk (*) to select all columns.</th>
</tr>
</thead>
</table>

Parameters

<table>
<thead>
<tr>
<th>model_name</th>
<th>Name of the model (case-insensitive).</th>
</tr>
</thead>
</table>

Examples

Use REVERSE_NORMALIZE on the hp and cyl columns in table mtcars, where hp is in normalization model mtcars_normfit, and cyl is not in the normalization model.

```sql
=> SELECT REVERSE_NORMALIZE (hp, cyl USING PARAMETERS model_name='mtcars_normfit') FROM mtcars;
```

```
  hp  | cyl
------|----
 42502 | 8
 58067 | 8
 26371 | 4
 42502 | 8
 31182 | 6
 32031 | 4
 26937 | 4
 34861 | 6
 34861 | 6
 50992 | 8
 50992 | 8
 49577 | 8
 25805 | 4
 18447 | 4
 29767 | 6
 65142 | 8
 69387 | 8
 14768 | 4
```

Model Evaluation

A set of Vertica machine learning functions evaluate the prediction data that is generated by trained models, or return information about the models themselves.

**CONFUSION_MATRIX**

Computes the confusion matrix of a table with observed and predicted values of a response variable. CONFUSION_MATRIX produces a table with the following dimensions:

- Rows: Number of classes
- Columns: Number of classes + 2

Syntax

```
CONFUSION_MATRIX ( targets, predictions [ USING PARAMETERS num_classes = num-classes ] OVER()
```
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>targets</td>
<td>An input column that contains the true values of the response variable.</td>
</tr>
<tr>
<td>predictions</td>
<td>An input column that contains the predicted class labels.</td>
</tr>
</tbody>
</table>

Arguments `targets` and `predictions` must be set to input columns of the same data type, one of the following: INTEGER, BOOLEAN, or CHAR/VARCHAR. Depending on their data type, these columns identify classes as follows:

- INTEGER: Zero-based consecutive integers between 0 and \((\text{num-classes}-1)\) inclusive, where `num-classes` is the number of classes. For example, given the following input column values—\(\{0, 1, 2, 3, 4\}\)—Vertica assumes five classes.

  **Note:** If input column values are not consecutive, Vertica interpolates the missing values. Thus, given the following input values—\(\{0, 1, 3, 5, 6\}\)—Vertica assumes seven classes.

- BOOLEAN: Yes or No
- CHAR/VARCHAR: Class names. If the input columns are of type CHAR/VARCHAR columns, you must also set parameter `num_classes` to the number of classes.

  **Note:** Vertica computes the number of classes as the union of values in both input columns. For example, given the following sets of values in the `targets` and `predictions` input columns, Vertica counts four classes:

  \[
  \{\text{milk}, \text{soy milk}, \text{cream}\} \\
  \{\text{soy milk}, \text{almond milk}\}
  \]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num_classes</td>
<td>An integer &gt; 1, specifies the number of classes to pass to the function.</td>
</tr>
</tbody>
</table>

You must set this parameter if the specified input columns are of type CHAR/VARCHAR. Otherwise, the function processes this parameter.
according to the column data types:

- INTEGER: By default set to 2, you must set this parameter correctly if the number of classes is any other value.
- BOOLEAN: By default set to 2, cannot be set to any other value.

Examples

This example computes the confusion matrix for a logistic regression model that classifies cars in the mtcars data set as automatic or manual transmission. Observed values are in input column obs, while predicted values are in input column pred. Because this is a binary classification problem, all values are either 0 or 1.

In the table returned, all 19 cars with a value of 0 in column am are correctly predicted by PREDICT_LOGISTIC_REGRESSION as having a value of 0. Of the 13 cars with a value of 1 in column am, 12 are correctly predicted to have a value of 1, while 1 car is incorrectly classified as having a value of 0:

```sql
=> SELECT CONFUSION_MATRIX(obs::int, pred::int USING PARAMETERS num_classes=2) OVER()
    FROM (SELECT am AS obs, PREDICT_LOGISTIC_REG(mpg, cyl, disp, drat, wt, qsec, vs, gear, carb
          USING PARAMETERS model_name='myLogisticRegModel')AS pred
    FROM mtcars) AS prediction_output;
```

<table>
<thead>
<tr>
<th>actual_class</th>
<th>predicted_0</th>
<th>predicted_1</th>
<th>comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>19</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>13</td>
<td>Of 32 rows, 32 were used and 0 were ignored</td>
</tr>
</tbody>
</table>
(2 rows)

CROSS_VALIDATE

Performs k-fold cross validation on a learning algorithm using an input relation, and grid search for hyper parameters. The output is an average performance indicator of the selected algorithm. This function supports SVM classification, naive bayes, and logistic regression.

Syntax

```sql
CROSS_VALIDATE ( 'algorithm', 'input-relation', 'response-column', 'predictor-columns'
[ USING PARAMETERS
    [exclude_columns = 'excluded-columns']
   [, cv_model_name = 'model']
```

```
[, cv_metrics = 'metrics']
[, cv_fold_count = num-folds]
[, cv_hyperparams = 'hyperparams']
[, cv_prediction_cutoff = prediction-cutoff] ]
```

## Arguments

<table>
<thead>
<tr>
<th><strong>algorithm</strong></th>
<th>Name of the algorithm training function, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• LINEAR_REG</td>
</tr>
<tr>
<td></td>
<td>• LOGISTIC_REG</td>
</tr>
<tr>
<td></td>
<td>• NAIVE_BAYES</td>
</tr>
<tr>
<td></td>
<td>• SVM_CLASSIFIER</td>
</tr>
<tr>
<td></td>
<td>• SVM_REGRESSOR</td>
</tr>
</tbody>
</table>

| **input-relation** | The table or view that contains data used for training and testing. If the input relation is defined in Hive, use `SYNC_WITH_HCATALOG_SCHEMA` to sync the hcatalog schema, and then run the machine learning function. |

| **response-column** | Name of the input column that contains the response. |

| **predictor-columns** | Comma-separated list of columns in the input relation that represent independent variables for the model, or asterisk (*) to select all columns. If you select all columns, the argument list for parameter `exclude_columns` must include `response-column`, and any columns that are invalid as predictor columns. |

## Parameters

| **exclude_columns** | Comma-separated list of columns from `predictor-columns` to exclude from processing. |

<p>| <strong>cv_model_name</strong> | The name of a model that lets you retrieve results of the cross validation process. If you omit this parameter, results are displayed but not saved. If you set this parameter to a model name, you can retrieve the results with summary functions <code>GET_MODEL_ATTRIBUTE</code> and <code>GET_MODEL_SUMMARY</code> |</p>
<table>
<thead>
<tr>
<th>cv_metrics</th>
<th>The metrics used to assess the algorithm, specified either as a comma-separated list of metric names or in a <strong>JSON array</strong>. In both cases, you specify one or more of the following metric names:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• accuracy (default)</td>
<td></td>
</tr>
<tr>
<td>• error_rate</td>
<td></td>
</tr>
<tr>
<td>• TP: True positive, the number of cases of class 1 predicted as class 1</td>
<td></td>
</tr>
<tr>
<td>• FP: False positive, the number of cases of class 0 predicted as class 1</td>
<td></td>
</tr>
<tr>
<td>• TN: True negative, the number of cases of class 0 predicted as class 0</td>
<td></td>
</tr>
<tr>
<td>• FN: False negative, the number of cases of class 1 predicted as class 0</td>
<td></td>
</tr>
<tr>
<td>• TPR or recall: True positive rate, the correct predictions among class 1</td>
<td></td>
</tr>
<tr>
<td>• FPR: False positive rate, the wrong predictions among class 0</td>
<td></td>
</tr>
<tr>
<td>• TNR: True negative rate, the correct predictions among class 0</td>
<td></td>
</tr>
<tr>
<td>• FNR: False negative rate, the wrong predictions among class 1</td>
<td></td>
</tr>
<tr>
<td>• PPV or precision: The positive predictive value, the correct predictions among cases predicted as class 1</td>
<td></td>
</tr>
<tr>
<td>• NPV: Negative predictive value, the correct predictions among cases predicted as class 0</td>
<td></td>
</tr>
<tr>
<td>• MSE: Mean squared error</td>
<td>$\text{MSE}(y, \hat{y}) = \frac{1}{n_{\text{samples}}} \sum_{i=0}^{n_{\text{samples}}-1} (y_i - \hat{y}_i)^2$.</td>
</tr>
<tr>
<td>• MAE: Mean absolute error</td>
<td>$\text{MAE}(y, \hat{y}) = \frac{1}{n_{\text{samples}}} \sum_{i=0}^{n_{\text{samples}}-1}</td>
</tr>
</tbody>
</table>
- **rsquared**: coefficient of determination

\[ R^2(y, \hat{y}) = 1 - \frac{\sum_{i=0}^{n_{\text{samples}}-1} (y_i - \hat{y}_i)^2}{\sum_{i=0}^{n_{\text{samples}}-1} (y_i - \bar{y})^2} \]

- **explained_variance**

\[ \text{explained variance} (y, \hat{y}) = 1 - \frac{\text{Var}\{y - \bar{\hat{y}}\}}{\text{Var}\{y\}} \]

- **fscore**

\[ (1 + \beta^2) \times \text{precision} \times \text{recall} / (\beta^2 \times \text{precision} + \text{recall}) \]

\( \beta \) equals 1 by default

- **auc_roc**: AUC of ROC using the specified number of bins, by default 100

- **auc_prc**: AUC of PRC using the specified number of bins, by default 100

- **counts**: Shortcut that resolves to four other metrics: TP, FP, TN, and FN

- **count**: Valid only in JSON syntax, counts the number of cases labeled by one class (**case-class-label**) but predicted as another class (**predicted-class-label**):  

\[ \text{cv_metrics} = \{"\text{count}:[\text{case-class-label}, \text{predicted-class-label}]\} \]

<table>
<thead>
<tr>
<th><strong>cv_fold_count</strong></th>
<th>The number of folds to split the data.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default</strong>: 5</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>cv_hyperparams</strong></th>
<th>A JSON string that describes the combination of parameters for use in grid search of hyper parameters. The JSON string contains pairs of the hyper parameter name. The value of each hyper parameter can be specified as an array or sequence. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>{&quot;param1&quot;:[value1,value2,...], &quot;param2&quot;:{&quot;first&quot;:first_value, &quot;step&quot;:step_size, &quot;count&quot;:number_of_values} }</td>
</tr>
</tbody>
</table>

Hyper parameter names and string values should be quoted using the JSON standard. These parameters are passed to the training function.

| **cv_prediction_cutoff** | The cutoff threshold that is passed to the prediction stage of logistic regression, a FLOAT between 0 and 1, exclusive |
**Model Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>call_string</td>
<td>The value of all input arguments that were specified at the time CROSS_VALIDATE was called.</td>

<td>- accepted_row_count: The total number of rows in the input_relation, minus the number of rejected rows.</td>
</tr>
<tr>
<td></td>
<td>- rejected_row_count: The number of rows of the input_relation that were skipped because they contained an invalid value.</td>
</tr>
<tr>
<td></td>
<td>- feature_count: The number of features input to the machine learning model.</td>
</tr>
<tr>
<td>run_details</td>
<td>Information about each run, where a run means training a single model, and then testing that model on the one held-out fold:</td>
</tr>
<tr>
<td></td>
<td>- fold_id: The index of the fold held out for testing.</td>
</tr>
<tr>
<td></td>
<td>- iteration_count: The number of iterations used in model training on non-held-out folds.</td>
</tr>
<tr>
<td></td>
<td>- accuracy: All metrics specified in parameter cv_metrics, or accuracy if cv_metrics is not provided.</td>
</tr>
<tr>
<td></td>
<td>- error_rate: All metrics specified in parameter cv_metrics, or accuracy if the parameter is omitted.</td>
</tr>
</tbody>
</table>

**Privileges**

Non-superusers:
- SELECT privileges on the input relation
- CREATE and USAGE privileges on the default schema where machine learning algorithms generate models. If cv_model_name is provided, the cross validation results are saved as a model in the same schema.

### Specifying Metrics in JSON

Parameter cv_metrics can specify metrics as an array of JSON objects, where each object specifies a metric name. For example, the following expression sets cv_metrics to two metrics specified as JSON objects, accuracy and error_rate:

```
cv_metrics=['"accuracy", "error_rate"]'
```

In the next example, cv_metrics is set to two metrics, accuracy and TPR (true positive rate). Here, the TPR metric is specified as a JSON object that takes an array of two class label arguments, 2 and 3:

```
cv_metrics=['"accuracy",{"TPR":[2,3]} ]'
```

Metrics specified as JSON objects can accept parameters. In the following example, the f-score metric specifies parameter beta, which is set to 0.5:

```
cv_metrics=['{"f_score":{"beta":0.5}} ]'
```

Parameter support can be especially useful for certain metrics. For example, metrics auc_roc and auc_prc build a curve, and then compute the area under that curve. For ROC, the curve is formed by plotting metrics TPR against FPR; for PRC, PPV (precision) against TPR (recall). The accuracy of such curves can be increased by setting parameter num_bins to a value greater than the default value of 100. For example, the following expression computes AUC for an ROC curve built with 1000 bins:

```
cv_metrics=['{"auc_roc":{"num_bins":1000}} ]'
```

### Using Metrics with Multi-class Classifier Functions

All supported metrics are defined for binary classifier functions LOGISTIC_REG and SVM_CLASSIFIER. For multi-class classifier functions such as NAIVE_BAYES, these metrics can be calculated for each one-versus-the-rest binary classifier. Use arguments to request the metrics for each classifier. For example, if training data has integer class labels, you can set cv_metrics with the precision (PPV) metric as follows:

```
cv_metrics=['{"precision":[0,4]} ]'
```

This setting specifies to return two columns with precision computed for two classifiers:
- Column 1: classifies 0 versus not 0
- Colunn 2: classifies 4 versus not 4

If you omit class label arguments, the class with index 1 is used. Instead of computing metrics for individual one-versus-the-rest classifiers, the average is computed in one of the following styles: macro, micro, or weighted (default). For example, the following cv_metrics setting returns the average weighted by class sizes:

```plaintext
cv_metrics=['{"precision":{"avg":"weighted"}}']
```

AUC-type metrics can be similarly defined for multi-class classifiers. For example, the following cv_metrics setting computes the area under the ROC curve for each one-versus-the-rest classifier, and then returns the average weighted by class sizes.

```plaintext
cv_metrics=['{"auc_roc":{"avg":"weighted", "num_bins":1000}}']
```

**Examples**

```sql
=> SELECT CROSS_VALIDATE('svm_classifier', 'mtcars', 'am', 'mpg' USING PARAMETERS cv_fold_count=6,
                         cv_hyperparams='{"C":[1,5]}',
                         cv_model_name='cv_svm',
                         cv_metrics='accuracy, error_rate');
```

<table>
<thead>
<tr>
<th>C</th>
<th>accuracy</th>
<th>error_rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0.75556</td>
<td>0.24444</td>
</tr>
<tr>
<td>5</td>
<td>0.78333</td>
<td>0.21667</td>
</tr>
</tbody>
</table>

**ERROR_RATE**

Using an input table, returns a table that calculates the rate of incorrect classifications and displays them as FLOAT values. ERROR_RATE returns a table with the following dimensions:

- Rows: Number of classes plus one row that contains the total error rate across classes
- Columns: 2
Syntax

```
ERROR_RATE ( targets, predictions [ USING PARAMETERS num_classes = num-classes ] ) OVER()
```

Arguments

<table>
<thead>
<tr>
<th>targets</th>
<th>An input column that contains the true values of the response variable.</th>
</tr>
</thead>
<tbody>
<tr>
<td>predictions</td>
<td>An input column that contains the predicted class labels.</td>
</tr>
</tbody>
</table>

Arguments `targets` and `predictions` must be set to input columns of the same data type, one of the following: INTEGER, BOOLEAN, or CHAR/VARCHAR. Depending on their data type, these columns identify classes as follows:

- **INTEGER**: Zero-based consecutive integers between 0 and \((num\text{-}classes-1)\) inclusive, where \(num\text{-}classes\) is the number of classes. For example, given the following input column values—\(\{0, 1, 2, 3, 4\}\)—Vertica assumes five classes.

  **Note:**
  If input column values are not consecutive, Vertica interpolates the missing values. Thus, given the following input values—\(\{0, 1, 3, 5, 6\}\)—Vertica assumes seven classes.

- **BOOLEAN**: Yes or No
- **CHAR/VARCHAR**: Class names. If the input columns are of type CHAR/VARCHAR columns, you must also set parameter `num_classes` to the number of classes.

  **Note:**
  Vertica computes the number of classes as the union of values in both input columns. For example, given the following sets of values in the `targets` and `predictions` input columns, Vertica counts four classes:

  ```
  \{'milk', 'soy milk', 'cream'\}
  \{'soy milk', 'almond milk'\}
  ```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num_classes</td>
<td>An integer &gt; 1, specifies the number of classes to pass to the function.</td>
</tr>
<tr>
<td></td>
<td>You must set this parameter if the specified input columns are of type</td>
</tr>
<tr>
<td></td>
<td>CHAR/VARCHAR. Otherwise, the function processes this parameter according to</td>
</tr>
<tr>
<td></td>
<td>the column data types:</td>
</tr>
<tr>
<td></td>
<td>• INTEGER: By default set to 2, you must set this parameter correctly if</td>
</tr>
<tr>
<td></td>
<td>the number of classes is any other value.</td>
</tr>
<tr>
<td></td>
<td>• BOOLEAN: By default set to 2, cannot be set to any other value.</td>
</tr>
</tbody>
</table>

Privileges

Non-superusers: model owner, or USAGE privileges on the model

Examples

This example shows how to execute the ERROR_RATE function on an input table named mtcars. The response variables appear in the column obs, while the prediction variables appear in the column pred. Because this example is a classification problem, all response variable values and prediction variable values are either 0 or 1, indicating binary classification.

In the table returned by the function, the first column displays the class id column. The second column displays the corresponding error rate for the class id. The third column indicates how many rows were successfully used by the function and whether any rows were ignored.

```sql
=> SELECT ERROR_RATE(obs::int, pred::int USING PARAMETERS num_classes=2) OVER()
    FROM (SELECT am AS obs, PREDICT_LOGISTIC_REG(mpg, cyl, disp, drat, wt, qsec, vs, gear, carb
           USING PARAMETERS model_name='myLogisticRegModel', type='response') AS pred
          FROM mtcars) AS prediction_output;
```

<table>
<thead>
<tr>
<th>class</th>
<th>error_rate</th>
<th>comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>0.0769230797886848</td>
<td>Of 32 rows, 32 were used and 0 were ignored</td>
</tr>
<tr>
<td></td>
<td>0.03125</td>
<td></td>
</tr>
</tbody>
</table>

(3 rows)
**LIFT_TABLE**

Returns a table that compares the predictive quality of a machine learning model. This function is also known as a *lift chart*.

**Syntax**

```
LIFT_TABLE ( targets, probabilities
         [ USING PARAMETERS [num_bins = num-bins] [, main_class = class-name ] ] )
```

**Arguments**

| **targets** | An input column that contains the true values of the response variable, one of the following data types: INTEGER, BOOLEAN, or CHAR/VARCHAR. Depending on the column data type, the function processes column data as follows:

- INTEGER: Uses the input column as containing the true value of the response variable.
- BOOLEAN: Resolves Yes to 1, 0 to No.
- CHAR/VARCHAR: Resolves the value specified by parameter `main_class` to 1, all other values to 0.

**Note:**
If the input column is of data type INTEGER or BOOLEAN, the function ignores parameter `main_class`.

| **probabilities** | A FLOAT input column that contains the predicted probability of response being the main class, set to 1 if `targets` is of type INTEGER.

**Parameters**

| **num_bins** | An integer value that determines the number of decision boundaries. |
Decision boundaries are set at equally spaced intervals between 0 and 1, inclusive. The function computes the table at each $num-bin + 1$ point.

**Default:** 100

<table>
<thead>
<tr>
<th>main_class</th>
</tr>
</thead>
<tbody>
<tr>
<td>Used only if <strong>targets</strong> is of type CHAR/VARCHAR, specifies the class to associate with the <strong>probabilities</strong> argument.</td>
</tr>
</tbody>
</table>

**Examples**

Execute `LIFT_TABLE` on an input table `mtcars`.

```sql
=> SELECT LIFT_TABLE(obs::int, prob::float USING PARAMETERS num_bins=2) OVER()
    FROM (SELECT am AS obs, PREDICT_LOGISTIC_REG(mpg, cyl, disp, drat, wt, qsec, vs, gear, carb
           USING PARAMETERS model_name='myLogisticRegModel',
           name='myLogisticRegModel',
           type='probability') AS prob
    FROM mtcars) AS prediction_output;
```

<table>
<thead>
<tr>
<th>decision_boundary</th>
<th>positive_prediction_ratio</th>
<th>lift</th>
<th>comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>------------------</td>
<td>---------------------------</td>
<td>---------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>1.00</td>
<td>0.00</td>
<td>NaN</td>
<td></td>
</tr>
<tr>
<td>0.50</td>
<td>0.40625</td>
<td>2.46153846153846</td>
<td>Of 32 rows, 32 were used and 0</td>
</tr>
</tbody>
</table>

The first column, `decision_boundary`, indicates the cut-off point for whether to classify a response as 0 or 1. For instance, for each row, if `prob` is greater than or equal to `decision_boundary`, the response is classified as 1. If `prob` is less than `decision_boundary`, the response is classified as 0.

The second column, `positive_prediction_ratio`, shows the percentage of samples in class 1 that the function classified correctly using the corresponding `decision_boundary` value.

For the third column, `lift`, the function divides the `positive_prediction_ratio` by the percentage of rows correctly or incorrectly classified as class 1.

**MSE**

Returns a table that displays the mean squared error of the prediction and response columns in a machine learning model.
Syntax

MSE (targets, predictions) OVER()

Arguments

<table>
<thead>
<tr>
<th>targets</th>
<th>The model response variable, of type FLOAT.</th>
</tr>
</thead>
<tbody>
<tr>
<td>predictions</td>
<td>A FLOAT input column that contains predicted values for the response variable.</td>
</tr>
</tbody>
</table>

Examples

Execute the MSE function on input table faithful_testing. The response variables appear in the column obs, while the prediction variables appear in the column prediction.

```sql
=> SELECT MSE(obs, prediction) OVER()
  FROM (SELECT eruptions AS obs,
          PREDICT_LINEAR_REG (waiting USING PARAMETERS model_name='myLinearRegModel') AS prediction
  FROM faithful_testing) AS prediction_output;
```

<table>
<thead>
<tr>
<th>mse</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.252925741352641</td>
<td>Of 110 rows, 110 were used and 0 were ignored</td>
</tr>
</tbody>
</table>

PRC

Returns a table that displays the points on a receiver precision recall (PR) curve.

Syntax

PRC (targets, probabilities

[ USING PARAMETERS
  [num_bins = num-bins]
  [, f1_score = return-score ]
]
```
[, main_class = class-name ]
```

### Arguments

| **targets** | An input column that contains the true values of the response variable, one of the following data types: INTEGER, BOOLEAN, or CHAR/VARCHAR. Depending on the column data type, the function processes column data as follows:
| |
| --- | --- |
| |
| **INTEGER**: Uses the input column as containing the true value of the response variable.
| **BOOLEAN**: Resolves Yes to 1, 0 to No.
| **CHAR/VARCHAR**: Resolves the value specified by parameter `main_class` to 1, all other values to 0.

**Note:**
If the input column is of data type INTEGER or BOOLEAN, the function ignores parameter `main_class`.

| **probabilities** | A FLOAT input column that contains the predicted probability of response being the main class, set to 1 if `targets` is of type INTEGER. |

### Parameters

| **num_bins** | An integer value that determines the number of decision boundaries. Decision boundaries are set at equally spaced intervals between 0 and 1, inclusive. The function computes the table at each `num-bin + 1` point. **Default**: 100 |
| **f1_score** | A Boolean that specifies whether to return a column that contains the f1 score—the harmonic average of the precision and recall measures, where an F1 score reaches its best value at 1 (perfect precision and recall) and worst at 0. **Default**: false |
| **main_class** | Used only if `targets` is of type CHAR/VARCHAR, specifies the class to... |
associate with the *probabilities* argument.

**Examples**

Execute the PRC function on an input table named `mtcars`. The response variables appear in the column `obs`, while the prediction variables appear in column `pred`.

```sql
=> SELECT PRC(obs::int, prob::float USING PARAMETERS num_bins=2, f1_score=true) OVER() 
   FROM (SELECT am AS obs, 
            PREDICT_LOGISTIC_REG(mpg, cyl, disp, drat, wt, qsec, vs, gear, carb 
            USING PARAMETERS model_name='myLogisticRegModel', 
            type='probability') AS prob 
   FROM mtcars) AS prediction_output;
```

<table>
<thead>
<tr>
<th>decision_boundary</th>
<th>recall</th>
<th>precision</th>
<th>f1_score</th>
<th>comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>0.40625</td>
<td>0.5777777777777778</td>
<td>Of 32 rows, 32 were used and 0 were ignored (2 rows)</td>
</tr>
</tbody>
</table>

The first column, `decision_boundary`, indicates the cut-off point for whether to classify a response as 0 or 1. For example, in each row, if the probability is equal to or greater than `decision_boundary`, the response is classified as 1. If the probability is less than `decision_boundary`, the response is classified as 0.

**READ_TREE**

Reads the contents of trees within the random forest or XGBoost model.

**Syntax**

```sql
READ_TREE ( USING PARAMETERS model_name = 'model-name' [, tree_id = tree-id] [, format = 'format'] )
```

**Parameters**

| model_name | Identifies the model that is stored as a result of training, where `model-name` conforms to conventions described in Identifiers. It must also |
be unique among all names of sequences, tables, projections, views, and models within the same schema.

| tree_id | The tree identifier, an integer between 0 and \( n-1 \), where \( n \) is the number of trees in the random forest or XGBoost model. If you omit this parameter, all trees are returned. |
| format | Output format of the returned tree, one of the following: |
|        | - tabular: Returns a table with the twelve output columns. |
|        | - graphviz: Returns DOT language source that can be passed to a graphviz tool and render a graphic visualization of the tree. |

**Privileges**

Non-superusers: USAGE privileges on the model

**Examples**

Get tabular output from READ_TREE for a random forest model:

```sql
=> SELECT READ_TREE ( USING PARAMETERS model_name='myRFModel', tree_id=1 , format= 'tabular') LIMIT 2;

- [ RECORD 1 ]-----------------------------
tree_id | 1
node_id | 1
node_depth | 0
is_leaf | f
is_categorical_split | f
split_predictor | petal_length
split_value | 1.921875
weighted_information_gain | 0.111242236024845
left_child_id | 2
right_child_id | 3
prediction | |
probability/variance | |

- [ RECORD 2 ]-----------------------------
tree_id | 1
node_id | 2
node_depth | 1
is_leaf | t
is_categorical_split | |
split_predictor | |
split_value | |
weighted_information_gain | |
left_child_id | |
Get **graphviz**-formatted output from **READ_TREE**:  

```
>= SELECT READ_TREE (USING PARAMETERS model_name='myRFModel', tree_id=1, format='graphviz') LIMIT 1;
```

This renders as follows:

See Also

- **RF_REGRESSOR**
- **XGB_CLASSIFIER**
- **XGB_REGRESSOR**
**RF_PREDICTOR_IMPORTANCE**

Measures the importance of the predictors in a random forest model using the Mean Decrease Impurity (MDI) approach. The importance vector is normalized to sum to 1.

**Syntax**

```sql
RF_PREDICTOR_IMPORTANCE ( USING PARAMETERS model_name = 'model-name' [, tree_id = tree-id] )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Identifies the model that is stored as a result of the training, where <code>model-name</code> must be of type <code>rf_classifier</code> or <code>rf_regressor</code>.</td>
</tr>
<tr>
<td>tree_id</td>
<td>Identifies the tree to process, an integer between 0 and n-1, where n is the number of trees in the forest. If you omit this parameter, the function uses all trees to measure importance values.</td>
</tr>
</tbody>
</table>

**Privileges**

Non-superusers: USAGE privileges on the model

**Examples**

This example shows how you can use the RF_PREDICTOR_IMPORTANCE function.

```sql
=> SELECT RF_PREDICTOR_IMPORTANCE ( USING PARAMETERS model_name = 'myRFModel');

predictor_index | predictor_name | importance_value
-----------------|---------------|------------------
0                | sepal.length  | 0.10673318092655 |
1                | sepal.width   | 0.0279536658041994 |
2                | petal.length  | 0.499198722346586 |
3                | petal.width   | 0.366084293756561 |
(4 rows)
```
See Also

- RF_CLASSIFIER
- RF_REGRESSOR

**ROC**

Returns a table that displays the points on a receiver operating characteristic curve. The ROC function tells you the accuracy of a classification model as you raise the discrimination threshold for the model.

**Syntax**

```sql
ROC ( targets, probabilities
    [ USING PARAMETERS
        [num_bins = num-bins]
        [, AUC = output]
        [, main_class = class-name ] ] ] )
OVER()
```

**Arguments**

<table>
<thead>
<tr>
<th>targets</th>
<th>An input column that contains the true values of the response variable, one of the following data types: INTEGER, BOOLEAN, or CHAR/VARCHAR. Depending on the column data type, the function processes column data as follows:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- <strong>INTEGER</strong>: Uses the input column as containing the true value of the response variable.</td>
</tr>
<tr>
<td></td>
<td>- <strong>BOOLEAN</strong>: Resolves Yes to 1, 0 to No.</td>
</tr>
<tr>
<td></td>
<td>- <strong>CHAR/VARCHAR</strong>: Resolves the value specified by parameter main_class to 1, all other values to 0.</td>
</tr>
</tbody>
</table>

*Note:*

If the input column is of data type INTEGER or BOOLEAN, the function ignores parameter main_class.
probabilities | A FLOAT input column that contains the predicted probability of response being the main class, set to 1 if targets is of type INTEGER.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| num_bins  | An integer value that determines the number of decision boundaries. Decision boundaries are set at equally spaced intervals between 0 and 1, inclusive. The function computes the table at each num-bin + 1 point. **Default**: 100
| Greater values result in more precise approximations of the AUC. |
| AUC       | A Boolean value that specifies whether to output the area under the curve (AUC) value. **Default**: True |
| main_class| Used only if targets is of type CHAR/VARCHAR, specifies the class to associate with the probabilities argument. |

### Examples

Execute ROC on input table mtcars. Observed class labels are in column obs, predicted class labels are in column prob:

```sql
=> SELECT ROC(obs::int, prob::float USING PARAMETERS num_bins=5, AUC = True) OVER() FROM (SELECT am AS obs, PREDICT_LOGISTIC_REG (mpg, cyl, disp, drat, wt, qsec, vs, gear, carb USING PARAMETERS model_name='myLogisticRegModel', type='probability') AS prob FROM mtcars) AS prediction_output;
```

<table>
<thead>
<tr>
<th>decision_boundary</th>
<th>false_positive_rate</th>
<th>true_positive_rate</th>
<th>AUC</th>
<th>comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0.5</td>
<td>0</td>
<td>1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>Of 32 rows, 32 were used and 0 were ignored (3 rows)</td>
</tr>
</tbody>
</table>

The function returns a table with the following results:
- **decision_boundary** indicates the cut-off point for whether to classify a response as 0 or 1. In each row, if `prob` is equal to or greater than `decision_boundary`, the response is classified as 1. If `prob` is less than `decision_boundary`, the response is classified as 0.
- **false_positive_rate** shows the percentage of false positives (when 0 is classified as 1) in the corresponding `decision_boundary`.
- **true_positive_rate** shows the percentage of rows that were classified as 1 and also belong to class 1.

**RSQUARED**

Returns a table with the R-squared value of the predictions in a regression model.

**Syntax**

```sql
RSQUARED ( targets, predictions ) OVER()
```

**Important:**
The `OVER()` clause must be empty.

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>targets</code></td>
<td>A FLOAT response variable for the model.</td>
</tr>
<tr>
<td><code>predictions</code></td>
<td>A FLOAT input column that contains the predicted values for the response variable.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to execute the **RSQUARED** function on an input table named `faithful_testing`. The observed values of the response variable appear in the column, `obs`, while the predicted values of the response variable appear in the column, `pred`.

```sql
=> SELECT RSQUARED(obs, prediction) OVER() FROM (SELECT eruptions AS obs,
```
Model Management

Vertica provides several functions for managing models.

**EXPORT_MODELS**

Exports machine learning models. Vertica supports three model formats:

- Native Vertica (VERTICA_MODELS)
- PMML
- TensorFlow

**Syntax**

```
EXPORT_MODELS ( 'output-dir', 'export-target' [ USING PARAMETERS category = 'model-category' ] )
```

**Arguments**

<table>
<thead>
<tr>
<th><strong>output-dir</strong></th>
<th>Absolute path of an output directory to store the exported models.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>export-target</strong></td>
<td>Specifies which models to export as follows:</td>
</tr>
<tr>
<td>[schema.](model-name</td>
<td>* )</td>
</tr>
</tbody>
</table>

where schema optionally specifies to export models from the specified schema. If omitted, EXPORT_MODELS uses the default schema. Supply * (asterisk) to export all models from the schema.
**Parameters**

<table>
<thead>
<tr>
<th>category</th>
<th>The category of models to export, one of the following:</th>
</tr>
</thead>
</table>
| | • VERTICA_MODELS  
| | • PMML  
| | • TENSORFLOW |

EXPORT_MODELS exports models of the specified category according to the scope of the export operation—that is, whether it applies to a single model, or to all models within a schema. See *Export Scope and Category Processing* below.

*Exported Files* below describes the files that EXPORT_MODELS exports for each category.

If you omit this parameter, EXPORT_MODELS exports the model, or models in the specified schema, according to their model type.

**Privileges**

Superuser

**Export Scope and Category Processing**

EXPORT_MODELS executes according to the following parameter settings:

- Scope of the export operation: single model, or all models within a given schema
- Category specified or omitted

The following table shows how these two parameters control the export process:

<table>
<thead>
<tr>
<th>Export scope</th>
<th>If category specified...</th>
<th>If category omitted...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single model</td>
<td>Convert the model to the specified category, provided the model and category are <em>compatible</em>; otherwise, return with a mismatch</td>
<td>Export the model according to model type.</td>
</tr>
<tr>
<td>Export scope</td>
<td>If category specified...</td>
<td>If category omitted...</td>
</tr>
<tr>
<td>-------------------------</td>
<td>------------------------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>All models in schema</td>
<td>Export only models that are <strong>compatible</strong> with the specified category and issue mismatch warnings on all other models in the schema.</td>
<td>Export all models in the schema according to model type.</td>
</tr>
</tbody>
</table>

**Exported Files**

**EXPORT_MODELS** exports the following files for each model category:

<table>
<thead>
<tr>
<th>Model category</th>
<th>Exported files</th>
</tr>
</thead>
<tbody>
<tr>
<td>VERTICA_MODELS</td>
<td>• Multiple binary files (exact number dependent on model type)&lt;br&gt;• <code>metadata.json</code>: Metadata file with model information — model name, category, type, Vertica version on export.&lt;br&gt;• <code>crc.json</code>: Used on import to validate other files of this model.</td>
</tr>
<tr>
<td>PMML</td>
<td>• XML file with the same name as the model and complying with PMML standard.&lt;br&gt;• <code>metadata.json</code>: Metadata file with model information — model name, category, type, Vertica version on export.&lt;br&gt;• <code>crc.json</code>: Used on import to validate other files of this model.</td>
</tr>
<tr>
<td>TENSORFLOW</td>
<td>• <code>model-name.pb</code>: Contains the TensorFlow model, saved in 'frozen graph' format.&lt;br&gt;• <code>metadata.json</code>: Metadata file with model information — model name, category, type, Vertica version on export.&lt;br&gt;• <code>tf_model_desc.json</code>: Summary model description.&lt;br&gt;• <code>model.json</code>:Verbose model description.&lt;br&gt;• <code>crc.json</code>: Used on import to validate other files of this model.</td>
</tr>
</tbody>
</table>
Categories and Compatible Models

If EXPORT_MODELS specifies a single model and also sets the category parameter, the function succeeds if the model type and category are compatible; otherwise, it returns with an error:

<table>
<thead>
<tr>
<th>Model type</th>
<th>Compatible categories</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMML</td>
<td>PMML</td>
</tr>
<tr>
<td>TensorFlow</td>
<td>TENSORFLOW</td>
</tr>
<tr>
<td>VERTICA_MODELS</td>
<td>PMML</td>
</tr>
<tr>
<td></td>
<td>VERTICA_MODELS</td>
</tr>
</tbody>
</table>

If EXPORT_MODELS specifies to export all models from a schema and sets a category, it issues a warning message on each model that is incompatible with that category. The function then continues to process remaining models in that schema.

EXPORT_MODELS logs all errors and warnings in output-dir/export_log.json.

Examples

Export models without changing their category:

- Export model myschema.mykmeansmodel without changing its category:

```
=> SELECT EXPORT_MODELS ('/home/dbadmin', 'myschema.mykmeansmodel');
EXPORT_MODELS
--------------
Success
(1 row)
```

- Export all models in schema myschema without changing their categories:

```
=> SELECT EXPORT_MODELS ('/home/dbadmin', 'myschema.*');
EXPORT_MODELS
--------------
Success
(1 row)
```

Export models that are compatible with the specified category:
The category is set to PMML. Models of type PMML and VERTICA_MODELS are compatible with the PMML category, so the export operation succeeds if `my_kmeans` is of either type:

```sql
=> SELECT EXPORT_MODELS ('/tmp/', 'my_kmeans' USING PARAMETERS category='PMML');
```

The category is set to VERTICA_MODELS. Only models of type VERTICA_MODELS are compatible with the VERTICA_MODELS category, so the export operation succeeds only if `my_kmeans` is of that type:

```sql
=> SELECT EXPORT_MODELS ('/tmp/', 'public.my_kmeans' USING PARAMETERS category='VERTICA_MODELS');
```

The category is set to TENSORFLOW. Only models of type TensorFlow are compatible with the TENSORFLOW category, so the model `tf_mnist_keras` must be of type TensorFlow:

```sql
=> SELECT EXPORT_MODELS ('/tmp/', 'tf_mnist_keras', USING PARAMETERS category='TENSORFLOW');
export_models
-----------------
Success
(1 row)
```

After exporting the TensorFlow model `tf_mnist_keras`, list the exported files:

```
$ ls tf_mnist_keras/
crc.json  metadata.json  mnist_keras.pb  model.json  tf_model_desc.json
```

See Also

**IMPORT_MODELS**

**GET_MODEL_ATTRIBUTE**

Extracts either a specific attribute from a model or all attributes from a model. Use this function to view a list of attributes and row counts or view detailed information about a single attribute. The output of GET_MODEL_ATTRIBUTE is a table format where users can select particular columns or rows.
Syntax

GET_MODEL_ATTRIBUTE ( USING PARAMETERS model_name = 'model-name' [, attr_name = 'attribute' ] )

Parameters

| model_name | Name of the model (case-insensitive). |
| attr_name  | Name of the model attribute to extract. If omitted, the function shows all available attributes. Attribute names are case-sensitive. |

Privileges

Non-superusers: model owner, or USAGE privileges on the model

Examples

This example returns a summary of all model attributes.

```
=> SELECT GET_MODEL_ATTRIBUTE ( USING PARAMETERS model_name='myLinearRegModel');
```

```
tagle| | | | #_of_rows
---|---|---|---|---
details | predictor, coefficient, std_err, t_value, p_value | 2
regularization | type, lambda | 1
iteration_count | iteration_count | 1
rejected_row_count | rejected_row_count | 1
accepted_row_count | accepted_row_count | 1
call_string | call_string | 1
(6 rows)
```

This example extracts the details attribute from the myLinearRegModel model.

```
=> SELECT GET_MODEL_ATTRIBUTE ( USING PARAMETERS model_name='myLinearRegModel', attr_ name='details');
```

```
taggle| | | | | |
---|---|---|---|---
coeffNames | coeff | stderr | zValue | pValue

GET_MODEL_SUMMARY

Returns summary information of a model.

Syntax

GET_MODEL_SUMMARY (USING PARAMETERS model_name = 'model-name')

Parameters

| model_name | Name of the model (case-insensitive). |

Privileges

Non-superusers: model owner, or USAGE privileges on the model

Examples

This example shows how you can view the summary of a linear regression model.

```sql
=> SELECT GET_MODEL_SUMMARY( USING PARAMETERS model_name='myLinearRegModel');
```

```
<table>
<thead>
<tr>
<th>predictor</th>
<th>coefficient</th>
<th>std_err</th>
<th>t_value</th>
<th>p_value</th>
</tr>
</thead>

**IMPORT_MODELS**

Imports models into Vertica, either Vertica models that were exported with **EXPORT_MODELS**, or models in Predictive Model Markup Language (PMML) or TensorFlow format. You can use this function to move models between Vertica clusters, or to import PMML and TensorFlow models trained elsewhere.

Other Vertica model management operations such as **GET_MODEL_SUMMARY** and **GET_MODEL_ATTRIBUTE** support imported models.

⚠️ **Caution:**
Changing the exported model files causes the import functionality to fail on attempted re-import.

**Syntax**

```
IMPORT_MODELS ('source'
    [ USING PARAMETERS [ new_schema = 'schema-name' ] [, category = 'model-category' ] ])
```

**Arguments**

| **source** | The absolute path of the location from which to import models, one of the |
The directory of a single model:

```
path/model-directory
```

The parent directory of multiple model directories:

```
parent-dir-path/*
```

## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>new_schema</code></td>
<td>An existing schema where the machine learning models are imported. If omitted, models are imported to the default schema. IMPORT_MODELS extracts the name of the imported model from its <code>metadata.json</code> file, if it exists. Otherwise, the function uses the name of the model directory.</td>
</tr>
<tr>
<td><code>category</code></td>
<td>Specifies the category of the model to import, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- VERTICA_MODELS</td>
</tr>
<tr>
<td></td>
<td>- PMML</td>
</tr>
<tr>
<td></td>
<td>- TENSORFLOW</td>
</tr>
</tbody>
</table>

This parameter is required if the model directory has no `metadata.json` file. IMPORT_MODELS returns with an error if one of the following cases is true:

- No category is specified and the model directory has no `metadata.json`.
- The specified category does not match the model type.

**Note:**

If the category is TENSORFLOW, IMPORT_MODELS only imports the following files from the model directory:

- `model-name.pb`
- `model-name.json`
- `model-name.pbtxt` (optional)
Privileges

Superuser

Requirements and Restrictions

The following requirements and restrictions apply:

- If you export a model, then import it again, the export and import model directory names must match. If naming conflicts occur, import the model to a different schema by using the new_schema parameter, and then rename the model.

- The machine learning configuration parameter MaxModelSizeKB sets the maximum size of a model that can be imported into Vertica.

- Some PMML features and attributes are not currently supported. See PMML Features and Attributes for details.

- If you import a PMML model with both metadata.json and crc.json files, the CRC file must contain the metadata file's CRC value. Otherwise, the import operation returns with an error.

Examples

Import models into the specified schema:

In both examples no model category is specified, so IMPORT_MODEL uses the model's metadata.json file to determine its category:

- Import a single model mykmeansmodel into the newschema schema:

  => SELECT IMPORT_MODELS ('/home/dbadmin/myschema/mykmeansmodel' USING PARAMETERS new_schema='newschema')
IMPORT_MODELS
-----------------
Success
(1 row)

- Import all models in the myschema directory into the newschema schema:

  => SELECT IMPORT_MODELS ('/home/dbadmin/myschema/*' USING PARAMETERS new_
Specify the category of models to import:

In the first two examples, IMPORT_MODELS returns with success only if the specified model and category match; otherwise, it returns an error:

- Import kmeans_pmml as a PMML model:

```
SELECT IMPORT_MODELS ('/root/user/kmeans_pmml' USING PARAMETERS category='PMML')
import_models
-------------------
Success
(1 row)
```

- Import tf_mnist_estimator as a TensorFlow model:

```
=> SELECT IMPORT_MODELS ( '/path/tf_models/tf_mnist_estimator' USING PARAMETERS category='TENSORFLOW');
import_models
-------------------
Success
(1 row)
```

- Import all TensorFlow models from the specified directory:

```
=> SELECT IMPORT_MODELS ( '/path/tf_models/*' USING PARAMETERS category='TENSORFLOW');
import_models
-------------------
Success
(1 row)
```

See Also

- `EXPORT_MODELS`

**UPGRADE_MODEL**

Upgrades a model from a previous Vertica version. Vertica automatically runs this function during an upgrade of the database and if you run the IMPORT_MODELS function. Manually call this function to upgrade models after a backup or restore.
Syntax

UPGRADE_MODEL ( [ USING PARAMETERS [model_name = 'model-name'] ] )

Parameters

| model_name | Name of the model to upgrade. If you omit this parameter, Vertica upgrades all models on which you have privileges. |

Privileges

Non-superuser: Upgrades only models that the user owns.

Examples

Upgrade model myLogisticRegModel:

=> SELECT UPGRADE_MODEL( USING PARAMETERS model_name = 'myLogisticRegModel');
   UPGRADE_MODEL
   ---------------------
   1 model(s) upgrade
(1 row)

Upgrade all models that the user owns:

=> SELECT UPGRADE_MODEL();
   UPGRADE_MODEL
   ---------------------
   20 model(s) upgrade
(1 row)
Mathematical Functions

Some of these functions are provided in multiple forms with different argument types. Except where noted, any given form of a function returns the same data type as its argument. The functions working with DOUBLE PRECISION data could vary in accuracy and behavior in boundary cases depending on the host system.

ABS

Returns the absolute value of the argument. The return value has the same data type as the argument.

Behavior Type

Immutable

Syntax

ABS ( expression )

Parameters

| expression | Is a value of type INTEGER or DOUBLE PRECISION |

Examples

```
SELECT ABS(-28.7);
abs
-----
28.7
(1 row)
```
ACOS

Returns a DOUBLE PRECISION value representing the trigonometric inverse cosine of the argument.

Behavior Type

Immutable

Syntax

ACOS ( expression )

Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>Is a value of type DOUBLE PRECISION</th>
</tr>
</thead>
</table>

Example

```
SELECT ACOS (1);
acos
-------
 0
(1 row)
```

ASIN

Returns a DOUBLE PRECISION value representing the trigonometric inverse sine of the argument.

Behavior Type

Immutable
**Syntax**

\[
\text{ASIN ( expression )}
\]

**Parameters**

| expression | Is a value of type DOUBLE PRECISION |

**Example**

```sql
SELECT ASIN(1);
```

<table>
<thead>
<tr>
<th>asin</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.5707963267949</td>
</tr>
</tbody>
</table>

(1 row)

---

**ATAN**

Returns a DOUBLE PRECISION value representing the trigonometric inverse tangent of the argument.

**Behavior Type**

**Immutable**

**Syntax**

\[
\text{ATAN ( expression )}
\]

**Parameters**

| expression | DOUBLE PRECISION value |
Example

```sql
SELECT ATAN(1);
atn
---------------------
0.785398163397448
(1 row)
```

ATAN2

Returns a DOUBLE PRECISION value representing the trigonometric inverse tangent of the arithmetic dividend of the arguments.

Behavior Type

Immutable

Syntax

```sql
ATAN2 ( quotient, divisor )
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>quotient</td>
<td>Is an expression of type DOUBLE PRECISION representing the quotient</td>
</tr>
<tr>
<td>divisor</td>
<td>Is an expression of type DOUBLE PRECISION representing the divisor</td>
</tr>
</tbody>
</table>

Example

```sql
SELECT ATAN2(2,1);
ATAN2
---------------------
1.10714871779409
(1 row)
```
CBRT

Returns the cube root of the argument. The return value has the type DOUBLE PRECISION.

Behavior Type

Immutable

Syntax

CBRT ( expression )

Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>Value of type DOUBLE PRECISION</th>
</tr>
</thead>
</table>

Examples

```
SELECT CBRT(27.0);
```

```
cbrt
------
  3
(1 row)
```

CEILING

Rounds up the returned value up to the next whole number. For example, given arguments of 5.01 and 5.99, CEILING returns 6.

Note:

CEILING is the opposite of FLOOR, which rounds down the returned value.
Behavior Type

Immutable

Syntax

CEIL[ING] ( expression )

Parameters

| expression | Resolves to an INTEGER or DOUBLE PRECISION value. |

Examples

```sql
=> SELECT CEIL(-42.8);
CEIL
-------
-42
(1 row)

SELECT CEIL(48.01);
CEIL
-------
49
(1 row)
```

COS

Returns a DOUBLE PRECISION value that represents the trigonometric cosine of the passed parameter.

Behavior Type

Immutable

Syntax

COS ( expression )
Parameters

| expression | An expression of type DOUBLE PRECISION |

Example

```
SELECT COS(-1);
  COS
--------------
  0.54030230586814
(1 row)
```

COSH

Returns a DOUBLE PRECISION value that represents the hyperbolic cosine of the passed parameter.

Behavior Type

Immutable

Syntax

```
COSH ( expression )
```

Parameters

| expression | An expression of type DOUBLE PRECISION |

Example

```
=> SELECT COSH(-1);
  COSH
--------------
  1.54308063481524
```
COT

Returns a DOUBLE PRECISION value representing the trigonometric cotangent of the argument.

Behavior Type

Immutable

Syntax

COT ( expression )

Parameters

| expression | Is a value of type DOUBLE PRECISION |

Example

```
SELECT COT(1);
    cot
----------
0.642092615934331
(1 row)
```

DEGREES

Converts an expression from radians to fractional degrees, or from degrees, minutes, and seconds to fractional degrees. The return value has the type DOUBLE PRECISION.

Behavior Type

Immutable
Syntax

DEGREES ( { radians | degrees, minutes, seconds } )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>radians</td>
<td>Unit of angular measure. $2\pi$ radians is equal to a full rotation.</td>
</tr>
<tr>
<td>degrees</td>
<td>Unit of angular measure, equal to $1/360$ of a full rotation.</td>
</tr>
<tr>
<td>minutes</td>
<td>Unit of angular measurement, representing $1/60$ of a degree.</td>
</tr>
<tr>
<td>seconds</td>
<td>Unit of angular measurement, representing $1/60$ of a minute.</td>
</tr>
</tbody>
</table>

Examples

```sql
SELECT DEGREES(0.5);
DEGREES
---------------
 28.6478897565412
(1 row)
SELECT DEGREES(1,2,3);
DEGREES
---------------
 1.03416666666667
(1 row)
```

DISTANCE

Returns the distance (in kilometers) between two points. You specify the latitude and longitude of the starting point and the ending point. You can also specify the radius of curvature for greater accuracy when using an ellipsoidal model.

Behavior Type

Immutable
Syntax

```
DISTANCE ( lat0, lon0, lat1, lon1 [, radius-of-curvature ] )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>lat0</code></td>
<td>Starting point latitude.</td>
</tr>
<tr>
<td><code>lon0</code></td>
<td>Starting point longitude.</td>
</tr>
<tr>
<td><code>lat1</code></td>
<td>Ending point latitude</td>
</tr>
<tr>
<td><code>lon1</code></td>
<td>Ending point longitude</td>
</tr>
<tr>
<td><code>radius-of-curvature</code></td>
<td>Specifies the radius of the curvature of the earth at the midpoint between the starting and ending points. This parameter allows for greater accuracy when using an ellipsoidal earth model. If you omit this parameter, DISTANCE uses the WGS-84 average r1 radius, about 6371.009 km.</td>
</tr>
</tbody>
</table>

**Example**

This example finds the distance in kilometers for 1 degree of longitude at latitude 45 degrees, assuming earth is spherical.

```
SELECT DISTANCE(45,0,45,1);
```

```
DISTANCE
------------------------
78.6262959272162
(1 row)
```

**DISTANCEV**

Returns the distance (in kilometers) between two points using the Vincenty formula. Because the Vincenty formula includes the parameters of the WGS-84 ellipsoid model, you need not specify a radius of curvature. You specify the latitude and longitude of both the starting point and the ending point. This function is more accurate, but will be slower, than the DISTANCE function.
Behavior Type

Immutable

Syntax

DISTANCEV (lat0, lon0, lat1, lon1);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lat0</td>
<td>Specifies the latitude of the starting point.</td>
</tr>
<tr>
<td>lon0</td>
<td>Specifies the longitude of the starting point.</td>
</tr>
<tr>
<td>lat1</td>
<td>Specifies the latitude of the ending point.</td>
</tr>
<tr>
<td>lon1</td>
<td>Specifies the longitude of the ending point.</td>
</tr>
</tbody>
</table>

Example

This example finds the distance in kilometers for 1 degree of longitude at latitude 45 degrees, assuming earth is ellipsoidal.

```
SELECT DISTANCEV(45,0, 45,1);
```

```
distanceV
---------------------
 78.846347995916
(1 row)
```

EXP

Returns the exponential function, e to the power of a number. The return value has the same data type as the argument.

Behavior Type

Immutable
Syntax

\[
\text{EXP} \left( exponent \right)
\]

Parameters

| exponent | Is an expression of type INTEGER or DOUBLE PRECISION |

Example

```
SELECT EXP(1.0);
```

```
  exp
------------------
2.71828182845905
(1 row)
```

FLOOR

Rounds down the returned value to the next whole number. For example, given arguments of 5.01 and 5.99, FLOOR returns 5.

**Note:**
FLOOR is the opposite of CEILING, which rounds up the returned value.

Behavior Type

Immutable

Syntax

\[
\text{FLOOR} \left( expression \right)
\]

Parameters

| expression | Resolves to an INTEGER or DOUBLE PRECISION value. |
Examples

=> SELECT FLOOR((TIMESTAMP '2005-01-17 10:00' - TIMESTAMP '2005-01-01') / INTERVAL '7');
FLOOR
-------
 2
(1 row)

=> SELECT FLOOR(-42.8);
FLOOR
-------
-43
(1 row)

=> SELECT FLOOR(42.8);
FLOOR
-------
 42
(1 row)

Although the following example looks like an INTEGER, the number on the left is $2^{49}$ as an INTEGER, while the number on the right is a FLOAT:

=> SELECT 1<<49, FLOOR(1 << 49);
?column? |  floor
-----------------------------
562949953421312 | 562949953421312
(1 row)

Compare the previous example to:

=> SELECT 1<<50, FLOOR(1 << 50);
?column? |  floor
-----------------------------
1125899906842624 | 1.12589990684262e+15
(1 row)

HASH

Calculates a hash value over the function arguments, producing a value in the range $0 \leq x < 2^{63}$.

The HASH function is typically used to segment a projection over a set of cluster nodes. The function selects a specific node for each row based on the values of the row columns. The HASH function distributes data evenly across the cluster, which facilitates optimal query execution.
Behavior Type

Immutable

Syntax

HASH ( { * | expression[,..] } )

Arguments

<table>
<thead>
<tr>
<th>*</th>
<th>expression[,...]</th>
<th>One of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>* (asterisk)</td>
<td>Specifies to hash all columns in the queried table.</td>
<td></td>
</tr>
<tr>
<td>expression</td>
<td>An expression of any data type. Functions that are included in expression must be deterministic. If specified in a projection's hash segmentation clause, each expression typically resolves to a column reference.</td>
<td></td>
</tr>
</tbody>
</table>

Examples

```sql
=> SELECT HASH(product_price, product_cost) FROM product_dimension  
   WHERE product_price = '11';  
   hash  
   ---------------------  
   4157497907121511878  
   1799398249227328285  
   3250220637492749639  
   (3 rows)
```

See Also

Hash Segmentation Clause
**LN**

Returns the natural logarithm of the argument. The return data type is the same as the argument.

**Behavior Type**

*Immutable*

**Syntax**

```
LN ( expression )
```

**Parameters**

| expression | Is an expression of type INTEGER or DOUBLE PRECISION |

**Example**

```sql
SELECT LN(2);

<table>
<thead>
<tr>
<th>ln</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.693147180559945</td>
</tr>
</tbody>
</table>

(1 row)
```

**LOG**

Returns the logarithm to the specified base of the argument. The data type of the return value is the same data type as the passed parameter.

**Behavior Type**

*Immutable*
Syntax

```
LOG ( [ base, ] expression )
```

Parameters

<table>
<thead>
<tr>
<th>base</th>
<th>Specifies the base (default is base 10)</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>An expression of type INTEGER or DOUBLE PRECISION</td>
</tr>
</tbody>
</table>

Examples

```
=> SELECT LOG(2.0, 64);
  LOG
  -----
   6
 (1 row)
SELECT LOG(100);
  LOG
  -----
   2
 (1 row)
```

LOG10

Returns the base 10 logarithm of the argument, also known as the common logarithm. The data type of the return value is the same as the data type of the passed parameter.

Behavior Type

Immutable

Syntax

```
LOG10 ( expression )
```
Parameters

| expression | An expression of type INTEGER or DOUBLE PRECISION |

Examples

```sql
=> SELECT LOG10(30);
  LOG10
-----------------
  1.47712125471966
(1 row)
```

MOD

Returns the remainder of a division operation.

Behavior Type

Immutable

Syntax

```sql
MOD( expression1, expression2 )
```

Parameters

| expression1 | A numeric data type that specifies the dividend. |
| expression2 | A numeric data type that specifies the divisor. |

Computation Rules

When computing `MOD(expression1, expression2)`, the following rules apply:
• If either expression1 or expression2 is the null value, then the result is the null value.
• If expression2 is zero, then an exception condition is raised: data exception — division by zero.
• Otherwise, the result is the unique exact numeric value $R$ with scale 0 (zero) such that all of the following are true:
  • $R$ has the same sign as expression2.
  • The absolute value of $R$ is less than the absolute value of expression1.
  • expression2 = expression1 * $K + R$ for some exact numeric value $K$ with scale 0 (zero).

Examples

```
SELECT MOD(9,4);
   mod
-----
   1
(1 row)
SELECT MOD(10,3);
   mod
-----
   1
(1 row)
SELECT MOD(-10,3);
   mod
-----
  -1
(1 row)
SELECT MOD(-10,-3);
   mod
-----
  -1
(1 row)
SELECT MOD(10,-3);
   mod
-----
   1
(1 row)
```

=> SELECT MOD(6.2,0);
ERROR 3117: Division by zero
PI

Returns the constant pi (\(\pi\)), the ratio of any circle's circumference to its diameter in Euclidean geometry. The return type is DOUBLE PRECISION.

Behavior Type
Immutable

Syntax
PI()

Examples

```
SELECT PI();
  pi
----------------
  3.14159265358979
(1 row)
```

POWER

Returns a DOUBLE PRECISION value representing one number raised to the power of another number.

Behavior Type
Immutable

Syntax
POW[ER] ( expression1, expression2 )
Parameters

<table>
<thead>
<tr>
<th>expression1</th>
<th>DOUBLE PRECISION value that represents the base.</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression2</td>
<td>DOUBLE PRECISION value that represents the exponent.</td>
</tr>
</tbody>
</table>

Examples

```
SELECT POWER(9.0, 3.0);
```

```
Powe
-------
 729
(1 row)
```

RADIANS

Returns a DOUBLE PRECISION value representing an angle expressed in radians. You can express the input angle in DEGREES, and optionally include minutes and seconds.

Behavior Type

Immutable

Syntax

```
RADIANS (degrees [, minutes, seconds])
```

Parameters

<table>
<thead>
<tr>
<th>degrees</th>
<th>A unit of angular measurement, representing 1/360 of a full rotation.</th>
</tr>
</thead>
<tbody>
<tr>
<td>minutes</td>
<td>A unit of angular measurement, representing 1/60 of a degree.</td>
</tr>
<tr>
<td>seconds</td>
<td>A unit of angular measurement, representing 1/60 of a minute.</td>
</tr>
</tbody>
</table>
Examples

```
SELECT RADIANS(45);
  RADIANS
-------------------
  0.785398163397448
(1 row)
SELECT RADIANS (1,2,3);
  RADIANS
-------------------
  0.018049613347708
(1 row)
```

RANDOM

Returns a uniformly-distributed random DOUBLE PRECISION value $x$, where $0 \leq x < 1$.

Typical pseudo-random generators accept a seed, which is set to generate a reproducible pseudo-random sequence. Vertica, however, distributes SQL processing over a cluster of nodes, where each node generates its own independent random sequence.

Results depending on RANDOM are not reproducible because the work might be divided differently across nodes. Therefore, Vertica automatically generates truly random seeds for each node each time a request is executed and does not provide a mechanism for forcing a specific seed.

Behavior Type

Volatile

Syntax

RANDOM()

Examples

In the following example, RANDOM returns a float $\geq 0$ and $< 1.0$:

```
SELECT RANDOM();
```
**RANDOMINT**

Accepts and returns an INTEGER value. RANDOMINT\((n)\) returns one of the \(n\) integers from 0 through \(n - 1\).

Typical pseudo-random generators accept a seed, which is set to generate a reproducible pseudo-random sequence. Vertica, however, distributes SQL processing over a cluster of nodes, where each node generates its own independent random sequence.

Results depending on RANDOM are not reproducible because the work might be divided differently across nodes. Therefore, Vertica automatically generates truly random seeds for each node each time a request is executed and does not provide a mechanism for forcing a specific seed.

**Behavior Type**

Volatile

**Syntax**

```
RANDOMINT( n )
```

**Parameters**

The value accepted is any positive integer \((n)\) between the values 1 and 9,223,372,036,854,775,807.

For general information on integer data types, refer to the section, INTEGER.

**Restrictions**

If you provide a negative value, or if you exceed the maximum value, Vertica returns an error.
Example

In the following example, the result is an INTEGER, which is \( \geq 0 \) and \( < n \), randomly chosen from the set \{0,1,2,3,4\}.

```sql
=> SELECT RANDOMINT(5);
RANDOMINT
--------
 3
(1 row)
```

RANDOMINT_CRYPTO

Accepts and returns an INTEGER value from a set of values between 0 and the specified function argument -1. For this cryptographic random number generator, Vertica uses RAND_bytes to provide the random value.

Behavior Type

Volatile

Syntax

```sql
RANDOMINT_CRYPTO ( integer-expression )
```

Parameters

| integer-expression | Resolves to a positive integer between 1 and \( 2^{63} - 1 \), inclusive. |

Examples

In the following example, RANDOMINT_CRYPTO returns an INTEGER \( \geq 0 \) and less than the specified argument 5, randomly chosen from the set \{0, 1, 2, 3, 4\}.

```sql
=> SELECT RANDOMINT_crypto(5);
RANDOMINT_crypto
------------------
 3
(1 row)
```
ROUND

Rounds a value to a specified number of decimal places, retaining the original precision and scale. Fractions greater than or equal to .5 are rounded up. Fractions less than .5 are rounded down (truncated).

Behavior Type

Immutable

Syntax

ROUND ( expression [, places ] )

Parameters

| expression | Is an expression of type NUMERIC or DOUBLE PRECISION (FLOAT). |
| places     | An INTEGER value. When places is a positive integer, Vertica rounds the value to the right of the decimal point using the specified number of places. When places is a negative integer, Vertica rounds the value on the left side of the decimal point using the specified number of places. |

Notes

Using ROUND with a NUMERIC datatype returns NUMERIC, retaining the original precision and scale.

=> SELECT ROUND(3.5);
  ROUND
  -------
  4.0
(1 row)
Examples

=> SELECT ROUND(2.0, 1.0) FROM dual;
ROUND
-------
 2.0
(1 row)

=> SELECT ROUND(12.345, 2.0);
ROUND
-------
 12.350
(1 row)

=> SELECT ROUND(3.444444444444444);
ROUND
-------
 3.000000000000000
(1 row)

=> SELECT ROUND(3.14159, 3);
ROUND
-------
 3.14200
(1 row)

=> SELECT ROUND(1234567, -3);
ROUND
-------
 1235000
(1 row)

=> SELECT ROUND(3.4999, -1);
ROUND
-------
 0.0000
(1 row)

The following example creates a table with two columns, adds one row of values, and shows sample rounding to the left and right of a decimal point.

=> CREATE TABLE sampleround (roundcol1 NUMERIC, roundcol2 NUMERIC);
CREATE TABLE

=> INSERT INTO sampleround VALUES (1234567, .1234567);
OUTPUT
-------
 1
(1 row)

=> SELECT ROUND(roundcol1,-3) AS pn3, ROUND(roundcol1,-4) AS pn4, ROUND(roundcol1,-5) AS pn5 FROM sampleround;

<table>
<thead>
<tr>
<th>pn3</th>
<th>pn4</th>
<th>pn5</th>
</tr>
</thead>
<tbody>
<tr>
<td>1235000.000000000000000</td>
<td>1230000.000000000000000</td>
<td>1200000.000000000000000</td>
</tr>
</tbody>
</table>
(1 row)
=> SELECT ROUND(roundcol2,3) AS p3, ROUND(roundcol2,4) AS p4, ROUND(roundcol2,5) AS p5 FROM sampleround;

<table>
<thead>
<tr>
<th>p3</th>
<th>p4</th>
<th>p5</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.1230000000000</td>
<td>0.1235000000000</td>
<td>0.1234600000000</td>
</tr>
</tbody>
</table>

**SIGN**

Returns a DOUBLE PRECISION value of -1, 0, or 1 representing the arithmetic sign of the argument.

**Behavior Type**

Immutable

**Syntax**

SIGN (expression)

**Parameters**

<table>
<thead>
<tr>
<th>expression</th>
<th>Is an expression of type DOUBLE PRECISION</th>
</tr>
</thead>
</table>

**Examples**

```
SELECT SIGN(-8.4);
  sign
-------
  -1
(1 row)
```
SIN

Returns a DOUBLE PRECISION value that represents the trigonometric sine of the passed parameter.

Behavior Type

Immutable

Syntax

SIN ( expression )

Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>An expression of type DOUBLE PRECISION</th>
</tr>
</thead>
</table>

Example

```
SELECT SIN(30 * 2 * 3.14159 / 360);
SIN
-------------------
0.499999616987256
(1 row)
```

SINH

Returns a DOUBLE PRECISION value that represents the hyperbolic sine of the passed parameter.

Behavior Type

Immutable
**Syntax**

`SINH ( expression )`

**Parameters**

| expression | An expression of type DOUBLE PRECISION |

**Example**

```sql
=> SELECT SINH(30 * 2 * 3.14159 / 360);

SINH
----------------
0.547852969600632
```

**SQRT**

Returns a DOUBLE PRECISION value representing the arithmetic square root of the argument.

**Behavior Type**

**Immutable**

**Syntax**

`SQRT ( expression )`

**Parameters**

| expression | Is an expression of type DOUBLE PRECISION |
Examples

```
SELECT SQRT(2);
  sqrt
------------------
  1.4142135623731
(1 row)
```

TAN

Returns a DOUBLE PRECISION value that represents the trigonometric tangent of the passed parameter.

Behavior Type

Immutable

Syntax

```
TAN ( expression )
```

Parameters

```
expression | An expression of type DOUBLE PRECISION
```

Example

```
=> SELECT TAN(30);

TAN
------------------
-6.40533119664628
(1 row)
```
TANH

Returns a DOUBLE PRECISION value that represents the hyperbolic tangent of the passed parameter.

**Behavior Type**

Immutable

**Syntax**

TANH( expression )

**Parameters**

| expression | An expression of type DOUBLE PRECISION |

**Example**

```
=> SELECT TANH(-1);
  TANH
-----------------
-0.761594155955765
```

TRUNC

Returns the expression value fully truncated (toward zero). Supplying a places argument truncates the expression to the number of decimal places you indicate.

**Behavior Type**

Immutable
Syntax

TRUNC ( expression [, places ] )

Parameters

| expression | Is an expression of type NUMERIC or DOUBLE PRECISION (FLOAT). |
| places     | An INTEGER value. When places is a positive integer, Vertica truncates the value to the right of the decimal point. When places is a negative integer, Vertica truncates the value on the left side of the decimal point. |

Notes

Using TRUNC with a NUMERIC datatype returns NUMERIC, retaining the original precision and scale.

```sql
=> SELECT TRUNC(3.5);
  TRUNC
--------
  3.0
(1 row)
```

Examples

```sql
=> SELECT TRUNC(42.8);
  TRUNC
--------
  42.0
(1 row)

=> SELECT TRUNC(42.4382, 2);
  TRUNC
--------
  42.4300
(1 row)
```

The following example creates a table with two columns, adds one row of values, and shows sample truncating to the left and right of a decimal point.

```sql
=> CREATE TABLE sampletrunc (truncol1 NUMERIC, truncol2 NUMERIC);
CREATE TABLE
WIDTH_BUCKET

Constructs equiwidth histograms, in which the histogram range is divided into intervals (buckets) of identical sizes. In addition, values below the low bucket return 0, and values above the high bucket return bucket_count +1. Returns an integer value.

Behavior Type

Immutable

Syntax

WIDTH_BUCKET ( expression, hist_min, hist_max, bucket_count )

Parameters

expression  | The expression for which the histogram is created. This expression must evaluate to a numeric or datetime value or to a value that can be implicitly converted to a numeric or datetime value. If expression evaluates to null, then the expression returns null.
| **hist_min** | An expression that resolves to the low boundary of bucket 1. Must also evaluate to numeric or datetime values and cannot evaluate to null. |
| **hist_max** | An expression that resolves to the high boundary of bucket bucket_count. Must also evaluate to a numeric or datetime value and cannot evaluate to null. |
| **bucket_count** | An expression that resolves to a constant, indicating the number of buckets. This expression always evaluates to a positive INTEGER. |

**Notes**

- WIDTH_BUCKET divides a data set into buckets of equal width. For example, Age = 0–20, 20–40, 40–60, 60–80. This is known as an equiwidth histogram.
- When using WIDTH_BUCKET pay attention to the minimum and maximum boundary values. Each bucket contains values equal to or greater than the base value of that bucket, so that age ranges of 0–20, 20–40, and so on, are actually 0–19.99 and 20–39.999.
- WIDTH_BUCKET accepts the following data types: (FLOAT and/or INTEGER), (TIMESTAMP and/or DATE and/or TIMESTAMPTZ), or (INTERVAL and/or TIME).

**Examples**

The following example returns five possible values and has three buckets: 0 (Up to 100), 1 (100–300), 2 (300–500), 3 (500–700), and 4 (700 and up):

```sql
SELECT product_description, product_cost, WIDTH_BUCKET(product_cost, 100, 700, 3);
```

The following example creates a nine-bucket histogram on the annual_income column for customers in Connecticut who are female doctors. The results return the bucket number to an “Income” column, divided into eleven buckets, including an underflow and an overflow. Note that if customers had an annual incomes greater than the maximum value, they would be assigned to an overflow bucket, 10:

```sql
SELECT customer_name, annual_income, WIDTH_BUCKET(annual_income, 100000, 1000000, 9) AS "Income" FROM public.customer_dimension WHERE customer_state='CT' AND title='Dr.' AND customer_gender='Female' AND household_id < '1000' ORDER BY "Income";
```

In the following result set, the reason there is a bucket 0 is because buckets are numbered from 1 to bucket_count. Anything less than the given value of hist_min goes in bucket 0.
0, and anything greater than the given value of hist_max goes in the bucket bucket_count+1. In this example, bucket 9 is empty, and there is no overflow. The value 12,283 is less than 100,000, so it goes into the underflow bucket.

<table>
<thead>
<tr>
<th>customer_name</th>
<th>annual_income</th>
<th>Income</th>
</tr>
</thead>
<tbody>
<tr>

- NTILE [Analytic]
**NULL-handling Functions**

NULL-handling functions take arguments of any type, and their return type is based on their argument types.

**COALESCE**

Returns the value of the first non-null expression in the list. If all expressions evaluate to null, then COALESCE returns null.

COALESCE conforms to the ANSI SQL-92 standard.

**Behavior Type**

**Immutable**

**Syntax**

COALESCE ( { * | expression[,..] } )

**Arguments**

<table>
<thead>
<tr>
<th>*</th>
<th>expression[,..]</th>
<th>One of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>- * (asterisk)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Evaluates all columns in the queried table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- expression</td>
</tr>
<tr>
<td></td>
<td></td>
<td>An expression of any data type. Functions that are included in expression must be deterministic.</td>
</tr>
</tbody>
</table>
Example

COALESCE returns the first non-null value in each row that is queried from table lead_vocalists. Note that in the first row, COALESCE returns an empty string.

```
=> SELECT quote_nullable(fname) fname,
    quote_nullable(lname) lname,
    quote_nullable(coalesce (fname, lname)) "1st non-null value"
FROM lead_vocalists ORDER BY fname;

<table>
<thead>
<tr>
<th>fname</th>
<th>lname</th>
<th>1st non-null value</th>
</tr>
</thead>
<tbody>
<tr>
<td>''</td>
<td>''</td>
<td>''</td>
</tr>
<tr>
<td>'Diana'</td>
<td>'Ross'</td>
<td>'Diana'</td>
</tr>
<tr>
<td>'Grace'</td>
<td>'Slick'</td>
<td>'Grace'</td>
</tr>
<tr>
<td>'Mick'</td>
<td>'Jagger'</td>
<td>'Mick'</td>
</tr>
<tr>
<td>'Steve'</td>
<td>'Winwood'</td>
<td>'Steve'</td>
</tr>
<tr>
<td>NULL</td>
<td>'Cher'</td>
<td>'Cher'</td>
</tr>
</tbody>
</table>
```

- CASE Expressions
- ISNULL

IFNULL

Returns the value of the first non-null expression in the list.

IFNULL is an alias of NVL.

Behavior Type

Immutable

Syntax

```
IFNULL ( expression1 , expression2 )
```
Parameters

- If `expression1` is null, then `IFNULL` returns `expression2`.
- If `expression1` is not null, then `IFNULL` returns `expression1`.

Notes

- `COALESCE` is the more standard, more general function.
- `IFNULL` is equivalent to `ISNULL`.
- `IFNULL` is equivalent to `COALESCE` except that `IFNULL` is called with only two arguments.
- `ISNULL(a,b)` is different from `x IS NULL`.
- The arguments can have any data type supported by Vertica.
- Implementation is equivalent to the CASE expression. For example:

  ```sql
  CASE WHEN expression1 IS NULL THEN expression2
       ELSE expression1 END;
  ```

- The following statement returns the value 140:

  ```sql
  SELECT IFNULL(NULL, 140) FROM employee_dimension;
  ```

- The following statement returns the value 60:

  ```sql
  SELECT IFNULL(60, 90) FROM employee_dimension;
  ```

Examples

```sql
=> SELECT IFNULL(SCORE, 0.0) FROM TESTING;
IFNULL
-------
 100.0
 87.0
   .0
   .0
   .0
(5 rows)
```

- ISNULL

ISNULL

Returns the value of the first non-null expression in the list.

ISNULL is an alias of NVL.

Behavior Type

Immutable

Syntax

ISNULL ( expression1 , expression2 );

Parameters

- If expression1 is null, then ISNULL returns expression2.
- If expression1 is not null, then ISNULL returns expression1.

Notes

- COALESCE is the more standard, more general function.
- ISNULL is equivalent to COALESCE except that ISNULL is called with only two arguments.
- ISNULL(a,b) is different from x IS NULL.
- The arguments can have any data type supported by Vertica.
- Implementation is equivalent to the CASE expression. For example:

  CASE WHEN expression1 IS NULL THEN expression2
ELSE expression1 END;

- The following statement returns the value 140:

```
SELECT ISNULL(NULL, 140) FROM employee_dimension;
```

- The following statement returns the value 60:

```
SELECT ISNULL(60, 90) FROM employee_dimension;
```

### Examples

```
SELECT product_description, product_price,
       ISNULL(product_cost, 0.0) AS cost
FROM product_dimension;
```

<table>
<thead>
<tr>
<th>product_description</th>
<th>product_price</th>
<th>cost</th>
</tr>
</thead>
<tbody>

### NULLIF

Compares two expressions. If the expressions are not equal, the function returns the first expression (expression1). If the expressions are equal, the function returns null.

### Behavior Type

**Immutable**
Syntax

NULLIF( expression1, expression2 )

Parameters

<table>
<thead>
<tr>
<th>expression1</th>
<th>Is a value of any data type.</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression2</td>
<td>Must have the same data type as expr1 or a type that can be implicitly cast to match expression1. The result has the same type as expression1.</td>
</tr>
</tbody>
</table>

Examples

The following series of statements illustrates one simple use of the NULLIF function.

Creates a single-column table t and insert some values:

```
CREATE TABLE t (x TIMESTAMPTZ);
INSERT INTO t VALUES('2009-09-04 09:14:00-04');
INSERT INTO t VALUES('2010-09-04 09:14:00-04');
```

Issue a select statement:

```
SELECT x, NULLIF(x, '2009-09-04 09:14:00 EDT') FROM t;
```

```
x | nullif
---+---------
2009-09-04 09:14:00-04 | 2010-09-04 09:14:00-04
```

```
SELECT NULLIF(1, 2);
```

```
1 (1 row)
```

```
SELECT NULLIF(1, 1);
```

```
(1 row)
```

```
SELECT NULLIF(20.45, 50.80);
```

```
20.45 (1 row)
```
**NULLIFZERO**

Evaluates to NULL if the value in the column is 0.

**Syntax**

`NULLIFZERO(expression)`

**Parameters**

| expression | (INTEGER, DOUBLE PRECISION, INTERVAL, or NUMERIC) is the string to evaluate for 0 values. |

**Example**

The TESTING table below shows the test scores for 5 students. Note that test scores are missing for S. Robinson and K. Johnson (NULL values appear in the Score column.)

```sql
=> SELECT * FROM TESTING;
Name       | Score
---------- |-------
J. Doe     | 100
R. Smith   | 87
L. White   | 0
S. Robinson|       
K. Johnson |       
(5 rows)
```

The SELECT statement below specifies that Vertica should return any 0 values in the Score column as Null. In the results, you can see that Vertica returns L. White's 0 score as Null.

```sql
=> SELECT Name, NULLIFZERO(Score) FROM TESTING;
Name       | NULLIFZERO
---------- |------------
J. Doe     | 100
R. Smith   | 87
L. White   |            
S. Robinson|            
K. Johnson |            
(5 rows)
```
NVL

Returns the value of the first non-null expression in the list.

Behavior Type

Immutable

Syntax

NVL ( expression1, expression2 );

Parameters

- If expression1 is null, then NVL returns expression2.
- If expression1 is not null, then NVL returns expression1.

Notes

- COALESCE is the more standard, more general function.
- NVL is equivalent to COALESCE except that NVL is called with only two arguments.
- The arguments can have any data type supported by Vertica.
- Implementation is equivalent to the CASE expression:

  CASE WHEN expression1 IS NULL THEN expression2 ELSE expression1 END;

Examples

expression1 is not null, so NVL returns expression1:

```
SELECT NVL('fast', 'database');
nvl
------
 fast
(1 row)
```

expression1 is null, so NVL returns expression2:

```
SELECT NVL(null, 'database');
nvl
------
 database
(1 row)
```
SELECT NVL(null, 'database');

nvl
---------
database
(1 row)

eexpression2 is null, so NVL returns expression1:

SELECT NVL('fast', null);

nvl
------
fast
(1 row)

In the following example, expression1 (title) contains nulls, so NVL returns expression2 and substitutes 'Withheld' for the unknown values:

SELECT customer_name, NVL(title, 'Withheld') as title
FROM customer_dimension
ORDER BY title;

customer_name | title
---------------|--------
Alexander I. Lang | Dr.
Steve S. Harris | Dr.
Daniel R. King | Dr.
Luigi I. Sanchez | Dr.
Duncan U. Carcetti | Dr.
Meghan K. Li | Dr.
Laura B. Perkins | Dr.
Samantha V. Robinson | Dr.
Joseph P. Wilson | Mr.
Kevin R. Miller | Mr.
Lauren D. Nguyen | Mrs.
Emily E. Goldberg | Mrs.
Darlene K. Harris | Ms.
Meghan J. Farmer | Ms.
Bettercare | Withheld
Ameristar | Withheld
Initech | Withheld

(17 rows)

See Also

- CASE Expressions
- COALESCE
- ISNULL
- NVL2
NVL2

Takes three arguments. If the first argument is not NULL, it returns the second argument, otherwise it returns the third argument. The data types of the second and third arguments are implicitly cast to a common type if they don't agree, similar to COALESCE.

Behavior Type

Immutable

Syntax

NVL2 ( expression1, expression2, expression3 );

Parameters

- If expression1 is not null, then NVL2 returns expression2.
- If expression1 is null, then NVL2 returns expression3.

Notes

Arguments two and three can have any data type supported by Vertica.

Implementation is equivalent to the CASE expression:

    CASE WHEN expression1 IS NOT NULL THEN expression2 ELSE expression3 END;

Examples

In this example, expression1 is not null, so NVL2 returns expression2:

```
SELECT NVL2('very', 'fast', 'database');
nvl2
-------
  fast
(1 row)
```

In this example, expression1 is null, so NVL2 returns expression3:
SELECT `NVL2(null, 'fast', 'database');

nvl2
-----------
database
(1 row)

In the following example, expression1 (title) contains nulls, so NVL2 returns expression3 ('Withheld') and also substitutes the non-null values with the expression 'Known':

```
SELECT customer_name, NVL2(title, 'Known', 'Withheld') as title
FROM customer_dimension
ORDER BY title;
```

<table>
<thead>
<tr>
<th>customer_name</th>
<th>title</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alexander I. Lang</td>
<td>Known</td>
</tr>
<tr>
<td>Steve S. Harris</td>
<td>Known</td>
</tr>

- COALESCE

**ZEROIFNULL**

Evaluates to 0 if the column is NULL.

**Syntax**

```
ZEROIFNULL(expression)
```
Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>String to evaluate for NULL values, one of the following data types:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• INTEGER</td>
</tr>
<tr>
<td></td>
<td>• DOUBLE PRECISION</td>
</tr>
<tr>
<td></td>
<td>• INTERVAL</td>
</tr>
<tr>
<td></td>
<td>• NUMERIC</td>
</tr>
</tbody>
</table>

Examples

The following query returns scores for five students from table test_results, where Score is set to 0 for L. White, and null for S. Robinson and K. Johnson:

```sql
=> SELECT Name, Score FROM test_results;
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>J. Doe</td>
<td>100</td>
</tr>
<tr>
<td>R. Smith</td>
<td>87</td>
</tr>
<tr>
<td>L. White</td>
<td>0</td>
</tr>
<tr>
<td>S. Robinson</td>
<td></td>
</tr>
<tr>
<td>K. Johnson</td>
<td>0</td>
</tr>
</tbody>
</table>

(5 rows)

The next query invokes ZEROIFNULL on column Score, so Vertica returns 0 for S. Robinson and K. Johnson:

```sql
=> SELECT Name, ZEROIFNULL (Score) FROM test_results;
```

<table>
<thead>
<tr>
<th>Name</th>
<th>ZEROIFNULL</th>
</tr>
</thead>
<tbody>
<tr>
<td>J. Doe</td>
<td>100</td>
</tr>
<tr>
<td>R. Smith</td>
<td>87</td>
</tr>
<tr>
<td>L. White</td>
<td>0</td>
</tr>
<tr>
<td>S. Robinson</td>
<td>0</td>
</tr>
<tr>
<td>K. Johnson</td>
<td>0</td>
</tr>
</tbody>
</table>

(5 rows)

You can also use ZEROIFNULL in `PARTITION BY` expressions, which must always resolve to a non-null value. For example:

```sql
CREATE TABLE t1 (a int, b int) PARTITION BY (ZEROIFNULL(a));
```

Vertica invokes this function when it partitions table t1, typically during a load operation. During the load, the function checks the data of the PARTITION BY expression—in this
case, column a—for null values. If encounters a null value in a given row, it sets the partition key to 0, instead of returning with an error.
Pattern Matching Functions

Used with the MATCH Clause, the Vertica pattern matching functions return additional data about the patterns found/output. For example, you can use these functions to return values representing the name of the event or pattern that matched the input row, the sequential number of the match, or a partition-wide unique identifier for the instance of the pattern that matched.

Pattern matching is particularly useful for clickstream analysis where you might want to identify users' actions based on their Web browsing behavior (page clicks). A typical online clickstream funnel is:

Company home page -> product home page -> search -> results -> purchase online

Using the above clickstream funnel, you can search for a match on the user's sequence of web clicks and identify that the user:

- Landed on the company home page.
- Navigated to the product page.
- Ran a search.
- Clicked a link from the search results.
- Made a purchase.

For examples that use this clickstream model, see Event Series Pattern Matching.

**Note:**
GROUP BY and PARTITION BY expressions do not support window functions.

See Also

- MATCH Clause
- Event Series Pattern Matching

**EVENT_NAME**

Returns a VARCHAR value representing the name of the event that matched the row.
Syntax

EVENT_NAME()

Notes

Pattern matching functions must be used in MATCH Clause syntax; for example, if you call EVENT_NAME() on its own, Vertica returns the following error message:

```sql
=> SELECT event_name();
ERROR: query with pattern matching function event_name must include a MATCH clause
```

Example

Note:
This example uses the schema defined in Event Series Pattern Matching.

The following statement analyzes users' browsing history on website2.com and identifies patterns where the user landed on website2.com from another website (Entry) and browsed to any number of other pages (Onsite) before making a purchase (Purchase). The query also outputs the values for EVENT_NAME(), which is the name of the event that matched the row.

```sql
SELECT uid, sid, ts, refurl, pageurl, action, event_name()
FROM clickstream_log
MATCH (PARTITION BY uid, sid ORDER BY ts)
DEFINE
  Entry AS RefURL NOT ILIKE '%website2.com%' AND PageURL ILIKE '%website2.com%',
  Onsite AS PageURL ILIKE '%website2.com%' AND Action='V',
  Purchase AS PageURL ILIKE '%website2.com%' AND Action = 'P'
PATTERN
  P AS (Entry Onsite* Purchase)
ROWS MATCH FIRST EVENT);
```

```
uid | sid  | ts   | refurl          | pageurl              | action | event_name
--- | ---- | ---- | --------------- | ------------------- | ------ | ------------
1   | 100  | 12:00:00 | website1.com | website2.com/home | V      | Entry
1   | 100  | 12:01:00 | website2.com/home | website2.com/floby | V      | Onsite
1   | 100  | 12:02:00 | website2.com/floby | website2.com/shamwow | V      | Onsite
1   | 100  | 12:03:00 | website2.com/shamwow | website2.com/buy | P      | Purchase
```

- MATCH Clause
- MATCH_ID
- PATTERN_ID
- Event Series Pattern Matching

MATCH_ID

Returns a successful pattern match as an INTEGER value. The returned value is the ordinal position of a match within a partition.

Syntax

MATCH_ID()

Notes

Pattern matching functions must be used in MATCH Clause syntax; for example, if you call MATCH_ID() on its own, Vertica returns the following error message:

```sql
=> SELECT match_id();
ERROR:  query with pattern matching function match_id must include a MATCH clause
```

Example

Note:
This example uses the schema defined in Event Series Pattern Matching.

The following statement analyzes users' browsing history on a site called website2.com and identifies patterns where the user reached website2.com from another Web site (Entry in the MATCH clause) and browsed to any number of other pages (Onsite) before
making a purchase (Purchase). The query also outputs values for the MATCH_ID(), which represents a sequential number of the match.

```
SELECT uid, sid, ts, refurl, pageurl, action, match_id()
FROM clickstream_log
MATCH
(PARTITION BY uid, sid ORDER BY ts
DEFINE
   Entry AS RefURL NOT ILIKE '%website2.com%' AND PageURL ILIKE '%website2.com%',
   Onsite AS PageURL ILIKE '%website2.com%' AND Action='V',
   Purchase AS PageURL ILIKE '%website2.com%' AND Action = 'P'
PATTERN
   P AS (Entry Onsite* Purchase)
ROWS MATCH FIRST EVENT);
```

<table>

PATTERN_ID

Returns an integer value that is a partition-wide unique identifier for the instance of the pattern that matched.

Syntax

PATTERN_ID()
**Notes**

Pattern matching functions must be used in MATCH Clause syntax; for example, if call PATTERN_ID() on its own, Vertica returns the following error message:

```sql
=> SELECT pattern_id();
ERROR: query with pattern matching function pattern_id must include a MATCH clause
```

**Example**

**Note:**
This example uses the schema defined in Event Series Pattern Matching.

The following statement analyzes users' browsing history on website2.com and identifies patterns where the user landed on website2.com from another Web site (Entry) and browsed to any number of other pages (Onsite) before making a purchase (Purchase). The query also outputs values for PATTERN_ID(), which represents the partition-wide identifier for the instance of the pattern that matched.

```sql
SELECT uid, sid, ts, refurl, pageurl, action, pattern_id()
FROM clickstream_log
MATCH (PARTITION BY uid, sid ORDER BY ts
DEFINE
  Entry AS RefURL NOT ILIKE '%website2.com%' AND PageURL ILIKE '%website2.com%','
  Onsite AS PageURL ILIKE '%website2.com%' AND Action='V',
  Purchase AS PageURL ILIKE '%website2.com%' AND Action = 'P'
PATTERN
  P AS (Entry Onsite* Purchase)
ROWS MATCH FIRST EVENT);
```

Regular Expression Functions

A regular expression lets you perform pattern matching on strings of characters. The regular expression syntax allows you to precisely define the pattern used to match strings, giving you much greater control than wildcard matching used in the LIKE predicate. The Vertica regular expression functions let you perform tasks such as determining if a string value matches a pattern, extracting a portion of a string that matches a pattern, or counting the number of times a pattern occurs within a string.

Vertica uses the Perl Compatible Regular Expression (PCRE) library to evaluate regular expressions. As its name implies, PCRE's regular expression syntax is compatible with the syntax used by the Perl 5 programming language. You can read PCRE's documentation about its library. However, if you are unfamiliar with using regular expressions, the Perl Regular Expressions Documentation is a good introduction.

Note:
The regular expression functions only operate on valid UTF-8 strings. If you try using a regular expression function on a string that is not valid UTF-8, the query fails with an error. To prevent an error from occurring, use the ISUTF8 function as an initial clause to ensure the strings you pass to the regular expression functions are valid UTF-8 strings. Alternatively, or you can use the 'b' argument to treat the strings as binary octets, rather than UTF-8 encoded strings.

ISUTF8

Tests whether a string is a valid UTF-8 string. Returns true if the string conforms to UTF-8 standards, and false otherwise. This function is useful to test strings for UTF-8 compliance before passing them to one of the regular expression functions, such as REGEXP_LIKE, which expect UTF-8 characters by default.

ISUTF8 checks for invalid UTF8 byte sequences, according to UTF-8 rules:

- invalid bytes
- an unexpected continuation byte
- a start byte not followed by enough continuation bytes
- an Overload Encoding
The presence of an invalid UTF-8 byte sequence results in a return value of false.

To coerce a string to UTF-8, use MAKEUTF8.

**Syntax**

```sql
ISUTF8( string );
```

**Parameters**

| string | The string to test for UTF-8 compliance. |

**Examples**

```sql
=> SELECT ISUTF8('£'); -- UTF-8 INVERTED QUESTION MARK ISUTF8
  t
  (1 row)
=> SELECT ISUTF8('€'); -- UNDEFINED UTF-8 CHARACTER
  f
  (1 row)
```

**REGEXP_COUNT**

Returns the number times a regular expression matches a string.

This function operates on UTF-8 strings using the default locale, even if the locale is set otherwise.

*Important:*

If you port a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

**Syntax**

```sql
REGEXP_COUNT ( string-expression, pattern [, position [, regexp-modifier ]... ] )
```
# Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>string-expression</code></td>
<td>The VARCHAR or LONG VARCHAR expression to evaluate for matches with the regular expression specified in <code>pattern</code>. If <code>string-expression</code> is in the <code>_raw_</code> column of a flex or columnar table, cast the string to a LONG VARCHAR before searching for <code>pattern</code>.</td>
</tr>
<tr>
<td><code>pattern</code></td>
<td>The regular expression to match against <code>string-expression</code>. The regular expression must conform with Perl regular expression syntax.</td>
</tr>
<tr>
<td><code>position</code></td>
<td>The number of characters from the start of the string where the function should start searching for matches. By default, the function begins searching for a match at the first (leftmost) character. Setting this parameter to a value greater than 1 begins searching for a match at the <code>n</code>th character you specify. Default: 1</td>
</tr>
</tbody>
</table>
| `regexp-modifier` | One or more single-character flags that modify how the regular expression `pattern` is matched to `string-expression`:

- **b**: Treat strings as binary octets, rather than UTF-8 characters.
- **c** (default): Force the match to be case sensitive.
- **i**: Force the match to be case insensitive.
- **m**: Treat the string to match as multiple lines. Using this modifier, the start of line (^) and end of line ($) regular expression operators match line breaks (\n) within the string. Without the `m` modifier, the start and end of line operators match only the start and end of the string.
- **n**: Match the regular expression operator (.) to a newline (\n). By default, the . operator matches any character except a newline.
- **x**: Add comments to regular expressions. The `x` modifier causes the function to ignore all un-escaped space characters and comments in the regular expression. Comments start with hash (#) and end with a newline (\n). All spaces in the regular expression to be matched in strings must be escaped with a backslash (\).
Examples

Count the number of occurrences of the substring an in the specified string (a man, a plan, a canal: Panama):

```sql
=> SELECT REGEXP_COUNT('a man, a plan, a canal: Panama', 'an');
REGEXP_COUNT
-----------
 4
(1 row)
```

Find the number of occurrences of the substring an, starting with the fifth character.

```sql
=> SELECT REGEXP_COUNT('a man, a plan, a canal: Panama', 'an', 5);
REGEXP_COUNT
----------
 3
(1 row)
```

Find the number of occurrences of a substring containing a lower-case character followed by an:

```sql
=> SELECT REGEXP_COUNT('a man, a plan, a canal: Panama', '[a-z]an');
REGEXP_COUNT
----------
 3
(1 row)
```

REGEXP_COUNT specifies the i modifier, so it ignores case:

```sql
=> SELECT REGEXP_COUNT('a man, a plan, a canal: Panama', '[a-z]an', 1, 'i');
REGEXP_COUNT
-----------
 4
```

**REGEXP_ILIKE**

Returns true if the string contains a match for the regular expression. REGEXP_ILIKE is similar to the LIKE predicate, except that it uses a case insensitive regular expression, rather than simple wildcard character matching.

This function operates on UTF-8 strings using the default locale, even if the locale is set otherwise.
Important:
If you port a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

Syntax

REGEXP_ILIKE ( string-expression, pattern )

Parameters

<table>
<thead>
<tr>
<th>string-expression</th>
<th>The VARCHAR or LONG VARCHAR expression to evaluate for matches with the regular expression specified in pattern. If string-expression is in the <strong>raw</strong> column of a flex or columnar table, cast the string to a LONG VARCHAR before searching for pattern.</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern</td>
<td>The regular expression to match against string-expression. The regular expression must conform with Perl regular expression syntax.</td>
</tr>
</tbody>
</table>

Examples

This example creates a table containing several strings to demonstrate regular expressions.

1. Create table longvc with a single, long varchar column body, and insert data with distinct characters:

```
=> CREATE table longvc(body long varchar (1048576));
CREATE TABLE
=> insert into longvc values ('На берегу пустынных волн');
=> insert into longvc values ('Voin syödä lasia, se ei vahingoita minua');
=> insert into longvc values ('私はガラスを食べられます。それは私を傷つけません。');
=> insert into longvc values ('Je peux manger du verre, ça ne me fait pas mal.');
=> insert into longvc values (' zesbaésbaa' );
=> insert into longvc values ('Out of the frying pan, he landed immediately in the fire');
=> SELECT * FROM longvc;

<table>
<thead>
<tr>
<th>body</th>
</tr>
</thead>
<tbody>
<tr>
<td>-------------------</td>
</tr>
<tr>
<td>Na beregu putstynnyh voln</td>
</tr>
<tr>
<td>Voin syodai lasia, se ei vahingoita minua</td>
</tr>
</tbody>
</table>
```
2. Pattern match table rows containing the character ç:

```sql
=> SELECT * FROM longvc where regexp_ilike(body, 'ç');

<table>
<thead>
<tr>
<th>body</th>
</tr>
</thead>
</table>
| Je peux manger du verre, ça ne me fait pas mal.
|---------------------------------------------|

(1 row)
```

3. Select all rows that contain the characters A/a:

```sql
=> SELECT * FROM longvc where regexp_ilike(body, 'A');

<table>
<thead>
<tr>
<th>body</th>
</tr>
</thead>
</table>
| Je peux manger du verre, ça ne me fait pas mal.
| Voin syödä lasia, se ei vahingoita minua
|---------------------------------------------|

(3 rows)
```

4. Select all rows that contain the characters O/o:

```sql
=> SELECT * FROM longvc where regexp_ilike(body, 'O');

<table>
<thead>
<tr>
<th>body</th>
</tr>
</thead>
</table>
| Voin syödä lasia, se ei vahingoita minua
| Out of the frying pan, he landed immediately in the fire
|---------------------------------------------|

(2 rows)
```

**REGEXP_INSTR**

Returns the starting or ending position in a string where a regular expression matches. REGEXP_INSTR returns 0 if no match for the regular expression is found in the string.

This function operates on UTF-8 strings using the default locale, even if the locale is set otherwise.

**Important:**
If you port a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.
Syntax

`REGEXP_INSTR (string-expression, pattern [, position [, occurrence [, return-position [, regexp-modifier ]... [, captured-subexp ]]]])`  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>string-expression</code></td>
<td>The VARCHAR or LONG VARCHAR expression to evaluate for matches with the regular expression specified in <code>pattern</code>. If <code>string-expression</code> is in the <code>__raw__</code> column of a flex or columnar table, cast the string to a LONG VARCHAR before searching for <code>pattern</code>.</td>
</tr>
<tr>
<td><code>pattern</code></td>
<td>The regular expression to match against <code>string-expression</code>. The regular expression must conform with <a href="https://www.perl.com/pod/perlfunc.html#%40%22%40%40">Perl regular expression syntax</a>.</td>
</tr>
</tbody>
</table>
| `position` | The number of characters from the start of the string where the function should start searching for matches. By default, the function begins searching for a match at the first (leftmost) character. Setting this parameter to a value greater than 1 begins searching for a match at the `n`th character you specify.  

**Default:** 1 |
| `occurrence` | Controls which occurrence of a pattern match in the string to return. By default, the function returns the position of the first matching substring. Use this parameter to find the position of subsequent matching substrings. For example, setting this parameter to 3 returns the position of the third substring that matches the pattern.  

**Default:** 1 |
| `return-position` | Sets the position within the string to return. Using the default position (0), the function returns the string position of the first character of the substring that matches the pattern. If you set `return-position` to 1, the function returns the position of the first character after the end of the matching substring.  

**Default:** 0 |
**regexp-modifier**

One or more single-character flags that modify how the regular expression pattern is matched to string-expression:

- **b**: Treat strings as binary octets, rather than UTF-8 characters.
- **c** (default): Force the match to be case sensitive.
- **i**: Force the match to be case insensitive.
- **m**: Treat the string to match as multiple lines. Using this modifier, the start of line (^) and end of line ($) regular expression operators match line breaks (\n) within the string. Without the m modifier, the start and end of line operators match only the start and end of the string.
- **n**: Match the regular expression operator (.) to a newline (\n). By default, the . operator matches any character except a newline.
- **x**: Add comments to regular expressions. The x modifier causes the function to ignore all un-escaped space characters and comments in the regular expression. Comments start with hash (#) and end with a newline (\n). All spaces in the regular expression to be matched in strings must be escaped with a backslash (\).

**captured-subexp**

The captured subexpression whose position to return. By default, the function returns the position of the first character in string that matches the regular expression. If you set this value from 1 – 9, the function returns the subexpression captured by the corresponding set of parentheses in the regular expression. For example, setting this value to 3 returns the substring captured by the third set of parentheses in the regular expression.

**Default**: 0

**Note:**

The subexpressions are numbered left to right, based on the appearance of opening parenthesis, so nested regular expressions. For example, in the regular expression `\s* (\w+\s+ (\w+))`, subexpression 1 is the one that captures everything but any leading whitespaces.
Examples

Find the first occurrence of a sequence of letters starting with the letter e and ending with the letter y in the specified string (easy come, easy go).

```sql
=> SELECT REGEXP_INSTR('easy come, easy go','e\w*y');
REGEXP_INSTR(1)
---
 1
(1 row)
```

Starting at the second character (2), find the first sequence of letters starting with the letter e and ending with the letter y:

```sql
=> SELECT REGEXP_INSTR('easy come, easy go','e\w*y',2);
REGEXP_INSTR(1)
---
 12
(1 row)
```

Starting at the first character (1), find the second sequence of letters starting with the letter e and ending with the letter y:

```sql
=> SELECT REGEXP_INSTR('easy come, easy go','e\w*y',1,2);
REGEXP_INSTR(1)
---
 12
(1 row)
```

Find the position of the first character after the first whitespace:

```sql
=> SELECT REGEXP_INSTR('easy come, easy go','\s',1,1,1);
REGEXP_INSTR(1)
---
 6
(1 row)
```

Find the position of the start of the third word in a string by capturing each word as a subexpression, and returning the third subexpression's start position.

```sql
=> SELECT REGEXP_INSTR('one two three','(\w+)\s+(\w+)\s+(\w+)',1,1,0,'',3);
REGEXP_INSTR(1)
---
 9
(1 row)
```
REGEXP_LIKE

Returns true if the string matches the regular expression. REGEXP_LIKE is similar to the LIKE predicate, except that it uses regular expressions rather than simple wildcard character matching.

This function operates on UTF-8 strings using the default locale, even if the locale is set otherwise.

Important:
If you port a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

Syntax

```
REGEXP_LIKE ( string-expression, pattern [, regexp-modifier ].. )
```

Parameters

<table>
<thead>
<tr>
<th>string-expression</th>
<th>The VARCHAR or LONG VARCHAR expression to evaluate for matches with the regular expression specified in <code>pattern</code>. If <code>string-expression</code> is in the <code>__raw__</code> column of a flex or columnar table, cast the string to a LONG VARCHAR before searching for <code>pattern</code>.</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern</td>
<td>The regular expression to match against <code>string-expression</code>. The regular expression must conform with Perl regular expression syntax.</td>
</tr>
</tbody>
</table>
| regexp-modifier   | One or more single-character flags that modify how the regular expression `pattern` is matched to `string-expression`:

  - `b`: Treat strings as binary octets, rather than UTF-8 characters.
  - `c` (default): Force the match to be case sensitive.
  - `i`: Force the match to be case insensitive.
  - `m`: Treat the string to match as multiple lines. Using this flag causes `pattern` to be treated as a multiple-line pattern. |

modifier, the start of line (^) and end of line ($) regular expression operators match line breaks (\n) within the string. Without the m modifier, the start and end of line operators match only the start and end of the string.

- n: Match the regular expression operator (.) to a newline (\n). By default, the . operator matches any character except a newline.
- x: Add comments to regular expressions. The x modifier causes the function to ignore all un-escaped space characters and comments in the regular expression. Comments start with hash (#) and end with a newline (\n). All spaces in the regular expression to be matched in strings must be escaped with a backslash (\).

**Examples**

Create a table that contains several strings:

```sql
=> CREATE TABLE t (v VARCHAR);
CREATE TABLE
=> CREATE PROJECTION t1 AS SELECT * FROM t;
CREATE PROJECTION
=> COPY t FROM stdin;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> aaa
>> Aaa
>> abc
>> abc1
>> 123
>> 
=> SELECT * FROM t;
v
-------
  aaa
  Aaa
  abc
  abc1
  123
(5 rows)
```

Select all records from table t that contain the letter a:

```sql
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'a');
v
------
  Aaa
  aaa
  abc
```
Select all rows from table t that start with the letter a:

```sql
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'^a');
   v
    -----
    aaa
    abc
    abc1
   (3 rows)
```

Select all rows that contain the substring aa:

```sql
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'aa');
   v
    -----
    Aaa
    aaa
   (2 rows)
```

Select all rows that contain a digit.

```sql
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'\d');
   v
    -----
    123
    abc1
   (2 rows)
```

Select all rows that contain the substring aaa.

```sql
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'aaa');
   v
    -----
    aaa
   (1 row)
```

Select all rows that contain the substring aaa using case-insensitive matching.

```sql
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'aaa', 'i');
   v
    -----
    Aaa
    aaa
   (2 rows)
```

Select rows that contain the substring a b c.

```sql
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'a b c');
   v
```
Select rows that contain the substring `a b c`, ignoring space within the regular expression.

```sql
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'a b c','x');
  v
  ------
  abc
  abc1
(2 rows)
```

Add multi-line rows to table `t`:

```sql
=> COPY t FROM stdin RECORD TERMINATOR '!';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
  >> Record 1 line 1
  >> Record 1 line 2
  >> Record 1 line 3!
  >> Record 2 line 1
  >> Record 2 line 2
  >> Record 2 line 3!
  >> \.
```

Select rows from table `t` that start with the substring `Record` and end with the substring `line 2`.

```sql
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'^Record.*line 2$');
  v
  ---
(0 rows)
```

Select rows that start with the substring `Record` and end with the substring `line 2`, treating multiple lines as separate strings.

```sql
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'^Record.*line 2$','m');
  v
    ----------------------------
  Record 2 line 1
  Record 2 line 2
  Record 2 line 3
  Record 1 line 1
  Record 1 line 2
  Record 1 line 3
(2 rows)
```
REGEXP_NOT_ILIKE

Returns true if the string does not match the case-insensitive regular expression. This function operates on UTF-8 strings using the default locale, even if the locale is set otherwise.

Important:
If you port a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

Syntax

REGEXP_NOT_ILIKE ( string-expression, pattern )

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string-expression</td>
<td>The VARCHAR or LONG VARCHAR expression to evaluate for matches with the regular expression specified in pattern. If string-expression is in the <strong>raw</strong> column of a flex or columnar table, cast the string to a LONG VARCHAR before searching for pattern.</td>
</tr>
<tr>
<td>pattern</td>
<td>The regular expression to match against string-expression. The regular expression must conform with Perl regular expression syntax.</td>
</tr>
</tbody>
</table>

Examples

1. Create a table (longvc) with a single, long varchar column (body). Then, insert data with some distinct characters, and query the table contents:

```sql
=> CREATE table longvc(body long varchar (1048576));
CREATE TABLE
=> insert into longvc values ('На берегу пустынных волн');
=> insert into longvc values ('Voin syödä lasia, se ei vahingoita minua');
```
== insert into longvc values ('私はガラスを食べられます。それは私は傷つけません。'); ==
== insert into longvc values ('Je peux manger du verre, ça ne me fait pas mal.'); ==
== insert into longvc values ('zésbaésbaa'); ==
== SELECT * FROM longvc; ==

<table>
<thead>
<tr>
<th>Na берегу пустынных волн</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voin syödä lasia, se ei vahingoita minua</td>
</tr>
<tr>
<td>zésbaésbaa</td>
</tr>
<tr>
<td>(5 rows)</td>
</tr>
</tbody>
</table>

2. Find all rows that do not contain the character ç:

== SELECT * FROM longvc where regexp_not_ilike(body, 'ç'); ==

<table>
<thead>
<tr>
<th>Na берегу пустынных волн</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voin syödä lasia, se ei vahingoita minua</td>
</tr>
<tr>
<td>(4)</td>
</tr>
</tbody>
</table>

3. Find all rows that do not contain the substring a:

== SELECT * FROM longvc where regexp_not_ilike(body, 'a'); ==

<table>
<thead>
<tr>
<th>Na берегу пустынных волн</th>
</tr>
</thead>
<tbody>
<tr>
<td>(2)</td>
</tr>
</tbody>
</table>

**REGEXP_NOT_LIKE**

Returns true if the string does not contain a match for the regular expression. REGEXP_NOT_LIKE is a case sensitive regular expression.

This function operates on UTF-8 strings using the default locale, even if the locale is set otherwise.

**Important:**
If you port a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.
Syntax

REGEXP_NOT_LIKE ( string-expression, pattern )

Parameters

<table>
<thead>
<tr>
<th>string-expression</th>
<th>The VARCHAR or LONG VARCHAR expression to evaluate for matches with the regular expression specified in pattern. If string-expression is in the <strong>raw</strong> column of a flex or columnar table, cast the string to a LONG VARCHAR before searching for pattern.</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern</td>
<td>The regular expression to match against string-expression. The regular expression must conform with Perl regular expression syntax.</td>
</tr>
</tbody>
</table>

Examples

1. Create a table (longvc) with the LONG VARCHAR column body. Then, insert data with some distinct characters and query the table contents:

   ```sql
   => CREATE table longvc(body long varchar (1048576));
   CREATE TABLE
   => insert into longvc values ('На берегу пустынных волн');
   => insert into longvc values ('Voin syödä lasia, se ei vahingoita minua');
   => insert into longvc values ('私はガラスを食べます。それは私は傷つけません。');
   => insert into longvc values ('Je peux manger du verre, ça ne me fait pas mal.');
   => insert into longvc values ('zésbaésbaa');
   => SELECT * FROM longvc;
   body
   ---------------------------------------------
   На берегу пустынных волн
   Voin syödä lasia, se ei vahingoita minua
   私はガラスを食べます。それは私は傷つけません。
   Je peux manger du verre, ça ne me fait pas mal.
   zésbaésbaa
   (5 rows)
   
2. Use REGEXP_NOT_LIKE to return rows that do not contain the character ç:

   ```sql
   => SELECT * FROM longvc where regexp_not_like(body, 'ç');
   body
   ---------------------------------------------
   Voin syödä lasia, se ei vahingoita minua
<table>
<thead>
<tr>
<th>3. Return all rows that do not contain the characters &quot;ö&quot; and &quot;ä&quot;:</th>
</tr>
</thead>
<tbody>
<tr>
<td>=&gt; SELECT * FROM longvc where regexp_not_like(body, '.*ö.*ä');</td>
</tr>
<tr>
<td>body</td>
</tr>
<tr>
<td>Je peux manger du verre, ça ne me fait pas mal.</td>
</tr>
<tr>
<td>zésbaésbaa</td>
</tr>
<tr>
<td>На берегу пустынных волн</td>
</tr>
<tr>
<td>私自ガラスを食べられます。それは私が傷つけません。</td>
</tr>
<tr>
<td>(4 rows)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>4. Pattern match all rows that do not contain the characters &quot;z&quot; and &quot;ešbaa&quot;:</th>
</tr>
</thead>
<tbody>
<tr>
<td>=&gt; SELECT * FROM longvc where regexp_not_like(body, 'z.*ešbaa');</td>
</tr>
<tr>
<td>body</td>
</tr>
<tr>
<td>Je peux manger du verre, ça ne me fait pas mal.</td>
</tr>
<tr>
<td>Voin syödä lasia, se ei vahingoita minua</td>
</tr>
<tr>
<td>zésbaésbaa</td>
</tr>
<tr>
<td>На берегу пустынных волн</td>
</tr>
<tr>
<td>私自ガラスを食べられます。それは私が傷つけません。</td>
</tr>
<tr>
<td>(5 rows)</td>
</tr>
</tbody>
</table>

**REGEXP_REPLACE**

Replaces all occurrences of a substring that match a regular expression with another substring. REGEXP_REPLACE is similar to the REPLACE function, except it uses a regular expression to select the substring to be replaced.

This function operates on UTF-8 strings using the default locale, even if the locale is set otherwise.

ℹ️ **Important:**

If you port a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

### Syntax

```
REGEXP_REPLACE ( string-expression, target
    [, replacement [, position [, occurrence[...]] [, regexp-modifier]]])
```
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string-expression</td>
<td>The VARCHAR or LONG VARCHAR expression to evaluate for matches with the regular expression specified in pattern. If string-expression is in the <strong>raw</strong> column of a flex or columnar table, cast the string to a LONG VARCHAR before searching for pattern.</td>
</tr>
<tr>
<td>pattern</td>
<td>The regular expression to match against string-expression. The regular expression must conform with Perl regular expression syntax.</td>
</tr>
<tr>
<td>replacement</td>
<td>The string to replace matched substrings. If you do not supply a replacement, the function deletes matched substrings. The replacement string can contain backreferences for substrings captured by the regular expression. The first captured substring is inserted into the replacement string using \1, the second \2, and so on.</td>
</tr>
<tr>
<td>position</td>
<td>The number of characters from the start of the string where the function should start searching for matches. By default, the function begins searching for a match at the first (leftmost) character. Setting this parameter to a value greater than 1 begins searching for a match at the n-th character you specify. Default: 1</td>
</tr>
<tr>
<td>occurrence</td>
<td>Controls which occurrence of a pattern match in the string to return. By default, the function returns the position of the first matching substring. Use this parameter to find the position of subsequent matching substrings. For example, setting this parameter to 3 returns the position of the third substring that matches the pattern. Default: 1</td>
</tr>
<tr>
<td>regexp-modifier</td>
<td>One or more single-character flags that modify how the regular expression pattern is matched to string-expression:</td>
</tr>
<tr>
<td></td>
<td>* b: Treat strings as binary octets, rather than UTF-8 characters.</td>
</tr>
<tr>
<td></td>
<td>* c (default): Force the match to be case sensitive.</td>
</tr>
</tbody>
</table>
- i: Force the match to be case insensitive.
- m: Treat the string to match as multiple lines. Using this modifier, the start of line (^) and end of line ($) regular expression operators match line breaks (\n) within the string. Without the m modifier, the start and end of line operators match only the start and end of the string.
- n: Match the regular expression operator (.) to a newline (\n). By default, the . operator matches any character except a newline.
- x: Add comments to regular expressions. The x modifier causes the function to ignore all un-escaped space characters and comments in the regular expression. Comments start with hash (#) and end with a newline (\n). All spaces in the regular expression to be matched in strings must be escaped with a backslash (\).

**How Oracle Handles Subexpressions**

Unlike Oracle, Vertica can handle an unlimited number of captured subexpressions, while Oracle is limited to nine.

In Vertica, you can use \10 in the replacement pattern to access the substring captured by the tenth set of parentheses in the regular expression. In Oracle, \10 is treated as the substring captured by the first set of parentheses, followed by a zero. To force this Oracle behavior in Vertica, use the \g back reference and enclose the number of the captured subexpression in curly braces. For example, \g{1}0 is the substring captured by the first set of parentheses followed by a zero.

You can also name captured subexpressions to make your regular expressions less ambiguous. See the PCRE documentation for details.

**Examples**

Find groups of word characters—letters, numbers and underscore—that end with thy in the string healthy, wealthy, and wise, and replace them with nothing.

```sql
=> SELECT REGEXP_REPLACE('healthy, wealthy, and wise','\w+thy');
REGEXP_REPLACE
-------------
, , and wise
```
Find groups of word characters ending with thy and replace with the string something.

```sql
=> SELECT REGEXP_REPLACE('healthy, wealthy, and wise','\w+thy', 'something');
REGEXP_REPLACE
something, something, and wise
(1 row)
```

Find groups of word characters ending with thy and replace with the string something starting at the third character in the string.

```sql
=> SELECT REGEXP_REPLACE('healthy, wealthy, and wise','\w+thy', 'something', 3);
REGEXP_REPLACE
hesomething, something, and wise
(1 row)
```

Replace the second group of word characters ending with thy with the string something.

```sql
=> SELECT REGEXP_REPLACE('healthy, wealthy, and wise','\w+thy', 'something', 1, 2);
REGEXP_REPLACE
healthy, something, and wise
(1 row)
```

Find groups of word characters ending with thy capturing the letters before the thy, and replace with the captured letters plus the letters ish.

```sql
=> SELECT REGEXP_REPLACE('healthy, wealthy, and wise', '(\w+)thy', '\1ish');
REGEXP_REPLACE
healish, wealish, and wise
(1 row)
```

Create a table to demonstrate replacing strings in a query.

```sql
=> CREATE TABLE customers (name varchar(50), phone varchar(11));
CREATE TABLE
=> CREATE PROJECTION customers1 AS SELECT * FROM customers;
CREATE PROJECTION
=> COPY customers FROM stdin;
Enter data to be copied followed by a newline. End with a backslash and a period on a line by itself.
>> Able, Adam|17815551234
>> Baker, Bob|18005551111
>> Chu, Cindy|16175559876
>> Dodd, Dinara|15083452121
>> .
```

Query the customers, using REGEXP_REPLACE to format phone numbers.
SELECT name, REGEXP_REPLACE(phone, '(\d)(\d)(\d)(\d)', '\1-(\2)\3-\4') as phone FROM customers;

<table>
<thead>
<tr>
<th>name</th>
<th>phone</th>
</tr>
</thead>
<tbody>
<tr>
<td>Able, Adam</td>
<td>1-(781) 555-1234</td>
</tr>
<tr>
<td>Baker, Bob</td>
<td>1-(800) 555-1111</td>
</tr>
<tr>
<td>Chu, Cindy</td>
<td>1-(617) 555-9876</td>
</tr>
<tr>
<td>Dodd, Dinara</td>
<td>1-(508) 345-2121</td>
</tr>
</tbody>
</table>

**REGEXP_SUBSTR**

Returns the substring that matches a regular expression within a string. If no matches are found, REGEXP_SUBSTR returns NULL. This is different from an empty string, which the function can return if the regular expression matches a zero-length string.

This function operates on UTF-8 strings using the default locale, even if the locale is set otherwise.

**Important:**
If you port a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

**Syntax**

REGEXP_SUBSTR (string-expression, pattern

[, position [, occurrence [, regexp-modifier [, captured-subexp ]]... ]])

**Parameters**

<table>
<thead>
<tr>
<th>string-expression</th>
<th>The VARCHAR or LONG VARCHAR expression to evaluate for matches with the regular expression specified in pattern. If string-expression is in the <strong>raw</strong> column of a flex or columnar table, cast the string to a LONG VARCHAR before searching for pattern.</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern</td>
<td>The regular expression to match against string-expression. The regular expression must conform with Perl regular expression syntax.</td>
</tr>
</tbody>
</table>
| **position** | The number of characters from the start of the string where the function should start searching for matches. By default, the function begins searching for a match at the first (leftmost) character. Setting this parameter to a value greater than 1 begins searching for a match at the n<sup>th</sup> character you specify.  
**Default:** 1 |
| **occurrence** | Controls which occurrence of a pattern match in the string to return. By default, the function returns the position of the first matching substring. Use this parameter to find the position of subsequent matching substrings. For example, setting this parameter to 3 returns the position of the third substring that matches the pattern.  
**Default:** 1 |
| **regexp-modifier** | One or more single-character flags that modify how the regular expression pattern is matched to string-expression:  
- b: Treat strings as binary octets, rather than UTF-8 characters.  
- c (default): Force the match to be case sensitive.  
- i: Force the match to be case insensitive.  
- m: Treat the string to match as multiple lines. Using this modifier, the start of line (^) and end of line ($) regular expression operators match line breaks (\n) within the string. Without the m modifier, the start and end of line operators match only the start and end of the string.  
- n: Match the regular expression operator (.) to a newline (\n). By default, the . operator matches any character except a newline.  
- x: Add comments to regular expressions. The x modifier causes the function to ignore all un-escaped space characters and comments in the regular expression. Comments start with hash (#) and end with a newline (\n). All spaces in the regular expression to be matched in strings must be escaped with a backslash (\). |
| **captured-subexp** | The captured subexpression whose position to return. By default, the function returns the position of the first character in string that matches the regular expression. If you set this value from 1 – 9, the function returns the subexpression |
captured by the corresponding set of parentheses in the regular expression. For example, setting this value to 3 returns the substring captured by the third set of parentheses in the regular expression.

**Default:** 0

**Note:**
The subexpressions are numbered left to right, based on the appearance of opening parenthesis, so nested regular expressions. For example, in the regular expression \s*\(\w+\s+\(\w+\)\), subexpression 1 is the one that captures everything but any leading whitespaces.

### Examples

Select the first substring of letters that end with thy.

```sql
=> SELECT REGEXP_SUBSTR('healthy, wealthy, and wise','\w+thy');
REGEXP_SUBSTR
---------------
healthy
(1 row)
```

Select the first substring of letters that ends with thy starting at the second character in the string.

```sql
=> SELECT REGEXP_SUBSTR('healthy, wealthy, and wise','\w+thy',2);
REGEXP_SUBSTR
---------------
ealthy
(1 row)
```

Select the second substring of letters that ends with thy.

```sql
=> SELECT REGEXP_SUBSTR('healthy, wealthy, and wise','\w+thy',1,2);
REGEXP_SUBSTR
---------------
wealthy
(1 row)
```

Return the contents of the third captured subexpression, which captures the third word in the string.

```sql
=> SELECT REGEXP_SUBSTR('one two three', '(\w+)\s+(\w+)\s+(\w+)', 1, 1, '', 3);
```
<table>
<thead>
<tr>
<th>REGEXP_SUBSTR</th>
</tr>
</thead>
<tbody>
<tr>
<td>three</td>
</tr>
<tr>
<td>(1 row)</td>
</tr>
</tbody>
</table>
Sequence Functions

The sequence functions provide simple, multiuser-safe methods for obtaining successive sequence values from sequence objects.

CURRVAL

Returns the last value across all nodes that was set by NEXTVAL on this sequence in the current session. If NEXTVAL was never called on this sequence since its creation, Vertica returns an error.

Syntax

CURRVAL ('[[database.]schema.]sequence-name')

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject</td>
</tr>
<tr>
<td>sequence-name</td>
<td>The target sequence</td>
</tr>
</tbody>
</table>

Privileges

- SELECT privilege on sequence
- USAGE privilege on sequence schema
Restrictions

You cannot invoke CURRVAL in a SELECT statement, in the following contexts:

- WHERE clause
- GROUP BY clause
- ORDER BY clause
- DISTINCT clause
- UNION
- Subquery

You also cannot invoke CURRVAL to act on a sequence in:

- UPDATE or DELETE subqueries
- Views

Examples

See Also

NEXTVAL

LAST_INSERT_ID

Returns the last value of an AUTO_INCREMENT/IDENTITY column. If multiple sessions concurrently load the same table with an AUTO_INCREMENT/IDENTITY column, the function returns the last value generated for that column.

**Note:**
This function works only with AUTO_INCREMENT/IDENTITY columns. It does not work with named sequences.

Syntax

LAST_INSERT_ID()
Privileges

- Table owner
- USAGE privileges on the table schema

Examples

See AUTO_INCREMENT and IDENTITY Sequences in the Administrator's Guide.

NEXTVAL

Returns the next value in a sequence. Call NEXTVAL after creating a sequence to initialize the sequence with its default value. Thereafter, call NEXTVAL to increment the sequence value for ascending sequences, or decrement its value for descending sequences.

Syntax

```
NEXTVAL ( '"[database.]schema.]sequence"')
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td>sequence</td>
<td>Identifies the target sequence.</td>
</tr>
</tbody>
</table>

Privileges

- SELECT privilege on sequence
- USAGE privilege on sequence schema
Restrictions

You cannot invoke NEXTVAL in a SELECT statement, in the following contexts:

- WHERE clause
- GROUP BY clause
- ORDER BY clause
- DISTINCT clause
- UNION
- Subquery

You also cannot invoke NEXTVAL to act on a sequence in:

- UPDATE or DELETE subqueries
- Views

You can use subqueries to work around some of these restrictions. For example, to use sequences with a DISTINCT clause:

```sql
=> SELECT t.col1, shift_allocation_seq.NEXTVAL FROM (SELECT DISTINCT col1 FROM av_temp1) t;
```

Examples

CURRVAL
String Functions

String functions perform conversion, extraction, or manipulation operations on strings, or return information about strings.

This section describes functions and operators for examining and manipulating string values. Strings in this context include values of the types CHAR, VARCHAR, BINARY, and VARBINARY.

Unless otherwise noted, all of the functions listed in this section work on all four data types. As opposed to some other SQL implementations, Vertica keeps CHAR strings unpadded internally, padding them only on final output. So converting a CHAR(3) 'ab' to VARCHAR(5) results in a VARCHAR of length 2, not one with length 3 including a trailing space.

Some of the functions described here also work on data of non-string types by converting that data to a string representation first. Some functions work only on character strings, while others work only on binary strings. Many work for both. BINARY and VARBINARY functions ignore multibyte UTF-8 character boundaries.

Non-binary character string functions handle normalized multibyte UTF-8 characters, as specified by the Unicode Consortium. Unless otherwise specified, those character string functions for which it matters can optionally specify whether VARCHAR arguments should be interpreted as octet (byte) sequences, or as (locale-aware) sequences of UTF-8 characters. This is accomplished by adding "USING OCTETS" or "USING CHARACTERS" (default) as a parameter to the function.

Some character string functions are stable because in general UTF-8 case-conversion, searching and sorting can be locale dependent. Thus, LOWER is stable, while LOWERB is immutable. The USING OCTETS clause converts these functions into their "B" forms, so they become immutable. If the locale is set to collation=binary, which is the default, all string functions—except CHAR_LENGTH/CHARACTER_LENGTH, LENGTH, SUBSTR, and OVERLAY—are converted to their "B" forms and so are immutable.

BINARY implicitly converts to VARBINARY, so functions that take VARBINARY arguments work with BINARY.

ASCII

Converts the first character of a VARCHAR datatype to an INTEGER.
Behavior Type

Immutable

Syntax

ASCII ( expression )

Parameters

expression (VARCHAR) is the string to convert.

Notes

- ASCII is the opposite of the CHR function.
- ASCII operates on UTF-8 characters, not only on single-byte ASCII characters. It continues to get the same results for the ASCII subset of UTF-8.

Examples

This example returns employees whose last name begins with M. The ASCII equivalent of M is 77:

```sql
=> SELECT employee_last_name FROM employee_dimension
    WHERE ASCII(SUBSTR(employee_last_name, 1, 1)) = 76
    LIMIT 5;
 employee_last_name  
 Lewis              
 Lewis              
 Lampert            
 Lampert            
 Li                 
 (5 rows)
```

BIT_LENGTH

Returns the length of the string expression in bits (bytes * 8) as an INTEGER.
Behavior Type

Immutable

Syntax

BIT_LENGTH ( expression )

Parameters

| expression | (CHAR or VARCHAR or BINARY or VARBINARY) is the string to convert |

Notes

BIT_LENGTH applies to the contents of VARCHAR and VARBINARY fields.

Examples

<table>
<thead>
<tr>
<th>Expression</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELECT BIT_LENGTH('abc'::varbinary);</td>
<td>24</td>
</tr>
<tr>
<td>SELECT BIT_LENGTH('abc'::binary);</td>
<td>8</td>
</tr>
<tr>
<td>SELECT BIT_LENGTH(''::varbinary);</td>
<td>0</td>
</tr>
<tr>
<td>SELECT BIT_LENGTH(''::binary);</td>
<td>8</td>
</tr>
<tr>
<td>SELECT BIT_LENGTH(null::varbinary);</td>
<td></td>
</tr>
<tr>
<td>SELECT BIT_LENGTH(null::binary);</td>
<td></td>
</tr>
<tr>
<td>SELECT BIT_LENGTH(VARCHAR 'abc');</td>
<td>24</td>
</tr>
<tr>
<td>SELECT BIT_LENGTH(CHAR 'abc');</td>
<td>24</td>
</tr>
<tr>
<td>SELECT BIT_LENGTH(CHAR(6) 'abc');</td>
<td>48</td>
</tr>
<tr>
<td>SELECT BIT_LENGTH(VARCHAR(6) 'abc');</td>
<td>24</td>
</tr>
<tr>
<td>SELECT BIT_LENGTH(BINARY(6) 'abc');</td>
<td>48</td>
</tr>
<tr>
<td>SELECT BIT_LENGTH(BINARY 'abc');</td>
<td>24</td>
</tr>
</tbody>
</table>
SELECT BIT_LENGTH(VARBINARY 'abc'); 24
SELECT BIT_LENGTH(VARBINARY(6) 'abc'); 24

See Also

- CHARACTER_LENGTH
- LENGTH
- OCTET_LENGTH

BITCOUNT

Returns the number of one-bits (sometimes referred to as set-bits) in the given VARBINARY value. This is also referred to as the population count.

Behavior Type

Immutable

Syntax

BITCOUNT ( expression )

Parameters

| expression | (BINARY or VARBINARY) is the string to return. |

Examples

=> SELECT BITCOUNT(HEX_TO_BINARY('0x10'));
    BITCOUNT
    --------
    1
    (1 row)
=> SELECT BITCOUNT(HEX_TO_BINARY('0xF0'));
    BITCOUNT
    --------
BITSTRING_TO_BINARY

Translates the given VARCHAR bitstring representation into a VARBINARY value. This function is the inverse of TO_BITSTRING.

**Behavior Type**

**Immutable**

**Syntax**

BITSTRING_TO_BINARY ( expression )

**Parameters**

| expression | The VARCHAR string to process. |

**Examples**

If there are an odd number of characters in the hex value, the first character is treated as the low nibble of the first (furthest to the left) byte.

```sql
=> SELECT BITSTRING_TO_BINARY('0110000101100010');
BITSTRING_TO_BINARY
---------------------
ab
(1 row)
```
**BTRIM**

Removes the longest string consisting only of specified characters from the start and end of a string.

**Behavior Type**

Immutable

**Syntax**

\[
\text{BTRIM( expression [ , characters-to-remove ] )}
\]

**Parameters**

<table>
<thead>
<tr>
<th>expression</th>
<th>(CHAR or VARCHAR) is the string to modify</th>
</tr>
</thead>
<tbody>
<tr>
<td>characters-to-remove</td>
<td>(CHAR or VARCHAR) specifies the characters to remove. The default is the space character.</td>
</tr>
</tbody>
</table>

**Example**

\[
=> \text{SELECT BTRIM('xyxtrimyyx', 'xy');}
\]

\[
\begin{array}{|l|}
\hline
\text{BTRIM( 'trim' )} \\
\hline
\text{trim} \\
\text{(1 row)} \\
\hline
\end{array}
\]

**See Also**

- LTRIM
- RTRIM
- TRIM
CHARACTER_LENGTH

The CHARACTER_LENGTH() function:

- Returns the string length in UTF-8 characters for CHAR and VARCHAR columns
- Returns the string length in bytes (octets) for BINARY and VARBINARY columns
- Strips the padding from CHAR expressions but not from VARCHAR expressions
- Is identical to LENGTH() for CHAR and VARCHAR. For binary types, CHARACTER_LENGTH() is identical to OCTET_LENGTH().

Behavior Type

Immutable if USING OCTETS, stable otherwise.

Syntax

[ CHAR_LENGTH | CHARACTER_LENGTH ] ( expression ... [ USING { CHARACTERS | OCTETS } ] )

Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>(CHAR or VARCHAR) is the string to measure</th>
</tr>
</thead>
<tbody>
<tr>
<td>USING CHARACTERS</td>
<td>OCTETS</td>
</tr>
</tbody>
</table>

Examples

```sql
=> SELECT CHAR_LENGTH('1234567890') USING OCTETS;
<table>
<thead>
<tr>
<th>octet_length</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
</tr>
<tr>
<td>(1 row)</td>
</tr>
</tbody>
</table>

=> SELECT CHAR_LENGTH('1234567890') USING OCTETS;
<table>
<thead>
<tr>
<th>char_length</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
</tr>
<tr>
<td>(1 row)</td>
</tr>
</tbody>
</table>

=> SELECT CHAR_LENGTH(NULL::CHAR(10)) IS NULL;
| ?column?              |
| true                  |
```

Vertica Analytic Database (11.0.x)
See Also

- `BIT_LENGTH`

**CHR**

Converts the first character of an `INTEGER` datatype to a `VARCHAR`.

**Behavior Type**

Immutable

**Syntax**

`CHR ( expression )`

**Parameters**

| expression (INTEGER) | is the string to convert and is masked to a single character. |

**Notes**

- CHR is the opposite of the `ASCII` function.
- CHR operates on UTF-8 characters, not only on single-byte ASCII characters. It continues to get the same results for the ASCII subset of UTF-8.

**Examples**

This example returns the `VARCHAR` datatype of the CHR expressions 65 and 97 from the `employee` table:
COLLATION

Applies a collation to two or more strings. Use COLLATION with ORDER BY, GROUP BY, and equality clauses.

Syntax

\[
\text{COLLATION (}'expression'[\text{,} 'locale_or_collation_name'][\text{]})
\]

Parameters

<table>
<thead>
<tr>
<th>'expression'</th>
<th>Any expression that evaluates to a column name or to two or more values of type CHAR or VARCHAR.</th>
</tr>
</thead>
<tbody>
<tr>
<td>'locale_or_collation_name'</td>
<td>The ICU (International Components for Unicode) locale or collation name to use when collating the string. If you omit this parameter, COLLATION uses the collation associated with the session locale.</td>
</tr>
</tbody>
</table>

To determine the current session locale, enter the vsq1 meta-command \locale:

\[
\text{=> } \text{\locale}\n\text{en_US@collation=binary}
\]

To set the locale and collation, use \locale as follows:
Locales

The locale used for COLLATION can be one of the following:

- The default locale
- A session locale
- A locale that you specify when you call COLLATION. If you specify the locale, Vertica applies the collation associated with that locale to the data. COLLATION does not modify the collation for any other columns in the table.

For a list of valid ICU locales, go to Locale Explorer (ICU).

Binary and Non-Binary Collations

The Vertica default locale is en_US@collation=binary, which uses *binary collation*. Binary collation compares binary representations of strings. Binary collation is fast, but it can result in a sort order where K precedes c because the binary representation of K is lower than c.

For non-binary collation, Vertica transforms the data according to the rules of the locale or the specified collation, and then applies the sorting rules. Suppose the locale collation is non-binary and you request a GROUP BY on string data. In this case, Vertica calls COLLATION, whether or not you specify the function in your query.

For information about collation naming, see Collator Naming Scheme.

Examples

Collating GROUP BY Results

The following examples are based on a Premium_Customer table that contains the following data:

```sql
=> SELECT * FROM Premium_Customer;
ID | LName | FName
---+-------+------
1  | Mc Coy | Bob
```
The first statement shows how COLLATION applies the collation for the EN_US locale to the LName column for the locale EN_US. Vertica sorts the GROUP BY output as follows:

- Last names with spaces
- Last names where "coy" starts with a lowercase letter
- Last names where "Coy" starts with an uppercase letter

```sql
=> SELECT * FROM Premium_Customer ORDER BY COLLATION(LName, 'EN_US'), FName;
```

<table>
<thead>
<tr>
<th>ID</th>
<th>LName</th>
<th>FName</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Mc Coy</td>
<td>Bob</td>
</tr>
<tr>
<td>2</td>
<td>Mc Coy</td>
<td>Janice</td>
</tr>
<tr>
<td>6</td>
<td>Mccoy</td>
<td>Cameron</td>
</tr>
<tr>
<td>7</td>
<td>Mccoy</td>
<td>Lisa</td>
</tr>
<tr>
<td>5</td>
<td>McCoy</td>
<td>Brendon</td>
</tr>
<tr>
<td>3</td>
<td>McCoy</td>
<td>Jody</td>
</tr>
<tr>
<td>4</td>
<td>McCoy</td>
<td>Peter</td>
</tr>
</tbody>
</table>

The next statement shows how COLLATION collates the LName column for the locale LEN_AS:

- LEN indicates the language (L) is English (EN).
- AS (Alternate Shifted) instructs COLLATION that lowercase letters come before uppercase (shifted) letters.

In the results, the last names in which "coy" starts with a lowercase letter precede the last names where "Coy" starts with an uppercase letter.

```sql
=> SELECT * FROM Premium_Customer ORDER BY COLLATION(LName, 'LEN_AS'), FName;
```

<table>
<thead>
<tr>
<th>ID</th>
<th>LName</th>
<th>FName</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>Mccoy</td>
<td>Cameron</td>
</tr>
<tr>
<td>7</td>
<td>Mccoy</td>
<td>Lisa</td>
</tr>
<tr>
<td>1</td>
<td>Mc Coy</td>
<td>Bob</td>
</tr>
<tr>
<td>5</td>
<td>McCoy</td>
<td>Brendon</td>
</tr>
<tr>
<td>2</td>
<td>Mc Coy</td>
<td>Janice</td>
</tr>
<tr>
<td>3</td>
<td>McCoy</td>
<td>Jody</td>
</tr>
<tr>
<td>4</td>
<td>McCoy</td>
<td>Peter</td>
</tr>
</tbody>
</table>

**Comparing Strings with an Equality Clause**

In the following query, COLLATION removes spaces and punctuation when comparing two strings in English. It then determines whether the two strings still have the same value after the punctuation has been removed:
Sorting Strings in Non-English Languages

The following table contains data that uses the German character eszett, ß:

| ßstringß | 1 | 10 |
| SSstringSS | 2 | 20 |
| random1 | 3 | 30 |
| random1 | 4 | 40 |
| random2 | 5 | 50 |

When you specify the collation LDE_S1:

- LDE indicates the language (L) is German (DE).
- S1 indicates the strength (S) of 1 (primary). This value indicates that the collation does not need to consider accents and case.

The query returns the data in the following order:

| random1 |
| random1 |
| random2 |
| SSstringSS |
| ßstringß |

**CONCAT**

Used to concatenate two strings.

**Syntax**

CONCAT ('string1', 'string2')

**Behavior Type**

Immutable
Parameters

<table>
<thead>
<tr>
<th>'string1'</th>
<th>Can be any datatype.</th>
</tr>
</thead>
<tbody>
<tr>
<td>'string2'</td>
<td></td>
</tr>
</tbody>
</table>

Restrictions

Varbinary and long varbinary types cannot be mixed with other types. These types return varbinary and long varbinary, respectively.

Similarly, long varchar types return long varchar.

Otherwise, the result is varchar.

**Note:**
If either argument is null, concat returns null.

Example

The following simple examples use a sample table named alphabet, which contains two rows, letter1 and letter2. The contents are as follows.

```sql
=> CREATE TABLE alphabet (letter1 varchar(2), letter2 varchar(2));
=> CREATE TABLE
=> COPY alphabet FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
=> A|B
=> C|D
=> .
=> SELECT * FROM alphabet;
  letter1 | letter2
  --------|--------
  C       | D
  A       | B
(2 rows)
```

The following example concatenates the contents of the first column with a character string.

```sql
=> SELECT CONCAT(letter1, ' is a letter') FROM alphabet;
  CONCAT
-----
A is a letter
```
C is a letter
(2 rows)

The following example nests the CONCAT function.

```sql
=> SELECT CONCAT(CONCAT(letter1, ' and '), CONCAT(letter2, ' are both letters')) FROM alphabet;
```

```
C and D are both letters
A and B are both letters
(2 rows)
```

**DECODE**

Compares expression to each search value one by one. If expression is equal to a search, the function returns the corresponding result. If no match is found, the function returns default. If default is omitted, the function returns null.

DECODE is similar to the IF-THEN-ELSE and CASE expressions:

```sql
CASE expression
[WHEN search THEN result]
[WHEN search THEN result]
...
[ELSE default];
```

The arguments can have any data type supported by Vertica. The result types of individual results are promoted to the least common type that can be used to represent all of them. This leads to a character string type, an exact numeric type, an approximate numeric type, or a DATETIME type, where all the various result arguments must be of the same type grouping.

**Behavior Type**

*Immutable*

**Syntax**

```sql
DECODE ( expression, search, result [ , search, result ]...[, default ] )
```
Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>The value to compare.</th>
</tr>
</thead>
<tbody>
<tr>
<td>search</td>
<td>The value compared against expression.</td>
</tr>
<tr>
<td>result</td>
<td>The value returned, if expression is equal to search.</td>
</tr>
<tr>
<td>default</td>
<td>Optional. If no matches are found, DECODE returns default. If default is omitted, then DECODE returns NULL (if no matches are found).</td>
</tr>
</tbody>
</table>

Example

The following example converts numeric values in the weight column from the product_dimension table to descriptive values in the output.

```sql
=> SELECT product_description, DECODE(weight,
   2, 'Light',
   50, 'Medium',
   71, 'Heavy',
   99, 'Call for help',
   'N/A')
FROM product_dimension
WHERE category_description = 'Food'
AND department_description = 'Canned Goods'
AND sku_number BETWEEN 'SKU-#49750' AND 'SKU-#49999'
LIMIT 15;
```

<table>
<thead>
<tr>
<th>product_description</th>
<th>case</th>
</tr>
</thead>
<tbody>
<tr>
<td>Brand #499 canned corn</td>
<td>N/A</td>
</tr>
<tr>
<td>Brand #49900 fruit cocktail</td>
<td>Medium</td>
</tr>
<tr>
<td>Brand #49837 canned tomatoes</td>
<td>Heavy</td>
</tr>
<tr>
<td>Brand #49782 canned peaches</td>
<td>N/A</td>
</tr>
<tr>
<td>Brand #49805 chicken noodle soup</td>
<td>N/A</td>
</tr>
<tr>
<td>Brand #49944 canned chicken broth</td>
<td>N/A</td>
</tr>
<tr>
<td>Brand #49819 canned chili</td>
<td>N/A</td>
</tr>
<tr>
<td>Brand #49848 baked beans</td>
<td>N/A</td>
</tr>
<tr>
<td>Brand #49989 minestrone soup</td>
<td>N/A</td>
</tr>
<tr>
<td>Brand #49778 canned peaches</td>
<td>N/A</td>
</tr>
<tr>
<td>Brand #49770 canned peaches</td>
<td>N/A</td>
</tr>
<tr>
<td>Brand #4977 fruit cocktail</td>
<td>N/A</td>
</tr>
<tr>
<td>Brand #49933 canned olives</td>
<td>N/A</td>
</tr>
<tr>
<td>Brand #49750 canned olives</td>
<td>Call for help</td>
</tr>
<tr>
<td>Brand #49777 canned tomatoes</td>
<td>N/A</td>
</tr>
</tbody>
</table>

(15 rows)
EDIT_DISTANCE

Calculates and returns the Levenshtein distance between two strings. The return value indicates the minimum number of single-character edits—insertions, deletions, or substitutions—that are required to change one string into the other.

Behavior Type

Immutable

Syntax

EDIT_DISTANCE ( string-expression1, string-expression2 )

Parameters

<table>
<thead>
<tr>
<th>string-expression1</th>
<th>string-expression2</th>
</tr>
</thead>
<tbody>
<tr>
<td>The two VARCHAR expressions to compare.</td>
<td></td>
</tr>
</tbody>
</table>

Examples

The Levenshtein distance between kitten and knitting is 3:

```sql
=> SELECT EDIT_DISTANCE ('kitten', 'knitting');
EDIT_DISTANCE
-----------
3
(1 row)
```

EDIT_DISTANCE calculates that no fewer than three changes are required to transform kitten to knitting:

1. kitten → knitten (insert n after k)
2. knitten → knittin (substitute i for e)
3. knittin → knitting (append g)
GREATEST

Returns the largest value in a list of expressions of any data type. All data types in the list must be the same or compatible. A NULL value in any one of the expressions returns NULL. Results can vary, depending on the locale's collation setting.

Behavior Type

Stable

Syntax

GREATEST ( { * | expression[,]… } )

Arguments

<table>
<thead>
<tr>
<th>*</th>
<th>expression[,]…</th>
<th>The expressions to evaluate, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>* (asterisk)</td>
<td>Evaluates all columns in the queried table.</td>
</tr>
<tr>
<td></td>
<td>expression</td>
<td>An expression of any data type. Functions that are included in expression must be deterministic.</td>
</tr>
</tbody>
</table>

Examples

GREATEST returns 10 as the largest value in the list:

```sql
=> SELECT GREATEST(7,5,10);
   GREATEST
   ------
    10
(1 row)
```

If you put quotes around the integer expressions, GREATEST compares the values as strings and returns '7' as the greatest value:
The next example returns FLOAT 1.5 as the greatest because the integer is implicitly cast to float:

```sql
=> SELECT GREATEST(1, 1.5);
GREATEST
--------
  1.5
(1 row)
```

GREATEST queries all columns in a view based on the VMart table `product_dimension`, and returns the largest value in each row:

```sql
=> CREATE VIEW query1 AS SELECT shelf_width, shelf_height, shelf_depth FROM product_dimension;
CREATE VIEW
=> SELECT shelf_width, shelf_height, shelf_depth, greatest(*) FROM query1 WHERE shelf_width = 1;
shelf_width | shelf_height | shelf_depth | greatest
-------------|--------------|-------------|---------
 1            | 3            | 1           | 3       
 1            | 3            | 3           | 3       
 1            | 5            | 4           | 5       
 1            | 2            | 2           | 2       
 1            | 1            | 3           | 3       
 1            | 2            | 2           | 2       
 1            | 2            | 3           | 3       
 1            | 1            | 5           | 5       
 1            | 1            | 4           | 4       
 1            | 5            | 3           | 5       
 1            | 4            | 2           | 4       
 1            | 4            | 5           | 5       
 1            | 5            | 3           | 5       
 1            | 2            | 5           | 5       
 1            | 4            | 2           | 4       
 1            | 4            | 4           | 4       
 1            | 1            | 2           | 2       
 1            | 4            | 3           | 4       
...```
GREATESTB

Returns the largest value in a list of expressions of any data type, using binary ordering. All data types in the list must be the same or compatible. A NULL value in any one of the expressions returns NULL. Results can vary, depending on the locale's collation setting.

Behavior Type

Immutable

Syntax

GREATEST ( [ * | expression[, ...] ] )

Arguments

<table>
<thead>
<tr>
<th>*</th>
<th>expression[, ...]</th>
<th>The expressions to evaluate, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>* (asterisk)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Evaluates all columns in the queried table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>expression</td>
</tr>
<tr>
<td></td>
<td></td>
<td>An expression of any data type. Functions that are</td>
</tr>
<tr>
<td></td>
<td></td>
<td>included in expression must be deterministic.</td>
</tr>
</tbody>
</table>

Examples

The following command selects straße as the greatest in the series of inputs:

```sql
=> SELECT GREATESTB('straße', 'strasse');
GREATESTB
--------
straße
(1 row)
```

GREATESTB returns 10 as the largest value in the list:

```sql
=> SELECT GREATESTB(7,5,10);
```
If you put quotes around the integer expressions, GREATESTB compares the values as strings and returns '7' as the greatest value:

```sql
=> SELECT GREATESTB('7', '5', '10');
GREATESTB
----------
7
(1 row)
```

The next example returns FLOAT 1.5 as the greatest because the integer is implicitly cast to float:

```sql
=> SELECT GREATESTB(1, 1.5);
GREATESTB
----------
1.5
(1 row)
```

GREATESTB queries all columns in a view based on the VMart table `product_dimension`, and returns the largest value in each row:

```sql
=> CREATE VIEW query1 AS SELECT shelf_width, shelf_height, shelf_depth FROM product_dimension;
CREATE VIEW
=> SELECT shelf_width, shelf_height, shelf_depth, greatestb(*) FROM query1 WHERE shelf_width = 1;

<table>
<thead>
<tr>
<th>shelf_width</th>
<th>shelf_height</th>
<th>shelf_depth</th>
<th>greatestb(*)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>3</td>
<td>1</td>
<td>3</td>
</tr>
<tr>
<td>1</td>
<td>3</td>
<td>3</td>
<td>3</td>
</tr>
<tr>
<td>1</td>
<td>5</td>
<td>4</td>
<td>5</td>
</tr>
<tr>
<td>1</td>
<td>2</td>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>3</td>
<td>3</td>
</tr>
<tr>
<td>1</td>
<td>2</td>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>1</td>
<td>2</td>
<td>3</td>
<td>3</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>5</td>
<td>5</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>4</td>
<td>4</td>
</tr>
<tr>
<td>1</td>
<td>5</td>
<td>3</td>
<td>5</td>
</tr>
<tr>
<td>1</td>
<td>4</td>
<td>2</td>
<td>4</td>
</tr>
<tr>
<td>1</td>
<td>5</td>
<td>5</td>
<td>5</td>
</tr>
<tr>
<td>1</td>
<td>5</td>
<td>3</td>
<td>5</td>
</tr>
<tr>
<td>1</td>
<td>2</td>
<td>5</td>
<td>5</td>
</tr>
<tr>
<td>1</td>
<td>4</td>
<td>2</td>
<td>4</td>
</tr>
</tbody>
</table>
```

See Also

LEASTB
**HEX_TO_BINARY**

Translates the given VARCHAR hexadecimal representation into a VARBINARY value.

**Behavior Type**

Immutable

**Syntax**

```sql
HEX_TO_BINARY ( [ 0x ] expression )
```

**Parameters**

<table>
<thead>
<tr>
<th>expression</th>
<th>(BINARY or VARBINARY) String to translate.</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x</td>
<td>Optional prefix.</td>
</tr>
</tbody>
</table>

**Notes**

VARBINARY HEX_TO_BINARY(VARCHAR) converts data from character type in hexadecimal format to binary type. This function is the inverse of TO_HEX.

```
HEX_TO_BINARY(TO_HEX(x)) = x
TO_HEX(HEX_TO_BINARY(x)) = x
```

If there are an odd number of characters in the hexadecimal value, the first character is treated as the low nibble of the first (furthest to the left) byte.

**Examples**

If the given string begins with "0x" the prefix is ignored. For example:

```
=> SELECT HEX_TO_BINARY('0x6162') AS hex1, HEX_TO_BINARY('6162') AS hex2;
hex1 | hex2
------------
ab | ab
```
If an invalid hex value is given, Vertica returns an “invalid binary representation” error; for example:

```sql
=> SELECT HEX_TO_BINARY('0xffgf');
ERROR: invalid hex string "0xffgf"
```

**See Also**

- `TO_HEX`

**HEX_TO_INTEGER**

Translates the given VARCHAR hexadecimal representation into an INTEGER value.

Vertica completes this conversion as follows:

- Adds the 0x prefix if it is not specified in the input
- Casts the VARCHAR string to a NUMERIC
- Casts the NUMERIC to an INTEGER

**Behavior Type**

*Immutable*

**Syntax**

```
HEX_TO_INTEGER ( [ 0x ] expression )
```

**Parameters**

<table>
<thead>
<tr>
<th>expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VARCHAR</td>
<td>The string to translate.</td>
</tr>
<tr>
<td>0x</td>
<td>The optional prefix.</td>
</tr>
</tbody>
</table>
Examples

You can enter the string with or without the Ox prefix. For example:

```sql
=> SELECT HEX_TO_INTEGER ('0aedc')
    AS hex1, HEX_TO_INTEGER ('aedc') AS hex2;

hex1 | hex2
-----+-----
 44764 | 44764

(1 row)
```

If you pass the function an invalid hex value, Vertica returns an invalid input syntax error; for example:

```sql
=> SELECT HEX_TO_INTEGER ('0xffgf');
ERROR 3691: Invalid input syntax for numeric: "0xffgf"
```

See Also

- TO_HEX
- HEX_TO_BINARY

INET_ATON

Returns an integer that represents the value of the address in host byte order, given the dotted-quad representation of a network address as a string.

Behavior Type

Immutable

Syntax

INET_ATON ( expression )

Parameters

- `expression` (VARCHAR) is the string to convert.
Notes

The following syntax converts an IPv4 address represented as the string A to an integer I. INET_ATON trims any spaces from the right of A, calls the Linux function inet_pton, and converts the result from network byte order to host byte order using ntohl.

=> INET_ATON(VARCHAR A) -> INT8 I

If A is NULL, too long, or inet_pton returns an error, the result is NULL.

Examples

The generated number is always in host byte order. In the following example, the number is calculated as \(209 \times 256^3 + 207 \times 256^2 + 224 \times 256 + 40\).

=> SELECT INET_ATON('209.207.224.40');
    inet_aton
    ---------
    3520061480
    (1 row)

=> SELECT INET_ATON('1.2.3.4');
    inet_aton
    ---------
    16909060
    (1 row)

=> SELECT TO_HEX(INET_ATON('1.2.3.4'));
    to_hex
    -------
    1020304
    (1 row)

See Also

- INET_NTOA

INET_NTOA

Returns the dotted-quad representation of the address as a VARCHAR, given a network address as an integer in network byte order.
Behavior Type

Immutable

Syntax

INET_NTOA (expression)

Parameters

| expression | (INTEGER) is the network address to convert. |

Notes

The following syntax converts an IPv4 address represented as integer I to a string A.

INET_NTOA converts I from host byte order to network byte order using htonl, and calls the Linux function inet_ntop.

=> INET_NTOA(INT8 I) -> VARCHAR A

If I is NULL, greater than 2^32 or negative, the result is NULL.

Examples

=> SELECT INET_NTOA(16909060);
  inet_ntoa
  1.2.3.4
  (1 row)

=> SELECT INET_NTOA(03021962);
  inet_ntoa
  0.46.28.138
  (1 row)
See Also

- INET_ATON

INITCAP

Capitalizes first letter of each alphanumeric word and puts the rest in lowercase.

Behavior Type

Immutable

Syntax

INITCAP ( expression )

Parameters

| expression | (VARCHAR) is the string to format. |

Notes

- Depends on collation setting of the locale.
- INITCAP is restricted to 32750 octet inputs, since it is possible for the UTF-8 representation of result to double in size.

Examples

<table>
<thead>
<tr>
<th>Expression</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELECT INITCAP('high speed database');</td>
<td>High Speed Database</td>
</tr>
<tr>
<td>SELECT INITCAP('LINUX TUTORIAL');</td>
<td>Linux Tutorial</td>
</tr>
</tbody>
</table>
SELECT INITCAP('abc DEF 123aVC 124Btd,lAsT');  |  Abc Def 123AvC 124Btd,Last
SELECT INITCAP('');                        |  
SELECT INITCAP(null);                      |  

**INITCAPB**

Capitalizes first letter of each alphanumeric word and puts the rest in lowercase. Multibyte characters are not converted and are skipped.

**Behavior Type**

Immutable

**Syntax**

INITCAPB ( expression )

**Parameters**

*expression* (VARCHAR) is the string to format.

**Notes**

Depends on collation setting of the locale.

**Examples**

<table>
<thead>
<tr>
<th>Expression</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELECT INITCAPB('étudiant');</td>
<td>éTudiant</td>
</tr>
<tr>
<td>SELECT INITCAPB('high speed database');</td>
<td>High Speed Database</td>
</tr>
<tr>
<td>SELECT INITCAPB('LINUX TUTORIAL');</td>
<td>Linux Tutorial</td>
</tr>
</tbody>
</table>
SELECT INITCAP('abc DEF 123aVC 124Btd,Last');  
Abc Def 123Avc 124Btd,Last

SELECT INITCAP('');

SELECT INITCAP(NULL);

**INSERT**

Inserts a character string into a specified location in another character string.

**Syntax**

```
INSERT( 'string1', n, m, 'string2' )
```

**Behavior Type**

**Immutable**

**Parameters**

<table>
<thead>
<tr>
<th>string1</th>
<th>(VARCHAR) Is the string in which to insert the new string.</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>A character of type INTEGER that represents the starting point for the insertion within <code>string1</code>. You specify the number of characters from the first character in <code>string1</code> as the starting point for the insertion. For example, to insert characters before &quot;c&quot;, in the string &quot;abcdef,&quot; enter 3.</td>
</tr>
<tr>
<td>m</td>
<td>A character of type INTEGER that represents the number of characters in <code>string1</code> (if any) that should be replaced by the insertion. For example, if you want the insertion to replace the letters &quot;cd&quot; in the string &quot;abcdef,&quot; enter 2.</td>
</tr>
<tr>
<td>string2</td>
<td>(VARCHAR) Is the string to be inserted.</td>
</tr>
</tbody>
</table>

**Example**

The following example changes the string Warehouse to Storehouse using the INSERT function:
INSTR

Searches string for substring and returns an integer indicating the position of the character in string that is the first character of this occurrence. The return value is based on the character position of the identified character.

Behavior Type

Immutable

Syntax

INSTR ( string, substring [, position [, occurrence ]] )

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>(CHAR or VARCHAR, or BINARY or VARBINARY) Text expression to search.</td>
</tr>
<tr>
<td>substring</td>
<td>(CHAR or VARCHAR, or BINARY or VARBINARY) String to search for.</td>
</tr>
<tr>
<td>position</td>
<td>Nonzero integer indicating the character of string where Vertica begins the search. If position is negative, then Vertica counts backward from the end of string and then searches backward from the resulting position. The first character of string occupies the default position 1, and position cannot be 0.</td>
</tr>
<tr>
<td>occurrence</td>
<td>Integer indicating which occurrence of string Vertica searches. The value of occurrence must be positive (greater than 0), and the default is 1.</td>
</tr>
</tbody>
</table>

Notes

Both position and occurrence must be of types that can resolve to an integer. The default values of both parameters are 1, meaning Vertica begins searching at the first
character of string for the first occurrence of substring. The return value is relative to the beginning of string, regardless of the value of position, and is expressed in characters.

If the search is unsuccessful (that is, if substring does not appear occurrence times after the position character of string, the return value is 0.

Examples

The first example searches forward in string ‘abc’ for substring ‘b’. The search returns the position in ‘abc’ where ‘b’ occurs, or position 2. Because no position parameters are given, the default search starts at ‘a’, position 1.

```sql
=> SELECT INSTR('abc', 'b');
INSTR
------
 2
(1 row)
```

The following three examples use character position to search backward to find the position of a substring.

**Note:**
Although it might seem intuitive that the function returns a negative integer, the position of n occurrence is read left to right in the sting, even though the search happens in reverse (from the end—or right side—of the string).

In the first example, the function counts backward one character from the end of the string, starting with character ‘c’. The function then searches backward for the first occurrence of ‘a’, which it finds it in the first position in the search string.

```sql
=> SELECT INSTR('abc', 'a', -1);
INSTR
------
 1
(1 row)
```

In the second example, the function counts backward one byte from the end of the string, starting with character ‘c’. The function then searches backward for the first occurrence of ‘a’, which it finds it in the first position in the search string.

```sql
=> SELECT INSTR(VARBINARY 'abc', VARBINARY 'a', -1);
INSTR
------
 1
```
In the third example, the function counts backward one character from the end of the string, starting with character ‘b’, and searches backward for substring ‘bc’, which it finds in the second position of the search string.

```sql
=> SELECT INSTR('abcb', 'bc', -1);
INSTR
-------
 2
(1 row)
```

In the fourth example, the function counts backward one character from the end of the string, starting with character ‘b’, and searches backward for substring ‘bcef’, which it does not find. The result is 0.

```sql
=> SELECT INSTR('abcb', 'bcef', -1);
INSTR
-------
 0
(1 row)
```

In the fifth example, the function counts backward one byte from the end of the string, starting with character ‘b’, and searches backward for substring ‘bcef’, which it does not find. The result is 0.

```sql
=> SELECT INSTR(VARBINARY 'abcb', VARBINARY 'bcef', -1);
INSTR
-------
 0
(1 row)
```

Multibyte characters are treated as a single character:

```sql
=> SELECT INSTR('aébc', 'b');
INSTR
-------
 3
(1 row)
```

Use INSTRB to treat multibyte characters as binary:

```sql
=> SELECT INSTRB('aébc', 'b');
INSTRB
-------
 4
(1 row)
```
INSTRB

Searches string for substring and returns an integer indicating the octet position within string that is the first occurrence. The return value is based on the octet position of the identified byte.

Behavior Type

Immutable

Syntax

INSTRB ( string , substring [, position [, occurrence ] ] )

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>Is the text expression to search.</td>
</tr>
<tr>
<td>substring</td>
<td>Is the string to search for.</td>
</tr>
<tr>
<td>position</td>
<td>Is a nonzero integer indicating the character of string where Vertica begins the search. If position is negative, then Vertica counts backward from the end of string and then searches backward from the resulting position. The first byte of string occupies the default position 1, and position cannot be 0.</td>
</tr>
<tr>
<td>occurrence</td>
<td>Is an integer indicating which occurrence of string Vertica searches. The value of occurrence must be positive (greater than 0), and the default is 1.</td>
</tr>
</tbody>
</table>

Notes

Both position and occurrence must be of types that can resolve to an integer. The default values of both parameters are 1, meaning Vertica begins searching at the first byte of string for the first occurrence of substring. The return value is relative to the beginning of string, regardless of the value of position, and is expressed in octets.

If the search is unsuccessful (that is, if substring does not appear occurrence times after the position character of string, then the return value is 0.)
Example

```sql
=> SELECT INSTRB('straße', 'ß');
INSTRB
---------
 5
(1 row)
```

See Also

- INSTR

ISUTF8

Tests whether a string is a valid UTF-8 string. Returns true if the string conforms to UTF-8 standards, and false otherwise. This function is useful to test strings for UTF-8 compliance before passing them to one of the regular expression functions, such as `REGEXP_LIKE`, which expect UTF-8 characters by default.

ISUTF8 checks for invalid UTF8 byte sequences, according to UTF-8 rules:

- invalid bytes
- an unexpected continuation byte
- a start byte not followed by enough continuation bytes
- an Overload Encoding

The presence of an invalid UTF-8 byte sequence results in a return value of false.

To coerce a string to UTF-8, use `MAKEUTF8`.

Syntax

```sql
ISUTF8( string );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>The string to test for UTF-8 compliance.</td>
</tr>
</tbody>
</table>
Examples

```sql
=> SELECT ISUTF8(E'\xC2\xBF'); -- UTF-8 INVERTED QUESTION MARK ISUTF8
-------
t
(1 row)
```

```sql
=> SELECT ISUTF8(E'\xC2\xC0'); -- UNDEFINED UTF-8 CHARACTER ISUTF8
-------
f
(1 row)
```

LEAST

Returns the smallest value in a list of expressions of any data type. All data types in the list must be the same or compatible. A NULL value in any one of the expressions returns NULL. Results can vary, depending on the locale's collation setting.

Behavior Type

Stable

Syntax

```
LEAST ( { * | expression[,..] } )
```

Arguments

<table>
<thead>
<tr>
<th>*</th>
<th>expression[,..]</th>
<th>The expressions to evaluate, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>* (asterisk)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Evaluates all columns in the queried table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>expression</td>
</tr>
<tr>
<td></td>
<td></td>
<td>An expression of any data type. Functions that are included in expression must be deterministic.</td>
</tr>
</tbody>
</table>
Examples

LEASTB returns 5 as the smallest value in the list:

```sql
=> SELECT LEASTB(7, 5, 10);
LEASTB
--------
  5
(1 row)
```

If you put quotes around the integer expressions, LEASTB compares the values as strings and returns '10' as the smallest value:

```sql
=> SELECT LEASTB('7', '5', '10');
LEASTB
--------
  '10'
(1 row)
```

LEAST returns 1.5, as INTEGER 2 is implicitly cast to FLOAT:

```sql
=> SELECT LEAST(2, 1.5);
LEAST
-------
  1.5
(1 row)
```

LEAST queries all columns in a view based on the VMart table product_dimension, and returns the smallest value in each row:

```sql
=> CREATE VIEW query1 AS SELECT shelf_width, shelf_height, shelf_depth FROM product_dimension;
CREATE VIEW
=> SELECT shelf_height, shelf_width, shelf_depth, least(*) FROM query1 WHERE shelf_height = 5;
```

<table>
<thead>
<tr>
<th></th>
<th>shelf_height</th>
<th>shelf_width</th>
<th>shelf_depth</th>
<th>least</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>3</td>
<td>4</td>
<td>3</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>4</td>
<td>3</td>
<td>3</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>1</td>
<td>4</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>4</td>
<td>1</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>2</td>
<td>4</td>
<td>2</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>2</td>
<td>3</td>
<td>2</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>1</td>
<td>3</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>1</td>
<td>3</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>5</td>
<td>1</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>1</td>
<td>3</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>2</td>
<td>4</td>
<td>2</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>4</td>
<td>5</td>
<td>4</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>2</td>
<td>4</td>
<td>2</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>4</td>
<td>4</td>
<td>4</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>3</td>
<td>4</td>
<td>3</td>
<td></td>
</tr>
</tbody>
</table>
See Also

GREATEST

LEASTB

Returns the smallest value in a list of expressions of any data type, using binary ordering. All data types in the list must be the same or compatible. A NULL value in any one of the expressions returns NULL. Results can vary, depending on the locale's collation setting.

Behavior Type

Immutable

Syntax

LEASTB ( { * | expression[,]... } )

Arguments

<table>
<thead>
<tr>
<th>*</th>
<th>expression[,]...</th>
<th>The expressions to evaluate, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>* (asterisk)</td>
<td>Evaluates all columns in the queried table.</td>
<td></td>
</tr>
<tr>
<td>expression</td>
<td>An expression of any data type. Functions that are included in expression must be deterministic.</td>
<td></td>
</tr>
</tbody>
</table>

Examples

The following command selects strasse as the smallest value in the list:

```sql
=> SELECT LEASTB('straße', 'strasse');
LEASTB
--------
strasse
```
LEASTB returns 5 as the smallest value in the list:

\[
\text{LEASTB}(7, 5, 10);
\]

\[
\begin{align*}
\text{LEAST} & \quad \text{---} \\
5 & \quad (1 \text{ row})
\end{align*}
\]

If you put quotes around the integer expressions, LEAST compares the values as strings and returns '10' as the smallest value:

\[
\text{LEASTB}('7', '5', '10');
\]

\[
\begin{align*}
\text{LEASTB} & \quad \text{---} \\
10 & \quad (1 \text{ row})
\end{align*}
\]

The next example returns 1.5, as INTEGER 2 is implicitly cast to FLOAT:

\[
\text{LEASTB}(2, 1.5);
\]

\[
\begin{align*}
\text{LEASTB} & \quad \text{---} \\
1.5 & \quad (1 \text{ row})
\end{align*}
\]

LEASTB queries all columns in a view based on the VMart table product_dimension, and returns the smallest value in each row:

\[
\text{CREATE VIEW query1 AS SELECT shelf_width, shelf_height, shelf_depth FROM product_dimension;}
\]

\[
\text{CREATE VIEW query2 AS SELECT shelf_height, shelf_width, shelf_depth, leastb(*) FROM query1 WHERE shelf_height = 5;}
\]

<table>
<thead>
<tr>
<th>shelf_height</th>
<th>shelf_width</th>
<th>shelf_depth</th>
<th>leastb</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>3</td>
<td>4</td>
<td>3</td>
</tr>
<tr>
<td>5</td>
<td>4</td>
<td>3</td>
<td>3</td>
</tr>
<tr>
<td>5</td>
<td>1</td>
<td>4</td>
<td>1</td>
</tr>
<tr>
<td>5</td>
<td>4</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>5</td>
<td>2</td>
<td>4</td>
<td>2</td>
</tr>
<tr>
<td>5</td>
<td>2</td>
<td>3</td>
<td>2</td>
</tr>
<tr>
<td>5</td>
<td>1</td>
<td>3</td>
<td>1</td>
</tr>
<tr>
<td>5</td>
<td>5</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>5</td>
<td>2</td>
<td>4</td>
<td>2</td>
</tr>
<tr>
<td>5</td>
<td>4</td>
<td>5</td>
<td>4</td>
</tr>
<tr>
<td>5</td>
<td>2</td>
<td>4</td>
<td>2</td>
</tr>
<tr>
<td>5</td>
<td>4</td>
<td>4</td>
<td>4</td>
</tr>
<tr>
<td>5</td>
<td>3</td>
<td>4</td>
<td>3</td>
</tr>
<tr>
<td>5</td>
<td>5</td>
<td>4</td>
<td>4</td>
</tr>
<tr>
<td>5</td>
<td>5</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>5</td>
<td>3</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

...
See Also

GREATESTB

LEFT

Returns the specified characters from the left side of a string.

Behavior Type

Immutable

Syntax

LEFT ( string-expr, length )

Parameters

<table>
<thead>
<tr>
<th>string-expr</th>
<th>The string expression to return.</th>
</tr>
</thead>
<tbody>
<tr>
<td>length</td>
<td>An integer value that specifies how many characters to return.</td>
</tr>
</tbody>
</table>

Examples

```sql
=> SELECT LEFT('vertica', 3);
LEFT
------
ver
(1 row)
```

```sql
SELECT DISTINCT(
    LEFT(customer_name, 4) FnameTruncated
) FROM customer_dimension ORDER BY FnameTruncated LIMIT 10;
```

----------

SUBSTR

**LENGTH**

Returns the length of a string. The behavior of LENGTH varies according to the input data type:

- CHAR and VARCHAR: Identical to `CHARACTER_LENGTH`, returns the string length in UTF-8 characters.
- CHAR: Strips padding.
- BINARY and VARBINARY: Identical to `OCTET_LENGTH`, returns the string length in bytes (octets).

**Behavior Type**

Immutable

**Syntax**

`LENGTH ( expression )`

**Parameters**

<table>
<thead>
<tr>
<th>expression</th>
<th>String to evaluate, one of the following: CHAR, VARCHAR, BINARY or VARBINARY.</th>
</tr>
</thead>
</table>

Vertica Analytic Database (11.0.x)
Examples

<table>
<thead>
<tr>
<th>Statement</th>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELECT LENGTH('1234 '::CHAR(10));</td>
<td>4</td>
</tr>
<tr>
<td>SELECT LENGTH('1234 '::VARCHAR(10));</td>
<td>6</td>
</tr>
<tr>
<td>SELECT LENGTH('1234 '::BINARY(10));</td>
<td>10</td>
</tr>
<tr>
<td>SELECT LENGTH('1234 '::VARBINARY(10));</td>
<td>6</td>
</tr>
<tr>
<td>SELECT LENGTH(NULL::CHAR(10)) IS NULL;</td>
<td>t</td>
</tr>
</tbody>
</table>

See Also

BIT_LENGTH

LOWER

Takes a string value and returns a VARCHAR value converted to lowercase.

Behavior Type

stable

Syntax

LOWER ( expression )

Arguments

<table>
<thead>
<tr>
<th>expression</th>
<th>CHAR or VARCHAR string to convert, where the string width is ≤ 65000 octets.</th>
</tr>
</thead>
</table>

**Important:**
In practice, expression should not exceed 32,500 octets. LOWER does not use the locale's collation setting—for example,
The UTF-8 representation of the input value might be double its original width. As a result, LOWER returns an error if the input value exceeds 32,500 octets.

Note also that if expression is a table column, LOWER calculates its size from the column's defined width, and not from the column data. If the column width is greater than VARCHAR (32500), Vertica returns an error.

**Examples**

```sql
=> SELECT LOWER('AbCdEfG');
  LOWER
----------
 abcdefg
(1 row)
=> SELECT LOWER('The Bat In The Hat');
  LOWER
---------------------
 the bat in the hat
(1 row)
=> SELECT LOWER('ÉTUDIANT');
  LOWER
----------
 étudiant
(1 row)
```

**LOWERB**

Returns a character string with each ASCII character converted to lowercase. Multi-byte characters are skipped and not converted.

**Behavior Type**

*Immutable*

**Syntax**

```sql
LOWERB ( expression )
```
Parameters

| expression | CHAR or VARCHAR string to convert |

Examples

In the following example, the multi-byte UTF-8 character É is not converted to lowercase:

```
=> SELECT LOWERB('ÉTUDIANT');
   LOWERB
  -------
  étudiant
     (1 row)
=> SELECT LOWER('ÉTUDIANT');
   LOWER
  -------
  étudiant
     (1 row)
=> SELECT LOWERB('AbCdEfG');
   LOWERB
  -------
  abcdefg
     (1 row)
=> SELECT LOWERB('The Vertica Database');
   LOWERB
  ----------------
  the vertica database
     (1 row)
```

LPAD

Returns a VARCHAR value representing a string of a specific length filled on the left with specific characters.

Behavior Type

Immutable

Syntax

`LPAD ( expression , length [ , fill ] )`
### Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>(CHAR OR VARCHAR) specifies the string to fill</th>
</tr>
</thead>
<tbody>
<tr>
<td>length</td>
<td>(INTEGER) specifies the number of characters to return</td>
</tr>
<tr>
<td>fill</td>
<td>(CHAR OR VARCHAR) specifies the repeating string of characters with which to fill the output string. The default is the space character.</td>
</tr>
</tbody>
</table>

### Examples

```sql
=> SELECT LPAD('database', 15, 'xy');
LPAD
-------
xyxyxydatabase
(1 row)
```

If the string is already longer than the specified length it is truncated on the right:

```sql
=> SELECT LPAD('establishment', 10, 'abc');
LPAD
--------
establishm
(1 row)
```

### LTRIM

Returns a VARCHAR value representing a string with leading blanks removed from the left side (beginning).

### Behavior Type

**Immutable**

### Syntax

```sql
LTRIM ( expression [ , characters ] )
```
Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>(CHAR or VARCHAR) is the string to trim</th>
</tr>
</thead>
<tbody>
<tr>
<td>characters</td>
<td>(CHAR or VARCHAR) specifies the characters to remove from the left side of expression. The default is the space character.</td>
</tr>
</tbody>
</table>

Examples

```sql
=> SELECT LTRIM('zzyyyyyyyyyyyyytrim', 'xyz');
LTRIM
------
trim
(1 row)
```

See Also

- BTRIM
- RTRIM
- TRIM

MAKEUTF8

Coerces a string to UTF-8 by removing or replacing non-UTF-8 characters.

Flagging of invalid UTF-8 characters is byte by byte. For example, the byte sequence 0xE0 0x7F 0x80 is an invalid three-byte UTF-8 sequence, but the middle byte, 0x7F, is a valid one-byte UTF-8 character. In this example, 0x7F is preserved and the other two bytes are removed or replaced.

Syntax

```sql
MAKEUTF8(string [USING PARAMETERS param=value]);
```
Arguments

| string         | The input string, which might contain non-UTF-8 characters |

Parameters

| replacement_string | The string (VARCHAR(16)) that replaces each non-UTF-8 character in the input string. If this parameter is omitted, non-UTF-8 characters are removed. |

Examples

These examples use a table with the following contents:

```
=> SELECT * FROM people;
  name
  ------
  Dáithí
  Fiona
  Móirín
  Róisín
  Séamus
  Séan
  Tiarnán
  Aíne
(8 rows)
```

ISUTF8 returns false for all of these. Calling MAKEUTF8 without a replacement removes the special characters:

```
=> SELECT MAKEUTF8(name) FROM people;
  MAKEUTF8
  ------
  Dith
  Fona
  Mirn
  Risn
  Samus
  San
  Tiarnn
  ine
(8 rows)
```

You can instead specify a replacement string:
=> SELECT MAKEUTF8(name USING PARAMETERS replacement_string='^') FROM people;

MAKEUTF8
---------
D^i^th
F^ona
M^i^rn
R^is^n
S^amus
S^an
Ti^rn^n
^ine
(8 rows)

MD5

Calculates the MD5 hash of string, returning the result as a VARCHAR string in hexadecimal.

Behavior Type

Immutable

Syntax

MD5 ( string )

Parameters

| string | Is the argument string. |

Examples

=> SELECT MD5('123');

MD5
-------------------------------
202cb962ac59075b964b07152d234b70
(1 row)

=> SELECT MD5('Vertica':bytea);

MD5
-------------------------------
See Also

- SHA1
- SHA224
- SHA256
- SHA384
- SHA512

OCTET_LENGTH

Takes one argument as an input and returns the string length in octets for all string types.

Behavior Type

Immutable

Syntax

OCTET_LENGTH ( expression )

Parameters

| expression | (CHAR or VARCHAR or BINARY or VARBINARY) is the string to measure. |

Notes

- If the data type of expression is a CHAR, VARCHAR or VARBINARY, the result is the same as the actual length of expression in octets. For CHAR, the length does not include any trailing spaces.
- If the data type of expression is BINARY, the result is the same as the fixed-length of expression.
- If the value of expression is NULL, the result is NULL.
## Examples

<table>
<thead>
<tr>
<th>Expression</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SELECT OCTET_LENGTH(CHAR(10) '1234 ')</code>;</td>
<td>4</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(CHAR(10) '1234')</code>;</td>
<td>4</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(CHAR(10) ' 1234')</code>;</td>
<td>6</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(VARCHAR(10) '1234 ')</code>;</td>
<td>6</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(VARCHAR(10) '1234')</code>;</td>
<td>5</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(VARCHAR(10) ' 1234')</code>;</td>
<td>4</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(VARCHAR(10) '1234')</code>;</td>
<td>7</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH('abc':VARBINARY) ;</code></td>
<td>3</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(VARBINARY 'abc');</code></td>
<td>3</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(VARBINARY ' abc ');</code></td>
<td>5</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(BINARY(6) 'abc');</code></td>
<td>6</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(VARBINARY '');</code></td>
<td>0</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH('':BINARY);</code></td>
<td>1</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(null::VARBINARY);</code></td>
<td></td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(null::BINARY);</code></td>
<td></td>
</tr>
</tbody>
</table>

## See Also

- `BIT_LENGTH`
- `CHARACTER_LENGTH`
- `LENGTH`

## OVERLAY

Replaces part of a string with another string and returns the new string value as a VARCHAR.
Behavior Type

**Immutable** if using **OCTETS**, **Stable** otherwise

Syntax

OVERLAY ( input-string PLACING replace-string FROM position [ FOR extent ] [ USING { CHARACTERS | OCTETS } ] )

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input-string</td>
<td>The string to process, of type CHAR or VARCHAR.</td>
</tr>
<tr>
<td>replace-string</td>
<td>The string to replace the specified substring of input-string, of type CHAR or VARCHAR.</td>
</tr>
<tr>
<td>position</td>
<td>Integer ≥1 that specifies the first character or octet of input-string to overlay replace-string.</td>
</tr>
<tr>
<td>extent</td>
<td>Integer that specifies how many characters or octets of input-string to overlay with replace-string. If omitted, OVERLAY uses the length of replace-string.</td>
</tr>
</tbody>
</table>

For example, compare the following calls to OVERLAY:

- OVERLAY omits FOR clause. The number of characters replaced in the input string equals the number of characters in replacement string ABC:

  ```sql
  dbadmin=> SELECT OVERLAY ('123456789' PLACING 'ABC' FROM 5);
  overlay
  --------------
  1234ABC89
  (1 row)
  ```

- OVERLAY includes a FOR clause that specifies to replace four characters in the input string with the replacement string. The replacement string
is three characters long, so OVERLAY returns a string that is one character shorter than the input string:

```sql
=> SELECT OVERLAY ('123456789' PLACING 'ABC' FROM 5 FOR 4);
  overlay
--------------
  1234ABC9
(1 row)
```

- OVERLAY includes a FOR clause that specifies to replace -2 characters in the input string with the replacement string. The function returns a string that is two characters longer than the input string:

```sql
=> SELECT OVERLAY ('123456789' PLACING 'ABC' FROM 5 FOR -2);
  overlay
--------------
  1234ABC3456789
(1 row)
```

### USING CHARACTERS | OCTETS

Specifies whether OVERLAY uses characters (default) or octets.

**Note:**
If you specify USING OCTETS, Vertica calls the OVERLAYB function.

### Examples

```sql
=> SELECT OVERLAY('123456789' PLACING 'xxx' FROM 2);
overlay
--------
1xxx56789
(1 row)

=> SELECT OVERLAY('123456789' PLACING 'XXX' FROM 2 USING OCTETS);
overlayb
--------
1XXX56789
(1 row)

=> SELECT OVERLAY('123456789' PLACING 'xxx' FROM 2 FOR 4);
overlay
--------
OVERLAYB

Replaces part of a string with another string and returns the new string as an octet value.

The OVERLAYB function treats the multibyte character string as a string of octets (bytes) and use octet numbers as incoming and outgoing position specifiers and lengths. The strings themselves are type VARCHAR, but they treated as if each byte was a separate character.

Behavior Type

Immutable

Syntax

OVERLAYB ( input-string, replace-string, position [, extent ] )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input-string</td>
<td>The string to process, of type CHAR or VARCHAR.</td>
</tr>
<tr>
<td>replace-string</td>
<td>The string to replace the specified substring of input-string, of type CHAR or VARCHAR.</td>
</tr>
<tr>
<td>position</td>
<td>Integer ≥1 that specifies the first octet of input-string to overlay replace-string.</td>
</tr>
<tr>
<td>extent</td>
<td>Integer that specifies how many octets of input-string to overlay with replace-string. If omitted, OVERLAY uses the</td>
</tr>
</tbody>
</table>
Examples

```sql
=> SELECT OVERLAYB('123456789', 'ééé', 2);
OVERLAYB
---------
1ééé89
(1 row)

=> SELECT OVERLAYB('123456789', 'ßßß', 2);
OVERLAYB
---------
1ßßß89
(1 row)

=> SELECT OVERLAYB('123456789', 'xxx', 2);
OVERLAYB
---------
1xxx56789
(1 row)

=> SELECT OVERLAYB('123456789', 'xxx', 2, 4);
OVERLAYB
---------
1xxx6789
(1 row)

=> SELECT OVERLAYB('123456789', 'xxx', 2, 5);
OVERLAYB
---------
1xxx789
(1 row)

=> SELECT OVERLAYB('123456789', 'xxx', 2, 6);
OVERLAYB
---------
1xxx89
(1 row)
```

POSITION

Returns an INTEGER value representing the character location of a specified substring with a string (counting from one).

Behavior Type

Immutable
Syntax 1

POSITION ( substring IN string [ USING { CHARACTERS | OCTETS } ] )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>substring</td>
<td>(CHAR or VARCHAR) is the substring to locate</td>
</tr>
<tr>
<td>string</td>
<td>(CHAR or VARCHAR) is the string in which to locate the substring</td>
</tr>
<tr>
<td>USING CHARACTERS</td>
<td>Determines whether the position is reported by using characters (the default) or octets.</td>
</tr>
</tbody>
</table>

Syntax 2

POSITION ( substring IN string )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>substring</td>
<td>(VARBINARY) is the substring to locate</td>
</tr>
<tr>
<td>string</td>
<td>(VARBINARY) is the string in which to locate the substring</td>
</tr>
</tbody>
</table>

Notes

- When the string and substring are CHAR or VARCHAR, the return value is based on either the character or octet position of the substring.
- When the string and substring are VARBINARY, the return value is always based on the octet position of the substring.
- The string and substring must be consistent. Do not mix VARBINARY with CHAR or VARCHAR.
- POSITION is similar to STRPOS although POSITION allows finding by characters and by octet.
- If the string is not found, the return value is zero.
Examples

```sql
=> SELECT POSITION('é' IN 'étudiant' USING CHARACTERS);
  position
  --------
   1
(1 row)
=> SELECT POSITION('ß' IN 'straße' USING OCTETS);
  positionb
  -------
   5
(1 row)
=> SELECT POSITION('c' IN 'abcd' USING CHARACTERS);
  position
  -----
   3
(1 row)
=> SELECT POSITION(VARBINARY '456' IN VARBINARY '123456789');
  position
  ------
   4
(1 row)
```

```sql
SELECT POSITION('n' in 'León') as 'default',
  POSITIONB('León', 'n') as 'POSITIONB',
  POSITION('n' in 'León' USING CHARACTERS) as 'pos_chars',
  POSITION('n' in 'León' USING OCTETS) as 'pos_oct',
  INSTR('León', 'n'),
  INSTRB('León', 'n'),
  REGEXP_INSTR('León', 'n');
```

Default | POSITIONB | pos_chars | pos_oct | INSTR | INSTRB | REGEXP_INSTR
--------|----------|-----------|---------|-------|--------|-------------
4       | 5        | 4         | 5       | 4     | 5      | 4           
(1 row)

**POSITIONB**

Returns an INTEGER value representing the octet location of a specified substring with a string (counting from one).

**Behavior Type**

Immutable

**Syntax**

```sql
POSITIONB ( string, substring )
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>(CHAR or VARCHAR) is the string in which to locate the substring</td>
</tr>
<tr>
<td>substring</td>
<td>(CHAR or VARCHAR) is the substring to locate</td>
</tr>
</tbody>
</table>

Examples

```sql
=> SELECT POSITIONB('straße', 'ße');
POSITIONB
---------
 5
(1 row)
=> SELECT POSITIONB('étudiant', 'é');
POSITIONB
---------
 1
(1 row)
```

QUOTE_IDENT

Returns the specified string argument in the format required to use the string as an identifier in an SQL statement. Quotes are added as needed—for example, if the string contains non-identifier characters or is an SQL or Vertica-reserved keyword:

- 1time
- Next week
- SELECT

Embedded double quotes are doubled.

- SQL identifiers such as table and column names are stored as created, and references to them are resolved using case-insensitive compares. Thus, you do not need to double-quote mixed-case identifiers.
- Vertica quotes all reserved keywords, even if unused.

Behavior Type

Immutable
Syntax

`QUOTE_IDENT( 'string' )`

Parameters

| string | String to quote |

Examples

Quoted identifiers are case-insensitive, and Vertica does not supply the quotes:

```
=> SELECT QUOTE_IDENT('Vertica');
QUOTE_IDENT
----------------
Vertica
(1 row)
=> SELECT QUOTE_IDENT('Vertica database');
QUOTE_IDENT
----------------
"Vertica database"
(1 row)
```

Embedded double quotes are doubled:

```
=> SELECT QUOTE_IDENT('Vertica "!" database');
QUOTE_IDENT
----------------
"Vertica ""!"" database"
(1 row)
```

The following example uses the SQL keyword `SELECT`, so results are double quoted:

```
=> SELECT QUOTE_IDENT('select');
QUOTE_IDENT
---------
"select"
(1 row)
```

See Also

- `QUOTE_LITERAL`
- `QUOTE_NULLABLE`
QUOTE_LITERAL

Returns the given string suitably quoted for use as a string literal in a SQL statement string. Embedded single quotes and backslashes are doubled. As per the SQL standard, the function recognizes two consecutive single quotes within a string literal as a single quote character.

Behavior Type

Immutable

Syntax

QUOTE_LITERAL ( string )

Parameters

| string-expression | Argument that resolves to one or more strings to format as string literals. |

Examples

In the following example, the first query returns no first name for Cher or Sting; the second query uses QUOTE_LITERAL, which sets off string values with single quotes, including empty strings. In this case, fname for Sting is set to an empty string (' '), while fname for Cher is empty, indicating that it is set to null value:

```sql
=> SELECT * FROM lead_vocalists ORDER BY lname ASC;
fname | lname | band
----------------------------------------------
Cher  | "Sonny and Cher"
Mick  | Jagger | "Rolling Stones"
Diana | Ross   | "Supremes"
Grace | Slick  | "Jefferson Airplane","Jefferson Starship"
Sting | "Police"
Stevie| Winwood | "Spencer Davis Group","Traffic","Blind Faith"
(6 rows)

=> SELECT QUOTE_LITERAL (fname) "First Name", QUOTE_NULLABLE (lname) "Last Name", band FROM lead_vocalists ORDER BY lname ASC;
First Name | Last Name | band
----------------------------------------------
Cher | | null
Mick | | null
Diana | | null
Grace | | null
Stevie | | null
Sting | | null
(6 rows)
```
### See Also

- Character String Literals
- QUOTE_NULLABLE

### QUOTE_NULLABLE

Returns the given string suitably quoted for use as a string literal in an SQL statement string; or if the argument is null, returns the unquoted string NULL. Embedded single-quotes and backslashes are properly doubled.

### Behavior Type

**Immutable**

### Syntax

```
QUOTE_NULLABLE ( string-expression )
```

### Parameters

<table>
<thead>
<tr>
<th><code>string-expression</code></th>
<th>Argument that resolves to one or more strings to format as string literals. If <code>string-expression</code> resolves to null value, QUOTE_NULLABLE returns NULL.</th>
</tr>
</thead>
</table>
Examples

The following examples use the table lead_vocalists, where the first names (fname) for Cher and Sting are set to NULL and an empty string, respectively.

```sql
=> SELECT * from lead_vocalists ORDER BY lname DESC;
fname | lname | band
-------------------------------
Stevie | Winwood | ["Spencer Davis Group","Traffic","Blind Faith"]
       |        | ["Police"]
Grace  | Slick  | ["Jefferson Airplane","Jefferson Starship"]
Diana  | Ross   | ["Supremes"]
Mick   | Jagger | ["Rolling Stones"]
        | Cher   | ["Sonny and Cher"]
(6 rows)
```

```sql
=> SELECT * FROM lead_vocalists WHERE fname IS NULL;
fname | lname | band
-------------------------------
       | Cher  | ["Sonny and Cher"]
(1 row)
```

```sql
=> SELECT * FROM lead_vocalists WHERE fname = '';
fname | lname | band
-------------------------------
       | Sting | ["Police"]
(1 row)
```

The following query uses QUOTE_NONNULL. Like QUOTE_LITERAL, QUOTE_NONNULL sets off string values with single quotes, including empty strings. Unlike QUOTE_LITERAL, QUOTE_NONNULL outputs NULL for null values:

```sql
=> SELECT QUOTE_NONNULL (fname) "First Name", QUOTE_NONNULL (lname) "Last Name", band FROM lead_vocalists ORDER BY fname DESC;
First Name | Last Name | band
---------------------------------------------
NULL       | 'Cher'   | ["Sonny and Cher"]
'Stevie'   | 'Winwood'| ["Spencer Davis Group","Traffic","Blind Faith"]
'Mick'     | 'Jagger' | ["Rolling Stones"]
'Grace'    | 'Slick'  | ["Jefferson Airplane","Jefferson Starship"]
'Diana'    | 'Ross'   | ["Supremes"]
' '        | 'Sting'  | ["Police"]
(6 rows)
```

See Also

Character String Literals
REPEAT

Replicates a string the specified number of times and concatenates the replicated values as a single string. The return value takes on the data type of the string argument. Return values for non-LONG data types and LONG data types can be up to 65000 and 3200000 bytes in length, respectively. If the length of string * count exceeds these limits, Vertica silently truncates the results.

Behavior Type

Immutable

Syntax

REPEAT ( 'string', count )

Parameters

<table>
<thead>
<tr>
<th>string</th>
<th>The string to repeat, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHAR</td>
<td></td>
</tr>
<tr>
<td>VARCHAR</td>
<td></td>
</tr>
<tr>
<td>BINARY</td>
<td></td>
</tr>
<tr>
<td>VARBINARY</td>
<td></td>
</tr>
<tr>
<td>LONG VARCHAR</td>
<td></td>
</tr>
<tr>
<td>LONG VARBINARY</td>
<td></td>
</tr>
</tbody>
</table>

| count | An integer expression that specifies how many times to repeat string. |

Examples

The following example repeats vmart three times:

```sql
=> SELECT REPEAT ('vmart', 3);
REPEAT
------------------
vmartvmartvmart
(1 row)
```
**REPLACE**

Replaces all occurrences of characters in a string with another set of characters.

**Behavior Type**

Immutable

**Syntax**

REPLACE ('string', 'target', 'replacement')

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>The string to modify.</td>
</tr>
<tr>
<td>target</td>
<td>The characters in string to replace.</td>
</tr>
<tr>
<td>replacement</td>
<td>The characters to replace target.</td>
</tr>
</tbody>
</table>

**Examples**

```sql
> SELECT REPLACE('Documentation%20Library', '%20', ' ');  
     REPLACE  
-------------------  
Documentation Library  
(1 row)  
> SELECT REPLACE('This & That', '&amp;', 'and');  
     REPLACE  
-------------------  
This and That  
(1 row)  
> SELECT REPLACE('straße', 'ß', 'ss');  
     REPLACE  
-------  
strasse  
(1 row)  
```
RIGHT

Returns the specified characters from the right side of a string.

Behavior Type

Immutable

Syntax

RIGHT ( string-expr, length )

Parameters

<table>
<thead>
<tr>
<th>string-expr</th>
<th>The string expression to return.</th>
</tr>
</thead>
<tbody>
<tr>
<td>length</td>
<td>An integer value that specifies how many characters to return.</td>
</tr>
</tbody>
</table>

Examples

The following query returns the last three characters of the string 'vertica':

```sql
=> SELECT RIGHT('vertica', 3);
RIGHT
-----
ica
(1 row)
```

The following query queries date column date_ordered from table store.store_orders_fact. It coerces the dates to strings and extracts the last five characters from each string. It then returns all distinct strings:

```sql
SELECT DISTINCT(
    RIGHT(date_ordered::varchar, 5)) MonthDays
FROM store.store_orders_fact ORDER BY MonthDays;
```

MonthDays
----------
01-01
01-02
01-03
See Also

SUBSTR

RPAD

Returns a VARCHAR value representing a string of a specific length filled on the right with specific characters.

Behavior Type

Immutable

Syntax

RPAD ( expression , length [ , fill ] )
Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>(CHAR OR VARCHAR) specifies the string to fill</th>
</tr>
</thead>
<tbody>
<tr>
<td>length</td>
<td>(INTEGER) specifies the number of characters to return</td>
</tr>
<tr>
<td>fill</td>
<td>(CHAR OR VARCHAR) specifies the repeating string of characters with which to fill the output string. The default is the space character.</td>
</tr>
</tbody>
</table>

Examples

=> SELECT RPAD('database', 15, 'xzy');
   RPAD
   ------------
   databasexzyxzyx
(1 row)

If the string is already longer than the specified length it is truncated on the right:

=> SELECT RPAD('database', 6, 'xzy');
   RPAD
   ----
   database
(1 row)

RTRIM

Returns a VARCHAR value representing a string with trailing blanks removed from the right side (end).

Behavior Type

Immutable

Syntax

RTRIM ( expression [ , characters ] )
Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>(CHAR or VARCHAR) is the string to trim</th>
</tr>
</thead>
<tbody>
<tr>
<td>characters</td>
<td>(CHAR or VARCHAR) specifies the characters to remove from the right side of expression. The default is the space character.</td>
</tr>
</tbody>
</table>

Examples

```sql
=> SELECT RTRIM('trimzzyyyyyyyyyyyyyyyy', 'xyz');
RTRIM
------
trim
(1 row)
```

See Also

- BTRIM
- LTRIM
- TRIM

SHA1

Uses the US Secure Hash Algorithm 1 to calculate the SHA1 hash of string. Returns the result as a VARCHAR string in hexadecimal.

Behavior Type

**Immutable**

Syntax

```sql
SHA1 ( string )
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>The VARCHAR or VARBINARY string to be calculated.</td>
</tr>
</tbody>
</table>

Examples

The following examples calculate the SHA1 hash of the provided strings:

```
=> SELECT SHA1('123');

SHA1
------------------------
40bd001563085fc35165329ea1ff5c5ecdbb6ef
(1 row)
```

```
=> SELECT SHA1('Vertica'::bytea);

SHA1
------------------------
ee2cffe344995c6c301546c4fc5ee152d77c11
(1 row)
```

See Also

- MD5
- SHA224
- SHA256
- SHA384
- SHA512

SHA224

Uses the US Secure Hash Algorithm 2 to calculate the SHA224 hash of string. Returns the result as a VARCHAR string in hexadecimal.

Behavior Type

Immutable
Syntax

SHA224 ( string )

Parameters

| string | The VARCHAR or VARBINARY string to be calculated. |

Examples

The following examples calculate the SHA224 hash of the provided strings:

```
=> SELECT SHA224('abc');
    SHA224
--------------------------
78d8045d684abd2eece923758f3cd781489df3a48e1278982466017f
(1 row)
```

```
=> SELECT SHA224('Vertica'::bytea);
    SHA224
--------------------------
135ac268f64ff3124aeeebc3cc0af0a29fd600a3be8e29ed97e45e25
(1 row)
```

```
=> SELECT sha224(''::varbinary) = 'd14a028c2a3a2bc9476102bb288234c415a2b01f08s8ea62ac5b3e42f' AS "TRUE";
    TRUE
-------------
t
(1 row)
```

See Also

- MD5
- SHA1
- SHA256
- SHA384
- SHA512
SHA256

Uses the US Secure Hash Algorithm 2 to calculate the SHA256 hash of string. Returns the result as a VARCHAR string in hexadecimal.

Behavior Type

Immutable

Syntax

SHA256 ( string )

Parameters

<table>
<thead>
<tr>
<th>string</th>
</tr>
</thead>
<tbody>
<tr>
<td>The VARCHAR or VARBINARY string to be calculated.</td>
</tr>
</tbody>
</table>

Examples

The following examples calculate the SHA256 hash of the provided strings:

```sql
=> SELECT SHA256('abc');
    SHA256
---------
a665a45920422f9d417e4867efdc4fb8a04a1f3fff1fa07e998e86f7f7a27ae3
(1 row)

=> SELECT SHA256('Vertica'::bytea);
    SHA256
--------------------
9981b0b7df9f5be06e9e1a7f4ae2336a7868d9a522b9a6ca6a87cd9ed95ba53
(1 row)

=> SELECT sha256('') = 'e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855' AS TRUE;
     TRUE
    ------
     t
(1 row)
```
See Also

- MD5
- SHA1
- SHA224
- SHA384
- SHA512

SHA384

Uses the US Secure Hash Algorithm 2 to calculate the SHA384 hash of string. Returns the result as a VARCHAR string in hexadecimal.

Behavior Type

Immutable

Syntax

SHA384 ( string )

Parameters

| string | The VARCHAR or VARBINARY string to be calculated. |

Examples

The following examples calculate the SHA384 hash of the provided strings:

```sql
=> SELECT SHA384('123');

<table>
<thead>
<tr>
<th>SHA384</th>
</tr>
</thead>
<tbody>
<tr>
<td>9a0a82f0c0cf31470d7affede3406cc9aa8410671520b727844eda15b4c25532a9b5cd8aaf9cec4919d76255b6bf00f</td>
</tr>
</tbody>
</table>
(1 row)
```

```sql
=> SELECT SHA384('Vertica':::bytea);

<table>
<thead>
<tr>
<th>SHA384</th>
</tr>
</thead>
<tbody>
<tr>
<td>4f5712e0364f63124a8a8695e189f75f618b299e0f4140ce03edf384f75407f6</td>
</tr>
</tbody>
</table>
(1 row)
```
SHA512

Uses the US Secure Hash Algorithm 2 to calculate the SHA512 hash of string. Returns the result as a VARCHAR string in hexadecimal.

Behavior Type

Immutable

Syntax

SHA512 ( string )

Parameters

| string | The VARCHAR or VARBINARY string to be calculated. |

Examples

The following examples calculate the SHA512 hash of the provided strings:

```sql
=> SELECT SHA512('123');
SHA512
-----------------------------
3431a717dc3289862bbd636a064d26980b47ebe4e684b800c0f4756f0c24985866ef97763aef548fedb0ce28722c96bb
(1 row)
```
SOUNDEX

Takes a VARCHAR argument and returns a four-character code that enables comparison of that argument with other SOUNDEX-encoded strings that are spelled differently in English, but are phonetically similar. SOUNDEX implements an algorithm that was developed by Robert C. Russell and Margaret King Odell, and is described in The Art of Computer Programming, Vol. 3.

Behavior Type

Immutable

Syntax

SOUNDEX (string-expression)
Parameters

**string-expression** The VARCHAR expression to encode.

Soundex Encoding Algorithm

Vertica uses the following Soundex encoding algorithm, which complies with most SQL implementations:

1. Save the first letter. Map all occurrences of a, e, i, o, u, y, h, w to zero (0).
2. Replace all consonants (include the first letter) with digits:
   - b, f, p, v → 1
   - c, g, j, k, q, s, x, z → 2
   - d, t → 3
   - l → 4
   - m, n → 5
   - r → 6
3. Replace all adjacent same digits with one digit, and then remove all zero (0) digits
4. If the saved letter's digit is the same as the resulting first digit, remove the digit (keep the letter).
5. Append 3 zeros if result contains less than 3 digits. Remove all except first letter and 3 digits after it.

**Note:**

Encoding ignores all non-alphabetic characters—for example, the apostrophe in O'Connor.

Examples

Find last names in the employee_dimension table that are phonetically similar to Lee:

```sql
SELECT employee_last_name, employee_first_name, employee_state
FROM public.employee_dimension
WHERE SOUNDEX(employee_last_name) = SOUNDEX('Lee')
ORDER BY employee_state, employee_last_name, employee_first_name;
```

<table>
<thead>
<tr>
<th>Employee_last_name</th>
<th>Employee_first_name</th>
<th>Employee_state</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lea</td>
<td>James</td>
<td>AZ</td>
</tr>
<tr>
<td>Li</td>
<td>Sam</td>
<td>AZ</td>
</tr>
<tr>
<td>Lee</td>
<td>Darlene</td>
<td>CA</td>
</tr>
<tr>
<td>Lee</td>
<td>Juanita</td>
<td>CA</td>
</tr>
<tr>
<td>Li</td>
<td>Amy</td>
<td>CA</td>
</tr>
<tr>
<td>Li</td>
<td>Barbara</td>
<td>CA</td>
</tr>
</tbody>
</table>
See Also
SOUNDEX_MATCHES

SOUNDEX_MATCHES

Compares the Soundex encodings of two strings. The function then returns an integer that indicates the number of matching characters, in the same order. The return value is 0 to 4 inclusive, where 0 indicates no match, and 4 an exact match.

For details on how Vertica implements Soundex encoding, see SOUNDEX.

Behavior Type
Immutable

Syntax
SOUNDEX_MATCHES ( string-expression1, string-expression2 )

Parameters

<table>
<thead>
<tr>
<th>string-expression1</th>
<th>string-expression2</th>
</tr>
</thead>
<tbody>
<tr>
<td>The two VARCHAR expressions to encode and compare.</td>
<td></td>
</tr>
</tbody>
</table>

Examples

Find how well the Soundex encodings of two strings match:

- Compare the Soundex encodings of Lewis and Li:

  ```sql
  > SELECT SOUNDEX_MATCHES('Lewis', 'Li');
  SOUNDEX_MATCHES
  -------------------
  1
  ```
Compare the Soundex encodings of Lee and Li:

```sql
SELECT SOUNDEX_MATCHES('Lee', 'Li');
```

<table>
<thead>
<tr>
<th>SOUNDEX_MATCHES</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
</tr>
</tbody>
</table>

Find last names in the `employee_dimension` table whose Soundex encodings match at least 3 characters in the encoding for Lewis:

```sql
SELECT DISTINCT employee_last_name
FROM public.employee_dimension
WHERE SOUNDEX_MATCHES (employee_last_name, 'Lewis') >= 3 ORDER BY employee_last_name;
```

<table>
<thead>
<tr>
<th>employee_last_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lea</td>
</tr>
<tr>
<td>Lee</td>
</tr>
<tr>
<td>Leigh</td>
</tr>
<tr>
<td>Lewis</td>
</tr>
<tr>
<td>Li</td>
</tr>
<tr>
<td>Reyes</td>
</tr>
</tbody>
</table>

See Also

**SOUNDEX**

**SPACE**

Returns the specified number of blank spaces, typically for insertion into a character string.

**Behavior Type**

**Immutable**

**Syntax**

`SPACE(n)`
Parameters

| n   | An integer argument that specifies how many spaces to insert. |

Example

The following example concatenates strings x and y with 10 spaces inserted between them:

```
=> SELECT 'x' || SPACE(10) || 'y' AS Ten_spaces;
  Ten_spaces
  ------------
   x    y
(1 row)
```

SPLIT_PART

Splits string on the delimiter and returns the string at the location of the beginning of the specified field (counting from 1).

Behavior Type

Immutable

Syntax

SPLIT_PART ( string , delimiter , field )

Parameters

<table>
<thead>
<tr>
<th>string</th>
<th>Argument string</th>
</tr>
</thead>
<tbody>
<tr>
<td>delimiter</td>
<td>Delimiter</td>
</tr>
<tr>
<td>field</td>
<td>(INTEGER) Number of the part to return</td>
</tr>
</tbody>
</table>
Notes

Use this with the character form of the subfield.

Examples

The specified integer of 2 returns the second string, or def.

```sql
=> SELECT SPLIT_PART('abc~@~def~@~ghi', '~@~', 2);
SPLIT_PART
----------
def
(1 row)
```

In the next example, specify 3, which returns the third string, or 789.

```sql
=> SELECT SPLIT_PART('123~|~456~|~789', '~|~', 3);
SPLIT_PART
---------
789
(1 row)
```

The tildes are for readability only. Omitting them returns the same results:

```sql
=> SELECT SPLIT_PART('123|456|789', '|', 3);
SPLIT_PART
---------
789
(1 row)
```

See what happens if you specify an integer that exceeds the number of strings: The result is not null, it is an empty string.

```sql
=> SELECT SPLIT_PART('123|456|789', '|', 4);
SPLIT_PART
---------
(1 row)
=> SELECT SPLIT_PART('123|456|789', '|', 4) IS NULL;
?column?
---------
f
(1 row)
```

If SPLIT_PART had returned NULL, LENGTH would have returned 0.

```sql
=> SELECT LENGTH (SPLIT_PART('123|456|789', '|', 4));
```
If the locale of your database is BINARY, SPLIT_PART calls SPLIT_PARTB:

```
=> SHOW LOCALE;
   name     |                     setting
----------+---------------------
 locale   | en_US@collation=binary {LEN_KBINARY} (1 row)
=> SELECT SPLIT_PART('123456789', '5', 1);
split_partb
----------
 1234
(1 row)
```

```
=> SET LOCALE TO 'en_US@collation=standard';
INFO 2567: Canonical locale: 'en_US@collation=standard'
Standard collation: 'LEN'
English (United States, collation=standard)
=> SELECT SPLIT_PART('123456789', '5', 1);
split_part
----------
 1234
(1 row)
```

See Also

- `SPLIT_PARTB`

SPLIT_PARTB

Splits string on the delimiter and returns the string at the location of the beginning of the specified field (counting from 1). The VARCHAR arguments are treated as octets rather than UTF-8 characters.

Behavior Type

Immutable

Syntax

```
SPLIT_PARTB ( string , delimiter , field )
```
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>(VARCHAR) Is the argument string.</td>
</tr>
<tr>
<td>delimiter</td>
<td>(VARCHAR) Is the given delimiter.</td>
</tr>
<tr>
<td>field</td>
<td>(INTEGER) is the number of the part to return.</td>
</tr>
</tbody>
</table>

### Notes

Use this function with the character form of the subfield.

### Examples

The specified integer of 3 returns the third string, or soupçon.

```sql
=> SELECT SPLIT_PARTB('straße~@~café~@~soupçon', '~@~', 3);
SPLIT_PARTB
----------
soupçon
(1 row)
```

The tildes are for readability only. Omitting them returns the same results:

```sql
=> SELECT SPLIT_PARTB('straße @ café @ soupçon', '@', 3);
SPLIT_PARTB
----------
soupçon
(1 row)
```

See what happens if you specify an integer that exceeds the number of strings: The result is not null, it is an empty string.

```sql
=> SELECT SPLIT_PARTB('straße @ café @ soupçon', '@', 4);
SPLIT_PARTB
--------
(1 row)
=> SELECT SPLIT_PARTB('straße @ café @ soupçon', '@', 4) IS NULL;
?column?
--------
 f
(1 row)
```

If the locale of your database is BINARY, SPLIT_PART calls SPLIT_PARTB:
SHOW LOCALE;
name | setting
--- | --------------
locale | en_US@collation=binary (LEN_BINARY) (1 row)
=> SELECT SPLIT_PART('123456789', '5', 1);
split_partb
----------
1234 (1 row)

=> SET LOCALE TO 'en_US@collation=standard';
INFO 2567: Canonical locale: 'en_US@collation=standard'
Standard collation: 'LEN'
English (United States, collation=standard)
SET
=> SELECT SPLIT_PART('123456789', '5', 1);
split_part
----------
1234 (1 row)

See Also

- SPLIT_PART

STRPOS

Returns an INTEGER value representing the character location of a specified substring within a string (counting from one).

Behavior Type

Immutable

Syntax

STRPOS ( string , substring )

Parameters

| string          | (CHAR or VARCHAR) is the string in which to locate the substring |
**Notes**

STRPOS is similar to [POSITION](#) although POSITION allows finding by characters and by octet.

If the string is not found, the return value is zero.

**Examples**

```sql
=> SELECT STRPOS('abcd', 'c');

<table>
<thead>
<tr>
<th>STRPOS</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
</tr>
</tbody>
</table>

(1 row)
```

**STRPOSB**

Returns an INTEGER value representing the location of a specified substring within a string, counting from one, where each octet in the string is counted (as opposed to characters).

**Behavior Type**

*Immutable*

**Syntax**

```
STRPOSB ( string , substring )
```

**Parameters**

<table>
<thead>
<tr>
<th><strong>string</strong></th>
<th>(CHAR or VARCHAR) is the string in which to locate the substring</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>substring</strong></td>
<td>(CHAR or VARCHAR) is the substring to locate</td>
</tr>
</tbody>
</table>
**Notes**

STRPOSB is identical to POSITIONB except for the order of the arguments.

**Examples**

```sql
=> SELECT STRPOSB('straße', 'e');
STRPOSB
--------
7
(1 row)

=> SELECT STRPOSB('étudiant', 'tud');
STRPOSB
--------
3
(1 row)
```

**SUBSTR**

Returns VARCHAR or VARBINARY value representing a substring of a specified string.

**Behavior Type**

Immutable

**Syntax**

```sql
SUBSTR ( string , position [ , extent ] )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>(CHAR/VARCHAR or BINARY/VARBINARY) is the string from which to extract a substring. If null, Vertica returns no results.</td>
</tr>
<tr>
<td>position</td>
<td>(INTEGER or DOUBLE PRECISION) is the starting position of the substring (counting from one by characters). If 0 or negative, Vertica returns no results.</td>
</tr>
</tbody>
</table>
| extent    | (INTEGER or DOUBLE PRECISION) is the length of the substring to extract (in
characters). The default is the end of the string.

Notes

SUBSTR truncates DOUBLE PRECISION input values.

Examples

```sql
=> SELECT SUBSTR('abc':binary(3),1);
  substr
  -------
   abc
   (1 row)
=> SELECT SUBSTR('123456789', 3, 2);
  substr
  -------
    34
    (1 row)
=> SELECT SUBSTR('123456789', 3);
  substr
  -------
  3456789
  (1 row)
=> SELECT SUBSTR(TO_BITSTRING(HEX_TO_BINARY('0x10')), 2, 2);
  substr
  -------
    00
    (1 row)
=> SELECT SUBSTR(TO_HEX(10010), 2, 2);
  substr
  -------
    71
    (1 row)
```

SUBSTRB

Returns an octet value representing the substring of a specified string.

Behavior Type

Immutable
**Syntax**

```
SUBSTRB ( string , position [ , extent ] )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>(CHAR/VARCHAR) is the string from which to extract a substring.</td>
</tr>
<tr>
<td>position</td>
<td>(INTEGER or DOUBLE PRECISION) is the starting position of the substring (counting from one in octets).</td>
</tr>
<tr>
<td>extent</td>
<td>(INTEGER or DOUBLE PRECISION) is the length of the substring to extract (in octets). The default is the end of the string</td>
</tr>
</tbody>
</table>

**Notes**

- This function treats the multibyte character string as a string of octets (bytes) and uses octet numbers as incoming and outgoing position specifiers and lengths. The strings themselves are type VARCHAR, but they treated as if each octet were a separate character.
- SUBSTRB truncates DOUBLE PRECISION input values.

**Examples**

```
=> SELECT SUBSTRB('soupçon', 5);
SUBSTRB
--------
çon
(1 row)

=> SELECT SUBSTRB('soupçon', 5, 2);
SUBSTRB
--------
ç
(1 row)
```

Vertica returns the following error message if you use BINARY/VARBINARY:

```
=> SELECT SUBSTRB('abc':binary(3),1);
ERROR: function substrb(binary, int) does not exist, or permission is denied for substrb(binary, int)
HINT: No function matches the given name and argument types. You may need to add explicit type
```
SUBSTRING

Returns a value representing a substring of the specified string at the given position, given a value, a position, and an optional length. SUBSTRING truncates DOUBLE PRECISION input values.

Behavior Type

Immutable if USING OCTETS, stable otherwise.

Syntax

```
SUBSTRING ( string, position[, length ]
[USING {CHARACTERS | OCTETS } ] )
SUBSTRING ( string FROM position [ FOR length ]
[USING { CHARACTERS | OCTETS } ] )
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>(CHAR/VARCHAR or BINARY/VARBINARY) is the string from which to extract a substring</td>
</tr>
<tr>
<td>position</td>
<td>(INTEGER or DOUBLE PRECISION) is the starting position of the substring (counting from one by either characters or octets). (The default is characters.) If position is greater than the length of the given value, an empty value is returned.</td>
</tr>
<tr>
<td>length</td>
<td>(INTEGER or DOUBLE PRECISION) is the length of the substring to extract in either characters or octets. (The default is characters.) The default is the end of the string. If a length is given the result is at most that many bytes. The maximum length is the length of the given value less the given position. If no length is given or if the given length is greater than the maximum length then</td>
</tr>
<tr>
<td>USING CHARACTERS</td>
<td>OCTETS</td>
</tr>
<tr>
<td>------------------</td>
<td>--------</td>
</tr>
<tr>
<td>the length is set to the maximum length.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

```sql
=> SELECT SUBSTRING('abc':binary(3),1);
  substring
  -----------
  abc
  (1 row)

=> SELECT SUBSTRING('soupçon', 5, 2 USING CHARACTERS);
  substring
  -----------
  ço
  (1 row)

=> SELECT SUBSTRING('soupçon', 5, 2 USING OCTETS);
  substring
  -----------
  ç
  (1 row)
```

If you use a negative position, then the functions starts at a non-existent position. In this example, that means counting eight characters starting at position -4. So the function starts at the empty position -4 and counts five characters, including a position for zero which is also empty. This returns three characters.

```sql
=> SELECT SUBSTRING('1234567890', -4, 8);
  substring
  -----------
  123
  (1 row)
```

**TO_BITSTRING**

Returns a VARCHAR that represents the given VARBINARY value in bitstring format. This function is the inverse of **BITSTRING_TO_BINARY**.

**Behavior Type**

*Immutable*
Syntax

\texttt{TO\_BITSTRING ( expression )}

Parameters

| expression | The VARCHAR string to process. |

Examples

\begin{verbatim}
=> SELECT TO\_BITSTRING('ab':BINARY(2));
    to\_bitstring
-----------------
   0110000101100010
(1 row)

=> SELECT TO\_BITSTRING(HEX\_TO\_BINARY('0x10'));
    to\_bitstring
---------------
  00010000
(1 row)

=> SELECT TO\_BITSTRING(HEX\_TO\_BINARY('0xF0'));
    to\_bitstring
---------------
11110000
(1 row)
\end{verbatim}

See Also

BITCOUNT

TO\_HEX

Returns a VARCHAR or VARBINARY representing the hexadecimal equivalent of a number. This function is the inverse of \texttt{HEX\_TO\_BINARY}.

Behavior Type

Immutable
Syntax
TO_HEX ( number )

Parameters

<table>
<thead>
<tr>
<th>number</th>
<th>An INTEGER or VARBINARY value to convert to hexadecimal. If you supply a VARBINARY argument, the function's return value is not preceded by 0x.</th>
</tr>
</thead>
</table>

Examples

=> SELECT TO_HEX(123456789);
  TO_HEX
  ---------
  75bcd15
  (1 row)

For VARBINARY inputs, the returned value is not preceded by 0x. For example:

=> SELECT TO_HEX('ab':::binary(2));
  TO_HEX
  ---------
  6162
  (1 row)

TRANSLATE

Replaces individual characters in string_to_replace with other characters.

Behavior Type

Immutable

Syntax
TRANSLATE ( string_to_replace, from_string, to_string );
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string_to_replace</td>
<td>String to be translated.</td>
</tr>
<tr>
<td>from_string</td>
<td>Contains characters that should be replaced in string_to_replace.</td>
</tr>
<tr>
<td>to_string</td>
<td>Any character in string_to_replace that matches a character in from_string is replaced by the corresponding character in to_string.</td>
</tr>
</tbody>
</table>

### Example

```sql
=> SELECT TRANSLATE('straße', 'ß', 'ss');
TRANSLATE
---------
strase
(1 row)
```

### TRIM

Combines the BTRIM, LTRIM, and RTRIM functions into a single function.

### Behavior Type

*Immutable*

### Syntax

```
TRIM ( [ [ LEADING | TRAILING | BOTH ] characters FROM ] expression )
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LEADING</td>
<td>Removes the specified characters from the left side of the string</td>
</tr>
<tr>
<td>TRAILING</td>
<td>Removes the specified characters from the right side of the string</td>
</tr>
<tr>
<td>BOTH</td>
<td>Removes the specified characters from both sides of the string (default)</td>
</tr>
</tbody>
</table>
**characters** (CHAR or VARCHAR) specifies the characters to remove from expression. The default is the space character.

**expression** (CHAR or VARCHAR) is the string to trim

**Examples**

```sql
=> SELECT '-' || TRIM(LEADING 'x' FROM 'xxdatabasexx') || '-';
?column?
----------
-databasexx-
(1 row)

=> SELECT '-' || TRIM(TRAILING 'x' FROM 'xxdatabasexx') || '-';
?column?
----------
-xxdatabase-
(1 row)

=> SELECT '-' || TRIM(BOTH 'x' FROM 'xxdatabasexx') || '-';
?column?
----------
-database-
(1 row)

=> SELECT '-' || TRIM('x' FROM 'xxdatabasexx') || '-';
?column?
----------
-database-
(1 row)

=> SELECT '-' || TRIM(LEADING FROM 'database ') || '-';
?column?
----------
-database -
(1 row)

=> SELECT '-' || TRIM(' database ') || '-'; ?column?
----------
-database-
(1 row)
```

**See Also**

- BTRIM
- LTRIM
- RTRIM
UPPER

Returns a VARCHAR value containing the argument converted to uppercase letters.

Starting in Release 5.1, this function treats the string argument as a UTF-8 encoded string, rather than depending on the collation setting of the locale (for example, collation=binary) to identify the encoding.

Behavior Type

stable

Syntax

UPPER ( expression )

Parameters

| expression | CHAR or VARCHAR containing the string to convert |

Notes

UPPER is restricted to 32500 octet inputs, since it is possible for the UTF-8 representation of result to double in size.

Examples

```sql
=> SELECT UPPER('AbCdEfG');
  UPPER
  ------
  ABCDEFG
(1 row)
=> SELECT UPPER('étudiant');
  UPPER
  ------
  ÉTUDIANT
(1 row)
```
**UPPERB**

Returns a character string with each ASCII character converted to uppercase. Multibyte characters are not converted and are skipped.

**Behavior Type**

Immutable

**Syntax**

```sql
UPPERB ( expression )
```

**Parameters**

- `expression` (CHAR or VARCHAR) is the string to convert

**Examples**

In the following example, the multibyte UTF-8 character é is not converted to uppercase:

```sql
=> SELECT UPPERB('étudiant');
UPPERB
---------
étUDIANT
(1 row)

=> SELECT UPPERB('AbCdEfG');
UPPERB
--------
ABCDEFG
(1 row)

=> SELECT UPPERB('The Vertica Database');
UPPERB
------------------
THE VERTICA DATABASE
(1 row)
```
V6_ATON

Converts an IPv6 address represented as a character string to a binary string.

Behavior Type

Immutable

Syntax

V6_ATON ( expression )

Parameters

expression (VARCHAR) is the string to convert.

Notes

The following syntax converts an IPv6 address represented as the character string A to a binary string B.

V6_ATON trims any spaces from the right of A and calls the Linux function inet_pton.

=> V6_ATON(VARCHAR A) -> VARBINARY(16) B

If A has no colons it is prepended with '::ffff:'. If A is NULL, too long, or if inet_pton returns an error, the result is NULL.

Examples

=> SELECT V6_ATON('2001:DB8::8:800:200C:417A');

v6_aton

----------------------------------------
\001\015\270\000\000\000\000\010\010\000 \014Az
(1 row)

=> SELECT V6_ATON('1.2.3.4');
v6_aton

\000\000\000\000\000\000\000\000\000\000\000\000\000\000\377\377\001\002\003\004
(1 row)
SELECT TO_HEX(V6_ATON('2001:DB8::8:800:200C:417A'));
to_hex
-------------------------------
20010db80000000000000000200c417a
(1 row)
=> SELECT V6_ATON('::1.2.3.4');
v6_aton
-------------------------------
\000\000\000\000\000\000\000\000\000\000\000\000\000\000\000\000\000\000\000\000\000\001\002\003\004
(1 row)

See Also

- **V6_NTOA**

V6_NTOA

Converts an IPv6 address represented as varbinary to a character string.

**Behavior Type**

*Immutable*

**Syntax**

V6_NTOA ( expression )

**Parameters**

| expression | (VARBINARY) is the binary string to convert. |

**Notes**

The following syntax converts an IPv6 address represented as VARBINARY B to a string A.
V6_NTOA right-pads B to 16 bytes with zeros, if necessary, and calls the Linux function `inet_ntop`.

=> V6_NTOA(VARBINARY B) -> VARCHAR A

If B is NULL or longer than 16 bytes, the result is NULL.

Vertica automatically converts the form '::ffff:1.2.3.4' to '1.2.3.4'.

**Examples**

=> SELECT V6_NTOA(' \001\015\270\000\000\000\000\010\010\000 \014Az');
   v6_ntoa
   ---------------------
   2001:db8::8:800:200c:417a
   (1 row)

=> SELECT V6_NTOA(V6_ATON('1.2.3.4'));
   v6_ntoa
   -------
   1.2.3.4
   (1 row)

=> SELECT V6_NTOA(V6_ATON('::1.2.3.4'));
   v6_ntoa
   -------
   ::1.2.3.4
   (1 row)

**See Also**

- V6_ATON

**V6_SUBNETA**

Calculates a subnet address in CIDR (Classless Inter-Domain Routing) format from a binary or alphanumerical IPv6 address.

**Behavior Type**

Immutable
Syntax

V6_SUBNETA (expression1, expression2)

Parameters

| expression1 | (VARBINARY or VARCHAR) is the string to calculate. |
| expression2 | (INTEGER) is the size of the subnet. |

Notes

The following syntax calculates a subnet address in CIDR format from a binary or varchar IPv6 address.

V6_SUBNETA masks a binary IPv6 address B so that the N leftmost bits form a subnet address, while the remaining rightmost bits are cleared. It then converts to an alphanumeric IPv6 address, appending a slash and N.

=> V6_SUBNETA(BINARY B, INT8 N) -> VARCHAR C

The following syntax calculates a subnet address in CIDR format from an alphanumeric IPv6 address.

=> V6_SUBNETA(VARCHAR A, INT8 N) -> V6_SUBNETA(V6_ATON(A), N) -> VARCHAR C

Examples

=> SELECT V6_SUBNETA(V6_ATON('2001:db8::8:800:200c:417a'), 28);

v6_subneta

-------------------
2001:db0::/28
(1 row)

See Also

- V6_SUBNETN
V6_SUBNETN

Calculates a subnet address in CIDR (Classless Inter-Domain Routing) format from a varbinary or alphanumeric IPv6 address.

Behavior Type

Immutable

Syntax

V6_SUBNETN ( expression1, expression2 )

Parameters

<table>
<thead>
<tr>
<th>expression1</th>
<th>(VARBINARY or VARCHAR) is the string to calculate.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notes:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• V6_SUBNETN (&lt;VARBINARY&gt;, &lt;INTEGER&gt;) returns VARBINARY.</td>
</tr>
<tr>
<td></td>
<td>OR</td>
</tr>
<tr>
<td></td>
<td>• V6_SUBNETN (&lt;VARCHAR&gt;, &lt;INTEGER&gt;) returns VARBINARY, after using V6_ATON to convert the &lt;VARCHAR&gt; string to &lt;VARBINARY&gt;.</td>
</tr>
<tr>
<td>expression2</td>
<td>(INTEGER) is the size of the subnet.</td>
</tr>
</tbody>
</table>

Notes

The following syntax masks a BINARY IPv6 address B so that the N left-most bits of S form a subnet address, while the remaining right-most bits are cleared.

V6_SUBNETN right-pads B to 16 bytes with zeros, if necessary and masks B, preserving its N-bit subnet prefix.

=> V6_SUBNETN(VARBINARY B, INT8 N) -> VARBINARY(16) S
If B is NULL or longer than 16 bytes, or if N is not between 0 and 128 inclusive, the result is NULL.

S = [B]/N in Classless Inter-Domain Routing notation (CIDR notation).

The following syntax masks an alphanumeric IPv6 address A so that the N leftmost bits form a subnet address, while the remaining rightmost bits are cleared.

$$=> \text{V6\_SUBNETN(VARCHAR A, INT8 N)} -> \text{V6\_SUBNETN(V6\_ATON(A), N)} -> \text{VARBINARY(16) S}$$

**Example**

This example returns VARBINARY, after using V6\_ATON to convert the VARCHAR string to VARBINARY:

$$=> \text{SELECT V6\_SUBNETN(V6\_ATON('2001:db8::8:800:200c:417a'), 28);}$$

<table>
<thead>
<tr>
<th>v6_subnetn</th>
</tr>
</thead>
<tbody>
<tr>
<td>\001\015\260\000\000\000\000\000\000\000\000\000\000\000\000\000\000</td>
</tr>
</tbody>
</table>
Parameters

\[\text{expression} \quad \text{(VARBINARY or VARCHAR)} \text{ is the type to convert.}\]

Notes

\[\text{V6\_TYPE(VARBINARY } B \text{) returns INT8 } T.\]

\[\Rightarrow \text{V6\_TYPE(VARCHAR } A \text{) } \Rightarrow \text{V6\_TYPE(V6\_ATON(A)) } \Rightarrow \text{INT8 } T\]

The IPv6 types are defined in the Network Working Group's [IP Version 6 Addressing Architecture memo](#).

<table>
<thead>
<tr>
<th>GLOBAL</th>
<th>0</th>
<th>Global unicast addresses</th>
</tr>
</thead>
<tbody>
<tr>
<td>LINKLOCAL</td>
<td>1</td>
<td>Link-Local unicast (and Private-Use) addresses</td>
</tr>
<tr>
<td>LOOPBACK</td>
<td>2</td>
<td>Loopback</td>
</tr>
<tr>
<td>UNSPECIFIED</td>
<td>3</td>
<td>Unspecified</td>
</tr>
<tr>
<td>MULTICAST</td>
<td>4</td>
<td>Multicast</td>
</tr>
</tbody>
</table>

IPv4-mapped and IPv4-compatible IPv6 addresses are also interpreted, as specified in [IPv4 Global Unicast Address Assignments](#).

- For IPv4, Private-Use is grouped with Link-Local.
- If \(B\) is VARBINARY, it is right-padded to 16 bytes with zeros, if necessary.
- If \(B\) is NULL or longer than 16 bytes, the result is NULL.

Details

IPv4 (either kind):

<table>
<thead>
<tr>
<th>0.0.0.0/8</th>
<th>UNSPECIFIED</th>
<th>10.0.0.0/8</th>
<th>LINKLOCAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>127.0.0.0/8</td>
<td>LOOPBACK</td>
<td></td>
<td></td>
</tr>
<tr>
<td>169.254.0.0/16</td>
<td>LINKLOCAL</td>
<td></td>
<td></td>
</tr>
<tr>
<td>172.16.0.0/12</td>
<td>LINKLOCAL</td>
<td></td>
<td></td>
</tr>
<tr>
<td>192.168.0.0/16</td>
<td>LINKLOCAL</td>
<td></td>
<td></td>
</tr>
<tr>
<td>224.0.0.0/4</td>
<td>MULTICAST</td>
<td></td>
<td></td>
</tr>
<tr>
<td>others</td>
<td></td>
<td></td>
<td>GLOBAL</td>
</tr>
</tbody>
</table>

IPv6:

<table>
<thead>
<tr>
<th>::0/128</th>
<th>UNSPECIFIED</th>
<th>::1/128</th>
<th>LOOPBACK</th>
</tr>
</thead>
<tbody>
<tr>
<td>fe80::/10</td>
<td>LINKLOCAL</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ff00::/8</td>
<td>MULTICAST</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Examples

=> SELECT V6_TYPE(V6_ATON('192.168.2.10'));
  v6_type
  --------
    1
  (1 row)

=> SELECT V6_TYPE(V6_ATON('2001:db8::8:800:200c:417a'));
  v6_type
  --------
    0
  (1 row)

System Information Functions

These functions provide system information regarding user sessions. A superuser has unrestricted access to all system information, but users can view only information about their own, current sessions.

CURRENT_DATABASE

Returns the name of the current database, equivalent to DBNAME.

Behavior Type

Stable

Syntax

Note: Parentheses are optional.

CURRENT_DATABASE()

Examples

=> SELECT CURRENT_DATABASE;
CURRENT_DATABASE
---------------------
VMart
(1 row)

CURRENT_SCHEMA

Returns the name of the current schema.
Behavior Type

Stable

Syntax

CURRENT_SCHEMA()

Note:
You can call this function without parentheses.

Privileges

None

Examples

The following command returns the name of the current schema:

```sql
=> SELECT CURRENT_SCHEMA();
current_schema
-----------
public
(1 row)
```

The following command returns the same results without the parentheses:

```sql
=> SELECT CURRENT_SCHEMA;
current_schema
-----------
public
(1 row)
```

The following command shows the current schema, listed after the current user, in the search path:

```sql
=> SHOW SEARCH_PATH;
name | setting
-----+-------------------------------------
search_path | "$user", public, v_catalog, v_monitor, v_internal
(1 row)
```
See Also

- SET SEARCH_PATH

**CURRENT_USER**

Returns a VARCHAR containing the name of the user who initiated the current database connection.

**Behavior Type**

Stable

**Syntax**

CURRENT_USER()

**Notes**

- The CURRENT_USER function does not require parentheses.
- This function is useful for permission checking.
- CURRENT_USER is equivalent to SESSION_USER, USER, and USERNAME.

**Examples**

```sql
=> SELECT CURRENT_USER();
CURRENT_USER
----------
dbadmin
(1 row)
```

The following command returns the same results without the parentheses:

```sql
=> SELECT CURRENT_USER;
CURRENT_USER
----------
dbadmin
(1 row)
```
DBNAME (function)

Returns the name of the current database, equivalent to CURRENT_DATABASE.

Behavior Type

Immutable

Syntax

DBNAME()

Examples

```sql
=> SELECT DBNAME();
  dbname
  -------------------
  VMart
  (1 row)
```

HAS_TABLE_PRIVILEGE

Returns true or false to verify whether a user has the specified privilege on a table.

Behavior Type

Stable

Syntax

HAS_TABLE_PRIVILEGE ([ user, ] ['[[database.]schema.]table', 'privilege'])
# Parameters

<table>
<thead>
<tr>
<th><strong>user</strong></th>
<th>Name or OID of a database user. If omitted, Vertica checks privileges for the current user.</th>
</tr>
</thead>
</table>
| **[database.]schema** | Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example:  

```
myschema.thisDbObject
```

If you specify a database, it must be the current database. |
| **table** | Name or OID of the table to check. |
| **privilege** | A [table privilege](#), one of the following:  

- SELECT: [Query](#) tables. SELECT privileges are granted by default to the PUBLIC role.  
- INSERT: Insert table rows with INSERT, and load data with COPY.  

**Note:**  
COPY FROM STDIN is allowed for users with INSERT privileges, while COPY FROM *file* requires admin privileges.  

- UPDATE: [Update](#) table rows.  
- DELETE: [Delete](#) table rows.  
- REFERENCES: Create [foreign key constraints](#) on this table. This privilege must be set on both referencing and referenced tables.  
- TRUNCATE: [Truncate](#) table contents. Non-owners of tables can also execute the following partition operations on them:  
  - DROP_PARTITIONS  
  - SWAP_PARTITIONS_BETWEEN_TABLES  
  - MOVE_PARTITIONS_TO_TABLE  
- ALTER: Modify a table's DDL with ALTER TABLE.  
- DROP: [Drop a table](#). |
**Privileges**

Non-superuser, one of the following:

- Table owner
- USAGE privilege on the table schema and one or more privileges on the table

**Examples**

```
=> SELECT HAS_TABLE_PRIVILEGE('store.store_dimension', 'SELECT');
   HAS_TABLE_PRIVILEGE
  --------------
     t
 (1 row)

=> SELECT HAS_TABLE_PRIVILEGE('release', 'store.store_dimension', 'INSERT');
   HAS_TABLE_PRIVILEGE
  --------------
     t
 (1 row)

=> SELECT HAS_TABLE_PRIVILEGE(45035996273711159, 45035996273711160, 'select');
   HAS_TABLE_PRIVILEGE
  --------------
     t
 (1 row)
```

**LIST_ENABLED_CIPHERS**

Returns a list of enabled cipher suites, which are sets of algorithms used to secure TLS/SSL connections.

By default, Vertica uses OpenSSL's default cipher suites. For more information, see the OpenSSL man page.

**Syntax**

`LIST_ENABLED_CIPHERS()`

**Example**

```
=> SELECT LIST_ENABLED_CIPHERS();
```
SSL_RSA_WITH_RC4_128_MDS
SSL_RSA_WITH_RC4_128_SHA
TLS_RSA_WITH_AES_128_CBC_SHA

See Also

- TLS Protocol
- Security Parameters

SESSION_USER

Returns a VARCHAR containing the name of the user who initiated the current database session.

Behavior Type

Stable

Syntax

SESSION_USER()

Notes

- The SESSION_USER function does not require parentheses.
- SESSION_USER is equivalent to CURRENT_USER, USER, and USERNAME.

Examples

```sql
=> SELECT SESSION_USER();
session_user
----------
dbadmin
(1 row)
```

The following command returns the same results without the parentheses:

```sql
=> SELECT SESSION_USER;
```
session_user
-----------------
dbadmin
(1 row)

**USER**

Returns a VARCHAR containing the name of the user who initiated the current database connection.

**Behavior Type**

*Stable*

**Syntax**

`USER()`

**Notes**

- The `USER` function does not require parentheses.
- `USER` is equivalent to `CURRENT_USER`, `SESSION_USER`, and `USERNAME`.

**Examples**

```sql
=> SELECT USER();
  current_user
  -----------------
  dbadmin
  (1 row)
```

The following command returns the same results without the parentheses:

```sql
=> SELECT USER;
  current_user
  -----------------
  dbadmin
  (1 row)
```
**USERNAME**

Returns a VARCHAR containing the name of the user who initiated the current database connection.

**Behavior Type**

*Stable*

**Syntax**

`USERNAME()`

**Notes**

- This function is useful for permission checking.
- `USERNAME` is equivalent to `CURRENT_USER`, `SESSION_USER` and `USER`.

**Examples**

```sql
=> SELECT USERNAME();
username
----------
dbadmin
(1 row)
```

**VERSION**

Returns a VARCHAR containing a Vertica node's version information.

**Behavior Type**

*Stable*
Syntax

VERSION()

**Note:**
The parentheses are required.

Examples

```sql
=> SELECT VERSION();

<table>
<thead>
<tr>
<th>VERSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>--------</td>
</tr>
</tbody>
</table>

Vertica Analytic Database v10.0.0-0
(1 row)
**Timeseries Functions**

Timeseries aggregate functions evaluate the values of a given set of variables over time and group those values into a window for analysis and aggregation.

One output row is produced per time slice—or per partition per time slice—if partition expressions are present.

**TS_FIRST_VALUE**

Processes the data that belongs to each time slice. A time series aggregate (TSA) function, TS_FIRST_VALUE returns the value at the start of the time slice, where an interpolation scheme is applied if the timeslice is missing, in which case the value is determined by the values corresponding to the previous (and next) timeslices based on the interpolation scheme of const (linear).

TS_FIRST_VALUE returns one output row per time slice, or one output row per partition per time slice if partition expressions are specified.

**Behavior Type**

*Immutable*

**Syntax**

```
TS_FIRST_VALUE ( expression [ IGNORE NULLS ] [, { 'CONST' | 'LINEAR' } ] )
```

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>expression</code></td>
<td>An INTEGER or FLOAT expression on which to aggregate and interpolate.</td>
</tr>
<tr>
<td><code>IGNORE NULLS</code></td>
<td>The IGNORE NULLS behavior changes depending on a CONST or LINEAR interpolation scheme. See <a href="#">When Time Series Data</a></td>
</tr>
<tr>
<td>'CONST'</td>
<td>'LINEAR'</td>
</tr>
<tr>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td>Specifies the interpolation value as constant or linear:</td>
<td></td>
</tr>
<tr>
<td>- CONST (default): New value is interpolated based on previous input records.</td>
<td></td>
</tr>
<tr>
<td>- LINEAR: Values are interpolated in a linear slope based on the specified time slice.</td>
<td></td>
</tr>
</tbody>
</table>

**Requirements**

You must use an ORDER BY clause with a TIMESTAMP column.

**Multiple Time Series Aggregate Functions**

The same query can call multiple time series aggregate functions. They share the same gap-filling policy as defined by the TIMESERIES Clause; however, each time series aggregate function can specify its own interpolation policy. For example:

```sql
=> SELECT slice_time, symbol,
      TS_FIRST_VALUE(bid, 'const') fv_c,
      TS_FIRST_VALUE(bid, 'linear') fv_l,
      TS_LAST_VALUE(bid, 'const') lv_c
FROM TickStore
TIMESERIES slice_time AS '3 seconds'
OVER(PARTITION BY symbol ORDER BY ts);
```

**Examples**

See [Gap Filling and Interpolation](#) in Analyzing Data.

**See Also**

- [TS_LAST_VALUE](#)
- Time Series Analytics
**TS_LAST_VALUE**

Processes the data that belongs to each time slice. A time series aggregate (TSA) function, TS_LAST_VALUE returns the value at the end of the time slice, where an interpolation scheme is applied if the timeslice is missing. In this case the value is determined by the values corresponding to the previous (and next) timeslices based on the interpolation scheme of const (linear).

TS_LAST_VALUE returns one output row per time slice, or one output row per partition per time slice if partition expressions are specified.

**Behavior Type**

Immutable

**Syntax**

```sql
TS_LAST_VALUE ( expression [ IGNORE NULLS ] [, { 'CONST' | 'LINEAR' } ] )
```

**Parameters**

<table>
<thead>
<tr>
<th>expression</th>
<th>An INTEGER or FLOAT expression on which to aggregate and interpolate.</th>
</tr>
</thead>
<tbody>
<tr>
<td>IGNORE NULLS</td>
<td>The IGNORE NULLS behavior changes depending on a CONST or LINEAR interpolation scheme. See <a href="#">When Time Series Data Contains Nulls</a> in Analyzing Data for details.</td>
</tr>
<tr>
<td>'CONST'</td>
<td>'LINEAR'</td>
</tr>
<tr>
<td></td>
<td>• CONST (default): New value is interpolated based on previous input records.</td>
</tr>
<tr>
<td></td>
<td>• LINEAR: Values are interpolated in a linear slope based on the specified time slice.</td>
</tr>
</tbody>
</table>

**Requirements**

You must use the ORDER BY clause with a TIMESTAMP column.
Multiple Time Series Aggregate Functions

The same query can call multiple time series aggregate functions. They share the same gap-filling policy as defined by the TIMESERIES Clause; however, each time series aggregate function can specify its own interpolation policy. For example:

```sql
=> SELECT slice_time, symbol, 
   TS_FIRST_VALUE(bid, 'const') fv_c, 
   TS_FIRST_VALUE(bid, 'linear') fv_l, 
   TS_LAST_VALUE(bid, 'const') lv_c 
FROM TickStore 
TIMESERIES slice_time AS '3 seconds' 
OVER(PARTITION BY symbol ORDER BY ts);
```

Examples

See Gap Filling and Interpolation in Analyzing Data.

**URI Encode/Decode Functions**

The functions in this section follow the RFC 3986 standard for percent-encoding a Universal Resource Identifier (URI).

**URI_PERCENT_DECODE**

Decodes a percent-encoded Universal Resource Identifier (URI) according to the RFC 3986 standard.

**Syntax**

```sql
URI_PERCENT_DECODE (expression)
```

**Behavior Type**

Immutable

**Parameters**

- `expression` (VARCHAR) is the string to convert.

**Examples**

The following example invokes `uri_percent_decode` on the Websites column of the URI table and returns a decoded URI:

```sql
=> SELECT URI_PERCENT_DECODE(Websites) from URI;
```

```
http://www.faqs.org/rfcs/rfc3986.html x xj%a%
(1 row)
```

The following example returns the original URI in the Websites column and its decoded version:
SELECT Websites, URI_PERCENT_ENCODE (Websites) from URI;

<table>
<thead>
<tr>
<th>Websites</th>
<th>URI_PERCENT_ENCODE</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://www.faqs.org/rfc/rfc3986.html+x%20x%6a%25a%25">http://www.faqs.org/rfc/rfc3986.html+x%20x%6a%a%</a></td>
<td><a href="http://www.faqs.org/rfc/rfc3986.html">http://www.faqs.org/rfc/rfc3986.html</a> x xj%a%</td>
</tr>
</tbody>
</table>

(1 row)

**URI_PERCENT_ENCODE**

Encodes a Universal Resource Identifier (URI) according to the RFC 3986 standard for percent encoding. For compatibility with older encoders, this function converts + to space; space is converted to %20.

**Syntax**

`URI_PERCENT_ENCODE (expression)`

**Behavior Type**

*Immutable*

**Parameters**

| expression | (VARCHAR) is the string to convert. |

**Examples**

The following example shows how the `uri_percent_encode` function is invoked on a the Websites column of the URI table and returns an encoded URI:

```sql
=> SELECT URI_PERCENT_ENCODE(Websites) from URI;

<table>
<thead>
<tr>
<th>URI_PERCENT_ENCODE</th>
</tr>
</thead>
<tbody>
<tr>
<td>http%3A%2F%2Fexample.com%2F%3D11%2F1S</td>
</tr>
</tbody>
</table>
```

(1 row)

The following example returns the original URI in the Websites column and it's encoded form:
UUID Functions

Currently, Vertica provides one function to support UUID data types, UUID_GENERATE.

UUID_GENERATE

Returns a new universally unique identifier (UUID) that is generated based on high-quality randomness from /dev/urandom.

Behavior Type

Volatile

Syntax

UUID_GENERATE()

Example

```sql
=> CREATE TABLE Customers(
    cust_id UUID DEFAULT UUID_GENERATE(),
    lname VARCHAR(36),
    fname VARCHAR(24));
CREATE TABLE
=> INSERT INTO Customers VALUES (DEFAULT, 'Kearney', 'Thomas');
OUTPUT
--------
 1
(1 row)

=> COPY Customers (lname, fname) FROM STDIN;
Enter data to be copied followed by a newline. End with a backslash and a period on a line by itself.
>> Pham|Duc
>> Garcia|Mary
```
```sql
=> SELECT * FROM Customers;

cust_id | lname | fname
---------|-------|-------
03fe0794-ac5d-42d4-8246-54f7ec81ed0c | Pham | Duc
6950313d-c77e-4c11-a86e-0a54aa3ec114 | Kearney | Thomas
9c9653ce-c2e4-4441-b0f7-0137b54cc28c | Garcia | Mary
(3 rows)
```
Vertica Meta-Functions

Vertica built-in (meta) functions access the internal state of Vertica and are used in SELECT queries with the function name and an argument (where required). These functions are not part of the SQL standard and take the following form:

```sql
SELECT <meta-function-name>(<args>);
```

**Note:**
The query cannot contain other clauses, such as FROM or WHERE.

The behavior type of Vertica meta-functions is **immutable**.

Alphabetical List of Vertica Meta-Functions

The following list shows all Vertica meta-functions in alphabetical order.

Jump to letter: A - B - C - D - E - F - G - H - I - K - L - M - N - P - R - S - V

**ADVANCE_EPOCH**
Manually closes the current epoch and begins a new epoch.

**ALTER_LOCATION_LABEL**
Adds a label to a storage location, or changes or removes an existing label.

**ALTER_LOCATION_SIZE**
Eon Mode only.

**ALTER_LOCATION_USE**
Alters the type of files that can be stored at the specified storage location.

**ANALYZE_CONSTRAINTS**
Analyzes and reports on constraint violations within the specified scope.

**ANALYZE_CORRELATIONS**
I found no explanation in the Jira nor in the revision history for this topic.

**ANALYZE_EXTERNAL_ROW_COUNT**
Calculates the exact number of rows in an external table.

**ANALYZE_STATISTICS**
Collects and aggregates data samples and storage information from all nodes that store projections associated with the specified table.

**ANALYZE_STATISTICS_PARTITION**
Collects and aggregates data samples and storage information for a range of partitions in the specified table.

**ANALYZE_WORKLOAD**
Runs Workload Analyzer, a utility that analyzes system information held in system tables.

**AUDIT**
Returns the raw data size (in bytes) of a database, schema, or table as it is counted in an audit of the database size.

**AUDIT_FLEX**
Returns the estimated ROS size of __raw__ columns, equivalent to the export size of the flex data in the audited objects.

**AUDIT_LICENSE_SIZE**
Triggers an immediate audit of the database size to determine if it is in compliance with the raw data storage allowance included in your Vertica licenses.

**AUDIT_LICENSE_TERM**
Triggers an immediate audit to determine if the Vertica license has expired.

**AWS_GET_CONFIG**
Returns the current Amazon Web Services (AWS) credentials set by AWS_SET_CONFIG or ALTER SESSION.

**AWS_SET_CONFIG**
Sets the values of AWS Library User-Defined Session Parameters for the current session.

**AZURE_TOKEN_CACHE_CLEAR**
Clears the cached access token for Azure.

**BACKGROUND_DEPOT_WARMING**

**BUILD_FLEXTABLE_VIEW**
Creates, or re-creates, a view for a default or user-defined _keys table, ignoring any empty keys.

**CALENDAR_HIERARCHY_DAY**
Specifies to group DATE partition keys into a hierarchy of years, months, and days.

**CANCEL_DEPOT_WARMING**
Eon Mode only.

**CANCEL_REBALANCE_CLUSTER**
Stops any rebalance task that is currently in progress or is waiting to execute.

**CANCEL_REFRESH**
Cancels refresh-related internal operations initiated by START_REFRESH and REFRESH.

**CHANGE_CURRENT_STATEMENT_RUNTIME_PRIORITY**
Changes the run-time priority of an active query.

**CHANGE_RUNTIME_PRIORITY**
Changes the run-time priority of a query that is actively running.

**CLEAN_COMMUNAL_STORAGE**
Eon Mode only.

**CLEAR_CACHES**
Clears the Vertica internal cache files.

**CLEAR_DATA_COLLECTOR**
Clears all memory and disk records from Data Collector tables and logs, and resets collection statistics in system table DATA_COLLECTOR.

**CLEAR_DATA_DEPOT**
Eon Mode only.

**CLEAR_DEPOT_PIN_POLICY_PARTITION**
Eon Mode only.

**CLEAR_DEPOT_PIN_POLICY_PROJECTION**
Eon Mode only.

**CLEAR_DEPOT_PIN_POLICY_TABLE**
Eon Mode only.

**CLEAR_FETCH_QUEUE**
Eon Mode only.

**CLEAR_HDFS_CACHES**
Clears the configuration information copied from HDFS and any cached connections.

**CLEAR_OBJECT_STORAGE_POLICY**
Removes a user-defined storage policy from the specified database, schema or table.

**CLEAR_PROFILING**
Clears from memory data for the specified profiling type.

**CLEAR_PROJECTION_REFRESHES**
Clears information projection refresh history from system table PROJECTION_REFRESHES.

**CLEAR_RESOURCE_REJECTIONS**
Clears the content of the RESOURCE_REJECTIONS and DISK_RESOURCE_REJECTIONS system tables.

**CLOSE_ALL_RESULTSETS**
Closes all result set sessions within Multiple Active Result Sets (MARS) and frees the MARS storage for other result sets.

**CLOSE_ALL_SESSIONS**
Closes all external sessions except the one that issues this function.

**CLOSE_RESULTSET**
Closes a specific result set within Multiple Active Result Sets (MARS) and frees the MARS storage for other result sets.

**CLOSE_SESSION**
Interrupts the specified external session, rolls back the current transaction if any, and closes the socket.

**CLOSE_USER_SESSIONS**
Stops the session for a user, rolls back any transaction currently running, and closes the connection.

**COMPACT_STORAGE**
Bundles existing data (.fdb) and index (.pidx) files into the .gt file format.
**COMPUTE_FLEXTABLE KEYS**
Computes the virtual columns (keys and values) from the flex table VMap data.

**COMPUTE_FLEXTABLE KEYS AND BUILD VIEW**
Combines the functionality of BUILD_FLEXTABLE_VIEW and COMPUTE_FLEXTABLE KEYS to compute virtual columns (keys) from the VMap data of a flex table and construct a view.

**COPY_PARTITIONS_TO_TABLE**
Copies partitions from one table to another.

**COPY_TABLE**
Copies one table to another.

**CURRENT_SCHEMA**
Returns the name of the current schema.

**DATA_COLLECTOR_HELP**
Returns online usage instructions about the Data Collector, the V_MONITOR.DATACOLLECTOR system table, and the Data Collector control functions.

**DELETE_TOKENIZER_CONFIG_FILE**
Deletes a tokenizer configuration file.

**DEMOTE_SUBCLUSTER_TO_SECONDARY**
Only.

**DESCRIBE_LOAD_BALANCE_DECISION**
Evaluates if any load balancing routing rules apply to a given IP address and describes how the client connection would be handled.

**DESIGNER_ADD Design QUERIES**
Reads and evaluates queries from an input file, and adds the queries that it accepts to the specified design.

**DESIGNER_ADD Design QUERIES_FROM_RESULTS**
Executes the specified query and evaluates results in the following columns:.

**DESIGNER_ADD Design QUERY**
Reads and parses the specified query, and if accepted, adds it to the design.

**DESIGNER_ADD Design TABLES**
Adds the specified tables to a design.

**DESIGNER_CANCEL_POPULATE Design**
Cancels population or deployment operation for the specified design if it is currently running.

**DESIGNER_CREATE Design**
Creates a design with the specified name.

**DESIGNER Design PROJECTION ENCODINGS**
Analyzes encoding in the specified projections, creates a script to implement encoding recommendations, and optionally deploys the recommendations.

**DESIGNER DROP All DESIGNS**
Removes all Database Designer-related schemas associated with the current user.

**DESIGNER DROP Design**
Removes the schema associated with the specified design and all its contents.

**DESIGNER_OUTPUT_ALL Design Projections**
Displays the DDL statements that define the design projections to standard output.

**DESIGNER_OUTPUT_DEPLOYMENT_SCRIPT**
Displays the deployment script for the specified design to standard output.

**DESIGNER_RESET**
Discards all run-specific information of the previous Database Designer build or deployment of the specified design but keeps its configuration.

**DESIGNER_RUN_POPULATE**
Populates the design and creates the design and deployment scripts.

**DESIGNER_SET_LICENSE**
Sets K-safety for a comprehensive design and stores the K-safety value in the DESIGNS table.

**DESIGNER_SET_DESIGN_TYPE**
Specifies whether Database Designer creates a comprehensive or incremental design.

**DESIGNER_SET_OPTIMIZATION_OBJECTIVE**
Valid only for comprehensive database designs, specifies the optimization objective Database Designer uses.

**DESIGNER_SET_PROPOSE_UNSEGMENTED_PROJECTIONS**
Specifies whether a design can include unsegmented projections.

**DESIGNER_SINGLE_RUN**
Evaluates all queries that completed execution within the specified timespan, and returns with a design that is ready for deployment.

**DESIGNER_WAIT_FOR_DESIGN**
Waits for completion of operations that are populating and deploying the design.

**DISABLE_DUPLICATE_KEY_ERROR**
Disables error messaging when Vertica finds duplicate primary or unique key values at run time (for use with key constraints that are not automatically enabled).

**DISABLE_LOCAL_SEGMENTS**
Disables local data segmentation, which breaks projections segments on nodes into containers that can be easily moved to other nodes.

**DISABLE_PROFILING**
Disables for the current session collection of profiling data of the specified type.

**DISPLAY_LICENSE**
Returns the terms of your Vertica license.

**DO_TM_TASK**
Runs a Tuple Mover operation on the specified table or projection and commits current transactions.

**DROP_EXTERNAL_ROW_COUNT**
Removes external table row count statistics compiled by ANALYZE_EXTERNAL_ROW_COUNT.

**DROP_LICENSE**
Drops a license key from the global catalog.

**DROP_LOCATION**
Removes the specified storage location.

**DROP_PARTITIONS**
Drops the specified table partition keys.

**DROP_STATISTICS**
Removes statistical data on database projections previously generated by `ANALYZE_STATISTICS`.

**DROP_STATISTICS_PARTITION**
Removes statistical data on database projections previously generated by `ANALYZE_STATISTICS_PARTITION`.

**DUMP_CATALOG**
Returns an internal representation of the Vertica catalog.

**DUMP_LOCKTABLE**
Returns information about deadlocked clients and the resources they are waiting for.

**DUMP_PARTITION_KEYS**
Dumps the partition keys of all projections in the system.

**DUMP_PROJECTION_PARTITION_KEYS**
Dumps the partition keys of the specified projection.

**DUMP_TABLE_PARTITION_KEYS**
Dumps the partition keys of all projections for the specified table.

**EMPTYMAP**
Constructs a new VMap with one row but without keys or data.

**ENABLED_ROLE**
Checks whether a Vertica user role is enabled, and returns true or false.

**ENABLE_ELASTIC_CLUSTER**
Enables elastic cluster scaling, which makes enlarging or reducing the size of your database cluster more efficient by segmenting a node's data into chunks that can be easily moved to other hosts.

**ENABLE_LOCAL_SEGMENTS**
Enables local storage segmentation, which breaks projections segments on nodes into containers that can be easily moved to other nodes.

**ENABLE_PROFILING**
Enables collection of profiling data of the specified type for the current session.

**ENFORCE_OBJECT_STORAGE_POLICY**
Enterprise Mode only.

**EVALUATE_DELETE_PERFORMANCE**
Evaluates projections for potential DELETE and UPDATE performance issues.

**EXPORT_CATALOG**
Generates a SQL script for recreating a physical schema design on another cluster.

**EXPORT_DIRECTED_QUERIES**
Generates SQL for creating directed queries from a set of input queries, and writes the SQL to the specified file or to standard output.

**EXPORT_OBJECTS**
Generates a SQL script you can use to recreate non-virtual catalog objects on another cluster.

**EXPORT_STATISTICS**
Generates statistics in XML format from data previously collected by ANALYZE_STATISTICS.

**EXPORT_STATISTICS_PARTITION**
Generates partition-level statistics in XML format from data previously collected by ANALYZE_STATISTICS_PARTITION.

**EXPORT_TABLES**
Generates a SQL script that can be used to recreate a logical schema—schemas, tables, constraints, and views—on another cluster.

**EXTERNAL_CONFIG_CHECK**
Tests the Hadoop configuration of a Vertica cluster.

**FINISH_FETCHING_FILES**
Eon Mode only.

**FLUSH_DATA_COLLECTOR**
Waits until memory logs are moved to disk and then flushes the Data Collector, synchronizing the log with disk storage.

**FLUSH_REAPER_QUEUE**
Eon Mode only.

**GET_AHM_EPOCH**
Returns the number of the epoch in which the Ancient History Mark is located.

**GET_AHM_TIME**
Returns a TIMESTAMP value representing the Ancient History Mark.

**GET_AUDIT_TIME**
Reports the time when the automatic audit of database size occurs.

**GET_CLIENT_LABEL**
Returns the client connection label for the current session.

**GET_COMPLIANCE_STATUS**
Displays whether your database is in compliance with your Vertica license agreement.

**GET_CONFIG_PARAMETER**
Gets the value of a configuration parameter at the database level or for a specific node.

**GET_CURRENT_EPOCH**
The epoch into which data (COPY, INSERT, UPDATE, and DELETE operations) is currently being written.

**GET_DATA_COLLECTOR_NOTIFY_POLICY**
Lists any notification policies set on a Data Collector component.

**GET_DATA_COLLECTOR_POLICY**
Retrieves a brief statement about the retention policy for the specified component.
GET_LAST_GOOD_EPOCH
Returns the last good epoch number.

GET_METADATA
Returns the metadata of a Parquet file.

GET_NUM_ACCEPTED_ROWS
Returns the number of rows loaded into the database for the last completed load for the current session.

GET_NUM_REJECTED_ROWS
Returns the number of rows that were rejected during the last completed load for the current session.

GET_PRIVILEGES_DESCRIPTION
Returns the effective privileges the current user has on an object, including explicit, implicit, inherited, and role-based privileges.

GET_PROJECTIONS
Returns contextual and projection information about projections of the specified anchor table.

GET_PROJECTION_SORT_ORDER
Returns the order of columns in a projection's ORDER BY clause.

GET_PROJECTION_STATUS
Returns information relevant to the status of a projection:

GET_TOKENIZER_PARAMETER
Returns the configuration parameter for a given tokenizer.

HADOOP_IMPERSONATION_CONFIG_CHECK
Reports the delegation tokens Vertica will use when accessing Kerberized data in HDFS.

HASH_EXTERNAL_TOKEN
Returns a hash of a string token, for use with HADOOP_IMPERSONATION_CONFIG_CHECK.

HAS_ROLE
Checks whether a Vertica user role is granted to the specified user or role, and returns true or false.

HCATALOGCONNECTOR_CONFIG_CHECK
Tests the configuration of a Vertica cluster that uses the HCatalog Connector to access Hive data.

HDFS_CLUSTER_CONFIG_CHECK
Tests the configuration of a Vertica cluster that uses HDFS.

IMPORT_DIRECTED_QUERIES
Imports to the database catalog directed queries from a SQL file that was generated by EXPORT_DIRECTED_QUERIES.

IMPORT_STATISTICS
Imports statistics from the XML file that was generated by EXPORT_STATISTICS.

INFER_EXTERNAL_TABLE_DDL
Inspects a file in Parquet or ORC format and returns a CREATE EXTERNAL TABLE AS COPY statement that can be used to read the file.

**INSTALL_LICENSE**
Installs the license key in the global catalog.

**INTERRUPT_STATEMENT**
Interrupts the specified statement in a user session, rolls back the current transaction, and writes a success or failure message to the log file.

**KERBEROS_CONFIG_CHECK**
Tests the Kerberos configuration of a Vertica cluster.

**KERBEROS_HDFS_CONFIG_CHECK**
Tests the Kerberos configuration of a Vertica cluster that uses HDFS.

**LAST_INSERT_ID**
Returns the last value of an AUTO_INCREMENT/IDENTITY column.

**LDAP_LINK_DRYRUN_CONNECT**
Takes a set of LDAP Link connection parameters as arguments and begins a dry run connection between the LDAP server and Vertica.

**LDAP_LINK_DRYRUN_SEARCH**
Takes a set of LDAP Link connection and search parameters as arguments and begins a dry run search for users and groups that would get imported from the LDAP server.

**LDAP_LINK_DRYRUN_SYNC**
Takes a set of LDAP Link connection and search parameters as arguments and begins a dry run synchronization between the database and the LDAP server, which maps and synchronizes the LDAP server's users and groups with their equivalents in Vertica.

**LDAP_LINK_SYNC_CANCEL**
Cancels in-progress LDAP Link synchronizations (including those started by LDAP_LINK_DRYRUN_SYNC) between the LDAP server and Vertica.

**LDAP_LINK_SYNC_START**
Begins the synchronization between the LDAP server and Vertica immediately rather than waiting for the interval set in LDAPLinkInterval.

**MAKE_AHM_NOW**
Sets the Ancient History Mark (AHM) to the greatest allowable value.

**MAPAGGREGATE**
Returns a LONG VARBINARY VMap with keys and value pairs supplied from two VARCHAR input columns of an existing columnar table.

**MAPCONTAINSKEY**
Determines whether a VMap contains a virtual column (key).

**MAPCONTAINSVVALUE**
Determines whether a VMap contains a specific value.

**MAPDELIMITEDEXTRACTOR**
Extracts data with a delimiter character, and other optional arguments, returning a single VMap value.

**MAPITEMS**
Returns information about items in a VMap.

**MAPJSONEXTRACTOR**
Extracts content of repeated JSON data objects, including nested maps, or data with an outer list of JSON elements.

**MAPKEYS**
Returns the virtual columns (and values) present in any VMap data.

**MAPKEYSINFO**
Returns virtual column information from a given map.

**MAPLOOKUP**
Returns single-key values from VMAP data.

**MAPPUT**
Accepts a VMap and one or more key/value pairs and returns a new VMap with the key/value pairs added.

**MAPREGEXEXTRACTOR**
Extracts data from a regular expression and returns the results as a VMap.

**MAPSIZE**
Returns the number of virtual columns present in any VMap data.

**MAPSTRING**
Recursively builds a string representation VMap data, including nested JSON maps.

**MAPVALUES**
Returns a string representation of the top-level values from a VMap.

**MAPVERSION**
Returns the version or invalidity of any map data.

**MARK DESIGN KSAFE**
Enables or disables high availability in your environment, in case of a failure.

**MATERIALIZE FLEXTABLE_COLUMNS**
Materializes virtual columns listed as key_names in the flextable_keys table you compute using either COMPUTE_FLEXTABLE_KEYS or COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW.

**MEASURE LOCATION PERFORMANCE**
Measures a storage location's disk performance.

**MEMORY TRIM**
Calls glibc function malloc_trim() to reclaim free memory from malloc and return it to the operating system.

**MIGRATE ENTERPRISE TO EON**
Enterprise Mode only.

**MOVE PARTITIONS TO TABLE**
Moves partitions from one table to another.

**MOVE RETIRED LOCATION DATA**
Moves all data from the specified retired storage location or from all retired storage locations in the database.

**MOVE STATEMENT TO RESOURCE_POOL**
Attempts to move the specified query to the specified target pool.

**NOTIFY**

Specifies the text message to include with a notification.

**PARTITION_PROJECTION**

Splits ROS containers for a specified projection.

**PARTITION_TABLE**

Invokes the Tuple Mover to reorganize ROS storage containers as needed to conform with the current partitioning policy.

**PROMOTE_SUBCLUSTER_TO_PRIMARY**

Eon Mode only.

**PURGE**

Permanently removes delete vectors from ROS storage containers so disk space can be reused.

**PURGE_PARTITION**

Purges a table partition of deleted rows.

**PURGE_PROJECTION**

Permanently removes deleted data from physical storage so disk space can be reused.

**PURGE_TABLE**

Permanently removes deleted data from physical storage so disk space can be reused.

**READ_CONFIG_FILE**

Reads and returns the key-value pairs of all the parameters of a given tokenizer.

**REALIGN_CONTROL_NODES**

Causes Vertica to re-evaluate which nodes in the cluster or subcluster are control nodes and which nodes are assigned to them as dependents when large cluster is enabled.

**REBALANCE_CLUSTER**

Rebalances the database cluster synchronously as a session foreground task.

**REBALANCE_SHARDS**

Eon Mode only.

**REBALANCE_TABLE**

Synchronously rebalances data in the specified table.

**REENABLE_DUPLICATE_KEY_ERROR**

Restores the default behavior of error reporting by reversing the effects of DISABLE_DUPLICATE_KEY_ERROR.

**REFRESH**

Synchronously refreshes one or more table projections in the foreground, and updates system table PROJECTION_REFRESHES.

**REFRESH_COLUMNS**

Refreshes table columns that are defined with the constraint SET USING or DEFAULT USING.

**RELEASE_ALL_JVM_MEMORY**

Forces all sessions to release the memory consumed by their Java Virtual Machines (JVM).
**RELEASE JVM MEMORY**
Terminates a Java Virtual Machine (JVM), making available the memory the JVM was using.

**RELEASE SYSTEM TABLES ACCESS**
Enables non-superuser access to all system tables.

**RELOAD ADMINTOOLS_CONF**
Updates the admintools.conf on each UP node in the cluster.

**RELOAD SPREAD**
Updates cluster changes to the catalog's Spread configuration file.

**RESERVE SESSION RESOURCE**
Reserves memory resources from the general resource pool for the exclusive use of the Vertica backup and restore process.

**RESET LOAD BALANCE POLICY**
Resets the counter each host in the cluster maintains, to track which host it will refer a client to when the native connection load balancing scheme is set to ROUNDROBIN.

**RESET SESSION**
Applies your default connection string configuration settings to your current session.

**RESTORE FLEXTABLE DEFAULT KEYS TABLE AND VIEW**
Restores the _keys table and the _view.

**RESTORE LOCATION**
Restores a storage location that was previously retired with RETIRE LOCATION.

**RESTRICT SYSTEM TABLES ACCESS**
Checks system table SYSTEM_TABLES to determine which system tables non-superusers can access.

**RETIRE LOCATION**
Inactivates the specified storage location.

**RUN INDEX TOOL**
Runs the Index tool on a Vertica database to perform one of these tasks:

**S3EXPORT**
Exports data to an Amazon S3 bucket from the Vertica cluster.

**S3EXPORT_PARTITION**
The S3EXPORT_PARTITION function allows Vertica output to be used by the Amazon Elastic MapReduce (EMR) feature.

**SECURITY_CONFIG_CHECK**
Returns the status of various security-related parameters.

**SET CONFIG PARAMETER**
Sets the value of a configuration parameter at the database level or for a specific node.

**SET AHM EPOCH**
Sets the Ancient History Mark (AHM) to the specified epoch.

**SET AHM TIME**
Sets the Ancient History Mark (AHM) to the epoch corresponding to the specified time on the initiator node.
**SET_AUDIT_TIME**
Sets the time that Vertica performs automatic database size audit to determine if the size of the database is compliant with the raw data allowance in your Vertica license.

**SET_CLIENT_LABEL**
Assigns a label to a client connection for the current session.

**SET_CONTROL_SET_SIZE**
Sets the number of control nodes that participate in the spread service when large cluster is enabled.

**SET_DATA_COLLECTOR_NOTIFY_POLICY**
Enables or disables automatic notification of Data Collector component changes.

**SET_DATA_COLLECTOR_POLICY**
Updates the following retention policy properties for the specified component:

**SET_DATA_COLLECTOR_TIME_POLICY**
Updates the retention policy property INTERVAL_TIME for the specified component.

**SET_DEPOT_PIN_POLICY_PARTITION**
Eon Mode only.

**SET_DEPOT_PIN_POLICY_PROJECTION**
Eon Mode only.

**SET_DEPOT_PIN_POLICY_TABLE**
Eon Mode only.

**SET_LOAD_BALANCE_POLICY**
Sets how native connection load balancing chooses a host to handle a client connection.

**SET_LOCATION_PERFORMANCE**
Sets disk performance for a storage location.

**SET_OBJECT_STORAGE_POLICY**
Creates or changes the storage policy of a database object by assigning it a labeled storage location.

**SET_SCALING_FACTOR**
Sets the scaling factor that determines the number of storage containers used when rebalancing the database and when using local data segmentation is enabled.

**SET_SPREAD_OPTION**
Changes spread daemon settings.

**SET_TOKENIZER_PARAMETER**
Configures the tokenizer parameters.

**SHOW_PROFILING_CONFIG**
Shows whether profiling is enabled.

**SHUTDOWN**
Shuts down a Vertica database.

**SHUTDOWN_SUBCLUSTER**
Eon Mode only.

**SLEEP**
Waits a specified number of seconds before executing another statement or command.
START REAPING FILES
Eon Mode only.

START_REBALANCE_CLUSTER
Asynchronously rebalances the database cluster as a background task.

START_REFRESH
Refreshes projections in the current schema with the latest data of their respective anchor tables.

SWAP PARTITIONS BETWEEN TABLES
Swaps partitions between two tables.

SYNC CATALOG
Eon Mode only.

SYNC WITH HCATALOG SCHEMA
Copies the structure of a Hive database schema available through the HCatalog Connector to a Vertica schema.

SYNC WITH HCATALOG SCHEMA TABLE
Copies the structure of a single table in a Hive database schema available through the HCatalog Connector to a Vertica table.

VALIDATE_STATISTICS
Validates statistics in the XML file generated by EXPORT_STATISTICS.

VERIFY HADOOP_CONF_DIR
Verifies that the Hadoop configuration that is used to access HDFS is valid on all Vertica nodes.

AWS Library Functions

This section contains the functions associated with the Vertica library for Amazon Web Services (AWS).

AWS_GET_CONFIG

⚠️ Deprecated:
The AWS library is deprecated. To export delimited data to S3 or any other destination, use EXPORT TO DELIMITED.

Returns the current Amazon Web Services (AWS) credentials set by AWS_SET_CONFIG or ALTER SESSION.
Syntax

AWS_GET_CONFIG( 'parameter' )

**parameter**

- `aws_id`
- `aws_secret`
- `aws_session_token`
- `aws_region`
- `aws_ca_path`
- `aws_ca_bundle`
- `aws_proxy`
- `aws_verbose`
- `aws_max_send_speed`
- `aws_max_recv_speed`

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>aws_id</code></td>
<td>Retrieves the value for the 20-character AWS access key used to authenticate your account</td>
</tr>
<tr>
<td><code>aws_secret</code></td>
<td>Retrieves the value for the 40-character AWS secret access key used to authenticate your account</td>
</tr>
<tr>
<td><code>aws_session_token</code></td>
<td>The AWS temporary security token generated by running the AWS STS command <code>get-session-token</code>. This AWS STS command generates temporary credentials you can use to implement multi-factor authentication for security purposes. For more information on <code>get-session-token</code> see the <a href="https://docs.aws.amazon.com/cli/latest/userguide/cli-configure-files.html">AWS documentation</a>.</td>
</tr>
<tr>
<td><code>aws_region</code></td>
<td>Retrieves the region where your AWS bucket is located. See the AWS Documentation for the full list of values. <strong>Default value:</strong> <code>us-east-1</code></td>
</tr>
<tr>
<td><code>aws_ca_path</code></td>
<td>Retrieves the path Vertica uses to look up SSL server certificates.</td>
</tr>
<tr>
<td><code>aws_ca_bundle</code></td>
<td>Retrieves the path Vertica uses to look up an SSL server certificate bundle.</td>
</tr>
<tr>
<td><code>aws_proxy</code></td>
<td>A string value that lets you set an HTTP/HTTPS proxy for the AWS library.</td>
</tr>
<tr>
<td>proxy</td>
<td>aws_verbose</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------</td>
</tr>
<tr>
<td>aws_max_send_speed</td>
<td>Retrieves the value for the maximum transfer speed when sending data to AWS S3, in bytes per second.</td>
</tr>
<tr>
<td>aws_max_recv_speed</td>
<td>Retrieves the value for the maximum transfer speed for receiving data to AWS S3, in bytes per second.</td>
</tr>
</tbody>
</table>

**Examples**

This example retrieves a stored AWS access key in a session.

```sql
=> SELECT AWS_GET_CONFIG('aws_id');
aws_get_config
-----------------  
AKABCOEXAMPLEPKPXQY (1 row)
```

**See Also**

- AWS Library Parameters
- Vertica AWS Library

**AWS_SET_CONFIG**

⚠️ Deprecated:
The AWS library is deprecated. To export delimited data to S3 or any other destination, use EXPORT TO DELIMITED.

Sets the values of AWS Library S3-Compatible User-Defined Session Parameters for the current session. This function is designed to be used with a table that contains those values, rather than by setting values explicitly in the function call.
Syntax

AWS_SET_CONFIG('parameter', 'value')

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aws_id</td>
<td>The 20-character AWS access key used to authenticate your account.</td>
</tr>
<tr>
<td>aws_secret</td>
<td>The 40-character AWS secret access key used to authenticate your account.</td>
</tr>
<tr>
<td>aws_session_token</td>
<td>The AWS temporary security token generated by running the AWS STS command get-session-token. This AWS STS command generates temporary credentials you can use to implement multi-factor authentication for security purposes. For more information on get-session-token see the AWS documentation.</td>
</tr>
<tr>
<td>aws_region</td>
<td>Specifies the region where your AWS bucket is located. See the AWS Documentation for the full list of values.</td>
</tr>
<tr>
<td></td>
<td>You can configure aws_region with only one region. To access buckets in multiple regions, reset the parameter each time you change regions.</td>
</tr>
<tr>
<td></td>
<td><strong>Default value:</strong> us-east-1</td>
</tr>
<tr>
<td>aws_ca_path</td>
<td>The path Vertica uses to look up SSL server certificates.</td>
</tr>
<tr>
<td></td>
<td><strong>Default value:</strong> System-dependent</td>
</tr>
<tr>
<td>aws_ca_bundle</td>
<td>The path Vertica uses to look up an SSL server certificate bundle.</td>
</tr>
<tr>
<td></td>
<td><strong>Default value:</strong> System-dependent</td>
</tr>
<tr>
<td>aws_proxy</td>
<td>A string value that lets you set an HTTP/HTTPS proxy for the AWS library.</td>
</tr>
<tr>
<td>aws_verbose</td>
<td>When enabled, logs libcurl debug messages to dbLog.</td>
</tr>
<tr>
<td></td>
<td><strong>Default value:</strong> false</td>
</tr>
<tr>
<td>aws_max_send</td>
<td>The maximum transfer speed for sending data to AWS S3, in bytes per second.</td>
</tr>
<tr>
<td>speed</td>
<td>Default value: unlimited</td>
</tr>
<tr>
<td>---------------------</td>
<td>--------------------------</td>
</tr>
<tr>
<td>aws_max_recv_speed</td>
<td>The maximum transfer speed when receiving data to AWS S3, in bytes per second.</td>
</tr>
</tbody>
</table>

### Examples

Configure session parameters for an AWS access key and secret access key with credentials in the keychain table:

```sql
=> SELECT AWS_SET_CONFIG('aws_id', accesskey),
     AWS_SET_CONFIG('aws_secret', secretaccesskey)
FROM keychain;

<table>
<thead>
<tr>
<th>aws_id</th>
<th>aws_secret</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

### S3EXPORT

**Deprecated:**
The AWS library is deprecated. To export delimited data to S3 or any other destination, use `EXPORT TO DELIMITED`.

Exports data to an Amazon S3 bucket from the Vertica cluster.

**Important:**
If the S3 bucket name contains a period (.) in its path, set `prepend_hash` to true, or specify a file extension in the export syntax.
Syntax

S3EXPORT( source-data USING PARAMETERS parameter=setting[,]...)

Arguments

*source-data* Specifies the source of the export operation.

Parameter Settings

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Set to...</th>
</tr>
</thead>
</table>
| url            | String value ≤ 236 characters that specifies the URL of the S3 bucket and object base name, one of the following:  
|                | • HTTPS URL  
|                | • S3 URL  
|                | URLs can contain only ASCII characters, 0x01 to 0x7F. |
| chunksize      | Specifies in bytes the size of the buffer that stores each chunk of exported data, between 5 MB and 5 GB.  
|                | You might need to increase this value from the default if you export data from a very wide table, or a table with LONG VARBINARY or LONG VARCHAR columns. If the width of a single column’s data is exceeds the buffer width, Vertica returns an error like this:  
|                | The specified buffer of 10485760 bytesRead is too small.  
|                | See [Adjusting the Export Chunk Size for Wide Tables](#) for more information.  

Note: The maximum number of chunks allowed in an *from_charset* and *to_charset* values are system-dependent. See your operating system documentation for more details.
<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Set to…</th>
</tr>
</thead>
<tbody>
<tr>
<td>compression</td>
<td>Uses the specified filter to compress exported data. Valid settings are one of the following:</td>
</tr>
<tr>
<td></td>
<td>• bzip</td>
</tr>
<tr>
<td></td>
<td>• none</td>
</tr>
<tr>
<td>Default</td>
<td>none</td>
</tr>
<tr>
<td>delimiter</td>
<td>Specifies the column delimiter character.</td>
</tr>
<tr>
<td>Default</td>
<td></td>
</tr>
<tr>
<td>enclosed_by</td>
<td>The character used to enclose string and date/time data. If you omit this parameter, no character encloses these data types.</td>
</tr>
<tr>
<td>Default</td>
<td>'' (empty string)</td>
</tr>
<tr>
<td>escape_as</td>
<td>The character used to escape values in exported data that must be escaped, including the enclosed_by value.</td>
</tr>
<tr>
<td>Default</td>
<td>\ (backslash)</td>
</tr>
<tr>
<td>from_charset*</td>
<td>The character set in which data is currently encoded.</td>
</tr>
<tr>
<td>to_charset*</td>
<td>The character set in which to encode the export.</td>
</tr>
<tr>
<td>null_as 'null-string'</td>
<td>Specifies a string to represent null values in the source data. If this parameter is included, S3EXPORT exports all null values as null-string. Otherwise, S3EXPORT exports null values as zero-length strings.</td>
</tr>
<tr>
<td>prepend_hash</td>
<td>Boolean, specifies whether to prepend unique hash values assigned to exported objects instead of the standard values.</td>
</tr>
<tr>
<td><strong>Important:</strong> If the S3 bucket name contains a period (. ) in its</td>
<td></td>
</tr>
</tbody>
</table>

* from_charset and to_charset values are system-dependent. See your operating system documentation for more details.,
<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Set to…</th>
</tr>
</thead>
<tbody>
<tr>
<td>path, prepend_hash to <code>true</code>, or specify a file extension in the export syntax.</td>
<td>Default: false</td>
</tr>
<tr>
<td>record_terminator</td>
<td>Specifies what character marks the end of a record. Default: \n</td>
</tr>
<tr>
<td>header</td>
<td>Boolean, specifies whether to include the headers of the exported columns in the first row. Default: false</td>
</tr>
</tbody>
</table>

* from_charset and to_charset values are system-dependent. See your operating system documentation for more details., continued

**Examples**

Export column1 data from exampleTable:

```sql
=> SELECT s3export(column1 USING PARAMETERS url='s3://exampleBucket/object', delimiter=','
    chunksize='10485760', record_terminator='
', from_charset='ASCII',
    to_charset='UTF-8', prepend_hash='true'
    header='true') OVER () FROM exampleTable;
```

**See Also**

- AWS_SET_CONFIG
- AWS Library S3-Compatible User-Defined Session Parameters
- Export Data to Amazon S3 Using the AWS Library
S3EXPORT_PARTITION

**Deprecated:**
The AWS library is deprecated. To export delimited data to S3 or any other destination, use EXPORT TO DELIMITED.

The S3EXPORT_PARTITION function allows Vertica output to be used by the Amazon Elastic MapReduce (EMR) feature. Since EMR stores and consumes data from S3 using the partition key included in the key of the S3 file, S3EXPORT_PARTITION exports data by adding the partition key in the url/filename.

**Syntax**

S3EXPORT_PARTITION ( expression USING PARAMETERS { parameter=setting } [, ... ] )

- **expression** Specifies the source of the export operation.

- **url**
  - The URL of the S3 bucket and object base name. Also include the partition key as part of the URL to export data so it is usable by EMR.
  - The URL can be either the HTTPS URL or the S3 URL. URL length is limited to a maximum of 236 characters.
  - URLs should contain only ASCII characters, 0x01 to 0x7F.

- **delimiter**
  - Specifies the column delimiter character.
  - Default value: | (vertical bar)

- **chunksize**
  - Determines the buffer size used to send bytes to S3. Valid settings can range between 5 MB and 5 GB.
  - The maximum number of chunks allowed in an export is 10000.
  - Default value: 10485760

- **record_terminator**
  - Specifies what character marks the end of a record.
  - Default value: \n
- **from_charset**
  - Specifies the character set in which your data is currently encoded.
<table>
<thead>
<tr>
<th>to_charset</th>
<th>Specifies the character set in which you want to encode your export.</th>
</tr>
</thead>
</table>
| prepend_hash | Prepends the unique hash values assigned to exported objects instead of the standard appendation.  
If your S3 bucket contains a period in its path, set the prepend_hash parameter to true.  
**Default value:** false |

from_charset and to_charset values are system-dependent. Refer to your operating system documentation for more details.

**Examples**

In the following example, st and yr are the partition keys:

```
=> SELECT s3EXPORT_PARTITION(* USING PARAMETERS url='s3://db001/bystate.date')
          OVER (PARTITION by st, yr) from T;
rows | url
--- | ---
184647 | s3://db001/st=MA/yr=2005/bystate.77fcab9836b93a04.dat
282633 | s3://db001/st=VA/yr=2007/bystate.77fcab9836b93a05.dat
282633 | s3://db001/st=VA/yr=2009/bystate.77fcab9836b93a05.dat
(3 rows)
```

**See Also**

- [AWS_GET_CONFIG](#)
- [AWS Library Parameters](#)
- [Vertica AWS Library](#)

**Catalog Management Functions**

This section contains catalog management functions specific to Vertica.
**DROP_LICENSE**

Drops a license key from the global catalog. Dropping expired keys is optional. Vertica automatically ignores expired license keys if a valid, alternative license key is installed.

**Syntax**

```sql
DROP_LICENSE( 'license-name' )
```

**Parameters**

| license-name | The name of the license to drop. Use the name (or long license key) in the NAME column of system table LICENSES. |

**Privileges**

Superuser

**Examples**

```sql
=> SELECT DROP_LICENSE('9b2d81e2-aab1-4cfb-bc07-fa9a696e8f5e');
```

**See Also**

Managing Licenses

**DUMP_CATALOG**

Returns an internal representation of the Vertica catalog. This function is used for diagnostic purposes.
DUMP_CATALOG returns only the objects that are visible to the user.

Syntax

DUMP_CATALOG()

Privileges

None

Examples

The following query obtains an internal representation of the Vertica catalog:

```sql
=> SELECT DUMP_CATALOG();
```

The output is written to the specified file:

```sql
\o /tmp/catalog.txt
SELECT DUMP_CATALOG();
\o
```

**EXPORT_CATALOG**

- **Note:**
  - This function and EXPORT_OBJECTS return equivalent output.

Generates a SQL script for recreating a physical schema design on another cluster.

The SQL script conforms to the following requirements:

- Only includes objects to which the user has access.
- Orders CREATE statements according to object dependencies so they can be recreated in the correct sequence. For example, if a table is in a non-PUBLIC schema, the required CREATE SCHEMA statement precedes the CREATE TABLE statement. Similarly, a table's CREATE ACCESS POLICY statement follows the table's CREATE TABLE statement.
- If possible, creates projections with their KSAFE clause, if any, otherwise with their OFFSET clause.

**Syntax**

```sql
EXPORT_CATALOG ( ['destination'] [, 'scope'] )
```

**Parameters**

**Note:**
If you omit all parameters, this function exports to standard output all objects to which you have access.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>destination</code></td>
<td>Specifies where to send output, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- An empty string (&quot;&quot;&quot;) writes the script to standard output.</td>
</tr>
<tr>
<td></td>
<td>- The path and name of a SQL output file. This option is valid only for <strong>superusers</strong>. If you specify a file that does not exist, the function creates one. If you specify only a file name, Vertica creates it in the catalog directory. If the file already exists, the function silently overwrites its contents.</td>
</tr>
<tr>
<td><code>scope</code></td>
<td>Determines what to export. Within the specified scope, EXPORT_CATALOG exports all the objects to which you have access:</td>
</tr>
<tr>
<td></td>
<td>- DESIGN (default): Exports all catalog objects: schemas, tables, constraints, views, access policies, projections, and SQL macros.</td>
</tr>
<tr>
<td></td>
<td>- DESIGN_ALL: Deprecated</td>
</tr>
<tr>
<td></td>
<td>- TABLES: Exports all tables and their access policies. See also EXPORT_TABLES.</td>
</tr>
<tr>
<td></td>
<td>- DIRECTED_QUERIES: Exports all directed queries that are stored in the database. For details, see Managing Directed Queries.</td>
</tr>
</tbody>
</table>

**Privileges**

None
Example

See Exporting the Catalog.

See Also

- EXPORT_OBJECTS
- EXPORT_TABLES
- Exporting the Catalog

**EXPORT_OBJECTS**

**Note:**
This function and EXPORT_CATALOG return equivalent output.

Generates a SQL script you can use to recreate non-virtual catalog objects on another cluster.

The SQL script conforms to the following requirements:

- Only includes objects to which the user has access.
- Orders CREATE statements according to object dependencies so they can be recreated in the correct sequence. For example, if a table is in a non-PUBLIC schema, the required CREATE SCHEMA statement precedes the CREATE TABLE statement. Similarly, a table's CREATE ACCESS POLICY statement follows the table's CREATE TABLE statement.
- If possible, creates projections with their KSAFE clause, if any, otherwise with their OFFSET clause.

**Syntax**

`EXPORT_OBJECTS( ['[destination]'] [, ['[scope]'] [, 'mark-ksafe']])`
Parameters

**Note:**
If you omit all parameters, this function exports to standard output all objects to which you have access.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>destination</em></td>
<td>Specifies where to send output, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- An empty string ('') writes the script to standard output.</td>
</tr>
<tr>
<td></td>
<td>- The path and name of a SQL output file. This option is valid only for <em>superusers</em>. If you specify a file that does not exist, the function creates one. If you specify only a file name, Vertica creates it in the catalog directory. If the file already exists, the function silently overwrites its contents.</td>
</tr>
</tbody>
</table>

| *scope* | Specifies one or more objects to export as a comma-delimited list: |
|         | [database.]schema[.object][,...] |
|         | - If set to an empty string, Vertica exports all objects to which the user has access. |
|         | - If you specify a schema, Vertica exports all objects in that schema. |
|         | - If you specify a database, it must be the current database. |

| *mark-ksafe* | Boolean argument, specifies whether to include a MARK_DESIGN_KSAFE statement in the generated script with the correct K-safe value for the database: |
|             | - true (default): Include the MARK_DESIGN_KSAFE statement at the end of the output script. |
|             | - false: Omit the from the script. |

**Privileges**

None
Example

See Exporting Objects.

See Also

- EXPORT_CATALOG
- EXPORT_TABLES

**EXPORT_TABLES**

Generates a SQL script that can be used to recreate a logical schema—schemas, tables, constraints, and views—on another cluster. EXPORT_TABLES only exports objects to which the user has access.

The SQL script conforms to the following requirements:

- Only includes objects to which the user has access.
- Orders CREATE statements according to object dependencies so they can be recreated in the correct sequence. For example, if a table references a named sequence, a CREATE SEQUENCE statement precedes the CREATE TABLE statement. Similarly, a table’s CREATE ACCESS POLICY statement follows the table’s CREATE TABLE statement.

Syntax

```
EXPORT_TABLES( ['destination'] [, ['scope']] )
```

**Note:**

If you omit all parameters, EXPORT_CATALOG exports to standard output all tables to which you have access.
Parameters

<table>
<thead>
<tr>
<th>destination</th>
<th>Specifies where to send output, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• An empty string (&quot;&quot;&quot;) writes the script to standard output.</td>
</tr>
<tr>
<td></td>
<td>• The path and name of a SQL output file. This option is valid only for superusers. If you specify a file that does not exist, the function creates one. If you specify only a file name, Vertica creates it in the catalog directory. If the file already exists, the function silently overwrites its contents.</td>
</tr>
</tbody>
</table>

| scope | Specifies one or more tables to export, as follows: |
|       | [database.]schema[.table][,...] |
|       | • If set to an empty string, Vertica exports all non-virtual table objects to which you have access, including table schemas, sequences, and constraints. |
|       | • If you specify a schema, Vertica exports all non-virtual table objects in that schema. |
|       | • If you specify a database, it must be the current database. |

Privileges

None

Example

See Exporting Tables.

See Also

- Exporting Tables
- EXPORT_CATALOG
- EXPORT_OBJECTS
**INSTALL_LICENSE**

Installs the license key in the global catalog.

**Syntax**

```
INSTALL_LICENSE('filename')
```

**Parameters**

| filename | The absolute path name of a valid license file. |

**Privileges**

Superuser

**Examples**

```
=> SELECT INSTALL_LICENSE('/tmp/vlicense.dat');
```

**See Also**

Managing Licenses

**MARK_DESIGN_KSAFE**

Enables or disables high availability in your environment, in case of a failure. Before enabling recovery, MARK_DESIGN_KSAFE queries the catalog to determine whether a cluster's physical schema design meets the following requirements:
- Small, unsegmented tables are replicated on all nodes.
- Large table superprojections are segmented with each segment on a different node.
- Each large table projection has at least one buddy projection for K-safety=1 (or two buddy projections for K-safety=2).

Buddy projections are also segmented across database nodes, but the distribution is modified so segments that contain the same data are distributed to different nodes. See High Availability With Projections in Vertica Concepts.

MARK_DESIGN_KSAFE does not change the physical schema.

Syntax

MARK_DESIGN_KSAFE ( k )

Parameters

<table>
<thead>
<tr>
<th>k</th>
<th>Specifies the level of K-safety, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Enables high availability if the schema design meets requirements for K-safety=2</td>
</tr>
<tr>
<td>1</td>
<td>Enables high availability if the schema design meets requirements for K-safety=1</td>
</tr>
<tr>
<td>0</td>
<td>Disables high availability</td>
</tr>
</tbody>
</table>

Return Messages

If you specify a k value of 1 or 2, Vertica returns one of the following messages.

Success:

Marked design n-safe

Failure:

The schema does not meet requirements for K-n.
Fact table projection projection-name has insufficient "buddy" projections.

where n is a K-safety setting.
Privileges

Superuser

Notes

- The database's internal recovery state persists across database restarts but it is not checked at startup time.
- When one node fails on a system marked K-safe=1, the remaining nodes are available for DML operations.

Examples

```sql
=> SELECT MARK дизайн_ksafe(1);
  mark_design_ksafe  
---------------------
  Marked design 1-safe
(1 row)
```

If the physical schema design is not K-safe, messages indicate which projections do not have a buddy:

```sql
=> SELECT MARK дизайн_ksafe(1);
The given K value is not correct;
the schema is 0-safe
Projection pp1 has 0 buddies,
which is smaller that the given K of 1
Projection pp2 has 0 buddies,
which is smaller that the given K of 1
  .
  .
(1 row)
```

- Failure Recovery
**RELOAD_ADMINTOOLS_CONF**

Updates the admintools.conf on each UP node in the cluster. Updates include:

- IP addresses and catalog paths
- Node names for all nodes in the current database

This function provides a manual method to instruct the server to update admintools.conf on all UP nodes. For example, if you restart a node, call this function to confirm its admintools.conf file is accurate.

**Syntax**

RELOAD_ADMINTOOLS_CONF()

**Privileges**

Superuser

**Example**

Update admintools.conf on each UP node in the cluster:

```sql
=> SELECT RELOAD_ADMINTOOLS_CONF();
RELOAD_ADMINTOOLS_CONF
--------------
admintools.conf reloaded
(1 row)
```

**Client Connection Management Functions**

This section contains client connection management functions specific to Vertica.
**DESCRIBE_LOAD_BALANCE_DECISION**

Evaluates if any load balancing routing rules apply to a given IP address and describes how the client connection would be handled. This function is useful when you are evaluating connection load balancing policies you have created, to ensure they work the way you expect them to.

You pass this function an IP address of a client connection, and it uses the load balancing routing rules to determine how the connection will be handled. The logic this function uses is the same logic used when Vertica load balances client connections, including determining which nodes are available to handle the client connection.

This function assumes the client connection has opted into being load balanced. If actual clients have not opted into load balancing, the connections will not be redirected. See Enabling Native Connection Load Balancing in ADO.NET, Enabling Native Connection Load Balancing in JDBC, and Enabling Native Connection Load Balancing in ODBC, for information on enabling load balancing on the client. For vsql, use the -C command-line option to enable load balancing.

**Syntax**

```
DESSCRIBE_LOAD_BALANCE_DECISION(’ip_address’)
```

**Arguments**

| ‘ip_address’ | An IP address of a client connection to be tested against the load balancing rules. This can be either an IPv4 or IPv6 address. |

**Return Value**

A step-by-step description of how the load balancing rules are being evaluated, including the final decision of which node in the database has been chosen to service the connection.
Privileges

None.

Examples

The following example demonstrates calling DESCRIBE_LOAD_BALANCE_DECISION with three different IP addresses, two of which are handled by different routing rules, and one which is not handled by any rule.

```sql
=> SELECT describe_load_balance_decision('192.168.1.25');
    describe_load_balance_decision
-------------------------------------------------------------
Describing load balance decision for address [192.168.1.25]
Load balance cache internal version id (node-local): [2]
Considered rule [etl_rule] source ip filter [10.20.100.0/24]... input address does not match source ip filter for this rule.
Considered rule [internal_clients] source ip filter [192.168.1.0/24]... input address matches this rule
Matched to load balance group [group_1] the group has policy [ROUNDROBIN] number of addresses [2]
(0) LB Address: [10.20.100.247]:5433
(1) LB Address: [10.20.100.248]:5433
Chose address at position [1]
Routing table decision: Success. Load balance redirect to: [10.20.100.248] port [5433]
(1 row)

=> SELECT describe_load_balance_decision('192.168.2.25');
    describe_load_balance_decision
-------------------------------------------------------------
Describing load balance decision for address [192.168.2.25]
Load balance cache internal version id (node-local): [2]
Considered rule [etl_rule] source ip filter [10.20.100.0/24]... input address does not match source ip filter for this rule.
Considered rule [internal_clients] source ip filter [192.168.1.0/24]... input address does not match source ip filter for this rule.
Considered rule [subnet_192] source ip filter [192.0.0.0/8]... input address matches this rule
Matched to load balance group [group_all] the group has policy [ROUNDROBIN] number of addresses [3]
(0) LB Address: [10.20.100.247]:5433
(1) LB Address: [10.20.100.248]:5433
(2) LB Address: [10.20.100.249]:5433
Chose address at position [1]
Routing table decision: Success. Load balance redirect to: [10.20.100.248] port [5433]
(1 row)

=> SELECT describe_load_balance_decision('1.2.3.4');
```
describe_load_balance_decision
--------------------------------------------------------------------
Describing load balance decision for address [1.2.3.4]
Load balance cache internal version id (node-local): [2]
Considered rule [etl_rule] source ip filter [10.20.100.0/24]... input address does not match source ip filter for this rule.
Considered rule [internal_clients] source ip filter [192.168.1.0/24]... input address does not match source ip filter for this rule.
Considered rule [subnet_192] source ip filter [192.0.0.0/8]... input address does not match source ip filter for this rule.
Routing table decision: No matching routing rules: input address does not match any routing rule source filters. Details: [ Tried some rules but no matching]
No rules matched. Falling back to classic load balancing.
Classic load balance decision: Classic load balancing considered, but either the policy was NONE or no target was available. Details: [NONE or invalid]
(1 row)

The following example demonstrates calling DESCRIBE_LOAD_BALANCE_DECISION repeatedly with the same IP address. You can see that the load balance group's ROUNDROBIN load balance policy has it switch between the two nodes in the load balance group:

=> SELECT describe_load_balance_decision('192.168.1.25');
  describe_load_balance_decision
--------------------------------------------------------------------
Describing load balance decision for address [192.168.1.25]
Load balance cache internal version id (node-local): [1]
Considered rule [etl_rule] source ip filter [10.20.100.0/24]... input address does not match source ip filter for this rule.
Considered rule [internal_clients] source ip filter [192.168.1.0/24]... input address matches this rule
Matched to load balance group [group_1] the group has policy [ROUNDROBIN] number of addresses [2]
(0) LB Address: [10.20.100.247]:5433
(1) LB Address: [10.20.100.248]:5433
Chose address at position [1]
Routing table decision: Success. Load balance redirect to: [10.20.100.248] port [5433]
(1 row)

=> SELECT describe_load_balance_decision('192.168.1.25');
  describe_load_balance_decision
--------------------------------------------------------------------
Describing load balance decision for address [192.168.1.25]
Load balance cache internal version id (node-local): [1]
Considered rule [etl_rule] source ip filter [10.20.100.0/24]... input address does not match source ip filter for this rule.
Considered rule [internal_clients] source ip filter [192.168.1.0/24]... input address matches this rule
Matched to load balance group [group_1] the group has policy [ROUNDROBIN] number of addresses [2]
(0) LB Address: [10.20.100.247]:5433
(1) LB Address: [10.20.100.248]:5433
Chose address at position [0]
Routing table decision: Success. Load balance redirect to: [10.20.100.247]
Describing load balance decision for address [192.168.1.25]

Load balance cache internal version id (node-local): [1]
Considered rule [etl_rule] source ip filter [10.20.100.0/24]... input address does not match source ip filter for this rule.
Considered rule [internal_clients] source ip filter [192.168.1.0/24]... input address matches this rule
Matched to load balance group [group_1] the group has policy [ROUNDROBIN]
number of addresses [2]
(0) LB Address: [10.20.100.247]:5433
(1) LB Address: [10.20.100.248]:5433
Chose address at position [1]
Routing table decision: Success. Load balance redirect to: [10.20.100.248]
port [5433]
(1 row)

See Also

**GET_CLIENT_LABEL**

Returns the client connection label for the current session.

Syntax

`GET_CLIENT_LABEL()`

Privileges

None

Examples

Return the current client connection label:
See Also

Setting a Client Connection Label

**RESET_LOAD_BALANCE_POLICY**

Resets the counter each host in the cluster maintains, to track which host it will refer a client to when the native connection load balancing scheme is set to ROUNDROBIN. To reset the counter, run this function on all cluster nodes.

**Syntax**

```sql
RESET_LOAD_BALANCE_POLICY()
```

**Privileges**

Superuser

**Example**

```sql
=> SELECT RESET_LOAD_BALANCE_POLICY();

RESET_LOAD_BALANCE_POLICY
---------------------------
data load_application
(1 row)
```

Successfully reset stateful client load balance policies: "roundrobin".
(1 row)
**SET_CLIENT_LABEL**

Assigns a label to a client connection for the current session. You can use this label to distinguish client connections.

Labels appear in the `v_monitor.sessions` table. However, they are not updated in Data Collector tables because the change occurs after Vertica makes the connection.

**Syntax**

```
SET_CLIENT_LABEL('label-name')
```

**Parameters**

| label-name | VARCHAR name assigned to the client connection label. |

**Privileges**

None

**Examples**

Assign label `data_load_application` to the current client connection:

```sql
=> SELECT SET_CLIENT_LABEL('data_load_application');
SET_CLIENT_LABEL
--------------------------------------
client_label set to data_load_application
(1 row)
```

**See Also**

[Setting a Client Connection Label](#)
**SET_LOAD_BALANCE_POLICY**

Sets how native connection load balancing chooses a host to handle a client connection.

**Syntax**

```
SET_LOAD_BALANCE_POLICY('policy')
```

**Parameters**

<table>
<thead>
<tr>
<th>policy</th>
<th>The name of the load balancing policy to use, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• NONE (default): Disables native connection load balancing.</td>
</tr>
<tr>
<td></td>
<td>• ROUNDROBIN: Chooses the next host from a circular list of hosts in the cluster that are up—for example, in a three-node cluster, iterates over node1, node2, and node3, then wraps back to node1. Each host in the cluster maintains its own pointer to the next host in the circular list, rather than there being a single cluster-wide state.</td>
</tr>
<tr>
<td></td>
<td>• RANDOM: Randomly chooses a host from among all hosts in the cluster that are up.</td>
</tr>
</tbody>
</table>

**Note:**

Even if the load balancing policy is set on the server to something other than NONE, clients must indicate they want their connections to be load balanced by setting a connection property.

**Privileges**

Superuser

**Example**

The following example demonstrates enabling native connection load balancing on the server by setting the load balancing scheme to ROUNDROBIN:
=> SELECT SET_LOAD_BALANCE_POLICY('ROUNDROBIN');

```
SET_LOAD_BALANCE_POLICY
----------------------------------------------
Successfully changed the client initiator load balancing policy to: roundrobin
(1 row)
```

- About Native Connection Load Balancing

### Cloud Management Functions

This section contains functions for managing cloud integrations. See also Hadoop Functions for HDFS and AWS Library Functions for the S3 Export UDx.

#### AZURE_TOKEN_CACHE_CLEAR

Clears the cached access token for Azure. Call this function after changing the configuration of Azure managed identities.

An Azure object store can support and manage multiple identities. If multiple identities are in use, Vertica looks for an Azure tag with a key of VerticaManagedIdentityClientId, the value of which must be the client_id attribute of the managed identity to be used. If the Azure configuration changes, use this function to clear the cache.

### Syntax

`AZURE_TOKEN_CACHE_CLEAR ( )`

### Privileges

Superuser
Cluster Management Functions

This section contains functions that manage spread deployment on large, distributed database clusters.

**REALIGN_CONTROL_NODES**

Causes Vertica to re-evaluate which nodes in the cluster or subcluster are control nodes and which nodes are assigned to them as dependents when large cluster is enabled. Call this function after altering fault groups in an Enterprise Mode database, or changing the number of control nodes in either database mode. After calling this function, query the \texttt{V\_CATALOG\_CLUSTER\_LAYOUT} system table to see the proposed new layout for nodes in the cluster. You must also take additional steps before the new control node assignments take effect. See Changing the Number of Control Nodes and Realigning for details.

**Note:**

In Vertica versions prior to 10.0.1, control node assignments weren't restricted to be within the same Eon Mode subcluster. If you attempt to realign control nodes in a subcluster whose control nodes have dependents in other subclusters, this function returns an error. In this case, you must realign the control nodes in those other subclusters first. Realigning the other subclusters fixes the cross-subcluster dependencies, allowing you to realign the control nodes in the original subcluster you attempted to realign.

**Syntax**

**In Enterprise Mode:**

\begin{verbatim}
REALIGN_CONTROL_NODES()
\end{verbatim}

**In Eon Mode:**

\begin{verbatim}
REALIGN_CONTROL_NODES('subcluster_name')
\end{verbatim}
Parameters

| subcluster_name | The name of the subcluster where you want to realign control nodes. Only the nodes in this subcluster are affected. Other subclusters are unaffected. Only allowed when the database is running in Eon Mode. |

Privileges

Superuser

Example

In an Enterprise Mode database, choose control nodes from all nodes and assign the remaining nodes to a control node:

```
=> SELECT REALIGN_CONTROL_NODES();
```

In an Eon Mode database, re-evaluate the control node assignments in the subcluster named analytics:

```
=> SELECT REALIGN_CONTROL_NODES('analytics');
```

See Also

- Changing the Number of Control Nodes and Realigning Fault Groups

**REBALANCE_CLUSTER**

Rebalances the database cluster synchronously as a session foreground task. REBALANCE_CLUSTER returns only after the rebalance operation is complete. If the current session ends, the operation immediately aborts. To rebalance the cluster as a background task, call START_REBALANCE_CLUSTER.
On large cluster arrangements, you typically call REBALANCE_CLUSTER in a flow (see Changing the Number of Control Nodes and Realigning). After you change the number and distribution of control nodes (spread hosts), run REBALANCE_CLUSTER to achieve fault tolerance.

For detailed information about rebalancing tasks, see Rebalancing Data Across Nodes.

**Tip:**
By default, before performing a rebalance, Vertica queries system tables to compute the size of all projections involved in the rebalance task. This query can add significant overhead to the rebalance operation. To disable this query, set projection configuration parameter `RebalanceQueryStorageContainers` to 0.

**Syntax**

```sql
REBALANCE_CLUSTER()
```

**Privileges**

Superuser

**Example**

```sql
=> SELECT REBALANCE_CLUSTER();
REBALANCE_CLUSTER
-----------------------
  REBALANCED
(1 row)
```

**RELOAD_SPREAD**

Updates cluster changes to the catalog’s Spread configuration file. These changes include:

- New or realigned control nodes
- New Spread hosts or fault group
- New or dropped cluster nodes
This function is often used in a multi-step process for large and elastic cluster arrangements. Calling it might require you to restart the database. You must then rebalance the cluster to realize fault tolerance. For details, see Defining and Realigning Control Nodes in the Administrator's Guide.

**Caution:**
In an Eon Mode database, using this function could result in a database shutdown. Nodes may become disconnected after you call this function. If the database no longer has full shard coverage without these nodes, it shuts down to maintain data integrity. You can safely restart a database that shuts down after calling this function, as the disconnected nodes will rejoin the database on startup.

**Syntax**

```sql
RELOAD_SPREAD(true)
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>true</code></td>
<td>Updates cluster changes related to control message responsibilities to the Spread configuration file.</td>
</tr>
</tbody>
</table>

**Privileges**

**Superuser**

**Example**

Update the cluster with changes to control messaging:

```sql
=> SELECT reload_spread(true);
reload_spread
-----------------
reloaded
(1 row)
```
See Also

REBALANCE_CLUSTER

**SET_CONTROL_SET_SIZE**

Sets the number of control nodes that participate in the spread service when large cluster is enabled. If the database is running in Enterprise Mode, this function sets the number of control nodes for the entire database cluster. If the database is running in Eon Mode, this function sets the number of control nodes in the subcluster you specify. See Large Cluster for more information.

Syntax

**In Enterprise Mode:**

```
SET_CONTROL_SET_SIZE( control_nodes )
```

**In Eon Mode:**

```
SET_CONTROL_SET_SIZE('subcluster_name', control_nodes )
```

Parameters

<table>
<thead>
<tr>
<th>subcluster_name</th>
<th>The name of the subcluster where you want to set the number of control nodes. Only allowed when the database is running in Eon Mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td>control_nodes</td>
<td>The number of control nodes to assign to the cluster (when in Enterprise Mode) or subcluster (when in Eon Mode). Value can be one of the following:</td>
</tr>
<tr>
<td></td>
<td>- Positive integer value: Vertica assigns the number of control nodes you specify to the cluster or subcluster. This value can be larger than the current node count. This value cannot be</td>
</tr>
</tbody>
</table>
larger than 120 (the maximum number of control nodes for a
database). In Eon Mode, the total of this value plus the
number of control nodes set for all other subclusters cannot
be more than 120.

- `-1`: Makes every node in the cluster or subcluster into
control nodes. This value effectively disables large cluster for
the cluster or subcluster.

**Privileges**

**Superuser**

**Example**

In an Enterprise Mode database, set the number of control nodes for the entire cluster to 5:

```sql
=> SELECT set_control_set_size(5);
SET_CONTROL_SET_SIZE
-----------------------
Control size set
(1 row)
```

**See Also**

- Changing the Number of Control Nodes and Realigning
Cluster Scaling Functions

This section contains functions that control how the cluster organizes data for rebalancing.

CANCEL_REBALANCE_CLUSTER

 Stops any rebalance task that is currently in progress or is waiting to execute.

Syntax

CANCEL_REBALANCE_CLUSTER()

Privileges

Superuser

Example

=> SELECT CANCEL_REBALANCE_CLUSTER();
   CANCEL_REBALANCE_CLUSTER
   --------------------------
       CANCELED
   (1 row)

See Also

- START_REBALANCE_CLUSTER
- REBALANCE_CLUSTER
**DISABLE_LOCAL_SEGMENTS**

Disables local data segmentation, which breaks projections segments on nodes into containers that can be easily moved to other nodes. See Local Data Segmentation in the Administrator's Guide for details.

**Syntax**

DISABLE_LOCAL_SEGMENTS()

**Privileges**

Superuser

**Example**

```sql
=> SELECT DISABLE_LOCAL_SEGMENTS();
DISABLE_LOCAL_SEGMENTS
------------------------
DISABLED
(1 row)
```

**ENABLE ELASTIC_CLUSTER**

Enables elastic cluster scaling, which makes enlarging or reducing the size of your database cluster more efficient by segmenting a node's data into chunks that can be easily moved to other hosts.

**Syntax**

ENABLE_ELASTIC_CLUSTER()
Privileges

Superuser

Example

```sql
=> SELECT ENABLE_ELASTIC_CLUSTER();
ENABLE_ELASTIC_CLUSTER
------------------------
ENABLED
(1 row)
```

**ENABLE_LOCAL_SEGMENTS**

Enables local storage segmentation, which breaks projections segments on nodes into containers that can be easily moved to other nodes. See Local Data Segmentation in the Administrator's Guide for more information.

Syntax

`ENABLE_LOCAL_SEGMENTS()`

Privileges

Superuser

Example

```sql
=> SELECT ENABLE_LOCAL_SEGMENTS();
ENABLE_LOCAL_SEGMENTS
------------------------
ENABLED
(1 row)
```
**SET_SCALING_FACTOR**

Sets the scaling factor that determines the number of storage containers used when rebalancing the database and when using local data segmentation is enabled. See [Cluster Scaling](#) for details.

**Syntax**

```
SET_SCALING_FACTOR( factor )
```

**Parameters**

| factor | An integer value between 1 and 32. Vertica uses this value to calculate the number of storage containers each projection is broken into when rebalancing or when local data segmentation is enabled. |

**Privileges**

Superuser

**Best Practices**

The scaling factor determines the number of storage containers that Vertica uses to store each projection across the database during rebalancing when local segmentation is enabled. When setting the scaling factor, follow these guidelines:

- The number of storage containers should be greater than or equal to the number of partitions multiplied by the number of local segments:

  \[
  \text{num-storage-containers} \geq (\text{num-partitions} \times \text{num-local-segments})
  \]

- Set the scaling factor high enough so rebalance can transfer local segments to satisfy the skew threshold, but small enough so the number of storage containers does not
result in too many ROS containers, and cause ROS pushback. The maximum number of ROS containers (by default 1024) is set by configuration parameter ContainersPerProjectionLimit.

**Example**

```
=> SELECT SET_SCALING_FACTOR(12);
SET_SCALING_FACTOR
-------------------
SET
(1 row)
```

**START_REBALANCE_CLUSTER**

Asynchronously rebalances the database cluster as a background task. This function returns immediately after the rebalancing operation is complete. Rebalancing persists until the operation is complete, even if you close the current session or the database shuts down. In the case of shutdown, rebalancing resumes after the cluster restarts. To stop the rebalance operation, call CANCEL_REBALANCE.Cluster.

For detailed information about rebalancing tasks, see Rebalancing Data Across Nodes.

**Syntax**

```
START_REBALANCE_CLUSTER()
```

**Privileges**

Superuser

**Example**

```
=> SELECT START_REBALANCE_CLUSTER();
START_REBALANCE_CLUSTER
--------------------------
REBALANCING
```
See Also

REBALANCE_CLUSTER

Communications Functions

This section contains communication functions specific to Vertica.

**NOTIFY**

Specifies the text message to include with a notification.

**Syntax**

```
NOTIFY ( 'message', 'notifier', 'target-topic' )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>The message to send to the end point.</td>
</tr>
<tr>
<td>notifier</td>
<td>The name of the notifier used to deliver the message.</td>
</tr>
<tr>
<td>target-topic</td>
<td>The name of an existing destination Kafka topic for the message.</td>
</tr>
</tbody>
</table>

**Note:**

If the topic doesn't already exist, you can configure your Kafka broker to automatically create the specified topic. For more information, see the [Kafka documentation](#).
Privileges

Superuser

Examples

Send a message to confirm that an ETL job is complete:

```sql
=> SELECT NOTIFY('ETL Done!', 'my_notifier', 'DB_activity_topic');
```
Constraint Management Functions

This section contains constraint management functions specific to Vertica.

See also SQL system table V_CATALOG.TABLE_CONSTRAINTS.

**ANALYZE_CONSTRAINTS**

Analyzes and reports on constraint violations within the specified scope

You can enable automatic enforcement of primary key, unique key, and check constraints when INSERT, UPDATE, MERGE, or COPY statements execute. Alternatively, you can use ANALYZE_CONSTRAINTS to validate constraints after issuing these statements. Refer to Constraint Enforcement for more information.

ANALYZE_CONSTRAINTS performs a lock in the same way that SELECT * FROM t1 holds a lock on table t1. See LOCKS for additional information.

**Syntax**

ANALYZE_CONSTRAINTS ('[[database.]schema.]table'] [, 'column[,]'] )

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| [database.]schema | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:  

myschema.thisDbObject  

If you specify a database, it must be the current database. |
| table         | Identifies the table to analyze. If you omit specifying a schema, Vertica uses the current schema search path. If set to an empty string, Vertica analyzes all tables in the current schema. |
| column        | The column in table to analyze. You can specify multiple comma-delimited |
columns. Vertica narrows the scope of the analysis to the specified columns. If you omit specifying a column, Vertica analyzes all columns in table.

Privileges

- Schema: USAGE
- Table: SELECT

Detecting Constraint Violations During a Load Process

Vertica checks for constraint violations when queries are run, not when data is loaded. To detect constraint violations as part of the load process, use a COPY statement with the NO COMMIT option. By loading data without committing it, you can run a post-load check of your data using the ANALYZE_CONSTRAINTS function. If the function finds constraint violations, you can roll back the load because you have not committed it.

If ANALYZE_CONSTRAINTS finds violations, such as when you insert a duplicate value into a primary key, you can correct errors using the following functions. Effects last until the end of the session only:

- DISABLE_DUPLICATE_KEY_ERROR
- REENABLE_DUPLICATE_KEY_ERROR

Important:
If a check constraint SQL expression evaluates to an unknown for a given row because a column within the expression contains a null, the row passes the constraint condition.

Return Values

ANALYZE_CONSTRAINTS returns results in a structured set (see table below) that lists the schema name, table name, column name, constraint name, constraint type, and the column values that caused the violation.

If the result set is empty, then no constraint violations exist; for example:

> SELECT ANALYZE_CONSTRAINTS ('public.product_dimension', 'product_key');
The following result set shows a primary key violation, along with the value that caused the violation ('10'):

```
=> SELECT ANALYZE_CONSTRAINTS ('');
```

<table>
<thead>
<tr>
<th>Schema Name</th>
<th>Table Name</th>
<th>Column Names</th>
<th>Constraint Name</th>
<th>Constraint Type</th>
<th>Column Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>store</td>
<td>t1</td>
<td>c1</td>
<td>pk_t1</td>
<td>PRIMARY</td>
<td>('10')</td>
</tr>
</tbody>
</table>
```

The result set columns are described in further detail in the following table:

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schema Name</td>
<td>VARCHAR</td>
<td>The name of the schema.</td>
</tr>
<tr>
<td>Table Name</td>
<td>VARCHAR</td>
<td>The name of the table, if specified.</td>
</tr>
<tr>
<td>Column Names</td>
<td>VARCHAR</td>
<td>A list of comma-delimited columns that contain constraints.</td>
</tr>
<tr>
<td>Constraint Name</td>
<td>VARCHAR</td>
<td>The given name of the primary key, foreign key, unique, check, or not null constraint, if specified.</td>
</tr>
<tr>
<td>Constraint Type</td>
<td>VARCHAR</td>
<td>Identified by one of the following strings:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• PRIMARY KEY</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• FOREIGN KEY</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• UNIQUE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• CHECK</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• NOT NULL</td>
</tr>
<tr>
<td>Column Values</td>
<td>VARCHAR</td>
<td>Value of the constraint column, in the same order in which Column Names contains the value of that column in the violating row. When interpreted as SQL, the value of this column forms a list of values of the same type as the columns in Column Names; for example: ('1'), ('1', 'z')</td>
</tr>
</tbody>
</table>
Examples

See Detecting Constraint Violations in the Administrator's Guide.

**ANALYZE_CORRELATIONS**

⚠️ **Deprecated:**
This function is deprecated and will be removed in a future release.

Analyzes the specified tables for pairs of columns that are strongly correlated. `ANALYZE_CORRELATIONS` stores the 20 pairs with the strongest correlation. `ANALYZE_CORRELATIONS` also analyzes statistics.

`ANALYZE_CORRELATIONS` analyzes only pairwise single-column correlations.

For example, state name and country name columns are strongly correlated because the city name usually, but perhaps not always, identifies the state name. The city of Conshohoken is uniquely associated with Pennsylvania, while the city of Boston exists in Georgia, Indiana, Kentucky, New York, Virginia, and Massachusetts. In this case, city name is strongly correlated with state name.

**Behavior Type**

*Immutable*

**Syntax**

```
ANALYZE_CORRELATIONS ( '[[database.]schema.]table' [, 'recalculate'] )
```

**Parameters**

```
[database.]schema Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:
```
If you specify a database, it must be the current database.

**table-name**

Identifies the table to analyze. If you omit specifying a schema, Vertica uses the current schema search path. If set to an empty string, Vertica analyzes all tables in the current schema.

**recalculate**

Boolean that specifies whether to analyze correlated columns that were previously analyzed.

**Note:**

Column correlation analysis typically needs to be done only once.

Default: `false`

**Privileges**

One of the following:

- **Superuser**
- User with USAGE privilege on the design schema

**Example**

In the following example, `ANALYZE_CORRELATIONS` analyses column correlations for all tables in the `public` schema, even if they currently exist:

```sql
=> SELECT ANALYZE_CORRELATIONS ('public.*', 'true');
ANALYZE_CORRELATIONS
-------------------------
0
(1 row)
```

**DISABLE_DUPLICATE_KEY_ERROR**

Disables error messaging when Vertica finds duplicate primary or unique key values at run time (for use with key constraints that are not automatically enabled). Queries execute as
though no constraints are defined on the schema. Effects are session scoped.

**Syntax**

DISABLE_DUPLICATE_KEY_ERROR();

**Privileges**

Superuser

**Examples**

When you call DISABLE_DUPLICATE_KEY_ERROR, Vertica issues warnings letting you know that duplicate values will be ignored, and incorrect results are possible. DISABLE_DUPLICATE_KEY_ERROR is for use only for key constraints that are not automatically enabled.

```sql
=> select DISABLE_DUPLICATE_KEY_ERROR;
WARNING 3152: Duplicate values in columns marked as UNIQUE will now be ignored for the remainder of your session or until reenable_duplicate_key_error() is called
WARNING 3539: Incorrect results are possible. Please contact Vertica Support if unsure
disable_duplicate_key_error
Duplicate key error disabled
(1 row)
```

**See Also**

- [ANALYZE_CONSTRAINTS](#)
- [LAST_INSERT_ID](#)

**LAST_INSERT_ID**

Returns the last value of an AUTO_INCREMENT/IDENTITY column. If multiple sessions concurrently load the same table with an AUTO_INCREMENT/IDENTITY column, the function returns the last value generated for that column.
**Note:**
This function works only with `AUTO_INCREMENT/IDENTITY` columns. It does not work with named sequences.

**Syntax**

`LAST_INSERT_ID()`

**Privileges**

- Table owner
- USAGE privileges on the table schema

**Examples**

See [AUTO_INCREMENT and IDENTITY Sequences](#) in the Administrator's Guide.

**REENABLE_DUPLICATE_KEY_ERROR**

Restores the default behavior of error reporting by reversing the effects of `DISABLE_DUPLICATE_KEY_ERROR`. Effects are session-scoped.

**Syntax**

`REENABLE_DUPLICATE_KEY_ERROR();`

**Privileges**

Superuser
Examples

```sql
=> SELECT REENABLE_DUPLICATE_KEY_ERROR();
REENABLE_DUPLICATE_KEY_ERROR
---------------------------
Duplicate key error enabled
(1 row)
```

See Also

`ANALYZE_CONSTRAINTS`
Data Collector Functions

The Vertica Data Collector is a utility that extends system table functionality by providing a framework for recording events. It gathers and retains monitoring information about your database cluster and makes that information available in system tables, requiring few configuration parameter tweaks, and having negligible impact on performance.

Collected data is stored on disk in the DataCollector directory under the Vertica /catalog path. You can use the information the Data Collector retains to query the past state of system tables and extract aggregate information, as well as do the following:

- See what actions users have taken
- Locate performance bottlenecks
- Identify potential improvements to Vertica configuration

Data Collector works in conjunction with an advisor tool called Workload Analyzer, which intelligently monitors the performance of SQL queries and workloads and recommends tuning actions based on observations of the actual workload history.

By default, Data Collector is on and retains information for all sessions. If performance issues arise, a superuser can disable Data Collector by setting set configuration parameter EnableDataCollector to 0.

**CLEAR_DATA_COLLECTOR**

Clears all memory and disk records from Data Collector tables and logs, and resets collection statistics in system table DATA_COLLECTOR.

**Syntax**

```
CLEAR_DATA_COLLECTOR( [ 'component' ] )
```

**Parameters**

| component | Clears memory and disk records for the specified component. If you |
provide no argument, the function clears memory and disk records for all components.

Query system table DATA_COLLECTION for component names. For example:

```sql
=> SELECT DISTINCT component, description FROM data_collector WHERE component ilike '%Depot%' ORDER BY component;
```

<table>
<thead>
<tr>
<th>component</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DepotEvictions</td>
<td>Files evicted from the Depot</td>
</tr>
<tr>
<td>DepotFetches</td>
<td>Files fetched to the Depot</td>
</tr>
<tr>
<td>DepotUploads</td>
<td>Files Uploaded from the Depot</td>
</tr>
</tbody>
</table>

(3 rows)

**Privileges**

Superuser

**Examples**

The following command clears memory and disk records for the ResourceAcquisitions component:

```sql
=> SELECT clear_data_collector('ResourceAcquisitions');
```

```
clear_data_collector
------------------------
CLEAR                    
(1 row)
```

The following command clears data collection for all components:

```sql
=> SELECT clear_data_collector();
```

```
clear_data_collector
------------------------
CLEAR                    
(1 row)
```

**See Also**

Data Collector Utility
**DATA_COLLECTOR_HELP**

Returns online usage instructions about the Data Collector, the DATA_COLLECTOR system table, and the Data Collector control functions.

**Syntax**

DATA_COLLECTOR_HELP()

**Privileges**

None

**Returns**

The DATA_COLLECTOR_HELP() function returns the following information:

```sql
=> SELECT DATA_COLLECTOR_HELP();
------------------------------------------------------------------------------------------------------------------
Usage Data Collector
The data collector retains history of important system activities.
   This data can be used as a reference of what actions have been taken
       by users, but it can also be used to locate performance bottlenecks,
       or identify potential improvements to the Vertica configuration.
   This data is queryable via Vertica system tables.
Access a list of data collector components, and some statistics, by running:
    SELECT * FROM v_monitor.data_collector;

The amount of data retained by size and time can be controlled with several
functions.
   To just set the size amount:
       set_data_collector_policy(<component>,
         <memory retention (KB)>,
         <disk retention (KB)>);

   To set both the size and time amounts (the smaller one will dominate):
       set_data_collector_policy(<component>,
         <memory retention (KB)>,
         <disk retention (KB)>,
         <interval>);
```
To set just the time amount:
   set_data_collector_time_policy(<component>,
   <interval>);

To set the time amount for all tables:
   set_data_collector_time_policy(<interval>);

The current retention policy for a component can be queried with:
   get_data_collector_policy(<component>);

Data on disk is kept in the "DataCollector" directory under the Vertica
\catalog path. This directory also contains instructions on how to load
the monitoring data into another Vertica database.

To move the data collector logs and instructions to other storage locations,
create labeled storage locations using add_location and then use:
   set_data_collector_storage_location(<storage_label>);

Additional commands can be used to configure the data collection logs.
The log can be cleared with:
clear_data_collector([<optional component>]);
The log can be synchronized with the disk storage using:
flush_data_collector([<optional component>]);

See Also

- DATA_COLLECTOR
- TUNING_RECOMMENDATIONS
- Analyzing Workloads
- Data Collector Utility

**FLUSH_DATA_COLLECTOR**

Waits until memory logs are moved to disk and then flushes the Data Collector,
synchronizing the log with disk storage.

**Syntax**

```
FLUSH_DATA_COLLECTOR( ['component' ] )
```
Parameters

<table>
<thead>
<tr>
<th>component</th>
<th>Flushes data for the specified component. If you omit this argument, the function flushes data for all components.</th>
</tr>
</thead>
</table>

Query system table `DATA_COLLECTOR` for component names. For example:

```sql
=> SELECT DISTINCT component, description FROM data_collector WHERE component ilike '%Depot%' ORDER BY component;
```

<table>
<thead>
<tr>
<th>component</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DepotEvictions</td>
<td>Files evicted from the Depot</td>
</tr>
<tr>
<td>DepotFetched</td>
<td>Files fetched to the Depot</td>
</tr>
<tr>
<td>DepotUploaded</td>
<td>Files Uploaded from the Depot</td>
</tr>
</tbody>
</table>

(3 rows)

Privileges

Superuser

Examples

The following command flushes the Data Collector for the ResourceAcquisitions component:

```sql
=> SELECT flush_data_collector('ResourceAcquisitions');
```

```
flush_data_collector
------------------------
FLUSH                    
(1 row)
```

The following command flushes data collection for all components:

```sql
=> SELECT flush_data_collector();
```

```
flush_data_collector
------------------------
FLUSH                    
(1 row)
```
See Also

Data Collector Utility

GET_DATA_COLLECTOR_NOTIFY_POLICY

Lists any notification policies set on a Data Collector component.

Syntax

GET_DATA_COLLECTOR_NOTIFY_POLICY('component')

<table>
<thead>
<tr>
<th>component</th>
<th>Name of the Data Collector component to check for notification policies.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Query system table DATA_COLLECTOR for component names. For example:</td>
</tr>
<tr>
<td></td>
<td>=&gt; SELECT DISTINCT component, description FROM data_collector WHERE component ilike '%Depot%' ORDER BY component;</td>
</tr>
<tr>
<td>DepotEvictions</td>
<td>Files evicted from the Depot</td>
</tr>
<tr>
<td>DepotFetches</td>
<td>Files fetched to the Depot</td>
</tr>
<tr>
<td>DepotUploads</td>
<td>Files Uploaded from the Depot</td>
</tr>
<tr>
<td></td>
<td>(3 rows)</td>
</tr>
</tbody>
</table>

Example

=> SELECT GET_DATA_COLLECTOR_NOTIFY_POLICY('LoginFailures');
GET_DATA_COLLECTOR_NOTIFY_POLICY
-----------------------------
Notifiable; Notifier: vertica_stats; Channel: vertica_notifications
(1 row)

The following example shows the output from the function when there is no notification policy for the component:

=> SELECT GET_DATA_COLLECTOR_NOTIFY_POLICY('LoginFailures');
GET_DATA_COLLECTOR_NOTIFY_POLICY
See Also

- SET_DATA COLLECTOR NOTIFY POLICY
- Producing Kafka Messages Using Notifiers

**GET_DATA COLLECTOR POLICY**

Retrieves a brief statement about the retention policy for the specified component.

**Syntax**

```
GET_DATA_COLLECTOR_POLICY( 'component' )
```

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>component</td>
<td>Returns the retention policy of the specified component.</td>
</tr>
</tbody>
</table>

Query system table `DATA_COLLECTOR` for component names. For example:

```
=> SELECT DISTINCT component, description FROM data_collector WHERE component ilike '%Depot%' ORDER BY component;
                   component    | description              |
-----------------|--------------------------|
DepotEvictions   | Files evicted from the Depot |
DepotFetches     | Files fetched to the Depot |
DepotUploads     | Files Uploaded from the Depot |

(3 rows)
```

**Privileges**

None
Example

The following query returns the history of all resource acquisitions by specifying the ResourceAcquisitions component:

```
=> SELECT get_data_collector_policy('ResourceAcquisitions');
get_data_collector_policy
--------------------------------------------
1000KB kept in memory, 10000KB kept on disk.
(1 row)
```

See Also

- DATA_COLLECTOR
- Data Collector Utility

**SET_DATA_COLLECTOR_NOTIFY_POLICY**

Enables or disables automatic notification of Data Collector component changes.

**Syntax**

```
SET_DATA_COLLECTOR_NOTIFY_POLICY('component','notifier', 'topic', enabled)
```

<table>
<thead>
<tr>
<th>component</th>
<th>Name of the component whose change will be reported via the notifier.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Query system table DATA_COLLECTOR for component names. For example:</td>
</tr>
<tr>
<td></td>
<td>=&gt; SELECT DISTINCT component, description FROM data_collector WHERE component ilike '%Depot%' ORDER BY component;</td>
</tr>
<tr>
<td></td>
<td>component</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------</td>
</tr>
<tr>
<td>DepotEvictions</td>
<td>Files evicted from the Depot</td>
</tr>
<tr>
<td>DepotFetches</td>
<td>Files fetched to the Depot</td>
</tr>
<tr>
<td>DepotUploads</td>
<td>Files Uploaded from the Depot</td>
</tr>
<tr>
<td>(3 rows)</td>
<td></td>
</tr>
</tbody>
</table>

| notifier        | Name of the notifier that will send the message. |
### Examples

To be notified of failed login attempts, you can create a notifier that sends a notification when the DC component `LoginFailures` updates. The `TLSMODE 'verify-ca'` verifies that the server's certificate is signed by a trusted CA.

```sql
=> CREATE NOTIFIER vertica_stats ACTION 'kafka://kafka01.example.com:9092' MAXMEMORYSIZE '10M' TLSMODE 'verify-ca';
CREATE NOTIFIER
=> SELECT SET_DATA_COLLECTOR_NOTIFY_POLICY('LoginFailures','vertica_stats','vertica_notifications', true);
SET_DATA_COLLECTOR_NOTIFY_POLICY
-----------------------------
SET
(1 row)
```

The following example shows how to disable the policy created in the previous example:

```sql
=> SELECT SET_DATA_COLLECTOR_NOTIFY_POLICY('LoginFailures','vertica_stats','vertica_notifications', false);
SET_DATA_COLLECTOR_NOTIFY_POLICY
-----------------------------
SET
(1 row)
```

### See Also

- `GET_DATA_COLLECTOR_NOTIFY_POLICY`
- Producing Kafka Messages Using Notifiers
**SET_DATA_COLLECTOR_POLICY**

Updates the following retention policy properties for the specified component:

- MEMORY_BUFFER_SIZE_KB
- DISK_SIZE_KB
- INTERVAL_TIME

Before you change a retention policy, you can view its current settings by querying system table `DATA_COLLECTOR` or by calling meta-function `GET_DATA_COLLECTOR_POLICY`.

**Syntax**

```
SET_DATA_COLLECTOR_POLICY('component', 'memory-buffer-size', 'disk-size' [, 'interval-time'] )
```

### Parameters

<table>
<thead>
<tr>
<th><strong>Parameter</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>component</code></td>
<td>Specifies the retention policy to update. Query system table <code>DATA_COLLECTOR</code> for component names. For example:</td>
</tr>
<tr>
<td></td>
<td><code>=&gt; SELECT DISTINCT component, description FROM data_collector WHERE component ilike '%Depot%' ORDER BY component;</code></td>
</tr>
<tr>
<td></td>
<td>component</td>
</tr>
<tr>
<td></td>
<td>DepotEvictions</td>
</tr>
<tr>
<td></td>
<td>DepotFetches</td>
</tr>
<tr>
<td></td>
<td>DepotUploads</td>
</tr>
<tr>
<td></td>
<td>(3 rows)</td>
</tr>
<tr>
<td><code>memory-buffer-size</code></td>
<td>Specifies in kilobytes the maximum amount of data that is buffered in memory before moving it to disk. The policy retention policy property MEMORY_BUFFER_SIZE_KB is set from this value.</td>
</tr>
<tr>
<td></td>
<td><strong>Caution:</strong> If you set this parameter to 0, the function returns</td>
</tr>
<tr>
<td><code>interval-time</code></td>
<td>Specifies the interval between data collection operations. The policy retention policy property INTERVAL_TIME is set from this value.</td>
</tr>
</tbody>
</table>
with a warning that the Data Collector cannot retain any data for this component in memory or on disk.

Consider setting this parameter to a high value in the following cases:

- Unusually high levels of data collection. If `memory-buffer-size` is set too low, the Data Collector might be unable to flush buffered data to disk fast enough to keep up with the activity level, which can lead to loss of in-memory data.
- Very large data collector records—for example, records with very long query strings. The Data Collector uses double-buffering, so it cannot retain in memory records that are more than 50 percent larger than `memory-buffer-size`.

`disk-size` Specifies in kilobytes the maximum disk space allocated for this component's Data Collector table. The policy retention policy property DISK_SIZE_KB is set from this value. If set to 0, the Data Collector retains only as much component data as it can buffer in memory, as specified by `memory-buffer-size`.

`interval-time` `INTERVAL` data type that specifies how long data of a given component is retained in that component's Data Collector table. The retention policy property INTERVAL_TIME is set from this value. If you set this parameter to a positive value, it also changes the policy property INTERVAL_SET to t (true).

For example, if you specify component TupleMoverEvents and set interval-time to an interval of two days ('2 days '::interval), the Data Collector table dc_tuple_mover_events retains records of Tuple Mover activity over the last 48 hours. Older Tuple Mover data are automatically dropped from this table.

**Note:** Setting a component's policy's INTERVAL_TIME property has no effect on how much data storage the Data Collector retains on disk for that component. Maximum disk storage capacity is determined by the disk-size property.
DISK_SIZE_KB property. Setting the INTERVAL_TIME property only affects how long data is retained by the component's Data Collector table. For details, see Configuring Data Retention Policies.

To disable the INTERVAL_TIME policy property, set this parameter to a negative integer. Doing so reverts two retention policy properties to their default settings:

- INTERVAL_SET: f
- INTERVAL_TIME: 0

With these two properties thus set, the component's Data Collector table retains data on all component events until it reaches its maximum limit, as set by retention policy property DISK_SIZE_KB.

Privileges

Superuser

Examples

See Configuring Data Retention Policies.

**SET_DATA_COLLECTOR_TIME_POLICY**

Updates the retention policy property INTERVAL_TIME for the specified component. Calling this function has no effect on other properties of the same component. You can use this function to update the INTERVAL_TIME property of all component retention policies.

To set other retention policy properties, call **SET_DATA_COLLECTOR_POLICY**.

Syntax

```
SET_DATA_COLLECTOR_TIME_POLICY( [ 'component', ] 'interval-time' )
```
Parameters

**component**

Specifies the retention policy to update. If you omit this argument, Vertica updates the retention policy of all Data Collector components.

Query system table `DATA_COLLECTOR` for component names. For example:

```
=> SELECT DISTINCT component, description FROM data_collector WHERE component ilike '%Depot%' ORDER BY component;
```

<table>
<thead>
<tr>
<th>component</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DepotEvictions</td>
<td>Files evicted from the Depot</td>
</tr>
<tr>
<td>DepotFetches</td>
<td>Files fetched to the Depot</td>
</tr>
<tr>
<td>DepotUploads</td>
<td>Files Uploaded from the Depot</td>
</tr>
</tbody>
</table>

(3 rows)

**interval-time**

`INTERVAL` data type that specifies how long data of a given component is retained in that component's Data Collector table. The retention policy property `INTERVAL_TIME` is set from this value. If you set this parameter to a positive value, it also changes the policy property `INTERVAL_SET` to `t` (true).

For example, if you specify component TupleMoverEvents and set `interval-time` to an interval of two days (`'2 days'::interval`), the Data Collector table `dc_tuple_mover_events` retains records of Tuple Mover activity over the last 48 hours. Older Tuple Mover data are automatically dropped from this table.

**Note:**

Setting a component's policy's `INTERVAL_TIME` property has no effect on how much data storage the Data Collector retains on disk for that component. Maximum disk storage capacity is determined by the `DISK_SIZE_KB` property. Setting the `INTERVAL_TIME` property only affects how long data is retained by the component's Data Collector table. For details, see `Configuring Data Retention Policies`.

To disable the `INTERVAL_TIME` policy property, set this parameter to a negative integer. Doing so reverts two retention policy properties...
to their default settings:

- INTERVAL_SET: f
- INTERVAL_TIME: 0

With these two properties thus set, the component's Data Collector table retains data on all component events until it reaches its maximum limit, as set by retention policy property DISK_SIZE_KB.

**Privileges**

Superuser

**Examples**

See Configuring Data Retention Policies.
Database Designer Functions

Database Designer functions perform the following operations, generally performed in the following order:

1. Create a design.
2. Set design properties.
3. Populate a design.
4. Create design and deployment scripts.
5. Get design data.
6. Clean up.

Important:
You can also use meta-function DESIGNER_SINGLE_RUN, which encapsulates all of these steps with a single call. The meta-function iterates over all queries within a specified timespan, and returns with a design ready for deployment.

For detailed information, see Workflow for Running Database Designer Programmatically. For information on required privileges, see Privileges for Running Database Designer Functions.

Caution:
Before running Database Designer functions on an existing schema, back up the current design by calling EXPORT_CATALOG.

Create a design

DESIGNER_CREATE_DESIGN directs Database Designer to create a design.

Set design properties

The following functions let you specify design properties:

<table>
<thead>
<tr>
<th>DESIGNER_SET_DESIGN_TYPE</th>
<th>Specifies whether the design is comprehensive or</th>
</tr>
</thead>
</table>
incremental.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DESIGNER_DESIGN_PROJECTION_ENCODINGS</td>
<td>Analyzes encoding in the specified projections and creates a script that implements encoding recommendations.</td>
</tr>
<tr>
<td>DESIGNER_SET_DESIGN_KSAFETY</td>
<td>Sets the K-safety value for a comprehensive design.</td>
</tr>
<tr>
<td>DESIGNER_SET_OPTIMIZATION_OBJECTIVE</td>
<td>Specifies whether the design optimizes for query or load performance.</td>
</tr>
<tr>
<td>DESIGNER_SET_PROPOSE_UNSEGMENTED_PROJECTIONS</td>
<td>Enables inclusion of unsegmented projections in the design.</td>
</tr>
</tbody>
</table>

## Populate a design

The following functions let you add tables and queries to your Database Designer design:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DESIGNER_ADD_DESIGN_TABLES</td>
<td>Adds the specified tables to a design.</td>
</tr>
<tr>
<td>DESIGNER_ADD_DESIGN_QUERY</td>
<td>Adds queries to the design and weights them.</td>
</tr>
<tr>
<td>DESIGNER_ADD_DESIGN_QUERIES</td>
<td></td>
</tr>
<tr>
<td>DESIGNER_ADD_DESIGN_QUERIES_FROM_RESULTS</td>
<td></td>
</tr>
</tbody>
</table>
Create design and deployment scripts

The following functions populate the Database Designer workspace and create design and deployment scripts. You can also analyze statistics, deploy the design automatically, and drop the workspace after the deployment:

<table>
<thead>
<tr>
<th>Function Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DESIGNE_RUN_POPULATE_DESIGN_AND_DEPLOY</td>
<td>Populates the design and creates design and deployment scripts.</td>
</tr>
<tr>
<td>DESIGNE_WAIT_FOR_DESIGN</td>
<td>Waits for a currently running design to complete.</td>
</tr>
</tbody>
</table>

Reset a design

DESIGNER_RESET_DESIGN discards all the run-specific information of the previous Database Designer build or deployment of the specified design but retains its configuration.

Get design data

The following functions display information about projections and scripts that the Database Designer created:

<table>
<thead>
<tr>
<th>Function Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DESIGNER_OUTPUT_ALL_DESIGN_PROJECTIONS</td>
<td>Sends to standard output DDL statements that define design projections.</td>
</tr>
<tr>
<td>DESIGNER_OUTPUT_DEPLOYMENT_SCRIPT</td>
<td>Sends to standard output a design's deployment script.</td>
</tr>
</tbody>
</table>

Clean up

The following functions cancel any running Database Designer operation or drop a Database Designer design and all its contents:

<table>
<thead>
<tr>
<th>Function Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DESIGNER_CANCEL_POPULATE_DESIGN</td>
<td>Cancels population or deployment operation for the specified design if it is currently running.</td>
</tr>
<tr>
<td>DESIGNER_DROP_DESIGN</td>
<td>Removes the schema associated with the specified design and all its contents.</td>
</tr>
</tbody>
</table>
DESIGNER_DROP_ALL_DESIGNS

Removes all Database Designer-related schemas associated with the current user.

**DESIGNER_ADD DESIGN QUERIES**

Reads and evaluates queries from an input file, and adds the queries that it accepts to the specified design. All accepted queries are assigned a weight of 1 (see DESIGNER_ADD DESIGN QUERIES).

The following requirements apply:

- All queried tables must previously be added to the design with DESIGNER_ADD DESIGN TABLES.
- If the design type is incremental, the Database Designer reads only the first 100 queries in the input file, and ignores all queries beyond that number.

All accepted queries are added to the system table DESIGN QUERIES.

**Behavior Type**

Immutable

**Syntax**

DESIGNER_ADD DESIGN QUERIES ( 'design-name', 'input-file' [, return-results] )

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>design-name</td>
<td>Name of the target design.</td>
</tr>
<tr>
<td>input-file</td>
<td>Absolute path to the queries file.</td>
</tr>
<tr>
<td>return-results</td>
<td>Boolean, optionally specifies whether to return results of the add operation to standard output. If set to true, Database Designer returns the following results:</td>
</tr>
</tbody>
</table>
Privileges

Superuser, or design creator with all privileges required to execute the queries in *input-file*.

Errors

Database Designer returns an error in the following cases:

- The query contains illegal syntax.
- The query references:
  - External or system tables only
  - Local temporary or other non-design tables
- DELETE or UPDATE query has one or more subqueries.
- INSERT query does not include a SELECT clause.
- Database Designer cannot optimize the query.

Examples

The following example adds queries from *vmart_queries.sql* to the VMART DESIGN design. This file contains nine queries. The statement includes a third argument of true, so Database Designer returns results of the add operation:

```sql
=> SELECT DESIGNER_ADD DESIGN QUERIES ('VMART DESIGN', '/tmp/examples/vmart_queries.sql', 'true');
... DESIGNER_ADD DESIGN QUERIES
-----------------------------------------------
 Number of accepted queries               = 9
 Number of queries referencing non-design tables = 0
 Number of unsupported queries            = 0
 Number of illegal queries                = 0
(1 row)
```
See Also

Running Database Designer Programmatically

**DESIGNER_ADD DESIGN QUERIES FROM RESULTS**

Executes the specified query and evaluates results in the following columns:

- **QUERY_TEXT** (required): Text of potential design queries.
- **QUERY_WEIGHT** (optional): The weight assigned to each query that indicates its importance relative to other queries, a real number >0 and ≤ 1. Database Designer uses this setting when creating the design to prioritize the query. If DESIGNER_ADD DESIGN QUERIES FROM RESULTS returns any results that omit this value, Database Designer sets their weight to 1.

After evaluating the queries in QUERY_TEXT, DESIGNER_ADD DESIGN QUERIES FROM RESULTS adds all accepted queries to the design. An unlimited number of queries can be added to the design.

Before you add queries to a design, you must add the queried tables with **DESIGNER_ADD DESIGN TABLES**.

**Behavior Type**

Immutable

**Syntax**

DESIGNER_ADD DESIGN QUERIES FROM RESULTS ( 'design-name', 'query' )

**Parameters**

| design-name | Name of the target design. |
query | A valid SQL query whose results contain columns named QUERY_TEXT and, optionally, QUERY_WEIGHT.

Privileges

Superuser, or design creator with all privileges required to execute the specified query, and all queries returned by this function

Errors

Database Designer returns an error in the following cases:

- The query contains illegal syntax.
- The query references:
  - External or system tables only
  - Local temporary or other non-design tables
- DELETE or UPDATE query has one or more subqueries.
- INSERT query does not include a SELECT clause.
- Database Designer cannot optimize the query.

Example

The following example queries the system table QUERY_REQUESTS for all long-running queries (> 1 million microseconds) and adds them to the VMART_DESIGN design. The query returns no information on query weights, so all queries are assigned a weight of 1:

```sql
=> SELECT DESIGNER_ADD_DESIGN_QUERIES_FROM_RESULTS ('VMART_DESIGN',
    'SELECT request as query_text FROM query_requests where request_duration_ms > 1000000 AND request_type = 
    ''QUERY'';');
```

See Also

Running Database Designer Programmatically
**DESIGNER_ADDDESIGN_QUERY**

Reads and parses the specified query, and if accepted, adds it to the design. Before you add queries to a design, you must add the queried tables with `DESIGNER_ADDDESIGN_TABLES`.

All accepted queries are added to the system table `DESIGN_QUERIES`.

**Behavior Type**

**Immutable**

**Syntax**

`DESIGNER_ADDDESIGN_QUERY ( 'design-name', 'design-query' [, query-weight] )`

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>design-name</td>
<td>Name of the target design.</td>
</tr>
<tr>
<td>design-query</td>
<td>Executable SQL query.</td>
</tr>
<tr>
<td>query-weight</td>
<td>Optionally assigns a weight to each query that indicates its importance relative to other queries, a real number &gt;0 and ≤ 1. Database Designer uses this setting to prioritize queries in the design. If you omit this parameter, Database Designer assigns a weight of 1.</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser, or design creator with all privileges required to execute the specified query
Errors

Database Designer returns an error in the following cases:

- The query contains illegal syntax.
- The query references:
  - External or system tables only
  - Local temporary or other non-design tables
- DELETE or UPDATE query has one or more subqueries.
- INSERT query does not include a SELECT clause.
- Database Designer cannot optimize the query.

Examples

The following example adds the specified query to the VMART_DESIGN design and assigns that query a weight of 0.5:

```sql
=> SELECT DESIGNER_ADD DESIGN_QUERY (  
    'VMART_DESIGN',  
    'SELECT customer_name, customer_type FROM customer_dimension ORDER BY customer_name ASC;', 0.5  
 );
```

Running Database Designer Programmatically

**DESIGNER_ADD DESIGN TABLES**

Adds the specified tables to a design. You must run DESIGNER_ADD DESIGN TABLES before adding design queries to the design. If no tables are added to the design, Vertica does not accept design queries.

Behavior Type

**Immutable**
Syntax

DESIGNER_ADD_DESIGN_TABLES ( 'design-name', '[ table-spec[,..] ]' [, 'analyze-statistics' ] )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>design-name</td>
<td>Name of the Database Designer design.</td>
</tr>
<tr>
<td>table-spec[,..]</td>
<td>One or more comma-delimited arguments that specify which tables to add to the design, where each table-spec argument can specify tables as follows:</td>
</tr>
</tbody>
</table>
|                    | • [schema.]table  
|                    |   Add table to the design.                                                                                                                  |
|                    | • schema.*        
|                    |   Add all tables in schema.                                                                                                                  |
|                    | If set to an empty string, Vertica adds all tables in the database to which the user has access.                                             |
| analyze-statistics | Boolean that optionally specifies whether to run ANALYZE_STATISTICS after adding the specified tables to the design, by default set to false. |
|                    | Accurate statistics help Database Designer optimize compression and query performance. Updating statistics takes time and resources.           |

Privileges

Superuser, or design creator with USAGE privilege on the design table schema and owner of the design table
Examples

The following example adds to design VMART\_DESIGN all tables from schemas online\_sales and store, and analyzes statistics for those tables:

```sql
=> SELECT DESIGNER\_ADD\_DESIGN\_TABLES('VMART\_DESIGN', 'online\_sales.*, store.*', 'true');
DESIGNER\_ADD\_DESIGN\_TABLES
----------------------------- 7
(1 row)
```

See Also

Running Database Designer Programmatically

**DESIGNER\_CANCEL\_POPULATE\_DESIGN**

Cancels population or deployment operation for the specified design if it is currently running. When you cancel a deployment, the Database Designer cancels the projection refresh operation. It does not roll back projections that it already deployed and refreshed.

Behavior Type

Immutable

Syntax

```sql
DESIGNER\_CANCEL\_POPULATE\_DESIGN ( 'design-name' )
```

Parameters

| design-name | Name of the design operation to cancel. |
Privileges

Superuser, or design creator

Examples

The following example cancels a currently running design for VMART_DESIGN and then drops the design:

```
=> SELECT DESIGNER_CANCEL_POPULATE_DESIGN ('VMART_DESIGN');
=> SELECT DESIGNER_DROP_DESIGN ('VMART_DESIGN', 'true');
```

See Also

Running Database Designer Programmatically

**DESIGNER_CREATE_DESIGN**

Creates a design with the specified name.

Behavior Type

Immutable

Syntax

```
DESIGNER_CREATE_DESIGN ( 'design-name' )
```
Parameters

<table>
<thead>
<tr>
<th>design-name</th>
<th>Name of the design to create, can contain only alphanumeric and underscore (_) characters. Two users cannot have designs with the same name at the same time.</th>
</tr>
</thead>
</table>

Privileges

- Superuser
- DBDUSER with WRITE privileges on storage location of design-name.

Database Designer System Views

If any of the following V_MONITOR tables do not already exist from previous designs, DESIGNER_CREATEDESIGN creates them:

- DESIGNS
- DESIGN_TABLES
- DEPLOYMENT_PROJECTIONS
- DEPLOYMENT_PROJECTION_STATEMENTS
- DESIGN_QUERIES
- OUTPUT_DEPLOYMENT_STATUS
- OUTPUT_EVENT_HISTORY

Examples

The following example creates the design VMART_DESIGN:

```sql
=> SELECT DESIGNER_CREATEDESIGN('VMART_DESIGN');
DESIGNER_CREATEDESIGN
---------------------
0
(1 row)
```
See Also

Running Database Designer Programmatically

**DESIGNER_DESIGN_PROJECTION_ENCODINGS**

Analyzes encoding in the specified projections, creates a script to implement encoding recommendations, and optionally deploys the recommendations.

**Behavior Type**

_Immutable_

**Syntax**

```
DESIGNER_DESIGN_PROJECTION_ENCODINGS ( '[ proj-spec[,] ]', '[destination] [, 'deploy'] [, 'reanalyze-encodings'] )
```

**Parameters**

| _proj-spec[,...]_ | One or more comma-delimited projections to add to the design. Each projection can be specified in one of the following ways:

- `[schema.]table.projection`
  Specifies to analyze _projection_.
- _schema.*_
  Specifies to analyze all projections in the named schema.
- `[schema.]table`
  Specifies to analyze all projections of the named table.

If set to an empty string, Vertica analyzes all projections in the database to which the user has access. |
For example, the following statement specifies to analyze all projections in schema private, and send the results to the file encodings.sql:

```sql
=> SELECT DESIGNER_DESIGN_PROJECTION_ENCODINGS ('mydb.private.*','encodings.sql');
```

destination

Specifies where to send output, one of the following:

- Empty string (""") writes the script to standard output.
- Pathname of a SQL output file. If you specify a file that does not exist, the function creates one. If you specify only a file name, Vertica creates it in the catalog directory. If the file already exists, the function silently overwrites its contents.

deploy

Boolean that specifies whether to deploy encoding changes.

Default: false

reanalyze-encodings

Boolean that specifies whether DESIGNER_DESIGN_PROJECTION_ENCODINGS analyzes encodings in a projection where all columns are already encoded:

- false: Analyzes no columns and generates no recommendations if all columns are encoded.
- true: Ignores existing encodings and generates recommendations.

Default: false

Privileges

Superuser, or DBDUSER with the following privileges:

- OWNER of all projections to analyze
- USAGE privilege on the schema for the specified projections
Examples

The following example requests that Database Designer analyze encodings of the table `online_sales.call_center_dimension`:

- The second parameter `destination` is set to an empty string, so the script is sent to standard output (shown truncated below).
- The last two parameters `deploy` and `reanalyze-encodings` are omitted, so Database Designer does not execute the script or reanalyze existing encodings:

```sql
=> SELECT DESIGNER_DESIGN_PROJECTION_ENCODINGS ('online_sales.call_center_dimension','');

CREATE PROJECTION call_center_dimension_DBD_1_seg_EncodingDesign /*+createtime(D)*/
(  
call_center_key ENCODING COMMONDELTA_COMP,
  cc_closed_date,
  cc_open_date,
  cc_name ENCODING ZSTD_HIGH_COMP,
  cc_class ENCODING ZSTD_HIGH_COMP,
  cc_employees,
  cc_hours ENCODING ZSTD_HIGH_COMP,
  cc_manager ENCODING ZSTD_HIGH_COMP,
  cc_address ENCODING ZSTD_HIGH_COMP,
  cc_city ENCODING ZSTD_COMP,
  cc_state ENCODING ZSTD_FAST_COMP,
  cc_region ENCODING ZSTD_HIGH_COMP
)  
AS
SELECT call_center_dimension.call_center_key,
  call_center_dimension.cc_closed_date,
  call_center_dimension.cc_open_date,
  call_center_dimension.cc_name,
  call_center_dimension.cc_class,
  call_center_dimension.cc_employees,
  call_center_dimension.cc_hours,
  call_center_dimension.cc_manager,
  call_center_dimension.cc_address,
  call_center_dimension.cc_city,
  call_center_dimension.cc_state,
  call_center_dimension.cc_region
FROM online_sales.call_center_dimension
ORDER BY call_center_dimension.call_center_key
SEGMENTED BY hash(call_center_dimension.call_center_key) ALL NODES KSAFE 1;

select refresh('online_sales.call_center_dimension');

select make_ahm_now();

DROP PROJECTION online_sales.call_center_dimension CASCADE;
```
ALTER PROJECTION online_sales.call_center_dimension_DBD_1_seg.EncodingDesign RENAME TO call_center_dimension;
(1 row)

See Also

Running Database Designer Programatically

**DESIGNER_DROP_ALL DESIGNS**

Removes all Database Designer-related schemas associated with the current user. Use this function to remove database objects after one or more Database Designer sessions complete execution.

**Behavior Type**

*Immutable*

**Syntax**

`DESIGNER_DROP_ALL DESIGNS()`

**Parameters**

None.

**Privileges**

Superuser, or design creator
Example

The following example removes all schema and their contents associated with the current user. DESIGNER_DROP_ALL_DESIGNS returns the number of designs dropped:

```
=> SELECT DESIGNER_DROP_ALL_DESIGNS();
DESIGNER_DROP_ALL_DESIGNS
---------------------------
          2
(1 row)
```

See Also

- DESIGNER_CANCEL_POPULATE_DESIGN
- DESIGNER_DROP_DESIGN

**DESIGNER_DROP_DESIGN**

Removes the schema associated with the specified design and all its contents. Use DESIGNER_DROP_DESIGN after a Database Designer design or deployment completes successfully. You must also use it to drop a design before creating another one under the same name.

To drop all designs that you created, use DESIGNER_DROP_ALL_DESIGNS.

Behavior Type

Immutable

Syntax

```
DESIGNER_DROP_DESIGN ( 'design-name' [, force-drop ] )
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>design-name</td>
<td>Name of the design to drop.</td>
</tr>
<tr>
<td>force-drop</td>
<td>Boolean that overrides any dependencies that otherwise prevent Vertica from executing this function—for example, the design is in use or is currently being deployed. If you omit this parameter, Vertica sets it to false.</td>
</tr>
</tbody>
</table>

Privileges

Superuser, or design creator

Example

The following example deletes the Database Designer design VMART_DESIGN and all its contents:

```sql
=> SELECT DESIGNER_DROP_DESIGN ('VMART_DESIGN');
```

See Also

Running Database Designer Programmatically

**DESIGNER_OUTPUT_ALL_DESIGN_PROJECTIONS**

Displays the DDL statements that define the design projections to standard output.

Behavior Type

Immutable
Syntax

DESIGNER_OUTPUT_ALL DESIGN PROJECTIONS ('design-name')

Parameters

| design-name | Name of the target design. |

Privileges

Superuser or DBDUSER

Examples

The following example returns the design projection DDL statements for vmart_design:

```sql
=> SELECT DESIGNER_OUTPUT_ALL DESIGN PROJECTIONS('vmart_design');
CREATE PROJECTION customer_dimension_DBD_1_rep_VMART DESIGN /*+createtype(D)*/
(   customer_key ENCODING DELTAVAL,
   customer_type ENCODING AUTO,
   customer_name ENCODING AUTO,
   customer_gender ENCODING REL,
   title ENCODING AUTO,
   household_id ENCODING DELTAVAL,
   customer_address ENCODING AUTO,
   customer_city ENCODING AUTO,
   customer_state ENCODING AUTO,
   customer_region ENCODING AUTO,
   marital_status ENCODING AUTO,
   customer_age ENCODING DELTAVAL,
   number_of_children ENCODING BLOCKDICT_COMP,
   annual_income ENCODING DELTARANGE_COMP,
   occupation ENCODING AUTO,
   largest_bill_amount ENCODING DELTAVAL,
   store_membership_card ENCODING BLOCKDICT_COMP,
   customer_since ENCODING DELTAVAL,
   deal_stage ENCODING AUTO,
   deal_size ENCODING DELTARANGE_COMP,
   last_deal_update ENCODING DELTARANGE_COMP
 )
AS
SELECT customer_key,
```
customer_type,
customer_name,
customer_gender,
title,
household_id,
customer_address,
customer_city,
customer_state,
customer_region,
marital_status,
customer_age,
number_of_children,
annual_income,
occupation,
largest_bill_amount,
store_membership_card,
customer_since,
deal_stage,
deal_size,
lastDeal_update
FROM public.customer_dimension
ORDER BY customer_gender,
annual_income
UNSEGMENTED ALL NODES;
CREATE PROJECTION product_dimension_DBD_2_rep_VMART DESIGN /*createType(D)*/
{
...
Syntax

DESIGNER_OUTPUT_DEPLOYMENT_SCRIPT ('design-name')

Parameters

| design-name | Name of the target design. |

Privileges

Superuser, or design creator

Examples

The following example displays the deployment script for VMART_DESIGN:

```sql
=> SELECT DESIGNER_OUTPUT_DEPLOYMENT_SCRIPT('VMART_DESIGN');
CREATE PROJECTION customer_dimension_DBD_1_rep_VMART_DESIGN /*+createtype(D)/
...;
CREATE PROJECTION product_dimension_DBD_2_rep_VMART_DESIGN /*+createtype(D)/
...;
select refresh('public.customer_dimension,
        public.product_dimension,
        public.promotion.dimension,
        public.date_dimension');
select make_ahm_now();
DROP PROJECTION public.customer_dimension_super CASCADE;
DROP PROJECTION public.product_dimension_super CASCADE;
...;
```

See Also

DESIGNER_OUTPUT_ALL DESIGN_PROJECTIONS
**DESIGNER_RESET_DESIGN**

Discards all run-specific information of the previous Database Designer build or deployment of the specified design but keeps its configuration. You can make changes to the design as needed, for example, by changing parameters or adding additional tables and/or queries, before running the design again.

**Behavior Type**

*Immutable*

**Syntax**

```
DESIGNER_RESET_DESIGN ( 'design-name' )
```

**Parameters**

<table>
<thead>
<tr>
<th>design-name</th>
<th>Name of the design to reset.</th>
</tr>
</thead>
</table>

**Privileges**

Superuser, or design creator

**Example**

The following example resets the Database Designer design VMART_DESIGN:

```
=> SELECT DESIGNER_RESET_DESIGN ('VMART_DESIGN');
```
**DESIGNER_RUN_POPULATE Design AND DEPLOY**

Populates the design and creates the design and deployment scripts. DESIGNER_RUN_POPULATE DESIGN AND DEPLOY can also analyze statistics, deploy the design, and drop the workspace after the deployment.

The files output by this function have the permissions 666 or rw-rw-rw-, which allows any Linux user on the node to read or write to them. It is highly recommended that you keep the files in a secure directory.

⚠️ **Caution:**

DESIGNER_RUN_POPULATE Design AND DEPLOY does not create a backup copy of the current design before deploying the new design. Before running this function, back up the existing schema design with EXPORT CATALOG.

**Behavior Type**

Immutable

**Syntax**

```
DESIGNER_RUN_POPULATE Design AND DEPLOY (  
   'design-name',  
   'output-design-file',  
   'output-deployment-file'  
   [ , 'analyze-statistics']  
   [ , 'deploy']  
   [ , 'drop-design-workspace']  
   [ , 'continue-after-error']  
)
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>design-name</td>
<td>Name of the design to populate and deploy.</td>
</tr>
<tr>
<td>output-design-filename</td>
<td>The file to contain DDL statements that create Vertica.</td>
</tr>
</tbody>
</table>
design projections, where `output-design-filename` includes the full path on the node where the session is connected.

| **output-deployment-filename** | The file to contain the deployment script, where `output-deployment-filename` includes the full path on the node where the session is connected. |

| **analyze-statistics** | Specifies whether to collect or refresh statistics for the tables before populating the design. If set to true, Vertica Invokes `ANALYZE_STATISTICS`. Accurate statistics help Database Designer optimize compression and query performance. However, updating statistics requires time and resources.  

**Default:** false |

| **deploy** | Specifies whether to deploy the Database Designer design using the deployment script created by this function.  

**Default:** true |

| **drop-design-workspace** | Specifies whether to drop the design workspace after the design is deployed.  

**Default:** true |

| **continue-after-error** | Specifies whether `DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY` continues to run after an error occurs. By default, an error causes this function to terminate.  

**Default:** false |

### Privileges

- Superuser
- Design creator with WRITE privileges on storage locations of design and deployment scripts
Requirements

Before calling this function, you must:

- Create a design, a logical schema with tables.
- Associate tables with the design.
- Load queries to the design.
- Set design properties (K-safety level, mode, and policy).

Examples

The following example creates projections for and deploys the VMART_DESIGN design, and analyzes statistics about the design tables.

```sql
=> SELECT DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY ('VMART_DESIGN',
   ['/tmp/examples/vmart_design_files/design_projections.sql',
   '/tmp/examples/vmart_design_files/design_deploy.sql',
   'true',
   'true',
   'false',
   'false')
```

See Also

Running Database Designer Programmatically

**DESIGNER_SET_DESIGN_KSAFETY**

Sets K-safety for a comprehensive design and stores the K-safety value in the DESIGNS table. Database Designer ignores this function for incremental designs.

Behavior Type

**Immutable**
## Syntax

`DESIGNER_SET Design_KSAFETY ( 'design-name' [ , k-level ] )`

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>design-name</code></td>
<td>Name of the design for which you want to set the K-safety value, type VARCHAR.</td>
</tr>
</tbody>
</table>
| `k-level` | An integer between 0 and 2 that specifies the level of K-safety for the target design. This value must be compatible with the number of nodes in the database cluster:  
  - `k-level = 0`: ≥ 1 nodes  
  - `k-level = 1`: ≥ 3 nodes  
  - `k-level = 2`: ≥ 5 nodes  
  If you omit this parameter, Vertica sets K-safety for this design to 0 or 1, according to the number of nodes: 1 if the cluster contains ≥ 3 nodes, otherwise 0.  
  If you are a DBADMIN user and `k-level` differs from system K-safety, Vertica changes system K-safety as follows:  
  - If `k-level` is less than system K-safety, Vertica changes system K-safety to the lower level after the design is deployed.  
  - If `k-level` is greater than system K-safety and is valid for the database cluster, Vertica creates the required number of buddy projections for the tables in this design. If the design applies to all database tables, or all tables in the database have the required number of buddy projections, Database Designer changes system K-safety to `k-level`.  
    If the design excludes some database tables and the number of their buddy projections is less than `k-level`, Database Designer leaves system K-safety unchanged. Instead, it returns a warning and indicates which tables need new buddy projections in order to adjust system K-safety.  
    If you are a DBDUSER, Vertica ignores this parameter. |
Privileges

Superuser, or design creator

Examples

The following example set K-safety for the VMARTDESIGN design to 1:

```sql
=> SELECT DESIGNER_SET_DESIGN_KSAFETY('VMARTDESIGN', 1);
```

See Also

Running Database Designer Programmatically

**DESIGNER_SET_DESIGN_TYPE**

Specifies whether Database Designer creates a comprehensive or incremental design. DESIGNER_SET_DESIGN_TYPE stores the design mode in the DESIGNS table.

**Important:**

If you do not explicitly set a design mode with this function, Database Designer creates a comprehensive design.

Behavior Type

Immutable

Syntax

```sql
DESIGNER_SET_DESIGN_TYPE ( 'design-name', 'mode' )
```
Parameters

<table>
<thead>
<tr>
<th>design-name</th>
<th>Name of the target design.</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>Name of the mode that Database Designer should use when designing the database, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• COMPREHENSIVE: Creates an initial or replacement design for all tables in the specified schemas. You typically create a comprehensive design for a new database.</td>
</tr>
<tr>
<td></td>
<td>• INCREMENTAL: Modifies an existing design with additional projection that are optimized for new or modified queries.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Incremental designs always inherit the K-safety value of the database.</td>
</tr>
</tbody>
</table>

For more information, see Design Types.

Privileges

Superuser, or design creator

Examples

The following examples show the two design mode options for the VMART_DESIGN design:

```sql
=> SELECT DESIGNER_SET DESIGN_TYPE('VMART_DESIGN', 'COMPREHENSIVE');
DESIGNER_SET DESIGN_TYPE
--------------------
  0
(1 row)
=> SELECT DESIGNER_SET DESIGN_TYPE('VMART_DESIGN', 'INCREMENTAL');
DESIGNER_SET DESIGN_TYPE
--------------------
  0
(1 row)
```
See Also

Running Database Designer Programmatically

**DESIGNER_SET_OPTIMIZATION_OBJECTIVE**

Valid only for comprehensive database designs, specifies the optimization objective Database Designer uses. Database Designer ignores this function for incremental designs.

DESIGNER_SET_OPTIMIZATION_OBJECTIVE stores the optimization objective in the DESIGNS table.

Behavior Type

Immutable

Syntax

```
DESIGNER_SET_OPTIMIZATION_OBJECTIVE ( 'design-name', 'policy' )
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>design-name</td>
<td>Name of the target design.</td>
</tr>
<tr>
<td>policy</td>
<td>Specifies the design's optimization policy, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- QUERY: Optimize for query performance. This can result in a larger database storage footprint because additional projections might be created.</td>
</tr>
<tr>
<td></td>
<td>- LOAD: Optimize for load performance so database size is minimized. This can result in slower query performance.</td>
</tr>
<tr>
<td></td>
<td>- BALANCED: Balance the design between query performance and database size.</td>
</tr>
</tbody>
</table>
Privileges

Superuser, or design creator

Examples

The following example sets the optimization objective option for the VMART_DESIGN design: to QUERY:

```sql
=> SELECT DESIGNER_SET_OPTIMIZATION_OBJECTIVE( 'VMART_DESIGN', 'QUERY');
DESIGNER_SET_OPTIMIZATION_OBJECTIVE
--------------------
0
(1 row)
```

See Also

Running Database Designer Programatically

*DESIGNER_SET_PROPOSE_UNSEGMENTED_PROJECTIONS*

Specifies whether a design can include unsegmented projections. Vertica ignores this function on a one-node cluster, where all projections must be unsegmented.

Behavior Type

Immutable

Syntax

```
DESIGNER_SET_PROPOSE_UNSEGMENTED_PROJECTIONS ( 'design-name', unsegmented )
```
Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>design-name</td>
<td>Name of the target design.</td>
</tr>
<tr>
<td>unsegmented</td>
<td>Boolean that specifies whether Database Designer can propose unsegmented projections for tables in this design. When you create a design, the <code>propose_unsegmented_projections</code> value in system table <code>DESIGNS</code> for this design is set to true. If <code>DESIGNER_SET_PROPOSE_UNSEGMENTED_PROJECTIONS</code> sets this value to false, Database Designer proposes only segmented projections.</td>
</tr>
</tbody>
</table>

Privileges

Superuser, or design creator

Example

The following example specifies that Database Designer can propose only segmented projections for tables in the design VMART_DESIGN:

```sql
=> SELECT DESIGNER_SET_PROPOSE_UNSEGMENTED_PROJECTIONS('VMART_DESIGN', false);
```

See Also

Running Database Designer Programmatically

**DESIGNER_SINGLE_RUN**

Evaluates all queries that completed execution within the specified timespan, and returns with a design that is ready for deployment. This design includes projections that are recommended for optimizing the evaluated queries. Unless you redirect output, `DESIGNER_SINGLE_RUN` returns the design to stdout.
Tip:
Before running DESIGNER_SINGLE_RUN, collect statistics on the queried data by calling ANALYZE_STATISTICS and ANALYZE_STATISTICS_PARTITION.

Syntax

DESIGNER_SINGLE_RUN ('interval')

| interval | Specifies an interval of time that precedes the meta-function call. Database Designer evaluates all queries that ran to completion over the specified interval. |

Privileges

Superuser or DBUSER

Examples

```
---------------------------------------------
-- SSBM dataset test
---------------------------------------------
-- create ssbm schema
\! $TARGET/bin/vsql -f 'sql/SSBM/SSBM_schema.sql' > /dev/null 2>&1
\! $TARGET/bin/vsql -f 'sql/SSBM/SSBM_constraints.sql' > /dev/null 2>&1
\! $TARGET/bin/vsql -f 'sql/SSBM/SSBM_funcdeps.sql' > /dev/null 2>&1

-- run these queries
\! $TARGET/bin/vsql -f 'sql/SSBM/SSBM_queries.sql' > /dev/null 2>&1
-- Run single API

(1 row)

**DESIGNER_WAIT_FOR_DESIGN**

Waits for completion of operations that are populating and deploying the design. Ctrl+C cancels this operation and returns control to the user.

**Behavior Type**

*Immutable*
**Syntax**

```
DESIGNER_WAIT_FOR_DESIGN ('design-name')
```

**Parameters**

| design-name | Name of the running design. |

**Privileges**

Superuser, or DBDUSER with USAGE privilege on the design schema

**Examples**

The following example requests to wait for the currently running design of VMART_DESIGN to complete:

```
=> SELECT DESIGNER_WAIT_FOR_DESIGN ('VMART_DESIGN');
```

**See Also**

- `DESIGNER_CANCEL_POPULATE_DESIGN`
- `DESIGNER_DROP_ALL DESIGNS`
- `DESIGNER_DROP_DESIGN`
Database Management Functions

This section contains the database management functions specific to Vertica.

**CLEARRESOURCE REJECTIONS**

Clears the content of the `RESOURCE_REJECTIONS` and `DISKRESOURCE_REJECTIONS` system tables. Normally, these tables are only cleared during a node restart. This function lets you clear the tables whenever you need. For example, you might want to clear the system tables after you resolved a disk space issue that was causing disk resource rejections.

**Syntax**

```
CLEARRESOURCE REJECTIONS();
```

**Privileges**

Superuser

**Example**

The following command clears the content of the `RESOURCE_REJECTIONS` and `DISKRESOURCE_REJECTIONS` system tables:

```
=> SELECT clear_resource_rejections();
clear_resource_rejections
-----------------------------
   OK
(1 row)
```
See Also

- DISKRESOURCE_REJECTIONS
- RESOURCE_REJECTIONS

COMPACT_STORAGE

Bundles existing data (.fdb) and index (.pidx) files into the .gt file format. The .gt format is enabled by default for data files created version 7.2 or later. If you upgrade a database from an earlier version, use COMPACT_STORAGE to bundle storage files into the .gt format. Your database can continue to operate with a mix of file storage formats.

If the settings you specify for COMPACT_STORAGE vary from the limit specified in configuration parameter MaxBundleableROSSizeKB, Vertica does not change the size of the automatically created bundles.

Note:
Run this function during periods of low demand.

Syntax

SELECT COMPACT_STORAGE ("[database.]schema.object-name", min-ros-filesize-qb, 'small-or-all-files', 'simulate');

Parameters

<table>
<thead>
<tr>
<th>[database.]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>

| object-name       | Specifies the table or projection to bundle. If set to an empty                                          |
string, COMPACT_STORAGE evaluates the data of all projections in the database for bundling.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>min-ros-filesize-kb</td>
<td>Integer $\geq 1$, specifies in kilobytes the minimum size of an independent ROS file. COMPACT_STORAGE bundles storage container ROS files below this size into a single file.</td>
</tr>
<tr>
<td>small-or-all-files</td>
<td>One of the following: \begin{itemize} \item small: Bundles only files smaller than the limit specified in \textit{min-ros-filesize-kb} \item all: Bundles files smaller than the limit specified in \textit{min-ros-filesize-kb} and bundles the .fdb and .pidx files for larger storage containers. \end{itemize}</td>
</tr>
<tr>
<td>simulate</td>
<td>Specifies whether to simulate the storage settings and produce a report describing the impact of those settings. \begin{itemize} \item true: Produces a report on the impact of the specified bundle settings without actually bundling storage files. \item false: Performs the bundling as specified. \end{itemize}</td>
</tr>
</tbody>
</table>

**Privileges**

**Superuser**

**Storage and Performance Impact**

Bundling reduces the number of files in your file system by at least fifty percent and improves the performance of file-intensive operations. Improved operations include backups, restores, and mergeout.

Vertica creates small files for the following reasons:

- Tables contain hundreds of columns.
- Partition ranges are small (partition by minute).
- Local segmentation is enabled and your factor is set to a high value.
Example

The following example describes the impact of bundling the table EMPLOYEES:

```sql
=> SELECT COMPACT_STORAGE('employees', 1024,'small','true');
Task: compact_storage

On node v_vmart_node0001:
  Projection Name :public.employees_b0 | selected_storage_containers :0 | selected_files_to_compact :0 | files_after_compact : 0 | modified_storage_KB :0

On node v_vmart_node0002:
  Projection Name :public.employees_b0 | selected_storage_containers :1 | selected_files_to_compact :6 | files_after_compact : 1 | modified_storage_KB :0

On node v_vmart_node0003:
  Projection Name :public.employees_b0 | selected_storage_containers :2 | selected_files_to_compact :12 | files_after_compact : 2 | modified_storage_KB :0

On node v_vmart_node0001:
  Projection Name :public.employees_b1 | selected_storage_containers :2 | selected_files_to_compact :12 | files_after_compact : 2 | modified_storage_KB :0

On node v_vmart_node0002:
  Projection Name :public.employees_b1 | selected_storage_containers :0 | selected_files_to_compact :0 | files_after_compact : 0 | modified_storage_KB :0

On node v_vmart_node0003:
  Projection Name :public.employees_b1 | selected_storage_containers :1 | selected_files_to_compact :6 | files_after_compact : 1 | modified_storage_KB :0

Success
(1 row)
```

**CURRENT_SCHEMA**

Returns the name of the current schema.

**Behavior Type**

**Stable**
Syntax

CURRENT_SCHEMA()

**Note:**
You can call this function without parentheses.

Privileges

None

Examples

The following command returns the name of the current schema:

```
=> SELECT CURRENT_SCHEMA();
current_schema
-------------
public
(1 row)
```

The following command returns the same results without the parentheses:

```
=> SELECT CURRENT_SCHEMA;
current_schema
-------------
public
(1 row)
```

The following command shows the current schema, listed after the current user, in the search path:

```
=> SHOW SEARCH_PATH;
name | setting
-----------------------------
search_path | "$user", public, v_catalog, v_monitor, v_internal
(1 row)
```
See Also

- `SET SEARCH_PATH`

**DUMP_LOCKTABLE**

Returns information about deadlocked clients and the resources they are waiting for.

**Syntax**

```sql
DUMP_LOCKTABLE()
```

**Privileges**

None

**Notes**

Use `DUMP_LOCKTABLE` if Vertica becomes unresponsive:

1. Open an additional vsql connection.
2. Execute the query:

```
=> SELECT DUMP_LOCKTABLE();
```

The output is written to vsql. See [Monitoring the Log Files](#).

You can also see who is connected using the following command:

```
=> SELECT * FROM SESSIONS;
```

Close all sessions using the following command:

```
=> SELECT CLOSE_ALL_SESSIONS();
```

Close a single session using the following command:
=> SELECT CLOSE_SESSION('session_id');

You get the session_id value from the **V_MONITOR.SESSIONS** system table.

**See Also**

- CLOSE_ALL_SESSIONS
- CLOSE_SESSION
- LOCKS
- SESSIONS

---

**DUMP_PARTITION_KEYS**

Dumps the partition keys of all projections in the system.

**Syntax**

DUMP_PARTITION_KEYS( )

---

**Note:**

The **ROS** objects of partitioned tables without partition keys are ignored by the tuple mover and are not merged during automatic tuple mover operations.

**Privileges**

User must have select privileges on the table or usage privileges on the schema.

**Example**

=> SELECT DUMP_PARTITION_KEYS( );

Partition keys on node v_vmart_node0001
  Projection 'states_b0'
  Storage [ROS container]
  No of partition keys: 1
### Partition keys: NH
Storage [ROS container]
- No of partition keys: 1
- Partition keys: MA

### Projection 'states_b1'
Storage [ROS container]
- No of partition keys: 1
- Partition keys: VT

### Storage [ROS container]
- No of partition keys: 1
- Partition keys: ME

### Storage [ROS container]
- No of partition keys: 1
- Partition keys: CT

---

**See Also**

- DUMP_PROJECTION_PARTITION_KEYS
- DUMP_TABLE_PARTITION_KEYS
- PARTITION_PROJECTION
- PARTITION_TABLE
- PARTITIONS
- Partitioning Tables in the Administrator's Guide

---

**GET_CONFIG_PARAMETER**

Gets the value of a configuration parameter at the database level or for a specific node.

#### Syntax

```
GET_CONFIG_PARAMETER( 'parameter-name', ['level'])
```

#### Parameters

<table>
<thead>
<tr>
<th>parameter-name</th>
<th>The parameter value to get. See Configuration Parameters in the Administrator's Guide for a list of supported parameters, their purposes, and usage examples.</th>
</tr>
</thead>
</table>
| Level | The level at which the configuration parameter was set. This parameter can be the literal string 'session' to get the session-level setting. It can also be the name of a node whose parameter value you wish to get.

If you omit this parameter or set it to NULL, this function returns the value set at the database level. |

Privileges

None

Examples

Get the AnalyzeRowCountInterval parameter at the database level:

```sql
=> SELECT GET_CONFIG_PARAMETER ('AnalyzeRowCountInterval');
GET_CONFIG_PARAMETER
---------------------
3600
```

Get the MaxSessionUDParameterSize parameter at the session level:

```sql
=> SELECT GET_CONFIG_PARAMETER ('MaxSessionUDParameterSize','session');
GET_CONFIG_PARAMETER
---------------------
2000
(1 row)
```

See Also

- `SET_CONFIG_PARAMETER`
- `Managing Configuration Parameters: VSQL`
- `CONFIGURATION_PARAMETERS`
**KERBEROS_CONFIG_CHECK**

Tests the Kerberos configuration of a Vertica cluster. The function succeeds if it can kinit with both the keytab file and the current user's credential, and reports errors otherwise.

**Syntax**

```
KERBEROS_CONFIG_CHECK()
```

**Parameters**

This function has no parameters.

**Privileges**

This function does not require privileges.

**Examples**

The following example shows the results when the Kerberos configuration is valid.

```sql
=> SELECT KERBEROS_CONFIG_CHECK();
  kerberos_config_check
---------------------------------------------------------------
  ok: krb5 exists at [/etc/krb5.conf]
  ok: Vertica Keytab file is set to [/etc/vertica.keytab]
  ok: Vertica Keytab file exists at [/etc/vertica.keytab]
  Kerberos configuration parameters set in the database
    KerberosServiceName : [vertica]
    KerberosHostname : [data.hadoop.com]
    KerberosRealm : [EXAMPLE.COM]
    KerberosKeytabFile : [/etc/vertica.keytab]
  Vertica Principal: [vertica/data.hadoop.com@EXAMPLE.COM]
  [OK] Vertica can kinit using keytab file
  [OK] User [bob] has valid client authentication for kerberos principal [bob@EXAMPLE.COM]]
```

(1 row)
**MEMORY_TRIM**

Calls glibc function `malloc_trim()` to reclaim free memory from malloc and return it to the operating system. Details on the trim operation are written to system table `MEMORY_EVENTS`.

Unless you turn off memory polling, Vertica automatically detects when glibc accumulates an excessive amount of free memory in its allocation arena. When this occurs, Vertica consolidates much of this memory and returns it to the operating system. Call this function if you disable memory polling and wish to reduce glibc-allocated memory manually.

For more information, see Memory Trimming.

**Syntax**

```sql
MEMORY_TRIM()
```

**Privileges**

Superuser

**Examples**

```sql
=> SELECT memory_trim();
```

```
memory_trim
Pre-RSS: [378822656] Post-RSS: [372129792] Benefit: [0.0176675]
(1 row)
```

**RUN_INDEX_TOOL**

Runs the Index tool on a Vertica database to perform one of these tasks:
• Run a per-block cyclic redundancy check (CRC) on data storage to verify data integrity.
• Check that the sort order in ROS containers is correct.

The function writes summary information about its operation to standard output; detailed information on results is logged in `vertica.log` on the current node. For more about evaluating tool output, see:

• Evaluating CRC Errors
• Evaluating Sort Order Errors

You can also run the Index tool on a database that is down, from the Linux command line. For details, see CRC and Sort Order Check.

⚠️ **Caution:**

Use this function only under guidance from Vertica Support.

### Syntax

```sql
RUN_INDEX_TOOL ( 'taskType', global, '[projFilter]' [, numThreads ] );
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>taskType</code></td>
<td>Specifies the operation to run, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• <code>checkcrc</code>: Run a cyclic redundancy check (CRC) on each block of existing data storage to check the data integrity of ROS data blocks.</td>
</tr>
<tr>
<td></td>
<td>• <code>checksort</code>: Evaluate each ROS row to determine whether it is sorted correctly. If ROS data is not sorted correctly in the projection’s order, query results that rely on sorted data will be incorrect.</td>
</tr>
<tr>
<td><code>global</code></td>
<td>Boolean, specifies whether to run the specified task on all nodes (true), or the current one (false).</td>
</tr>
<tr>
<td><code>projFilter</code></td>
<td>Specifies the scope of the operation:</td>
</tr>
<tr>
<td></td>
<td>• Empty string (<code>'</code>): Run the check on all projections.</td>
</tr>
<tr>
<td></td>
<td>• A string that specifies one or more projections as follows:</td>
</tr>
<tr>
<td></td>
<td>• <code>projection-name</code>: Run the check on this projection</td>
</tr>
</tbody>
</table>
• `projection-prefix*`: Run the check on all projections that begin with the string `projection-prefix`.

| `numThreads` | An unsigned (positive) or signed (negative) integer that specifies the number of threads used to run this operation:
|              | • `n`: Number of threads, ≥ 1
|              | • `-n`: Negative integer, denotes a fraction of all CPU cores as follows: `num-cores / n`
|              | Thus, `-1` specifies all cores, `-2`, half the cores, `-3`, a third of all cores, and so on.
|              | **Default**: 1

**Privileges**

Superuser

**Optimizing Performance**

You can optimize meta-function performance by setting two parameters:

• `projFilter`: Narrows the scope of the operation to one or more projections.
• `numThreads`: Specifies the number of threads used to execute the function.

**SECURITY_CONFIG_CHECK**

Returns the status of various security-related parameters. Use this function to verify completeness of your TLS configuration.

**Syntax**

```
SECURITY_CONFIG_CHECK( 'db-component' )
```
Parameters

<table>
<thead>
<tr>
<th>db-component</th>
<th>The component to check. Currently, NETWORK is the only supported component.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>NETWORK: Returns the status and parameters for spread encryption, internode TLS, and client-server TLS.</td>
</tr>
</tbody>
</table>

Example

In this example, SECURITY_CONFIG_CHECK shows that spread encryption and data channel TLS are disabled because EncryptSpreadComm and DataSSLParams are disabled. Similarly, client-server TLS is disabled because the TLS CONFIGURATION "server" has a server certificate, but its TLSMODE is disabled. Setting TLSMODE to 'Enable' would be sufficient for Server Mode. See TLS Protocol for more information.

```
=> SELECT SECURITY_CONFIG_CHECK('NETWORK');
SECURITY_CONFIG_CHECK
--------------------------
Spread security details:
* EncryptSpreadComm = []
Spread encryption is disabled
It is NOT safe to set/change other security config parameters while spread is not encrypted!
Please set EncryptSpreadComm to enable spread encryption first

Data Channel security details:
* DataSSLParams is unset
SSL on the data channel is disabled
Please set EncryptSpreadComm and DataSSLParams to enable SSL on the data channel

Client-Server network security details:
* TLS Configuration 'server' TLSMODE is DISABLE
* TLS Configuration 'server' has a certificate set
Client-Server TLS is disabled
To enable Client-Server TLS set a certificate on TLS Configuration 'server' and/or set the tlsmode to 'ENABLE' or higher

(1 row)
```
See Also

- Internode TLS
- TLS Protocol

**SET_CONFIG_PARAMETER**

Sets the value of a configuration parameter at the database level or for a specific node.

**Important:**
Vertica encourages use of `ALTER NODE`, `ALTER DATABASE`, and `ALTER SESSION` to set and clear configuration parameters.

**Caution:**
Vertica is designed to operate with minimal configuration changes, so use this capability sparingly. Carefully follow documented guidelines for the parameter you wish to configure.

**Syntax**

```
SET_CONFIG_PARAMETER( 'parameter-name', value, ['Level'])
```

**Parameters**

<table>
<thead>
<tr>
<th>parameter-name</th>
<th>The parameter value to set. See <a href="#">Configuration Parameters</a> in the Administrator's Guide for a list of supported parameters, their purposes, and usage examples.</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>The value to set for <code>parameter-name</code>. Syntax for this argument varies depending upon the parameter and its expected data type. For strings, enclose the argument in single quotes; integer arguments can be unquoted. If value is specified as NULL, the parameter is cleared.</td>
</tr>
</tbody>
</table>
| Level       | The level at which the value should be set. This can be the name of a node to set the value specifically for a node. Pr it can be the literal string session to set the value at the session level.

If you omit this parameter or set it to NULL, the parameter is set at the database level. If a parameter is set at the session level, the value overrides the value set at the database level. If set for a node, the node setting supersedes the session and database-level setting. |

**Note:** Some parameters require restart for the value to take effect.

### Privileges

Superuser

### Examples

Set the `AnalyzeRowCountInterval` parameter to 3600 at the database level:

```sql
=> SELECT SET_CONFIG_PARAMETER('AnalyzeRowCountInterval',3600);
SET_CONFIG_PARAMETER
------------------------
Parameter set successfully
(1 row)
```

**Note:** You can achieve the same result with `ALTER DATABASE`:

```
ALTER DATABASE DEFAULT SET PARAMETER AnalyzeRowCountInterval = 3600;
```

Set the `MaxSessionUDParameterSize` parameter to 2000 at the session level.

```sql
=> SELECT SET_CONFIG_PARAMETER('MaxSessionUDParameterSize',2000,'SESSION');
SET_CONFIG_PARAMETER
------------------------
Parameter set successfully
(1 row)
```
See Also

- GET_CONFIG_PARAMETER
- Managing Configuration Parameters: VSQL
- CONFIGURATION_PARAMETERS

**SET_SPREAD_OPTION**

Changes `spread` daemon settings. This function is mainly used to set the timeout before `spread` assumes a node has gone down.

**Important:**

Changing `spread` settings with `SET_SPREAD_OPTION` has minor impact on your cluster as it pauses while the new settings are propagated across the entire cluster.

**Syntax**

`SET_SPREAD_OPTION( option-name, option-value )`

**Parameters**

<table>
<thead>
<tr>
<th>option-name</th>
<th>String containing the spread daemon setting to change.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Currently, this function supports only one option: TokenTimeout. This setting controls how long <code>spread</code> waits for a node to respond to a message before assuming it is lost. See Adjusting Spread Daemon Timeouts For Virtual Environments for more information.</td>
</tr>
</tbody>
</table>

| option-value | The new setting for option-name. |
Example

```sql
=> SELECT SET_SPREAD_OPTION( 'TokenTimeout', '35000');
NOTICE 9003: Spread has been notified about the change

SET_SPREAD_OPTION

---------------
Spread option 'TokenTimeout' has been set to '35000'.

(1 row)
```

```sql
=> SELECT * FROM V_MONITOR.SPREAD_STATE;

```

<table>
<thead>
<tr>
<th>node_name</th>
<th>token_timeout</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_vmart_node0001</td>
<td>35000</td>
</tr>
<tr>
<td>v_vmart_node0002</td>
<td>35000</td>
</tr>
<tr>
<td>v_vmart_node0003</td>
<td>35000</td>
</tr>
</tbody>
</table>

(3 rows);
```

See Also

**SHUTDOWN**

Shuts down a Vertica database. By default, the shutdown fails if any users are connected. You can check the status of the shutdown operation in the `vertica.log` file.

**Tip:**
Before calling SHUTDOWN, you can close all current user connections and prevent further connection attempts as follows:

1. Temporarily set configuration parameter MaxClientSessions to 0.
2. Call `CLOSE_ALL_SESSIONS` to close all non-dbamin connections.

Syntax

```
SHUTDOWN ( [ 'false' | 'true' ] )
```
Parameters

| false | Default, returns a message if users are connected and aborts the shutdown. |
| true  | Forces the database to shut down, disallowing further connections. |

Privileges

Superuser

Examples

The following command attempts to shut down the database. Because users are connected, the command fails:

```sql
=> SELECT SHUTDOWN('false');
NOTICE: Cannot shut down while users are connected
SHUTDOWN
------------------------
Shutdown: aborting shutdown (1 row)
```

See Also

SESSIONS

Directed Queries Functions

The following meta-functions let you batch export query plans as directed queries from one Vertica database, and import those directed queries to another database.
**EXPORT_DIRECTED_QUERIES**

Generates SQL for creating directed queries from a set of input queries, and writes the SQL to the specified file or to standard output.

**Syntax**

```
EXPORT_DIRECTED_QUERIES('input-file', '[output-file]')
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>input-file</code></td>
<td>A SQL file that contains one or more input queries. See Input Format below for details on format requirements.</td>
</tr>
<tr>
<td><code>output-file</code></td>
<td>Specifies where to write the generated SQL for creating directed queries. If the file name already exists, EXPORT_DIRECTED_QUERIES returns with an error. If you supply an empty string, Vertica writes the SQL to standard output. See Output Format below for details.</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser

**Input Format**

The input file that you supply to EXPORT_DIRECTED_QUERIES contains one or more input queries. For each input query, you can optionally specify two fields that are used in the generated directed query:

- `DirQueryName` provides the directed query's unique identifier, a string that conforms to conventions described in Identifiers.
- `DirQueryComment` specifies a quote-delimited string, up to 128 characters.

You format each input query as follows:
Output Format

EXPORT_DIRECTED_QUERIES generates SQL for creating directed queries, and writes the SQL to the specified file or to standard output. In both cases, output conforms to the following format:

```sql
/* Query: directed-query-name */
/* Comment: directed-query-comment */
SAVE QUERY input-query;
CREATE DIRECTED QUERY CUSTOM 'directed-query-name'
COMMENT 'directed-query-comment'
OPTVER 'vertica-release-num'
PSDATE 'timestamp'
annotated-query
```

Error Handling

If any errors or warnings occur during EXPORT_DIRECTED_QUERIES execution, it returns with a message like this one:

```
1 queries successfully exported.
1 warning message was generated.
Queries exported to /home/dbadmin/outputQueries.
See error report, /home/dbadmin/outputQueries.err for details.
```

EXPORT_DIRECTED_QUERIES writes all errors and warnings to a file that it creates on the same path as the output file, and uses the output file's base name.

For example:

```
--DirQueryName=query-name
--DirQueryComment='comment'
input-query

WARNING: Name field not supplied. Using auto-generated name: 'Autoname:2016-04-25 15:03:32.115317.0'
Input Query: SELECT employee_dimension.employee_first_name, employee_dimension.employee_last_name, employee_dimension.job_title FROM public.employee_dimension WHERE (employee_dimension.employee_city = 'Boston':::varchar(6)) ORDER BY employee_dimension.job_title;
END WARNING
```
Examples

See Batch Query Plan Export in the Administrator's Guide.

See Also

- Batch Query Plan Export
- IMPORT_DIRECTED_QUERIES

**IMPORT_DIRECTED_QUERIES**

Imports to the database catalog directed queries from a SQL file that was generated by EXPORT_DIRECTED_QUERIES. If no directed queries are specified, Vertica lists all directed queries in the SQL file.

Syntax

```sql
IMPORT_DIRECTED_QUERIES( 'export-file[, 'directed-query-name[,...]]' )
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>export-file</code></td>
<td>A SQL file generated by EXPORT_DIRECTED_QUERIES. When you run this file, Vertica creates the specified directed queries in the current database catalog.</td>
</tr>
<tr>
<td><code>directed-query-name</code></td>
<td>The name of a directed query that is defined in <code>export-file</code>. You can specify multiple comma-delimited directed query names. If you omit this parameter, Vertica lists the names of all directed queries in <code>export-file</code>.</td>
</tr>
</tbody>
</table>
Privileges

Superuser

See Also

- Batch Query Plan Export
- EXPORT_DIRECTED_QUERIES

Eon Mode Functions

The following functions are meant to be used in Eon Mode.

**ALTER_LOCATION_SIZE**

Eon Mode only

Resizes the depot on one node, all nodes in a subcluster, or all nodes in the database.

**Important:**
Reducing the size of the depot is liable to increase contention over depot usage and require frequent evictions. This behavior can increase the number of queries and load operations that are routed to communal storage for processing, which can incur slower performance and increased access charges.

Syntax

```
ALTER_LOCATION_SIZE( 'Location', '[target]', 'size')
```
### Parameters

<table>
<thead>
<tr>
<th>Location</th>
<th>Specifies the location to resize, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>depot</td>
<td>Resizes the node's current depot. The depot's absolute path in the Linux filesystem. If you change the depot size on multiple nodes and specify a path, the path must be identical on all affected nodes. By default, this is not the case, as the node's name is typically this path. For example, the default depot path for node 1 in the <code>verticadb</code> database is <code>/vertica/data/verticadb/v_verticadb_node0001_depot</code>.</td>
</tr>
<tr>
<td>target</td>
<td>The node or nodes on which to change the depot, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- Node name: Resize the specified node.</td>
</tr>
<tr>
<td></td>
<td>- Subcluster name: Resize depots of all nodes in the specified subcluster.</td>
</tr>
<tr>
<td></td>
<td>- Empty string: Resize all depots in the database.</td>
</tr>
<tr>
<td>size</td>
<td>Valid only if the storage location usage type is set to <code>depot</code>, specifies the maximum amount of disk space that the depot can allocate from the storage location's file system.</td>
</tr>
<tr>
<td></td>
<td>You can specify <code>size</code> in two ways:</td>
</tr>
<tr>
<td></td>
<td>- <code>integer%</code>: Percentage of storage location disk size.</td>
</tr>
<tr>
<td></td>
<td>- `integer{K</td>
</tr>
</tbody>
</table>

**Important:**
The depot size cannot exceed 80 percent of the file system disk space where the depot is stored. If you specify a value that is too large, Vertica issues a warning and automatically changes the value to 80 percent of the file system size.

### Privileges

**Superuser**
Examples

Increase depot size on all nodes to 80 percent of file system:

```sql
=> SELECT node_name, location_label, location_path, max_size, disk_percent FROM storage_locations
WHERE location_usage = 'DEPOT' ORDER BY node_name;
```

<table>
<thead>
<tr>
<th>node_name</th>
<th>location_label</th>
<th>location_path</th>
<th>max_size</th>
<th>disk_percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_vmart_node0001</td>
<td>auto-data-depot</td>
<td>/home/dbadmin/verticadb</td>
<td>36060108000</td>
<td>70%</td>
</tr>
<tr>
<td>v_vmart_node0002</td>
<td>auto-data-depot</td>
<td>/home/dbadmin/verticadb</td>
<td>36059377664</td>
<td>70%</td>
</tr>
<tr>
<td>v_vmart_node0003</td>
<td>auto-data-depot</td>
<td>/home/dbadmin/verticadb</td>
<td>36060108000</td>
<td>70%</td>
</tr>
</tbody>
</table>

(3 rows)

```sql
=> SELECT alter_location_size('depot', '', '80%');
```

alter_location_size
----------------------
depotSize changed.
(1 row)

```sql
=> SELECT node_name, location_label, location_path, max_size, disk_percent FROM storage_locations
WHERE location_usage = 'DEPOT' ORDER BY node_name;
```

<table>
<thead>
<tr>
<th>node_name</th>
<th>location_label</th>
<th>location_path</th>
<th>max_size</th>
<th>disk_percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_vmart_node0001</td>
<td>auto-data-depot</td>
<td>/home/dbadmin/verticadb</td>
<td>41211552768</td>
<td>80%</td>
</tr>
<tr>

Eon Mode Architecture

**BACKGROUND_DEPOT_WARMING**

Eon Mode only

⚠️ **Deprecated:**

Vertica version 10.0.0 removes support for foreground depot warming. When enabled, depot warming always happens in the background. Because foreground depot warming no longer exists, this function serves no purpose and has been deprecated. Calling it has no effect.

Forces a node that is warming its depot to start processing queries while continuing to warm its depot in the background. Depot warming only occurs when a node is joining the database and is activating its subscriptions. This function only has an effect if:

- The database is running in Eon Mode.
- The node is currently warming its depot.
- The node is warming its depot from communal storage. This is the case when the UseCommunalStorageForBatchDepotWarming configuration parameter is set to the default value of 1. See Eon Mode Parameters for more information about this parameter.

After calling this function, the node warms its depot in the background while taking part in queries.

This function has no effect on a node that is not warming its depot.
Syntax

```
BACKGROUND_DEPOT_WARMING('node-name' [, 'subscription-name'])
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>node-name</strong></td>
<td>The name of the node that you want to warm its depot in the background.</td>
</tr>
<tr>
<td><strong>subscription-name</strong></td>
<td>The name of a shard that the node subscribes to that you want the node to warm in the background. You can find the names of the shards a node subscribes to in the SHARD_NAME column of the NODE_SUBSCRIPTIONS system table.</td>
</tr>
</tbody>
</table>

**Note:**
When you supply the name of a specific shard subscription to warm in the background, the node may not immediately begin processing queries. It continues to warm any other shard subscriptions in the foreground if they are not yet warm. The node does not begin taking part in queries until it finishes warming the other subscriptions.

Return Value

A message indicating that the node's warming will continue in the background.

Privileges

The user must be a **superuser**.
Examples

The following example demonstrates having node 6 of the verticadb database warm its depot in the background:

```sql
=> SELECT BACKGROUND_DEPOT_WARMING('v_verticadb_node0006');
```

```
+--------------------------------------------------+
<table>
<thead>
<tr>
<th>BACKGROUND_DEPOT_WARMING</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depot warming running in background. Check monitoring tables for progress.</td>
</tr>
<tr>
<td>(1 row)</td>
</tr>
</tbody>
</table>
+--------------------------------------------------+
```

See Also

**CANCEL_DEPOT_WARMING**

Eon Mode only

Cancels depot warming on a node. Depot warming only occurs when a node is joining the database and is activating its subscriptions. You can choose to cancel all warming on the node, or cancel the warming of a specific shard's subscription. The node finishes whatever data transfers it is currently carrying out to warm its depot and removes pending warming-related transfers from its queue. It keeps any data it has already loaded into its depot. If you cancel warming for a specific subscription, it stops warming its depot if all of its other subscriptions are warmed. If they aren't warmed, the node continues to warm those other subscriptions.

This function only has an effect if:

- The database is running in Eon Mode.
- The node is currently warming its depot.

Syntax

```sql
CANCEL_DEPOT_WARMING('node-name' [, 'subscription-name'])
```
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'node-name'</td>
<td>The name of the node whose depot warming you want canceled.</td>
</tr>
<tr>
<td>'subscription-name'</td>
<td>The name of a shard that the node subscribes to that you want the node to stop warming. You can find the names of the shards a node subscribes to in the SHARD_NAME column of the NODE_SUBSCRIPTIONS system table.</td>
</tr>
</tbody>
</table>

Return Value

Returns a message indicating warming has been canceled.

Privileges

The user must be a superuser.

Usage Considerations

Canceling depot warming can negatively impact the performance of your queries. A node with a cold depot may have to retrieve much of its data from communal storage, which is slower than accessing the depot.

Examples

The following demonstrates canceling the depot warming taking place on node 7:

```sql
=> SELECT CANCEL_DEPOT_WARMING('v_verticadb_node007');
CANCEL_DEPOT_WARMING
---------------------------------
Depot warming cancelled.
(1 row)
```
See Also

**CLEAN_COMMUNAL_STORAGE**

Eon Mode only

Marks for deletion invalid data in communal storage, often data that leaked due to an event where Vertica cleanup mechanisms failed. Events that require calling this function include:

- Node failure
- Interrupted migration of an Enterprise database to Eon
- Restoring objects from backup

**Tip:**

It is generally good practice to call CLEAN_COMMUNAL_STORAGE soon after completing an Enterprise-to-Eon migration, and reviving the migrated Eon database.

Syntax

```
CLEAN_COMMUNAL_STORAGE ( ['actually-delete'] )
```

Parameters

<table>
<thead>
<tr>
<th>actually-delete</th>
<th>BOOLEAN, specifies whether to queue data files for deletion:</th>
</tr>
</thead>
<tbody>
<tr>
<td>true (default)</td>
<td>Add files to the reaper queue and return immediately. The queued files are removed automatically by the reaper service, or can be removed manually by calling FLUSH_REAPER_QUEUE.</td>
</tr>
<tr>
<td>false</td>
<td>false: Report information about extra files but do not queue them for deletion.</td>
</tr>
</tbody>
</table>
Privileges

Superuser

Examples

```sql
=> SELECT CLEAN_COMMUNAL_STORAGE('true')
CLEAN_COMMUNAL_STORAGE
---------------------------------------------------------------
CLEAN COMMUNAL STORAGE
Task was canceled.
Total leaked files: 9265
Total size: 4236501526
Files have been queued for deletion.
Check communal_cleanup_records for more information.
(1 row)
```

**CLEAR_DATA_DEPOT**

Eon Mode only

Deletes the specified depot data. You can clear depot data of a single table or all tables, from one subcluster, a single node, or the entire database cluster. Clearing depot data has no effect on communal storage.

**Note:**

Clearing depot data can incur extra processing time for any subsequent queries that require that data and must now fetch it from communal storage.

Syntax

```sql
CLEAR_DATA_DEPOT( [ 'table-name' ] [ , 'target-depots' ] )
```
Arguments

Note:
To clear all depot data from the database cluster, call this function with no arguments.

<table>
<thead>
<tr>
<th>table-name</th>
<th>Name of the table to delete from the target depots. If you omit a table name or supply an empty string, data of all tables is deleted from the target depots.</th>
</tr>
</thead>
</table>
| target-depots | Specifies to clear all data from the specified depots, one of the following:  
  - subcluster-name: Clears depot data from the specified subcluster.  
  - node-name: Clears depot data from the specified node. Depot data on other nodes in the same subcluster are unaffected.  
This argument optionally qualifies the argument for table-name. If you omit this argument or supply an empty string, Vertica clears all depot data from the database cluster. |

Privileges

Superuser

Examples

Clear all depot data for table t1 table from the depot of subcluster subcluster_1:

```
=> SELECT CLEAR_DATA_DEPOT('t1', 'subcluster_1');
clear_data_depot
------------------
Depot cleared
(1 row)
```

Clear all depot data from subcluster subcluster_1:
-> SELECT CLEAR_DATA_DEPOT('', 'subcluster_1');
clear_data_depot
-------------------
Depot cleared
(1 row)

Clear all depot data from a single node:

-> select clear_data_depot('', 'v_vmart_node0001');
clear_data_depot
-------------------
Depot cleared
(1 row)

Clear all depot data for table t1 from the database cluster:

-> SELECT CLEAR_DATA_DEPOT('t1');
clear_data_depot
-------------------
Depot cleared
(1 row)

Clear all depot data from the database cluster:

-> SELECT CLEAR_DATA_DEPOT();
clear_data_depot
-------------------
Depot cleared
(1 row)

**CLEAR_DEPOT_PIN_POLICY_PARTITION**

Eon Mode only

Clears a depot pinning policy from the specified table or projection partitions. After the object is unpinned, it can be evicted from the depot by any unpinned or pinned object..

**Syntax**

CLEAR_DEPOT_PIN_POLICY_PARTITION( '[[database.]schema.]object-name', 'min-range-value', 'max-range-value' [, subcluster ] )
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>[database.]schema</strong></td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><strong>object-name</strong></td>
<td>The table or projection with a partition pinning policy to clear.</td>
</tr>
<tr>
<td><strong>min-range-value</strong></td>
<td>Clears a pinning policy from the specified range of partition keys in table, where min-range-value must be ≤ max-range-value. If the policy applies to a single partition, min-range-value and max-range-value must be equal.</td>
</tr>
<tr>
<td><strong>max-range-value</strong></td>
<td></td>
</tr>
<tr>
<td><strong>subcluster</strong></td>
<td>Clears the specified pinning policy from the subcluster depot.</td>
</tr>
<tr>
<td></td>
<td>If you omit this parameter, the policy is cleared from all database depots.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

See Also

- Managing Depot Caching
- SET_DEPOT_PIN_POLICY_PARTITION

**CLEAR_DEPOT_PIN_POLICY_PROJECTION**

Eon Mode only

Clears a depot pinning policy from the specified projection. After the object is unpinned, it can be evicted from the depot by any unpinned or pinned object.
Syntax

CLEAR_DEPOT_PIN_POLICY_PROJECTION( '[[database.]schema.]projection' [, 'subcluster' ] )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td>projection</td>
<td>Projection with a pinning policy to clear.</td>
</tr>
<tr>
<td>subcluster</td>
<td>Clears the specified pinning policy from the subcluster depot. If you omit this parameter, the policy is cleared from all database depots.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

See Also

- Managing Depot Caching
- CLEAR_DEPOT_PIN_POLICY_PARTITION
- SET_DEPOT_PIN_POLICY_TABLE

CLEAR_DEPOT_PIN_POLICY_TABLE

Eon Mode only
Cleårs a depot pinning policy from the specified table. After the object is unpinned, it can be evicted from the depot by any unpinned or pinned object.

**Syntax**

```
CLEAR_DEPOT_PIN_POLICY_TABLE( '[[database.]schema.]table' [, 'subcluster' ] )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>database</code></td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td><code>schema</code></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td><code>table</code></td>
<td>Table with a pinning policy to clear.</td>
</tr>
<tr>
<td><code>subcluster</code></td>
<td>Clears the specified pinning policy from the subcluster depot. If you omit this parameter, the policy is cleared from all database depots.</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser

**See Also**

- Managing Depot Caching
- SET_DEPOT_PIN_POLICY_TABLE

**CLEAR_FETCH_QUEUE**

Eon Mode only
Removes all entries or entries for a specific transaction from the queue of fetch requests of data from the communal storage. You can view the fetch queue by querying the DEPOT.FETCH_QUEUE system table. This function removes all of the queued requests synchronously. It returns after all the fetches have been removed from the queue.

**Syntax**

`CLEAR_FETCH_QUEUE([transaction_id])`

**Parameters**

| `transaction_id` | The id of the transaction whose fetches will be cleared from the queue. If this value is not specified, all fetches are removed from the fetch queue. |

**Example**

This example clears all of the queued fetches for all transactions.

```sql
e=> SELECT CLEAR_FETCH_QUEUE();

CLEAR_FETCH_QUEUE

-----------------------
Cleared the fetch queue.

(1 row)
```

This example clears the fetch queue for a specific transaction.

```sql
e=> SELECT node_name,transaction_id FROM depot_fetch_queue;

+---------------- | ------------------|
<table>
<thead>
<tr>
<th>node_name</th>
<th>transaction_id</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_verticadb_node0001</td>
<td>45035996273719510</td>
</tr>
<tr>
<td>v_verticadb_node0003</td>
<td>45035996273719510</td>
</tr>
<tr>
<td>v_verticadb_node0002</td>
<td>45035996273719510</td>
</tr>
<tr>
<td>v_verticadb_node0001</td>
<td>45035996273719777</td>
</tr>
<tr>
<td>v_verticadb_node0003</td>
<td>45035996273719777</td>
</tr>
<tr>
<td>v_verticadb_node0002</td>
<td>45035996273719777</td>
</tr>
</tbody>
</table>

(6 rows)
e=> SELECT clear_fetch_queue(45035996273719510);

clear_fetch_queue
```
Cleared the fetch queue.

(1 row)

=> SELECT node_name, transaction_id from depot_fetch_queue;

<table>
<thead>
<tr>
<th>node_name</th>
<th>transaction_id</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_verticadb_node0001</td>
<td>45035996273719777</td>
</tr>
<tr>
<td>v_verticadb_node0003</td>
<td>45035996273719777</td>
</tr>
<tr>
<td>v_verticadb_node0002</td>
<td>45035996273719777</td>
</tr>
</tbody>
</table>

(3 rows)

**DEMOTE_SUBCLUSTER_TO_SECONDARY**

Eon Mode only

Converts a primary subcluster to a secondary subcluster.

Vertica will not allow you to demote a primary subcluster if any of the following are true:

- The subcluster contains a **critical node**.
- The subcluster is the only primary subcluster in the database. You must have at least one primary subcluster.
- The **initiator node** is a member of the subcluster you are trying to demote. You must call DEMOTE_SUBCLUSTER_TO_SECONDARY from another subcluster.

**Important:**

This function call can take a long time to complete because all of the nodes in the subcluster you are demoting will take a global catalog lock, write a checkpoint, and then commit. This global catalog lock can cause other database tasks to fail with errors.

Schedule calls to this function to occur when other database activity is low.

**Syntax**

DEMOTE_SUBCLUSTER_TO_SECONDARY('subcluster-name')
Parameters

| `subcluster-name` | The name of the primary subcluster to demote to a secondary subcluster. |

Privileges

Superuser

Examples

The following example demotes the subcluster `analytics_cluster` to a secondary subcluster:

```sql
=> SELECT DISTINCT subcluster_name, is_primary from subclusters;
   subcluster_name | is_primary
--------------------
 analytics_cluster | t
 load_subcluster   | t
(2 rows)

=> SELECT DEMOTE_SUBCLUSTER_TO_SECONDARY('analytics_cluster');
 DEMOTE_SUBCLUSTER_TO_SECONDARY
--------------------
 DEMOTE SUBCLUSTER TO SECONDARY
(1 row)

=> SELECT DISTINCT subcluster_name, is_primary from subclusters;
   subcluster_name | is_primary
--------------------
 analytics_cluster | f
 load_subcluster   | t
(2 rows)
```

Attempting to demote the subcluster that contains the initiator node results in an error:

```sql
=> SELECT node_name FROM sessions WHERE user_name = 'dbadmin'
   AND client_type = 'vsql';
   node_name
--------------------
 v_verticadb_node0004
(1 row)

=> SELECT node_name, is_primary FROM subclusters WHERE subcluster_name = 'analytics';
```
<table>
<thead>
<tr>
<th>node_name</th>
<th>is_primary</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_verticadb_node0004</td>
<td>t</td>
</tr>
<tr>
<td>v_verticadb_node0005</td>
<td>t</td>
</tr>
<tr>
<td>v_verticadb_node0006</td>
<td>t</td>
</tr>
</tbody>
</table>

(3 rows)

```sql
SELECT DEMOTE_SUBCLUSTER_TO_SECONDARY('analytics');
```

**ERROR 9204:** Cannot promote or demote subcluster including the initiator node

**HINT:** Run this command on another subcluster

---

**See Also**

**FINISH_FETCHING_FILES**

Eon Mode only

Fetches all the files that are queued for fetching from the communal storage.

**Syntax**

```
FINISH_FETCHING_FILES()
```

**Privileges**

Superuser

**Examples**

Get all the files queued from communal storage:

```sql
SELECT FINISH_FETCHING_FILES();
```

```
FINISH_FETCHING_FILES

```

Finished fetching all the files

(1 row)
See Also

- Eon Mode Concepts

**FLUSH_REAPER_QUEUE**

Eon Mode only

Deletes all data marked for deletion in the database. Use this function to remove all data marked for deletion before the reaper service deletes disk files.

**Syntax**

```sql
FLUSH_REAPER_QUEUE( [sync-catalog] )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `sync-catalog` | Specifies to sync metadata in the database catalog on all nodes before the function executes:  
  - `true` (default): Sync the database catalog
  - `false`: Run without syncing. |

**Privileges**

Superuser

**Examples**

Remove all files that are marked for deletion:

```sql
=> SELECT FLUSH_REAPER_QUEUE();
```

Veronica Analytic Database (11.0.x)  Page 3517 of 6730
Sync’d catalog and deleted all files in the reaper queue.
(1 row)

See Also

CLEAN_COMMUNAL_STORAGE

MIGRATE_ENTERPRISE_TO_EON

Enterprise Mode only

Migrates an Enterprise database to an Eon Mode database. MIGRATE_ENTERPRISE_TO_EON runs in the foreground; until it returns—either with success or an error—it blocks all operations in the same session on the source Enterprise database. If successful, MIGRATE_ENTERPRISE_TO_EON returns with a list of nodes in the migrated database.

If migration is interrupted before the meta-function returns—for example, the client disconnects, or a network outage occurs—the migration returns an error. In this case, call MIGRATE_ENTERPRISE_TO_EON again to restart migration. For details, see Handling Interrupted Migration.

You can repeat migration multiple times to the same communal storage location—for example, to capture changes that occurred in the source database during the previous migration. For details, see Repeating Migration.

Syntax

MIGRATE_ENTERPRISE_TO_EON ( 'communal-storage-location', 'depot-location' [, is-dry-run] )

<table>
<thead>
<tr>
<th>communal-storage-location</th>
<th>URI of communal storage whose scheme conforms to one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>s3://: AWS, PureStorage, MinIO</td>
</tr>
<tr>
<td></td>
<td>gs://: GCP</td>
</tr>
<tr>
<td></td>
<td>webhdfs://: Communal storage on HDFS</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>depot-location</th>
<th>Path of Eon depot location, typically:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>/vertica/depot</td>
</tr>
</tbody>
</table>
**Important:**
Management Console requires this convention to enable access to depot data and activity.

**is-dry-run**
Boolean. If set to true, MIGRATE.ENTERPRISE_TO.EON only checks whether the Enterprise source database complies with all migration prerequisites. If the meta-function discovers any compliance issues, it writes these to the migration error log migrate_enterprise_to_eon_error.log in the database directory.

**Default:** false

**Privileges**
Superuser

**Examples**

Migrate an Enterprise database to Eon Mode on AWS:

```sql
=> SELECT MIGRATE.ENTERPRISE_TO.EON ('s3://verticadbbucket', '/vertica/depot');
migrate_enterprise_to_eon

v_vmart_node0001,v_vmart_node0002,v_vmart_node0003,v_vmart_node0004
(1 row)
```

**See Also**

Migrating an Enterprise Database to Eon Mode

**PROMOTE_SUBCLUSTER_TO_PRIMARY**

Eon Mode only
Converts a secondary subcluster to a **primary subcluster**. You cannot use this function to promote the subcluster that contains the **initiator node**. You must call it while connected to a node in another subcluster.

**Important:**
This function call can take a long time to complete because all of the nodes in the subcluster you are promoting will take a global catalog lock, write a checkpoint, and then commit. This global catalog lock can cause other database tasks to fail with errors.

Schedule calls to this function to occur when other database activity is low.

**Syntax**

```
PROMOTE_SUBCLUSTER_TO_PRIMARY('subcluster-name')
```

**Parameters**

<table>
<thead>
<tr>
<th><strong>subcluster-name</strong></th>
<th>The name of the secondary cluster to promote to a primary subcluster.</th>
</tr>
</thead>
</table>

**Privileges**

Superuser

**Examples**

The following example promotes the subcluster named `analytics_cluster` to a primary cluster:

```
=> SELECT DISTINCT subcluster_name, is_primary from subclusters;

**REBALANCE_SHARDS**

Eon Mode only

Rebalances shard assignments in a subcluster or across the entire cluster in Eon Mode. If the current session ends, the operation immediately aborts. The amount of time required to rebalance shards scales in a roughly linear fashion based on the number of objects in your database.

Run `REBALANCE_SHARDS` after you modify your cluster using `ALTER NODE` or when you add nodes to a subcluster.

Note:

Vertica rebalances shards in a subcluster automatically when you:

- Remove a node from a subcluster.
- Add a new subcluster with the admintools command `db_add_subcluster` with the `-s` option followed by a list of hosts.

After you rebalance shards, you will no longer be able to restore objects from a backup taken before the rebalancing. (Full backups are always possible.) After you rebalance, make another full backup so you will be able to restore objects from it in the future.
Syntax

REBALANCE_SHARDS(['subcluster-name'])

Parameters

| subcluster-name | The name of the subcluster where shards will be rebalanced. If you do not supply this parameter, all subclusters in the database rebalance their shards. |

Privileges

Superuser

Examples

The following shows that the nodes in the in the newly-added analytics subcluster do not yet have shard subscriptions. It then calls REBALANCE_SHARDS to update the node's subscriptions:

```sql
=> SELECT subcluster_name, n.node_name, shard_name, subscription_state FROM v_catalog.nodes n LEFT JOIN v_catalog.node_subscriptions ns ON (n.node_name = ns.node_name) ORDER BY 1,2,3;
```

<table>
<thead>
<tr>
<th>subcluster_name</th>
<th>node_name</th>
<th>shard_name</th>
<th>subscription_state</th>
</tr>
</thead>
<tbody>
<tr>

**SET_DEPOT_PIN_POLICY_PARTITION**

Eon Mode only

Pins the specified partitions of a table or projection to a subcluster depot, or all database depots, to reduce exposure to depot eviction.

Partition groups can be pinned only if all partitions within the group are pinned individually. If you alter or remove table partitioning, Vertica drops all partition pin policies for that table. The table's pin policy, if any, is unaffected.

For details on pinning policies and usage guidelines, see Pinning Depot Objects.
Syntax

```sql
SET_DEPOT_PIN_POLICY_PARTITION ('[[\text{database.}]\text{schema.}]\text{object-name}', '\text{min-range-value}', '\text{max-range-value}' [, \text{subcluster} ] )
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td><code>myschema.thisDbObject</code></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>object-name</code></td>
<td>Table or projection to pin. If you specify a projection, it must store the partition keys.</td>
</tr>
<tr>
<td><code>min-range-value</code></td>
<td>Minimum and maximum value of partition keys in <code>object-name</code> to pin, where <code>min-range-value</code> must be ≤ <code>max-range-value</code>. To specify a single partition, <code>min-range-value</code> and <code>max-range-value</code> must be equal.</td>
</tr>
<tr>
<td><code>max-range-value</code></td>
<td>Note: After you pin a table or one of its projections to a subcluster, you cannot subsequently pin any of its partitions to that subcluster. Conversely, you can pin one or more table partitions to a subcluster, and then pin the table or one of its projections to that subcluster.</td>
</tr>
<tr>
<td><code>subcluster</code></td>
<td>Sets this pinning policy on the <code>subCluster</code> depot. If you omit this parameter, the policy is set on all database depots.</td>
</tr>
</tbody>
</table>
Privileges

Superuser

Precedence of Pin Policies

In general, partition management functions that involve two partitioned tables give precedence to the pin policy of the target table, as follows:

<table>
<thead>
<tr>
<th>Function</th>
<th>Application of pin policy</th>
</tr>
</thead>
<tbody>
<tr>
<td>COPY_PARTITIONS_TO_TABLE</td>
<td>Partition-level pinning is reliable if the source and target tables have pin policies on the same partition keys. If the two tables have different pin policies, then the partition pin policies of the target table apply.</td>
</tr>
<tr>
<td>MOVE_PARTITIONS_TO_TABLE</td>
<td>Partition-level pin policies of the target table apply.</td>
</tr>
<tr>
<td>SWAP_PARTITIONS_BETWEEN_TABLES</td>
<td>Partition-level pin policies of the target table apply.</td>
</tr>
</tbody>
</table>

For example, the following statement copies partitions from table foo to table bar:

```sql
=> SELECT COPY_PARTITIONS_TO_TABLE('foo', '1', '5', 'bar');
```

In this case, the following logic applies:

- If the two tables have different partition pin policies, then the pin policy of target table bar for partition keys 1-5 applies.
- If table bar does not exist, then Vertica creates it from table foo, and copies foo's policy on partition keys 1-5. Subsequently, if you clear the partition pin policy from either table, it is also cleared from the other.

See Also

CLEAR_DEPOT_PIN_POLICY_PARTITION
**SET_DEPOT_PIN_POLICY_PROJECTION**

Eon Mode only

Pins a projection to a subcluster depot, or all database depots, to reduce its exposure to depot eviction. For details on pinning policies and usage guidelines, see Pinning Depot Objects.

**Syntax**

```
SET_DEPOT_PIN_POLICY_PROJECTION ( '[database.]schema.projection' [, 'subcluster' ] )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td><code>projection</code></td>
<td>Projection to pin.</td>
</tr>
<tr>
<td><code>subcluster</code></td>
<td>Sets this pinning policy on the subcluster depot. If you omit this parameter, the policy is set on all database depots.</td>
</tr>
</tbody>
</table>

**Note:**

After you pin a table to a subcluster, you cannot subsequently pin any of its projections to that subcluster. Conversely, you can pin one or more projections of a table to a subcluster, and then pin the table to that subcluster.

**Privileges**

Superuser
See Also

CLEAR_DEPOT_PIN_POLICY_PROJECTION

SET_DEPOT_PIN_POLICY_TABLE

Eon Mode only

Pins a table to a subcluster depot, or all database depots, to reduce its exposure to depot eviction. For details on pinning policies and usage guidelines, see Pinning Depot Objects.

Syntax

SET_DEPOT_PIN_POLICY_TABLE ( '[database.]schema.]table' [, 'subcluster' ] )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>table</td>
<td>Table to pin.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> After you pin a table to a subcluster, you cannot subsequently pin any of its partitions or projections to that subcluster. Conversely, you can pin one or more partitions or projections of a table to a subcluster, and then pin the table to that subcluster</td>
</tr>
<tr>
<td>subcluster</td>
<td>Sets this pinning policy on the subcluster depot. If you omit this parameter, the policy is set on all database depots.</td>
</tr>
</tbody>
</table>
Privileges

CLEAR_DEPOT_PIN_POLICY_TABLE

**SHUTDOWN_SUBCLUSTER**

Eon Mode only

Shuts down a subcluster. This function shuts down the subcluster synchronously, returning when shutdown is complete with the message *Subcluster shutdown*. If the subcluster is already down, the function returns with no error.

**Caution:**
This function does not test whether the target subcluster is critical (a subcluster whose loss would cause the database to shut down). Using this function to shut down a critical subcluster results in the database shutting down. Always verify that the subcluster you want to shut down is not critical by querying the **CRITICAL_SUBCLUSTERS** system table before calling this function.

**Important:**
Stopping a subcluster does not warn you if there are active user sessions connected to the subcluster. This behavior is same as stopping an individual node. Before stopping a subcluster, verify that no users are connected to it.

Syntax

```
SHUTDOWN_SUBCLUSTER('subcluster-name')
```
**Arguments**

| subcluster-name | Name of the subcluster to shut down. |

**Privileges**

Superuser

**Examples**

The following example demonstrates shutting down the subcluster `analytics`:

```sql
=> SELECT subcluster_name, node_name, node_state FROM nodes order by 1,2;
```

```
<table>
<thead>
<tr>
<th>subcluster_name</th>
<th>node_name</th>
<th>node_state</th>
</tr>
</thead>
<tbody>
<tr>
<td>analytics</td>
<td>v_verticadb_node0004</td>
<td>UP</td>
</tr>
<tr>
<td>analytics</td>
<td>v_verticadb_node0005</td>
<td>UP</td>
</tr>
<tr>
<td>analytics</td>
<td>v_verticadb_node0006</td>
<td>UP</td>
</tr>
<tr>
<td>default_subcluster</td>
<td>v_verticadb_node0001</td>
<td>UP</td>
</tr>
<tr>
<td>default_subcluster</td>
<td>v_verticadb_node0002</td>
<td>UP</td>
</tr>
<tr>
<td>default_subcluster</td>
<td>v_verticadb_node0003</td>
<td>UP</td>
</tr>
</tbody>
</table>
```

(6 rows)

```sql
=> SELECT SHUTDOWN_SUBCLUSTER('analytics');
```

```
WARNING 4539: Received no response from v_verticadb_node0004 in stop subcluster
WARNING 4539: Received no response from v_verticadb_node0005 in stop subcluster
WARNING 4539: Received no response from v_verticadb_node0006 in stop subcluster
SHUTDOWN_SUBCLUSTER
```

Subcluster shutdown

(1 row)

```sql
=> SELECT subcluster_name, node_name, node_state FROM nodes order by 1,2;
```

```
<table>
<thead>
<tr>
<th>subcluster_name</th>
<th>node_name</th>
<th>node_state</th>
</tr>
</thead>
<tbody>
<tr>
<td>analytics</td>
<td>v_verticadb_node0004</td>
<td>DOWN</td>
</tr>
<tr>
<td>analytics</td>
<td>v_verticadb_node0005</td>
<td>DOWN</td>
</tr>
<tr>
<td>analytics</td>
<td>v_verticadb_node0006</td>
<td>DOWN</td>
</tr>
<tr>
<td>default_subcluster</td>
<td>v_verticadb_node0001</td>
<td>UP</td>
</tr>
<tr>
<td>default_subcluster</td>
<td>v_verticadb_node0002</td>
<td>UP</td>
</tr>
<tr>
<td>default_subcluster</td>
<td>v_verticadb_node0003</td>
<td>UP</td>
</tr>
</tbody>
</table>
```

(6 rows)

**Note:**

The "WARNING 4539" messages after calling SHUTDOWN_
SUBCLUSTER occur because the nodes are in the process of shutting down. They are expected.

See Also

**START_REAPING_FILES**

Eon Mode only

Starts the disk file deletion in the background as an asynchronous function. By default, this meta-function syncs the catalog before beginning deletion. Disk file deletion is handled in the foreground by `FLUSH_REAPER_QUEUE`.

Syntax

```sql
START_REAPING_FILES()
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>false</code></td>
<td>When set to false, the reaper skips the catalog sync before starting the service.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

Examples

Start the reaper service:

```sql
=> SELECT START_REAPING_FILES();
```

Starts the reaper service and skips the initial catalog sync:
SYNC_CATALOG

Eon Mode only

Synchronizes the catalog to communal storage to enable reviving the current catalog version in the case of an imminent crash. Vertica synchronizes all pending checkpoint and transaction logs to communal storage.

Syntax

```sql
SYNC_CATALOG( [ 'node-name' ] )
```

Parameters

| `node-name` | The node to synchronize. If you omit this argument, Vertica synchronizes the catalog on all nodes. |

Privileges

Superuser

Examples

Synchronize the catalog on all nodes:

```sql
=> SELECT SYNC_CATALOG();
```

Synchronize the catalog on one node:

```sql
=> SELECT SYNC_CATALOG( 'node001' );
```
Epoch Management Functions

This section contains the epoch management functions specific to Vertica.

ADVANCE_EPOCH

Manually closes the current epoch and begins a new epoch.

Syntax

ADVANCE_EPOCH ( [ integer ] )

Parameters

| integer | Specifies the number of epochs to advance. |

Privileges

Superuser

Notes

This function is primarily maintained for backward compatibility with earlier versions of Vertica.

Example

The following command increments the epoch number by 1:
GET_AHM_EPOCH

Returns the number of the epoch in which the Ancient History Mark is located. Data deleted up to and including the AHM epoch can be purged from physical storage.

Syntax

GET_AHM_EPOCH()

Note:
The AHM epoch is 0 (zero) by default (purge is disabled).

Privileges

None

Examples

=> SELECT GET_AHM_EPOCH();
    GET_AHM_EPOCH
------------------------
    Current AHM epoch: 0
(1 row)

GET_AHM_TIME

Returns a TIMESTAMP value representing the Ancient History Mark. Data deleted up to and including the AHM epoch can be purged from physical storage.

Syntax

GET_AHM_TIME()
Privileges

None

Examples

```sql
=> SELECT GET_AHM_TIME();
   GET_AHM_TIME
--------------------
(1 row)
```

**GET_CURRENT_EPOCH**

The epoch into which data (COPY, INSERT, UPDATE, and DELETE operations) is currently being written.

Returns the number of the current epoch.

Syntax

`GET_CURRENT_EPOCH()`

Privileges

None

Examples

```sql
=> SELECT GET_CURRENT_EPOCH();
   GET_CURRENT_EPOCH
-------------------
  683
(1 row)
```
**GET_LAST_GOOD_EPOCH**

Returns the last good epoch number. If the database has no projections, the function returns an error.

**Syntax**

```
GET_LAST_GOOD_EPOCH()
```

**Privileges**

None

**Examples**

```
=> SELECT GET_LAST_GOOD_EPOCH();

GET_LAST_GOOD_EPOCH
---------------------
     682
(1 row)
```

**MAKE_AHM_NOW**

Sets the Ancient History Mark (AHM) to the greatest allowable value. This lets you purge all deleted data.

⚠️ **Caution:**

After running this function, you cannot query historical data that precedes the current epoch. Only database administrators should use this function.

MAKE_AHM_NOW performs the following operations:

- Advances the epoch.
- Sets the AHM to the last good epoch (LGE) — at least to the epoch that is current when you execute MAKE_AHM_NOW.
Syntax

\texttt{MAKE\_AHM\_NOW \( \left[ \text{true} \right] \)}

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{true}</td>
<td>Allows AHM to advance when one of the following conditions is true:</td>
</tr>
</tbody>
</table>
| | • One or more nodes are down.  
| | • One projection is being refreshed from another (retentive refresh). |

In both cases, you must supply this argument to \texttt{MAKE\_AHM\_NOW}, otherwise Vertica returns an error. If you execute \texttt{MAKE\_AHM\_NOW(true)} during retentive refresh, Vertica rolls back the refresh operation and advances the AHM.

\textbf{Caution:}

If the function advances AHM beyond the last good epoch of the down nodes, those nodes must recover all data from scratch.

Privileges

Superuser

Setting AHM When Nodes Are Down

If any node in the cluster is down, you must call \texttt{MAKE\_AHM\_NOW} with an argument of \texttt{true}; otherwise, the function returns an error.

\textbf{Note:}

This requirement applies only to Enterprise mode; in Eon mode, it is ignored.

In the following example, \texttt{MAKE\_AHM\_NOW} advances the AHM even though a node is down:

\texttt{=> SELECT MAKE\_AHM\_NOW(true);}

\texttt{WARNING: Received no response from v_vmartdb_node0002 in get cluster LGE}
WARNING: Received no response from v_vmartdb_node0002 in get cluster LGE
WARNING: Received no response from v_vmartdb_node0002 in set AHM
MAKE_AHM_NOW

--------------------
AHM set (New AHM Epoch: 684)
(1 row)

See Also

- SET_AHM_EPOCH
- SET_AHM_TIME

**SET_AHM_EPOCH**

Sets the Ancient History Mark (AHM) to the specified epoch. This function allows deleted data up to and including the AHM epoch to be purged from physical storage.

SET_AHM_EPOCH is normally used for testing purposes. Instead, consider using SET_AHM_TIME which is easier to use.

Syntax

```
SET_AHM_EPOCH ( epoch, [ true ] )
```

Parameters

| **epoch** | Specifies one of the following:
|------------|---------------------------------------------------------------|
|            | - The number of the epoch in which to set the AHM
|            | - Zero (0) (the default) disables PURGE
|            | **Important:**
|            | The number of the specified epoch must be:
|            |   - Greater than the current AHM epoch
|            |   - Less than the current epoch
Query the `SYSTEM` table to view current epoch values relative to the AHM.

<table>
<thead>
<tr>
<th>true</th>
<th>Allows the AHM to advance when nodes are down.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Caution: If you advance AHM beyond the last good epoch of the down nodes, those nodes must recover all data from scratch.</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser

**Setting AHM When Nodes Are Down**

If any node in the cluster is down, you must call `SET_AHM_EPOCH` with an argument of `true`; otherwise, the function returns an error.

**Note:**
This requirement applies only to Enterprise mode; in Eon mode, it is ignored.

**Examples**

The following command sets the AHM to a specified epoch of 12:

```sql
=> SELECT SET_AHM_EPOCH(12);
```

The following command sets the AHM to a specified epoch of 2 and allows the AHM to advance despite a failed node:

```sql
=> SELECT SET_AHM_EPOCH(2, true);
```
See Also

- MAKE_AHM_NOW
- SET_AHM_TIME

SET_AHM_TIME

Sets the Ancient History Mark (AHM) to the epoch corresponding to the specified time on the initiator node. This function allows historical data up to and including the AHM epoch to be purged from physical storage. SET_AHM_TIME returns a TIMESTAMPTZ that represents the end point of the AHM epoch.

Syntax

SET_AHM_TIME ( time, [ true ] )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>time</td>
<td>A TIMESTAMPTIMESTAMPTZ value that is automatically converted to the appropriate epoch number.</td>
</tr>
<tr>
<td>true</td>
<td>Allows the AHM to advance when nodes are down.</td>
</tr>
</tbody>
</table>

Caution:
If you advance AHM beyond the last good epoch of the down nodes, those nodes must recover all data from scratch.

Privileges

Superuser
Setting AHM When Nodes Are Down

If any node in the cluster is down, you must call SET_AHM_TIME with an argument of true; otherwise, the function returns an error.

**Note:**
This requirement applies only to Enterprise mode; in Eon mode, it is ignored.

Examples

Epochs depend on a configured epoch advancement interval. If an epoch includes a three-minute range of time, the purge operation is accurate only to within minus three minutes of the specified timestamp:

```sql
=> SELECT SET_AHM_TIME('2008-02-27 18:13');
   set_ahm_time
------------------------
  AHM set to '2008-02-27 18:11:50-05'
(1 row)
```

**Note:**
The –05 part of the output string is a time zone value, an offset in hours from UTC (Universal Coordinated Time, traditionally known as Greenwich Mean Time, or GMT).

In the previous example, the actual AHM epoch ends at 18:11:50, roughly one minute before the specified timestamp. This is because SET_AHM_TIME selects the epoch that ends at or before the specified timestamp. It does not select the epoch that ends after the specified timestamp because that would purge data deleted as much as three minutes after the AHM.

For example, using only hours and minutes, suppose that epoch 9000 runs from 08:50 to 11:50 and epoch 9001 runs from 11:50 to 15:50. SET_AHM_TIME ("11:51") chooses epoch 9000 because it ends roughly one minute before the specified timestamp.

In the next example, suppose that a node went down at 11:00:00 AM on January 1st 2017. At noon, you want to advance the AHM to 11:15:00, but the node is still down.

Suppose you try to set the AHM using this command:
Then you will receive an error message. Vertica prevents you from moving the AHM past the point where a node went down. Vertica returns this error to prevent the AHM from advancing past the down node's last good epoch. You can force the AHM to advance by supplying the optional second parameter:

```sql
=> SELECT SET_AHM_TIME('2017-01-01 11:15:00', true);
```

However, if you force the AHM past the last good epoch, the failed node will have to recover from scratch.

Flex Table Functions

This section contains helper functions for use in working with flex tables and flexible columns for complex types. You can use these functions with flex tables, their associated `flex_table_keys` tables and `flex_table_view` views, and flexible columns in external tables. These functions do not apply to other tables.

For more information about flex tables, see Using Flex Tables. For more information about flexible columns for complex types, see Using Flexible Complex Types.

**BUILD_FLEXTABLE_VIEW**

Creates, or re-creates, a view for a default or user-defined _keys table, ignoring any empty keys.

Note:
If the length of a key exceeds 65,000, Vertica truncates the key.
Syntax

`BUILD_FLEXTABLE_VIEW ( '[database.]schema.]flex-table' [ [,view-name'] [,user-keys-table'] ])`

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>flex-table</td>
<td>The flex table name. By default, this function builds or rebuilds a view for the input table with the current contents of the associated flex_table_keys table.</td>
</tr>
<tr>
<td>view-name</td>
<td>A custom view name. Use this option to build a new view for <code>flex-table</code> with the name you specify.</td>
</tr>
<tr>
<td>user-keys-table</td>
<td>Specifies a keys table from which to create the view. Use this option if you created a custom user_keys table from the flex_table map data, rather than from the default flex_table_keys table. The function builds a view from the keys in user_keys table, rather than from the flex_table_keys table.</td>
</tr>
</tbody>
</table>

Examples

The following examples show how to call `build_flextable_view` with 1, 2, or 3 arguments.

**Creating a Default View**

To create, or re-create, a default view:
1. Call the function with an input flex table, `darkdata`:

```sql
=> SELECT BUILD_FLEXTABLE_VIEW('darkdata');
build_flextable_view
-------------------------------------
The view public.darkdata_view is ready for querying
(1 row)
```

The function creates a view with the default name (`darkdata_view`) from the `darkdata_keys` table.

2. Query a key name (`user.id`) from the new or updated view:

```sql
=> SELECT "user.id" FROM darkdata_view;
user.id
--------
340857907
727774963
390498773
288187825
164464905
125434448
601328899
352494946
(12 rows)
```

Creating a Custom Name View

To create, or re-create, a view with a custom name:

1. Call the function with two arguments, an input flex table, `darkdata`, and the name of the view to create, `dd_view`:

```sql
=> SELECT BUILD_FLEXTABLE_VIEW('darkdata', 'dd_view');
build_flextable_view
---------------------
The view public.dd_view is ready for querying
(1 row)
```

2. Query a key name (`user.lang`) from the new or updated view (`dd_view`):

```sql
=> SELECT "user.lang" FROM dd_view;
user.lang
--------
tr
ten
es
en
en
it
es
en
(12 rows)
```
Creating a View from a Custom Keys Table

To create a view from a custom _keys table with build_flextable_view, the custom table must have the same schema and table definition as the default table (darkdata_keys). Create a custom keys table, using any of these three approaches:

1. Create a columnar table with all keys from the default keys table for a flex table (darkdata_keys):

```sql
=> CREATE TABLE new_darkdata_keys AS SELECT * FROM darkdata_keys;
CREATE TABLE
```

2. Create a columnar table without content (LIMIT 0) from the default keys table for a flex table (darkdata_keys):

```sql
=> CREATE TABLE new_darkdata_keys AS SELECT * FROM darkdata_keys LIMIT 0;
CREATE TABLE
kdb=> SELECT * FROM new_darkdata_keys;
key_name | frequency | data_type_guess
---------+-----------+-------------------
(0 rows)
```

3. Create a columnar table without content (LIMIT 0) from the default keys table, and insert two values ('user.lang', 'user.name') into the key_name column:

```sql
=> CREATE TABLE dd_keys AS SELECT * FROM darkdata_keys limit 0;
CREATE TABLE
=> INSERT INTO dd_keys (key_name) values ('user.lang');
OUTPUT
-------
1
(1 row)
=> INSERT INTO dd_keys (key_name) values ('user.name');
OUTPUT
-------
1
(1 row)
=> SELECT * FROM dd;
key_name | frequency | data_type_guess
---------+-----------+-------------------
user.lang | | 
user.name | | 
(2 rows)
```

4. After creating a custom keys table, call build_flextable_view with all arguments (an input flex table, the new view name, the custom keys table):

```sql
=> SELECT BUILD_FLEXTABLE_VIEW('darkdata', 'dd_view', 'dd_keys');
build_flextable_view
------------------------------------------------------------------------
The view public.dd_view is ready for querying
(1 row)
```
5. Query the new view:

```sql
=> SELECT * FROM dd_view;
```

- `COMPUTE_FLEXTABLE_KEYS`
- `COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW`
- `MATERIALIZE_FLEXTABLE_COLUMNS`
- `RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW`

**COMPUTE_FLEXTABLE_KEYS**

Computes the virtual columns (keys and values) from the flex table VMap data. Use this function to compute keys without creating an associated table view. To also build a view, use `COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW`.

**Note:**
If the length of a key exceeds 65,000, Vertica truncates the key.

The function stores its results in the associated flex_keys table, which has the following columns:

- key_name
- frequency
- data_type_guess

For more information, see Computing Flex Table Keys.

**Syntax**

```sql
COMPUTE_FLEXTABLE_KEYS ('[[database.]schema.]flex-table')
```

**Arguments**

| [database.]schema | Specifies a schema, by default public. If schema is any |
schema other than public, you must supply the schema name. For example:

```
myschema.thisDbObject
```

If you specify a database, it must be the current database.

- **flex-table**
  - Name of a flex table.

### Using Data Type Guessing

The results of the flex_keys table data_type_guess column depend on the EnableBetterFlexTypeGuessing configuration parameter. By default, the parameter is 1 (ON). This setting results in the function returning all non-string keys in the data_type_guess column as one of the following types (and others listed in SQL Data Types):

- BOOLEAN
- INTEGER
- FLOAT
- TIMESTAMP
- DATE

Setting the configuration parameter to 0 (OFF), results in the function returning only string types (\[LONG\]VARCHAR) or (\[LONG\]VARBINARY) for all values in the data_type_guess column of the flex_keys table.

### Assigning Flex Key Data Types

Use the sample CSV data in this section to compare the results of using or not using the EnableBetterFlexTypeGuessing configuration parameter. When the parameter is ON, the function determines key non-string data types in your map data more accurately. The default for the parameter is 1 (ON).

| Year,Quarter,Region,Species,Grade,Pond,Value,Number of Quotes,Available |
|---------------------------------|--------------------------|------------------|
| 2015,1,2 - Northwest Oregon & Willamette,Douglas-fir,1P,$615.12 ,12,No |
| 2015,1,2 - Northwest Oregon & Willamette,Douglas-fir,SM,$610.78 ,12,Yes |
| 2015,1,2 - Northwest Oregon & Willamette,Douglas-fir,2S,$596.00 ,20,Yes |
| 2015,1,2 - Northwest Oregon & Willamette,Hemlock,P,$520.00 ,6,Yes |
| 2015,1,2 - Northwest Oregon & Willamette,Hemlock,SM,$510.00 ,6,No |
| 2015,1,2 - Northwest Oregon & Willamette,Hemlock,2S,$490.00 ,14,No |
To compare the data type assignment results, complete the following steps:

1. Save the CSV data file (here, as trees.csv).
2. Create a flex table (trees) and load trees.csv using the fcsvparser:

   ```
   => CREATE FLEX TABLE trees();
   => COPY trees FROM '/home/dbadmin/tempdat/trees.csv' PARSER fcsvparser();
   ```

3. Use COMPUTE_FLEXTABLE_KEYS with the trees flex table.

   ```
   => SELECT COMPUTE_FLEXTABLE_KEYS('trees');
   ```

   Please see public.trees_keys for updated keys
   (1 row)

4. Query the trees_keys table output:

   ```
   => SELECT * FROM trees_keys;
   ```

   ```
   key_name | frequency | data_type_guess
   ---------|-----------|----------------
   Year     | 6         | Integer
   Quarter  | 6         | Integer
   Region   | 6         | Varchar(66)
   Available| 6         | Boolean
   Number of Quotes | 6  | Integer
   Grade    | 6         | Varchar(20)
   Species  | 6         | Varchar(22)
   Pond Value | 6  | Numeric(8,3)
   (8 rows)
   ```

5. Set the EnableBetterFlexTypeGuessing parameter to 0 (OFF).
6. Call COMPUTE_FLEXTABLE.Keys with the trees flex table again.
7. Query the trees_keys table to compare the data_type_guess values with the previous results. Without the configuration parameter set, all of the non-string data types are VARCHARS of various lengths:

   ```
   => SELECT * FROM trees_keys;
   ```

   ```
   key_name | frequency | data_type_guess
   ---------|-----------|----------------
   Year     | 6         | varchar(20)
   Quarter  | 6         | varchar(20)
   Region   | 6         | varchar(66)
   Available| 6         | varchar(20)
   Grade    | 6         | varchar(20)
   Number of Quotes | 6  | varchar(20)
   Pond Value | 6  | varchar(20)
   Species  | 6         | varchar(22)
   (8 rows)
   ```

8. To maintain accurate results for non-string data types, set the EnableBetterFlexTypeGuessing parameter back to 1 (ON).
For more information about setting the EnableBetterFlexTypeGuessing configuration parameter, see Setting Flex Table Configuration Parameters.

**COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW**

Combines the functionality of BUILD_FLEXTABLE_VIEW and COMPUTE_FLEXTABLE_KEYS to compute virtual columns (keys) from the VMap data of a flex table and construct a view. Creating a view with this function ignores empty keys. If you do not need to perform both operations together, use one of the single-operation functions instead.

**Note:**
If the length of a key exceeds 65,000, Vertica truncates the key.

Syntax

```
COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW ('flex-table')
```

Arguments

| flex-table | Name of a flex table |

Examples

This example shows how to call the function for the darkdata flex table.

```sql
=> SELECT COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW('darkdata');
compute_flextable_keys_and_build_view
```
See Also

- BUILD_FLEXTABLE_VIEW
- COMPUTE_FLEXTABLE_KEYS
- MATERIALIZE_FLEXTABLE_COLUMNS
- RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW

**EMPTYMAP**

Constructs a new VMap with one row but without keys or data. Use this transform function to populate a map without using a flex parser. Instead, you use either from SQL queries or from map data present elsewhere in the database.

**Syntax**

`EMPTYMAP()`

**Examples**

Create an Empty Map

```
=> SELECT EMPTYMAP();
emptymap

<table>
<thead>
<tr>
<th>emptymap</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

(1 row)
```

Create an Empty Map from an Existing Flex Table

If you create an empty map from an existing flex table, the new map has the same number of rows as the table from which it was created.

This example shows the result if you create an empty map from the `darkdata` table, which has 12 rows of JSON data:
=> SELECT EMPTYMAP() FROM darkdata;

emptymap

(12 rows)

- MAPLOOKUP
- MAPSIZE
- MAPTOSTRING
- MAPVALUES
- MAPVERSION

**MAPAGGREGATE**

Returns a LONG VARBINARY VMap with keys and value pairs supplied from two VARCHAR input columns of an existing columnar table. Using this function requires specifying an over() clause for the source table.

**Syntax**

MAPAGGREGATE (source-column1, source-column2)
Arguments

| source-column1 | Table column with values to use as the keys of the key/value pair of the returned VMap data. |
| source-column2 | Table column with values to use as the values in the key/value pair of the returned VMap data. |

Examples

This example creates a columnar table `btest`, with two VARCHAR columns, named `keys` and `values`, and adds three sets of values:

```sql
=> CREATE TABLE btest(keys varchar(10), values varchar(10));
CREATE TABLE
=> COPY btest FROM stdin;
COPY btest FROM stdin
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> one|1
>> two|2
>> three|3
>> .
```

After populating the `btest` table, call `mapaggregate()`, using the `over (PARTITION BEST)` clause. This call returns the `raw_map` data:

```sql
=> SELECT MAPAGGREGATE(keys, values) OVER(PARTITION BEST) FROM btest;

<table>
<thead>
<tr>
<th>raw_map</th>
</tr>
</thead>
<tbody>
<tr>
<td>\001\000\000\000\023\000\000\000\003\000\000\000\020\000\000\000\021\000\000\000\022\000\000\000\00132 \003\000\000\020\000\000\023\000\000\030\000\000\000</td>
</tr>
</tbody>
</table>
(1 row)
```

The next example illustrates using `MAPTOSTRING()` with the returned `raw_map` from `mapaggregate()` to see the values:

```sql
=> SELECT MAPTOSTRING(raw_map) FROM (SELECT MAPAGGREGATE(keys, values) OVER(PARTITION BEST) FROM btest) bit;

<table>
<thead>
<tr>
<th>mptostring</th>
</tr>
</thead>
<tbody>
<tr>
<td>{ &quot;one&quot;: &quot;1&quot;,</td>
</tr>
</tbody>
</table>
```
See Also

- MAPCONTAINSKEY
- MAPCONTAINSVALUE
- MAPITEMS
- MAPKEYS
- MAPKEYSINFO
- MAPLOOKUP
- MAPSIZE
- MAPISTOSTRING
- MAPVALUES
- MAPVERSION

**MAPCONTAINSKEY**

Determines whether a VMap contains a virtual column (key). This scalar function returns true (t), if the virtual column exists, or false (f) if it does not. Determining that a key exists before calling maplookup() lets you distinguish between NULL returns. The maplookup() function uses for both a non-existent key and an existing key with a NULL value.

**Syntax**

```
MAPCONTAINSKEY (VMap-data, 'virtual-column-name')
```

**Arguments**

<table>
<thead>
<tr>
<th><em>VMap-data</em></th>
<th>Any VMap data. The VMap can exist as:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• The <strong>raw</strong> column of a flex table</td>
</tr>
<tr>
<td></td>
<td>• Data returned from a map function such as</td>
</tr>
</tbody>
</table>
MAPLOOKUP
- Other database content

virtual-column-name | Name of the key to check.

Examples

This example shows how to use the mapcontainskey() functions with maplookup(). View the results returned from both functions. Check whether the empty fields that maplookup() returns indicate a NULL value for the row (t) or no value (f):

You can use mapcontainskey() to determine that a key exists before calling maplookup(). The maplookup() function uses both NULL returns and existing keys with NULL values to indicate a non-existent key.

```sql
=> SELECT MAPLOOKUP(_raw_, 'user.location'), MAPCONTAINSKEY(_raw_, 'user.location')
FROM darkdata ORDER BY 1;
<table>
<thead>
<tr>
<th>maplookup</th>
<th>mapcontainskey</th>
</tr>
</thead>
<tbody>
<tr>
<td>t</td>
<td>t</td>
</tr>
<tr>
<td>t</td>
<td>t</td>
</tr>
<tr>
<td>t</td>
<td>t</td>
</tr>
<tr>
<td>t</td>
<td>t</td>
</tr>
<tr>
<td>t</td>
<td>t</td>
</tr>
<tr>
<td>t</td>
<td>t</td>
</tr>
<tr>
<td>t</td>
<td>t</td>
</tr>
<tr>
<td>t</td>
<td>t</td>
</tr>
<tr>
<td>t</td>
<td>t</td>
</tr>
<tr>
<td>t</td>
<td>t</td>
</tr>
<tr>
<td>t</td>
<td>t</td>
</tr>
<tr>
<td>f</td>
<td>f</td>
</tr>
<tr>
<td>f</td>
<td>f</td>
</tr>
<tr>
<td>f</td>
<td>f</td>
</tr>
<tr>
<td>f</td>
<td>f</td>
</tr>
</tbody>
</table>
(12 rows)
```

- MAPAGGREGATE
- MAPCONTAINSVALUE
- MAPITEMS
- MAPKEYS
- MAPKEYSINFO
- MAPLOOKUP
- MAPSIZE
MAPCONTAINSVALUE

Determines whether a VMap contains a specific value. Use this scalar function to return true (t) if the value exists, or false (f) if it does not.

Syntax

MAPCONTAINSVALUE (VMap-data, 'virtual-column-value')

Arguments

<table>
<thead>
<tr>
<th>VMap-data</th>
<th>Any VMap data. The VMap can exist as:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The <strong>raw</strong> column of a flex table</td>
</tr>
<tr>
<td></td>
<td>Data returned from a map function such as MAPLOOKUP</td>
</tr>
<tr>
<td></td>
<td>Other database content</td>
</tr>
<tr>
<td>virtual-column-value</td>
<td>Value to confirm.</td>
</tr>
</tbody>
</table>

Examples

This example shows how to use mapcontainsvalue() to determine whether or not a virtual column contains a particular value. Create a flex table (ftest), and populate it with some virtual columns and values. Name both virtual columns one:

```sql
=> CREATE FLEX TABLE ftest();
CREATE TABLE => copy ftest from stdin parser fjsonparser();
Enter data to be copied followed by a newline. End with a backslash and a period on a line by itself.
>> {"one":1, "two":2}
>> {"one":"one","2":"2"}
>> \. 
```
Call `mapcontainsvalue()` on the `ftest` map data. The query returns false (f) for the first virtual column, and true (t) for the second, which contains the value one:

```
=> SELECT MAPCONTAINSVALUE(__raw__, 'one') FROM ftest;

mapcontainsvalue
--------------
f
 t
(2 rows)
```

- `MAPVERSION`

**MAPDELIMITEDEXTRACTOR**

Extracts data with a delimiter character, and other optional arguments, returning a single VMap value. The `USING PARAMETERS` phrase specifies optional parameters for the function.

**Syntax**

```
MAPDELIMITEDEXTRACTOR (record_value USING PARAMETERS delimiter=character
 [,header_names= value,]
 [trim= value,]
 [treat_empty_val_as_null = value,])
```
Arguments

| record_value | VARCHAR | String containing a JSON or delimited format record on which the expression will be applied. |

Parameters

| delimiter     | VARCHAR | Single delimiter character. |
|              |         | Default value: | |

| header_names | VARCHAR | [Optional] Specifies header names for columns. |
|             |         | Default value: ucoln |

Where n is the column offset number, starting with 0 for the first column. The function uses default values if you do not specify values for the header_names parameter.

| trim         | BOOLEAN | [Optional] Trims white space from header names and field values. |
|             |         | Default value: true |

| treat_empty_val_as_null | BOOLEAN | [Optional] Specifies that empty fields become NULLs, rather than empty strings (' '). |
|                        |         | Default value: true |

Examples

These examples use a short set of delimited data:

<table>
<thead>
<tr>
<th>Name</th>
<th>CITY</th>
<th>New city</th>
<th>State</th>
<th>zip</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tom</td>
<td>BOSTON</td>
<td>boston</td>
<td>MA</td>
<td>01</td>
</tr>
<tr>
<td>Eric</td>
<td>Burlington</td>
<td>BURLINGTON</td>
<td>MA</td>
<td>02</td>
</tr>
<tr>
<td>Jamie</td>
<td>cambridge</td>
<td>CAMBRIDGE</td>
<td>MA</td>
<td>08</td>
</tr>
</tbody>
</table>

To begin, save this data as delim.dat.
1. Create a flex table, dflex:

```sql
CREATE FLEX TABLE dflex();
```

2. Use COPY to load the delim.dat file. Use the flex tables fdelimitedparser with the header='false' option:

```sql
COPY dflex FROM '/home/release/kmm/flextables/delim.dat' parser fdelimitedparser (header='false');
```

3. Create a columnar table, dtab, with an identity id column, a delim column, and a column to hold a VMap, named vmap:

```sql
CREATE TABLE dtab (id IDENTITY(1,1), delim varchar(128), vmap long varbinary(512));
```

4. Use COPY to load the delim.dat file into the dtab table. For the mapdelimitedextractor function, add a header row with USING PARAMETERS header_names= option to specify the header row for the sample data, along with delimiter '!

```sql
COPY dtab(delim, vmap AS MAPDELIMITEDEXTRACTOR (delim
  USING PARAMETERS header_names='Name|City|New City|State|Zip') FROM
'/home/dbadmin/data/delim.dat'
DELIMITER '!');
```

5. Use maptostring for the flex table dflex to view the __raw__ column contents. Notice the default header names in use (ucol0 – ucol4), since you specified header='false' when you loaded the flex table:

```sql
SELECT MAPTOSTRING(__raw__) FROM dflex limit 10;
```

```json
{  "ucol0" : "Jamie",
   "ucol1" : "cambridge",
   "ucol2" : "CAMBRIDGE",
   "ucol3" : "MA",
   "ucol4" : "08"
}
```
6. Use `maptostring` again, this time with the `dtab` table's `vmap` column. Compare the results of this output to those for the `flex` table. Note that `maptostring` returns the header_name parameter values you specified when you loaded the data:

```sql
=> SELECT MAPTOSTRING(vmap) FROM dtab;

+---------------------+
<table>
<thead>
<tr>
<th>mptostring</th>
</tr>
</thead>
</table>
+---------------------+
| {
|   "CITY" : "CITY",
|   "Name" : "Name",
|   "New City" : "New city",
|   "State" : "State",
|   "Zip" : "zip"
| }                 |
| {
|   "CITY" : "BOSTON",
|   "Name" : "Tom",
|   "New City" : "boston",
|   "State" : "MA",
|   "Zip" : "01"
| }                 |
| {
|   "CITY" : "BURLINGTON",
|   "Name" : "Eric",
|   "New City" : "BURLINGTON",
|   "State" : "MA",
|   "Zip" : "02"
| }                 |
+---------------------+
```
7. Query the `delim` column to view the contents differently:

```sql
=> SELECT delim FROM dtab;
   delim
---------
 Name|CITY|New city|State|zip
 Tom|BOSTON|boston|MA|02121
 Eric|Burlington|BURLINGTON|MA|02482
 Jamie|cambridge|CAMBRIDGE|MA|02811
(4 rows)
```

**See Also**

- `MAPJSONEXTRACTOR`
- `MAPREGEXEXTRACTOR`

**MAPITEMS**

Returns information about items in a VMap. Use this transform function with one or more optional arguments to access polystructured values within the VMap data. This function requires an `OVER()` clause.

**Syntax**

```sql
MAPITEMS (VMap-data [, passthrough-arg[,...] ])
```

**Arguments**

- **VMap-data**: Any VMap data. The VMap can exist as:
The __raw__ column of a flex table

- Data returned from a map function such as MAPLOOKUP
- Other database content

### max_key_length

In a __raw__ column, determines the maximum length of keys that the function can return. Keys that are longer than `max_key_length` cause the query to fail. Defaults to the smaller of VMap column length and 65K.

### max_value_length

In a __raw__ column, determines the maximum length of values the function can return. Values that are larger than `max_value_length` cause the query to fail. Defaults to the smaller of VMap column length and 65K.

### passthrough-arg

One or more arguments indicating keys within the map data in VMap-data.

## Examples

The following examples illustrate using `MAPITEMS()` with the `over(PARTITION BEST)` clause.

This example determines the number of virtual columns in the map data using a flex table, labeled darkmountain. Query using the `count()` function to return the number of virtual columns in the map data:

```sql
=> SELECT COUNT(keys) FROM (SELECT MAPITEMS(darkmountain.__raw__) OVER(PARTITION BEST) FROM darkmountain) AS a;
```

```
count
-------
 19
(1 row)
```

The next example determines what items exist in the map data:

```sql
=> SELECT * FROM (SELECT MAPITEMS(darkmountain.__raw__) OVER(PARTITION BEST) FROM darkmountain) AS a;
```

```
keys | values
-----+-------
hike_safety | 50.6
name | Mt Washington
type | mountain
height | 17000
hike_safety | 12.2
name | Denali
type | mountain
```
The following example shows how to restrict the length of returned values to 100000:

```sql
=> SELECT LENGTH(keys), LENGTH(values) FROM (SELECT MAPITEMS(__raw__ USING PARAMETERS max_value_length=100000) OVER() FROM t1) x;
LENGTH | LENGTH
--------|--------
9       | 98899  
(1 row)
```

**Directly Query a Key Value in a VMap**

Review the following JSON input file, `simple.json`. In particular, notice the array called `three_Array`, and its four values:

```json
{
  "one": "one",
  "two": 2,
  "three_Array": [
    "three_One",
    "three_Two",
    3,
    "three_Four"
  ],
  "four": 4,
  "five_Map": {
    "five_One": 51,
    "five_Two": "Fifty-two",
    "five_Three": "fifty three",
    "five_Four": 54,
    "five_Five": "5 x 5"
  },
  "six": 6
}
```

1. Create a flex table, `mapper`:

```sql
=> CREATE FLEX TABLE mapper();
CREATE TABLE
```
2. Load simple.json into the flex table mapper:

```sql
=> COPY mapper FROM '/home/dbadmin/data/simple.json' parser fjsonparser (flatten_arrays=false, flatten_maps=false); Rows Loaded
--------------
 1
(1 row)
```

3. Call MAPKEYS on the flex table's __raw__ column to see the flex table's keys, but not the key submaps. The return values indicate three_Array as one of the virtual columns:

```sql
=> SELECT MAPKEYS(__raw__) OVER() FROM mapper;
   keys
--------------
     five_Map
     four
     one
     six
     three_Array
     two
(6 rows)
```

4. Call mapitems on flex table mapper with three_Array as a pass-through argument to the function. The call returns these array values:

```sql
=> SELECT __identity__, MAPITEMS(three_Array) OVER(PARTITION BY __identity__) FROM mapper;
   __identity__ | keys   | values
--------------+--------|--------
            1 | 0      | three_One
            1 | 1      | three_Two
            1 | 2      | 3
            1 | 3      | three_Four
(4 rows)
```

**MAPJSONEXTRACTOR**

Extracts content of repeated JSON data objects, including nested maps, or data with an outer list of JSON elements. The USING PARAMETERS phrase specifies optional parameters for the function. Empty input does not generate a Warning or Error.

**Syntax**

```sql
MAPJSONEXTRACTOR (record_value [USING PARAMETERS [flatten_maps=value] [,flatten_arrays = value,] [reject_on_duplicate = value,] [reject_on_empty_key = value,] [omit_empty_keys = value,] [start_point = value]])
```

**Arguments**

| record_value | VARCHAR | String containing a JSON or delimited format record on which the expression will be applied. |

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flatten_maps</td>
<td>BOOLEAN</td>
<td>[Optional] Flattens sub-maps within the JSON data, separating map levels with a period (.).</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Default value:</strong> true</td>
</tr>
<tr>
<td>flatten_arrays</td>
<td>BOOLEAN</td>
<td>[Optional] Converts lists to sub-maps with integer keys. Lists are not flattened by default.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Default value:</strong> false</td>
</tr>
<tr>
<td>reject_on</td>
<td>BOOLEAN</td>
<td>[Optional] Specifies whether to ignore duplicate records (false), or to reject duplicates (true). In either case, the</td>
</tr>
</tbody>
</table>
### Examples

These examples use the following sample JSON data:

```json
{
  "id": "5001", "type": "None"
}
{
  "id": "5002", "type": "Glazed"
}
{
  "id": "5005", "type": "Sugar"
}
{
  "id": "5007", "type": "Powdered Sugar"
}
{
  "id": "5004", "type": "Maple"
}
```

Save this example data as `bake_single.json`, and load that file.

1. Create a flex table, `flexjson`:

```sql
=> CREATE FLEX TABLE flexjson();
CREATE TABLE
```

2. Use `COPY` to load the `bake_single.json` file with the `fjsonparser` parser:

```sql
=> COPY flexjson FROM '/home/dbadmin/data/bake_single.json' parser fjsonparser();
Rows Loaded
----------
5
(1 row)
```
3. Create a columnar table, `coljson`, with an identity column (id), a json column, and a column to hold a VMap, called `vmap`:

```sql
=> CREATE TABLE coljson(id IDENTITY(1,1), json varchar(128), vmap long varbinary(10000));
```

4. Use COPY to load the `bake_single.json` file into the `coljson` table, using the `MapJSONExtractor` function:

```sql
=> COPY coljson (json, vmap AS MapJSONExtractor(json)) FROM '/home/dbadmin/data/bake_single.json';
Rows Loaded
-----------
 5
(1 row)
```

5. Use the `maptoString` function for the flex table `flexjson` to output the `__raw__` column contents as strings:

```sql
=> SELECT MAPTOSTRING(__raw__) FROM flexjson limit 5;

maptoString
-------------------------

{  
  "id" : "5001",
  "type" : "None"
}

{  
  "id" : "5002",
  "type" : "Glazed"
}

{  
  "id" : "5005",
  "type" : "Sugar"
}

{  
  "id" : "5007",
  "type" : "Powdered Sugar"
}

{  
  "id" : "5004",
  "type" : "Maple"
}

(5 rows)
```

6. Use the `maptoString` function again, this time with the `coljson` table's `vmap` column and compare the results. The element order differs:

```sql
=> SELECT MAPTOSTRING(vmap) FROM coljson limit 5;

maptoString
-------------------------

**MAPKEYS**

Returns the virtual columns (and values) present in any VMap data. This transform function requires an OVER(PARTITION BEST) clause.

**Syntax**

`MAPKEYS (VMap-data)`
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VMap-data</td>
<td>Any VMap data. The VMap can exist as:</td>
</tr>
<tr>
<td></td>
<td>- The <strong>raw</strong> column of a flex table</td>
</tr>
<tr>
<td></td>
<td>- Data returned from a map function such as MAPLOOKUP</td>
</tr>
<tr>
<td></td>
<td>- Other database content</td>
</tr>
<tr>
<td>max_key_length</td>
<td>In a <strong>raw</strong> column, specifies the maximum length of keys that the function can return. Keys that are longer than max_key_length cause the query to fail. Defaults to the smaller of VMap column length and 65K.</td>
</tr>
</tbody>
</table>

Examples

Determine Number of Virtual Columns in Map Data

This example shows how to create a query, using an over(PARTITION BEST) clause with a flex table, darkdata to find the number of virtual column in the map data. The table is populated with JSON tweet data.

```sql
=> SELECT COUNT(keys) FROM (SELECT MAPKEYS(darkdata.__raw__) OVER(PARTITION BEST) FROM darkdata) AS a;
   count
  -------
   550   
(1 row)
```

Query Ordered List of All Virtual Columns in the Map

This example shows a snippet of the return data when you query an ordered list of all virtual columns in the map data:

```sql
=> SELECT * FROM (SELECT MAPKEYS(darkdata.__raw__) OVER(PARTITION BEST) FROM darkdata) AS a;
   keys
--------------------------
 contributors
 coordinates
 created_at
 delete.status.id
 delete.status.id_str
 delete.status.user_id
```
delete.status.user_id_str
entities.hashtags
entities.media
entities.urls
entities.user_mentions
favorited
geo
id

user.statuses_count
user.time_zone
user.url
user.utc_offset
user.verified
(125 rows)

Specify the Maximum Length of Keys that MAPKEYS Can Return

=> SELECT MAPKEYS(__raw__ USING PARAMETERS max_key_length=100000) OVER() FROM mapper;

keys
-----------
five_Map
two
four
one
six
three_Array
(6 rows)

MAPKEYSINFO

Returns virtual column information from a given map. This transform function requires an OVER(PARTITION BEST) clause.

Syntax

MAPKEYSINFO (VMap-data)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VMap-data</td>
<td>Any VMap data. The VMap can exist as:</td>
</tr>
<tr>
<td></td>
<td>• The <strong>raw</strong> column of a flex table</td>
</tr>
<tr>
<td></td>
<td>• Data returned from a map function such as MAPLOOKUP</td>
</tr>
<tr>
<td></td>
<td>• Other database content</td>
</tr>
<tr>
<td>max_key_length</td>
<td>In a <strong>raw</strong> column, determines the maximum length of keys that</td>
</tr>
<tr>
<td></td>
<td>the function can return. Keys that are longer than max_key_length cause</td>
</tr>
<tr>
<td></td>
<td>the query to fail. Defaults to the smaller of VMap column length and 65K.</td>
</tr>
</tbody>
</table>

Returns

This function is a superset of the MAPKEYS() function. It returns the following information about each virtual column:

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>keys</td>
<td>The virtual column names in the raw data.</td>
</tr>
<tr>
<td>length</td>
<td>The data length of the key name, which can differ from the actual string length.</td>
</tr>
<tr>
<td>type_oid</td>
<td>The OID type into which the value should be converted. Currently, the type is always 116 for a LONG VARCHAR, or 199 for a nested map that is</td>
</tr>
<tr>
<td>Column</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>stored</td>
<td>as a LONG VARBINARY.</td>
</tr>
<tr>
<td>row_num</td>
<td>The number of rows in which the key was found.</td>
</tr>
<tr>
<td>field_num</td>
<td>The field number in which the key exists.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows a snippet of the return data you receive if you query an ordered list of all virtual columns in the map data:

```sql
=> SELECT * FROM (SELECT MAPKEYSINFO(darkdata.__raw__) OVER(PARTITION BEST) FROM darkdata) AS a;

<table>
<thead>
<tr>
<th></th>
<th>length</th>
<th>type_oid</th>
<th>row_num</th>
<th>field_num</th>
</tr>
</thead>
<tbody>
<tr>
<td>contributors</td>
<td>0</td>
<td>116</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>coordinates</td>
<td>0</td>
<td>116</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>created_at</td>
<td>30</td>
<td>116</td>
<td>1</td>
<td>2</td>
</tr>

<td>9</td>
</tr>
<tr>
<td>id_str</td>
<td>18</td>
<td>116</td>
<td>1</td>
<td>10</td>
</tr>
</tbody>
</table>

(550 rows)

**Specify the Maximum Length of Keys that MAPKEYSINFO Can Return**

```sql
=> SELECT MAPKEYSINFO(__raw__ USING PARAMETERS max_key_length=100000) OVER() FROM mapper;

```

<table>
<thead>
<tr>
<th></th>
<th>length</th>
<th>type_oid</th>
</tr>
</thead>
<tbody>
<tr>
<td>five_Map</td>
<td></td>
<td></td>
</tr>
<tr>
<td>four</td>
<td></td>
<td></td>
</tr>
<tr>
<td>one</td>
<td></td>
<td></td>
</tr>
<tr>
<td>six</td>
<td></td>
<td></td>
</tr>
<tr>
<td>three_Array</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**MAPLOOKUP**

Returns single-key values from VMAP data. This scalar function returns a LONG VARCHAR, with values, or NULL if the virtual column does not have a value.

Using maplookup is case insensitive to virtual column names. To avoid loading same-name values, set the fjsonparser parser reject_on_duplicate parameter to true when data loading.

You can control the behavior for non-scalar values in a VMAP (like arrays), when loading data with the fjsonparser or favroparser parsers and its flatten-arrays argument. See JSON Data and the FJSONPARSER reference.

For information about using maplookup() to access nested JSON data, see Querying Nested Data.

**Syntax**

```
MAPLOOKUP (VMap-data, 'virtual-column-name' [USING PARAMETERS [case_sensitive={false | true}] [, buffer_size=n} ]
```
## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VMap-data</strong></td>
<td>Any VMap data. The VMap can exist as:</td>
</tr>
<tr>
<td></td>
<td>- The <code>raw</code> column of a flex table</td>
</tr>
<tr>
<td></td>
<td>- Data returned from a map function such as <code>MAPLOOKUP</code></td>
</tr>
<tr>
<td><strong>virtual-column-name</strong></td>
<td>The name of the virtual column whose values this function returns.</td>
</tr>
<tr>
<td><strong>buffer_size</strong></td>
<td>[Optional parameter] Specifies the maximum length (in bytes) of each value returned for <code>virtual-column-name</code>. To return all values for <code>virtual-column-name</code>, specify a <code>buffer_size</code> equal to or greater than (=&gt;) the number of bytes for any returned value. Any returned values greater in length than <code>buffer_size</code> are rejected. Default value: 0 (No limit on <code>buffer_size</code>)</td>
</tr>
<tr>
<td><strong>case_sensitive</strong></td>
<td>[Optional parameter] Specifies whether to return values for <code>virtual-column-name</code> if keys with different cases exist.</td>
</tr>
</tbody>
</table>

### Examples

This example returns the values of one virtual column, `user.location`:

```sql
=> SELECT MAPLOOKUP(__raw__, 'user.location') FROM darkdata ORDER BY 1;
maplookup
----------
Chile
Nesnia
Uptown
.
.```

Vertica Analytic Database (11.0.x) Page 3572 of 6730
Using maplookup buffer_size

Use the buffer_size= parameter to indicate the maximum length of any value that maplookup returns for the virtual column you specify. If none of the returned key values can be greater than n bytes, use this parameter to allocate n bytes as the buffer_size.

For the next example, save this JSON data to a file, simple_name.json:

```json
{
   "name": "sierra",
   "age": "63",
   "eyes": "brown",
   "weapon": "doggie"
}
{
   "name": "janis",
   "age": "10",
   "eyes": "blue",
   "weapon": "humor"
}
{
   "name": "ben",
   "age": "43",
   "eyes": "blue",
   "weapon": "sword"
}
{
   "name": "jen",
   "age": "38",
   "eyes": "green",
   "weapon": "shopping"
}
```

1. Create a flex table, logs.
2. Load the simple_name.json data into logs, using the fjsonparser. Specify the flatten_arrays option as True:

   ```sql
   => COPY logs FROM '/home/dbadmin/data/simple_name.json'
       PARSER fjsonparser(flatten_arrays=True);
   ```

3. Use maplookup with buffer_size=0 for the logs table name key. This query returns all of the values:

   ```sql
   => SELECT MAPLOOKUP(_raw_, 'name' USING PARAMETERS buffer_size=0) FROM logs;
   MapLookup
   -----------
   sierra
   ben
   janis
   jen
   ```
4. Next, call `maplookup()` three times, specifying the `buffer_size` parameter as 3, 5, and 6, respectively. Now, `maplookup()` returns values with a byte length less than or equal to `(<=)` `buffer_size`:

```sql
=> SELECT MAPLOOKUP(_raw__, 'name' USING PARAMETERS buffer_size=3) FROM logs;
MapLookup
---------
ben
jen
(4 rows)
=> SELECT MAPLOOKUP(_raw__, 'name' USING PARAMETERS buffer_size=5) FROM logs;
MapLookup
---------
janis
jen
ben
(4 rows)
=> SELECT MAPLOOKUP(_raw__, 'name' USING PARAMETERS buffer_size=6) FROM logs;
MapLookup
---------
sierra
janis
jen
ben
(4 rows)
```

**Disambiguate Empty Output Rows**

This example shows how to interpret empty rows. Using `maplookup` without first checking whether a key exists can be ambiguous. When you review the following output, 12 empty rows, you cannot determine whether a `user.location` key has:

- A non-NULL value
- A NULL value
- No value

```sql
=> SELECT MAPLOOKUP(_raw__, 'user.location') FROM darkdata;
maplookup
---------
```
To disambiguate empty output rows, use the mapcontainskey() function in conjunction with maplookup(). When maplookup returns an empty field, the corresponding value from mapcontainskey indicates t for a NULL or other value, or f for no value.

The following example output using both functions lists rows with NULL or a name value as t, and rows with no value as f:

```sql
=> SELECT MAPLOOKUP(__raw__, 'user.location'), MAPCONTAINSKEY(__raw__, 'user.location')
FROM darkdata ORDER BY 1;
maplookup | mapcontainskey
----------|-------------------
    |      
 t | t
 t | t
 t | t
    |      
 Chile | t
 Nesnia | t
 Uptown | t
   |      
   | >>>>>>>>No value
   | >>>>>>>>No value
   | >>>>>>>>No value
   | >>>>>>>>No value
   |      
   |      
(12 rows)
```

Check for Case-Sensitive Virtual Columns

You can use maplookup() with the case_sensitive parameter to return results when key names with different cases exist.

1. Save the following sample content as a JSON file. This example saves the file as repeated_key_name.json:

```json
{
    "test": "lower1"
}
{
    "TEST": "upper1"
}
{
    "TEst": "half1"
}
{
    "test": "lower2",
    "TEst": "half2"
}
{
    "TEST": "upper2",
    "TEst": "half3"
}
```
2. Create a flex table, dupe, and load the JSON file:

```sql
=> CREATE FLEX TABLE dupe();
CREATE TABLE dbt=> COPY dupe FROM '/home/release/KData/repeated_key_name.json' parser fjsonparser();
Rows Loaded
---------------
 8
(1 row)
```

- MAPVERSION
**MAPPUT**

Accepts a VMap and one or more key/value pairs and returns a new VMap with the key/value pairs added. Keys must be set using the auxiliary function `SetMapKeys()`, and can only be constant strings. If the VMap has any of the new input keys, then the original values are replaced by the new ones.

**Syntax**

```
MAPPUT (VMap-data, value[,...]) USING PARAMETERS keys=SetMapKeys('key'[,...])
```

**Arguments**

<table>
<thead>
<tr>
<th><strong>VMap-data</strong></th>
<th>Any VMap data. The VMap can exist as:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• The <strong>raw</strong> column of a flex table</td>
</tr>
<tr>
<td></td>
<td>• Data returned from a map function such as <code>MAPLOOKUP</code>.</td>
</tr>
<tr>
<td></td>
<td>• Other database content</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>VMap-data</strong></th>
<th>Any VMap data. The VMap can exist as:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• The <strong>raw</strong> column of a flex table</td>
</tr>
<tr>
<td></td>
<td>• Data returned from a map function such as <code>MAPLOOKUP</code>.</td>
</tr>
<tr>
<td></td>
<td>• Other database content</td>
</tr>
</tbody>
</table>

| **value[,...]** | One or more values to add to the VMap specified in VMap-data. |

**Parameters**

| **keys** | The result of `SetMapKeys()`. `SetMapKeys()` takes one or more constant string arguments. |

The following example shows how to create a flex table and use COPY to enter some basic JSON data. After creating a second flex table (`vmapdata2`), insert the new vmap results from `mapput()`, with additional key/value pairs.
1. Create sample table:

```sql
=> CREATE FLEX TABLE vmapdata1();
CREATE TABLE
```

2. Load sample JSON data from STDIN:

```sql
=> COPY vmapdata1 FROM stdin parser fjsonparser();
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> {"aaa":1, "bbb": 2, "ccc": 3}
>> \.
```

3. Create another flex table and use the function to insert data into it:

```sql
=> CREATE FLEX TABLE vmapdata2();
=> INSERT INTO vmapdata2 SELECT MAPPUT(_raw_, '7','8','9'
   using parameters keys=SetMapKeys('xxx','yyy','zzz')) from vmapdata1;
```

4. View the difference between the original and the new flex tables:

```sql
=> SELECT MAPTOSTRING(_raw_) FROM vmapdata1;
maptostring
-----------------------------------------------
{  "aaa" : "1",
   "bbb" : "2",
   "ccc" : "3"
}
(1 row)

=> SELECT MAPTOSTRING(_raw_) from vmapdata2;
maptostring
-----------------------------------------------
{  "mapput" : {
      "aaa" : "1",
      "bbb" : "2",
      "ccc" : "3",
      "xxx" : "7",
      "yyy" : "8",
      "zzz" : "9"
   }
}
```

**See Also**

- MAPAGGREGATE
MAPREGEXEXTRACTOR

Extracts data from a regular expression and returns the results as a VMap. Use the USING PARAMETERS pattern= phrase, followed by the regular expression.

Syntax

MAPREGEXEXTRACTOR (record_value USING PARAMETERS pattern = phrase
[,use_jit = value,]
[record_terminator = value,]
[logline_column = value])

Arguments

| record_value | VARCHAR   | String containing a JSON or delimited format record on which the expression will be applied. |

Parameters

| pattern=    | VARCHAR   | The regular expression as a string.  
|             |           | Default value: An empty string (""). |
| use_jit     | BOOLEAN   | [Optional] Uses just-in-time compiling when parsing the regular expression. |
Default value: false.

| record_terminator | VARCHAR | [Optional] The character used to separate input records. Default value: 

| logline_column | VARCHAR | [Optional] The destination column containing the full string that the regular expression matched. Default value: An empty string (" ").

Examples

These examples use the following regular expression, which searches for information that includes the timestamp, date, thread_name, and thread_id strings.

Caution: For display purposes, this sample regular expression adds new line characters to split long lines of text. To use this expression in a query, first copy and edit the example to remove any new line characters.

This example expression loads any thread_id hex value, regardless of whether it has a 0x prefix, (<thread_id>(?::0x)?[0-9a-f]+).

```
'^(?<time>\d{4}-\d{2}-\d{2}\s\d{2}:\d{2}:\d{2}\.\d+)(?<thread_name>[A-Za-z ]+):(?<thread_id>(?:0x)?[0-9a-f]+)
-(?<transaction_id>[0-9a-f])\{|\{(?<component>\w+)\)}
\{(?<level>\w+)}> ?(?:<(?<level>\w+)> @(?:<enode>\w+)>?: )
(?<text>.*')
```

The following examples may include newline characters for display purposes.

1. Create a flex table, flogs:

```sql
=> CREATE FLEX TABLE flogs();
CREATE TABLE
```

2. Use COPY to load a sample log file (vertica.log), using the flex table fregexparser. Note that this example includes added line characters for displaying long text lines.

```sql
=> COPY flogs FROM '/home/dbadmin/tempdat/vertica.log' PARSER FREGEXPARSER(pattern= '
'^(?<time>\d{4}-\d{2}-\d{2}\s\d{2}:\d{2}:\d{2}\.\d+)(?<thread_name>[A-Za-z ]+):
(?<thread_id>(?:0x)?[0-9a-f]+)-(?<transaction_id>[0-9a-f])\{|\{(?<component>\w+)\)}
\{(?<level>\w+)}> ?(?:<(?<level>\w+)> @(?:<enode>\w+)>?: )
(?<text>.*')
Rows Loaded
```
3. Use MapToString to return the results from calling MapRegexExtractor with a regular expression. The output returns the results of the function in string format.

```sql
=> SELECT MAPTOSTRING(MapregexExtractor(E'2014-04-02 04:02:51.011
TM Moveout:0x2aab9000f860-a000000002067 [Txn] <INFO>
Begin Txn: a0000000002067 'Moveout: Tuple Mover'' using PARAMETERS
pattern='^(?<time>\d\d\d-\d\d-\d\d \d\d:\d\d:\d\d.\d+)(?<thread_name>[A-Za-z ]+:(?<thread_id>\?:\d)(?:0-9a-f+)\n-?\(<?transaction_id>\[0-9a-f]\)\(?:\[<component>\w+\]\)\{(<?level>\w+)\}\(<?elevel>\w+)\ @\[<?enode>\w+]\)?\}(<?text>.*')) FROM flogs where __identity__=13;
maptostring

{ "component": "Txn",
  "level": "INFO",
  "text": "Begin Txn: a0000000002067 'Moveout: Tuple Mover'",
  "thread_id": "0x2aab9000f860",
  "thread_name": "TM Moveout",
  "time": "2014-04-02 04:02:51.011",
  "transaction_id": "a0000000002067"
}
(1 row)
```

- MAPJSONEXTRACTOR

**MAPSIZE**

Returns the number of virtual columns present in any VMap data. Use this scalar function to determine the size of keys.

**Syntax**

`MAPSIZE (VMap-data)`
Arguments

<table>
<thead>
<tr>
<th>VMap-data</th>
<th>Any VMap data. The VMap can exist as:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• The <strong>raw</strong> column of a flex table</td>
</tr>
<tr>
<td></td>
<td>• Data returned from a map function such as MAPLOOKUP</td>
</tr>
<tr>
<td></td>
<td>• Other database content</td>
</tr>
</tbody>
</table>

Examples

This example shows the returned sizes from the number of keys in the flex table darkmountain:

```sql
=> SELECT MAPSIZE(__raw__) FROM darkmountain;
    mapsize
    -------
       3
       4
       4
       4
       4
(5 rows)
```

**MAPTOSTRING**

Recursively builds a string representation VMap data, including nested JSON maps. Use this transform function to display the VMap contents in a readable LONG VARCHAR format. Use maptostring to see how map data is nested before querying virtual columns with mapvalues().

**Syntax**

```sql
MAPTOSTRING ( VMap-data [ USING PARAMETERS canonical_json={true | false} ] )
```

**Arguments**

<table>
<thead>
<tr>
<th>VMap-data</th>
<th>Any VMap data. The VMap can exist as:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• The <strong>raw</strong> column of a flex table</td>
</tr>
<tr>
<td></td>
<td>• Data returned from a map function such as MAPLOOKUP</td>
</tr>
<tr>
<td></td>
<td>• Other database content</td>
</tr>
</tbody>
</table>

**Parameters**

<table>
<thead>
<tr>
<th>canonical_json</th>
<th>=bool [Optional parameter]</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Produces canonical JSON output by default, using the first instance of any duplicate keys in the map data.</td>
</tr>
<tr>
<td></td>
<td>Use this parameter as other UDF parameters, preceded by using parameters, as shown in the examples. Setting this argument to false maintains the previous behavior of maptostring() and returns same-name keys and their values.</td>
</tr>
<tr>
<td></td>
<td>Default value: canonical-json=true</td>
</tr>
</tbody>
</table>

Examples

The following example shows how to create a sample flex table, darkdata, and load JSON data from STDIN. By calling maptostring() twice with both values for the canonical_json parameter, you can see the different results on the flex table __raw__ column data.

1. Create sample table:

```sql
=> CREATE FLEX TABLE darkdata();
```

2. Load sample JSON data from STDIN:

```sql
=> COPY darkdata FROM stdin parser fjsonparser();
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> {"aaa": 1, "aaa": 2, "AAA": 3, "bbb": "aaa\"bbb"}
>> .
```

3. Call maptostring() with its default behavior using canonical JSON output, and then review the flex table contents. The function returns the first duplicate key and its value ("aaa": "1") but omits remaining duplicate keys ("aaa": "2"):

```sql
=> SELECT MAPTOSTRING (__raw__) FROM darkdata;
```

```
<table>
<thead>
<tr>
<th>maptostring</th>
</tr>
</thead>
<tbody>
<tr>
<td>{</td>
</tr>
</tbody>
</table>
|   "AAA" : "3",
|   "aaa" : "1",
|   "bbb" : "aaa\"bbb"
| }           |
| (1 row)     |
```

4. Next, call maptostring() with using parameters canonical_json=false). This time, the function returns the first duplicate keys and their values:

```sql
=> SELECT MAPTOSTRING(__raw__ using parameters canonical_json=false) FROM darkdata;
```

```
<table>
<thead>
<tr>
<th>maptostring</th>
</tr>
</thead>
<tbody>
<tr>
<td>{</td>
</tr>
</tbody>
</table>
|   "aaa": "1",
|   "aaa": "2",
|   "AAA": "3",
|   "bbb": "aaa"bbb"
| }           |
| (1 row)     |
```

**MAPVALUES**

Returns a string representation of the top-level values from a VMap. This transform function requires an OVER() clause.

**Syntax**

\[ \text{MAPVALUES}(\text{VMap-data}) \]

**Arguments**

<table>
<thead>
<tr>
<th><strong>VMap-data</strong></th>
<th>Any VMap data. The VMap can exist as:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- The <strong>raw</strong> column of a flex table</td>
</tr>
<tr>
<td></td>
<td>- Data returned from a map function such as MAPLOOKUP</td>
</tr>
<tr>
<td></td>
<td>- Other database content</td>
</tr>
</tbody>
</table>

| **max_value_length** | In a __raw__ column, specifies the maximum length of values the function can return. Values that are larger than max_value_length cause the query to fail. Defaults to the smaller of VMap column length and 65K. |
Examples

The following example shows how to query a darkmountain flex table, using an over() clause (in this case, the over(PARTITION BEST) clause) with mapvalues().

```sql
=> SELECT * FROM (SELECT MAPVALUES(darkmountain.__raw__) OVER(PARTITION BEST) FROM darkmountain) AS a;
  values
  29029
  34.1
  Everest
  mountain
  29029
  15.4
  Mt St Helens
  volcano
  17000
  12.2
  Denali
  mountain
  14000
  22.8
  Kilimanjaro
  mountain
  50.6
  Mt Washington
  mountain
(19 rows)
```

Specify the Maximum Length of Values that MAPVALUES Can Return

```sql
=> SELECT MAPVALUES(__raw__ USING PARAMETERS max_value_length=100000) OVER() FROM mapper;
  keys
  five_Map
  four
  one
  six
  three_Array
  two
(6 rows)
```

See Also

- EMPTYMAP
- MAPAGGREGATE
- MAPCONTAINSKEY
MAPVERSION

Returns the version or invalidity of any map data. This scalar function returns the map version (such as 1) or -1, if the map data is invalid.

Syntax

MAPVERSION (VMap-data)

Arguments

<table>
<thead>
<tr>
<th>VMap-data</th>
<th>Any VMap data. The VMap can exist as:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- The <strong>raw</strong> column of a flex table</td>
</tr>
<tr>
<td></td>
<td>- Data returned from a map function such as MAPLOOKUP</td>
</tr>
<tr>
<td></td>
<td>- Other database content</td>
</tr>
</tbody>
</table>

Examples

The following example shows how to use mapversion() with the darkmountainflex table, returning mapversion 1 for the flex table map data:

```
=> SELECT MAPVERSION(__raw__) FROM darkmountain;
mapversion
--------
1
```

**MATERIALIZE_FLEXTABLE_COLUMNS**

Materializes virtual columns listed as *key_names* in the *flextable_keys* table you compute using either `COMPUTE_FLEXTABLE_KEYS` or `COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW`.

**Note:**
Each column that you materialize with this function counts against the data storage limit of your license. To check your Vertica license compliance, call the `AUDIT()` or `AUDIT_FLEX()` functions.

**Syntax**

```
MATERIALIZE_FLEXTABLE_COLUMNS ("[[database.schema.]flex-table]", n-columns [, keys-table-name])
```
## Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than <code>public</code>, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>flex-table</code></td>
<td>The name of the flex table with columns to materialize. Specifying only the flex table name attempts to materialize up to 50 columns of key names in the default <code>flex_table_keys</code> table. When you use this argument, the function: Skips any columns already materialized Ignores any empty keys To materialize a specific number of columns, use the optional parameter <code>n_columns</code>, described next.</td>
</tr>
<tr>
<td><code>n-columns</code></td>
<td>The number of columns to materialize, up to 9800. The function attempts to materialize the number of columns from the <code>flex_table_keys</code> table, skipping any columns already materialized. It orders the materialized results by frequency, descending, <code>key_name</code> when materializing the first <code>n</code> columns.</td>
</tr>
<tr>
<td><code>keys-table-name</code></td>
<td>The name of a flex_keys_table from which to materialize columns. The function: Materializes the number of columns (value of <code>n-columns</code>) from <code>keys-table-name</code> Skips any columns already materialized Orders the materialized results by frequency, descending, <code>key_name</code> when materializing the first <code>n</code> columns.</td>
</tr>
</tbody>
</table>
Examples

The following example shows how to call MATERIALIZE_FLEXTABLE_COLUMNS to materialize columns. First, load a sample file of tweets (tweets_10000.json) into the flex table twitter_r.

After loading data and computing keys for the sample flex table, call materialize_flextable_columns to materialize the first four columns:

```sql
=> COPY twitter_r FROM '/home/release/KData/tweets_10000.json' parser jsonparser();
Rows Loaded
----------
10000
(1 row)
=> SELECT compute_flextable_keys ('twitter_r');
compute_flextable_keys
-----------------------------------
Please see public.twitter_r_keys for updated keys
(1 row)
=> select materialize_flextable_columns('twitter_r', 4);
materialize_flextable_columns
-----------------------------------
The following columns were added to the table public.twitter_r:
  contributors
  entities.hashtags
  entities.urls
For more details, run the following query:
SELECT * FROM v_catalog.materialize_flextable_columns_results WHERE table_schema = 'public' and table_name = 'twitter_r';
(1 row)
```

The last message in the example recommends querying system table MATERIALIZE_FLEXTABLE_COLUMNS_RESULTS for the results of materializing the columns, as shown:

```sql
=> SELECT * FROM v_catalog.materialize_flextable_columns_results WHERE table_schema = 'public' and table_name = 'twitter_r';
  table_id | table_schema | table_name | creation_time | key_name
----------|--------------|------------|---------------|---------
4583596273733172 | public | twitter_r | 2013-11-20 17:00:27.945484-05 | contributors
ADDED | Added successfully
4583596273733172 | public | twitter_r | 2013-11-20 17:00:27.945510-05 | entities.hashtags
ADDED | Added successfully
4583596273733172 | public | twitter_r | 2013-11-20 17:00:27.945519-05 | entities.urls
ADDED | Added successfully
4583596273733172 | public | twitter_r | 2013-11-20 17:00:27.945532-05 | created_at
EXISTS | Column of same name already
(4 rows)
```
See Also

- COMPUTE_FLEXTABLE.Keys
- COMPUTE_FLEXTABLE.Keys_AND_BUILD_VIEW
- RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW

RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW

Restores the _keys table and the _view. The function also links the _keys table with its associated flex table, in cases where either table is dropped. The function also indicates whether it restored one or both objects.

Syntax

RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW ('flex-table')

Arguments

flex-table | Name of a flex table

Examples

This example shows how to invoke this function with an existing flex table, restoring both the _keys table and _view:

```sql
=> SELECT RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW('darkdata');
RESTORE_FLEXTABLE_DEFAULT.Keys_TABLE_AND_VIEW
-----------------------------
The keys table public.darkdata_keys was restored successfully.
The view public.darkdata_view was restored successfully.
(1 row)
```

This example illustrates that the function restored darkdata_view, but that darkdata_keys did not need restoring:
The keys table public.darkdata_keys already exists and is linked to darkdata. The view public.darkdata_view was restored successfully.

After restoring the _keys table, there is no content. To populate the flex keys, call the COMPUTE_FLEXTABLE_KEYS meta function.

<table>
<thead>
<tr>
<th>key_name</th>
<th>frequency</th>
<th>data_type_guess</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(0 rows)

Hadoop Functions

This section contains functions to manage interactions with Hadoop.

**CLEAR_HDFS_CACHES**

Clears the configuration information copied from HDFS and any cached connections.

This function affects reads using the hdfs scheme in the following ways:

- This function flushes information loaded from configuration files copied from Hadoop (such as core-site.xml). These files are found on the path set by the HadoopConfDir configuration parameter.
- This function flushes information about which NameNode is active in a High Availability (HA) Hadoop cluster. Therefore, the first request to Hadoop after calling this function is slower than expected.
Vertica maintains a cache of open connections to NameNodes to reduce latency. This function flushes that cache.

**Syntax**

```
CLEAR_HDFS_CACHES()
```

**Privileges**

Superuser

**Example**

The following example clears the Hadoop configuration information:

```sql
=> SELECT CLEAR_HDFS_CACHES();

\n  CLEAR_HDFS_CACHES
----------------
     Cleared

(1 row)
```

**See Also**

Apache Hadoop Parameters

**EXTERNAL_CONFIG_CHECK**

Tests the Hadoop configuration of a Vertica cluster. This function tests HDFS configuration files, HCatalog Connector configuration, and Kerberos configuration.

This function calls the following functions:

- `KERBEROS_CONFIG_CHECK`
- `HADOOP_IMPERSONATION_CONFIG_CHECK`
- `HDFS_CLUSTER_CONFIG_CHECK`
- `HCATALOGCONNECTOR_CONFIG_CHECK`
If you call this function with an argument, it passes the argument to functions it calls that also take an argument.

**Syntax**

```sql
EXTERNAL_CONFIG_CHECK(["what_to_test"])
```

**Arguments**

| `what_to_test` | A string specifying the authorities, nameservices, and/or HCatalog schemas to test. The format is a comma-separated list of "key=value" pairs, where keys are "authority", "nameservice", and "schema". The value is passed to all of the sub-functions; see those reference pages for details on how values are interpreted. |

**Privileges**

This function does not require privileges.

**Examples**

The following example tests the configuration of only the nameservice named "ns1". Output has been omitted due to length.

```sql
=> SELECT EXTERNAL_CONFIG_CHECK('nameservice=ns1');
```

**GET_METADATA**

Returns the metadata of a Parquet file. Metadata includes the number and sizes of row groups, column names, and information about chunks and compression. Metadata is returned as JSON.

This function inspects one file. Parquet data usually spans many files in a single directory; choose one. The function does not accept a directory name as an argument.
Syntax

GET_METADATA( 'filename' )

Arguments

| filename | The name of a Parquet file. Any path that is valid for COPY is valid for this function. This function does not operate on files in other formats. |

Privileges

Superuser, or non-superuser with READ privileges on the USER-accessible storage location (see GRANT (Storage Location)).

Examples

In the following example, the "employees" directory contains many Parquet files containing data for a single table.

```sql
=> SELECT GET_METADATA('/data/employees/000000_0');

GET_METADATA

- schema:
  message spark_schema {
    optional int32 employeeID;
    optional group personal {
      optional binary name (String);
      optional group address {
        optional binary street (String);
        optional binary city (String);
        optional int32 zipcode;
      }
      optional int32 taxID;
    }
    optional binary department (String);
  }

metadata:
{
  "FileName": "/data/employees/000000_0",
```
"FileFormat": "Parquet",
"Version": "1.0",
"CreatedBy": "parquet-mr version 1.10.1 (build a89df8f9932b6ef6633d06069e50c9b7970bebd1)",

  ]
]
**HADOOP_IMPERSONATION_CONFIG_CHECK**

Reports the delegation tokens Vertica will use when accessing Kerberized data in HDFS. The HadoopImpersonationConfig configuration parameter specifies one or more authorities, nameservices, and HCatalog schemas and their associated tokens. For each tested value, the function reports what doAs user or delegation token Vertica will use for access. Use this function to confirm that you have defined your delegation tokens as you intended.

You can call this function with an argument to specify the authority, nameservice, or HCatalog schema to test, or without arguments to test all configured values.

This function does not check that you can use these delegation tokens to access HDFS.

See [Proxy Users and Delegation Tokens](#) for more about impersonation.

**Syntax**

```
HADOOP_IMPERSONATION_CONFIG_CHECK( ['what_to_test' ] )
```

**Arguments**

| **what_to_test** | A string specifying the authorities, nameservices, and/or HCatalog schemas to test. For example, a value of 'nameservice=ns1' means the function tests only access to the nameservice "ns1" and ignores any other authorities and schemas. A value of 'nameservice=ns1, schema=hcat1' means the function tests one nameservice and one HCatalog schema. If you do not specify this argument, the function tests all authorities, nameservices, and schemas defined in HadoopImpersonationConfig. |

**Privileges**

This function does not require privileges.
**Examples**

Consider the following definition of HadoopImpersonationConfig:

```json
[{
   "nameservice": "ns1",
   "token": "RANDOM-TOKEN-STRING"
}, {
   "nameservice": "*",
   "doAs": "Paul"
}, {
   "schema": "hcat1",
   "doAs": "Fred"
}]
```

The following query tests only the "ns1" name service:

```sql
=> SELECT HADOOP_IMPERSONATION_CONFIG_CHECK('nameservice=ns1');
-- hadoop_impersonation_config_check --
Connections to nameservice [ns1] will use a delegation token with hash [b3dd9e71cd695d91]
```

This function returns a hash of the token for security reasons. You can call `HASH_EXTERNAL_TOKEN` with the expected value and compare that hash to the one in this function's output.

A query with no argument tests all values:

```sql
=> SELECT HADOOP_IMPERSONATION_CONFIG_CHECK();
-- hadoop_impersonation_config_check --
Connections to nameservice [ns1] will use a delegation token with hash [b3dd9e71cd695d91]
JDBC connections for HCatalog schema [hcat1] will doAs [Fred]
[1] hadoop_impersonation_config_check : [PASS]
```

### HASH_EXTERNAL_TOKEN

Returns a hash of a string token, for use with `HADOOP_IMPERSONATION_CONFIG_CHECK`. Call `HASH_EXTERNAL_TOKEN` with the delegation token you expect Vertica to use and compare it to the hash in the output of `HADOOP_IMPERSONATION_CONFIG_CHECK`. 

Syntax

```
HASHEXTERNAL_TOKEN('token')
```

Arguments

| token | A string specifying the token to hash. The token is configured in the HadoopImpersonationConfig parameter. |

Privileges

This function does not require privileges.

Examples

The following query tests the expected value shown in the example on the `HADOOP_IMPERSONATION_CONFIG_CHECK` reference page.

```
=> SELECT HASHEXTERNAL_TOKEN('RANDOM-TOKEN-STRING');
hash_external_token
--------------------
b3dd9e71cd695d91
(1 row)
```

**HCATALOGCONNECTOR_CONFIG_CHECK**

Tests the configuration of a Vertica cluster that uses the HCatalog Connector to access Hive data. The function first verifies that the HCatalog Connector is properly installed and reports on the values of several related configuration parameters. It then tests the connection using HiveServer2. This function does not support the WebHCat server.

If you specify an HCatalog schema, and if you have defined a delegation token for that schema, this function uses the delegation token. Otherwise, the function uses the default endpoint without a delegation token.

See Proxy Users and Delegation Tokens for more about delegation tokens.
### Syntax

`HCATALOGCONNECTOR_CONFIG_CHECK(["what_to_test"] )`

### Arguments

| `what_to_test` | A string specifying the HCatalog schemas to test. For example, a value of 'schema=hcat1' means the function tests only the "hcat1" schema and ignores any others that are found. |

### Privileges

This function does not require privileges.

### Examples

The following query tests with the default endpoint and no delegation token:

```sql
=> SELECT HCATALOGCONNECTOR_CONFIG_CHECK();
-- hcatalogconnector_config_check --
    HCatalogConnectorUseHiveServer2 : [1]
    EnableHCatImpersonation : [1]
    HCatalogConnectorUseORCReader : [1]
    HCatalogConnectorUseParquetReader : [1]
    HCatalogConnectorUseTxtReader : [0]
[INFO] Vertica is not configured to use its internal parsers for delimited files.
[INFO] This is off by default, but will be changed in a future release.
    HCatalogConnectorUseLibHDFSPP : [1]

[OK] HCatalog connector library is properly installed.
[INFO] Creating JDBC connection as session user.
[OK] Successful JDBC connection to HiveServer2 as user [USER].
[!] hcatalogconnector_config_check : [PASS]
```

To test with the configured delegation token, pass the schema as an argument:

```sql
=> SELECT HCATALOGCONNECTOR_CONFIG_CHECK('schema=hcat1');
```
**HDFS_CLUSTER_CONFIG_CHECK**

Tests the configuration of a Vertica cluster that uses HDFS. The function scans the Hadoop configuration files found in HadoopConfDir and performs configuration checks on each cluster it finds. If you have more than one cluster configured, you can specify which one to test instead of testing all of them.

For each Hadoop cluster, it reports properties including:

- Nameservice name and associated NameNodes
- High-availability status
- RPC encryption status
- Kerberos authentication status
- HTTP(S) status

It then tests connections using http(s), hdfs, and webhdfs URL schemes. It tests the latter two using both the Vertica and session user.

See Configuring HDFS Access for information about configuration files and HadoopConfDir.

**Syntax**

```
HDFS_CLUSTER_CONFIG_CHECK( ['what_to_test'] )
```

**Arguments**

| what_to_test | A string specifying the authorities or nameservices to test. For example, a value of 'nameservice=ns1' means the function tests only "ns1" cluster. If you specify both an authority and a nameservice, the authority must be a NameNode in the specified nameservice for the check to pass. If you do not specify this argument, the function tests all cluster configurations found in HadoopConfDir. |

**Privileges**

This function does not require privileges.
Examples

The following example tests all clusters.

```sql
=> SELECT HDFS_CLUSTER_CONFIG_CHECK();

-- hdfs_cluster_config_check --

    Hadoop Conf Path : [/conf/hadoop_conf]
    [OK] HadoopConfDir verified on all nodes
    Connection Timeout (seconds) : [60]
    Token Refresh Frequency (seconds) : [0]
    HadoopFSBlockSizeBytes (MiB) : [64]

------------------------ Cluster 1 ------------------------

    Is DefaultFS : [true]
    Nameservice  : [vmns]
    Namenodes    : [node1.example.com:8020, node2.example.com:8020]
    High Availability : [true]
    RPC Encryption  : [false]
    Kerberos Authentication : [true]
    HTTPS Only  : [false]

    [INFO] Checking connections to [hdfs:///]
       vertica : [OK]
       dbuser  : [OK]

    [INFO] Checking connections to [http://node1.example.com:50070]
    [INFO] Node is in standby
    [INFO] Checking connections to [http://node2.example.com:50070]
    [OK] Can make authenticated external curl connection
    [INFO] Checking webhdfs
       vertica : [OK]
       USER    : [OK]

    [!] hdfs_cluster_config_check : [PASS]
```

**KERBEROS_HDFS_CONFIG_CHECK**

⚠️ **Deprecated:**
This function is deprecated and will be removed in a future release.
Instead, use `EXTERNAL_CONFIG_CHECK`.

Tests the Kerberos configuration of a Vertica cluster that uses HDFS. The function succeeds if it can use both the Vertica keytab file and the session user to access HDFS, and reports errors otherwise. This function is a more specific version of `KERBEROS_CONFIG_CHECK`. 
If the current session is not Kerberized, this function will not be able to use secured HDFS connections and will fail.

You can call this function with arguments to specify an HDFS configuration to test, or without arguments. If you call it with no arguments, this function reads the HDFS configuration files and fails if it does not find them. See Configuring HDFS Access. If it finds configuration files, it tests all configured nameservices.

The function performs the following tests, in order:

- Are Kerberos services available?
- Does a keytab file exist and are the Kerberos and HDFS configuration parameters set in the database?
- Can Vertica read and invoke `kinit` with the keys to authenticate to HDFS and obtain the database Kerberos ticket?
- Can Vertica perform `hdfs` and `webhdfs` operations using both the database Kerberos ticket and user-forwardable tickets for the current session?
- Can Vertica connect to HiveServer2? (This function does not support WebHCat.)

If any test fails, the function returns a descriptive error message.

**Syntax**

```
KERBEROS_HDFS_CONFIG_CHECK( [ 'hdfsHost:hdfsPort', 'webhdfsHost:webhdfsPort', 'webhcatHost' ] )
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>hdfsHost</code>, <code>hdfsPort</code></td>
<td>The hostname or IP address and port of the HDFS NameNode. Vertica uses this server to access data that is specified with <code>hdfs</code> URLs. If the value is empty, the function skips this part of the check.</td>
</tr>
<tr>
<td><code>webhdfsHost</code>, <code>webhdfsPort</code></td>
<td>The hostname or IP address and port of the WebHDFS server. Vertica uses this server to access data that is specified with <code>webhdfs</code> URLs. If the value is empty, the function skips this part of the check.</td>
</tr>
<tr>
<td><code>webhcatHost</code></td>
<td>Pass any value in this position. WebHCat is deprecated and this value is ignored but must be present.</td>
</tr>
</tbody>
</table>
Privileges

This function does not require privileges.

SYNC_WITH_HCATALOG_SCHEMA

Copies the structure of a Hive database schema available through the HCatalog Connector to a Vertica schema. If the HCatalog schema and the target Vertica schema have matching table names, SYNC_WITH_HCATALOG_SCHEMA overwrites the Vertica tables.

This function can synchronize the HCatalog schema directly. In this case, call it with the same schema name for the vertica_schema and hcatalog_schema parameters. The function can also synchronize a different schema to the HCatalog schema.

If you change the settings of HCatalog Connector configuration parameters, you must call this function again.

Syntax

SYNC_WITH_HCATALOG_SCHEMA( vertica_schema, hcatalog_schema, [drop_non_existent] )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vertica_schema</td>
<td>The target Vertica schema to store the copied HCatalog schema's metadata. This can be the same schema as hcatalog_schema, or it can be a separate one created with CREATE SCHEMA.</td>
</tr>
<tr>
<td>Caution:</td>
<td>Do not use the Vertica schema to store other data.</td>
</tr>
<tr>
<td>hcatalog_schema</td>
<td>The HCatalog schema to copy, created with CREATE HCATALOG SCHEMA</td>
</tr>
<tr>
<td>drop_non_existent</td>
<td>If true, drop any tables in vertica_schema that do not correspond to a table in hcatalog_schema</td>
</tr>
</tbody>
</table>
Privileges

Non-superuser: CREATE privileges on `vertica_schema`.

Users also require access to Hive data, one of the following:

- USAGE permissions on `hcat_schema`, if Hive does not use an authorization service to manage access.
- Permission through an authorization service (Sentry or Ranger), and access to the underlying files in HDFS. (Sentry can provide that access through ACL synchronization.)
- `dbadmin` user privileges, with or without an authorization service.

Data Type Matching

Hive STRING and BINARY data types are matched, in Vertica, to the VARCHAR(65000) and VARBINARY(65000) types. Adjust the data types with `ALTER TABLE` as needed after creating the schema. The maximum size of a VARCHAR or VARBINARY in Vertica is 65000, but you can use LONG VARCHAR and LONG VARBINARY to specify larger values.

Hive and Vertica define string length in different ways. In Hive the length is the number of characters; in Vertica it is the number of bytes. Thus, a character encoding that uses more than one byte, such as Unicode, can cause mismatches between the two. To avoid data truncation, set values in Vertica based on bytes, not characters.

If data size exceeds the column size, Vertica logs an event at read time in the QUERY_EVENTS system table.

Examples

The following example uses `SYNC_WITH_HCATALOG_SCHEMA` to synchronize an HCatalog schema named `hcat`:

```sql
=> CREATE HCATALOG SCHEMA hcat WITH hostname='hcathost' HCATALOG_SCHEMA='default'
    HCATALOG_USER='hcatuser';
CREATE_SCHEMA
=> SELECT sync_with_hcatalog_schema('hcat', 'hcat');
sync_with_hcatalog_schema
-----------------------------
Schema hcat synchronized with hcat
```
tables in hcat = 56
tables altered in hcat = 0
tables created in hcat = 56
stale tables in hcat = 0
table changes errored in hcat = 0
(1 row)
=> -- Use vsql's \d command to describe a table in the synced schema
=> \d hcat.messages
List of Fields by Tables
 Schema | Table     | Column | Type    | Size | Default | Not Null | Primary Key | Foreign Key
-------------+-----------+--------+---------+------+---------+----------+-------------+------------------------
 hcat       | messages  | id     | int     | 8    | f       | f        |             |             |
 hcat       | messages  | userid | varchar | 65000| f       | f        |             |             |
 hcat       | messages  | "time" | varchar | 65000| f       | f        |             |             |
 hcat       | messages  | message| varchar | 65000| f       | f        |             |             |
(4 rows)

The following example uses SYNC_WITH_HCATALOG_SCHEMA followed by ALTER TABLE to adjust a column value:

=> CREATE HCATALOG SCHEMA hcat WITH hostname='hcathost' HCATALOG_SCHEMA='default'
=> HCATALOG_USER='hcatuser';
CREATE SCHEMA
=> SELECT sync_with_hcatalog_schema('hcat', 'hcat');
...
=> ALTER TABLE hcat.t ALTER COLUMN a1 SET DATA TYPE long varchar(1000000);
=> ALTER TABLE hcat.t ALTER COLUMN a2 SET DATA TYPE long varbinary(1000000);

The following example uses SYNC_WITH_HCATALOG_SCHEMA with a local (non-HCatalog) schema:

=> CREATE HCATALOG SCHEMA hcat WITH hostname='hcathost' HCATALOG_SCHEMA='default'
=> HCATALOG_USER='hcatuser';
CREATE SCHEMA
=> CREATE SCHEMA hcat_local;
CREATE SCHEMA
=> SELECT sync_with_hcatalog_schema('hcat_local', 'hcat');

**SYNC_WITH_HCATALOG_SCHEMA_TABLE**

Copies the structure of a single table in a Hive database schema available through the HCatalog Connector to a Vertica table.

This function can synchronize the HCatalog schema directly. In this case, call it with the same schema name for the vertica_schema and hcatalog_schema parameters. The function can also synchronize a different schema to the HCatalog schema.
Syntax

SYNC_WITH_HCATALOG_SCHEMA_TABLE( vertica_schema, hcatalog_schema, table_name )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vertica_schema</td>
<td>The existing Vertica schema to store the copied HCatalog schema's metadata. This can be the same schema as hcatalog_schema, or it can be a separate one created with CREATE SCHEMA.</td>
</tr>
<tr>
<td>hcatalog_schema</td>
<td>The HCatalog schema to copy, created with CREATE HCATALOG SCHEMA.</td>
</tr>
<tr>
<td>table_name</td>
<td>The table in hcatalog_schema to copy. If table_name already exists in vertica_schema, the function overwrites it.</td>
</tr>
</tbody>
</table>

Privileges

Non-superuser: CREATE privileges on vertica_schema.

Users also require access to Hive data, one of the following:

- USAGE permissions on hcat_schema, if Hive does not use an authorization service to manage access.
- Permission through an authorization service (Sentry or Ranger), and access to the underlying files in HDFS. (Sentry can provide that access through ACL synchronization.)
- dbadmin user privileges, with or without an authorization service.

Data Type Matching

Hive STRING and BINARY data types are matched, in Vertica, to the VARCHAR(65000) and VARBINARY(65000) types. Adjust the data types with ALTER TABLE as needed after creating the schema. The maximum size of a VARCHAR or VARBINARY in Vertica is 65000, but you can use LONG VARCHAR and LONG VARBINARY to specify larger values.
Hive and Vertica define string length in different ways. In Hive the length is the number of characters; in Vertica it is the number of bytes. Thus, a character encoding that uses more than one byte, such as Unicode, can cause mismatches between the two. To avoid data truncation, set values in Vertica based on bytes, not characters.

If data size exceeds the column size, Vertica logs an event at read time in the QUERY_EVENTS system table.

**Examples**

The following example uses SYNC_WITH_HCATALOG_SCHEMA_TABLE to synchronize the "nation" table:

```sql
=> CREATE SCHEMA 'hcat_local';
CREATE SCHEMA

=> CREATE HCATALOG SCHEMA hcat WITH hostname='hcathost' HCATALOG_SCHEMA='hcat'
  HCATALOG_USER='hcatuser';
CREATE SCHEMA

=> SELECT sync_with_hcatalog_schema_table('hcat_local', 'hcat', 'nation');
sync_with_hcatalog_schema_table
-----------------------------------------------
  Schema hcat_local synchronized with hcat for table nation
  table nation is created in schema hcat_local
  (1 row)
```

The following example shows the behavior if the "nation" table already exists in the local schema:

```sql
=> SELECT sync_with_hcatalog_schema_table('hcat_local','hcat','nation');
sync_with_hcatalog_schema_table
-----------------------------------------------
  Schema hcat_local synchronized with hcat for table nation
  table nation is altered in schema hcat_local
  (1 row)
```

**VERIFY_HADOOP_CONF_DIR**

Verifies that the Hadoop configuration that is used to access HDFS is valid on all Vertica nodes. The configuration is valid if:

- all required configuration files are found on the path defined by the HadoopConfDir configuration parameter
- all properties needed by Vertica are set in those files

This function does not attempt to validate the settings of those properties; it only verifies that they have values.

It is possible for Hadoop configuration to be valid on some nodes and invalid on others. The function reports a validation failure if the value is invalid on any node; the rest of the output reports the details.

**Syntax**

```sql
VERIFY_HADOOP_CONF_DIR()
```

**Parameters**

This function has no parameters.

**Privileges**

This function does not require privileges.

**Examples**

The following example shows the results when the Hadoop configuration is valid.

```sql
=> SELECT VERIFY_HADOOP_CONF_DIR();

<table>
<thead>
<tr>
<th>verify_hadoop_conf_dir</th>
</tr>
</thead>
<tbody>
<tr>
<td>Validation Success</td>
</tr>
<tr>
<td>v_vmart_node0001: HadoopConfDir [PG_TESTOUT/config] is valid</td>
</tr>
<tr>
<td>v_vmart_node0002: HadoopConfDir [PG_TESTOUT/config] is valid</td>
</tr>
<tr>
<td>v_vmart_node0003: HadoopConfDir [PG_TESTOUT/config] is valid</td>
</tr>
<tr>
<td>v_vmart_node0004: HadoopConfDir [PG_TESTOUT/config] is valid</td>
</tr>
</tbody>
</table>

(1 row)
```

In the following example, the Hadoop configuration is valid on one node, but on other nodes a needed value is missing.

```sql
=> SELECT VERIFY_HADOOP_CONF_DIR();
```
LDAP Link Functions

This section contains the functions associated with the Vertica [LDAP Link](http://vertica.com) service.

**LDAP_LINK_DRYRUN_CONNECT**

Takes a set of [LDAP Link connection parameters](http://vertica.com) as arguments and begins a dry run connection between the LDAP server and Vertica.

By providing an empty string for the `LDAPLinkBindPswd` argument, you can also perform an anonymous bind if your LDAP server allows unauthenticated binds.

**Syntax**

```sql
LDAP_LINK_DRYRUN_CONNECT (  
    `'LDAPLinkURL'`,  
    `'LDAPLinkBindDN'`,  
    `'LDAPLinkBindPswd'`  
)
```

**Privileges**

Superuser

**Example**

This tests the connection to an LDAP server at ldap://example.dc.com with the DN CN=amir,OU=QA,DC=dc,DC=com.
To check the results of the bind, query the system table LDAP_LINK_DRYRUN_EVENTS.

```sql
=> SELECT event_timestamp, event_type, entry_name, role_name, link_scope, search_base from LDAP_LINK_DRYRUN_EVENTS;
```

<table>
<thead>
<tr>
<th>event_timestamp</th>
<th>event_type</th>
<th>entry_name</th>
<th>role_name</th>
<th>link_scope</th>
<th>search_base</th>
</tr>
</thead>
<tbody>
<tr>
<td>2019-12-09 15:41:43.589398-05</td>
<td>BIND_STARTED</td>
<td>-----------</td>
<td>----------</td>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>2019-12-09 15:41:43.590504-05</td>
<td>BIND_FINISHED</td>
<td>-----------</td>
<td>----------</td>
<td>------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>

See Also

- [LDAP_LINK_DRYRUN_SEARCH](#)
- [LDAP_LINK_DRYRUN_SYNC](#)
- Configuring LDAP Link with Dry Runs
- [LDAP Link Parameters](#)

**LDAP_LINK_DRYRUN_SEARCH**

Takes a set of [LDAP Link connection and search parameters](#) as arguments and begins a dry run search for users and groups that would get imported from the LDAP server.

By providing an empty string for the `LDAPLinkBindPswd` argument, you can also perform an [anonymous search](#) if your LDAP server’s Access Control List (ACL) is configured to allow unauthenticated searches. The settings for allowing anonymous binds are different from the ACL settings for allowing anonymous searches.

**Syntax**

```sql
LDAP_LINK_DRYRUN_SEARCH ( 
  'LDAPLinkURL',
  'LDAPLinkBindDN',
  'LDAPLinkBindPswd',
  'LDAPLinkSearchBase',
```

```sql
```
Privileges

Superuser

Example

This searches for users and groups in the LDAP server. In this case, the LDAPLinkSearchBase parameter specifies the dc.com domain and a sub scope, which replicates the entire subtree under the DN.

To further filter results, the function checks for users and groups with the person and group objectClass attributes. It then searches the group attribute cn, identifying members of that group with the member attribute, and then identifying those individual users with the attribute uid.

```sql
=> SELECT LDAP_LINK_DRYRUN_SEARCH
('ldap://example.dc.com','CN=amir,OU=QA,DC=dc,DC=com','$vertica$','dc=dc,dc=com','sub',
'(objectClass=person)','(objectClass=group)','uid','cn','member',10,'dn');

ldap_link_dryrun_search
-----------------------------------------------
Dry Run Search Completed. Query v_monitorldap_link_dryrun_events for results.
```

To check the results of the search, query the system table LDAP_LINK_DRYRUN_EVENTS.

```sql
=> SELECT event_timestamp, event_type, entry_name, ldapurihash, link_scope, search_base from LDAP_LINK_DRYRUN_EVENTS;

<table>
<thead>
<tr>
<th>event_timestamp</th>
<th>event_type</th>
<th>entry_name</th>
<th>ldapurihash</th>
<th>link_scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>2020-01-03 21:03:26.411753+05:30</td>
<td>BIND_STARTED</td>
<td>------------</td>
<td>0</td>
<td>sub</td>
</tr>
<tr>
<td></td>
<td>dc=dc,dc=com</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2020-01-03 21:03:26.422188+05:30</td>
<td>BIND_FINISHED</td>
<td>------------</td>
<td>0</td>
<td>sub</td>
</tr>
<tr>
<td></td>
<td>dc=dc,dc=com</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2020-01-03 21:03:26.422223+05:30</td>
<td>SYNC_STARTED</td>

<td>sub</td>
</tr>
<tr>
<td></td>
<td>dc=dc,dc=com</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2020-01-03 21:03:26.422229+05:30</td>
<td>SEARCH_STARTED</td>
<td>***********</td>
<td>0</td>
<td>sub</td>
</tr>
</tbody>
</table>
```
See Also

- `LDAP_LINK_DRYRUN_CONNECT`
- `LDAP_LINK_DRYRUN_SYNC`
- Configuring LDAP Link with Dry Runs
- LDAP Link Parameters

**LDAP_LINK_DRYRUN_SYNC**

Takes a set of [LDAP Link connection and search parameters](#) as arguments and begins a dry run synchronization between the database and the LDAP server, which maps and synchronizes the LDAP server's users and groups with their equivalents in Vertica. This meta-function also dry runs the creation and orphaning of users and roles in Vertica.

You can view the results of the dry run in the system table `LDAP_LINK_DRYRUN_EVENTS`.

To cancel an in-progress synchronization, use `LDAP_LINK_SYNC_CANCEL`.

**Syntax**

```sql
LDAP_LINK_DRYRUN_SYNC (    'LDAPLinkURL',    'LDAPLinkBindDN',    'LDAPLinkBindPswd',    'LDAPLinkSearchBase',    'LDAPLinkScope',    'LDAPLinkFilterUser',    'LDAPLinkFilterGroup',    'LDAPLinkUserName',    'LDAPLinkGroupName',    'LDAPLinkGroupMembers',    [LDAPLinkSearchTimeout],    Vertica Documentation SQL Reference Manual )
```
Priviligies

Superuser

Example

To perform a dry run to map the users and groups returned from LDAP_LINK_DRYRUN_SEARCH, pass the same parameters as arguments to LDAP_LINK_DRYRUN_SYNC.

```
=> SELECT LDAP_LINK_DRYRUN_SYNC
('ldap://example.dc.com', 'CN=amir,OU=QA,DC=dc,DC=com', '$vertica$', 'dc=DC,dc=com', 'sub', '(objectClass=person)', '(objectClass=group)', 'uid', 'cn', 'member', 10, 'dn');
```

```
Dry Run Connect and Sync Completed. Query v_monitor.ldap_link_dryrun_events for results.
```

To check the results of the sync, query the system table LDAP_LINK_DRYRUN_EVENTS.

```
=> SELECT event_timestamp, event_type, entry_name, ldapurihash, link_scope, search_base from LDAP_LINK_DRYRUN_EVENTS;

| event_timestamp     | | event_type   | | entry_name     | | ldapurihash |

**LDAP_LINK_SYNC_START**

Begins the synchronization between the LDAP server and Vertica immediately rather than waiting for the interval set in LDAPLinkInterval.

**Syntax**

```sql
ldap_link_sync_start()
```

**Privileges**

You must be a dbadamin user.

**Example**

```sql
=> SELECT ldap_link_sync_start();
```
See Also

LDAP Link Parameters

**LDAP_LINK_SYNC_CANCEL**

Cancels in-progress LDAP Link synchronizations (including those started by `LDAP_LINK_DRYRUN_SYNC`) between the LDAP server and Vertica.

Syntax

```plaintext
ldap_link_sync_cancel()
```

Privileges

You must be a dbadamin user.

Example

```plaintext
=> SELECT ldap_link_sync_cancel();
```

License Management Functions

This section contains function that monitor Vertica license status and compliance.

**AUDIT**

Returns the raw data size (in bytes) of a database, schema, or table as it is counted in an audit of the database size. Unless you specify zero error tolerance and 100 percent confidence level, AUDIT returns only approximate results that can vary over multiple iterations.

AUDIT estimates the size for data in Vertica tables using the same data sampling method as Vertica uses, to determine if a database complies with the licensed database size allowance. Vertica does not use these results to determine whether the size of the database complies with the Vertica license's data allowance. For details, see Auditing Database Size in the Administrator's Guide.

For data stored in external tables based on ORC or Parquet format, AUDIT uses the total size of the data files. This value is never estimated—it is read from the file system storing the ORC or Parquet files (either the Vertica node's local file system, S3, or HDFS).

**Syntax**

AUDIT('[[[database.]schema.]scope ]', 'granularity' [, error-tolerance[, confidence-level]] )

**Parameters**

<table>
<thead>
<tr>
<th>[database.]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td>myschema.thisDbObject</td>
<td>If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>
### scope
Specifies the extent of the audit:
- Empty string ('') audits the entire database.
- The name of the schema or table to audit.

The schema or table to audit. To audit the database, set this parameter to an empty string.

### granularity
The level at which the audit reports its results, one of the following strings:
- database
- schema
- table

The level of granularity must be equal to or less than the granularity of scope. If you omit this parameter, granularity is set to the same level as scope. Thus, if online_sales is a schema, the following statements are identical:

```sql
AUDIT('online_sales', 'schema');
AUDIT('online_sales');
```

If AUDIT sets granularity to a level lower than the target object, it returns with a message that refers you to system table USER_AUDITS. For details, see Querying V_CATALOG.USER_AUDITS, below.

### error-tolerance
Specifies the percentage margin of error allowed in the audit estimate. Enter the tolerance value as a decimal number, between 0 and 100. The default value is 5, for a 5% margin of error.

This argument has no effect on audits of external tables based on ORC or Parquet files. Audits of these tables always returns the actual size of the underlying data files.

Setting this value to 0 results in a full database audit, which is very resource intensive, as AUDIT analyzes the entire database. A full database audit significantly impacts performance, so Vertica does not recommend it for a production database.

**Caution:**
Due to the iterative sampling that the auditing process uses, setting the error tolerance to a small fraction of a
percent (for example, 0.00001) can cause AUDIT to run for a longer period than a full database audit. The lower you specify this value, the more resources the audit uses, as it performs more data sampling.

| confidence-level | Specifies the statistical confidence level percentage of the estimate. Enter the confidence value as a decimal number, between 0 and 100. The default value is 99, indicating a confidence level of 99%.

This argument has no effect on audits of external tables based on ORC or Parquet files. Audits of these tables always returns the actual size of the underlying data files.

The higher the confidence value, the more resources the function uses, as it performs more data sampling. Setting this value to 100 results in a full audit of the database, which is very resource intensive, as the function analyzes all of the database. A full database audit significantly impacts performance, so Vertica does not recommend it for a production database.

Privileges

Superuser, or the following privileges:

- SELECT privilege on the target tables
- USAGE privilege on the target schemas

Note:
If you audit a schema or the database, Vertica only returns the size of all objects that you have privileges to access within the audited object, as described above.

Querying V_CATALOG.USER_AUDITS

If AUDIT sets granularity to a level lower than the target object, it returns with a message that refers you to system table USER_AUDITS. To obtain audit data on objects of the specified granularity, query this table. For example, the following query seeks to audit all tables in the store schema:
\[ SELECT AUDIT('store', 'table'); \]

See table sizes in v_catalog.user_audits for schema store

(1 row)

The next query queries USER_AUDITS and obtains the latest audits on those tables:

\[ SELECT object_name, AVG(size_bytes)::int size_bytes, MAX(audit_start_timestamp::date) audit_start 
FROM user_audits WHERE object_schema='store'
GROUP BY rollup(object_name) HAVING GROUPING_ID(object_name) < 1 ORDER BY GROUPING_ID(); \]

<table>
<thead>
<tr>
<th>object_name</th>
<th>size_bytes</th>
<th>audit_start</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_dimension</td>
<td>22067</td>
<td>2017-10-26</td>
</tr>
<tr>
<td>store_orders_fact</td>
<td>27201312</td>
<td>2017-10-26</td>
</tr>
<tr>
<td>store_sales_fact</td>
<td>301260170</td>
<td>2017-10-26</td>
</tr>
</tbody>
</table>

(3 rows)

Examples

See Auditing Database Size.

**AUDIT_FLEX**

Returns the estimated ROS size of \_raw\_ columns, equivalent to the export size of the flex data in the audited objects. You can audit all flex data in the database, or narrow the audit scope to a specific flex table, projection, or schema. Vertica stores the audit results in system table USER_AUDITS.

The audit excludes the following:

- Flex keys
- Other columns in the audited tables.
- Temporary flex tables

Syntax

AUDIT_FLEX ('[scope]')
### Parameters

<table>
<thead>
<tr>
<th><strong>scope</strong></th>
<th>Specifies the extent of the audit:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Empty string ('')</td>
<td>audits all flexible tables in the database.</td>
</tr>
<tr>
<td>The name of a schema, projection, or flex table.</td>
<td></td>
</tr>
</tbody>
</table>

### Privileges

Superuser, or the following privileges:

- SELECT privilege on the target tables
- USAGE privilege on the target schemas

**Note:**
If you audit a schema or the database, Vertica only returns the size of all objects that you have privileges to access within the audited object, as described above.

### Examples

Audit all flex tables in the current database:

```sql
dbs=> select audit_flex('');
audit_flex
----------
 8567679
(1 row)
```

Audit the flex tables in schema public:

```sql
dbs=> select audit_flex('public');
audit_flex
----------
 8567679
(1 row)
```

Audit the flex data in projection bakery_b0:
Audit flex table bakery:

dbs=> select audit_flex('bakery_b0');
audit_flex
-----------
8566723
(1 row)

dbs=> select audit_flex('bakery');
audit_flex
-----------
8566723
(1 row)

To report the results of all audits saved in the USER_AUDITS, the following shows part of an extended display from the system table showing an audit run on a schema called test, and the entire database, dbs:

dbs=> \x
Expanded display is on.

dbs=> select * from user_audits;
-[- RECORD 1 ]-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-
| size_bytes | 0 |
| user_id    | 45035996273704962 |
| user_name  | release |

| sample_count | 0 |
| cell_count | 0 |
**AUDIT_LICENSE_SIZE**

Triggers an immediate audit of the database size to determine if it is in compliance with the raw data storage allowance included in your Vertica licenses.

If you use ORC or Parquet data stored in HDFS, results are only accurate if you run this function as a user who has access to all HDFS data. Either run the query with a principal that has read access to all such data, or use a Hadoop delegation token that grants this access. For more information about using delegation tokens, see Accessing Kerberized HDFS Data.

**Syntax**

AUDIT_LICENSE_SIZE()

**Privileges**

Superuser

**Example**

```sql
=> SELECT audit_license_size();
  audit_license_size
----------------------
Raw Data Size: 0.00TB +/- 0.00TB
License Size : 10.00TB
Utilization : 0%
Audit Time : 2015-09-24 12:19:15.425486-04
Compliance Status : The database is in compliance with respect to raw data size.
License End Date: 2015-11-23 00:00:00 Days Remaining: 60.53
(1 row)
```
**AUDIT_LICENSE_TERM**

Triggers an immediate audit to determine if the Vertica license has expired.

**Syntax**

AUDIT_LICENSE_TERM()

**Privileges**

Superuser

**Example**

```sql
=> SELECT audit_license_term();
    audit_license_term
-------------------------
Raw Data Size: 0.00TB +/- 0.00TB
License Size : 10.00TB
Utilization : 0%
Audit Time : 2015-09-24 12:19:15.425486-04
Compliance Status : The database is in compliance with respect to raw data size.

License End Date: 2015-11-23 00:00:00 Days Remaining: 60.53
(1 row)
```

**DISPLAY_LICENSE**

Returns the terms of your Vertica license. The information this function displays is:

- The start and end dates for which the license is valid (or "Perpetual" if the license has no expiration).
- The number of days you are allowed to use Vertica after your license term expires (the grace period)
- The amount of data your database can store, if your license includes a data allowance.
Syntax

DISPLAY_LICENSE()

Privileges

None

Examples

=> SELECT DISPLAY_LICENSE();

<table>
<thead>
<tr>
<th>DISPLAY_LICENSE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertica Systems, Inc.</td>
</tr>
<tr>
<td>2007-08-03</td>
</tr>
<tr>
<td>Perpetual</td>
</tr>
<tr>
<td>500GB</td>
</tr>
</tbody>
</table>

(1 row)

**GET_AUDIT_TIME**

Reports the time when the automatic audit of database size occurs. Vertica performs this audit if your Vertica license includes a data size allowance. For details of this audit, see Managing Licenses in the Administrator's Guide. To change the time the audit runs, use the SET_AUDIT_TIME function.

Syntax

GET_AUDIT_TIME()

Privileges

None
Example

```sql
=> SELECT get_audit_time();
get_audit_time
---------------------------------------------
The audit is scheduled to run at 11:59 PM each day.
(1 row)
```

**GET_COMPILANCE_STATUS**

Displays whether your database is in compliance with your Vertica license agreement. This information includes the results of Vertica’s most recent audit of the database size (if your license has a data allowance as part of its terms), the license term (if your license has an end date), and the number of nodes (if your license has a node limit).

GET_COMPILANCE_STATUS measures data allowance by TBs (where a TB equals $1024^4$ bytes).

The information displayed by GET_COMPILANCE_STATUS includes:

- The estimated size of the database (see Auditing Database Size in the Administrator's Guide for an explanation of the size estimate).
- The raw data size allowed by your Vertica license.
- The percentage of your allowance that your database is currently using.
- The number of nodes and license limit.
- The date and time of the last audit.
- Whether your database complies with the data allowance terms of your license agreement.
- The end date of your license.
- How many days remain until your license expires.

**Note:**

If your license does not have a data allowance, end date, or node limit, some of the values might not appear in the output for GET_COMPILANCE_STATUS.

If the audit shows your license is not in compliance with your data allowance, you should either delete data to bring the size of the database under the licensed amount, or upgrade your license. If your license term has expired, you should contact Vertica immediately to renew your license. See Managing Licenses in the Administrator's Guide for further details.
Syntax

GET_COMPLIANCE_STATUS()

Privileges

None

Examples

=> SELECT GET_COMPLIANCE_STATUS();
   get_compliance_status
   ------------------------
   Raw Data Size: 0.00TB +/- 0.00TB
   License Size : 10.00TB
   Utilization : 0%
   Audit Time : 2015-09-24 12:19:15.425486-04
   Compliance Status : The database is in compliance with respect to raw data size.

   License End Date: 2015-11-23 00:00:00 Days Remaining: 60.53
   (1 row)

The following example shows output for a Vertica for SQL on Apache Hadoop cluster.

=> SELECT GET_COMPLIANCE_STATUS();
   get_compliance_status
   ------------------------
   Node count : 4
   License Node limit : 5
   No size-compliance concerns for an Unlimited license

   No expiration date for a Perpetual license
   (1 row)

SET_AUDIT_TIME

Sets the time that Vertica performs automatic database size audit to determine if the size
of the database is compliant with the raw data allowance in your Vertica license. Use this
function if the audits are currently scheduled to occur during your database's peak activity
time. This is normally not a concern, since the automatic audit has little impact on database
performance.
Audits are scheduled by the preceding audit, so changing the audit time does not affect the next scheduled audit. For example, if your next audit is scheduled to take place at 11:59PM and you use SET_AUDIT_TIME to change the audit schedule 3AM, the previously scheduled 11:59PM audit still runs. As that audit finishes, it schedules the next audit to occur at 3AM.

Vertica always performs the next scheduled audit even where you have changed the audit time using SET_AUDIT_TIME and then triggered an automatic audit by issuing the statement, SELECT AUDIT_LICENSE_SIZE. Only after the next scheduled audit does Vertica begin auditing at the new time you set using SET_AUDIT_TIME. Thereafter, Vertica audits at the new time.

**Syntax**

SET_AUDIT_TIME(time)

<table>
<thead>
<tr>
<th>time</th>
<th>A string containing the time in 'HH:MM AM/PM' format (for example, '1:00 AM') when the audit should run daily.</th>
</tr>
</thead>
</table>

**Privileges**

Superuser

**Example**

```sql
=> SELECT SET_AUDIT_TIME('3:00 AM');

SET_AUDIT_TIME
---------------------
The scheduled audit time will be set to 3:00 AM after the next audit.
(1 row)
```

**Multiple Active Result Sets Functions**

This section contains the functions associated with the Vertica library for Multiple Active Result Sets (MARS).
**CLOSE_ALL_RESULTSETS**

Closes all result set sessions within Multiple Active Result Sets (MARS) and frees the MARS storage for other result sets.

**Syntax**

SELECT CLOSE_ALL_RESULTSETS ('session_id')

**Parameters**

| session_id | A string that specifies the Multiple Active Result Sets session. |

**Privileges**

None; however, without superuser privileges, you can only close your own session's results.

**Examples**

This example shows how you can view a MARS result set, then close the result set, and then confirm that the result set has been closed.

Query the MARS storage table. One session ID is open and three result sets appear in the output.

```sql
=> SELECT * FROM SESSION_MARS_STORE;
```

<table>
<thead>
<tr>
<th>node_name</th>
<th>session_id</th>
<th>user_name</th>
<th>resultset_id</th>
<th>row_count</th>
<th>remaining_row_count</th>
<th>bytes_used</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_vmart_node0001</td>
<td>server1.company.-83046:1y28gu9</td>
<td>dbadmin</td>
<td>7</td>
<td>777460</td>
<td>776460</td>
<td>89692848</td>
</tr>
<tr>
<td>v_vmart_node0001</td>
<td>server1.company.-83046:1y28gu9</td>
<td>dbadmin</td>
<td>8</td>
<td>324349</td>
<td>323349</td>
<td>81862010</td>
</tr>
<tr>
<td>v_vmart_node0001</td>
<td>server1.company.-83046:1y28gu9</td>
<td>dbadmin</td>
<td>9</td>
<td>277947</td>
<td>323349</td>
<td>81862010</td>
</tr>
</tbody>
</table>
```
Close all result sets for session server1.company.-83046:1y28gu9:

```sql
=> SELECT CLOSE_ALL_RESULTSETS('server1.company.-83046:1y28gu9');
--
close_all_resultsets
Closing all result sets from server1.company.-83046:1y28gu9
(1 row)
```

Query the MARS storage table again for the current status. You can see that the session and result sets have been closed:

```sql
=> SELECT * FROM SESSION_MARS_STORE;

<table>
<thead>
<tr>
<th>node_name</th>
<th>session_id</th>
<th>user_name</th>
<th>resultset_id</th>
<th>row_count</th>
<th>remaining_row_count</th>
<th>bytes_used</th>
</tr>
</thead>
</table>

(0 rows)
```

**CLOSE_RESULTSET**

Closes a specific result set within Multiple Active Result Sets (MARS) and frees the MARS storage for other result sets.

**Syntax**

```sql
SELECT CLOSE_RESULTSET ('session_id', ResultSetID)
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session_id</td>
<td>A string that specifies the Multiple Active Result Sets session containing the ResultSetID to close.</td>
</tr>
<tr>
<td>ResultSetID</td>
<td>An integer that specifies which result set to close.</td>
</tr>
</tbody>
</table>
Privileges

None; however, without superuser privileges, you can only close your own session's results.

Examples

This example shows a MARS storage table opened. One session_id is currently open, and one result set appears in the output.

```sql
=> SELECT * FROM SESSION_MARS_STORE;

<table>
<thead>
<tr>
<th>node_name</th>
<th>session_id</th>
<th>user_name</th>
<th>resultset_id</th>
<th>row_count</th>
<th>remaining_row_count</th>
<th>bytes_used</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_vmart_node0001</td>
<td>server1.company.-83046:1y28gu9</td>
<td>dbadmin</td>
<td>1</td>
<td>318718</td>
<td>312718</td>
<td>80441904</td>
</tr>
</tbody>
</table>

(1 row)
```

Close user session server1.company.-83046:1y28gu9 and result set 1:

```sql
=> SELECT CLOSE_RESULTSET('server1.company.-83046:1y28gu9', 1);

closing resultset

Closing result set 1 from server1.company.-83046:1y28gu9
(1 row)
```

Query the MARS storage table again for current status. You can see that result set 1 is now closed:

```sql
SELECT * FROM SESSION_MARS_STORE;

<table>
<thead>
<tr>
<th>node_name</th>
<th>session_id</th>
<th>user_name</th>
<th>resultset_id</th>
<th>row_count</th>
<th>remaining_row_count</th>
<th>bytes_used</th>
</tr>
</thead>
</table>

(0 rows)
```
Partition Management Functions

This section contains partition management functions specific to Vertica.

**CALENDAR_HIERARCHY_DAY**

Specifies to group DATE partition keys into a hierarchy of years, months, and days. The Vertica Tuple Mover regularly evaluates partition keys against the current date, and merges partitions as needed into the appropriate year and month partition groups.

**Syntax**

```
CALENDAR_HIERARCHY_DAY( partition-expression[, active-months[, active-years] ] )
```

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>partition-expression</strong></td>
<td>The DATE expression on which to group partition keys, which must be identical to the table's PARTITION BY expression.</td>
</tr>
<tr>
<td><strong>active-months</strong></td>
<td>An integer ( \geq 0 ) that specifies how many months preceding MONTH(CURRENT DATE) to store unique partition keys in separate partitions.</td>
</tr>
<tr>
<td></td>
<td>If you specify 1, only partition keys of the current month are stored in separate partitions.</td>
</tr>
<tr>
<td></td>
<td>If you specify 0, all partition keys of the current month are merged into a partition group for that month.</td>
</tr>
<tr>
<td></td>
<td>For details, see Hierarchical Partitioning.</td>
</tr>
<tr>
<td></td>
<td>Default value: 2</td>
</tr>
<tr>
<td><strong>active-years</strong></td>
<td>An integer ( \geq 0 ), specifies how many years preceding YEAR (CURRENT DATE) to partition group keys by month in separate partitions.</td>
</tr>
<tr>
<td>If you specify 1, only partition keys of the current year are stored in month partition groups.</td>
<td></td>
</tr>
<tr>
<td>If you specify 0, all partition keys of the current and previous years are merged into year partition groups.</td>
<td></td>
</tr>
<tr>
<td>For details, see Hierarchical Partitioning.</td>
<td></td>
</tr>
<tr>
<td>Default value: 2</td>
<td></td>
</tr>
</tbody>
</table>

**Important:**
The CALENDAR_HIERARCHY_DAY algorithm assumes that most table activity is focused on recent dates. Setting *active-years* and *active-months* to a low number $\geq 2$ serves to isolate merge activity to date-specific containers, and incurs minimal overhead. Vertica recommends that you use the default setting of 2 for *active-years* and *active-months*. For most users, these settings achieve an optimal balance between ROS storage and performance.

**Usage**

Specify this function in a table **partition clause**, as its GROUP BY expression:

```sql
PARTITION BY partition-expression
GROUP BY CALENDAR_HIERARCHY_DAY(
    group-expression
    [, active-months[, active-years] ]
)
```

For example:

```sql
=> CREATE TABLE public.store_orders
(
    order_no int,
    order_date timestamp NOT NULL,
    shipper varchar(20),
    ship_date date
);
...
=> ALTER TABLE public.store_orders
    PARTITION BY order_date::DATE
    GROUP BY CALENDAR_HIERARCHY_DAY(order_date::DATE, 3, 2) REORGANIZE;
```

For details on usage, see Hierarchical Partitioning in the Administrator's Guide.

Hierarchical Partitioning in the Administrator's Guide

COPY_PARTITIONS_TO_TABLE

Copies partitions from one table to another. This lightweight partition copy increases performance by initially sharing the same storage between two tables. After the copy operation is complete, the tables are independent of each other. Users can perform operations on one table without impacting the other. These operations can increase the overall storage required for both tables.

Note:
Although they share storage space, Vertica considers the partitions as discrete objects for license capacity purposes. For example, copying a one TB partition would only consume one TB of space. Your Vertica license, however, considers them as separate objects consuming two TB of space.

Syntax

COPY_PARTITIONS_TO_TABLE (
  "[[database.]schema.]source-table",
  "min-range-value",
  "max-range-value",
  "[[database.]schema.]target-table"
  [, 'force-split']
)

Parameters

[database.]schema
Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:

myschema.thisDbObject
If you specify a database, it must be the current database.

**source-table**
The source table of the partitions to copy.

**min-range-value**
The minimum and maximum value of partition keys to copy, where \( \text{min-range-value} \) must be \( \leq \text{max-range-value} \). To copy one partition, \( \text{min-range-value} \) and \( \text{max-range-value} \) must be equal.

**target-table**
The target table of the partitions to copy. If the table does not exist, Vertica creates a table from the source table's definition, by calling **CREATE TABLE** with LIKE and INCLUDING PROJECTIONS clause. The new table inherits ownership from the source table. For details, see Replicating a Table.

**force-split**
Optional Boolean argument, specifies whether to split ROS containers if the range of partition keys spans multiple containers or part of a single container:

- **true**: Split ROS containers as needed.
- **false** (default): Return with an error if ROS containers must be split to implement this operation.

### Privileges

Non-superuser, one of the following:

- Owner of source and target tables
- TRUNCATE privileges on source table, INSERT on target table

If the target table does not exist, you must also have CREATE privileges on the target schema to enable table creation.

### Table Attribute Requirements

The following attributes of both tables must be identical:

- Column definitions, including NULL/NOT NULL constraints
- Segmentation
- **Partition clause**
- Number of projections
• Projection sort order
• Primary and unique key constraints. However, the key constraints do not have to be identically enabled. For more information on constraints, see Constraints in the Administrator's Guide.

**Note:**
If the target table has primary or unique key constraints enabled and copying or moving the partitions will insert duplicate key values into the target table, Vertica rolls back the operation.

• Check constraints. For MOVE_PARTITIONS_TO_TABLE and COPY_PARTITIONS_TO_TABLE, Vertica enforces enabled check constraints on the target table only. For SWAP_PARTITIONS_BETWEEN_TABLES, Vertica enforces enabled check constraints on both tables. If there is a violation of an enabled check constraint, Vertica rolls back the operation.
• Number and definitions of text indices.

### Table Restrictions

The following restrictions apply to the source and target tables:

• If the source and target partitions are in different storage tiers, Vertica returns a warning but the operation proceeds. The partitions remain in their existing storage tier.
• The following tables cannot be used as sources or targets:
  • Temporary tables
  • Virtual tables
  • System tables
  • External tables

### Examples

If you call COPY_PARTITIONS_TO_TABLE and the target table does not exist, the function creates the table automatically. In the following example, the target table partn_backup.tradfes_200801 does not exist. COPY_PARTITIONS_TO_TABLE creates the table and replicates the partition. Vertica also copies all the constraints associated with the source table except foreign key constraints.

```sql
=> SELECT COPY_PARTITIONS_TO_TABLE ( 
  
```
See Also

Archiving Partitions

**DROP_PARTITIONS**

This function supersedes meta-function DROP_PARTITION, which was deprecated in Vertica 9.0.

Drops the specified table partition keys.

Syntax

```sql
DROP_PARTITIONS (   '[[database.]schema.]table-name',   'min-range-value',   'max-range-value'   [, 'force-split']
)
```

Parameters

<table>
<thead>
<tr>
<th><strong>[database.]schema</strong></th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>
The target table. The table cannot be used as a dimension table in a pre-join projection and cannot have out-of-date (unrefreshed) projections.

The minimum and maximum value of partition keys to drop, where `min-range-value` must be ≤ `max-range-value`. To drop one partition key, `min-range-value` and `max-range-value` must be equal.

Optional Boolean argument, specifies whether to split ROS containers if the range of partition keys spans multiple containers or part of a single container:
- `true`: Split ROS containers as needed.
- `false` (default): Return with an error if ROS containers must be split to implement this operation.

**Note:**
In rare cases, DROP_PARTITIONS executes at the same time as a mergeout operation on the same ROS container. As a result, the function cannot split the container as specified and returns with an error. When this happens, call DROP_PARTITIONS again.

**Privileges**

One of the following:
- DBADMIN
- Table owner
- USAGE privileges on the table schema and TRUNCATE privileges on the table

**Examples**

See Dropping Partitions in the Administrator's Guide.
See Also

PARTITION_TABLE

DUMP_PROJECTION_PARTITION_KEYS

Dumps the partition keys of the specified projection.

Syntax

DUMP_PROJECTION_PARTITION_KEYS( '[[database.]schema.]projection-name')

Parameters

<table>
<thead>
<tr>
<th>[database.]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>

| projection-name   | Projection name |

Privileges

Non-superuser: TRUNCATE on anchor table

Example

The following statements create the table and projection online_sales.online_sales_fact and online_sales.online_sales_fact_unseg_p, respectively, and
partitions table data by the column call_center_key:

```sql
=> CREATE TABLE online_sales.online_sales_fact
(
    sale_date_key int NOT NULL,
    ship_date_key int NOT NULL,
    product_key int NOT NULL,
    product_version int NOT NULL,
    customer_key int NOT NULL,
    call_center_key int NOT NULL,
    online_page_key int NOT NULL,
    shipping_key int NOT NULL,
    warehouse_key int NOT NULL,
    promotion_key int NOT NULL,
    pos_transaction_number int NOT NULL,
    sales_quantity int,
    sales_dollar_amount float,
    ship_dollar_amount float,
    net_dollar_amount float,
    cost_dollar_amount float,
    gross_profit_dollar_amount float,
    transaction_type varchar(16)
) PARTITION BY (online_sales_fact.call_center_key);

=> CREATE PROJECTION online_sales.online_sales_fact_unseg AS SELECT * from online_sales.online_sales_fact unsegmented all nodes;

The following DUMP_PROJECTION_PARTITION_KEYS statement dumps the partition key from the projection online_sales.online_sales_fact_unseg_p:

```sql
=> SELECT DUMP_PROJECTION_PARTITION_KEYS('online.sales.online_sales_fact_unseg_p');

Partition keys on node v_vmart_node0001
Projection 'online.sales.online_sales_fact_unseg_p'
Storage [ROS container]
  No of partition keys: 1
  Partition keys: 200
Storage [ROS container]
  No of partition keys: 1
  Partition keys: 199
...
Storage [ROS container]
  No of partition keys: 1
  Partition keys: 2
Storage [ROS container]
  No of partition keys: 1
  Partition keys: 1
Partition keys on node v_vmart_node0002
Projection 'online.sales.online_sales_fact_unseg_p'
Storage [ROS container]
  No of partition keys: 1
  Partition keys: 200
Storage [ROS container]
  No of partition keys: 1
  Partition keys: 199
...
```
See Also

- Partitioning Tables in the Administrator's Guide
- DUMP_PARTITION_KEYS
- DUMP_TABLE_PARTITION_KEYS
- PARTITION_PROJECTION
- PARTITION_TABLE

**DUMP_TABLE_PARTITION_KEYS**

Dumps the partition keys of all projections for the specified table.

Syntax

```
DUMP_TABLE_PARTITION_KEYS ( '[[database.]schema.]table-name' )
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than <code>public</code>, you must supply the schema name. For example: <code>&lt;myschema.thisDbObject&gt;</code></td>
</tr>
<tr>
<td><code>table-name</code></td>
<td>Name of the table</td>
</tr>
</tbody>
</table>

Privileges

Non-superuser: TRUNCATE on table
Examples

The following example creates a simple table called states and partitions the data by state:

```sql
=> CREATE TABLE states (year INTEGER NOT NULL,
    state VARCHAR NOT NULL)
PARTITION BY state;
=> CREATE PROJECTION states_p (state, year) AS
    SELECT * FROM states
ORDER BY state, year UNSEGMENTED ALL NODES;
```

Now dump the partition keys of all projections anchored on table states:

```sql
=> SELECT DUMP_TABLE_PARTITION_KEYS( 'states' );
DUMP_TABLE_PARTITION_KEYS
 Partition keys on node v_vmart_node0001
  Projection 'states_p'
    Storage [ROS container]
      No of partition keys: 1
      Partition keys: VT
    Storage [ROS container]
      No of partition keys: 1
      Partition keys: PA
    Storage [ROS container]
      No of partition keys: 1
      Partition keys: NY
    Storage [ROS container]
      No of partition keys: 1
      Partition keys: MA

Partition keys on node v_vmart_node0002
...
(1 row)
```

- Partitioning Tables in the Administrator's Guide
**MOVE_PARTITIONS_TO_TABLE**

Moves partitions from one table to another.

**Syntax**

```sql
MOVE_PARTITIONS_TO_TABLE (  
    '[[database.]schema.]source-table',  
    'min-range-value',  
    'max-range-value',  
    '[[database.]schema.]target-table'  
[, force-split]  
)
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td>source-table</td>
<td>The source table of the partitions to move.</td>
</tr>
<tr>
<td>min-range-value</td>
<td>The minimum and maximum value of partition keys to move, where <code>min-range-value</code> must be ≤ <code>max-range-value</code>. To move one partition, <code>min-range-value</code> and <code>max-range-value</code> must be equal.</td>
</tr>
<tr>
<td>max-range-value</td>
<td></td>
</tr>
<tr>
<td>target-table</td>
<td>The target table of the partitions to move. If the table does not exist, Vertica creates a table from the source table's definition, by calling <code>CREATE TABLE</code> with LIKE and INCLUDING PROJECTIONS clause. The new table inherits ownership from the source table. For details, see Replicating a Table.</td>
</tr>
<tr>
<td>force-split</td>
<td>Optional Boolean argument, specifies whether to split ROS containers if the range of partition keys spans multiple</td>
</tr>
</tbody>
</table>
containers or part of a single container:

- **true**: Split ROS containers as needed.
- **false** (default): Return with an error if ROS containers must be split to implement this operation.

**Privileges**

Non-superuser, one of the following:

- Owner of source and target tables
- TRUNCATE privileges on source table, INSERT on target table

If the target table does not exist, you must also have CREATE privileges on the target schema to enable table creation.

**Table Attribute Requirements**

The following attributes of both tables must be identical:

- Column definitions, including NULL/NOT NULL constraints
- Segmentation
- **Partition clause**
- Number of projections
- Projection sort order
- Primary and unique key constraints. However, the key constraints do not have to be identically enabled. For more information on constraints, see *Constraints* in the Administrator’s Guide.

**Note:**

If the target table has primary or unique key constraints enabled and copying or moving the partitions will insert duplicate key values into the target table, Vertica rolls back the operation.

- Check constraints. For **MOVE_PARTITIONS_TO_TABLE** and **COPY_PARTITIONS_TO_TABLE**, Vertica enforces enabled check constraints on the target table only. For **SWAP_PARTITIONS_BETWEEN_TABLES**, Vertica enforces enabled check constraints on both tables. If there is a violation of an enabled check constraint, Vertica rolls back the operation.
- Number and definitions of text indices.
**Table Restrictions**

The following restrictions apply to the source and target tables:

- If the source and target partitions are in different storage tiers, Vertica returns a warning but the operation proceeds. The partitions remain in their existing storage tier.
- The following tables cannot be used as sources or targets:
  - Temporary tables
  - Virtual tables
  - System tables
  - External tables

**Examples**

See Archiving Partitions.

**See Also**

- COPY_PARTITIONS_TO_TABLE
- SWAP_PARTITIONS_BETWEEN_TABLES

**PARTITION_PROJECTION**

Splits ROS containers for a specified projection. PARTITION_PROJECTION also purges data while partitioning ROS containers if deletes were applied before the AHM epoch.

**Syntax**

```
PARTITION_PROJECTION ( '[[database.]schema.]projection'
```
Parameters

<table>
<thead>
<tr>
<th>[database.]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>mysqlschema THISDBOBJECT</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>

| projection | The projection to partition. |

Privileges

- Table owner
- USAGE privilege on schema

Examples

In this example, PARTITION_PROJECTION forces a split of ROS containers on the states_p projection:

```
=> SELECT PARTITION_PROJECTION ('states_p');
PARTITION_PROJECTION
--------------------------
Projection partitioned
(1 row)
```

See Also

- PARTITION_TABLE
- Partitioning Tables in the Administrator's Guide
**PARTITION_TABLE**

Invokes the Tuple Mover to reorganize ROS storage containers as needed to conform with the current partitioning policy.

**Syntax**

```
PARTITION_TABLE ( '[schema.]table-name')
```

**Parameters**

<table>
<thead>
<tr>
<th>[database.]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>

| table-name        | The table to partition.                                                                                           |

**Privileges**

- Table owner
- USAGE privilege on schema

**Restrictions**

- You cannot run PARTITION_TABLE on a table that is an anchor table for a live aggregate projection or a Top-K projection.
- To reorganize storage to conform to a new policy, run PARTITION_TABLE after changing the partition GROUP BY expression.
See Also

- PARTITION_PROJECTION
- Partitioning Existing Table Data

**PURGE_PARTITION**

Purges a table partition of deleted rows. Similar to PURGE and PURGE_PROJECTION, this function removes deleted data from physical storage so you can reuse the disk space. PURGE_PARTITION removes data only from the AHM epoch and earlier.

**Syntax**

```
PURGE_PARTITION ( '[database.]schema.]table', partition-key )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>table</td>
<td>The partitioned table to purge.</td>
</tr>
<tr>
<td>partition-key</td>
<td>The key of the partition to purge.</td>
</tr>
</tbody>
</table>

**Privileges**

- Table owner
- USAGE privilege on schema
Example

The following example lists the count of deleted rows for each partition in a table, then calls `PURGE_PARTITION()` to purge the deleted rows from the data.

```sql
=> SELECT partition_key, table_schema, projection_name, sum(deleted_row_count) AS deleted_row_count FROM partitions
    GROUP BY partition_key, table_schema, projection_name
    ORDER BY partition_key;
```

<table>
<thead>
<tr>
<th>partition_key</th>
<th>table_schema</th>
<th>projection_name</th>
<th>deleted_row_count</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>1</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>2</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>4</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>5</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>6</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>7</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>8</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>9</td>
<td>public</td>
<td>t_super</td>
<td>1</td>
</tr>
</tbody>
</table>

(10 rows)

```sql
=> SELECT PURGE_PARTITION('t',5); -- Purge partition with key 5.
```

Task: merge partitions
(Table: public.t) (Projection: public.t_super)
(1 row)

```sql
=> SELECT partition_key, table_schema, projection_name, sum(deleted_row_count) AS deleted_row_count FROM partitions
    GROUP BY partition_key, table_schema, projection_name
    ORDER BY partition_key;
```

<table>
<thead>
<tr>
<th>partition_key</th>
<th>table_schema</th>
<th>projection_name</th>
<th>deleted_row_count</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>1</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>2</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>4</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>5</td>
<td>public</td>
<td>t_super</td>
<td>0</td>
</tr>
<tr>
<td>6</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>7</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>8</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>9</td>
<td>public</td>
<td>t_super</td>
<td>1</td>
</tr>
</tbody>
</table>

(10 rows)
See Also

- PURGE
- PURGE_PROJECTION
- PURGE_TABLE
- STORAGE_CONTAINERS

**SWAP_PARTITIONS_BETWEEN_TABLES**

Swaps partitions between two tables.

**Syntax**

```sql
SWAP_PARTITIONS_BETWEEN_TABLES (  
  '[[database.]schema.]staging-table',  
  'min-range-value',  
  'max-range-value',  
  '[[database.]schema.]target-table'  
  [, force-split]
)
```

**Parameters**

<table>
<thead>
<tr>
<th><code>[database.]schema</code></th>
<th>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td>staging-table</td>
<td>The staging table from which to swap partitions.</td>
</tr>
<tr>
<td><code>min-range-value</code></td>
<td>The minimum and maximum value of partition keys to swap, where <code>min-range-value</code> must be ( \leq ) <code>max-range-value</code>. To swap one partition, <code>min-range-value</code> and <code>max-range-value</code> must be equal.</td>
</tr>
</tbody>
</table>
The table to which the partitions are to be swapped. The target table cannot be the same as the staging table.

Optional Boolean argument, specifies whether to split ROS containers if the range of partition keys spans multiple containers or part of a single container:

- `true`: Split ROS containers as needed.
- `false` (default): Return with an error if ROS containers must be split to implement this operation.

Privileges

Non-superuser, one of the following:

- Owner of source and target tables
- TRUNCATE and INSERT privileges on source and target tables

If the target table does not exist, you must also have CREATE privileges on the target schema to enable table creation.

Requirements

The following attributes of both tables must be identical:

- Column definitions, including NULL/NOT NULL constraints
- Segmentation
- **Partition clause**
- Number of projections
- Projection sort order
- Primary and unique key constraints. However, the key constraints do not have to be identically enabled. For more information on constraints, see [Constraints](#) in the Administrator’s Guide.

Note:

If the target table has primary or unique key constraints enabled and copying or moving the partitions will insert duplicate key values into the target table, Vertica rolls back the operation.

- Check constraints. For `MOVE_PARTITIONSTO_TABLE` and `COPY_PARTITIONSTO_TABLE`, Vertica enforces enabled check constraints on the target table only. For
SWAP_PARTITIONS_BETWEEN_TABLES, Vertica enforces enabled check constraints on both tables. If there is a violation of an enabled check constraint, Vertica rolls back the operation.
- Number and definitions of text indices.

Restrictions

The following restrictions apply to the source and target tables:
- If the source and target partitions are in different storage tiers, Vertica returns a warning but the operation proceeds. The partitions remain in their existing storage tier.
- The following tables cannot be used as sources or targets:
  - Temporary tables
  - Virtual tables
  - System tables
  - External tables

Examples

See Swapping Partitions.

See Also

MOVE_PARTITIONS_TO_TABLE

Privileges and Access Functions

This section contains functions for managing user and role privileges, and access policies.

ENABLED_ROLE

Checks whether a Vertica user role is enabled, and returns true or false. This function is typically used when you create access policies on database roles.
**Syntax**

\[
\text{ENABLED_ROLE ( \text{"role"} )}
\]

**Parameters**

| role | The role to evaluate. |

**Privileges**

None

**Examples**

See:

- Creating Column Access Policies
- Creating Row Access Policies

**See Also**

CREATE ACCESS POLICY

**GET_PRIVILEGES_DESCRIPTION**

Returns the effective privileges the current user has on an object, including explicit, implicit, inherited, and role-based privileges.

Because this meta-function only returns effective privileges, GET_PRIVILEGES_DESCRIPTION only returns privileges with fully-satisfied prerequisites. For a list of
prerequisites for common operations, see Privileges Required for Common Database Operations.

For example, a user must have the following privileges to query a table:

- Schema: USAGE
- Table: SELECT

If user Brooke has SELECT privileges on table s1.t1 but lacks USAGE privileges on schema s1, Brooke cannot query the table, and GET_PRIVILEGES_DESCRIPTION does not return SELECT as a privilege for the table.

### Note:
Inherited privileges are not displayed if privilege inheritance is disabled at the database level.

## Syntax

```
GET_PRIVILEGES_DESCRIPTION( 'type', '[[database.]schema.]name' );
```

## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>type</strong></td>
<td>Specifies an object type, one of the following:</td>
</tr>
<tr>
<td>database</td>
<td></td>
</tr>
<tr>
<td>table</td>
<td></td>
</tr>
<tr>
<td>schema</td>
<td></td>
</tr>
<tr>
<td>view</td>
<td></td>
</tr>
<tr>
<td>sequence</td>
<td></td>
</tr>
<tr>
<td>model</td>
<td></td>
</tr>
<tr>
<td>library</td>
<td></td>
</tr>
<tr>
<td>resource pool</td>
<td></td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Specifies a database and schema, by default the current database and public, respectively.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the target object</td>
</tr>
</tbody>
</table>
Privileges

None

Example

In the following example, user Glenn has set the REPORTER role and wants to check his effective privileges on schema s1 and table s1.articles.

- Table s1.articles inherits privileges from its schema (s1).
- The REPORTER role has the following privileges:
  - SELECT on schema s1
  - INSERT WITH GRANT OPTION on table s1.articles
- User Glenn has the following privileges:
  - UPDATE and USAGE on schema s1.
  - DELETE on table s1.articles.

GET_PRIVILEGES_DESCRIPTION returns the following effective privileges for Glenn on schema s1:

```sql
=> SELECT GET_PRIVILEGES_DESCRIPTION('schema', 's1');
   GET_PRIVILEGES_DESCRIPTION
-----------------------------
   SELECT, UPDATE, USAGE
(1 row)
```

GET_PRIVILEGES_DESCRIPTION returns the following effective privileges for Glenn on table s1.articles:

```sql
=> SELECT GET_PRIVILEGES_DESCRIPTION('table', 's1.articles');
   GET_PRIVILEGES_DESCRIPTION
-----------------------------
   INSERT*, SELECT, UPDATE, DELETE
(1 row)
```

See Also

- Database Users and Privileges
- Database Roles
- Granting and Revoking Privileges
**HAS_ROLE**

Checks whether a Vertica user role is granted to the specified user or role, and returns true or false.

You can also query system tables `ROLES`, `GRANTS`, and `USERS` to obtain information on users and their role assignments. For details, see Viewing User Roles.

**Behavior Type**

*Stable*

**Syntax**

```
HAS_ROLE( [ 'grantee', ] 'verify-role' );
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>grantee</code></td>
<td>Valid only for superusers, specifies the name of a user or role to look up. If this argument is omitted, the function uses the current user name (CURRENT_USER). If you specify a role, Vertica checks whether this role is granted to the role specified in <code>verify-role</code>.</td>
</tr>
<tr>
<td><code>verify-role</code></td>
<td>Name of the role to verify for <code>grantee</code>.</td>
</tr>
</tbody>
</table>

**Privileges**

None
Examples

In the following example, a dbadmin user checks whether user MikeL is assigned the administrator role:

```sql
=> \c
You are now connected as user "dbadmin".
=> SELECT HAS_ROLE('MikeL', 'administrator');
   HAS_ROLE
  ----------
   t            
(1 row)
```

User MikeL checks whether he has the regional_manager role:

```sql
=> \c - MikeL
You are now connected as user "MikeL".
=> SELECT HAS_ROLE('regional_manager');
   HAS_ROLE
   ----------
   f            
(1 row)
```

The dbadmin grants the regional_manager role to the administrator role. On checking again, MikeL verifies that he now has the regional_manager role:

```sql
dbadmin=> \c
You are now connected as user "dbadmin".
dbadmin=> GRANT regional_manager to administrator;
GRANT ROLE
   
dbadmin=> \c - MikeL
You are now connected as user "MikeL".
dbadmin=> SELECT HAS_ROLE('regional_manager');
   HAS_ROLE
   ----------
   t            
(1 row)
```

See Also

- GRANTS
- ROLES
- USERS
- Database Users and Privileges
**RELEASE_SYSTEM_TABLES_ACCESS**

Enables non-superuser access to all system tables. After you call this function, Vertica ignores the IS_ACCESSIBLE_DURING_LOCKDOWN setting in table SYSTEM_TABLES. To resume enforcement of access restrictions on non-superusers to system tables, call RESTRICT_SYSTEM_TABLES_ACCESS.

**Syntax**

```
RELEASE_SYSTEM_TABLES_ACCESS()
```

**Privileges**

Superuser

---

**RESTRICT_SYSTEM_TABLES_ACCESS**

Checks system table SYSTEM_TABLES to determine which system tables non-superusers can access. Non-superuser access to each system table is specified by the Boolean column IS_ACCESSIBLE_DURING_LOCKDOWN. When you call this function, Vertica checks the IS_ACCESSIBLE_DURING_LOCKDOWN setting on each system table, and enforces access on all non-superuser accordingly.

By default, Vertica enforces IS_ACCESSIBLE_DURING_LOCKDOWN settings. To enable non-superuser access to all system tables, you must explicitly call RELEASE_SYSTEM_TABLES_ACCESS.

**Syntax**

```
RESTRICT_SYSTEM_TABLES_ACCESS()
```

**Privileges**

Superuser
Profiling Functions

This section contains profiling functions specific to Vertica.

CLEAR_PROFILING

Clears from memory data for the specified profiling type.

Note:
Vertica stores profiled data in memory, so profiling can be memory intensive depending on how much data you collect.

Syntax

CLEAR_PROFILING( 'profiling-type' [, 'scope'] )

Parameters

<table>
<thead>
<tr>
<th>profiling-type</th>
<th>The type of profiling data to clear:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>session: Clear profiling for basic session parameters and lock time out data.</td>
</tr>
<tr>
<td></td>
<td>query: Clear profiling for general information about queries that ran, such as the query strings used and the duration of queries.</td>
</tr>
<tr>
<td></td>
<td>ee: Clear profiling for information about the execution run of each query.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>scope</th>
<th>Specifies at what scope to clear profiling on the specified data, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>local: Clear profiling data for the current session.</td>
</tr>
<tr>
<td></td>
<td>global: Clear profiling data across all database sessions.</td>
</tr>
</tbody>
</table>
Example

The following statement clears profiled data for queries:

```sql
=> SELECT CLEAR_PROFLING('query');
```

See Also

- DISABLE_PROFILING
- ENABLE_PROFILING
- SHOW_PROFILING_CONFIG
- Profiling Database Performance

**DISABLE PROFILING**

Disables for the current session collection of profiling data of the specified type. For detailed information, see Enabling Profiling in the Administrator's Guide

**Syntax**

```sql
DISABLE_PROFILING( 'profiling-type' )
```

**Parameters**

<table>
<thead>
<tr>
<th>profiling-type</th>
<th>The type of profiling data to disable:</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>Disables profiling for basic session parameters and lock time out data.</td>
</tr>
<tr>
<td>query</td>
<td>Disables profiling for general information about queries that ran, such as the query strings used and the duration of queries.</td>
</tr>
<tr>
<td>ee</td>
<td>Disables profiling for information about the execution run of each query.</td>
</tr>
</tbody>
</table>
Example

The following statement disables profiling on query execution runs:

```
=> SELECT DISABLE_PROFILING('ee');
DISABLE_PROFILING
---------------------
EE Profiling Disabled
(1 row)
```

See Also

- `CLEAR_PROFILING`
- `ENABLE_PROFILING`
- `SHOW_PROFILING_CONFIG`

**ENABLE_PROFILING**

Enables collection of profiling data of the specified type for the current session. For detailed information, see Enabling Profiling in the Administrator's Guide.

**Note:**

Vertica stores session and query profiling data in memory, so profiling can be memory intensive, depending on how much data you collect.

Syntax

```
ENABLE_PROFILING( 'profiling-type' )
```

Parameters

<table>
<thead>
<tr>
<th><strong>profiling-type</strong></th>
<th>The type of profiling data to enable:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>session: Enable profiling for basic session parameters and</td>
</tr>
</tbody>
</table>
lock time out data.
- query: Enable profiling for general information about queries that ran, such as the query strings used and the duration of queries.
- ee: Enable profiling for information about the execution run of each query.

Example

The following statement enables profiling on query execution runs:

```sql
=> SELECT ENABLE_PROFILING('ee');
ENABLE_PROFILING
-----------------------
EE Profiling Enabled
(1 row)
```

See Also

- CLEAR_PROFILING
- DISABLE_PROFILING
- SHOW_PROFILING_CONFIG

**SHOW_PROFILING_CONFIG**

Shows whether profiling is enabled.

Syntax

`SHOW_PROFILING_CONFIG ()`

Example

The following statement shows that profiling is enabled globally for all profiling types (session, execution engine, and query):

```sql
SHOW_PROFILING_CONFIG ()
```
```
=> SELECT SHOW_PROFILING_CONFIG();
SHOW_PROFILING_CONFIG
-----------------------------------
Session Profiling: Session off, Global on
EE Profiling:     Session off, Global on
Query Profiling:  Session off, Global on
(1 row)
```

See Also

- `CLEAR_PROFILING`
- `DISABLE_PROFILING`
- `ENABLE_PROFILING`
- `Profiling Database Performance`
Projection Management Functions

This section contains projection management functions specific to Vertica.

See Also

- `V_CATALOG.PROJECTIONS`
- `V_CATALOG.PROJECTION_COLUMNS`
- `V_MONITOR.PROJECTION_REFRESHES`
- `V_MONITOR.PROJECTION_STORAGE`

**CLEAR_PROJECTION_REFRESHES**

Clears information projection refresh history from system table `PROJECTION_REFRESHES`.

System table `PROJECTION_REFRESHES` records information about refresh operations, successful and unsuccessful. `PROJECTION_REFRESHES` retains projection refresh data until one of the following events occurs:

- Another refresh operation starts on a given projection.
- `CLEAR_PROJECTION_REFRESHES` is called and clears data on all projections.
- The table's storage quota is exceeded.

`CLEAR_PROJECTION_REFRESHES` checks `PROJECTION_REFRESHES` Boolean column `IS_EXECUTING` to determine whether refresh operations are still running or are complete. The function only removes information for refresh operations that are complete.

Syntax

```
CLEAR_PROJECTION_REFRESHES()
```

Privileges

Superuser
Example

```sql
=> SELECT CLEAR_PROJECTION_REFRESHES();
CLEAR_PROJECTION_REFRESHES
---------------------------
CLEAR
(1 row)
```

See Also

- REFRESH
- START_REFRESH
- Clearing Projection Refresh History

**EVALUATE_DELETE_PERFORMANCE**

Evaluates projections for potential DELETE and UPDATE performance issues. If Vertica finds any issues, it issues a warning message. When evaluating multiple projections, EVALUATE_DELETE_PERFORMANCE returns up to ten projections with issues, and the name of a table that lists all issues that it found.

**Note:**

EVALUATE_DELETE_PERFORMANCE returns messages that specifically reference delete performance. Keep in mind, however, that delete and update operations benefit equally from the same optimizations.

For information on resolving delete and update performance issues, see DELETE and UPDATE Optimization in the Administrator’s Guide.

Syntax

```sql
EVALUATE_DELETE_PERFORMANCE ( ['[[database.]schema.]scope'] )
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>database</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td>If you specify a database, it must be the current database.</td>
<td></td>
</tr>
</tbody>
</table>

scope

Specifies the projections to evaluate, one of the following:

- **[table.]projection**
  Evaluate projection. For example:
  ```sql
  SELECT EVALUATE_DELETE_PERFORMANCE('store.store_orders_fact.store_orders_fact_b1');
  ```

- **table**
  Specifies to evaluate all projections of table. For example:
  ```sql
  SELECT EVALUATE_DELETE_PERFORMANCE('store.store_orders_fact');
  ```

If you supply no arguments, EVALUATE_DELETE_PERFORMANCE evaluates all projections that you can access. Depending on the size of your database, this can incur considerable overhead.

Privileges

Non-superuser: SELECT privilege on the anchor table

Example

EVALUATE_DELETE_PERFORMANCE evaluates all projections of table example for potential DELETE and UPDATE performance issues.
create table example (A int, B int, C int);

CREATE TABLE
create projection one_sort (A, B, C) as (select A, B, C from example) order by A;
CREATE PROJECTION
create projection two_sort (A, B, C) as (select A, B, C from example) order by A, B;
CREATE PROJECTION

select evaluate_delete_performance('example');

No projection delete performance concerns found.
(1 row)

The previous example show that the two projections one_sort and two_sort have no inherent structural issues that might cause poor DELETE performance. However, the data contained within the projection can create potential delete issues if the sorted columns do not uniquely identify a row or small number of rows.

In the following example, Perl is used to populate the table with data using a nested series of loops:

- The inner loop populates column C.
- The middle loop populates column B.
- The outer loop populates column A.

The result is column A contains only three distinct values (0, 1, and 2), while column B slowly varies between 20 and 0 and column C changes in each row:

perl -e 'for ($i=0; $i<3; $i++) { for ($j=0; $j<21; $j++) { for ($k=0; $k<19; $k++) { printf "%d,%d,%d\n", $i,$j,$k; }}}' | /opt/vertica/bin/vsql -c "copy example from stdin delimiter ',' direct;"
Password:
select * from example;

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
<th>C</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>20</td>
<td>18</td>
</tr>
<tr>
<td>0</td>
<td>20</td>
<td>17</td>
</tr>
<tr>

</tbody>
</table>
EVALUATE_DELETE_PERFORMANCE is run against the projections again to determine whether the data within the projections causes any potential DELETE performance issues. Projection one_sort has potential delete issues as it only sorts on column A which has few distinct values. Each value in the sort column corresponds to many rows in the projection, which can adversely impact DELETE performance. In contrast, projection two_sort is sorted on columns A and B, where each combination of values in the two sort columns identifies just a few rows, so deletes can be performed faster:

```sql
=> select evaluate_delete_performance('example');
evaluate_delete_performance
---------------------------------------------
The following projections exhibit delete performance concerns:
  "public"."one_sort_b1"
  "public"."one_sort_b0"
See v_catalog.projection_delete_concerns for more details.
```

Expanded display is on.
```sql
dbadmin=> select * from projection_delete_concerns;
-[- RECORD 1 ]-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-
---------------------------------------------
projection_id | 45035996273878562
projection_schema | public
```
If you omit supplying an argument to `EVALUATE_DELETE_PERFORMANCE`, it evaluates all projections that you can access:

```sql
=> select evaluate_delete_performance();

<table>
<thead>
<tr>
<th>evaluate_delete_performance</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

The following projections exhibit delete performance concerns:

- "public"."one_sort_b0"
- "public"."one_sort_b1"

See `v_catalog.projection_delete_concerns` for more details.

(1 row)

---

### GET_PROJECTION_SORT_ORDER

Returns the order of columns in a projection's ORDER BY clause.

**Syntax**

```sql
GET_PROJECTION_SORT_ORDER( '[[database.]schema.]projection' );
```

**Parameters**

| [database.]schema | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>projection</td>
<td>The target projection.</td>
</tr>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
</tbody>
</table>

If you specify a database, it must be the current database.
Privileges

Non-superuser: SELECT privilege on the anchor table

Examples

```
=> SELECT get_projection_sort_order ('store_orders_super');

get_projection_sort_order

public.store_orders_super [Sort Cols: "order_no", "order_date", "shipper", "ship_date"]

(1 row)
```

**GET_PROJECTION_STATUS**

Returns information relevant to the status of a projection:

- The current K-safety status of the database
- The number of nodes in the database
- Whether the projection is segmented
- The number and names of buddy projections
- Whether the projection is safe
- Whether the projection is up to date
- Whether statistics have been computed for the projection

Use `GET_PROJECTION_STATUS` to monitor the progress of a projection data refresh.

Syntax

```
GET_PROJECTION_STATUS ( '[[database.]schema.]projection' );
```

Parameters

```
[database.]schema | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name.
```
For example:
```
myschema.thisDbObject
```
If you specify a database, it must be the current database.

<table>
<thead>
<tr>
<th>projection</th>
<th>The projection for which to display status.</th>
</tr>
</thead>
</table>

Examples

```sql
=> SELECT GET_PROJECTATION_STATUS('public.customer_dimension_site01');
```

```
-- GET_PROJECTATION_STATUS

 Current system K is 1.
 # of Nodes: 4.
 public.customer_dimension_site01 [Segmented: No] [Seg Cols: ] [K: 3] [public.customer_dimension_site04, public.customer_dimension_site03, public.customer_dimension_site02]
 [Safe: Yes] [UptoDate: Yes][Stats: Yes]
```

**GET_PROJECTIONS**

Returns contextual and projection information about projections of the specified anchor table.

<table>
<thead>
<tr>
<th>Contextual information</th>
<th>Database K-safety</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Number of database nodes</td>
</tr>
<tr>
<td></td>
<td>Number of projections for this table</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Projection data</th>
<th>For each projection, specifies:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>All buddy projections</td>
</tr>
<tr>
<td></td>
<td>Whether it is segmented</td>
</tr>
<tr>
<td></td>
<td>Whether it is safe</td>
</tr>
<tr>
<td></td>
<td>Whether it is up-to-date</td>
</tr>
</tbody>
</table>

You can also use **GET_PROJECTIONS** to monitor the progress of a projection data refresh.
Syntax

```
GET_PROJECTIONS('[[database.]schema-name.]table')
```

Parameters

<table>
<thead>
<tr>
<th>**database.**schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
</tbody>
</table>

If you specify a database, it must be the current database.

| **table** | Anchor table of the projections to list. |

Privileges

None

Examples

The following example gets information about projections for VMart table `store.store_dimension`:

```sql
=> SELECT GET_PROJECTIONS('store.store_dimension');
- [ RECORD 1 ]--+
GET_PROJECTIONS | Current system K is 1.
# of Nodes: 3.
Table store.store_dimension has 2 projections.

  Projection Name: [Segmented] [Seg Cols] [# of Buddies] [Buddy Projections] [Safe] [UptoDate] [Stats]
  ---------------------------------------------------------------------------------------------------------------------------------+-------------------------------------------+-------------------------------------------+---------------------------------------------------+-----------------------------------+-----------------------------------+-----------------------------------|
  `store.store_dimension_b1` [Segmented: Yes] [Seg Cols: "store.store_dimension.store_key"] [K: 1] [store.store_dimension_b0] [Safe: Yes] [UptoDate: Yes] [Stats: RowCounts] `store.store_dimension_b0` [Segmented: Yes] [Seg Cols: "store.store_dimension.store_key"] [K: 1] [store.store_dimension_b1] [Safe: Yes] [UptoDate: Yes] [Stats: RowCounts]```
**REFRESH**

Synchronously refreshes one or more table projections in the foreground, and updates system table `PROJECTION_REFRESHES`. If you run `REFRESH` with no arguments, it refreshes all projections that contain stale data.

To understand projection refresh in detail, go to Refreshing Projections.

**Syntax**

```
REFRESH ( [ '[database.]schema.]table-name[,..]' ] )
```

**Parameters**

| `[database.]schema` | Specifies a schema, by default `public`. If `schema` is any schema other than `public`, you must supply the schema name. For example:
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>table-name</code></td>
<td>The anchor table of the projections to refresh. If you specify multiple tables, <code>REFRESH</code> attempts to refresh them in parallel. Such calls are part of the Database Designer deployment (and deployment script).</td>
</tr>
</tbody>
</table>

**Returns**

**Note:**

If `REFRESH` does not refresh any projections, it returns a header string with no results.
### Column... | Returns...
---|---
Projection Name | The projection targeted for refresh.
Anchor Table | The projection's associated anchor table.
Status | Projections' refresh status:
- queued: Queued for refresh.
- refreshing: Refresh is in process.
- refreshed: Refresh successfully completed.
- failed: Refresh did not successfully complete.
Refresh Method | Method used to refresh the projection.
Error Count | Number of times a refresh failed for the projection.
Duration (sec) | How long (in seconds) the projection refresh ran.

### Privileges
- **Superuser**
- Owner of the specified tables

### Refresh Methods
Vertica can refresh a projection from one of its buddies, if one is available. In this case, the target projection gets the source buddy's historical data. Otherwise, the projection is refreshed from scratch with data of the latest epoch at the time of the refresh operation. In this case, the projection cannot participate in historical queries on any epoch that precedes the refresh operation.

To determine the method used to refresh a given projection, query `REFRESH_METHOD` from system table `PROJECTION_REFRESHES`. 
Examples

The following example refreshes the projections in tables t1 and t2:

```sql
=> SELECT REFRESH('t1, t2');
```

Refresh completed with the following outcomes:

Projection Name: [Anchor Table] [Status] [Refresh Method] [Error Count] [Duration (sec)]
```
"public"."t1_p": [t1] [refreshed] [scratch] [0] [0]
"public"."t2_p": [t2] [refreshed] [scratch] [0] [0]
```

This next example shows that only the projection on table t was refreshed:

```sql
=> SELECT REFRESH('allow, public.deny, t');
```

Refresh completed with the following outcomes:

Projection Name: [Anchor Table] [Status] [Refresh Method] [Error Count] [Duration (sec)]
```
"n/a"."n/a": [n/a] [failed: insufficient permissions on table "allow"] [0] [1] [0]
"n/a"."n/a": [n/a] [failed: insufficient permissions on table "public.deny"] [0] [1] [0]
"public"."t_p1": [t] [refreshed] [scratch] [0] [0]
```

See Also

- `CLEAR_PROJECTION_REFRESSES`
- `START_REFRESH`

**REFRESH_COLUMNS**

Refreshes table columns that are defined with the constraint `SET USING` or `DEFAULT USING`. All refresh operations associated with a call to `REFRESH_COLUMNS` belong to the same transaction. Thus, all tables and columns specified by `REFRESH_COLUMNS` must be refreshed; otherwise, the entire operation is rolled back.
Syntax

REFRESH_COLUMNS ( 'table-list', '[column-list]' [, '[refresh-mode]' [, min-partition-key, max-partition-key] ]
)

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
</table>
| table-list | A comma-delimited list of the tables to refresh: <br>[[database.]schema.]table[, ...]  
**Important:**  
If you specify multiple tables, parameter refresh-mode must be set to REBUILD. |
| column-list | A comma-delimited list of columns to refresh, specified as follows:  
- [[[database.]schema.]table.]column[, ...]  
- [[[database.]schema.]table.]*  
where asterisk (*) specifies to refresh all SET USING/DEFAULT USING columns in table. For example:  

```
SELECT REFRESH_COLUMNS ('t1, t2', 't1.*, t2.b', 'REBUILD');
```

If column-list is set to an empty string (''), REFRESH_COLUMNS refreshes all SET USING/DEFAULT USING columns in the specified tables.  

The following requirements apply:  
- All specified columns must have a SET USING or DEFAULT USING constraint.  
- If REFRESH_COLUMNS specifies multiple tables, all column names must be qualified by their table names. If the target tables span multiple schemas, all column names must be fully qualified by their schema and table names. For example:
```sql
SELECT REFRESH_COLUMNS ('t1, t2', 't1.a, t2.b', 'REBUILD');
```

If you specify a database, it must be the current database.

<table>
<thead>
<tr>
<th>refresh-mode</th>
<th>Specifies how to refresh SET USING columns:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• UPDATE: Marks original rows as deleted and replaces them with new rows. In order to save these updates, you must issue a COMMIT statement.</td>
</tr>
<tr>
<td></td>
<td>• REBUILD: Replaces all data in the specified columns. The rebuild operation is auto-committed.</td>
</tr>
</tbody>
</table>

If set to an empty string or omitted, REFRESH_COLUMNS executes in UPDATE mode. If you specify multiple tables, you must explicitly specify REBUILD mode.

In both cases, REFRESH_COLUMNS returns an error if any SET USING column is defined as a primary or unique key in a table that enforces those constraints.

See REBUILD Mode Restrictions for limitations on using the REBUILD option.

<table>
<thead>
<tr>
<th>min-partition-key</th>
<th>max-partition-key</th>
</tr>
</thead>
<tbody>
<tr>
<td>Qualifies REBUILD mode, limiting the rebuild operation to one or more partitions. To specify a range of partitions, max-partition-key must be greater than min-partition-key. To update one partition, the two arguments must be equal.</td>
<td></td>
</tr>
</tbody>
</table>

The following requirements apply:

- The function can specify only one table to refresh.
- The table must be partitioned on the specified keys.

You can use these arguments to refresh columns with recently loaded data—that is, data in the latest partitions. Using this option regularly can significantly minimize the overhead otherwise incurred by rebuilding entire columns in a large table.

See Partition-based REBUILD Operations below for details.
Privileges

- Schemas of queried and flattened tables: USAGE
- Queried table: SELECT
- Flattened table: SELECT, UPDATE

UPDATE versus REBUILD Modes

In general, UPDATE mode is a better choice when changes to SET USING column data are confined to a relatively small number of rows. Use REBUILD mode when a significant amount of SET USING column data is stale and must be updated. It is generally good practice to call REFRESH_COLUMNS with REBUILD on any new SET USING column—for example, to populate a SET USING column after adding it with ALTER TABLE...ADD COLUMN.

REBUILD Mode Restrictions

If you call REFRESH_COLUMNS on a SET USING column and specify the refresh mode as REBUILD, Vertica returns an error if the column is specified in any of the following:

- Table's partition key
- Unsegmented projection
- **Projection with expressions**, or any **live aggregate projection that invokes a user-defined transform function** (UDTF)
- Sort order or segmentation of any projection
- Any projection that omits an anchor table column that is referenced in the column's SET USING expression
- **GROUPED clause** of any projection

Partition-based REBUILD Operations

If a flattened table is partitioned, you can reduce the overhead of calling REFRESH_COLUMNS in REBUILD mode, by specifying one or more partition keys. Doing so limits the rebuild operation to the specified partitions. For example, table public.orderFact is defined with SET USING column cust_name. This table is partitioned on column order_date, where the partition clause invokes Vertica function `CALENDAR_HIERARCHY_DAY`. 
Thus, you can call REFRESH_COLUMNS on specific time-delimited partitions of this table—in this case, on orders over the last two months:

```sql
=> SELECT REFRESH_COLUMNS ('public.orderFact',
   'cust_name',
   'REBUILD',
   TO_CHAR(ADD_MONTHS(current_date, -2),'YYYY-MM')||'-01',
   TO_CHAR(LAST_DAY(ADD_MONTHS(current_date, -1))));
```

 refresh_columns completed
(1 row)

### Rewriting SET USING Queries

When you call REFRESH_COLUMNS on a flattened table's SET USING (or DEFAULT USING) column, it executes the SET USING query by joining the target and source tables. By default, the source table is always the inner table of the join. In most cases, cardinality of the source table is less than the target table, so REFRESH_COLUMNS executes the join efficiently.

Occasionally—notably, when you call REFRESH_COLUMNS on a partitioned table—the source table can be larger than the target table. In this case, performance of the join operation can be suboptimal.

You can address this issue by enabling configuration parameter `RewriteQueryForLargeDim`. When enabled (1), Vertica rewrites the query, by reversing the inner and outer join between the target and source tables.

**Important:**

Enable this parameter only if the SET USING source data is in a table that is larger than the target table. If the source data is in a table smaller than the target table, then enabling RewriteQueryForLargeDim can adversely affect refresh performance.

### Examples

See Flattened Table Example and DEFAULT versus SET USING.
**START_REFRESH**

Refreshes projections in the [current schema](https://www.vertica.com/docs/11.0.x/UG_en.htm#com_vertica_ug_en_toc110) with the latest data of their respective anchor tables. START_REFRESH runs asynchronously in the background, and updates system table `PROJECTION_REFRESHES`. This function has no effect if a refresh is already running.

To refresh only projections of a specific table, use `REFRESH`. When you deploy a design through Database Designer, it automatically refreshes its projections.

**Syntax**

```
START_REFRESH()
```

**Privileges**

None

**Requirements**

All nodes must be up.

**Refresh Methods**

Vertica can refresh a projection from one of its buddies, if one is available. In this case, the target projection gets the source buddy's historical data. Otherwise, the projection is refreshed from scratch with data of the latest epoch at the time of the refresh operation. In this case, the projection cannot participate in historical queries on any epoch that precedes the refresh operation.

To determine the method used to refresh a given projection, query `REFRESH_METHOD` from system table `PROJECTION_REFRESHES`. 
Example

```sql
=> SELECT START_REFRESH();
START_REFRESH
-----------------------------
Starting refresh background process.
(1 row)
```

Purge Functions

This section contains purge functions specific to Vertica.

**PURGE**

Permanently removes delete vectors from ROS storage containers so disk space can be reused. **PURGE** removes all historical data up to and including the *Ancient History Mark* epoch.

**PURGE** does not delete temporary tables.

<table>
<thead>
<tr>
<th>Caution:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>PURGE</strong> can temporarily use significant disk space.</td>
</tr>
</tbody>
</table>

**Syntax**

```
SELECT PURGE()
```

**Privileges**

- Table owner
- USAGE privilege on schema

**Example**

After you delete data from a Vertica table, that data is marked for deletion. To see the data that is marked for deletion, query system table **DELETE_VECTORS**.

Run **PURGE** to remove the delete vectors from ROS containers.

```
=> SELECT * FROM test1;
    number
  -------

```
(6 rows)

=> DELETE FROM test1 WHERE number > 50;

OUTPUT
-------

2
(1 row)

=> SELECT * FROM test1;

number
-------

43
3
12
33
(4 rows)

=> SELECT node_name, projection_name, deleted_row_count FROM DELETE_VECTORS;

<table>
<thead>
<tr>
<th>node_name</th>
<th>projection_name</th>
<th>deleted_row_count</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_vmart_node002</td>
<td>test1_b1</td>
<td>1</td>
</tr>
<tr>
<td>v_vmart_node001</td>
<td>test1_b1</td>
<td>1</td>
</tr>
<tr>
<td>v_vmart_node001</td>
<td>test1_b0</td>
<td>1</td>
</tr>
<tr>
<td>v_vmart_node003</td>
<td>test1_b0</td>
<td>1</td>
</tr>
</tbody>
</table>
(4 rows)

=> SELECT PURGE();

... (Table: public.test1) (Projection: public.test1_b0)
... (Table: public.test1) (Projection: public.test1_b1)

(4 rows)

After the ancient history mark (AHM) advances:

=> SELECT * FROM DELETE_VECTORS;

(No rows)

See Also

- Purging Deleted Data
- PURGE_PARTITION
- PURGE_PROJECTION
- PURGE_TABLE
**PURGE_PARTITION**

Purges a table partition of deleted rows. Similar to PURGE and PURGE_PROJECTION, this function removes deleted data from physical storage so you can reuse the disk space. PURGE_PARTITION removes data only from the AHM epoch and earlier.

**Syntax**

```
PURGE_PARTITION ( '[database.]schema.table', partition-key )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `[database.]schema` | Specifies a schema, by default public. If `schema` is any schema other than public, you must supply the schema name. For example:  
|                   | `myschema.thisDbObject`                                                     |
| table             | The partitioned table to purge.                                             |
| partition-key     | The key of the partition to purge.                                         |

**Privileges**

- Table owner
- USAGE privilege on schema

**Example**

The following example lists the count of deleted rows for each partition in a table, then calls `PURGE_PARTITION()` to purge the deleted rows from the data.
```sql
=> SELECT partition_key, table_schema, projection_name, sum(deleted_row_count) AS deleted_row_count FROM partitions
    GROUP BY partition_key, table_schema, projection_name
    ORDER BY partition_key;
```

<table>
<thead>
<tr>
<th>partition_key</th>
<th>table_schema</th>
<th>projection_name</th>
<th>deleted_row_count</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>1</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>2</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>4</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>5</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>6</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>7</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>8</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>9</td>
<td>public</td>
<td>t_super</td>
<td>1</td>
</tr>
</tbody>
</table>

(10 rows)

```sql
=> SELECT PURGE_PARTITION('t',5); -- Purge partition with key 5.
    purge_partition
```

Task: merge partitions

(Table: public.t) (Projection: public.t_super)

(1 row)

```sql
=> SELECT partition_key, table_schema, projection_name, sum(deleted_row_count) AS deleted_row_count FROM partitions
    GROUP BY partition_key, table_schema, projection_name
    ORDER BY partition_key;
```

<table>
<thead>
<tr>
<th>partition_key</th>
<th>table_schema</th>
<th>projection_name</th>
<th>deleted_row_count</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>1</td>

**See Also**

- `PURGE`
- `PURGE_PROJECTION`
- `PURGE_TABLE`
- `STORAGE_CONTAINERS`
**PURGE_PROJECTION**

Permanently removes deleted data from physical storage so disk space can be reused. You can purge historical data up to and including the Ancient History Mark epoch.

⚠️ **Caution:**

PURGE_PROJECTION can use significant disk space while purging the data.

See **PURGE** for details about purge operations.

**Syntax**

```
PURGE_PROJECTION ( '[database.]schema.]projection' )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject</td>
</tr>
<tr>
<td>projection</td>
<td>The projection to purge.</td>
</tr>
</tbody>
</table>

**Privileges**

- Table owner
- USAGE privilege on schema
## Examples

The following example purges all historical data in projection tbl\_p that precedes the Ancient History Mark epoch.

```sql
=> CREATE TABLE tbl (x int, y int);
CREATE TABLE
=> INSERT INTO tbl VALUES(1,2);
OUTPUT
--------
1
(1 row)
=> INSERT INTO tbl VALUES(3,4);
OUTPUT
--------
1
(1 row)
dbadmin=> COMMIT;
COMMIT
=> CREATE PROJECTION tbl\_p AS SELECT x FROM tbl UNSEGMENTED ALL NODES;
WARNING 4468: Projection <public.tbl\_p> is not available for query processing. Execute the select start\_refresh() function to copy data into this projection. The projection must have a sufficient number of buddy projections and all nodes must be up before starting a refresh
CREATE PROJECTION
=> SELECT START\_REFRESH();

START\_REFRESH

-----------------------------------------------------------
Starting refresh background process.
=> DELETE FROM tbl WHERE x=1;
OUTPUT
--------
1
(1 row)
=> COMMIT;
COMMIT
=> SELECT MAKE\_AHM\_NOW();

MAKE\_AHM\_NOW

----------------------------------------
AHM set (New AHM Epoch: 9066)
(1 row)
=> SELECT PURGE\_PROJECTION ('tbl\_p');
PURGE\_PROJECTION

-----------------------------
Projection purged
(1 row)
```
See Also

- PURGE_TABLE
- STORAGE_CONTAINERS
- Purging Deleted Data in the Administrator’s Guide.

**PURGE_TABLE**

Note: This function was formerly named PURGE_TABLE_PROJECTIONS(). Vertica still supports the former function name.

Permanently removes deleted data from physical storage so disk space can be reused. You can purge historical data up to and including the Ancient History Mark epoch.

Purges all projections of the specified table. You cannot use this function to purge temporary tables.

Syntax

PURGE_TABLE ( ‘[[database.]schema.]table’ )

Parameters

| [database .]schema | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>table</td>
<td>The table to purge.</td>
</tr>
</tbody>
</table>
Privileges

- Table owner
- USAGE privilege on schema

**Caution:**
PURGE_TABLE could temporarily take up significant disk space while the data is being purged.

Example

The following example purges all projections for the store sales fact table located in the Vmart schema:

```sql
=> SELECT PURGE_TABLE('store.store_sales_fact');
```

See Also

- PURGE
- PURGE_TABLE
- STORAGE_CONTAINERS
- Purging Deleted Data
Session Management Functions

This section contains session management functions specific to Vertica.

See also the SQL system table V_MONITOR.SESSIONS.

**CANCEL REFRESH**

Cancels refresh-related internal operations initiated by START REFRESH and REFRESH.

Syntax

CANCEL REFRESH()

Privileges

None

Notes

- Refresh tasks run in a background thread in an internal session, so you cannot use INTERRUPT_STATEMENT to cancel those statements. Instead, use CANCEL REFRESH to cancel statements that are run by refresh-related internal sessions.
- Run CANCEL REFRESH() on the same node on which START REFRESH() was initiated.
- CANCEL REFRESH() cancels the refresh operation running on a node, waits for the cancelation to complete, and returns SUCCESS.
- Only one set of refresh operations runs on a node at any time.

Example

Cancel a refresh operation executing in the background.
=> SELECT START_REFRESH();
START_REFRESH
--------------------------------------------------------
Starting refresh background process.
(1 row)
=> SELECT CANCEL_REFRESH();
CANCEL_REFRESH
--------------------------------------------------------
Stopping background refresh process.
(1 row)

See Also

- INTERRUPT_STATEMENT
- SESSIONS
- START_REFRESH
- PROJECTION_REFRESHES

**CLOSE_ALL_SESSIONS**

Closes all external sessions except the one that issues this function. Call this function before shutting down the Vertica database.

Vertica closes sessions asynchronously, so another session can open before this function returns. In this case, reissue this function. To view the status of all open sessions, query system table **SESSIONS**.

Syntax

CLOSE_ALL_SESSIONS()

Privileges

Non-superuser: None to close your own session

Examples

Two user sessions are open on separate nodes:
```sql
=> SELECT * FROM sessions;
- RECORD 1 -
| node_name    | v_vmartdb_node0001 |
| user_name    | dbadmin            |
| client_hostname | 127.0.0.1:52110    |
| client_pid   | 4554              |
| login_timestamp | 2011-01-03 14:05:40.252625-05 |
| session_id   | stress04-4325:0x14 |
| client_label |                  |
| transaction_start | 2011-01-03 14:05:44.325781 |
| transaction_id | 45035996273728326  |
| transaction_description | user dbadmin (select * from sessions); |
| statement_start | 2011-01-03 15:36:13.896288 |
| statement_id   | 10                |
| last_statement_duration_us | 14978             |
| current_statement | select * from sessions; |
| ssl_state      | None              |
| authentication_method | Trust           |

- RECORD 2 -
| node_name    | v_vmartdb_node0002 |
| user_name    | dbadmin            |
| client_hostname | 127.0.0.1:57174    |

- **SHUTDOWN**
- Managing Sessions

**CLOSE_SESSION**

Interrupts the specified external session, rolls back the current transaction if any, and closes the socket. You can only close your own session.

It might take some time before a session is closed. To view the status of all open sessions, query the system table **SESSIONS**.

For detailed information about session management options, see Managing Sessions in the Administrator’s Guide.
Syntax

CLOSE_SESSION ( 'sessionid' )

Parameters

| sessionid | A string that specifies the session to close. This identifier is unique within the cluster at any point in time but can be reused when the session closes. |

Privileges

None

Examples

User session opened. Record 2 shows the user session running a COPY DIRECT statement.

```sql
taxonomy | SELECT * FROM sessions;
-------------------------+------------------------------------------------------------------------------------------------------------------
node_name | v_vmartdb_node0001
user_name | dbadmin
client_hostname | 127.0.0.1:52110
client_pid | 4554
login_timestamp | 2011-01-03 14:05:40.252625-05
session_id | stress04-4325:0x14
client_label | |
transaction_start | 2011-01-03 14:05:44.325781
transaction_id | 45035996273728326
transaction_description | user dbadmin (SELECT * FROM sessions;)
statement_start | 2011-01-03 15:36:13.896288
statement_id | 10
last_statement_duration_us | 14978
current_statement | select * from sessions;
ssl_state | None
authentication_method | Trust
-------------------------+------------------------------------------------------------------------------------------------------------------
node_name | v_vmartdb_node0002
user_name | dbadmin
client_hostname | 127.0.0.1:57174
client_pid | 30117
login_timestamp | 2011-01-03 15:33:00.842021-05
session_id | stress05-27944:0xc1a
```
Close user session stress05-27944:0xc1a

```sql
=> \x
Expanded display is off.
```

```sql
=> SELECT CLOSE_SESSION('stress05-27944:0xc1a');
```

Session close command sent. Check v_monitor.sessions for progress.

(1 row)

Query the sessions table again for current status, and you can see that the second session has been closed:

```sql
=> SELECT * FROM SESSIONS;
```

```
node_name | v_vmartdb_node001
user_name | dbadmin
client_hostname | 127.0.0.1:52110
client_pid | 4554
login_timestamp | 2011-01-03 14:05:40.252625-05
session_id | stress04-4325:0x14
client_label | 
transaction_start | 2011-01-03 14:05:44.325781
transaction_id | 45035996273728326
transaction_description | user dbadmin (select * from SESSIONS;)
statement_start | 2011-01-03 16:12:07.841298
statement_id | 20
last_statement_duration_us | 2099
current_statement | SELECT * FROM SESSIONS;
ssl_state | None
authentication_method | Trust
```

See Also

- `CLOSE_ALL_SESSIONS`
- `SHUTDOWN`
**CLOSE_USER_SESSIONS**

Stops the session for a user, rolls back any transaction currently running, and closes the connection. To determine the status of the sessions to close, query the `SESSIONS` table.

**Note:**
Running this function on your own sessions leaves one session running.

**Syntax**

CLOSE_USER_SESSIONS ( 'user-name' )

**Parameters**

| **user-name** | Specifies the user whose sessions are to be closed. If you specify your own user name, Vertica closes all sessions except the one in which you issue this function. |

**Privileges**

**DBADMIN**

**Examples**

This example closes all active session for user u1:

```sql
=> SELECT close_user_sessions('u1');
```
See Also

- CLOSE_ALL_SESSIONS
- CLOSE_SESSION
- SHUTDOWN

**GET_NUM_ACCEPTED_ROWS**

Returns the number of rows loaded into the database for the last completed load for the current session. GET_NUM_ACCEPTED_ROWS is a meta-function. Do not use it as a value in an INSERT query.

The number of accepted rows is not available for a load that is currently in process. Check the LOAD_STREAMS system table for its status.

This meta-function supports loads from STDIN, COPY LOCAL from a Vertica client, or a single file on the initiator. You cannot use GET_NUM_ACCEPTED_ROWS for multi-node loads.

Syntax

```
GET_NUM_ACCEPTED_ROWS();
```

Privileges

None

**Note:**

The data regarding accepted rows from the last load during the current session does not persist, and is lost when you initiate a new load.
Examples

This examples shows the number of accepted rows from the vmart_load_data.sql meta-command.

```
=> \\i vmart_load_data.sql;
=> SELECT GET_NUM_ACCEPTED_ROWS ();
GET_NUM_ACCEPTED_ROWS
------------------------
300000
(1 row)
```

See Also

- `GET_NUM_REJECTED_ROWS`

**GET_NUM_REJECTED_ROWS**

Returns the number of rows that were rejected during the last completed load for the current session. GET_NUM_REJECTED_ROWS is a meta-function. Do not use it as a value in an INSERT query.

Rejected row information is unavailable for a load that is currently running. The number of rejected rows is not available for a load that is currently in process. Check the `LOAD_STREAMS` system table for its status.

This meta-function supports loads from STDIN, COPY LOCAL from a Vertica client, or a single file on the initiator. You cannot use GET_NUM_REJECTED_ROWS for multi-node loads.

Syntax

```
GET_NUM_REJECTED_ROWS();
```
Privileges

None

Note: The data regarding rejected rows from the last load during the current session does not persist, and is dropped when you initiate a new load.

Examples

This example shows the number of rejected rows from the vmart_load_data.sql meta-command.

=> \i vmart_load_data.sql
=> SELECT GET_NUM_REJECTED_ROWS ();
GET_NUM_REJECTED_ROWS
------------------------
0
(1 row)

See Also

- GET_NUM_ACCEPTED_ROWS

**INTERRUPT_STATEMENT**

Interrupts the specified statement in a user session, rolls back the current transaction, and writes a success or failure message to the log file.

Sessions can be interrupted during statement execution. Only statements run by user sessions can be interrupted.

Syntax

INTERRUPT_STATEMENT( 'session-id', statement-id )
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session-id</td>
<td>Identifies the session to interrupt. This identifier is unique within the cluster at any point in time.</td>
</tr>
<tr>
<td>statement-id</td>
<td>Identifies the statement to interrupt. If the statement-id is valid, the statement can be interrupted and INTERRUPT_STATEMENT returns a success message. Otherwise the system returns an error.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

Messages

The following list describes messages you might encounter:

<table>
<thead>
<tr>
<th>Message</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Statement interrupt sent. Check SESSIONS for progress.</td>
<td>This message indicates success.</td>
</tr>
<tr>
<td>Session &lt;id&gt; could not be successfully interrupted: session not found.</td>
<td>The session ID argument to the interrupt command does not match a running session.</td>
</tr>
<tr>
<td>Session &lt;id&gt; could not be successfully interrupted: statement not found.</td>
<td>The statement ID does not match (or no longer matches) the ID of a running statement (if any).</td>
</tr>
<tr>
<td>No interruptible statement running</td>
<td>The statement is DDL</td>
</tr>
<tr>
<td>Message</td>
<td>Meaning</td>
</tr>
<tr>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td>Internal (system) sessions cannot be interrupted.</td>
<td>The session is internal, and only statements run by external sessions can be interrupted.</td>
</tr>
</tbody>
</table>

### Examples

Two user sessions are open. RECORD 1 shows user session running `SELECT FROM SESSION`, and RECORD 2 shows user session running `COPY DIRECT`:

```sql
=> SELECT * FROM SESSIONS;
- [ RECORD 1 ]----------------------------------
node_name | v_vmartdb_node001
user_name | dbadmin
client_hostname | 127.0.0.1:52110
client_pid | 4554
login_timestamp | 2011-01-03 14:05:40.252625-05
session_id | stress04-4325:0x14
client_label | 
transaction_start | 2011-01-03 14:05:44.325781
transaction_id | 45035996273272326
transaction_description | user dbadmin (select * from sessions;)
statement_start | 2011-01-03 15:36:13.896288
statement_id | 10
last_statement_duration_us | 14978
current_statement | select * from sessions;
ssl_state | None
authentication_method | Trust
- [ RECORD 2 ]----------------------------------
node_name | v_vmartdb_node003
user_name | dbadmin
client_hostname | 127.0.0.1:56367
client_pid | 1191
login_timestamp | 2011-01-03 15:31:44.939302-05
session_id | stress06-25663:xbec
client_label | 
transaction_start | 2011-01-03 15:34:51.05939
transaction_id | 54043195528458775
transaction_description | user dbadmin (COPY Mart_Fact FROM '/data/Mart_Fact.tbl' DELIMITER '|' NULL ''\n' DIRECT;)
statement_start | 2011-01-03 15:35:46.436748
statement_id | 5
last_statement_duration_us | 1591403
current_statement | COPY Mart_Fact FROM '/data/Mart_Fact.tbl' DELIMITER '|' NULL ''\n' DIRECT;
## Interrupt the COPY DIRECT statement running in session stress06-25663:0xbec:

\[\]$x$ Expanded display is off.

\>[SELECT INTERRUPT_STATEMENT('stress06-25663:0x1537', 5);

Interrupt statement

Statement interrupt sent. Check v\_monitor\_sessions for progress.

(1 row)

## Verify that the interrupted statement is no longer active by looking at the current\_statement column in the SESSIONS system table. This column becomes blank when the statement is interrupted:

\>[SELECT * FROM SESSIONS;

<table>
<thead>
<tr>
<th>node_name</th>
<th>v_vmartdb_node001</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_name</td>
<td>dbadmin</td>

See Also

- SESSIONS
- Managing Sessions
- Configuration Parameters

**RELEASE_ALL_JVM_MEMORY**

Forces all sessions to release the memory consumed by their Java Virtual Machines (JVM).

**Syntax**

\[
\text{RELEASE\_ALL\_JVM\_MEMORY();}
\]

**Privileges**

Must be a superuser.

**Example**

The following example demonstrates viewing the JVM memory use in all open sessions, then calling RELEASE_ALL_JVM_MEMORY() to release the memory:

```sql
=> select user_name,external_memory_kb FROM V_MONITOR.SESSIONS;

<table>
<thead>
<tr>
<th>user_name</th>
<th>external_memory_kb</th>
</tr>
</thead>
<tbody>
<tr>
<td>dbadmin</td>
<td>79785</td>
</tr>
</tbody>
</table>

(1 row)

=> SELECT RELEASE_ALL_JVM_MEMORY();

Release all JVM sessions command sent. Check v_monitor.sessions for progress.

(1 row)

=> select user_name,external_memory_kb FROM V_MONITOR.SESSIONS;

<table>
<thead>
<tr>
<th>user_name</th>
<th>external_memory_kb</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(1 row)
```
See Also

- RELEASE_JVM_MEMORY

**RELEASE_JVM_MEMORY**

Terminates a Java Virtual Machine (JVM), making available the memory the JVM was using.

Syntax

RELEASE_JVM_MEMORY();

Privileges

None.

Examples

User session opened. RECORD 2 shows the user session running COPY DIRECT statement.

```sql
=> SELECT RELEASE_JVM_MEMORY();
    release_jvm_memory
-----------------------------
Java process killed and memory released
(1 row)
```

See Also

- RELEASE_ALL_JVM_MEMORY
**RESERVE_SESSION_RESOURCE**

Reserves memory resources from the general resource pool for the exclusive use of the Vertica backup and restore process. No other Vertica process can access reserved resources. If insufficient resources are available, Vertica queues the reservation request.

This meta-function is a session level reservation. When a session ends Vertica automatically releases any resources reserved in that session. Because the meta-function operates at the session level, the resource name does not need to be unique across multiple sessions.

You can view reserved resources by querying the **SESSIONS** table.

**Syntax**

```
RESERVE_SESSION_RESOURCE ( 'name', memory
```

**Parameters**

<table>
<thead>
<tr>
<th>name</th>
<th>The name of the resource to reserve.</th>
</tr>
</thead>
<tbody>
<tr>
<td>memory</td>
<td>The amount of memory in kilobytes to allocate to the resource.</td>
</tr>
</tbody>
</table>

**Privileges**

None

**Example**

Reserve 1024 kilobytes of memory for the backup and restore process:

```
=> SELECT reserve_session_resource('VBR_reserve',1024);
-[ RECORD 1 ]-----------------------
reserve_session_resource | Grant succeed
```
**RESET_SESSION**

Applies your default connection string configuration settings to your current session.

**Syntax**

```
RESET_SESSION()
```

**Examples**

The following example shows how you use RESET_SESSION.

Resets the current client connection string to the default connection string settings:

```
=> SELECT RESET_SESSION();

RESET_SESSION

Reset session: done.
(1 row)
```
Statistics Management Functions

This section contains Vertica functions for collecting and managing table data statistics.

**ANALYZEEXTERNALROWCOUNT**

Calculates the exact number of rows in an external table. ANALYZEEXTERNALROWCOUNT runs in the background.

**Note:**
You cannot calculate row counts on external tables with **DO_TM_TASK**.

**Syntax**

```sql
ANALYZE_EXTERNAL_ROW_COUNT ('[[[database.]schema.]table-name ]')
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>database.schema</td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td>table-name</td>
<td>Specifies the name of the external table for which to calculate the exact row count. If you supply an empty string, Vertica calculate the exact number of rows for all external tables.</td>
</tr>
</tbody>
</table>

**Privileges**

Any INSERT/UPDATE/DELETE privilege on the external table
Examples

Calculate the exact row count for all external tables:

```sql
=> SELECT ANALYZE_EXTERNAL_ROW_COUNT('');
```

Calculate the exact row count for table `loader_rejects`:

```sql
=> SELECT ANALYZE_EXTERNAL_ROW_COUNT('loader_rejects');
```

See Also

- Collecting Database Statistics
- `DROP_EXTERNAL_ROW_COUNT`

**ANALYZE_STATISTICS**

**Note:**

ANALYZE_STATISTICS is an alias of the function ANALYZE_HISTOGRAM, which is no longer documented.

Collects and aggregates data samples and storage information from all nodes that store projections associated with the specified table. By default, Vertica analyzes multiple columns in a single-query execution plan, depending on resource limits. Such multi-column analysis facilitates the following objectives:

- Reduce plan execution latency.
- Speed up analysis of relatively small tables with many columns.

Vertica writes statistics to the database catalog. The query optimizer uses this collected data to create query plans. Without this data, the query optimizer assumes uniform distribution of data values and equal storage usage for all projections.

You can cancel statistics collection with CTRL+C or by calling `INTERRUPT_STATEMENT`.
Syntax

`ANALYZE_STATISTICS ('[[database.]schema.]table' [, 'column-list' [, percent ]])`

Returns

0—Success

If an error occurs, refer to `vertica.log` for details.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `database.]schema` | Specifies a schema, by default public. If `schema` is any schema other than public, you must supply the schema name. For example:  

```sql
myschema.thisDbObject
```

If you specify a database, it must be the current database.

<table>
<thead>
<tr>
<th><code>table</code></th>
<th>Table on which to collect data. If set to an empty string, Vertica collects statistics for all database tables and their projections.</th>
</tr>
</thead>
</table>
| `column-list` | Comma-delimited list of columns in `table`, typically predicate columns. Vertica narrows the scope of the data collection to the specified columns.  

If you alter a table to add a column and populate its contents with either default or other values, call `ANALYZE_STATISTICS` on this column to get the most current statistics. |

| `percent` | A float value between 0 and 100 that specifies what percentage of data to read from disk (not the amount of data to analyze). If you omit this argument, Vertica sets the percentage to 10.  

Analyzing more than 10 percent disk space takes proportionally longer to process, but produces a higher level of sampling accuracy. |
Privileges

Non-superuser:

- Schema: USAGE
- Table: One of INSERT, DELETE, or UPDATE

Restrictions

- Vertica supports ANALYZE_STATISTICS on local and global temporary tables. In both cases, you can obtain statistics only on tables that are created with the option ON_COMMIT_PRESERVE_ROWS. Otherwise, Vertica deletes table content on committing the current transaction, so no table data is available for analysis.
- Vertica collects no statistics from the following projections:
  - Live aggregate and Top-K projections
  - Projections that are defined to include an SQL function within an expression
- Vertica collects no statistics on columns of ARRAY or SET types.

See Also

- Collecting Table Statistics
- ANALYZE_STATISTICS_PARTITION

**ANALYZE_STATISTICS_PARTITION**

Collects and aggregates data samples and storage information for a range of partitions in the specified table. Vertica writes the collected statistics to the database catalog.

You can cancel statistics collection with CTRL+C or meta-function INTERRUPT_STATEMENT.

Syntax

ANALYZE_STATISTICS_PARTITION ('[[database.]schema.]table', 'min-range-value', 'max-range-value' [, 'column-list' [, percent ]])
Returns

0: Success

If an error occurs, refer to vertica.log for details.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>table</td>
<td>Table on which to collect data.</td>
</tr>
<tr>
<td>min-range-value</td>
<td>Minimum and maximum value of partition keys to analyze, where min-range-value must be ≤ max-range-value. To analyze one partition, min-range-value and max-range-value must be equal.</td>
</tr>
<tr>
<td>max-range-value</td>
<td></td>
</tr>
<tr>
<td>column-list</td>
<td>Comma-delimited list of columns in table, typically a predicate column. Vertica narrows the scope of the data collection to the specified columns.</td>
</tr>
<tr>
<td>percent</td>
<td>Float value between 0 and 100 that specifies what percentage of data to read from disk (not the amount of data to analyze). If you omit this argument, Vertica sets the percentage to 10.</td>
</tr>
<tr>
<td></td>
<td>Analyzing more than 10 percent disk space takes proportionally longer to process, but produces a higher level of sampling accuracy.</td>
</tr>
</tbody>
</table>

Privileges

Non-superuser:
Requirements and Restrictions

The following requirements and restrictions apply to `ANALYZE_STATISTICS_PARTITION`:

- The table must be partitioned and cannot contain unpartitioned data.
- The table partition expression must specify a single column. The following expressions are supported:
  - Expressions that specify only the column—that is, partition on all column values. For example:
    ```sql
    PARTITION BY ship_date GROUP BY CALENDAR_HIERARCHY_DAY(ship_date, 2, 2)
    ```
  - If the column is a `DATE` or `TIMESTAMP/TIMESTAMPTZ`, the partition expression can specify a supported date/time function that returns that column or any portion of it, such as month or year. For example, the following partition expression specifies to partition on the year portion of column `order_date`:
    ```sql
    PARTITION BY YEAR(order_date)
    ```
  - Expressions that perform addition or subtraction on the column. For example:
    ```sql
    PARTITION BY YEAR(order_date) - 1
    ```
- The table partition expression cannot coerce the specified column to another data type.
- Vertica collects no statistics from the following projections:
  - Live aggregate and Top-K projections
  - Projections that are defined to include an SQL function within an expression

Examples

See Collecting Partition Statistics.
**DROP_EXTERNAL_ROW_COUNT**

Removes external table row count statistics compiled by `ANALYZE_EXTERNAL_ROW_COUNT`. `DROP_EXTERNAL_ROW_COUNT` runs in the background.

⚠️ **Caution:**
Statistics can be time consuming to regenerate.

**Syntax**

```
DROP_EXTERNAL_ROW_COUNT ('[database.]schema.]table-name ');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>table-name</code></td>
<td>The external table for which to remove the exact row count. If you specify an empty string, Vertica drops the exact row count statistic for all external tables.</td>
</tr>
</tbody>
</table>

**Privileges**

- INSERT/UPDATE/DELETE privilege on table
- USAGE privilege on schema that contains the table

**Examples**

Drop row count statistics for external table `loader_rejects`:
=> SELECT DROP_EXTERNAL_ROW_COUNT('loader_rejects');

See Also

Collecting Database Statistics

**DROP_STATISTICS**

Removes statistical data on database projections previously generated by `ANALYZE_STATISTICS`. When you drop this data, the Vertica optimizer creates query plans using default statistics.

**Caution:**
Regenerating statistics can incur significant overhead.

**Syntax**

```
DROP_STATISTICS ('[[[database.]schema.]table]' [, 'category' [, '[column-list]']] )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>table</code></td>
<td>Table on which to drop statistics. If set to an empty string, Vertica drops statistics for all database tables and their projections.</td>
</tr>
<tr>
<td><code>category</code></td>
<td>Category of statistics to drop, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- <code>ALL</code> (default): Drop all statistics, including histograms and</td>
</tr>
<tr>
<td></td>
<td>other statistics. This is the default.</td>
</tr>
<tr>
<td></td>
<td>- <code>HIST</code>: Drop histograms, but keep other statistics.</td>
</tr>
<tr>
<td></td>
<td>- <code>OTHER</code>: Drop other statistics, but keep histograms.</td>
</tr>
<tr>
<td></td>
<td>- <code>ALL_NOSHIST</code>: Drop all statistics except for histograms.</td>
</tr>
<tr>
<td></td>
<td>- <code>HIST_NOSHORT</code>: Drop histograms and shortened statistics.</td>
</tr>
<tr>
<td></td>
<td>- <code>OTHER_NOSHORT</code>: Drop other statistics and shortened statistics.</td>
</tr>
<tr>
<td></td>
<td>- <code>ALL_NOSHORT</code>: Drop all statistics except for histograms and shortened statistics.</td>
</tr>
<tr>
<td></td>
<td>- <code>HIST_NOSHORT_NOSORTED</code>: Drop histograms and shortened statistics, but keep sorted statistics.</td>
</tr>
<tr>
<td></td>
<td>- <code>OTHER_NOSHORT_NOSORTED</code>: Drop other statistics and shortened statistics, but keep sorted statistics.</td>
</tr>
<tr>
<td></td>
<td>- <code>ALL_NOSHORT_NOSORTED</code>: Drop all statistics except for histograms and shortened statistics, but keep sorted statistics.</td>
</tr>
<tr>
<td></td>
<td>- <code>HIST_NOSTAT</code>: Drop histograms but keep statistics and statistics with sorted data.</td>
</tr>
<tr>
<td></td>
<td>- <code>OTHER_NOSTAT</code>: Drop other statistics but keep statistics and statistics with sorted data.</td>
</tr>
<tr>
<td></td>
<td>- <code>ALL_NOSTAT</code>: Drop all statistics except for histograms and statistics with sorted data.</td>
</tr>
<tr>
<td></td>
<td>- <code>HIST_NOSTAT_NOSORTED</code>: Drop histograms but keep statistics and statistics with sorted data.</td>
</tr>
<tr>
<td></td>
<td>- <code>OTHER_NOSTAT_NOSORTED</code>: Drop other statistics but keep statistics and statistics with sorted data.</td>
</tr>
<tr>
<td></td>
<td>- <code>ALL_NOSTAT_NOSORTED</code>: Drop all statistics except for histograms and statistics with sorted data.</td>
</tr>
<tr>
<td></td>
<td>- <code>HIST_NOSHORT_NOSORTED</code>: Drop histograms and shortened statistics, but keep sorted statistics.</td>
</tr>
<tr>
<td></td>
<td>- <code>OTHER_NOSHORT_NOSORTED</code>: Drop other statistics and shortened statistics, but keep sorted statistics.</td>
</tr>
<tr>
<td></td>
<td>- <code>ALL_NOSHORT_NOSORTED</code>: Drop all statistics except for histograms and shortened statistics, but keep sorted statistics.</td>
</tr>
<tr>
<td></td>
<td>- <code>HIST_NOSTAT_NOSORTED</code>: Drop histograms but keep statistics and statistics with sorted data.</td>
</tr>
<tr>
<td></td>
<td>- <code>OTHER_NOSTAT_NOSORTED</code>: Drop other statistics but keep statistics and statistics with sorted data.</td>
</tr>
<tr>
<td></td>
<td>- <code>ALL_NOSTAT_NOSORTED</code>: Drop all statistics except for histograms and statistics with sorted data.</td>
</tr>
</tbody>
</table>
row counts.
- HISTOGRAMS: Drop only histograms. Row count statistics remain.

<table>
<thead>
<tr>
<th>column-list</th>
</tr>
</thead>
<tbody>
<tr>
<td>Comma-delimited list of columns in \textit{table}, typically predicate columns. Vertica narrows the scope of dropped statistics to the specified columns. If you omit this parameter or supply an empty string, Vertica drops statistics on all columns.</td>
</tr>
</tbody>
</table>

**Privileges**

Non-superuser:

- Schema: USAGE
- Table: One of INSERT, DELETE, or UPDATE

**Examples**

Drop all base statistics for the table \textit{store.store_sales_fact}:

\begin{verbatim}
=> SELECT DROP_STATISTICS('store.store_sales_fact');
DROP_STATISTICS
----------------
   0
(1 row)
\end{verbatim}

Drop statistics for all table projections:

\begin{verbatim}
=> SELECT DROP_STATISTICS ('');
DROP_STATISTICS
----------------
   0
(1 row)
\end{verbatim}

**See Also**

DROP_STATISTICS_PARTITION
**DROP_STATISTICS_PARTITION**

Removes statistical data on database projections previously generated by `ANALYZE_STATISTICS_PARTITION`. When you drop this data, the Vertica optimizer creates query plans using table-level statistics, if available, or default statistics.

**Syntax**

```
DROP_STATISTICS_PARTITION (['database.schema.table', 'min-range-value', 'max-range-value'] [, category [, '[column-list]']] )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td><code>table</code></td>
<td>Table on which to drop statistics.</td>
</tr>
<tr>
<td><code>min-range-value</code></td>
<td>The minimum and maximum value of partition keys on which to drop statistics, where <code>min-range-value</code> must be ( \leq ) <code>max-range-value</code>. If you supply empty strings for both parameters, Vertica drops all partition-level statistics for this table or the specified columns.</td>
</tr>
<tr>
<td><code>max-range-value</code></td>
<td></td>
</tr>
<tr>
<td><code>category</code></td>
<td>The category of statistics to drop, one of the following:</td>
</tr>
</tbody>
</table>

**Important:**

The range of keys to drop must be equal to, or a superset of, the full range of partitions previously analyzed by `ANALYZE_STATISTICS_PARTITION`. If the range omits any analyzed partition, **DROP_STATISTICS_PARTITION** drops no statistics.
| | BASE (default): Drop histograms and row counts (min/max column values, histogram).  
| | HISTOGRAMS: Drop only histograms. Row count statistics remain.  
| | ALL: Drop all statistics.  

**column-list**

A comma-delimited list of columns in *table*, typically predicate columns. Vertica narrows the scope of dropped statistics to the specified columns. If you omit this parameter or supply an empty string, Vertica drops statistics on all columns.

**Privileges**

Non-superuser:

- Schema: USAGE
- Table: One of INSERT, DELETE, or UPDATE

**See Also**

**DROP_STATISTICS**

**EXPORT_STATISTICS**

Generates statistics in XML format from data previously collected by **ANALYZE_STATISTICS**. Before you export statistics, collect the latest data by calling **ANALYZE_STATISTICS**.

**Syntax**

```
EXPORT_STATISTICS ('[ filename ]', '[[database.]schema.]table' [, 'column[,]'] )
```
Parameters

**filename** Specifies where to write the generated XML. If *filename* already exists, `EXPORT_STATISTICS` overwrites it. If you supply an empty string, `EXPORT_STATISTICS` writes the XML to standard output.

**[database.]schema** Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example:

```plaintext
myschema.thisDbObject
```

If you specify a database, it must be the current database.

**table** Specifies the table on which to export projection statistics. If you supply an empty string, Vertica exports all statistics for the database.

**scope** Specifies the target table as follows:

```
[[database.]schema.]table
```

If you specify a database, it must be the current database.

**column** The name of a column in *table*, typically a predicate column. You can specify multiple comma-delimited columns. Vertica narrows the scope of exported statistics to the specified columns only.

Privileges

Superuser

Restrictions

`EXPORT_STATISTICS` does not export statistics for LONG data type columns.
Examples

The following statement exports statistics on the VMart example database to a file:

```sql
=> SELECT EXPORT_STATISTICS('/opt/vertica/examples/VMart_Schema/vmart_stats.xml');
EXPORT_STATISTICS
----------------------------------------
Statistics exported successfully
(1 row)
```

The next statement exports statistics on a single column (price) from a table named food:

```sql
=> SELECT EXPORT_STATISTICS('/opt/vertica/examples/VMart_Schema/price.xml', 'food.price');
EXPORT_STATISTICS
----------------------------------------
Statistics exported successfully
(1 row)
```

See Also

- `EXPORT_STATISTICS_PARTITION`
- `ANALYZE_STATISTICS`
- `DROP_STATISTICS`
- `IMPORT_STATISTICS`
- `VALIDATE_STATISTICS`
- Collecting Database Statistics
- Best Practices For Statistics Collection

**EXPORT_STATISTICS_PARTITION**

Generates partition-level statistics in XML format from data previously collected by `ANALYZE_STATISTICS_PARTITION`.

Syntax

```sql
EXPORT_STATISTICS_PARTITION ("[ filename ]", "[[database.]schema.]table",
                                "min-range-value", "max-range-value" [, "column[,...]" ] )
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>Specifies where to write the generated XML. If <code>filename</code> already exists, <code>EXPORT_STATISTICS_PARTITION</code> overwrites it. If you supply an empty string, the function writes to standard output.</td>
</tr>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td>table</td>
<td>The table on which to export data.</td>
</tr>
<tr>
<td><code>min-range-value</code> <code>max-range-value</code></td>
<td>The minimum and maximum value of partition keys on which to export statistics, where <code>min-range-value</code> must be ≤ <code>max-range-value</code>.  The range of keys to export must be equal to, or a superset of, the full range of partitions previously analyzed by ANALYZE_STATISTICS_PARTITION. If the range omits any analyzed partition, <code>EXPORT_STATISTICS_PARTITION</code> exports no statistics.</td>
</tr>
<tr>
<td>column</td>
<td>The name of a column in <code>table</code>, typically a predicate column. You can specify multiple comma-delimited columns. Vertica narrows the scope of exported statistics to the specified columns only.</td>
</tr>
</tbody>
</table>

Privileges

Superuser
Restrictions

EXPORT_STATISTICS_PARTITION does not export statistics for LONG data type columns.

See Also

- EXPORT_STATISTICS
- ANALYZE_STATISTICS_PARTITION

**IMPORT_STATISTICS**

Imports statistics from the XML file that was generated by EXPORT_STATISTICS. Imported statistics override existing statistics for the projections that are referenced in the XML file.

Syntax

IMPORT_STATISTICS ( 'filename' )

Parameters

| **filename** | The path and name of an XML input file that was generated by EXPORT_STATISTICS. |

Privileges

Superuser
Restrictions

- **IMPORT_STATISTICS** imports only valid statistics. If the source XML file has invalid statistics for a specific column, those statistics are not imported and Vertica throws a warning. If the statistics file has an invalid structure, the import operation fails. To check a statistics file for validity, run **VALIDATE_STATISTICS**.
- **IMPORT_STATISTICS** returns warnings for LONG data type columns, as the source XML file generated by EXPORT_STATISTICS contains no statistics for columns of that type.

Example

Import the statistics for the VMart database from an XML file previously created by EXPORT_STATISTICS:

```
=> SELECT IMPORT_STATISTICS('/opt/vertica/examples/VMart_Schema/vmart_stats.xml');

-----------------------------------------------
Importing statistics for projection date_dimension_super column date_key failure (stats did not contain row counts)
Importing statistics for projection date_dimension_super column date failure (stats did not contain row counts)
Importing statistics for projection date_dimension_super column full_date_description failure (stats did not contain row counts)
...
(1 row)
```

See Also

- ANALYZE_STATISTICS
- EXPORT_STATISTICS

**VALIDATE_STATISTICS**

Validates statistics in the XML file generated by EXPORT_STATISTICS.
Syntax

VALIDATE_STATISTICS ( 'XML-file' )

Parameters

| XML-file  | the path and name of the XML file that contains the statistics to validate. |

Privileges

Superuser

Reporting Valid Statistics

The following example shows the results when the statistics are valid:

```sql
=> SELECT EXPORT_STATISTICS('cust_dim_stats.xml','customer_dimension');
EXPORT_STATISTICS-----------------------------------
Statistics exported successfully
(1 row)
=> SELECT VALIDATE_STATISTICS('cust_dim_stats.xml');
VALIDATE_STATISTICS-------------------------------
(1 row)
```

Identifying Invalid Statistics

If VALIDATE_STATISTICS is unable to read a document's XML, it throws this error:

```sql
=> SELECT VALIDATE_STATISTICS('/home/dbadmin/stats.xml');
VALIDATE_STATISTICS-------------------------------
Error validating statistics file: At line 1:1. Invalid document structure
(1 row)
```
If some table statistics are invalid, VALIDATE_STATISTICS returns a report that identifies them. In the following example, the function reports that attributes distinct, buckets, rows, count, and distinctCount cannot be negative numbers.

```sql
=> SELECT VALIDATE_STATISTICS('/stats.xml');
WARNING 0: Invalid value '-1' for attribute 'distinct' under column 'public.t.x'.
  Please use a positive value.
WARNING 0: Invalid value '-1' for attribute 'buckets' under column 'public.t.x'.
  Please use a positive value.
WARNING 0: Invalid value '-1' for attribute 'rows' under column 'public.t.x'.
  Please use a positive value.
WARNING 0: Invalid value '-1' for attribute 'count' under bound '1', column 'public.t.x'.
  Please use a positive value.
WARNING 0: Invalid value '-1' for attribute 'distinctCount' under bound '1', column 'public.t.x'.
  Please use a positive value.
VALIDATE_STATISTICS
-----------------------
(1 row)
```

In this case, run `ANALYZE_STATISTICS` on the table again to create valid statistics.

**See Also**

- `ANALYZE_STATISTICS`
- `EXPORT_STATISTICS`
Storage Management Functions

This section contains storage management functions specific to Vertica.

**ALTER_LOCATION_LABEL**

Adds a label to a storage location, or changes or removes an existing label. You can change a location label if it is not specified by any storage policy.

**Caution:**
If you label an existing storage location that already contains data, and then include the labeled location in one or more storage policies, existing data could be moved. If the Tuple Mover determines data stored on a labeled location does not comply with a storage policy, it moves the data elsewhere.

**Syntax**

```
ALTER_LOCATION_LABEL ( 'path' , '[node]' , '[location-label]' )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>path</em></td>
<td>The storage location path.</td>
</tr>
<tr>
<td><em>node</em></td>
<td>The node where the label change is applied. If you supply an empty string, Vertica applies the change across all cluster nodes.</td>
</tr>
<tr>
<td><em>location-label</em></td>
<td>The label to assign to the specified storage location. If you supply an empty string, Vertica removes that storage location's label.</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser
Restrictions

You can remove a location label only if both of these conditions are true:

- The label is not specified in the storage policy of a database object.
- The labeled location is not the last available storage for the objects associated with it.

Example

The following `ALTER_LOCATION_LABEL` statement applies across all cluster nodes the label SSD to the storage location `/home/dbadmin/SSD/tables`:

```sql
=> SELECT ALTER_LOCATION_LABEL('/home/dbadmin/SSD/tables','','SSD');
ALTER_LOCATION_LABEL
-------------------------------
/home/dbadmin/SSD/tables label changed.
(1 row)
```

See Also

- Altering Location Labels
- `CLEAR_OBJECT_STORAGE_POLICY`
- `SET_OBJECT_STORAGE_POLICY`

**ALTER_LOCATION_SIZE**

Eon Mode only

Resizes the depot on one node, all nodes in a subcluster, or all nodes in the database.

**Important:**
Reducing the size of the depot is liable to increase contention over depot usage and require frequent evictions. This behavior can increase the number of queries and load operations that are routed to communal storage for processing, which can incur slower performance and increased access charges.
Syntax

ALTER_LOCATION_SIZE( 'location', '[target]', 'size' )

Parameters

<table>
<thead>
<tr>
<th>Location</th>
<th>Specifies the location to resize, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>depot</td>
<td>Resizes the node's current depot.</td>
</tr>
<tr>
<td>depot</td>
<td>The depot's absolute path in the Linux filesystem. If you change the depot size on multiple nodes and specify a path, the path must be identical on all affected nodes. By default, this is not the case, as the node's name is typically this path. For example, the default depot path for node 1 in the verticadb database is /vertica/data/verticadb/v_verticadb_node0001_depot.</td>
</tr>
<tr>
<td>target</td>
<td>The node or nodes on which to change the depot, one of the following:</td>
</tr>
<tr>
<td></td>
<td>Node name: Resize the specified node.</td>
</tr>
<tr>
<td></td>
<td>Subcluster name: Resize depots of all nodes in the specified subcluster.</td>
</tr>
<tr>
<td></td>
<td>Empty string: Resize all depots in the database.</td>
</tr>
<tr>
<td>size</td>
<td>Valid only if the storage location usage type is set to depot, specifies the maximum amount of disk space that the depot can allocate from the storage location's file system. You can specify size in two ways:</td>
</tr>
<tr>
<td></td>
<td>integer%: Percentage of storage location disk size.</td>
</tr>
<tr>
<td></td>
<td>integer{K</td>
</tr>
</tbody>
</table>

Important:
The depot size cannot exceed 80 percent of the file system disk space where the depot is stored. If you specify a value that is too large, Vertica issues a warning and automatically changes the value to 80 percent of the file system size.
Privileges

Superuser

Examples

Increase depot size on all nodes to 80 percent of file system:

=> SELECT node_name, location_label, location_path, max_size, disk_percent FROM storage_locations
   WHERE location_usage = 'DEPOT' ORDER BY node_name;

<table>
<thead>
<tr>
<th>node_name</th>
<th>location_label</th>
<th>location_path</th>
<th>max_size</th>
<th>disk_percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_vmart_node0001</td>
<td>auto-data-depot</td>
<td>/home/dbadmin/verticadb</td>
<td>3606010800</td>
<td>70%</td>
</tr>
<tr>
<td>v_vmart_node0002</td>
<td>auto-data-depot</td>
<td>/home/dbadmin/verticadb</td>
<td>36059377664</td>
<td>70%</td>
</tr>
<tr>
<td>v_vmart_node0003</td>
<td>auto-data-depot</td>
<td>/home/dbadmin/verticadb</td>
<td>3606010800</td>
<td>70%</td>
</tr>
</tbody>
</table>

(3 rows)

=> SELECT alter_location_size('depot', '', '80%');
alter_location_size
-----------------------

depotSize changed.
(1 row)

=> SELECT node_name, location_label, location_path, max_size, disk_percent FROM storage_locations
   WHERE location_usage = 'DEPOT' ORDER BY node_name;

<table>
<thead>
<tr>
<th>node_name</th>
<th>location_label</th>
<th>location_path</th>
<th>max_size</th>
<th>disk_percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_vmart_node0001</td>
<td>auto-data-depot</td>
<td>/home/dbadmin/verticadb</td>
<td>41211552768</td>
<td>80%</td>
</tr>
<tr>
<td>v_vmart_node0002</td>
<td>auto-data-depot</td>
<td>/home/dbadmin/verticadb</td>
<td>41210717184</td>
<td>80%</td>
</tr>
<tr>
<td>v_vmart_node0003</td>
<td>auto-data-depot</td>
<td>/home/dbadmin/verticadb</td>
<td>41211552768</td>
<td>80%</td>
</tr>
</tbody>
</table>

(3 rows)

Change the depot size to 75% of the filesystem size for all nodes in the analytics subcluster:

=> SELECT subcluster_name, subclusters.node_name, storage_locations.max_size, storage_locations.disk_percent FROM subclusters INNER JOIN storage_locations ON subclusters.node_name = storage_locations.node_name WHERE storage_locations.location_usage='DEPOT';

<table>
<thead>
<tr>
<th>subcluster_name</th>
<th>node_name</th>
<th>max_size</th>
<th>disk_percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>default_subcluster</td>
<td>v_verticadb_node0001</td>
<td>25264737485</td>
<td>60%</td>
</tr>
<tr>
<td>default_subcluster</td>
<td>v_verticadb_node0002</td>
<td>25264737485</td>
<td>60%</td>
</tr>
<tr>
<td>default_subcluster</td>
<td>v_verticadb_node0003</td>
<td>25264737485</td>
<td>60%</td>
</tr>
<tr>
<td>analytics</td>
<td>v_verticadb_node0004</td>
<td>25264737485</td>
<td>60%</td>
</tr>
<tr>
<td>analytics</td>
<td>v_verticadb_node0005</td>
<td>25264737485</td>
<td>60%</td>
</tr>
<tr>
<td>analytics</td>
<td>v_verticadb_node0006</td>
<td>25264737485</td>
<td>60%</td>

<td>60%</td>
</tr>
<tr>
<td>analytics</td>
<td>v_verticadb_node0009</td>
<td>25264737485</td>
<td>60%</td>
</tr>
</tbody>
</table>

(9 rows)
ALTER_LOCATION_SIZE('depot', 'analytics', '75%');

depotSize changed.
(1 row)

ALTER_LOCATION_Use

Alters the type of files that can be stored at the specified storage location.

Syntax

ALTER_LOCATION_Use ( 'path', '[node]', 'usage' )

Parameters

<table>
<thead>
<tr>
<th>path</th>
<th>Specifies where the storage location is mounted.</th>
</tr>
</thead>
<tbody>
<tr>
<td>node</td>
<td>Specifies the Vertica node with the storage location. An empty string ('' ) specifies to alter the location across all cluster nodes in a single transaction.</td>
</tr>
</tbody>
</table>
**usage**

<table>
<thead>
<tr>
<th>One of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>- DATA: The storage location stores only data files. This is the supported use for both a USER storage location, and a labeled storage location.</td>
</tr>
<tr>
<td>- TEMP: The location stores only temporary files that are created during loads or queries.</td>
</tr>
<tr>
<td>- DATA, TEMP: The location can store both types of files.</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser

**USER Storage Location Restrictions**

You cannot change a storage location from a USER usage type if you created the location that way, or to a USER type if you did not. You can change a USER storage location to specify DATA (storing TEMP files is not supported). However, doing so does not affect the primary objective of a USER storage location, to be accessible by non-dbadmin users with assigned privileges.

**Monitoring Storage Locations**

To obtain disk storage information that the database uses on each node, query system table `DISK_STORAGE`.

**Example**

The following example alters the storage location across all cluster nodes to store only data:

```sql
=> SELECT ALTER_LOCATION_USE ('/thirdVerticaStorageLocation/','','DATA');
```
See Also

- Altering Location Use
- DROP_LOCATION
- RESTORE_LOCATION
- RETIRE_LOCATION
- GRANT (Storage Location)
- REVOKE (Storage Location)

**CLEAR_CACHES**

Clears the Vertica internal cache files.

**Syntax**

```
CLEAR_CACHES ( )
```

**Privileges**

Superuser

**Notes**

If you want to run benchmark tests for your queries, in addition to clearing the internal Vertica cache files, clear the Linux file system cache. The kernel uses unallocated memory as a cache to hold clean disk blocks. If you are running version 2.6.16 or later of Linux and you have root access, you can clear the kernel file system cache as follows:

1. Make sure that all data in the cache is written to disk:
   ```
   # sync
   ```

2. Writing to the drop_caches file causes the kernel to drop clean caches, entries, and inodes from memory, causing that memory to become free, as follows:
- To clear the page cache:
  
  ```
  # echo 1 > /proc/sys/vm/drop_caches
  ```

- To clear the entries and inodes:

  ```
  # echo 2 > /proc/sys/vm/drop_caches
  ```

- To clear the page cache, entries, and inodes:

  ```
  # echo 3 > /proc/sys/vm/drop_caches
  ```

### Example

The following example clears the Vertica internal cache files:

```sql
=> SELECT CLEAR_CACHES();
CLEAR_CACHES
----------
Cleared
(1 row)
```

### CLEAR_OBJECT_STORAGE_POLICY

Removes a user-defined storage policy from the specified database, schema or table. Storage containers at the previous policy's labeled location are moved to the default location. By default, this move occurs after all pending mergeout tasks return.

### Syntax

```
CLEAR_OBJECT_STORAGE_POLICY ( 'object-name' [, 'key-min', 'key-max'] [ , 'enforce-storage-move' ] )
```

### Parameters

- **object-name**
  
  The object to clear, one of the following:
  
  - **database**: Clears `database` of its storage policy.
- `[database.]schema`: Clears `schema` of its storage policy.
- `[database.]table`: Clears `table` of its storage policy. If `table` is in any schema other than `public`, you must supply the schema name.

In all cases, `database` must be the name of the current database.

`key-min` `key-max`  
Valid only if `object-name` is a table, specifies the range of table partition key values stored at the labeled location.

`enforce-storage-move`  
Specifies when the Tuple Mover moves all existing storage containers for the specified object to its default storage location:

- `false` (default): Move storage containers only after all pending mergeout tasks return.
- `true`: Immediately move all storage containers to the new location.

**Tip:**
You can also enforce all storage policies immediately by calling Vertica meta-function `ENFORCE_OBJECT_STORAGE_POLICY`.

### Privileges

*Superuser*

### Examples

This following statement clears the storage policy for table `store.store_orders_fact`. The `true` argument specifies to implement the move immediately:

```sql
=> SELECT CLEAR_OBJECT_STORAGE_POLICY ('store.store_orders_fact', 'true');
CLEAR_OBJECT_STORAGE_POLICY
------------------------------------------
Object storage policy cleared.
Task: moving storages
  (Table: store.store_orders_fact) (Projection: store.store_orders_fact_b0)
```
(Table: store.store_orders_fact) (Projection: store.store_orders_fact_b1)

(1 row)

See Also

- Clearing Storage Policies
- ALTERLOCATIONLABEL
- SETOBJECTSTORAGEPOLICY
- ENFORCEOBJECTSTORAGEPOLICY

**DROPLOCATION**

Removes the specified storage location. Dropping a storage location is a permanent operation and cannot be undone. Therefore, you must [retire a storage location](#) with **RETIRELOCATION** before dropping it.

**Syntax**

```
DROPLOCATION(‘path’, ‘[node]’)
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Specifies where the storage location to drop is mounted.</td>
</tr>
<tr>
<td>node</td>
<td>The Vertica node where the location is available. If you supply an empty string, Vertica applies the change across all cluster nodes.</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser
Dropping a Shared Location

When a storage location is created in a shared location such as HDFS, Vertica creates subdirectories for each node to prevent conflicts. For example, suppose you create a shared storage location in /data. The location for v_vmart_node0001 is /data/v_vmart_node0001, the location for v_vmart_node0002 is /data/v_vmart_node0002, and so on. To drop a location on only one node, use the node-specific path such as /data/v_vmart_node0002. To drop a location on all nodes, use the same path that you used to create it (/data in this example).

Storage Locations with Temp and Data Files

If you use a storage location to store data and then alter it to store only temp files, the location can still contain data files. Vertica does not let you drop a storage location containing data files. You can use the function MOVE_RETIRED_LOCATION_DATA to manually merge out the data files from the storage location, or you can drop partitions. Deleting data files does not work.

Examples

The following example shows how to drop a previously retired storage location on v_vmart_node0003:

```sql
=> SELECT DROP_LOCATION('/data', 'v_vmart_node0003');
```

See Also

- Dropping Storage Locations
- Retiring Storage Locations
- ALTER_LOCATION_USE
- RESTORE_LOCATION
- RETIRE_LOCATION
- GRANT (Storage Location)
- REVOKE (Storage Location)
**ENFORCE_OBJECT_STORAGE_POLICY**

Enterprise Mode only

Applies storage policies of the specified object immediately. By default, the Tuple Mover enforces object storage policies after all pending mergeout operations are complete. Calling this function is equivalent to setting the `enforce-storage-move` parameter on related meta-functions. You typically use this function as the last step before dropping a storage location.

**Syntax**

```
ENFORCE_OBJECT_STORAGE_POLICY ( 'object-name' [, 'key-min', 'key-max'] )
```

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>object-name</code></td>
<td>Identifies the database object whose storage policies are to be applied, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• <code>database</code>: Applies <code>database</code> storage policies.</td>
</tr>
<tr>
<td></td>
<td>• <code>[database.]schema</code>: Applies <code>schema</code> storage policies.</td>
</tr>
<tr>
<td></td>
<td>• <code>[[database.]schema.]table</code>: Applies <code>table</code> storage policies. If <code>table</code> is in any schema other than <code>public</code>, you must supply the schema name.</td>
</tr>
<tr>
<td></td>
<td>In all cases, <code>database</code> must be the name of the current database.</td>
</tr>
<tr>
<td><code>key-min</code></td>
<td>Valid only if <code>object-name</code> is a table, specifies the range of table partition key values on which to perform the move.</td>
</tr>
<tr>
<td><code>key-max</code></td>
<td></td>
</tr>
</tbody>
</table>

**Privileges**

One of the following:

- Superuser
- Object owner and access to its storage location.
Examples

Apply storage policy updates to the test table:

```sql
=> SELECT ENFORCE_OBJECT_STORAGE_POLICY ('test');
```

See Also

- CLEAR_OBJECT_STORAGE_POLICY
- RETIRE_LOCATION
- DROP_LOCATION
- Managing Storage Locations

**MEASURE_LOCATION_PERFORMANCE**

Measures a storage location's disk performance.

**Syntax**

```sql
MEASURE_LOCATION_PERFORMANCE ( 'path', 'node' )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>path</code></td>
<td>Specifies where the storage location to measure is mounted.</td>
</tr>
<tr>
<td><code>node</code></td>
<td>The Vertica node where the location to be measured is available. To obtain a list of all node names on the cluster, query system table <code>DISK_STORAGE</code>.</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser
Notes

- If you intend to create a tiered disk architecture in which projections, columns, and partitions are stored on different disks based on predicted or measured access patterns, you need to measure storage location performance for each location in which data is stored. You do not need to measure storage location performance for temp data storage locations because temporary files are stored based on available space.
- The method of measuring storage location performance applies only to configured clusters. If you want to measure a disk before configuring a cluster see Measuring Storage Performance.
- Storage location performance equates to the amount of time it takes to read and write 1MB of data from the disk. This time equates to:

\[
\text{IO-time} = (\text{time-to-read-write-1MB} + \text{time-to-seek}) = (1/\text{throughput} + 1/\text{latency})
\]

Throughput is the average throughput of sequential reads/writes (units in MB per second).

Latency is for random reads only in seeks (units in seeks per second)

**Note:**
The IO time of a faster storage location is less than a slower storage location.

Example

The following example measures the performance of a storage location on v_vmartdb_node0004:

```sql
=> SELECT MEASURE_LOCATION_PERFORMANCE('/secondVerticaStorageLocation/', 'v_vmartdb_node0004');
WARNING: measure_location_performance can take a long time. Please check logs for progress
measure_location_performance
-----------------------------------------------
Throughput : 122 MB/sec. Latency : 140 seeks/sec
```
See Also

- CREATE LOCATION
- ALTER_LOCATION_USE
- RESTORE_LOCATION
- RETIRE_LOCATION
- Measuring Storage Performance

MOVE RETIRED LOCATION DATA

Moves all data from the specified retired storage location or from all retired storage locations in the database. MOVE RETIRED LOCATION DATA migrates the data to non-retired storage locations according to the storage policies of the objects whose data is stored in the location. This function returns only after it completes migration of all affected storage location data.

Note:
The Tuple Mover migrates data of retired storage locations when it consolidates data into larger ROS containers.

Syntax

MOVE RETIRED LOCATION DATA( ['location-path'] [, 'node'] )

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>location-path</td>
<td>The path of the storage location as specified in the LOCATION_PATH column of system table STORAGE_LOCATIONS. This storage location must be marked as retired. If you omit this argument, MOVE RETIRED LOCATION DATA moves data from all retired storage locations.</td>
</tr>
<tr>
<td>node</td>
<td>The node on which to move data of the retired storage location. If</td>
</tr>
</tbody>
</table>
"location-path" is undefined on node, this function returns an error.

If you omit this argument, MOVE_RETIREd_LOCATION_DATA moves data from location-path on all nodes.

Privileges

Superuser

Examples

1. Query system table STORAGE_LOCATIONS to show which storage locations are retired:

   ```
   => SELECT node_name, location_path, location_label, is_retired FROM STORAGE_LOCATIONS
      WHERE is_retired = 't';
   +-----------------------------------------------------------+
<table>
<thead>
<tr>
<th>node_name</th>
<th>location_path</th>
<th>location_label</th>
<th>is_retired</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_vmart_node0001</td>
<td>/home/dbadmin/SSDLoc</td>
<td>ssd</td>
<td>t</td>
</tr>
<tr>
<td>v_vmart_node0002</td>
<td>/home/dbadmin/SSDLoc</td>
<td>ssd</td>
<td>t</td>
</tr>
<tr>
<td>v_vmart_node0003</td>
<td>/home/dbadmin/SSDLoc</td>
<td>ssd</td>
<td>t</td>
</tr>
</tbody>
</table>
   (3 rows)
   ```

2. Query system table STORAGE_LOCATIONS for the location of the messages table, which is currently stored in retired storage location ssd:

   ```
   => SELECT node_name, total_row_count, location_label FROM STORAGE_CONTAINERS
      WHERE projection_name ILIKE 'messages%';
   +-------------------------+------------+----------------+
<table>
<thead>
<tr>
<th>node_name</th>
<th>total_row_count</th>
<th>location_label</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_vmart_node0001</td>
<td>333514</td>
<td>ssd</td>
</tr>
<tr>
<td>v_vmart_node0002</td>
<td>333255</td>
<td>ssd</td>
</tr>
<tr>
<td>v_vmart_node0003</td>
<td>333231</td>
<td>ssd</td>
</tr>
<tr>
<td>v_vmart_node0003</td>
<td>333255</td>
<td>ssd</td>
</tr>
<tr>
<td>v_vmart_node0003</td>
<td>333231</td>
<td>ssd</td>
</tr>
<tr>
<td>v_vmart_node0003</td>
<td>333514</td>
<td>ssd</td>
</tr>
</tbody>
</table>
   (6 rows)
   ```

3. Call MOVE_RETIREd_LOCATION_DATA to move the data off the ssd storage location.

   ```
   => SELECT MOVE_RETIREd_LOCATION_DATA('/home/dbadmin/SSDLoc');
   -------------------------------
   MOVE_RETIREd_LOCATION_DATA
   -------------------------------
   Move data off retired storage locations done
   ```
4. Repeat the previous query to verify the storage location of the messages table:

```
=> SELECT node_name, total_row_count, storage_type, location_label FROM storage_containers
    WHERE projection_name ILIKE 'messages%';
```

<table>
<thead>
<tr>
<th>node_name</th>
<th>total_row_count</th>
<th>location_label</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_vmart_node0001</td>
<td>333255</td>
<td>base</td>
</tr>
<tr>
<td>v_vmart_node0001</td>
<td>333514</td>
<td>base</td>
</tr>
<tr>
<td>v_vmart_node0003</td>
<td>333514</td>
<td>base</td>
</tr>
<tr>
<td>v_vmart_node0003</td>
<td>333231</td>
<td>base</td>
</tr>
<tr>
<td>v_vmart_node0002</td>
<td>333231</td>
<td>base</td>
</tr>
<tr>
<td>v_vmart_node0002</td>
<td>333255</td>
<td>base</td>
</tr>
</tbody>
</table>

(6 rows)

See Also

- RETIRE_LOCATION
- RESTORE_LOCATION
- Managing Storage Locations

**RESTORE_LOCATION**

Restores a storage location that was previously retired with RETIRE_LOCATION.

**Syntax**

```
RESTORE_LOCATION ( 'location-path', 'node' )
```

**Parameters**

<table>
<thead>
<tr>
<th>Location-path</th>
<th>node</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies where to mount the retired storage location.</td>
<td>The Vertica node where the retired location is available. An empty string specifies to perform this operation on all nodes. The operation fails if you dropped any locations.</td>
</tr>
</tbody>
</table>
Privileges

Superuser

Effects of Restoring a Previously Retired Location

After restoring a storage location, Vertica re-ranks all of the cluster storage locations. It uses the newly restored location to process queries as determined by its rank.

Monitoring Storage Locations

To obtain disk storage information that the database uses on each node, query system table `DISK_STORAGE`.

Examples

Restore the retired storage location on node4:

```
=> SELECT RESTORE_LOCATION ('/thirdVerticaStorageLocation/' , 'v_vmartdb_node0004');
```

See Also

- Altering Location Use
- CREATE LOCATION
- ALTER_LOCATION_USE
- DROP_LOCATION

**RETIRE_LOCATION**

Inactivates the specified storage location. To obtain a list of all existing storage locations, query system table `STORAGE_LOCATIONS`. 
Syntax

```
RETIRE_LOCATION ( 'location-path', 'node' [, enforce-storage-move ] )
```

Parameters

<table>
<thead>
<tr>
<th><strong>location-path</strong></th>
<th>Specifies where the storage location to retire resides.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>node</strong></td>
<td>The Vertica node where the location is available. An empty string specifies to perform this operation on all nodes.</td>
</tr>
<tr>
<td><strong>enforce-storage-move</strong></td>
<td>If set to true, the location label is set to an empty string, and the data is moved elsewhere. The location can then be dropped without errors or warnings. Use this argument to expedite dropping a location.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

Retiring a Shared Location

When you create a storage location in a shared HDFS location, Vertica creates subdirectories for each node to prevent conflicts. For example, suppose you create a shared storage location in `/data`. The location for `v_vmartdb_node0001` is `/data/v_vmartdb_node0001`, the location for `v_vmartdb_node0002` is `/data/v_vmartdb_node0002`, and so on. To retire a location on only one node, use the node-specific path such as `/data/v_vmartdb_node0002`. To retire a location on all nodes, use the same path that you used to create it (in this example, `/data`).

**Note:**

Vertica does not identify NFS as a shared file system.
Effects of Retiring a Storage Location

RETIRE_LOCATION checks that the location is not the only storage for data and temp files. At least one location must exist on each node to store data and temp files. However, you can store both sorts of files in either the same location or separate locations.

**Note:**
If a location is the last available storage for its associated objects, you can retire it only if you set `enforce-storage-move` to true.

When you retire a storage location:

- No new data is stored at the retired location, unless you first restore it `RESTORE_LOCATION`.
- By default, if the storage location being retired contains stored data, the data is not moved. Thus, you cannot drop the storage location. Instead, Vertica removes the stored data through one or more mergeouts. To drop the location immediately after retiring it, set parameter `enforce-storage-move` to true.
- If the storage location being retired is used only for temp files or you use `enforce-storage-move`, you can drop the location. See [Dropping Storage Locations](#) in the Administrator's Guide, and `DROP_LOCATION`.

Monitoring Storage Locations

To obtain disk storage information that the database uses on each node, query system table `DISK_STORAGE`.

Examples

The following examples show two approaches to retiring a storage location.

Specify that a storage location be dropped automatically at a future time:

```sql
=> SELECT RETIRE_LOCATION ('/data', 'v_vmartdb_node0004');
```

Specify that a storage location be dropped immediately:

```sql
=> SELECT RETIRE_LOCATION ('/data', 'v_vmartdb_node0004', true);
```
See Also

- Retiring Storage Locations
- CREATE LOCATION
- DROP LOCATION
- RESTORE LOCATION

**SET_LOCATION_PERFORMANCE**

Sets disk performance for a storage location.

Note:
Before calling this function, call MEASURE_LOCATION_PERFORMANCE to obtain the location's throughput and average latency.

Syntax

```
SET_LOCATION_PERFORMANCE ( 'path', 'node', 'throughput', 'average-latency'
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Specifies where the storage location to set is mounted.</td>
</tr>
<tr>
<td>node</td>
<td>Specifies the Vertica node where the location to set is available.</td>
</tr>
<tr>
<td>throughput</td>
<td>Specifies the throughput for the location, set to a value ≥1.</td>
</tr>
<tr>
<td>average-latency</td>
<td>Specifies the average latency for the location, set to a value ≥1.</td>
</tr>
</tbody>
</table>

Privileges

Superuser
Example

The following example sets the performance of a storage location on node2 to a throughput of 122 megabytes per second and a latency of 140 seeks per second.

```sql
=> SELECT SET_LOCATION_PERFORMANCE('/secondVerticaStorageLocation/','node2','122','140');
```

See Also

- CREATE LOCATION
- Measuring Storage Performance
- Setting Storage Performance

**SET_OBJECT_STORAGE_POLICY**

Creates or changes the storage policy of a database object by assigning it a labeled storage location. The Tuple Mover uses this location to store new and existing data for this object. If the object already has an active storage policy, calling SET_OBJECT_STORAGE_POLICY sets this object's default storage to the new labeled location. Existing data for the object is moved to the new location.

**Note:**

You cannot create a storage policy on a USER type storage location.

**Syntax**

```sql
SET_OBJECT_STORAGE_POLICY(
    '[[database.]schema.]object-name', 'Location-Label'
    [, 'key-min', 'key-max'] [, 'enforce-storage-move']
)
```

**Parameters**

| **database.** schema | Specifies a schema, by default public. If schema is any |
schema other than public, you must supply the schema name. For example:

```
myschema.thisDbObject
```

If you specify a database, it must be the current database.

<table>
<thead>
<tr>
<th><strong>object-name</strong></th>
<th>Identifies the database object assigned to a labeled storage location. The <em>object-name</em> can resolve to a database, schema, or table.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>location-label</strong></td>
<td>The label of <em>object-name</em>'s storage location.</td>
</tr>
<tr>
<td><strong>key-min</strong></td>
<td>Valid only if <em>object-name</em> is a table, specifies the range of table partition key values to store at the labeled location.</td>
</tr>
<tr>
<td><strong>key-max</strong></td>
<td></td>
</tr>
<tr>
<td><strong>enforce-storage-move</strong></td>
<td>Specifies when the Tuple Mover moves all existing storage containers for <em>object-name</em> to the labeled storage location:</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>● false (default): Move storage containers only after all pending mergeout tasks return.</td>
</tr>
<tr>
<td></td>
<td>● true: Immediately move all storage containers to the new location.</td>
</tr>
</tbody>
</table>

**Tip:**
You can also enforce all storage policies immediately by calling Vertica meta-function

```
ENFORCE_OBJECT_STORAGE_POLICY
```

### Privileges

One of the following:

- Superuser
- Object owner and access to its storage location.

### Examples

See Clearing Storage Policies
See Also

- Creating Storage Policies
- Moving Data Storage Locations
- ALTER_LOCATION_LABEL
- CLEAR_OBJECT_STORAGE_POLICY

Text Search Functions

This section contains text search functions specific to Vertica.

**DELETE_TOKENIZER_CONFIG_FILE**

Deletes a tokenizer configuration file.

**Syntax**

```
SELECT v_txtindex.DELETE_TOKENIZER_CONFIG_FILE (USING PARAMETERS proc_oid='proc_oid', confirm={true | false });
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>confirm</td>
<td>Boolean flag. Indicates that the configuration file should be removed even if the tokenizer is still in use.</td>
</tr>
<tr>
<td></td>
<td>True — Force deletion of the tokenizer when the used parameter value is True.</td>
</tr>
<tr>
<td></td>
<td>False — Delete tokenizer if the used parameter value is False.</td>
</tr>
<tr>
<td>Default</td>
<td>False</td>
</tr>
<tr>
<td>proc_oid</td>
<td>A unique identifier assigned to a tokenizer when it is created.</td>
</tr>
<tr>
<td></td>
<td>Users must query the system table vs_procedures to get the proc_</td>
</tr>
</tbody>
</table>
oid for a given tokenizer name. See Configuring a Tokenizer for more information.

Examples

The following example shows how you can use DELETE_TOKENIZER_CONFIG_FILE to delete the tokenizer configuration file:

```sql
=> SELECT v_txtindex.DELETE_TOKENIZER_CONFIG_FILE (USING PARAMETERS proc_oid='45035996274126984');
-- DELETE_TOKENIZER_CONFIG_FILE
 t
(1 row)
```

**GET_TOKENIZER_PARAMETER**

Returns the configuration parameter for a given tokenizer.

**Syntax**

```
SELECT v_txtindex.GET_TOKENIZER_PARAMETER(parameter_name USING PARAMETERS proc_oid='proc_oid');
```

**Parameters**

<table>
<thead>
<tr>
<th>parameter_name</th>
<th>Name of the parameter to be returned.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>One of the following:</td>
</tr>
<tr>
<td></td>
<td>• stopWordsCaseInsensitive</td>
</tr>
<tr>
<td></td>
<td>• minorSeparators</td>
</tr>
<tr>
<td></td>
<td>• majorSeparators</td>
</tr>
<tr>
<td></td>
<td>• minLength</td>
</tr>
<tr>
<td></td>
<td>• maxLength</td>
</tr>
<tr>
<td></td>
<td>• ngramsSize</td>
</tr>
<tr>
<td>proc_oid</td>
<td>A unique identifier assigned to a tokenizer when it is created. Users must query the system table vs_procedures to get the proc_oid for a given tokenizer name. See Configuring a Tokenizer for more information.</td>
</tr>
</tbody>
</table>

**Examples**

The following examples show how you can use GET_TOKENIZER_PARAMETER.

Return the stop words used in a tokenizer:

```sql
=> SELECT v_txtindex.GET_TOKENIZER_PARAMETER('stopwordscaseinsensitive' USING PARAMETERS proc_oid='45035996274126984');
getTokenizerParameter
------------------------
devil,TODAY,the,fox
(1 row)
```

Return the major separators used in a tokenizer:

```sql
=> SELECT v_txtindex.GET_TOKENIZER_PARAMETER('majorseparators' USING PARAMETERS proc_oid='45035996274126984');
getTokenizerParameter
------------------------
{}()[]
(1 row)
```

**READ_CONFIG_FILE**

Reads and returns the key-value pairs of all the parameters of a given tokenizer.

You must use the OVER() clause with this function.

**Syntax**

```sql
SELECT v_txtindex.READ_CONFIG_FILE(USING PARAMETERS proc_oid='proc_oid') OVER ()
```
Parameters

| proc_oid | A unique identifier assigned to a tokenizer when it is created. Users must query the system table vs_procedures to get the proc_oid for a given tokenizer name. See Configuring a Tokenizer for more information. |

Examples

The following example shows how you can use READ_CONFIG_FILE to return the parameters associated with a tokenizer:

```sql
=> SELECT v_txtindex.READ_CONFIG_FILE(USING PARAMETERS proc_oid='4503596274126984') OVER();
```

<table>
<thead>
<tr>
<th>config_key</th>
<th>config_value</th>
</tr>
</thead>
<tbody>
<tr>
<td>majorseparators</td>
<td>{}[]</td>
</tr>
<tr>
<td>stopwordscaseinsensitive</td>
<td>devil, TODAY, the, fox</td>
</tr>
</tbody>
</table>

(2 rows)

**SET_TOKENIZER_PARAMETER**

Configures the tokenizer parameters.

**Important:**

\n, \t, \r must be entered as Unicode using Vertica notation, U&’\000D’, or using Vertica escaping notation, E’\r’. Otherwise, they are taken literally as two separate characters. For example, \" \& \"r\".

Syntax

```sql
SELECT v_txtindex.SET_TOKENIZER_PARAMETER (parameter_name, parameter_value USING PARAMETERS proc_oid='proc_oid')
```
## Parameters

<table>
<thead>
<tr>
<th>parameter_name</th>
<th>Name of the parameter to be configured. Use one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>stopwordsCaseInsensitive</td>
<td>List of stop words. All the tokens that belong to the list are ignored. Vertica supports separators and stop words up to the first 256 Unicode characters.</td>
</tr>
<tr>
<td></td>
<td>If you want to define a stop word that contains a comma or a backslash, then it needs to be escaped. For example: &quot;Dear Jack,&quot; &quot;Dear Jack&quot;</td>
</tr>
<tr>
<td>Default:</td>
<td>' ' (empty list)</td>
</tr>
<tr>
<td>majorSeparators</td>
<td>List of major separators. Enclose in quotes with no spaces between.</td>
</tr>
<tr>
<td>Default:</td>
<td>E' []&lt;&gt;(){</td>
</tr>
<tr>
<td>minorSeparators</td>
<td>List of minor separators. Enclose in quotes with no spaces between.</td>
</tr>
<tr>
<td>Default:</td>
<td>E'/:=@.-#$_</td>
</tr>
<tr>
<td>minLength</td>
<td>Minimum length a token can have, type Integer. Must be greater than 0.</td>
</tr>
<tr>
<td>Default:</td>
<td>'2'</td>
</tr>
<tr>
<td>maxLength</td>
<td>Maximum length a token can be. Type Integer. Cannot be greater than 1024 bytes. For information about increasing the token size, see Text Search Parameters.</td>
</tr>
<tr>
<td>Default:</td>
<td>'128'</td>
</tr>
<tr>
<td>ngramsSize</td>
<td>Integer value greater than zero. Use only with ngram tokenizers.</td>
</tr>
<tr>
<td>Default:</td>
<td>'3'</td>
</tr>
<tr>
<td>used</td>
<td>Indicates when a tokenizer configuration cannot be changed. Type Boolean. After you set used to True, any calls to</td>
</tr>
</tbody>
</table>
setTokenizerParameter fail.

You must set the parameter used to True before using the configured tokenizer. Doing so prevents the configuration from being modified after being used to create a text index.

**Default:** False

<table>
<thead>
<tr>
<th>parameter_value</th>
<th>The value of a configuration parameter. If you want to disable minorSeparators or stopWordsCaseInsensitive, then set their values to ''.</th>
</tr>
</thead>
<tbody>
<tr>
<td>proc_oid</td>
<td>A unique identifier assigned to a tokenizer when it is created. Users must query the system table vs_procedures to get the proc_oid for a given tokenizer name. See Configuring a Tokenizer for more information.</td>
</tr>
</tbody>
</table>

## Examples

The following examples show how you can use SET_TOKENIZER_PARAMETER to configure stop words and separators.

Configure the stop words of a tokenizer:

```sql
=> SELECT v_txtindex.SET_TOKENIZER_PARAMETER('stopwordsCaseInsensitive', 'devil,TODAY,the,fox' USING PARAMETERS proc_oid='45035996274126984');
SET_TOKENIZER_PARAMETER
--------------------------
t (1 row)
```

Configure the major separators of a tokenizer:

```sql
=> SELECT v_txtindex.SET_TOKENIZER_PARAMETER('majorSeparators',E'{}&[]' USING PARAMETERS proc_oid='45035996274126984');
SET_TOKENIZER_PARAMETER
--------------------------
t (1 row)
```

## Table Management Functions

This section contains the functions associated with the Vertica library table management.
COPY_TABLE

Copies one table to another. This lightweight, in-memory function copies the DDL and all user-created projections from the source table. Projection statistics for the source table are also copied. Thus, the source and target tables initially have identical definitions and share the same storage.

Note:
Although they share storage space, Vertica regards the tables as discrete objects for license capacity purposes. For example, a single-terabyte table and its copy initially consume only one TB of space. However, your Vertica license regards them as separate objects that consume two TB of space.

After the copy operation is complete, the source and copy tables are independent of each other, so you can perform DML operations on one table without impacting the other. These operations can increase the overall storage required for both tables.

Caution:
If you create multiple copies of the same table concurrently, one or more of the copy operations is liable to fail. Instead, copy tables sequentially.

Syntax

```
COPY_TABLE (  
  '[[database.]schema.]source-table',  
  '[[database.]schema.]target-table'  
)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject</td>
</tr>
</tbody>
</table>
If you specify a database, it must be the current database.

**source-table**
The source table to copy. Vertica copies all data from this table to the target table.

**target-table**
The target table of the source table. If the target table already exists, Vertica appends the source to the existing table.

If the table does not exist, Vertica creates a table from the source table's definition, by calling `CREATE TABLE` with `LIKE` and `INCLUDING PROJECTIONS` clause. The new table inherits ownership from the source table. For details, see [Replicating a Table](#).

### Privileges

Non-superuser:

- Source table: INSERT, UPDATE, DELETE and SELECT
- Target schema/table (new): CREATE
- Target table (existing): INSERT

### Table Attribute Requirements

The following attributes of both tables must be identical:

- Column definitions, including NULL/NOT NULL constraints
- Segmentation
- Partitioning expression
- Number of projections
- Projection sort order
- Primary and unique key constraints. However, the key constraints do not have to be identically enabled.

**Note:**

If the target table has primary or unique key constraints enabled and moving the partitions will insert duplicate key values into the target table, Vertica rolls back the operation. Enforcing constraints requires disk reads and can slow the copy process.
- Number and definitions of text indices.

**Table Restrictions**

The following restrictions apply to the source and target tables:

- If the source and target partitions are in different storage tiers, Vertica returns a warning but the operation proceeds. The partitions remain in their existing storage tier.
- If the source table contains a sequence, Vertica converts the sequence to an integer before copying it to the target table. If the target table contains auto-increment, identity, or named sequence columns, Vertica cancels the copy and displays an error message.
- The following tables cannot be used as sources or targets:
  - Temporary tables
  - Virtual tables
  - System tables
  - External tables

**Examples**

If you call COPY_TABLE and the target table does not exist, the function creates the table automatically. In the following example, COPY_TABLE creates the target table `public.newtable`. Vertica also copies all the constraints associated with the source table `public.product_dimension` except foreign key constraints:

```
=> SELECT COPY_TABLE ( 'public.product_dimension', 'public.newtable');
-[ RECORD 1 ]---------------------------------------------
copy_table | Created table public.newtable.
Copied table public.product_dimension to public.newtable
```

**See Also**

[Creating a Table from Other Tables]
**INFER_EXTERNAL_TABLE_DDL**

Inspects a file in Parquet or ORC format and returns a `CREATE EXTERNAL TABLE AS COPY` statement that can be used to read the file. This statement might be incomplete. It could also contain more columns or columns with longer names than what Vertica supports; this function does not enforce Vertica system limits. Always inspect the output and address any issues before using it to create a table.

Parquet and ORC files contain insufficient information to infer the type of partition columns, so this function shows these columns with a data type of UNKNOWN and emits a warning.

The function handles most data types found in Parquet and ORC data, including complex types. If a type is not supported in Vertica, the function emits a warning.

By default, the function fully defines complex types, including handling nested types. You can instead treat the column as a single LONG VARBINARY value, which is useful if your data contains combinations of nesting that Vertica does not support.

**Syntax**

INFER_EXTERNAL_TABLE_DDL( 'path' USING PARAMETERS param=value[,,...] )

The following syntax is deprecated:

INFER_EXTERNAL_TABLE_DDL( 'path', 'table_name' [, 'vertica_type_for_complex_type'] )

**Arguments**

| path | Path to a file or directory. Any path that is valid for COPY is valid for this function. This function does not operate on files in other formats. |

**Parameters**

<p>| format | Input format (string), either Parquet or ORC. |</p>
<table>
<thead>
<tr>
<th>table_name</th>
<th>The name of the external table to create. This name does not depend on file contents.</th>
</tr>
</thead>
<tbody>
<tr>
<td>vertica_type_for_complex_type</td>
<td>Type used to represent all columns of complex types, if you do not want to expand them fully. The only supported value is LONG VARBINARY. For more information, see Using Flexible Complex Types.</td>
</tr>
</tbody>
</table>

**Privileges**

Non-superuser: READ privileges on the USER-accessible storage location.

**Examples**

In the following example, the input file contains data for a table with two INT columns. The table definition can be fully inferred, and you can use the returned SQL statement as-is.

```sql
=> SELECT INFER_EXTERNAL_TABLE_DDL('/data/orders/*.orc'
    USING PARAMETERS format = 'orc', table_name = 'orders');
```

```
create external table orders (id int, quantity int) as copy from '/data/orders/*.orc' orc;
(1 row)
```

The following example shows output with complex types. You can use the definition as-is or modify the VARCHAR sizes.

```sql
=> SELECT INFER_EXTERNAL_TABLE_DDL('/data/people/*.parquet'
    USING PARAMETERS format = 'parquet', table_name = 'employees');
```

```
WARNING 9311: This generated statement contains one or more varchar/varbinary columns which default to length 80
create external table "employees"(
  "employeeID" int,
  "personal" Row(
    "name" varchar,
    "address" Row(
      "street" varchar,
      "city" varchar,
```
In the following example, the input file contains a map in the "prods" column. You can read a map as an array of rows.

```sql
=> SELECT INFER_EXTERNAL_TABLE_DDL('/data/orders.parquet'
    USING PARAMETERS format='parquet', table_name='orders');
WARNING 9311: This generated statement contains one or more varchar/varbinary columns which default to length 80

create external table "orders"(
"orderkey" int,
"custkey" int,
"prods" Array[Row(
    "key" varchar,
    "value" numeric(12,2)
)],
"orderdate" date
) as copy from '/data/orders.parquet' parquet;
(1 row)
```

The following example uses partition columns. Types of partition column cannot be determined from the data and you must edit to specify the types.

```sql
=> SELECT INFER_EXTERNAL_TABLE_DDL('/data/sales/**/*'*
    USING PARAMETERS format = 'parquet', table_name = 'sales');
WARNING 9262: This generated statement is incomplete because of one or more unknown column types.
Fix these data types before creating the table

create external table "sales"(
"tx_id" int,
"date" UNKNOWN,
"region" UNKNOWN
) as copy from '/data/sales/**/*' parquet(hive_partition_cols='date,region');
(1 row)
```

For VARCHAR and VARBINARY columns, this function does not specify a length. The Vertica default length for these types is 80 bytes. If the data values are longer, using this table definition unmodified could cause data to be truncated. Always review VARCHAR and VARBINARY columns to determine if you need to specify a length. This function emits a warning if the input file contains columns of these types:

```sql
WARNING 9311: This generated statement contains one or more varchar/varbinary columns which default
```
**REBALANCE_TABLE**

Synchronously rebalances data in the specified table.

A rebalance operation performs the following tasks:

- Distributes data based on:
  - User-defined fault groups, if specified
  - Large cluster automatic fault groups
  - Redistributes database projection data across all nodes.

**Syntax**

```
REBALANCE_TABLE('[[database.]schema.]table-name')
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>table-name</code></td>
<td>The table to rebalance.</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser

**When to Rebalance**

Rebalancing is useful or even necessary after you perform the following tasks:
- Mark one or more nodes as ephemeral in preparation of removing them from the cluster.
- Add one or more nodes to the cluster so that Vertica can populate the empty nodes with data.
- Change the scaling factor of an elastic cluster, which determines the number of storage containers used to store a projection across the database.
- Set the control node size or realign control nodes on a large cluster layout
- Add nodes to or remove nodes from a fault group.

**Tip:**
By default, before performing a rebalance, Vertica queries system tables to compute the size of all projections involved in the rebalance task. This query can add significant overhead to the rebalance operation. To disable this query, set projection configuration parameter RebalanceQueryStorageContainers to 0.

**Example**

The following command shows how to rebalance data on the specified table.

```sql
=> SELECT REBALANCE_TABLE('online_sales.online_sales_fact');
REBALANCE_TABLE
---------------------
REBALANCED
(1 row)
```

**See Also**

- [REBALANCE_CLUSTERS](#)
- Rebalancing Data Across Nodes
- [NODES](#)
Tuple Mover Functions

This section contains tuple mover functions specific to Vertica.

DO_TM_TASK

Runs a Tuple Mover operation on the specified table or projection and commits current transactions.

Syntax

DO_TM_TASK('task', '[[database.]schema.]{ table | projection}' )

Parameters

<table>
<thead>
<tr>
<th>task</th>
<th>Specifies one of the following tuple mover operations:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• mergeout: Consolidates ROS containers and purge deleted records. For details, see Mergeout.</td>
</tr>
<tr>
<td></td>
<td>• analyze_row_count: Collects a minimal set of statistics and aggregate row counts for the specified projections, and saves it in the database catalog. Collects the number of rows in the specified projection. If you specify a table name, DO_TM_TASK returns the row counts for all projections of that table. For details, see Analyzing Row Counts.</td>
</tr>
<tr>
<td></td>
<td>• update_storage_catalog (recommended only for Eon Mode): Updates the catalog with metadata on bundled table data. For details, see Writing Bundle Metadata to the Catalog.</td>
</tr>
</tbody>
</table>

| [database.]schema | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: |
If you specify a database, it must be the current database.

<table>
<thead>
<tr>
<th>table</th>
<th>projection</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applies task to the specified table or projection. If you specify a projection and it is not found, DO_TM_TASK looks for a table with that name and, if found, applies the task to it and all projections associated with it.</td>
<td></td>
</tr>
<tr>
<td>If you specify no table or projection, the task is applied to all database tables and their projections.</td>
<td></td>
</tr>
</tbody>
</table>

Privileges

- Schema: USAGE
- Table: One of INSERT, UPDATE, or DELETE

Examples

Perform mergeout on all projections of table t1:

```sql
=> SELECT DO_TM_TASK('mergeout', 't1');
```
Workload Management Functions

This section contains workload management functions specific to Vertica.

**ANALYZE_WORKLOAD**

Runs Workload Analyzer, a utility that analyzes system information held in system tables.

Workload Analyzer intelligently monitors the performance of SQL queries and workload history, resources, and configurations to identify the root causes for poor query performance. ANALYZE_WORKLOAD returns tuning recommendations for all events within the scope and time that you specify, from system table TUNING_RECOMMENDATIONS.

Tuning recommendations are based on a combination of statistics, system and data collector events, and database-table-projection design. Workload Analyzer recommendations can help you quickly and easily tune query performance.

See Workload Analyzer Recommendations in the Administrator's Guide for the common triggering conditions and recommendations.

**Syntax**

```
ANALYZE_WORKLOAD ( 'scope' [, 'since-time' | save-data ]);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scope</td>
<td>Specifies the catalog objects to analyze, as follows:</td>
</tr>
<tr>
<td></td>
<td>[[database.]schema.]table</td>
</tr>
<tr>
<td></td>
<td>If set to an empty string, Vertica returns recommendations for all database objects.</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>since-time</td>
<td>Specifies the start time for the analysis time span, which continues up to the current system status, inclusive. If you omit this parameter,</td>
</tr>
</tbody>
</table>
ANALYZE_WORKLOAD returns recommendations on events since the last time you called this function.

**Note:**
You must explicitly cast strings to TIMESTAMP or TIMESTAMPTZ. For example:

```sql
SELECT ANALYZE_WORKLOAD('T1', '2010-10-04 11:18:15':TIMESTAMPTZ);
SELECT ANALYZE_WORKLOAD('T1', TIMESTAMPTZ '2010-10-04 11:18:15');
```

<table>
<thead>
<tr>
<th>save-data</th>
<th>Specifies whether to save returned values from ANALYZE_WORKLOAD:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• false (default): Results are discarded.</td>
</tr>
<tr>
<td></td>
<td>• true: Saves the results returned by ANALYZE_WORKLOAD.</td>
</tr>
<tr>
<td></td>
<td>Subsequent calls to ANALYZE_WORKLOAD return results that start</td>
</tr>
<tr>
<td></td>
<td>from the last invocation when results were saved. Object</td>
</tr>
<tr>
<td></td>
<td>events preceding that invocation are ignored.</td>
</tr>
</tbody>
</table>

**Return Values**

Returns aggregated tuning recommendations from **TUNING RECOMMENDATIONS**.

**Privileges**

Superuser

**Examples**

See [Getting Tuning Recommendations](#) in the Administrator's Guide.

**See Also**

- Analyzing Workloads
- Workload Analyzer Recommendations
**CHANGE_CURRENT_STATEMENT_RUNTIME_PRIORITY**

Changes the run-time priority of an active query.

**Note:**
This function replaces deprecated function CHANGE_RUNTIME_PRIORITY.

**Syntax**

\[
\text{CHANGE_CURRENT_STATEMENT_RUNTIME_PRIORITY}(\text{transaction-id}, \text{'value'})
\]

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>transaction-id</td>
<td>Identifies the transaction, obtained from the system table SESSIONS.</td>
</tr>
<tr>
<td>value</td>
<td>The RUNTIMEPRIORITY value: HIGH, MEDIUM, or LOW.</td>
</tr>
</tbody>
</table>

**Privileges**

- **Superuser**: None
- Non-superusers can only change the runtime priority of their own queries, and cannot raise the runtime priority of a query to a level higher than that of the resource pool.

**Example**

See Changing Runtime Priority of a Running Query.

**CHANGE_RUNTIME_PRIORITY**

Changes the run-time priority of a query that is actively running. Note that, while this function is still valid, you should instead use CHANGE_CURRENT_STATEMENT_RUNTIME_PRIORITY.
PRIORITY to change run-time priority. CHANGE_RUNTIME_PRIORITY will be deprecated in a future release of Vertica.

Syntax

CHANGE_RUNTIME_PRIORITY(TRANSACTION_ID, STATEMENT_ID, 'value')

Parameters

<table>
<thead>
<tr>
<th>TRANSACTION_ID</th>
<th>An identifier for the transaction within the session.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>TRANSACTION_ID cannot be NULL.</td>
</tr>
<tr>
<td></td>
<td>You can find the transaction ID in the Sessions table.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>STATEMENT_ID</th>
<th>A unique numeric ID assigned by the Vertica catalog, which identifies the currently executing statement.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>You can find the statement ID in the Sessions table.</td>
</tr>
<tr>
<td></td>
<td>You can specify NULL to change the run-time priority of the currently running query within the transaction.</td>
</tr>
</tbody>
</table>

| 'value'     | The RUNTIMEPRIORITY value. Can be HIGH, MEDIUM, or LOW. |

Privileges

No special privileges required. However, non-superusers can change the run-time priority of their own queries only. In addition, non-superusers can never raise the run-time priority of a query to a level higher than that of the resource pool.

Example

=> SELECT CHANGE_RUNTIME_PRIORITY(45035996273705748, NULL, 'low');
**MOVE_STATEMENT_TORESOURCE_POOL**

Attempts to move the specified query to the specified target pool.

**Syntax**

```
MOVE_STATEMENT_TORESOURCE_POOL (session_id, transaction_id, statement_id, target_resource_pool_name)
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>session_id</code></td>
<td>Identifier for the session where the query you want to move is currently executing.</td>
</tr>
<tr>
<td><code>transaction_id</code></td>
<td>Identifier for the transaction within the session.</td>
</tr>
<tr>
<td><code>statement_id</code></td>
<td>Unique numeric ID for the statement you want to move.</td>
</tr>
<tr>
<td><code>target_resource_pool_name</code></td>
<td>Name of the existing resource pool to which you want to move the specified query.</td>
</tr>
</tbody>
</table>

**Outputs**

The function may return the following results:

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MOV_REPLAN:</td>
<td>Target pool does not have sufficient resources. See v_monitor.resource_pool_move for details. Vertica will attempt to replan the statement on target pool.</td>
</tr>
<tr>
<td>MOV_REPLAN:</td>
<td>Target pool has priority HOLD. Vertica will attempt to replan the statement on target pool.</td>
</tr>
<tr>
<td>MOV_FAILED:</td>
<td>Statement not found.</td>
</tr>
<tr>
<td>MOV_NO_OP:</td>
<td>Statement already on target pool.</td>
</tr>
<tr>
<td>MOV_REPLAN:</td>
<td>Statement is in queue. Vertica will attempt to replan the statement on target pool.</td>
</tr>
</tbody>
</table>
MOV_SUCCE: Statement successfully moved to target pool.

Privileges

Superuser

Examples

The following example shows how you can move a specific statement to a resource pool called my_target_pool:

```sql
=> SELECT MOVE_STATEMENT_TO_RESOURCE_POOL ('v_vmart_node0001.example.-31427:0x82fbm', 45035996273711993, 1, 'my_target_pool');
```

See Also:

- Manually Moving Queries to Different Resource Pools
- RESOURCE_POOL_MOVE

SLEEP

Waits a specified number of seconds before executing another statement or command.

Syntax

```
SLEEP( seconds )
```

Parameters

| seconds | The wait time, specified in one or more seconds (0 or higher) expressed as a positive integer. Single quotes are optional; for example, SLEEP(3) is the same as SLEEP('3'). |
Notes

- This function returns value 0 when successful; otherwise it returns an error message due to syntax errors.
- You cannot cancel a sleep operation.
- Be cautious when using SLEEP() in an environment with shared resources, such as in combination with transactions that take exclusive locks.

Example

The following command suspends execution for 100 seconds:

```sql
=> SELECT SLEEP(100);

sleep
-------
 0
(1 row)
```

SQL Statements

The primary structure of a SQL query is its statement. Whether a statement stands on its own, or is part of a multi-statement query, each statement must end with a semicolon. The following example contains four common SQL statements—CREATE TABLE, INSERT, SELECT, and COMMIT:

```sql
=> CREATE TABLE comments (id INT, comment VARCHAR);
CREATE TABLE
=> INSERT INTO comments VALUES (1, 'Hello World');
OUTPUT
-------
 1
(1 row)

=> SELECT * FROM comments;

<table>
<thead>
<tr>
<th>id</th>
<th>comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Hello World</td>
</tr>
</tbody>
</table>
(1 row)

=> COMMIT;  
COMMIT
=>
```
ALTER Statements

ALTER statements let you change existing database objects.

ALTER ACCESS POLICY

Performs one of the following actions on existing access policies:

- Modify an access policy by changing its expression, and by enabling/disabling the policy.
- Copy an access policy from one table to another.

Syntax

Modify policy

```
ALTER ACCESS POLICY ON [database.schema]table
   { FOR COLUMN column [ expression ] | FOR ROWS [ WHERE expression ] } { GRANT TRUSTED } { ENABLE | DISABLE }
```

Copy policy

```
ALTER ACCESS POLICY ON [database.schema]table
   { FOR COLUMN column | FOR ROWS } COPY TO TABLE table;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `database.schema` | Specifies a schema, by default public. If `schema` is any schema other than public, you must supply the schema name. For example:  
<p>|               | <code>myschema.thisDbObject</code>                                                      |
|               | If you specify a database, it must be the current database.                |
| <strong>table</strong> | The name of the table that contains the access policy you want to enable, disable, or copy. |
| <strong>FOR COLUMN column [expression]</strong> | Replaces the access policy expression that was previously set for this column. Omit <code>expression</code> from the FOR COLUMN clause in order to enable or disable this policy only, or copy it to another table. |
| <strong>FOR ROWS [WHERE expression]</strong> | Replaces the row access policy expression that was previously set for this table. Omit WHERE <code>expression</code> from the FOR ROWS clause in order to enable or disable this policy only, or copy it to another table. |
| <strong>GRANT TRUSTED</strong> | Specifies that GRANT statements take precedence over the access policy in determining whether users can perform DML operations on the target table. If omitted, users can only modify table data if the access policy allows them to see the stored data in its original, unaltered state. For more information, see Access Policies and DML Operations. |
| <strong>ENABLE | DISABLE</strong> | Indicates whether to enable or disable the access policy at the table level. |
| <strong>COPY TO TABLE tablename</strong> | Copies the existing access policy to the specified table. The copied access policy includes its enabled/disabled and GRANT TRUSTED statuses. The following requirements apply: |</p>
<table>
<thead>
<tr>
<th>Privileges</th>
</tr>
</thead>
<tbody>
<tr>
<td>Superuser</td>
</tr>
</tbody>
</table>

### Examples

See [Managing Access Policies](#).

### See Also

- CREATE ACCESS POLICY

### ALTER AUTHENTICATION

Modifies the settings for a specified authentication method.

### Syntax

```
ALTER AUTHENTICATION auth_method_name {
| { ENABLE | DISABLE }
| { LOCAL | HOST [ { TLS | NO TLS } ] host_ip_address }
| RENAME TO new_auth_method_name
| METHOD value
| SET param=value[,...]
| PRIORITY value }
```
## Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>auth_method_name</code></td>
<td>Name of the authentication method that you want to create. Type: VARCHAR</td>
</tr>
<tr>
<td>`ENABLE</td>
<td>DISABLE`</td>
</tr>
<tr>
<td>`LOCAL</td>
<td>HOST`</td>
</tr>
<tr>
<td><code>host_ip_address</code></td>
<td></td>
</tr>
<tr>
<td><code>RENAME TO new_auth_method_name</code></td>
<td>Rename the authentication record. Type: VARCHAR</td>
</tr>
<tr>
<td><code>METHOD value</code></td>
<td>The authentication method you are altering.</td>
</tr>
<tr>
<td><code>SET param=value</code></td>
<td>Set a parameter name and value for the authentication method that you are creating. Required only for LDAP and Ident authentication. ALTER AUTHENTICATION validates the parameters you enter. See parameters for specific authentication types in Client Authentication.</td>
</tr>
<tr>
<td><code>PRIORITY value</code></td>
<td>If the user is associated with multiple authentication methods, the priority value specifies which authentication</td>
</tr>
<tr>
<td>Parameter Name</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| method         | Vertica tries first.  
|                | Default: 0  
|                | Type: INTEGER  
|                | Higher values indicate higher priorities. For example, a priority of 10 is higher than a priority of 5; priority 0 is the lowest possible value.  
|                | For details, see Priorities for Client Authentication Methods. |

**Privileges**

Superuser

**Examples**

**Enabling and Disabling Authentication Methods**

This example uses ALTER AUTHENTICATION to disable the `v_ldap` authentication method and then enable it again:

```
=> ALTER AUTHENTICATION v_ldap DISABLE;
=> ALTER AUTHENTICATION v_ldap ENABLE;
```

**Renaming Authentication Methods**

This example renames the `v_kerberos` authentication method to `K5`. All users who have been granted the `v_kerberos` authentication method now have the K5 method granted instead.

```
=> ALTER AUTHENTICATION v_kerberos RENAME TO K5;
```

**Modifying Authentication Parameters**

This example sets the system user for `ident1` authentication to `user1`:

```
=> CREATE AUTHENTICATION ident1 METHOD 'ident' LOCAL;
=> ALTER AUTHENTICATION ident1 SET system_users='user1';
```
When you set or modify LDAP or Identi parameters using ALTER AUTHENTICATION, Vertica validates them.

This example changes the IP address and specifies the parameters for an LDAP authentication method named Ldap1. Specify the bind parameters for the LDAP server. Vertica connects to the LDAP server, which authenticates the database client. If authentication succeeds, Vertica authenticates any users who have been associated with (granted) the Ldap1 authentication method on the designated LDAP server:

```sql
=> CREATE AUTHENTICATION Ldap1 METHOD 'ldap' HOST '172.16.65.196';
=> ALTER AUTHENTICATION Ldap1 SET host='ldap://172.16.65.177',
    binddn_prefix='cn=', binddn_suffix=',dc=qa_domain,dc=com';
```

The next example specifies the parameters for an LDAP authentication method named Ldap2. Specify the LDAP search and bind parameters. Sometimes, Vertica does not have enough information to create the distinguished name (DN) for a user attempting to authenticate. In such cases, you must specify to use LDAP search and bind:

```sql
=> CREATE AUTHENTICATION Ldap2 METHOD 'ldap' HOST '172.16.65.196';
=> ALTER AUTHENTICATION Ldap2 SET basedn='dc=qa_domain,dc=com',
    binddn='cn=Manager,dc=qa_domain,
    dc=com',search_attribute='cn',bind_password='secret';
```

### Changing the Authentication Method

This example changes the localpwd authentication from hash to trust:

```sql
=> CREATE AUTHENTICATION localpwd METHOD 'hash' LOCAL;
=> ALTER AUTHENTICATION localpwd METHOD 'trust';
```

### Set Multiple Realms

This example sets another realm for the authentication method krb_local:

```sql
=> ALTER AUTHENTICATION krb_local set realm = 'COMPANY.COM';
```

### See Also

- CREATE AUTHENTICATION
- DROP AUTHENTICATION
- GRANT (Authentication)
- REVOKE (Authentication)
- CLIENT_AUTH
ALTER CA BUNDLE

Adds and removes certificates from or changes the owner of a certificate authority (CA) bundle.

Syntax

ALTER CA BUNDLE name
    [ADD CERTIFICATES ca_cert[, ca_cert[, ...]]]
    [REMOVE CERTIFICATES ca_cert[, ca_cert[, ...]]]
    [OWNER TO user]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the CA bundle.</td>
</tr>
<tr>
<td>ca_cert</td>
<td>The name of the CA certificate to add or remove from the bundle.</td>
</tr>
<tr>
<td>user</td>
<td>The name of a database user.</td>
</tr>
</tbody>
</table>

Privileges

Ownership of the CA bundle.

Examples

See Managing CA Bundles.

See Also

- CREATE CA BUNDLE
- DROP CA BUNDLE

ALTER DATABASE

Use ALTER DATABASE to perform the following tasks:
- Drop all fault groups and their child fault groups from a database.
- Restore down nodes, and revert active standby nodes to standby status.
- Specify the subnet name of a public network to use for import/export.
- Set and clear database configuration parameters.

To see the current value of a parameter, query system table CONFIGURATION_PARAMETERS or use SHOW DATABASE.

**Syntax**

```
ALTER DATABASE db-spec {
  DROP ALL FAULT GROUP
  | EXPORT ON { subnet-name | DEFAULT }
  | RESET STANDBY
  | SET [PARAMETER] parameter=value [,..]
  | CLEAR [PARAMETER] parameter[,..]
}
```

**Parameters**

<table>
<thead>
<tr>
<th>db-spec</th>
<th>Specifies the database to alter, one of the following:</th>
</tr>
</thead>
</table>
|         | - The database name
|         | - DEFAULT: The current database

| DROP ALL FAULT GROUP | Drops all fault groups defined on the specified database.

<table>
<thead>
<tr>
<th>EXPORT ON</th>
<th>Specifies the network to use for importing and exporting data, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- subnet-name: A subnet of the public network.</td>
</tr>
<tr>
<td></td>
<td>- DEFAULT: Specifies to use a private network.</td>
</tr>
</tbody>
</table>

For details, see Identify the Database or Nodes Used for Import/Export, and Changing Node Export Addresses.

<table>
<thead>
<tr>
<th>RESET STANDBY</th>
<th>(Enterprise Mode only) Restores all down nodes and reverts their replacement nodes to standby status. If any replaced nodes cannot resume activity, Vertica leaves their standby nodes in place.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>SET [PARAMETER]</th>
<th>Sets the specified parameters.</th>
</tr>
</thead>
</table>
CLEAR [PARAMETER] Resets the specified parameters to their default values.

Privileges
Superuser

ALTER FAULT GROUP

Modifies an existing fault group. For example, use the ALTER FAULT GROUP statement to:

- Add a node to or drop a node from an existing fault group
- Add a child fault group to or drop a child fault group from a parent fault group
- Rename a fault group

Syntax

ALTER FAULT GROUP fault-group-name {
| ADD NODE node-name
| DROP NODE node-name
| ADD FAULT GROUP child-fault-group-name
| DROP FAULT GROUP child-fault-group-name
| RENAME TO new-fault-group-name }

Parameters

<table>
<thead>
<tr>
<th>fault-group-name</th>
<th>The existing fault group name you want to modify.</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-name</td>
<td>The node name you want to add to or drop from the existing (parent) fault group.</td>
</tr>
<tr>
<td>child-fault-group-name</td>
<td>The name of the child fault group you want to add to or remove from an existing parent fault group.</td>
</tr>
<tr>
<td>new-fault-group-name</td>
<td>The new name for the fault group you want to rename.</td>
</tr>
</tbody>
</table>
Privileges

Superuser

Example

This example shows how to rename the parent0 fault group to parent100:

```sql
=> ALTER FAULT GROUP parent0 RENAME TO parent100;
ALTER FAULT GROUP
```

Verify the change by querying the `FAULT_GROUPS` system table:

```sql
=> SELECT member_name FROM fault_groups;
member_name
---------------------
v_exampledb_node0003
parent100
mygroup
(3 rows)
```

See Also

- CREATE FAULT GROUP
- `V_CATALOG.FAULT_GROUPS`
- `V_CATALOG.CLUSTER_LAYOUT`
- Fault Groups
- High Availability With Fault Groups

ALTER FUNCTION Statements

Vertica provides ALTER statements for each type of user-defined extension. Each ALTER statement modifies the metadata of a user-defined function in the Vertica catalog:

<table>
<thead>
<tr>
<th>ALTER statement</th>
<th>Extension</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER FUNCTION (Scalar)</td>
<td>User-defined scalar functions (UDSFs)</td>
</tr>
<tr>
<td>ALTER AGGREGATE FUNCTION</td>
<td>User-defined aggregate functions (UDAFs)</td>
</tr>
</tbody>
</table>
### ALTER AGGREGATE FUNCTION

Alters a **user-defined aggregate function**.

#### Syntax

```sql
ALTER AGGREGATE FUNCTION [[db-name.]schema.]function-name( [ parameter-list ] ) { 
  OWNER TO new-owner 
  | RENAME TO new-name 
  | SET SCHEMA new-schema 
}
```

#### Parameters

<table>
<thead>
<tr>
<th><code>[db-name.]schema</code></th>
<th>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><strong>function-name</strong></td>
<td>Name of the SQL function to alter.</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------</td>
</tr>
<tr>
<td><strong>arg-list</strong></td>
<td>Comma-delimited list of parameters that are defined for this function. If none, specify an empty list.</td>
</tr>
</tbody>
</table>

**Note:**
Vertica supports function overloading, and uses the parameter list to identify the function to alter.

<table>
<thead>
<tr>
<th><strong>OWNER TO new-owner</strong></th>
<th>Transfers function ownership to another user.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>RENAME TO new-name</strong></td>
<td>Renames this function.</td>
</tr>
<tr>
<td><strong>SET SCHEMA new-schema</strong></td>
<td>Moves the function to another schema.</td>
</tr>
</tbody>
</table>

### Privileges

Non-superuser: USAGE on the schema and one of the following:

- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

<table>
<thead>
<tr>
<th>For these operations...</th>
<th>Schema privileges required...</th>
</tr>
</thead>
<tbody>
<tr>
<td>RENAME TO (rename function)</td>
<td>CREATE, USAGE</td>
</tr>
<tr>
<td>SET SCHEMA (move function to another schema)</td>
<td>CREATE: destination schema USAGE: current schema</td>
</tr>
</tbody>
</table>

### See Also

- CREATE AGGREGATE FUNCTION

**ALTER ANALYTIC FUNCTION**

Alters a user-defined analytic function.
Syntax

```
ALTER ANALYTIC FUNCTION [[db-name.]schema.]function-name( [ parameter-list ] ) {
  OWNER TO new-owner
  | RENAME TO new-name
  | SET FENCED boolean-expr
  | SET SCHEMA new-schema
}
```

Parameters

<table>
<thead>
<tr>
<th>[db-name.]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td>function-name</td>
<td>Name of the function to alter.</td>
</tr>
<tr>
<td>parameter-list</td>
<td>Comma-delimited list of parameters that are defined for this function. If none, specify an empty list.</td>
</tr>
</tbody>
</table>

**Note:** Vertica supports function overloading, and uses the parameter list to identify the function to alter.

<table>
<thead>
<tr>
<th>OWNER TO new-owner</th>
<th>Transfers function ownership to another user.</th>
</tr>
</thead>
<tbody>
<tr>
<td>RENAME TO new-name</td>
<td>Renames this function.</td>
</tr>
<tr>
<td>SET FENCED boolean-expr</td>
<td>Specifies whether to enable fenced mode for this function.</td>
</tr>
<tr>
<td>SET SCHEMA new-schema</td>
<td>Moves the function to another schema.</td>
</tr>
</tbody>
</table>

Privileges

Non-superuser: USAGE on the schema and one of the following:
Function owner
ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

<table>
<thead>
<tr>
<th>For these operations...</th>
<th>Schema privileges required...</th>
</tr>
</thead>
<tbody>
<tr>
<td>RENAME TO (rename function)</td>
<td>CREATE, USAGE</td>
</tr>
<tr>
<td>SET SCHEMA (move function to another schema)</td>
<td>CREATE: destination schema USAGE: current schema</td>
</tr>
</tbody>
</table>

See Also

CREATE ANALYTIC FUNCTION

ALTER FILTER

Alters a user-defined filter.

Syntax

```
ALTER FILTER [[db-name.]schema.]function-name( [ parameter-list ] ) |
  OWNER TO new-owner |
  RENAME TO new-name |
  SET FENCED boolean-expr |
  SET SCHEMA new-schema |
```  

Parameters

```
[db-name.]schema | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:
myschema.thisDbObject
```
<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>function-name</code></td>
<td>Name of the function to alter.</td>
</tr>
<tr>
<td><code>parameter-list</code></td>
<td>Comma-delimited list of parameters that are defined for this function. If none, specify an empty list.</td>
</tr>
</tbody>
</table>

**Note:**
Vertica supports function overloading, and uses the parameter list to identify the function to alter.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWNER TO <code>new-owner</code></td>
<td>Transfers function ownership to another user.</td>
</tr>
<tr>
<td>RENAME TO <code>new-name</code></td>
<td>Renames this function.</td>
</tr>
<tr>
<td>SET FENCED <code>boolean-exp</code></td>
<td>Specifies whether to enable fenced mode for this function.</td>
</tr>
<tr>
<td>SET SCHEMA <code>new-schema</code></td>
<td>Moves the function to another schema.</td>
</tr>
</tbody>
</table>

**Privileges**

Non-superuser: USAGE on the schema and one of the following:

- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

<table>
<thead>
<tr>
<th>For these operations...</th>
<th>Schema privileges required...</th>
</tr>
</thead>
<tbody>
<tr>
<td>RENAME TO (rename function)</td>
<td>CREATE, USAGE</td>
</tr>
<tr>
<td>SET SCHEMA (move function to another schema)</td>
<td>CREATE: destination schema USAGE: current schema</td>
</tr>
</tbody>
</table>

**See Also**

CREATE FILTER
**ALTER FUNCTION (SQL)**

Alters a user-defined SQL function.

**Syntax**

```
ALTER FUNCTION [[db-name.]schema.]function-name( [arg-list] ) { 
  OWNER TO new-owner  
  | RENAME TO new-name  
  | SET SCHEMA new-schema 
}
```

**Parameters**

<table>
<thead>
<tr>
<th>[db-name.]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td>function-name</td>
<td>The name of the SQL function to alter.</td>
</tr>
<tr>
<td>arg-list</td>
<td>A comma-delimited list of function argument names. If none, specify an empty list.</td>
</tr>
<tr>
<td>OWNER TO new-owner</td>
<td>Transfers function ownership to another user.</td>
</tr>
<tr>
<td>RENAME TO new-name</td>
<td>Renames this function.</td>
</tr>
<tr>
<td>SET SCHEMA new-schema</td>
<td>Moves the function to another schema.</td>
</tr>
</tbody>
</table>

**Privileges**

Non-superuser: USAGE on the schema and one of the following:
- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

<table>
<thead>
<tr>
<th>For these operations...</th>
<th>Schema privileges required...</th>
</tr>
</thead>
<tbody>
<tr>
<td>RENAME TO (rename function)</td>
<td>CREATE, USAGE</td>
</tr>
<tr>
<td>SET SCHEMA (move function to another schema)</td>
<td>CREATE: destination schema USAGE: current schema</td>
</tr>
</tbody>
</table>

**Examples**

Rename function SQL_one to SQL_two:

```sql
=> ALTER FUNCTION SQL_one (int, int) RENAME TO SQL_two;
```

Move function SQL_two to schema macros:

```sql
=> ALTER FUNCTION SQL_two (int, int) SET SCHEMA macros;
```

Reassign ownership of SQL_two:

```sql
=> ALTER FUNCTION SQL_two (int, int) OWNER TO user1;
```

**See Also**

- [User-Defined SQL Functions](https://docs.vertica.com/Vertica-Analytic-Database-11.0.x/Vertica-Documentation-SQL-Reference-Manual/Page-3787/)

**ALTER FUNCTION (Scalar)**

Alters a [user-defined scalar function](https://docs.vertica.com/Vertica-Analytic-Database-11.0.x/Vertica-Documentation-SQL-Reference-Manual/Page-3787/).
### Syntax

```sql
ALTER FUNCTION [[db-name.]schema.]function-name( [ parameter-list] ) {
  OWNER TO new-owner
  | RENAME TO new-name
  | SET FENCED boolean-expr
  | SET SCHEMA new-schema
}
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[db-name.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>function-name</code></td>
<td>Name of the function to alter.</td>
</tr>
<tr>
<td><code>parameter-list</code></td>
<td>Comma-delimited list of parameters that are defined for this function. If none, specify an empty list. Note: Vertica supports function overloading, and uses the parameter list to identify the function to alter.</td>
</tr>
<tr>
<td><code>OWNER TO new-owner</code></td>
<td>Transfers function ownership to another user.</td>
</tr>
<tr>
<td><code>RENAME TO new-name</code></td>
<td>Renames this function.</td>
</tr>
<tr>
<td><code>SET FENCED boolean-expr</code></td>
<td>Specifies whether to enable fenced mode for this function.</td>
</tr>
<tr>
<td><code>SET SCHEMA new-schema</code></td>
<td>Moves the function to another schema.</td>
</tr>
</tbody>
</table>

### Privileges

Non-superuser: USAGE on the schema and one of the following:
- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

<table>
<thead>
<tr>
<th>For these operations...</th>
<th>Schema privileges required...</th>
</tr>
</thead>
<tbody>
<tr>
<td>RENAME TO (rename function)</td>
<td>CREATE, USAGE</td>
</tr>
<tr>
<td>SET SCHEMA (move function to another schema)</td>
<td>CREATE: destination schema</td>
</tr>
<tr>
<td></td>
<td>USAGE: current schema</td>
</tr>
</tbody>
</table>

### Examples

Rename function UDF_one to UDF_two:

```
=> ALTER FUNCTION UDF_one (int, int) RENAME TO UDF_two;
```

Move function UDF_two to schema macros:

```
=> ALTER FUNCTION UDF_two (int, int) SET SCHEMA macros;
```

Disable fenced mode for function UDF_two:

```
=> ALTER FUNCTION UDF_two (int, int) SET FENCED false;
```

### See Also

CREATE FUNCTION (Scalar)

**ALTER PARSER**

Alters a [user-defined parser](#).
Syntax

ALTER PARSER [[db-name.]schema.]function-name( [ parameter-list ] ) {
    OWNER TO new-owner
    | RENAME TO new-name
    | SET FENCED boolean-expr
    | SET SCHEMA new-schema
}

Parameters

<table>
<thead>
<tr>
<th>[db-name.]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td>function-name</td>
<td>Name of the function to alter.</td>
</tr>
<tr>
<td>parameter-list</td>
<td>Comma-delimited list of parameters that are defined for this function. If none, specify an empty list.</td>
</tr>
<tr>
<td></td>
<td>Note: Vertica supports function overloading, and uses the parameter list to identify the function to alter.</td>
</tr>
<tr>
<td>OWNER TO new-owner</td>
<td>Transfers function ownership to another user.</td>
</tr>
<tr>
<td>RENAME TO new-name</td>
<td>Renames this function.</td>
</tr>
<tr>
<td>SET FENCED boolean-expr</td>
<td>Specifies whether to enable fenced mode for this function.</td>
</tr>
<tr>
<td>SET SCHEMA new-schema</td>
<td>Moves the function to another schema.</td>
</tr>
</tbody>
</table>

Privileges

Non-superuser: USAGE on the schema and one of the following:
- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

<table>
<thead>
<tr>
<th>For these operations...</th>
<th>Schema privileges required...</th>
</tr>
</thead>
<tbody>
<tr>
<td>RENAME TO (rename function)</td>
<td>CREATE, USAGE</td>
</tr>
<tr>
<td>SET SCHEMA (move function to another schema)</td>
<td>CREATE: destination schema USAGE: current schema</td>
</tr>
</tbody>
</table>

CREATE PARSER

**ALTER SOURCE**

Alters a user-defined load source function.

**Syntax**

```sql
ALTER SOURCE [[db-name.]schema.]function-name([ parameter-list ] ) {
    OWNER TO new-owner
    | RENAME TO new-name
    | SET FENCED boolean-expr
    | SET SCHEMA new-schema
}
```

**Parameters**

<table>
<thead>
<tr>
<th>[db-name.]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td>example</td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td>function-name</td>
<td>Name of the function to alter.</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------------</td>
</tr>
<tr>
<td>parameter-list</td>
<td>Comma-delimited list of parameters that are defined for this function. If none, specify an empty list.</td>
</tr>
</tbody>
</table>

**Note:**
Vertica supports function overloading, and uses the parameter list to identify the function to alter.

<table>
<thead>
<tr>
<th>OWNER TO new-owner</th>
<th>Transfers function ownership to another user.</th>
</tr>
</thead>
<tbody>
<tr>
<td>RENAME TO new-name</td>
<td>Renames this function.</td>
</tr>
<tr>
<td>SET FENCED boolean-expr</td>
<td>Specifies whether to enable fenced mode for this function.</td>
</tr>
<tr>
<td>SET SCHEMA new-schema</td>
<td>Moves the function to another schema.</td>
</tr>
</tbody>
</table>

### Privileges

Non-superuser: USAGE on the schema and one of the following:

- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

<table>
<thead>
<tr>
<th>For these operations…</th>
<th>Schema privileges required…</th>
</tr>
</thead>
<tbody>
<tr>
<td>RENAME TO (rename function)</td>
<td>CREATE, USAGE</td>
</tr>
<tr>
<td>SET SCHEMA (move function to another schema)</td>
<td>CREATE: destination schema, USAGE: current schema</td>
</tr>
</tbody>
</table>

### See Also

CREATE SOURCE
**ALTER TRANSFORM FUNCTION**

Delete this text and replace it with your own content.

**Syntax**

```
ALTER TRANSFORM FUNCTION [[db-name.]schema.]function-name( [ parameter-list ] ) {
  OWNER TO new-owner
  | RENAME TO new-name
  | SET FENCED boolean-expr
  | SET SCHEMA new-schema
}
```

**Parameters**

<table>

<td>CREATE: destination schema  USAGE: current schema</td>
</tr>
</tbody>
</table>

See Also

CREATE TRANSFORM FUNCTION

ALTER HCATALOG SCHEMA

Alters parameter values on a schema that was created with CREATE HCATALOG SCHEMA. HCatalog schemas are used by the HCatalog Connector to access data stored in a Hive data warehouse. For more information, see Using the HCatalog Connector in Integrating with Apache Hadoop.

Some parameters cannot be altered after creation. If you need to change one of those values, delete and recreate the schema instead. You can use ALTER HCATALOG SCHEMA to change the following parameters:

- HOSTNAME
- PORT
- HIVESERVER2_HOSTNAME
- WEBSERVICE_HOSTNAME
- WEBSERVICE_PORT
- WEBHDFS_ADDRESS
- HCATALOG_CONNECTION_TIMEOUT
Syntax

ALTER HCATALOG SCHEMA schema-name SET [param=value]+;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema-name</td>
<td>The name of the schema in the Vertica catalog to alter. The tables in the Hive database are available through this schema.</td>
</tr>
<tr>
<td>param</td>
<td>The name of the parameter to alter.</td>
</tr>
<tr>
<td>value</td>
<td>The new value for the parameter. You must specify a value; this statement does not read default values from configuration files like CREATE HCATALOG SCHEMA.</td>
</tr>
</tbody>
</table>

Privileges

One of the following:

- Superuser
- Schema owner

Examples

The following example shows how to change the Hive metastore hostname and port for the "hcat" schema. In this example, Hive uses High Availability metastore.

```sql
=> ALTER HCATALOG SCHEMA hcat SET HOSTNAME='thrift://ms1.example.com:9083,thrift://ms2.example.com:9083';
```

The following example shows the error you receive if you try to set an unalterable parameter.
ALTER CATALOG SCHEMA hcat SET HCATALOG_USER='admin';
ERROR 4856: Syntax error at or near "HCATALOG_USER" at character 39

**ALTER LIBRARY**

Replaces the library file that is currently associated with a UDx library in the Vertica catalog. Vertica automatically distributes copies of the updated file to all cluster nodes. UDxs defined in the catalog that reference the updated library automatically start using the updated library file.

*Important:* The current and replacement libraries must be developed in the same language.

**Syntax**

```
ALTER LIBRARY [[database.]schema.]Library-name [DEPENDS 'support-path'] AS 'Library-path';
```

**Parameters**

- **schema**
  - *Specifies a schema*, by default public. If *schema* is any schema other than public, you must supply the schema name. For example:
  ```
  myschema.thisDbObject
  ```
  - If you specify a database, it must be the current database.

- **Library-name**
  - The name of an existing library created with `CREATE LIBRARY`.

- **DEPENDS 'support-path'**
  - Indicates that the UDx library depends on one or more files or libraries, where *support-path* specifies one or more absolute paths to these dependencies on the initiator node.

  *Note:*
  - DEPENDS is ignored for R, as R packages must be installed locally on each node, including external dependencies.
  - For example, the following statement specifies a single dependency:
CREATE LIBRARY mylib AS '/path/to/java_udx' DEPENDS '/path/to/jar/this.jar' LANGUAGE 'Java';

DEPENDS can specify multiple support paths as follows:

- Separate multiple paths with colons (:). For example:

  CREATE LIBRARY mylib AS '/path/to/java_udx'
  DEPENDS '/path/to/jars/this.jar:/path/to/jars/that.jar'
  LANGUAGE 'Java';

- Specify a directory that contains multiple libraries with a trailing slash (/), optionally followed by asterisk wildcard (*). For example, the following DEPENDS clauses are identical:

  DEPENDS '/home/mydir/mylibs/'
  DEPENDS '/home/mydir/mylibs/*'

DEPENDS can specify libraries with multiple directory levels. For details, see Multi-level Library Dependencies.

**Important:**
The performance of CREATE LIBRARY is liable to degrade in Eon Mode, in proportion to the number and depth of dependencies specified by the DEPENDS clause.

| AS Library-path | The absolute path on the initiator node file system of the replacement library file. |

**Privileges**
Superuser

**Requirements**
The original and replacement libraries must comply with the following requirements, otherwise ALTER LIBRARY returns with an error:

- The libraries must be developed in the same programming language.
- Function signatures must match.
Multi-level Library Dependencies

If a DEPENDS clause specifies a library with multiple directory levels, Vertica follows the library path to include all subdirectories of that library. For example, the following CREATE LIBRARY statement enables UDx library mylib to import all Python packages and modules that it finds in subdirectories of site-packages:

```
=> CREATE LIBRARY mylib AS '/path/to/python_udx' DEPENDS '/path/to/python/site-packages' LANGUAGE 'Python';
```

**Important:**

DEPENDS can specify Java library dependencies that are up to 100 levels deep.

Examples

This example shows how to update an already-defined library myFunctions with a new file.

```
=> ALTER LIBRARY myFunctions AS '/home/dbadmin/my_new_functions.so';
```

Developing User-Defined Extensions (UDxs)

ALTER LOAD BALANCE GROUP

Changes the configuration of a load balance group.

**Syntax**

```
ALTER LOAD BALANCE GROUP group_name {
  RENAME TO new-name |
  SET FILTER TO 'ip-cidr-addr' |
  SET POLICY TO 'policy' |
  ADD {ADDRESS | FAULT GROUP | SUBCLUSTER} add-list |
  DROP {ADDRESS | FAULT GROUP | SUBCLUSTER} drop-list
}
```
## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>group_name</code></td>
<td>Name of an existing load balance group to change.</td>
</tr>
<tr>
<td><code>RENAME TO new-name</code></td>
<td>Renames the group to <code>new-name</code>.</td>
</tr>
<tr>
<td><code>SET FILTER TO 'ip-cidr-addr'</code></td>
<td>Changes the IP address filter that selects which members of a fault group or groups are included in the load balance group. This setting is only valid if the load balance group contains fault groups.</td>
</tr>
</tbody>
</table>
| `SET POLICY TO 'policy'` | Changes the policy the load balance group uses to select the target node for the incoming connection. One of:  
  - ROUNDROBIN  
  - RANDOM  
  - NONE  
  See [CREATE LOAD BALANCE GROUP](#) for details. |
| `ADD {ADDRESS | FAULT GROUP | SUBCLUSTER }` | Adds objects of the specified type to the load balance group. Load balance groups can only contain one type of object. For example, if you created the load balance group using a list of addresses, you can only add additional addresses, not fault groups or subclusters. |
| `add-list` | A comma-delimited list of objects (addresses, fault groups, or subclusters) to add to the load balance group. |
DROP \{ADDRESS | FAULT GROUP | SUBCLUSTER\}

Removes objects of the specified type from the load balance group (addresses, fault groups, or subclusters). The object type must match the type of the objects already in the load balance group.

(drop-list)

The list of objects to remove from the load balance group.

Privileges

Superuser

Example

Remove an address from the load balance group named group_2.

=> SELECT * FROM LOAD_BALANCE_GROUPS;

<table>
<thead>
<tr>
<th>name</th>
<th>policy</th>
<th>filter</th>
<th>type</th>
<th>object_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_1</td>
<td>ROUNDROBIN</td>
<td>Network Address Group</td>
<td>node01</td>
<td></td>
</tr>
<tr>
<td>group_1</td>
<td>ROUNDROBIN</td>
<td>Network Address Group</td>
<td>node02</td>
<td></td>
</tr>
<tr>
<td>group_2</td>
<td>ROUNDROBIN</td>
<td>Network Address Group</td>
<td>node03</td>
<td></td>
</tr>
</tbody>
</table>

(3 rows)

=> ALTER LOAD BALANCE GROUP group_2 DROP ADDRESS node03;

ALTER LOAD BALANCE GROUP

=> SELECT * FROM LOAD_BALANCE_GROUPS;

<table>
<thead>
<tr>
<th>name</th>
<th>policy</th>
<th>filter</th>
<th>type</th>
<th>object_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_1</td>
<td>ROUNDROBIN</td>
<td>Network Address Group</td>
<td>node01</td>
<td></td>
</tr>
<tr>
<td>group_1</td>
<td>ROUNDROBIN</td>
<td>Network Address Group</td>
<td>node02</td>
<td></td>
</tr>
<tr>
<td>group_2</td>
<td>ROUNDROBIN</td>
<td>Empty Group</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(3 rows)

The following example adds three network addresses to the group named group_2:

=> ALTER LOAD BALANCE GROUP group_2 ADD ADDRESS node01,node02,node03;

ALTER LOAD BALANCE GROUP

=> SELECT * FROM load_balance_groups WHERE name = 'group_2';

<table>
<thead>
<tr>
<th>name</th>
<th>group_2</th>
</tr>
</thead>
</table>
See Also

**ALTER MODEL**

Allows users to rename an existing model, change ownership, or move it to another schema.

**Syntax**

```
ALTER MODEL [ [database.]schema.]model
   { OWNER TO owner
     | RENAME TO new-name
     | SET SCHEMA schema
   }
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>model</code></td>
<td>Identifies the model to alter.</td>
</tr>
</tbody>
</table>
| OWNER TO  
owner | Reassigns ownership of this model to owner. If a non-superuser, you must be the current owner. |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>RENAME TO</td>
<td>Renames the mode, where new-name conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.</td>
</tr>
</tbody>
</table>
| SET SCHEMA       
schema | Moves the model from one schema to another. |

**Privileges**

Non-superuser: USAGE on the schema and one of the following:

- Model owner
- ALTER privilege on the model

For certain operations, non-superusers must have the following schema privileges:

<table>
<thead>
<tr>
<th>Schema privileges required...</th>
<th>For these operations...</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE, USAGE</td>
<td>Rename model</td>
</tr>
<tr>
<td>CREATE: destination schema</td>
<td>Move model to another schema</td>
</tr>
<tr>
<td>USAGE: current schema</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

See Altering Models.

**ALTER NETWORK ADDRESS**

Changes the configuration of an existing network address.

**Syntax**

```
ALTER NETWORK ADDRESS name {
    RENAME TO new-name
    | SET TO 'ip-addr' [PORT port-number]
    | { ENABLE | DISABLE }
}
```
Parameters

<table>
<thead>
<tr>
<th>name</th>
<th>Name of an existing network address to change.</th>
</tr>
</thead>
<tbody>
<tr>
<td>RENAME TO new-name</td>
<td>Renames the network address to new-name. This name change has no effect on the network address's membership in load balance groups.</td>
</tr>
<tr>
<td>SET TO 'ip-addr'</td>
<td>Changes the IP address assigned to the network address.</td>
</tr>
<tr>
<td>PORT port-number</td>
<td>Sets the port number for the network address. You must supply a network address when altering the port number.</td>
</tr>
<tr>
<td>ENABLE</td>
<td>DISABLE</td>
</tr>
</tbody>
</table>

Example

Rename the network address from test_addr to alt_node1, then change its IP address to 192.168.1.200 with port number 4000:

```sql
=> ALTER NETWORK ADDRESS test_addr RENAME TO alt_node1;
=> ALTER NETWORK ADDRESS alt_node1 SET TO '192.168.1.200' PORT 4000;
=> ALTER NETWORK ADDRESS
```

See Also

**ALTER NETWORK INTERFACE**

⚠️ Deprecated:
This statement has been deprecated. Instead, use **ALTER NETWORK ADDRESS**.

Renames a network interface.
Syntax

ALTER NETWORK INTERFACE network-interface-name RENAME TO new-network-interface-name

Parameters

<table>
<thead>
<tr>
<th>network-interface-name</th>
<th>The name of the existing network interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td>new-network-interface-name</td>
<td>The new name for the network interface.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

Examples

Rename a network interface:

```sql
=> ALTER NETWORK INTERFACE myNetwork RENAME TO myNewNetwork;
```

ALTER NODE

Sets and clears node-level configuration parameters on the specified node. ALTER NODE also performs the following management tasks:

- Changes the node type.
- Specifies the network interface of the public network on individual nodes that are used for import and export.
- Replaces a down node.

For information about removing a node, see

- Removing Nodes From a Database
- Removing Hosts From a Cluster
## Syntax

```
ALTER NODE node-name {
    EXPORT ON { network-interface | DEFAULT }
    | [IS] node-type
    | REPLACE [ WITH standby-node ]
    | RESET
    | SET [PARAMETER] parameter=value[,...]
    | CLEAR [PARAMETER] parameter[,...]
}
```

## Parameters

<table>
<thead>
<tr>
<th><strong>node-name</strong></th>
<th>The name of the node to alter.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>[IS] node-type</strong></td>
<td>Changes the node type, where <em>node-type</em> is one of the following:</td>
</tr>
<tr>
<td></td>
<td>• PERMANENT: (default): A node that stores data.</td>
</tr>
<tr>
<td></td>
<td>• EPHEMERAL: A node that is in transition from one type to another—typically, from PERMANENT to either STANDBY or EXECUTE.</td>
</tr>
<tr>
<td></td>
<td>• STANDBY: A node that is reserved to replace any node when it goes down. A standby node stores no segments or data until it is called to replace a down node. When used as a replacement node, Vertica changes its type to PERMANENT. For more information, see Active Standby Nodes.</td>
</tr>
<tr>
<td></td>
<td>• EXECUTE: A node that is reserved for computation purposes only. An execute node contains no segments or data.</td>
</tr>
<tr>
<td><strong>EXPORT ON</strong></td>
<td>Specifies the network to use for importing.</td>
</tr>
</tbody>
</table>

**Note:**

STANDBY and EXECUTE node types are supported only in Enterprise Mode.
and exporting data, one of the following:

- **network-interface**: The name of a network interface of the public network.
- **DEFAULT**: Use the default network interface of the public network, as specified by `ALTER DATABASE`.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>REPLACE</strong> [WITH <em>standby-node</em>]</td>
<td>(Enterprise Mode only) Replaces the specified node with an available active standby node. If you omit the WITH clause, Vertica tries to find a replacement node from the same fault group as the down node. If you specify a node that is not down, Vertica ignores this statement.</td>
</tr>
<tr>
<td><strong>RESET</strong></td>
<td>(Enterprise Mode only) Restores the specified down node and returns its replacement to standby status. If the down node cannot resume activity, Vertica ignores this statement and leaves the standby node in place.</td>
</tr>
<tr>
<td><strong>SET [PARAMETER] parameter=value</strong></td>
<td>Sets one or more configuration parameters to the specified value at the node level.</td>
</tr>
<tr>
<td><strong>CLEAR [PARAMETER] parameter</strong></td>
<td>Clears one or more specified configuration parameters.</td>
</tr>
</tbody>
</table>

### Privileges

Superuser

### Examples

Specify to use the default network interface of public network on `v_vmart_node0001` for import/export operations:

```sql
=> ALTER NODE v_vmart_node0001 EXPORT ON DEFAULT;
```

Replace down node `v_vmart_node0001` with an active standby node, then restore it:
ALTER NODE v_vmart_node0001 REPLACE WITH standby1;
...
ALTER NODE v_vmart_node0001 RESET;

Set and clear configuration parameter MaxClientSessions:

ALTER NODE v_vmart_node0001 SET MaxClientSessions = 0;
...
ALTER NODE v_vmart_node0001 CLEAR MaxClientSessions;

Set the node type as EPHEMERAL:

ALTER NODE v_vmart_node0001 IS EPHEMERAL;

### ALTER NOTIFIER

Updates an existing notifier.

**Note:**

To change the action URL associated with an existing identifier, drop the notifier and recreate it.

**Syntax**

```sql
ALTER NOTIFIER notifier-name
[ ENABLE | DISABLE ]
[ MAXPAYLOAD 'max-payload-size' ]
[ MAXMEMORYSIZE 'max-memory-size' ]
[ TLSMODE 'tls-mode' ]
[ CA BUNDLE bundle-name [ CERTIFICATE certificate-name ] ]
[ IDENTIFIED BY 'uuid' ]
[ [NO] CHECK COMMITTED ]
[ PARAMETERS 'adapter-params' ]
```

**Parameters**

<table>
<thead>
<tr>
<th>notifier-name</th>
<th>Specifies the notifier to update.</th>
</tr>
</thead>
<tbody>
<tr>
<td>[NO] CHECK COMMITTED</td>
<td>Specifies to wait for delivery confirmation before sending the next message in the queue. Not all messaging systems support delivery confirmation.</td>
</tr>
</tbody>
</table>
### ENABLE | DISABLE

Specifies whether to enable or disable the notifier.

### MAXPAYLOAD

The maximum size of the message, up to 2 TB, specified in kilobytes, megabytes, gigabytes, or terabytes as follows:

\[
\text{MAXPAYLOAD integer}\{\text{K|M|G|T}\}
\]

The default setting is adapter-specific—for example, 1 M for Kafka.

Changes to this parameter take effect either after the notifier is disabled and reenabled or after the database restarts.

### MAXMEMORYSIZE

The maximum size of the internal notifier, up to 2 TB, specified in kilobytes, megabytes, gigabytes, or terabytes as follows:

\[
\text{MAXMEMORYSIZE integer}\{\text{K|M|G|T}\}
\]

If the queue exceeds this size, the notifier drops excess messages.

### TLSMODE 'tls-mode'

Specifies the type of connection between the notifier and endpoint, one of the following:

- **disable** (default): Plaintext connection.
- **verify-ca**: Encrypted connection, and the server's certificate is verified as being signed by a trusted CA.

### CA BUNDLE bundle-name

Specifies a CA bundle. The certificates inside the bundle are used to validate the Kafka server's certificate if the TLSMODE requires it.

If a CA bundle is specified for a notifier that currently uses disable, which doesn't validate the Kafka server's certificate, the bundle will go unused when connecting to the Kafka server. This behavior persists unless the TLSMODE is changed to one that validates server certificates.

Changes to contents of the CA bundle take effect either after the notifier is disabled and reenabled or after the database restarts. However,
### Changes to which CA bundle the notifier uses

Changes to which CA bundle the notifier uses takes effect immediately.

<table>
<thead>
<tr>
<th>Certificate <code>certificate-name</code></th>
<th>Specifies a <a href="https://www.vertica.com/docs/11.0.1/en-us/vertica_analytic_database_11.0.1_sqlref_man_0000034025.html">client certificate</a> for validation by the endpoint.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>IDENTIFIED BY 'uuid'</code></td>
<td>Specifies the notifier's unique identifier. If set, all the messages published by this notifier have this attribute.</td>
</tr>
<tr>
<td><code>PARAMETERS 'adapter-params'</code></td>
<td>Specifies one or more optional adapter parameters that are passed as a string to the adapter. Adapter parameters apply only to the adapter associated with the notifier. Changes to this parameter take effect either after the notifier is disabled and reenabled or after the database restarts. For Kafka notifiers, refer to <a href="https://www.vertica.com/docs/11.0.1/en-us/vertica_analytic_database_11.0.1_sqlref_man_0000034025.html">Kafka and Vertica Configuration Settings</a>.</td>
</tr>
</tbody>
</table>

### Privileges

Superuser

### Encrypted Notifiers for SASL_SSL Kafka Configurations

Follow this procedure to create or alter notifiers for Kafka endpoints that use SASL_SSL. Note that you must repeat this procedure whenever you change the TLSMODE, certificates, or CA bundle for a given notifier.

1. Use CREATE or ALTER to disable the notifier while setting the TLSMODE, certificate, and CA bundle.

```
=> ALTER NOTIFIER encrypted_notifier
    DISABLE
    TLSMODE 'verify-ca'
    CA BUNDLE ca_bundle2;
```

2. ALTER the notifier and set the proper rdkafka adapter parameters for SASL_SSL.
ALTER NOTIFIER encrypted_notifier PARAMETERS 'sasl.username=user; sasl.password=password; sasl.mechanism=PLAIN; security.protocol=SASL_SSL';

3. Enable the notifier.

ALTER NOTIFIER encrypted_notifier ENABLE;

**Examples**

Update the settings on an existing notifier:

ALTER NOTIFIER my_dc_notifier ENABLE MAXMEMORYSIZE '2G' IDENTIFIED BY 'f8b0278a-3282-4e1a-9c86-e0f3f042a971' CHECK COMMITTED;

Change the TLSMODE and add a CA bundle and certificate to an existing notifier. This notifier connects to and verifies that the Kafka server's certificate is signed by a trusted CA.

ALTER NOTIFIER my_notifier TLSMODE 'verify-ca' CA BUNDLE ca_bundle CERTIFICATE client_cert;

**See Also**

- CREATE NOTIFIER
- DROP NOTIFIER
- Monitoring Vertica Using Notifiers

**ALTER PROJECTION**

Changes the DDL of the specified projection.

**Syntax**

ALTER PROJECTION [[database.]schema.]projection

{ RENAME TO new-name | ON PARTITION RANGE BETWEEN min-val AND max-val }
# Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
</table>
| **schema** | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:  

```
myschema.thisDbObject
```

If you specify a database, it must be the current database. |
| **projection** | The projection to change, where projection can be one of the following:  

- Projection base name: Rename all projections that share this base name.  
- Projection name: Rename the specified projection and its base name. If the projection is segmented, its buddies are unaffected by this change.  

See Projection Naming for projection name conventions. |
| **new-name** | The new projection name. |
| **ON PARTITION RANGE** | **Note:**  
Valid only for projections that were created with a partition range.  

Specifies to limit data of this projection to a range of partition keys, specified as follows:  

```
ON PARTITION RANGE BETWEEN min-range-value AND max-range-value
```

where the following requirements apply to min-range-value and ≤ max-range-value:  

- min-range-value must be ≤ max-range-value  
- They must resolve to a data type that is compatible with the table partition expression.  
- They can be:  
  - String literals—for example, 2021-07-31  
  - Expressions with stable or immutable functions, for example: |
max-range-value can be set to NULL, to specify that the partition range has no upper bound.

If the new range of keys is outside the previous range, Vertica throws a warning that the projection is out of date and must be refreshed before it can be used.

For other requirements and usage details, see Partition Range Projections.

**Privileges**

Non-superuser, CREATE and USAGE on the schema and one of the following anchor table privileges:

- Table owner
- ALTER privilege
- SELECT privilege only if defining a partition range projection

**Examples**

```
=> SELECT export_tables('', 'public.store_orders');

   export_tables
-------------------------------

CREATE TABLE public.store_orders
(
   order_no int,
   order_date timestamp NOT NULL,
   shipper varchar(20),
   ship_date date NOT NULL
);
(1 row)

=> CREATE PROJECTION store_orders_p AS SELECT * from store_orders;
CREATE PROJECTION

=> ALTER PROJECTION store_orders_p RENAME to store_orders_new;
ALTER PROJECTION
```
ALTER PROFILE

Changes a profile. All parameters that are not set in a profile inherit their setting from the default profile. You can use ALTER PROFILE to change the default profile.

Syntax

```
ALTER PROFILE name LIMIT [
  PASSWORD_LIFE_TIME setting
  PASSWORD_MIN_LIFE_TIME setting
  PASSWORD_GRACE_TIME setting
  FAILED_LOGIN_ATTEMPTS setting
  PASSWORD_LOCK_TIME setting
  PASSWORD_REUSE_MAX setting
  PASSWORD_REUSE_TIME setting
  PASSWORD_MAX_LENGTH setting
  PASSWORD_MIN_LENGTH setting
  PASSWORD_MIN_CHAR_CHANGE setting
  PASSWORD_MIN_UPPERCASE_LETTERS setting
  PASSWORD_MIN_LOWERCASE_LETTERS setting
  PASSWORD_MIN_DIGITS setting
  PASSWORD_MIN_SYMBOLS setting
]`
```

Parameters

**Note:**

To reset a parameter to inherit from the default profile, set its value to default.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>name</code></td>
<td>The name of the profile to create, where <code>name</code> conforms to conventions described in Identifiers.</td>
</tr>
</tbody>
</table>

To modify the default profile, set `name` to default. For example:

```
ALTER PROFILE DEFAULT LIMIT PASSWORD_MIN_SYMBOLS 1;
```
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PASSWORD_ LIFE_TIME</td>
<td>Set to an integer value, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- ≥ 1: The number of days a password remains valid.</td>
</tr>
<tr>
<td></td>
<td>- UNLIMITED: Password remains valid indefinitely.</td>
</tr>
<tr>
<td></td>
<td>After your password's lifetime and grace period expire, you must change your password on your next login, if you have not done so already.</td>
</tr>
<tr>
<td>PASSWORD_MIN_ LIFE_TIME</td>
<td>Set to an integer value, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- Default: 0</td>
</tr>
<tr>
<td></td>
<td>- ≥ 1: The number of days a password must be set before it can be changed</td>
</tr>
<tr>
<td></td>
<td>- UNLIMITED: Password can be reset at any time.</td>
</tr>
<tr>
<td>PASSWORD_ GRACE_TIME</td>
<td>Set to an integer value, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- ≥ 1: The number of days a password can be used after it expires.</td>
</tr>
<tr>
<td></td>
<td>- UNLIMITED: No grace period.</td>
</tr>
<tr>
<td>FAILED_LOGIN_ATTEMPTS</td>
<td>Set to an integer value, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- ≥ 1: The number of consecutive failed login attempts Vertica allows before locking your account.</td>
</tr>
<tr>
<td></td>
<td>- UNLIMITED: Vertica allows an unlimited number of failed login attempts.</td>
</tr>
<tr>
<td>PASSWORD_LOCK_TIME</td>
<td>Set to an integer value, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- ≥ 1: The number of days your account is locked after too many failed login attempts. The account is automatically unlocked when the lock time elapses.</td>
</tr>
<tr>
<td></td>
<td>- UNLIMITED: Account remains indefinitely inaccessible until a superuser manually unlocks it.</td>
</tr>
<tr>
<td>PASSWORD_REUSE_MAX</td>
<td>Set to an integer value, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- ≥ 1: The number of times you must change your password before you can reuse an earlier password.</td>
</tr>
<tr>
<td></td>
<td>- UNLIMITED: You can reuse an earlier password without any intervening changes.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>PASSWORD_REUSE_TIME</td>
<td>Set to an integer value, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- $\geq 1$: The number of days that must pass after a password is set before you can reuse it.</td>
</tr>
<tr>
<td></td>
<td>- UNLIMITED: You can reuse an earlier password immediately.</td>
</tr>
<tr>
<td>PASSWORD_MAX_LENGTH</td>
<td>The maximum number of characters allowed in a password, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- Integer between 8 and 512, inclusive</td>
</tr>
<tr>
<td>PASSWORD_MIN_LENGTH</td>
<td>The minimum number of characters required in a password, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- 0 to PASSWORD_MAX_LENGTH</td>
</tr>
<tr>
<td></td>
<td>- UNLIMITED: Minimum of PASSWORD_MAX_LENGTH</td>
</tr>
<tr>
<td>PASSWORD_MIN_LETTERS</td>
<td>Minimum number of letters (a-z and A-Z) that must be in a password, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- Integer between 0 and PASSWORD_MAX_LENGTH, inclusive</td>
</tr>
<tr>
<td></td>
<td>- UNLIMITED: 0 (no minimum)</td>
</tr>
<tr>
<td>PASSWORD_MIN_UPPERCASE_</td>
<td>Minimum number of uppercase letters (A-Z) that must be in a password, one of the following:</td>
</tr>
<tr>
<td>LOWERCASE_LETTERS</td>
<td>- Integer between 0 and PASSWORD_MAX_LENGTH, inclusive</td>
</tr>
<tr>
<td></td>
<td>- UNLIMITED: 0 (no minimum)</td>
</tr>
<tr>
<td>PASSWORD_MIN_LOWERCASE_</td>
<td>Minimum number of lowercase letters (a-z) that must be in a password, one of the following:</td>
</tr>
<tr>
<td>LOWERCASE_LETTERS</td>
<td>- Integer between 0 and PASSWORD_MAX_LENGTH, inclusive</td>
</tr>
<tr>
<td></td>
<td>- UNLIMITED: 0 (no minimum)</td>
</tr>
<tr>
<td>PASSWORD_MIN_DIGITS</td>
<td>Minimum number of digits (0-9) that must be in a password, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- Integer between 0 and PASSWORD_MAX_LENGTH, inclusive</td>
</tr>
<tr>
<td></td>
<td>- UNLIMITED: 0 (no minimum)</td>
</tr>
<tr>
<td>PASSWORD_MIN_SYMBOLS</td>
<td>Minimum number of symbols—printable non-letter and non-digit characters such as $, #, @—that must be in a password, one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>• Integer between 0 and PASSWORD_MAX_LENGTH, inclusive</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: 0 (no minimum)</td>
</tr>
<tr>
<td>PASSWORD_MIN_CHARS_CHANGE</td>
<td>Minimum number of characters that must be different from the previous password:</td>
</tr>
<tr>
<td></td>
<td>• Default: 0</td>
</tr>
<tr>
<td></td>
<td>• Integer between 0 and PASSWORD_MAX_LENGTH, inclusive</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: 0 (no minimum)</td>
</tr>
</tbody>
</table>

Superuser

**Profile Settings and Client Authentication**

The following profile settings affect [client authentication methods](#), such as LDAP or GSS:

- FAILED_LOGIN_ATTEMPTS
- PASSWORD_LOCK_TIME

All other profile settings are used only by Vertica to manage its passwords.

**Example**

```
ALTER PROFILE sample_profile LIMIT FAILED_LOGIN_ATTEMPTS 3;
```

**See Also**

- [CREATE PROFILE](#)
- [DROP PROFILE](#)
- [Creating a Database Name and Password](#)
ALTER PROFILE RENAME

Rename an existing profile.

**Syntax**

```
ALTER PROFILE name RENAME TO new-name;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The current name of the profile.</td>
</tr>
<tr>
<td>new-name</td>
<td>The new name for the profile.</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser

**Examples**

This example shows how to rename an existing profile.

```
ALTER PROFILE sample_profile RENAME TO new_sample_profile;
```

**See Also**

- ALTER PROFILE
- CREATE PROFILE
- DROP PROFILE

ALTER RESOURCE POOL

Modifies an existing resource pool by setting one or more parameters.
Note:
You can use ALTER RESOURCE POOL to modify some parameters in Vertica built-in resource pools. For details on default settings and restrictions, see Built-In Resource Pools Configuration.

Syntax

ALTER RESOURCE POOL pool-name [ FOR { SUBCLUSTER subcluster-name | CURRENT SUBCLUSTER } | parameter-name setting ]...

Parameters

<table>
<thead>
<tr>
<th>pool-name</th>
<th>The name of the resource pool. Built-in pool names cannot be used for user-defined pools.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note:</td>
<td>If you specify a resource pool name with uppercase letters, Vertica converts them to lowercase letters.</td>
</tr>
</tbody>
</table>

<p>| [ SUBCLUSTER subcluster-name | CURRENT SUBCLUSTER ] | Eon Mode only. Specifies the subcluster that the resource pool you are altering belongs to. If you specify a subcluster when altering a global resource pool, then the settings that you change override the global resource pool settings for that subcluster only. |
|---|---|
| • SUBCLUSTER — Use this keyword to alter the resource pool for a subcluster with the name subcluster-name if you are not connected to it, and it exists. |
| • CURRENT SUBCLUSTER — Alters the resource pool for the subcluster that you are currently connected to. |
| Note: | If you specify a subcluster, you can alter only the MAXMEMORYSIZE, MAXQUERYMEMORYSIZE, and MEMORYSIZE parameters for built-in pools. |</p>
<table>
<thead>
<tr>
<th>parameter-name</th>
<th>The parameter to set, listed below.</th>
</tr>
</thead>
<tbody>
<tr>
<td>setting</td>
<td>The value to set on parameter-name. To reset this parameter to its default value, specify DEFAULT.</td>
</tr>
</tbody>
</table>

**Note:**
Default values specified in this table pertain only to user-defined resource pools. For built-in pool default values, see Built-In Resource Pools Configuration, or query system table RESOURCE_POOL_DEFAULTS.

<table>
<thead>
<tr>
<th>CASCADE TO</th>
<th>Specifies a secondary resource pool for executing queries that exceed the RUNTIMECAP setting of their assigned resource pool:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>CASCADE TO secondary-pool</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>CPUAFFINITYMODE</th>
<th>Specifies whether the resource pool has exclusive or shared use of the CPUs specified in CPUAFFINITYSET:</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPUAFFINITYMODE</td>
<td>{ SHARED</td>
</tr>
</tbody>
</table>

- **SHARED:** Queries that run in this pool share its CPUAFFINITYSET CPUs with other Vertica resource pools.
- **EXCLUSIVE:** Dedicates CPUAFFINITYSET CPUs to this resource pool only, and excludes other Vertica resource pools. If CPUAFFINITYSET is set as a percentage, then that percentage of CPU resources available to Vertica is assigned solely for this resource pool.
- **ANY** (default): Queries in this resource pool can run on any CPU, invalid if CPUAFFINITYSET designates CPU resources.

**Important:**
CPUAFFINITYMODE and CPUAFFINITYSET must be set together in the same statement.

| CPUAFFINITYSET | Specifies which CPUs are available to this resource pool. All cluster nodes must have the same number of CPUs. The CPU resources assigned to this set are unavailable to general resource pools. |
**CPUAFFINITYSET**

```sql
CPUAFFINITYSET {
  'cpu-index[,..]' |
  'cpu-index_i-cpu-index_n' |
  'integer%' |
  NONE
}
```

- `cpu-index[,..]`: Dedicates one or more comma-delimited CPUs to this pool.
- `cpu-index_i-cpu-index_n`: Dedicates a range of contiguous CPU indexes to this pool.
- `integer%`: Percentage of all available CPUs to use for this pool. Vertica rounds this percentage down to include whole CPU units.
- `NONE` (default): No affinity set is assigned to this resource pool. The queries associated with this pool are executed on any CPU.

**Important:**

CPUAFFINITYSET and CPUAFFINITYMODE must be set together in the same statement.

**EXECUTIONPARALLELISM**

Limits the number of threads used to process any single query issued in this resource pool.

```sql
EXECUTIONPARALLELISM { limit | AUTO }
```

- **Limit**: An integer value between 1 and the number of cores. Setting this parameter to a reduced value increases throughput of short queries issued in the pool, especially if the queries are executed concurrently.
- **AUTO** or 0 (default): Vertica calculates the setting from the number of cores, available memory, and amount of data in the system. Unless memory is limited, or the amount of data is very small, Vertica sets this parameter to the number of cores on the node.

**MAXCONCURRENCY**

Sets the maximum number of concurrent execution slots available to the resource pool, across the cluster:

```sql
MAXCONCURRENCY { integer | NONE }
```

NONE (default) specifies unlimited number of concurrent execution slots.
MAXMEMORYSIZE

The maximum size per node the resource pool can grow by borrowing memory from the GENERAL pool:

```
MAXMEMORYSIZE { 
  'integer%' 
  | 'integer{K|M|G|T}' 
  | NONE 
}
```

- `integer%`: Percentage of total memory
- `integer{K|M|G|T}`: Amount of memory in kilobytes, megabytes, gigabytes, or terabytes
- `NONE` (default): Unlimited, pool can borrow any amount of available memory from the GENERAL pool.

MAXQUERYMEMORYSIZE

The maximum amount of memory that this pool can allocate at runtime to process a query. If the query requires more memory than this setting, Vertica stops execution and returns an error.

Set this parameter as follows:

```
MAXQUERYMEMORYSIZE { 
  'integer%' 
  | 'integer{K|M|G|T}' 
  | NONE 
}
```

- `integer%`: Percentage of MAXMEMORYSIZE for this pool.
- `integer{K|M|G|T}`: Amount of memory in kilobytes, megabytes, gigabytes, or terabytes, up to the value of MAXMEMORYSIZE.
- `NONE` (default): Unlimited; pool can borrow any amount of available memory from the GENERAL pool, within the limits set by MAXMEMORYSIZE.

**Important:**
Changes to MAXQUERYMEMORYSIZE are applied retroactively to queries that are currently executing. If you reduce this setting, queries that were budgeted with the previous memory size are liable to fail if they try to allocate more memory than the new setting allows.
| MEMORIESIZE | The amount of total memory available to the Vertica resource manager that is allocated to this pool per node:  
|{integer%} | {integer{K|M|G|T}} |  
| - integer%: Percentage of total memory  
| - integer{K|M|G|T}: Amount of memory in kilobytes, megabytes, gigabytes, or terabytes  
| **Default**: 0%. No memory allocated, the resource pool borrows memory from the GENERAL pool. |
| PLANNEDCONCURRENCY | Specifies the preferred number queries to execute concurrently in the resource pool. This setting applies to the entire cluster:  
| {num-queries | AUTO} |  
| - num-queries: Integer value ≥ 1, specifies the preferred number of concurrently executing queries. When possible, query resource budgets are limited to allow this level of concurrent execution.  
| - AUTO (default): Value is calculated automatically at query runtime. Vertica sets this parameter to the lower of these two calculations, but never less than 4:  
| - Number of logical cores  
| - Memory divided by 2GB  
| For clusters where the number of logical cores differs on different nodes, AUTO can apply differently on each node. Distributed queries run like the minimal effective planned concurrency. Single node queries run with the planned concurrency of the initiator.  
| **Tip**: Change this parameter only after evaluating performance over a period of time. |
| PRIORITY | Specifies priority of queries in this pool when they compete for resources in the GENERAL pool: |
### PRIORITY

**{ integer | HOLD }**

- **integer**: A negative or positive integer value, where higher numbers denote higher priority:
  - User-defined pools: -100 to 100
  - Built-in pools `SYSQUERY`, `RECOVERY`, and `TM`: -110 to 110
  - **HOLD**: Sets priority to -999. Queries in this pool are queued until `QUEUETIMEOUT` is reached.

**Default**: 0

### QUEUETIMEOUT

Species how long a request can wait for pool resources before it is rejected:

**{ integer | NONE }**

- **integer**: Maximum wait time in seconds
- **NONE**: No maximum wait time, request can be queued indefinitely.

**Default**: 300 seconds

### RUNTIMECAP

Prevents runaway queries by setting the maximum time a query in the pool can execute. If a query exceeds this setting, it tries to cascade to a secondary pool:

**{ 'interval' | NONE }**

- **interval**: An interval of 1 minute or 100 seconds; should not exceed one year.
- **NONE** (default): No time limit on queries running in this pool.

To specify a value in days, provide an integer value. To provide a value less than one day, provide the interval in the format `hours:minutes:seconds`. For example a value of `1:30:00` would equal 90 minutes.

If the user or session also has a `RUNTIMECAP`, the shorter limit applies.

### RUNTIMEPRIORITY

Determines how the resource manager should prioritize dedication of run-time resources (CPU, I/O bandwidth) to queries already running in this resource.
### pool:

RUNTIMEPRIORITY { HIGH | MEDIUM | LOW }

**Default:** MEDIUM

### RUNTIMEPRIORITYTHRESHOLD

Specifies in seconds a time limit in which a query must finish before the resource manager assigns to it the resource pool's RUNTIMEPRIORITY. All queries begin running at a HIGH priority. When a query's duration exceeds this threshold, it is assigned the RUNTIMEPRIORITY of the resource pool.

**RUNTIMEPRIORITYTHRESHOLD seconds**

**Default:** 2

### SINGLEINITIATOR

By default, set to false for backward compatibility. Do not change this setting.

---

## Privileges

Superuser

## Examples

This example shows how to alter resource pool `ceo_pool` by setting the priority to 5.

```sql
=> ALTER RESOURCE POOL ceo_pool PRIORITY 5;
```

This example shows how to designate a secondary resource pool for `ceo_pool`.

```sql
=> CREATE RESOURCE POOL second_pool;
=> ALTER RESOURCE POOL ceo_pool CASCADE TO second_pool;
```

This Eon Mode example decreases the MEMORYSIZE of the built-in TM resource pool to 0% on the `analytics_1` secondary subcluster because secondary subclusters do not run Tuple Mover operations:

```sql
=> ALTER RESOURCE POOL TM FOR SUBCLUSTER analytics_1 MEMORYSIZE '0%';
=> ALTER RESOURCE POOL
```

See [Tuning Tuple Mover Pool Settings](#) for more information.

- Managing Workloads

ALTER ROLE

Renames an existing role.

Note:
You cannot use ALTER ROLE to rename a role that was added to the Vertica database with the LDAPLink service.

Syntax

```
ALTER ROLE name RENAME TO new-name
```

Parameters

<table>
<thead>
<tr>
<th>name</th>
<th>The role to rename.</th>
</tr>
</thead>
<tbody>
<tr>
<td>new-name</td>
<td>The role's new name.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

Example

```
=> ALTER ROLE applicationadministrator RENAME TO appadmin;
```
ALTER ROLE

See Also

- CREATE ROLE
- DROP ROLE

ALTER ROUTING RULE

Changes an existing load balancing policy routing rule.

Syntax

```
ALTER ROUTING RULE rule_name {
    RENAME TO new_name |
    SET ROUTE TO 'ip_addr'|
    SET GROUP TO group_name
}
```

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the existing routing rule to change.</td>
</tr>
<tr>
<td>RENAME TO new_name</td>
<td>Changes the name of the routing rule to new_name.</td>
</tr>
<tr>
<td>SET ROUTE TO 'ip_addr'</td>
<td>Changes the IP address range that this rule applies to. The ip_addr is the new range of incoming IP addresses in CIDR format.</td>
</tr>
<tr>
<td>SET GROUP TO group_name</td>
<td>Changes the load balancing group that handles the connections that match this rule.</td>
</tr>
</tbody>
</table>

Example

This example changes the routing rule named etl_rule so it uses the load balancing group named etl_rule to handle incoming connections in the IP address range of 10.20.100.0 to 10.20.100.255.
ALTER ROUTING RULE etl_rule SET GROUP TO etl_group;
ALTER ROUTING RULE
=> ALTER ROUTING RULE etl_rule SET ROUTE TO '10.20.100.0/24';
ALTERN ROUTING RULE
=> \\x
Expanded display is on.
=> SELECT * FROM routing_rules WHERE NAME = 'etl_rule';
---+---------------------------------------------------
name | etl_rule
source_address | 10.20.100.0/24
destination_name | etl_group

**See Also**

**ALTER SCHEMA**

Changes one or more schemas in one of the following ways:

- Enables or disables inheritance of schema privileges by tables created in the schemas.
- Reassigns schema ownership to another user.
- Renames schemas.

**Syntax**

**Set inheritance of schema privileges**

```
ALTER SCHEMA [database.]schema DEFAULT {INCLUDE | EXCLUDE} SCHEMA PRIVILEGES
```

**Reassign schema ownership**

```
ALTER SCHEMA [database.]schema OWNER TO user-name [CASCADE]
```

**Rename schemas**

```
ALTER SCHEMA [database.]schema[,..] RENAME TO new-schema-name[,..]
```
# Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>The schema to modify. If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>
| DEFAULT {INCLUDE | EXCLUDE} SCHEMA PRIVILEGES | Specifies whether to enable or disable default inheritance of privileges for new tables in the specified schema:  
  - EXCLUDE SCHEMA PRIVILEGES (default): Disables inheritance of schema privileges.  
  - INCLUDE SCHEMA PRIVILEGES: Specifies to grant tables in the specified schema the same privileges granted to that schema. This option has no effect on existing tables in the schema.  
  See also Enabling Schema Inheritance. |
| OWNER TO | Reassigns schema ownership to the specified user:  
  `OWNER TO user-name [CASCADE]`  
  By default, ownership of objects in the reassigned schema remain unchanged. To reassign ownership of schema objects to the new schema owner, qualify the OWNER TO clause with CASCADE. For details, see Cascading Schema Ownership below. |
| RENAME TO | Renames one or more schemas:  
  `RENAME TO new-schema-name[,...]`  
  The following requirements apply:  
  - The new schema name conforms to conventions described in Identifiers. It must also be unique among all names of |
sequences, tables, projections, views, models, and schemas in the database.

- If you specify multiple schemas to rename, the source and target lists must have the same number of names.

**Caution:**
Renaming a schema referenced by a view causes the view to fail unless another schema is created to replace it.

**Privileges**
One of the following:

- Superuser
- Schema owner

**Cascading Schema Ownership**
By default, `ALTER SCHEMA...OWNER TO` does not affect ownership of objects in the target schema or the privileges granted on them. If you qualify the `OWNER TO` clause with `CASCADE`, Vertica acts as follows on objects in the target schema:

- Transfers ownership of objects owned by the previous schema owner to the new owner.
- Revokes all object privileges granted by the previous schema owner.

If issued by non-superusers, `ALTER SCHEMA...OWNER TO CASCADE` ignores all objects that belong to other users, and returns with notices on the objects that it cannot change.

For example:

1. Schema `ms` is owned by user `mayday`, and contains two tables: `ms.t1` owned by `mayday`, and `ms.t2` owned by user `joe`:

```sql
=> \dt
List of tables
| Schema | Name | Kind | Owner | Comment |
---+---+---+---+---+---
  | ms | t1 | table | mayday |
  | ms | t2 | table | joe |
```
2. User mayday transfers ownership of schema ms to user dbadmin, using CASCADE. On return, ALTER SCHEMA notifies user mayday that it cannot transfer ownership of table ms.t2 and its projections, which are owned by user joe:

```sql
=> \c mayday
You are now connected as user "mayday".
=> ALTER SCHEMA ms OWNER TO dbadmin CASCADE;
NOTICE 3583: Insufficient privileges on ms.t2
NOTICE 3583: Insufficient privileges on ms.t2_b0
NOTICE 3583: Insufficient privileges on ms.t2_b1
=> \c
You are now connected as user "dbadmin".
=> \dt
```

<table>
<thead>
<tr>
<th>Schema</th>
<th>Name</th>
<th>Kind</th>
<th>Owner</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>ms</td>
<td>t1</td>
<td>table</td>
<td>dbadmin</td>
<td></td>
</tr>
<tr>
<td>ms</td>
<td>t2</td>
<td>table</td>
<td>joe</td>
<td></td>
</tr>
</tbody>
</table>

3. User dbadmin transfers ownership of schema ms to user pat, again using CASCADE. This time, because dbadmin is a superuser, ALTER SCHEMA transfers ownership of all ms tables to user pat:

```sql
=> ALTER SCHEMA ms OWNER TO pat CASCADE;
=> \dt
```

<table>
<thead>
<tr>
<th>Schema</th>
<th>Name</th>
<th>Kind</th>
<th>Owner</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>ms</td>
<td>t1</td>
<td>table</td>
<td>pat</td>
<td></td>
</tr>
<tr>
<td>ms</td>
<td>t2</td>
<td>table</td>
<td>pat</td>
<td></td>
</tr>
</tbody>
</table>

## Swapping Schemas

Renaming schemas is useful for swapping schemas without actually moving data. To facilitate the swap, enter a non-existent, temporary placeholder schema. For example, the following ALTER SCHEMA statement uses the temporary schema temps to facilitate swapping schema S1 with schema S2. In this example, S1 is renamed to temps. Then S2 is renamed to S1. Finally, temps is renamed to S2.

```sql
=> ALTER SCHEMA S1, S2, temps RENAME TO temps, S1, S2;
```

## Examples

The following example renames schemas S1 and S2 to S3 and S4, respectively:
=> ALTER SCHEMA S1, S2 RENAME TO S3, S4;

This example sets the default behavior for new table t2 to automatically inherit the schema's privileges:

=> ALTER SCHEMA s1 DEFAULT INCLUDE SCHEMA PRIVILEGES;
=> CREATE TABLE s1.t2 (i, int);

This example sets the default for new tables to not automatically inherit privileges from the schema:

=> ALTER SCHEMA s1 DEFAULT EXCLUDE SCHEMA PRIVILEGES;

See Also

- CREATE SCHEMA
- DROP SCHEMA

ALTER SEQUENCE

Changes a named sequence in two ways:

- Sets parameters that control sequence behavior—for example, its start value, and range of minimum and maximum values. These changes take effect only when you start a new database session.
- Sets sequence name, schema, or ownership. These changes take effect immediately.

Note:
You can only modify a named sequence—that is, a sequence that was defined by CREATE SEQUENCE. AUTO_INCREMENT and IDENTITY sequences are owned by the table where they were created, and cannot be changed independently of that table.

Syntax

Change sequence behavior:

ALTER SEQUENCE [[database.]schema.]sequence
  [ INCREMENT [ BY ] integer ]
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>schema</strong></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject. If you specify a database, it must be the current database. If you do not specify a schema, the table is created in the default schema.</td>
</tr>
<tr>
<td><strong>sequence</strong></td>
<td>The name of the sequence to alter.</td>
</tr>
<tr>
<td><strong>INCREMENT [BY] integer</strong></td>
<td>A positive or negative integer that specifies how much to increment or decrement the sequence on each call to <code>NEXTVAL</code>, by default set to 1. Note: Setting this parameter to <code>integer</code> guarantees that column values always increment by at least <code>integer</code>. However, column values can sometimes increment by more than <code>integer</code> unless you also set the NO CACHE parameter.</td>
</tr>
<tr>
<td><strong>MINVALUE integer</strong></td>
<td>Modifies the minimum value a sequence can generate. If you change this value and the current value exceeds the range, the current value is changed to the minimum value if increment is greater than zero, or to the maximum value if increment is less than zero.</td>
</tr>
<tr>
<td><strong>MAXVALUE integer</strong></td>
<td>Modifies the maximum value for the sequence. If you change this value</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>NO MAXVALUE (default)</td>
<td>and the current value exceeds the range, the current value is changed to the minimum value if increment is greater than zero, or to the maximum value if increment is less than zero.</td>
</tr>
<tr>
<td>RESTART [WITH] integer</td>
<td>Changes the current value of the sequence to integer. The next call to NEXTVAL returns integer. <strong>Caution:</strong> Using ALTER SEQUENCE to set a sequence start value below its current value can result in duplicate keys.</td>
</tr>
<tr>
<td>CACHE integer NO CACHE (default)</td>
<td>Specifies how many sequence numbers are pre-allocated and stored in memory for faster access. Vertica sets up caching for each session, and distributes it across all nodes. By default, the sequence cache is set to 250,000. For details, see Distributing Named Sequences in the Administrator's Guide.</td>
</tr>
</tbody>
</table>
| CYCLE NO CYCLE (default) | Specifies whether the sequence can wrap when its minimum or maximum values are reached:  
  - CYCLE: The sequence wraps as follows:  
    - When an incrementing sequence reaches its upper limit, it is reset to its minimum value.  
    - When an decrementing sequence reaches its lower limit, it is reset to its maximum value.  
  - NO CYCLE (default): Calls to NEXTVAL return an error after the sequence reaches its maximum or minimum value. |
| RENAME TO seq-name | Renames a sequence within the current schema, where seq-name conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema. |
| SET SCHEMA schema-name | Moves the sequence to schema schema-name. |
| OWNER TO owner-name | Reassigns the current sequence owner to the specified owner. |

**Privileges**

Non-superuser: USAGE on the schema and one of the following:
Sequence owner
ALTER privilege on the sequence

For certain operations, non-superusers must have the following schema privileges:

<table>
<thead>
<tr>
<th>Schema privileges required...</th>
<th>For these operations...</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE, USAGE</td>
<td>Rename sequence</td>
</tr>
<tr>
<td>CREATE: destination schema</td>
<td></td>
</tr>
<tr>
<td>USAGE: current schema</td>
<td>Move sequence to another schema</td>
</tr>
</tbody>
</table>

### Examples

See [Altering Sequences](#) in the Administrator's Guide.

### See Also

CREATE SEQUENCE

### ALTER SUBCLUSTER

Changes the configuration of a subcluster. You can use this statement to rename a subcluster or make it the default subcluster.

### Syntax

```
ALTER SUBCLUSTER subcluster-name {
    RENAME TO new-name |
    SET DEFAULT
}
```

### Parameters

<table>
<thead>
<tr>
<th>subcluster-name</th>
<th>The name of the subcluster to alter.</th>
</tr>
</thead>
<tbody>
<tr>
<td>RENAME TO new-name</td>
<td>Changes the name of the subcluster to new-name.</td>
</tr>
</tbody>
</table>
**SET DEFAULT**

Makes the subcluster the default subcluster. When you add new nodes to the database and do not specify a subcluster to contain them, Vertica adds them to the default subcluster. There can be only one default subcluster at a time. The subcluster that was previously the default subcluster becomes a non-default subcluster.

---

**Privileges**

**Superuser**

---

**Examples**

This example makes the analytics_cluster the default subcluster:

```sql
=> SELECT DISTINCT subcluster_name FROM SUBCLUSTERS WHERE is_default = true;
subcluster_name
-----------------------
default_subcluster
(1 row)

=> ALTER SUBCLUSTER analytics_cluster SET DEFAULT;
ALTER SUBCLUSTER
=> SELECT DISTINCT subcluster_name FROM SUBCLUSTERS WHERE is_default = true;
subcluster_name
-----------------------
analytics_cluster
(1 row)
```

This example renames default_subcluster to load_subcluster:

```sql
=> ALTER SUBCLUSTER default_subcluster RENAME TO load_subcluster;
ALTER SUBCLUSTER

=> SELECT DISTINCT subcluster_name FROM subclusters;
subcluster_name
-----------------------
load_subcluster
analytics_cluster
(2 rows)
```

---

**See Also**
ALTER SESSION

ALTER SESSION sets and clears session-level configuration parameter values for the current session. To identify session-level parameters, query system table SESSION_PARAMETERS.

Syntax

ALTER SESSION {
  SET [PARAMETER]  parameter-name=value[,..]
  | CLEAR  { [PARAMETER]  parameter-name[,..] | PARAMETER ALL }
  | SET UDPARAMETER [ FOR libname ] key=value[,..]
  | CLEAR UDPARAMETER { [ FOR libname ] key[,..] | ALL }
}

Parameters

<table>
<thead>
<tr>
<th>SET [PARAMETER]</th>
<th>Sets one or more configuration parameters to the specified value.</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEAR [PARAMETER]</td>
<td>Clears the specified configuration parameters of changes that were set in the current session.</td>
</tr>
<tr>
<td>CLEAR PARAMETER ALL</td>
<td>Clears all session-level configuration parameters of changes that were set in the current session.</td>
</tr>
<tr>
<td>SET UDPARAMETER</td>
<td>Sets one or more user-defined session parameters (key=value) to be used with a UDx. Key value sizes are restricted as follows:</td>
</tr>
<tr>
<td></td>
<td>• Set from client side: 128 characters</td>
</tr>
<tr>
<td></td>
<td>• Set from UDx side: unlimited</td>
</tr>
</tbody>
</table>

You can limit the SET operation's scope to a single library by including the clause FOR Libname. For example:

```sql
=> ALTER SESSION SET UDPARAMETER FOR securelib username='alice';
```

If you specify a library, then only that library can access the parameter's value. Use this restriction to protect parameters that hold sensitive data, such as credentials.
CLEAR UDPARAMETER

Clears user-defined parameters, specified by one of the following options:

- `[FOR Libname] key[,...]`: Clears the `key`-specified parameters, optionally scoped to library `Libname`.
- `ALL`: Clears all user-defined parameters in the current session.

**Privileges**

None

**Examples**

**Set and clear a parameter**

- Force all U Dx es that support fenced mode to run in fenced mode, even if their definition specifies NOT FENCED:

  ```sql
  => ALTER SESSION SET ForceUDxFencedMode = 1;
  ALTER SESSION
  ```

- Clear ForceUDxFencedMode at the session level. Its value is reset to its default value 0:

  ```sql
  => ALTER SESSION CLEAR ForceUDxFencedMode;
  ALTER SESSION
  => SELECT parameter_name, current_value, default_value FROM configuration_params
     WHERE parameter_name = 'ForceUDxFencedMode';
  -------------------|-------------------|-------------------
  parameter_name | current_value | default_value
  -------------------|-------------------|-------------------
  ForceUDxFencedMode | 0 | 0
  (1 row)
  ```

- Clear all session-level configuration parameters of changes that were set in this session:

  ```sql
  => ALTER SESSION CLEAR PARAMETER ALL;
  ALTER SESSION
  ```
Set and clear a user-defined parameter

- Set the value of user-defined parameter RowCount in library MyLibrary to 25.

```sql
=> ALTER SESSION SET UDPARAMETER FOR MyLibrary RowCount = 25;
ALTER SESSION
```

- Clear RowCount at the session level:

```sql
=> ALTER SESSION CLEAR UDPARAMETER FOR MyLibrary RowCount;
ALTER SESSION
```

**ALTER SUBNET**

Renames an existing subnet.

**Syntax**

```
ALTER SUBNET subnet-name RENAME TO new-subnet-name
```

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subnet-name</td>
<td>The name of the existing subnet.</td>
</tr>
<tr>
<td>new-subnet-name</td>
<td>The new name for the subnet.</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser

**Examples**

```sql
=> ALTER SUBNET mysubnet RENAME TO myNewSubnet;
```
ALTER TABLE

Modifies the metadata of an existing table. All changes are auto-committed.

Syntax

```
ALTER TABLE [[database.]schema.]table {
  ADD COLUMN [ IF NOT EXISTS ] column datatype
    [ column-constraint ]
    [ ENCODING encoding-type ]
    [ PROJECTIONS (projections-list) | ALL PROJECTIONS ]
  ADD table-constraint
  | ALTER COLUMN column {
    ENCODING encoding-type PROJECTIONS (projection-list)
    | [ SET | DROP } expression }
  | ALTER CONSTRAINT constraint-name { ENABLED | DISABLED }
  | DROP CONSTRAINT constraint-name [ CASCADE | RESTRICT ]
  | DROP [ COLUMN ] [ IF EXISTS ] column [ CASCADE | RESTRICT ]
  | FORCE OUTER integer
  | [ { INCLUDE | EXCLUDE | MATERIALIZE } [ SCHEMA ] PRIVILEGES
  | OWNER TO owner
  | partition-clause [ REORGANIZE ]
  | REMOVE PARTITIONING
  | RENAME [ COLUMN ] name TO new-name
  | RENAME TO new-table-name [ ,... ]
  | REORGANIZE
  | SET {
    SCHEMA schema
    | ActivePartitionCount { count | DEFAULT }
    | MERGEOUT { 1 | 0 } }
}
```

Note:

Several ALTER TABLE clauses cannot be specified with other clauses in the same statement (see Exclusive ALTER TABLE Clauses below). Otherwise, ALTER TABLE supports multiple comma-delimited clauses. For example, the following ALTER TABLE statement changes table my-table in two ways: reassigns ownership to user Joe, and sets constraint UNIQUE on column b:

```
ALTER TABLE my-table OWNER TO Joe, ADD CONSTRAINT unique_b UNIQUE (b) ENABLED;
```

Parameters

| [database.]schema | Specifies a schema, by default public. If schema is |
any schema other than `public`, you must supply the schema name. For example:

```sql
myschema.thisDbObject
```

If you specify a database, it must be the current database.

<table>
<thead>
<tr>
<th><code>table</code></th>
<th>The table to alter.</th>
</tr>
</thead>
</table>

**ADD COLUMN**

Adds a column to the table and, by default, to all its superprojections:

```sql
ADD COLUMN [IF NOT EXISTS] column datatype
[ NULL | NOT NULL ]
[ENCODING encoding-type]
[PROJECTIONS (projections-list) | ALL PROJECTIONS]
```

The optional clause `IF NOT EXISTS` generates an informational message if `column` already exists under the specified name. If you omit this option and `column` exists, Vertica generates a ROLLBACK error message.

You can qualify the new column definition with one of these options:

- **column-constraint** specifies a column constraint as follows:
  ```sql
  {NULL | NOT NULL}
  | [ DEFAULT default-expr ] [ SET USING using-expr ]
  | DEFAULT USING exp)
  ```
- **ENCODING** specifies the column's `encoding type`, by default set to AUTO.
- **PROJECTIONS** adds the new column to one or more existing projections of this table, specified as a comma-delimited list of projection base names. Vertica adds the column to all buddies of each projection. The projection list cannot include projections with pre-aggregated data such as live aggregate projections; otherwise, Vertica rolls back the ALTER TABLE statement.
- **ALL PROJECTIONS** adds the column to all projections of this table, excluding projections with pre-aggregated data.
<table>
<thead>
<tr>
<th><strong>ADD</strong> table-constraint</th>
<th>Adds a constraint to a table that does not have any associated projections.</th>
</tr>
</thead>
</table>

**ALTER COLUMN**

You can alter an existing column in one of two ways:

- Set encoding on a column for one or more projections of this table:

  \[
  \text{ENCODING } \text{encoding-type} \text{ PROJECTIONS } (\text{projections-list})
  \]

  where \text{projections-list} is a comma-delimited list of projections to update with the new encoding. You can specify each projection in two ways:

  - Projection base name: Update all projections that share this base name.
  - Projection name: Update the specified projection. If the projection is segmented, the change is propagated to all buddies.

  If one of the projections does not contain the target column, Vertica returns with a rollback error.

  For details, see Projection Column Encoding.

  - Set or drop a setting for a column of scalar data:

    ```
    \begin{verbatim}
    SET { \text{DEFAULT} \text{expression} \\
               \text{USING} \text{expression} \\
               \text{DEFAULT USING} \text{expression} \\
               \text{NOT NULL} \\
               \text{DATA_TYPE} \text{datatype} }
    \end{verbatim}
    
    \begin{verbatim}
    DROP { \text{DEFAULT} \\
               \text{SET USING} \\
               \text{DEFAULT USING} \\
               \text{NOT NULL} }
    \end{verbatim}
    
    Setting a DEFAULT or SET USING expression has no effect on existing column values. To refresh the column with its DEFAULT or SET USING expression, update it as follows:

    - SET USING column: Call `REFRESH_COLUMNS` on the table.
    - DEFAULT column, update the column as follows:
<table>
<thead>
<tr>
<th><strong>Table Constraint</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ALTER CONSTRAINT</strong></td>
<td>Specifies whether to enforce primary key, unique key, and check constraints:</td>
</tr>
<tr>
<td>`ALTER CONSTRAINT constraint-name {ENABLED</td>
<td>DISABLED}`</td>
</tr>
<tr>
<td><strong>DROP CONSTRAINT</strong></td>
<td>Drops the specified table constraint from the table:</td>
</tr>
<tr>
<td>`DROP CONSTRAINT constraint-name [CASCADE</td>
<td>RESTRICT]`</td>
</tr>
<tr>
<td></td>
<td>• CASCADE: Drops a constraint and all dependencies in other tables.</td>
</tr>
<tr>
<td></td>
<td>• RESTRICT: Does not drop a constraint if there are dependent objects. Same as the default behavior.</td>
</tr>
<tr>
<td></td>
<td>Dropping a table constraint has no effect on views that reference the table.</td>
</tr>
<tr>
<td><strong>DROP [COLUMN]</strong></td>
<td>Drops the specified column from the table and that column's ROS containers:</td>
</tr>
<tr>
<td>`DROP [COLUMN] [IF EXISTS] column [CASCADE</td>
<td>RESTRICT]`</td>
</tr>
<tr>
<td></td>
<td>• IF EXISTS specifies to generate an informational message if the column does not exist. If you omit this option and the column does not exist, Vertica generates a ROLLBACK error message.</td>
</tr>
<tr>
<td></td>
<td>• CASCADE is required if the column has dependencies.</td>
</tr>
<tr>
<td></td>
<td>• RESTRICT drops the column only from the given table.</td>
</tr>
<tr>
<td></td>
<td>See Dropping Table Columns.</td>
</tr>
<tr>
<td><strong>FORCE OUTER integer</strong></td>
<td>Specifies whether a table is joined to another as an inner</td>
</tr>
</tbody>
</table>
or outer input. For details, see Controlling Join Inputs.

<table>
<thead>
<tr>
<th>INCLUDE</th>
<th>EXCLUDE</th>
<th>MATERIALIZE</th>
<th>PRIVILEGES</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies default inheritance of schema privileges for this table:</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• EXCLUDE PRIVILEGES (default) disables inheritance of privileges from the schema.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• INCLUDE PRIVILEGES grants the table the same privileges granted to its schema.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• MATERIALIZE PRIVILEGES copies grants to the table and creates a GRANT object on the table. This disables the inherited privileges flag on the table, so you can:</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Grant more specific privileges at the table level.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Use schema-level privileges as a template.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Move the table to a different schema.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Change schema privileges without affecting the table.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note:**
If **inherited privileges are disabled at the database level**, schema privileges can still be materialized.

See also Setting Privilege Inheritance on Tables and Views.

| OWNER TO owner | Changes the table owner. |

**partition-clause** [REORGANIZE]

Invalid for external tables, logically divides table data storage through a PARTITION BY clause:

```sql
PARTITION BY partition-expression
    [ GROUP BY group-expression ] [ SET ACTIVEDISTRIBUTIONCOUNT integer ]
```

For details, see Partition Clause.

If you qualify the partition clause with REORGANIZE and the table previously specified no partitioning, the Vertica **Tuple Mover** immediately implements the partition clause. If the table previously specified partitioning, the Tuple Mover evaluates ROS storage
| **REORGANIZE** | Valid only for partitioned tables, invokes the Tuple Mover to reorganize ROS storage containers as needed to conform with the table's current partition clause. ALTER TABLE...REORGANIZE and Vertica meta-function PARTITION_TABLE operate identically. REORGANIZE can also qualify a new partition clause. |
| **SET** | Changes a table setting, one of the following:  
  - SCHEMA *schema-name*  
    Moves the table from its current schema to *schema-name*. Vertica automatically moves all projections that are anchored to the source table to the destination schema. It also moves all IDENTITY and AUTO_INCREMENT columns to the destination schema. For details, see Moving Tables to Another Schema |
| **RENAME [COLUMN]** | Renames the specified column within the table. |
| **RENAME TO** | Renames one or more tables:  
  RENAME TO *new-table-name[,...]*  
  The following requirements apply:  
  - The renamed table must be in the same schema as the original table.  
  - The new table name conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.  
  - If you specify multiple tables to rename, the source and target lists must have the same number of names. |
| **REMOVE PARTITIONING** | Specifies to remove partitioning from a table definition. The Tuple Mover subsequently removes existing partitions from ROS containers. |
| **containers and reorganizes them as needed to conform with the new partition clause.** |
ActivePartitionCount { count | DEFAULT }
Valid only for partitioned tables, specifies how many partitions are active for this table, one of the following:
- count: Unsigned integer, supersedes configuration parameter ActivePartitionCount.
- DEFAULT: Removes the table-level active partition count. The table obtains its active partition count from the configuration parameter ActivePartitionCount.

For details on usage, see Active and Inactive Partitions.

MERGEOUT { 1 | 0 }
Specifies whether to enable or disable mergeout to ROS containers that consolidate projection data of this table. By default, mergeout is enabled (1) on all tables.

Privileges

Non-superuser: USAGE on the schema and one of the following:
- Table owner
- ALTER privileges

Non-superusers must also have SELECT privileges to enable or disable constraint enforcement, or remove partitioning.

For certain operations, non-superusers must have the following schema privileges:

<table>
<thead>
<tr>
<th>Schema privileges required...</th>
<th>For these operations...</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE, USAGE</td>
<td>Rename table</td>
</tr>
<tr>
<td>CREATE: destination schema</td>
<td>Move table to another schema</td>
</tr>
<tr>
<td>USAGE: current schema</td>
<td></td>
</tr>
</tbody>
</table>
Exclusive ALTER TABLE Clauses

The following ALTER TABLE clauses cannot be combined with another ALTER TABLE clause:

- ADD COLUMN
- DROP COLUMN
- RENAME COLUMN
- SET SCHEMA
- RENAME [TO]

Node Down Limitations

Enterprise Mode only

The following ALTER TABLE operations are not supported when one or more database cluster nodes are down:

- ALTER COLUMN … ADD table-constraint
- ALTER COLUMN … SET DATA TYPE
- ALTER COLUMN … { SET DEFAULT | DROP DEFAULT }
- ALTER COLUMN … { SET USING | DROP SET USING }
- ALTER CONSTRAINT
- DROP COLUMN
- DROP CONSTRAINT

Pre-Aggregated Projection Restrictions

You cannot modify the metadata of anchor table columns that are included in live aggregate or Top-K projections. You also cannot drop these columns. To make these changes, you must first drop all live aggregate and Top-K projections that are associated with it.

External Table Restrictions

Not all ALTER TABLE options pertain to external tables. For instance, you cannot add a column to an external table, but you can rename the table:

```sql
=> ALTER TABLE mytable RENAME TO mytable2;
ALTER TABLE
```
Locked Tables

If the operation cannot obtain an **O lock** on the target table, Vertica tries to close any internal **Tuple Mover** sessions that are running on that table. If successful, the operation can proceed. Explicit Tuple Mover operations that are running in user sessions do not close. If an explicit Tuple Mover operation is running on the table, the operation proceeds only when the operation is complete.

**See Also**

- Working with Native Tables
- Altering Table Definitions
- Adding Table Columns

**Table-Constraint**

Adds a constraint to table metadata. You can specify table constraints with **CREATE TABLE**, or add a constraint to an existing table with **ALTER TABLE**. For details, see **Setting Constraints** in the Administrator's Guide.

**Note:**

Adding a constraint to a table that is referenced in a view does not affect the view.

**Syntax**

```sql
[ CONSTRAINT constraint-name ]
{
  ... PRIMARY KEY (column[, ...]) [ ENABLED | DISABLED ]
  ... | FOREIGN KEY (column[, ...]) REFERENCES table [ (column[, ...]) ]
  ... | UNIQUE (column[, ...]) [ ENABLED | DISABLED ]
  ... | CHECK (expression) [ ENABLED | DISABLED ]
}
```
## Parameters

<table>
<thead>
<tr>
<th>Constraint</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CONSTRAINT</strong>&lt;br&gt;<strong>constraint-name</strong></td>
<td>Assigns a name to the constraint. Vertica recommends that you name all constraints.</td>
</tr>
<tr>
<td><strong>PRIMARY KEY</strong></td>
<td>Defines one or more NOT NULL columns as the primary key as follows:&lt;br&gt;**PRIMARY KEY (column[, ...]) [ENABLED</td>
</tr>
<tr>
<td><strong>FOREIGN KEY</strong></td>
<td>Adds a referential integrity constraint defining one or more columns as foreign keys as follows:&lt;br&gt;<strong>FOREIGN KEY (column[, ...]) REFERENCES table [(column[, ...])]</strong>&lt;br&gt;If you omit column, Vertica references the primary key in table.&lt;br&gt;If you do not name a foreign key constraint, Vertica assigns the name C_FOREIGN.</td>
</tr>
<tr>
<td><strong>UNIQUE</strong></td>
<td>Specifies that the data in a column or group of columns is unique with respect to all table rows, as follows:&lt;br&gt;**UNIQUE (column[, ...]) [ENABLED</td>
</tr>
</tbody>
</table>
If you do not name a unique constraint, Vertica assigns the name C_UNIQUE.

CHECK

Specifies a check condition as an expression that returns a Boolean value, as follows:

```
CHECK (expression) [ENABLED | DISABLED]
```

You can qualify this constraint with the keyword ENABLED or DISABLED. See Enforcing Constraints below.

If you do not name a check constraint, Vertica assigns the name C_CHECK.

Privileges

Non-superusers: table owner, or the following privileges:

- USAGE on schema
- ALTER on table
- SELECT on table to enable or disable constraint enforcement

Enforcing Constraints

A table can specify whether Vertica automatically enforces a primary key, unique key or check constraint with the keyword ENABLED or DISABLED. If you omit ENABLED or DISABLED, Vertica determines whether to enable the constraint automatically by checking the appropriate configuration parameter:

- EnableNewPrimaryKeysByDefault
- EnableNewUniqueKeysByDefault
- EnableNewCheckConstraintsByDefault

For details, see Constraint Enforcement.

Examples

The following example creates a table (t01) with a primary key constraint.
CREATE TABLE t01 (id int CONSTRAINT sampleconstraint PRIMARY KEY);

This example creates the same table without the constraint, and then adds the constraint with ALTER TABLE ADD CONSTRAINT

CREATE TABLE t01 (id int);
ALTER TABLE t01 ADD CONSTRAINT sampleconstraint PRIMARY KEY(id);
WARNING 2623: Column "id" definition changed to NOT NULL
ALTER TABLE

The following example creates a table (addapk) with two columns, adds a third column to the table, and then adds a primary key constraint on the third column.

=> CREATE TABLE addapk (col1 INT, col2 INT);
CREATE TABLE
=> ALTER TABLE addapk ADD COLUMN col3 INT;
ALTER TABLE
=> ALTER TABLE addapk ADD CONSTRAINT col3constraint PRIMARY KEY (col3) ENABLED;
WARNING 2623: Column "col3" definition changed to NOT NULL
ALTER TABLE

Using the sample table addapk, check that the primary key constraint is enabled (is_enabled is t).

=> SELECT constraint_name, column_name, constraint_type, is_enabled FROM PRIMARY_KEYS WHERE table_name IN ('addapk');

<table>
<thead>
<tr>
<th>constraint_name</th>
<th>column_name</th>
<th>constraint_type</th>
<th>is_enabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>col3constraint</td>
<td>col3</td>
<td>p</td>
<td>t</td>
</tr>
</tbody>
</table>
(1 row)

This example disables the constraint using ALTER TABLE ALTER CONSTRAINT.

=> ALTER TABLE addapk ALTER CONSTRAINT col3constraint DISABLED;

Check that the primary key is now disabled (is_enabled is f).

=> SELECT constraint_name, column_name, constraint_type, is_enabled FROM PRIMARY_KEYS WHERE table_name IN ('addapk');

<table>
<thead>
<tr>
<th>constraint_name</th>
<th>column_name</th>
<th>constraint_type</th>
<th>is_enabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>col3constraint</td>
<td>col3</td>
<td>p</td>
<td>f</td>
</tr>
</tbody>
</table>
(1 row)
For a general discussion of constraints, see Constraints. For additional examples of creating and naming constraints, see Naming Constraints.

**Projection Column Encoding**

After you create a table and its projections, you can call ALTER TABLE...ALTER COLUMN to set or change the encoding type of an existing column in one or more projections. For example:

```sql
ALTER TABLE store.store_dimension ALTER COLUMN store_region ENCODING rle PROJECTIONS (store.store_dimension_p1_b0, store.store_dimension_p2);
```

In this example, the ALTER TABLE statement specifies to set RLE encoding on column store_region for two projections: store_dimension_p1_b0 and store_dimension_p2. The PROJECTIONS list references the two projections by their projection name and base name, respectively. You can reference a projection either way; in both cases, the change is propagated to all buddies of the projection and stored in its DDL accordingly:

```sql
=> select export_objects('', 'store.store_dimension');

export_objects
------------------------------------------------------
CREATE TABLE store.store_dimension
(
   store_key int NOT NULL,
   store_name varchar(64),
   store_number int,
   store_address varchar(256),
   store_city varchar(64),
   store_state char(2),
   store_region varchar(64)
);

CREATE PROJECTION store.store_dimension_p1
(
   store_key,
   store_name,
   store_number,
   store_address,
   store_city,
   store_state,
   store_region ENCODING RLE
)
AS
SELECT store_dimension.store_key,
   store_dimension.store_name,
   store_dimension.store_number,
```
```
store_dimension.store_address,
store_dimension.store_city,
store_dimension.store_state,
store_dimension.store_region
FROM store.store_dimension
ORDER BY store_dimension.store_key
SEGMENTED BY hash(store_dimension.store_key) ALL NODES KSAFE 1;
```

CREATE PROJECTION store.store_dimension_p2
(
    store_key,
    store_name,
    store_number,
    store_address,
    store_city,
    store_state,
    store_region ENCODING RLE
)
AS SELECT ...

**Important:**
When you add or change a column's encoding type, it has no immediate
effect on existing projection data. Vertica applies the encoding only to
newly loaded data, and to existing data on **mergeout**.

**ALTER TLS CONFIGURATION**

Alters a specified TLS CONFIGURATION object. For information on existing TLS
CONFIGURATION objects, query **TLS_CONFIGURATIONS**.

**Syntax**

```
ALTER TLS CONFIGURATION tls_config_name {
    [ CERTIFICATE { NULL | cert_name } ]
    [ ADD CA CERTIFICATES ca_cert_name [ ,... ] ]
    [ REMOVE CA CERTIFICATES ca_cert_name [ ,... ] ]
    [ CIPHER SUITES { "" | openssl_cipher [ ,... ] } ]
    [ TLSMODE '{ DISABLE | ENABLE | TRY_VERIFY | VERIFY_CA | VERIFY_FULL }' ]
}
```

**Parameters**

<p>| <strong>tls_config_name</strong> | The TLS CONFIGURATION object to alter. |</p>
<table>
<thead>
<tr>
<th><strong>NULL</strong></th>
<th>Removes the non-CA certificate from the TLS CONFIGURATION.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>cert_name</strong></td>
<td>A certificate created with CREATE CERTIFICATE.</td>
</tr>
<tr>
<td><strong>ca_cert_name</strong></td>
<td>A CA certificate created with CREATE CERTIFICATE.</td>
</tr>
<tr>
<td><strong>openssl_cipher</strong></td>
<td>A comma-separated list of cipher suites to use instead of the default set of cipher suites. Providing an empty string for this parameter clears the alternate cipher suite list and instructs the specified TLS CONFIGURATION to use the default set of cipher suites. To view enabled cipher suites, use LIST_ENABLED_CIPHERS.</td>
</tr>
<tr>
<td><strong>TLSMODE</strong></td>
<td>How Vertica establishes TLS connections and handles client certificates, one of the following, in order of ascending security:</td>
</tr>
<tr>
<td>`{ DISABLE</td>
<td>ENABLE</td>
</tr>
<tr>
<td><strong>DISABLE</strong>: Disables TLS. All other options for this parameter enable TLS.</td>
<td></td>
</tr>
<tr>
<td><strong>ENABLE</strong>: Enables TLS. Vertica does not check client certificates.</td>
<td></td>
</tr>
<tr>
<td><strong>TRY_VERIFY</strong>: Establishes a TLS connection if one of the following is true:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• the client presents a valid certificate</td>
</tr>
<tr>
<td></td>
<td>• the client doesn't present a certificate</td>
</tr>
<tr>
<td>If the client presents an invalid certificate, the connection will use plaintext.</td>
<td></td>
</tr>
<tr>
<td><strong>VERIFY_CA</strong>: Connection succeeds if Vertica verifies that the client certificate is from a trusted CA. Using this TLSMODE forces connections without a client certificate to use plaintext.</td>
<td></td>
</tr>
<tr>
<td><strong>VERIFY_FULL</strong>: Connection succeeds if Vertica verifies that the certificate is from a trusted CA and the certificate's cn (Common Name) or subjectAltName attribute matches the hostname or IP address of the client. Note that for client certificates, cn is used for the username, so subjectAltName must match the hostname or IP address of the client.</td>
<td></td>
</tr>
</tbody>
</table>
VERIFY_FULL is unsupported for client-server TLS (the server TLS CONFIGURATION context) and behaves as VERIFY_CA.

**Privileges**

Superuser

**Examples**

To configure client-server TLS, see Configuring Client-server TLS.

To configure TLS for the LDAP Link service and its dry run functions, see TLS for LDAP Link.

To configure TLS for LDAP authentication records, see TLS for LDAP Authentication.

To remove all certificates and CA certificates from the LDAPLink TLS CONFIGURATION:

```sql
=> SELECT * FROM tls_configurations WHERE name='LDAPLink';
name | owner | certificate | ca_certificate | cipher_suites | mode
---------------------------------------
LDAPLink | dbadmin | server_cert | ca | | DISABLE
LDAPLink | dbadmin | server_cert | ica | | DISABLE
(2 rows)

=> ALTER TLS CONFIGURATION LDAPLink CERTIFICATE NULL REMOVE CA CERTIFICATES ca, ica;
ALTER TLS CONFIGURATION

=> SELECT * FROM tls_configurations WHERE name='LDAPLink';
name | owner | certificate | ca_certificate | cipher_suites | mode
---------------------------------------
LDAPLink | dbadmin | | | | DISABLE
(3 rows)
```

To use an alternate set of cipher suites for client-server TLS:

```sql
=> ALTER TLS CONFIGURATION server CIPHER SUITES
'DHE-PSK-AES256-CBC-SHA384,
DHE-PSK-AES128-GCM-SHA256,
PSK-AES128-CBC-SHA256';
ALTER TLS CONFIGURATION

=> SELECT name, cipher_suites FROM tls_configurations WHERE name='server';
name | cipher_suites
server | DHE-PSK-AES256-CBC-SHA384,DHE-PSK-AES128-GCM-SHA256,PSK-AES128-CBC-SHA256
(1 row)
```
ALTER USER

Changes user account parameters and user-level configuration parameters.

Syntax

```
ALTER USER user-name {  
  account-parameter value[,..]  
  | SET [PARAMETER] cfg-parameter=value[,..]  
  | CLEAR [PARAMETER] cfg-parameter[,..]  
}
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>user-name</code></td>
<td>Name of the user. Names that contain special characters must be double-quoted. To enforce case-sensitivity, use double-quotes. For details on name requirements, see Creating a Database Name and Password.</td>
</tr>
<tr>
<td><code>account-parameter</code></td>
<td>Specifies user account settings (see below).</td>
</tr>
<tr>
<td><code>set [parameter]</code></td>
<td>Sets the specified configuration parameters. The new setting applies only to the current session and to all later sessions launched by this user. Concurrent user sessions are unaffected by new settings unless they call meta-function <code>RESET_SESSION</code>.</td>
</tr>
<tr>
<td><code>clear [parameter]</code></td>
<td>Resets the specified configuration parameters to their default values.</td>
</tr>
</tbody>
</table>

**Note:**

Changes to a user account apply only to the current session and to all later sessions launched by this user.

**Important:**

SET | CLEAR PARAMETER can specify only user-level configuration parameters, otherwise Vertica returns an error. For details, see Setting.
User Account Parameters

Specify one or more user-account parameters and their settings as a comma-delimited list:

account-parameter value[,..]

**Important:**
The following user-account parameters are invalid for a user who is added to the Vertica database with the LDAPLink service:

- IDENTIFIED BY
- PROFILE
- SECURITY ALGORITHM

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCOUNT</td>
<td>Locks or unlocks user access to the database, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- UNLOCK (default)</td>
</tr>
<tr>
<td></td>
<td>- LOCK prevents a new user from logging in.</td>
</tr>
<tr>
<td></td>
<td>This can be useful when creating an account for a user who does not</td>
</tr>
<tr>
<td></td>
<td>need immediate access.</td>
</tr>
<tr>
<td></td>
<td><strong>Tip:</strong></td>
</tr>
<tr>
<td></td>
<td>To automate account locking, set a maximum number of failed login</td>
</tr>
<tr>
<td></td>
<td>attempts with <code>CREATE PROFILE</code>.</td>
</tr>
<tr>
<td>DEFAULT ROLE</td>
<td>Specifies what roles are the default roles for this user, set to one</td>
</tr>
<tr>
<td></td>
<td>of the following:</td>
</tr>
<tr>
<td></td>
<td>- NONE (default): Removes all default roles.</td>
</tr>
<tr>
<td></td>
<td>- <code>role [, ..]</code>: Comma-delimited list of roles.</td>
</tr>
<tr>
<td></td>
<td>- ALL: Sets as default all user roles.</td>
</tr>
<tr>
<td></td>
<td>- ALL EXCEPT <code>role [, ..]</code>: Comma-delimited list of roles to exclude</td>
</tr>
<tr>
<td></td>
<td>as default roles.</td>
</tr>
</tbody>
</table>

Default roles are automatically activated when a
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>user logs in.</td>
<td>The roles specified by this parameter supersede any roles assigned earlier.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> DEFAULT ROLE cannot be specified in combination with other ALTER USER parameters.</td>
</tr>
<tr>
<td>GRACEPERIOD</td>
<td>Specifies how long a user query can block on any session socket, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• NONE (default): Removes any grace period previously set on session queries.</td>
</tr>
<tr>
<td></td>
<td>• 'interval': Specifies as an interval the maximum grace period for current session queries, up to 20 days.</td>
</tr>
<tr>
<td></td>
<td>For details, see <a href="#">Handling Session Socket Blocking</a>.</td>
</tr>
<tr>
<td>IDENTIFIED BY</td>
<td>Changes the user’s password:</td>
</tr>
<tr>
<td></td>
<td>IDENTIFIED BY '[new-password]'</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• new-password: ASCII password that Vertica then hashes for internal storage. An empty string enables this user to access the database with no password.</td>
</tr>
<tr>
<td></td>
<td>• hashed-password: A pre-hashed password and its associated hex string hash-salt. Setting a password this way bypasses all password complexity requirements.</td>
</tr>
<tr>
<td></td>
<td>• REPLACE: Required for non-superusers, who must supply their current password. Non-superusers can only change their own passwords.</td>
</tr>
<tr>
<td></td>
<td>For details, see <a href="#">Password Guidelines</a> and <a href="#">Creating a Database Name and Password</a>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Setting</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>IDLESESSIONTIMEOUT</td>
<td>The length of time the system waits before disconnecting an idle session, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• NONE (default): No limit set for this user. If you omit this parameter, no limit is set for this user.</td>
</tr>
<tr>
<td></td>
<td>• 'interval ': An interval value, up to one year.</td>
</tr>
<tr>
<td></td>
<td>For details, see Managing Client Connections.</td>
</tr>
<tr>
<td>MAXCONNECTIONS</td>
<td>Sets the maximum number of connections the user can have to the server, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• NONE (default): No limit set. If you omit this parameter, the user can have an unlimited number of connections across the database cluster.</td>
</tr>
<tr>
<td></td>
<td>• integer ON DATABASE: Sets to integer the maximum number of connections across the database cluster.</td>
</tr>
<tr>
<td></td>
<td>• integer ON NODE: Sets to integer the maximum number of connections to each node.</td>
</tr>
<tr>
<td></td>
<td>For details, see Managing Client Connections.</td>
</tr>
<tr>
<td>MEMORYCAP</td>
<td>Sets how much memory can be allocated to user requests, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• NONE (default): No limit</td>
</tr>
<tr>
<td></td>
<td>• A string value that specifies the memory limit, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• 'int%': expresses the maximum as a percentage of total memory available to the Resource Manager, where int is an integer value between 0 and 100.</td>
</tr>
<tr>
<td></td>
<td>For example: MEMORYCAP '40%'</td>
</tr>
<tr>
<td>Parameter</td>
<td>Setting</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Memory Allocation</td>
<td>'int{K</td>
</tr>
<tr>
<td>Password expires</td>
<td>Forces immediate expiration of the user's password. The user must change the password on the next login.</td>
</tr>
<tr>
<td>Note:</td>
<td>PASSWORD EXPIRE has no effect when using external password authentication methods such as LDAP or Kerberos.</td>
</tr>
<tr>
<td>Profile</td>
<td>Assigns a profile that controls password requirements for this user, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- DEFAULT (default): Assigns the default database profile to this user.</td>
</tr>
<tr>
<td></td>
<td>- profile-name: A profile that is defined by CREATE PROFILE.</td>
</tr>
<tr>
<td>Note:</td>
<td>RENAME TO cannot be specified in combination with other ALTER USER parameters.</td>
</tr>
<tr>
<td>Resource Pool</td>
<td>Assigns a default resource pool to this user. The user must also be granted privileges to the pool, unless privileges to the pool are set to PUBLIC.</td>
</tr>
<tr>
<td>Runtime Cap</td>
<td>Sets how long this user's queries can execute, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- NONE (default): No limit set for this user. If you omit this parameter, no limit is set for this user.</td>
</tr>
<tr>
<td></td>
<td>- 'interval': An interval value, up to one day.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Setting</td>
</tr>
<tr>
<td>-----------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>A query's runtime limit can be set at three levels: the user's runtime limit, the user's resource pool, and the session setting. For more information, see Setting a Runtime Limit for Queries.</td>
</tr>
<tr>
<td>SEARCH_PATH</td>
<td>Specifies the user's default search path, that tells Vertica which schemas to search for unqualified references to tables and UDFs, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- DEFAULT (default): Sets the search path as follows:</td>
</tr>
<tr>
<td></td>
<td>&quot;$user&quot;, public, v_catalog, v_monitor, v_internal</td>
</tr>
<tr>
<td></td>
<td>- Comma-delimited list of schemas. For details, see Setting Search Paths.</td>
</tr>
<tr>
<td>SECURITY_ALGORITHM 'algorithm'</td>
<td>Sets the user-level security algorithm for hash authentication, where algorithm is one of the following:</td>
</tr>
<tr>
<td></td>
<td>- NONE (default): Uses the system-level parameter, SecurityAlgorithm</td>
</tr>
<tr>
<td></td>
<td>- SHA512</td>
</tr>
<tr>
<td></td>
<td>- MD5</td>
</tr>
<tr>
<td></td>
<td>The user's password expires when you change the SECURITY_ALGORITHM value and must be reset.</td>
</tr>
<tr>
<td>TEMPSPACECAP</td>
<td>Sets how much temporary file storage is available for user requests, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- NONE (default): No limit</td>
</tr>
<tr>
<td></td>
<td>- A string value that specifies the memory limit, one of the following:</td>
</tr>
<tr>
<td></td>
<td>int% expresses the maximum as a percentage of total memory</td>
</tr>
</tbody>
</table>
available to the Resource Manager, where \( int \) is an integer value between 0 and 100. For example:

MEMORYCAP '40%'

- \( int\{K|M|G|T\} \) expresses memory allocation in kilobytes, megabytes, gigabytes, or terabytes. For example:

TEMPSPACECAP '10G'

**Privileges**

Non-superusers can change the following options on their own user accounts:

- `IDENTIFIED BY`
- `RESOURCE_POOL`
- `SEARCH_PATH`
- `SECURITY_ALGORITHM`

When changing another user's default resource pool to one outside of the PUBLIC schema, the user must have USAGE privileges on the resource pool from at least one of the following:

- Object ownership
- Explicit grant to the user
- Default role

**Setting User-Level Configuration Parameters**

SET | CLEAR PARAMETER can specify only user-level configuration parameters, otherwise Vertica returns an error. Only superusers can set and clear user-level parameters, unless they are also supported at the session level.

To get the names of user-level parameters, query system table `CONFIGURATION_PARAMETERS`. For example:

```
SELECT parameter_name, allowed_levels FROM configuration_parameters
WHERE allowed_levels ilike '%USER%' AND parameter_name ilike '%depot%';
```
### Examples

#### Change user's password

```sql
=> CREATE USER user1;
=> ALTER USER user1 IDENTIFIED BY 'newpassword';
```

#### Change user's security algorithm and password

Change a user's hash authentication and password to SHA-512 and newpassword, respectively. When you execute the `ALTER USER` statement, Vertica hashes the password, using the SHA-512 algorithm, and saves the hashed version:
Assign user default roles

Make a user's assigned roles the user's default roles:

```sql
=> CREATE USER user1;
=> ALTER USER user1 SECURITY_ALGORITHM 'SHA512' IDENTIFIED BY 'newpassword'
```

Assign user default roles with EXCEPT

Set all user-assigned roles to default roles except role1:

```sql
=> CREATE USER user2;
CREATE USER
=> GRANT role1, role2, role3 to user2;
=> ALTER USER user2 DEFAULT ROLE ALL EXCEPT role1;
```

See Also

- CREATE USER
- DROP USER
- SHOW USER

ALTER VIEW

Modifies the metadata of an existing view. The changes are auto-committed.

Syntax

General Usage

```
ALTER VIEW [[database.]schema.]view {
    OWNER TO owner
    SET SCHEMA schema
    [ { INCLUDE | EXCLUDE | MATERIALIZE } ] [ SCHEMA ] PRIVILEGES
}
```
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code>&lt;br&gt;<strong>Note:</strong> If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>view</code></td>
<td>The view to alter.</td>
</tr>
<tr>
<td><code>SET SCHEMA schema</code></td>
<td>Moves the view from one schema to another.</td>
</tr>
<tr>
<td><code>OWNER TO owner</code></td>
<td>Changes the view owner.</td>
</tr>
</tbody>
</table>
| `{ INCLUDE | EXCLUDE | MATERIALIZE }
[SCHEMA] PRIVILEGES` | Specifies default inheritance of schema privileges for this view:<br>  - EXCLUDE [SCHEMA] PRIVILEGES (default) disables inheritance of privileges from the schema.<br>  - INCLUDE [SCHEMA] PRIVILEGES grants the view the same privileges granted to its schema.<br>  - MATERIALIZE: Copies grants to the view and creates a GRANT object on the view. This disables the inherited privileges flag on the view, so you can:<br>    - Grant more specific privileges at the view level<br>    - Use schema-level privileges as a template<br>    - Move the view to a different schema<br>    - Change schema privileges without affecting the view<br>**Note:** If inherited privileges are disabled at the database level, schema privileges can still be materialized. |

### Important:

The new view owner should also have SELECT privileges on the objects that the view references; otherwise the view is inaccessible to that user.
See also Setting Privilege Inheritance on Tables and Views in the Administrator's Guide.

<table>
<thead>
<tr>
<th>RENAME TO</th>
<th>Renames one or more views:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>RENAME TO new-view-name [,..]</code></td>
</tr>
</tbody>
</table>

The following requirements apply:

- The new view name conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
- If you specify multiple views to rename, the source and target lists must have the same number of names.
- Renaming a view requires USAGE and CREATE privileges on the schema that contains the view.

## Privileges

Non-superuser: USAGE on the schema and one of the following:

- View owner
- ALTER privilege on the view

For certain operations, non-superusers must have the following schema privileges:

<table>
<thead>
<tr>
<th>Schema privileges required...</th>
<th>For these operations...</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE, USAGE</td>
<td>Rename view</td>
</tr>
<tr>
<td>CREATE: destination schema</td>
<td>Move view to another schema</td>
</tr>
<tr>
<td>USAGE: current schema</td>
<td></td>
</tr>
</tbody>
</table>

## Example

Rename view view1 to view2:

```sql
=> CREATE VIEW view1 AS SELECT * FROM t;
CREATE VIEW
=> ALTER VIEW view1 RENAME TO view2;
ALTER VIEW
```
ACTIVATE DIRECTED QUERY

Activates a directed query and makes it available to the query optimizer across all sessions.

Syntax

ACTIVATE DIRECTED QUERY [ query-name ]

Parameters

| query-name | Identifies the directed query to activate. If omitted, Vertica activates the last-created directed query. To obtain identifiers for directed queries, use GET DIRECTED QUERY, or query the system table DIRECTED_QUERIES. |

Privileges

Superuser

Activation Life Cycle

After you activate a directed query, it remains active until it is explicitly deactivated by DEACTIVATE DIRECTED QUERY or removed from storage by DROP DIRECTED QUERY. If a directed query is active at the time of database shutdown, Vertica automatically reactivates it when you restart the database.

Examples

See Activating and Deactivating Directed Queries.

BEGIN

Starts a transaction block.
Note: BEGIN is a synonym for START TRANSACTION.

Syntax

BEGIN [ WORK | TRANSACTION ] [ isolation-level ] [ READ [ ONLY ] | WRITE ]

Parameters

<table>
<thead>
<tr>
<th>WORK</th>
<th>TRANSACTION</th>
<th>Optional keywords for readability only.</th>
</tr>
</thead>
<tbody>
<tr>
<td>isolation-level</td>
<td>Specifies the transaction's isolation level, which determines what data the transaction can access when other transactions are running concurrently, one of the following:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• READ COMMITTED (default)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• SERIALIZABLE</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• REPEATABLE READ (automatically converted to SERIALIZABLE)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• READ UNCOMMITTED (automatically converted to READ COMMITTED)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>For details, see Transactions.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>READ [ ONLY ]</th>
<th>WRITE</th>
<th>Specifies the transaction mode, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• READ WRITE (default): Transaction is read/write.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• READ ONLY: Transaction is read-only.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Setting the transaction session mode to read-only disallows the following SQL statements, but does not prevent all disk write operations:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• INSERT, UPDATE, DELETE, and COPY if the target table is not a temporary table</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• All CREATE, ALTER, and DROP commands</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• GRANT, REVOKE, and EXPLAIN if the SQL to run is one of the statements cited above.</td>
<td></td>
</tr>
</tbody>
</table>

Privileges

None
Examples

Create a transaction with the isolation level set to READ COMMITTED and the transaction mode to READ WRITE:

```sql
 => BEGIN TRANSACTION ISOLATION LEVEL READ COMMITTED READ WRITE;
 => CREATE TABLE sample_table (a INT);
 => INSERT INTO sample_table (a) VALUES (1);
 => COMMIT
```

See Also

- Transactions
- Creating and Rolling Back Transactions
- COMMIT
- END
- ROLLBACK

CALL

Invokes a stored procedure created with CREATE PROCEDURE (Stored).

Syntax

```sql
CALL [[database.]schema.]procedure( [ argument-list ]);
```

Parameters

| database | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: |
If you specify a database, it must be the current database.

<table>
<thead>
<tr>
<th>schema</th>
<th><code>myschema.thisDbObject</code></th>
</tr>
</thead>
</table>

**procedure**
The name of the stored procedure, where `procedure` conforms to conventions described in Identifiers.

**argument-list**
A comma-delimited list of arguments to pass to the stored procedure, whose types correspond to the types of the argument's **IN** parameters.

## Privileges

Non-superuser: EXECUTE on the procedure

## Examples

See Executing Stored Procedures and Stored Procedures: Use Cases and Examples.

## See Also

- **DO**
- **CREATE PROCEDURE (Stored)**
- **DROP PROCEDURE (STORED)**
COMMENT ON Statements

COMMENT ON statements let you create comments on database objects, such as schemas, tables, and libraries. Each object can have one comment. Comments are stored in the system table `COMMENTS`.

COMMENT ON CONSTRAINT

Adds, revises, or removes a comment on a constraint. Each object can have one comment. Comments are stored in the system table `COMMENTS`.

Syntax

```
COMMENT ON CONSTRAINT constraint ON [database.]schema.]table IS ... ('comment' | NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>constraint</code></td>
<td>The name of the constraint associated with the comment.</td>
</tr>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than <code>public</code>, you must supply the schema name. For example: <code>myschema.thisDbObject</code>. If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>table</code></td>
<td>The name of the table constraint with which to associate a comment.</td>
</tr>
<tr>
<td><code>comment</code></td>
<td>Specifies the comment text to add. If a comment already exists for this constraint, this comment overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.</td>
</tr>
<tr>
<td>NULL</td>
<td>Removes an existing comment.</td>
</tr>
</tbody>
</table>

**Privileges**

Non-superuser: object owner

**Example**

The following example adds a comment to the `constraint_x` constraint on the `promotion_dimension` table:

```sql
=> COMMENT ON CONSTRAINT constraint_x ON promotion_dimension IS 'Primary key';
```

The following example removes a comment from the `constraint_x` constraint on the `promotion_dimension` table:

```sql
=> COMMENT ON CONSTRAINT constraint_x ON promotion_dimension IS NULL;
```

**COMMENT ON FUNCTION**

Adds, revises, or removes a comment on a function. Each object can have one comment. Comments are stored in the system table `COMMENTS`.

**Syntax**

```
COMMENT ON FUNCTION [[database.]schema.]function (function-args) IS { 'comment' | NULL };
```

**Parameters**

- `[[database.]schema.]function` specifies a schema, by default public. If `schema` is any schema other than public, you must supply the schema name. For example:

  ```sql
  myschema.thisDbObject
  ```

  If you specify a database, it must be the current database.
<table>
<thead>
<tr>
<th>function</th>
<th>The name of the function with which to associate the comment.</th>
</tr>
</thead>
<tbody>
<tr>
<td>function-args</td>
<td>The function arguments.</td>
</tr>
<tr>
<td>comment</td>
<td>Specifies the comment text to add. If a comment already exists for this function, this overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.</td>
</tr>
<tr>
<td>NULL</td>
<td>Removes an existing comment.</td>
</tr>
</tbody>
</table>

**Privileges**

Non-superuser: object owner

**Examples**

The following example adds a comment to the macros.zerowhennull (x INT) function:

```
=> COMMENT ON FUNCTION macros.zerowhennull(x INT) IS 'Returns a 0 if not NULL';
```

The following example removes a comment from the macros.zerowhennull (x INT) function:

```
=> COMMENT ON FUNCTION macros.zerowhennull(x INT) IS NULL;
```

**COMMENT ON AGGREGATE FUNCTION**

Adds, revises, or removes a comment on an aggregate function. Each object can have one comment. Comments are stored in the system table `COMMENTS`.

**Syntax**

```
COMMENT ON AGGREGATE FUNCTION [[database.]schema.]function (function-args) IS { 'comment' | NULL };
```
## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>function</code></td>
<td>The name of the aggregate function with which to associate the comment.</td>
</tr>
<tr>
<td><code>function-args</code></td>
<td>The function arguments.</td>
</tr>
<tr>
<td><code>comment</code></td>
<td>Specifies the comment text to add. If a comment already exists for this function, this overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.</td>
</tr>
<tr>
<td><code>NULL</code></td>
<td>Removes an existing comment.</td>
</tr>
</tbody>
</table>

## Privileges

Non-superuser: object owner

## Examples

The following example adds a comment to the `APPROXIMATE_MEDIAN(x FLOAT)` function:

```sql
=> COMMENT ON AGGREGATE FUNCTION APPROXIMATE_MEDIAN(x FLOAT) IS 'alias of APPROXIMATE_PERCENTILE with 0.5 as its parameter';
```

The following example removes a comment from the `APPROXIMATE_MEDIAN(x FLOAT)` function:

```sql
=> COMMENT ON AGGREGATE FUNCTION APPROXIMATE_MEDIAN(x FLOAT) IS NULL;
```
COMMENT ON ANALYTIC FUNCTION

Adds, revises, or removes a comment on an analytic function. Each object can have one comment. Comments are stored in the system table COMMENTS.

Syntax

```
COMMENT ON ANALYTIC FUNCTION [database.]schema.function (function-args) IS { 'comment' | NULL };
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td>function</td>
<td>The name of the analytic function with which to associate the comment.</td>
</tr>
<tr>
<td>function-args</td>
<td>The function arguments.</td>
</tr>
<tr>
<td>comment</td>
<td>Specifies the comment text to add. If a comment already exists for this function, this overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.</td>
</tr>
<tr>
<td>NULL</td>
<td>Removes an existing comment.</td>
</tr>
</tbody>
</table>

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the user-defined an_rank() function:
=> COMMENT ON ANALYTIC FUNCTION an_rank() IS 'built from the AnalyticFunctions library';

The following example removes a comment from the user-defined an_rank() function:

=> COMMENT ON ANALYTIC FUNCTION an_rank() IS NULL;

**COMMENT ON LIBRARY**

Adds, revises, or removes a comment on a library. Each object can have one comment. Comments are stored in the system table `COMMENTS`.

**Syntax**

```plaintext
COMMENT ON LIBRARY [[database.]schema.]library IS {'comment' | NULL}
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>library</code></td>
<td>The name of the library associated with the comment.</td>
</tr>
<tr>
<td><code>comment</code></td>
<td>Specifies the comment text to add. If a comment already exists for this library, this comment overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.</td>
</tr>
<tr>
<td><code>NULL</code></td>
<td>Removes an existing comment.</td>
</tr>
</tbody>
</table>

**Privileges**

Non-superuser: object owner
Examples

The following example adds a comment to the library MyFunctions:

```sql
=> COMMENT ON LIBRARY MyFunctions IS 'In development';
```

The following example removes a comment from the library MyFunctions:

```sql
=> COMMENT ON LIBRARY MyFunctions IS NULL;
```

See Also

- [COMMENTS](#)

COMMENT ON NODE

Adds, revises, or removes a comment on a node. Each object can have one comment. Comments are stored in the system table COMMENTS.

Dropping an object drops all comments associated with the object.

Syntax

```
COMMENT ON NODE node-name IS { 'comment' | NULL }
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>node-name</code></td>
<td>The name of the node associated with the comment.</td>
</tr>
<tr>
<td><code>comment</code></td>
<td>Specifies the comment text to add. If a comment already exists for this node, this comment overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.</td>
</tr>
<tr>
<td><code>NULL</code></td>
<td>Removes an existing comment.</td>
</tr>
</tbody>
</table>
Privileges

Non-superuser: object owner

Examples

The following example adds a comment for the initiator node:

```sql
=> COMMENT ON NODE initiator IS 'Initiator node';
```

The following example removes a comment from the initiator node:

```sql
=> COMMENT ON NODE initiator IS NULL;
```

See Also

COMMENTS

COMMENT ON PROJECTION

Adds, revises, or removes a comment on a projection. Each object can have one comment. Comments are stored in the system table COMMENTS.

Dropping an object drops all comments associated with the object.

Syntax

```sql
COMMENT ON PROJECTION [[database.][schema.]]projection IS { 'comment' | NULL }
```

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>database</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject</td>
</tr>
</tbody>
</table>
If you specify a database, it must be the current database.

<table>
<thead>
<tr>
<th>projection</th>
<th>The name of the projection associated with the comment.</th>
</tr>
</thead>
<tbody>
<tr>
<td>comment</td>
<td>Specifies the text of the comment to add. If a comment already exists for this projection, the comment you enter here overwrites the previous comment. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.</td>
</tr>
<tr>
<td>NULL</td>
<td>Removes an existing comment.</td>
</tr>
</tbody>
</table>

**Privileges**

Non-superuser: object owner

**Examples**

The following example adds a comment to the `customer_dimension_vmart_node01` projection:

```sql
=> COMMENT ON PROJECTION customer_dimension_vmart_node01 IS 'Test data';
```

The following example removes a comment from the `customer_dimension_vmart_node01` projection:

```sql
=> COMMENT ON PROJECTION customer_dimension_vmart_node01 IS NULL;
```

**See Also**

COMMENTS

**COMMENT ON PROJECTION COLUMN**

Adds, revises, or removes a projection column comment. Each object can have one comment. Comments are stored in the system table COMMENTS.
Syntax

COMMENT ON COLUMN [[database.]schema.]projection.column IS ('comment' | NULL)

Parameters

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
</table>
| [database.]schema | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:  
  myschema.thisDbObject  
  If you specify a database, it must be the current database. |
| projection.column | The name of the projection and column with which to associate the comment. |
| comment | Specifies the comment text to add. If a comment already exists for this column, this comment overwrites the previous comment.  
  Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message. |
| NULL | Removes an existing comment. |

Privileges

Non-superuser: object owner

Example

The following example adds a comment to the customer_name column in the customer_dimension projection:

=> COMMENT ON COLUMN customer_dimension_vmart_node01.customer_name IS 'Last name only';

The following example removes a comment from the customer_name column in the customer_dimension projection:
COMMENT ON SCHEMA

Adds, revises, or removes a comment on a schema. Each object can have one comment. Comments are stored in the system table COMMENTS.

Syntax

```
COMMENT ON SCHEMA schema-name IS {'comment' | NULL}
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>schema-name</code></td>
<td>The schema associated with the comment.</td>
</tr>
<tr>
<td><code>comment</code></td>
<td>Text of the comment to add. If a comment already exists for this schema, the comment you enter here overwrites the previous comment. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.</td>
</tr>
<tr>
<td>NULL</td>
<td>Removes an existing comment.</td>
</tr>
</tbody>
</table>

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the public schema:

```
=> COMMENT ON SCHEMA public IS 'All users can access this schema';
```

The following example removes a comment from the public schema.

```
=> COMMENT ON SCHEMA public IS NULL;
```
COMMENT ON SEQUENCE

Adds, revises, or removes a comment on a sequence. Each object can have one comment. Comments are stored in the system table COMMENTS.

Syntax

COMMENT ON SEQUENCE [(database.]schema.]sequence IS { 'comment' | NULL }

Parameters

<table>
<thead>
<tr>
<th>[database .]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td>sequence</td>
<td>The name of the sequence associated with the comment.</td>
</tr>
<tr>
<td>comment</td>
<td>Specifies the text of the comment to add. If a comment already exists for this sequence, this comment overwrites the previous one.</td>
</tr>
<tr>
<td></td>
<td>Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.</td>
</tr>
<tr>
<td>NULL</td>
<td>Removes an existing comment.</td>
</tr>
</tbody>
</table>

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the sequence called prom_seq.

=> COMMENT ON SEQUENCE prom_seq IS 'Promotion codes';
The following example removes a comment from the prom_seq sequence.

```sql
=> COMMENT ON SEQUENCE prom_seq IS NULL;
```

**COMMENT ON TABLE**

Adds, revises, or removes a comment on a table. Each object can have one comment. Comments are stored in the system table `COMMENTS`.

**Syntax**

```
COMMENT ON TABLE [[database.]schema.]table IS { 'comment' | NULL }
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>database.schma</td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td>table</td>
<td>The name of the table with which to associate the comment.</td>
</tr>
<tr>
<td>comment</td>
<td>Specifies the text of the comment to add. Enclose the text of the comment within single-quotes. If a comment already exists for this table, the</td>
</tr>
<tr>
<td></td>
<td>comment you enter here overwrites the previous comment.</td>
</tr>
<tr>
<td></td>
<td>Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a</td>
</tr>
<tr>
<td></td>
<td>message.</td>
</tr>
<tr>
<td>NULL</td>
<td>Removes a previously added comment.</td>
</tr>
</tbody>
</table>

**Privileges**

Non-superuser: object owner
Examples

The following example adds a comment to the promotion_dimension table:

```sql
=> COMMENT ON TABLE promotion_dimension IS '2011 Promotions';
```

The following example removes a comment from the promotion_dimension table:

```sql
=> COMMENT ON TABLE promotion_dimension IS NULL;
```

**COMMENT ON TABLE COLUMN**

Adds, revises, or removes a table column comment. Each object can have one comment. Comments are stored in the system table `COMMENTS`.

**Syntax**

```sql
COMMENT ON COLUMN [[database.]schema.]table.column IS {'comment' | NULL}
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>table.column</code></td>
<td>The name of the table and column with which to associate the comment.</td>
</tr>
<tr>
<td><code>comment</code></td>
<td>Specifies the comment text to add. If a comment already exists for this column, this comment overwrites the previous comment. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.</td>
</tr>
<tr>
<td><code>NULL</code></td>
<td>Removes an existing comment.</td>
</tr>
</tbody>
</table>
Privileges

Non-superuser: object owner

Example

The following example adds a comment to the transaction_time column in the store_sales_fact table in the store schema:

```sql
=> COMMENT ON COLUMN store.store_sales_fact.transaction_time IS 'GMT';
```

The following example removes a comment from the transaction_time column in the store_sales_fact table in the store schema:

```sql
=> COMMENT ON COLUMN store.store_sales_fact.transaction_time IS NULL;
```

COMMENT ON TRANSFORM FUNCTION

Adds, revises, or removes a comment on a user-defined transform function. Each object can have one comment. Comments are stored in the system table COMMENTS.

Syntax

```sql
COMMENT ON TRANSFORM FUNCTION [[database.]schema.]tfunction ...
...( [ tfunction-arg-name tfunction-arg-type |[..|] ) IS {'comment' | NULL}
```

Parameters

<table>
<thead>
<tr>
<th><code>[database.]schema</code></th>
<th>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>myschema.thisDbObject</code></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>tfunction</code></td>
<td>The name of the transform function with which to associate</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>tfunction-arg-name</td>
<td>The names and data types of one or more transform function arguments. If you supply argument names and types, each type must match the type specified in the library used to create the original transform function.</td>
</tr>
<tr>
<td>comment</td>
<td>Specifies the comment text to add. If a comment already exists for this transform function, this comment overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.</td>
</tr>
<tr>
<td>NULL</td>
<td>Removes an existing comment.</td>
</tr>
</tbody>
</table>

**Privileges**

Non-superuser: object owner

**Examples**

The following example adds a comment to the `macros.zerowhennull (x INT) UTF` function:

```sql
=> COMMENT ON TRANSFORM FUNCTION macros.zerowhennull(x INT) IS 'Returns a 0 if not NULL';
```

The following example removes a comment from the `acros.zerowhennull (x INT)` function by using the **NULL** option:

```sql
=> COMMENT ON TRANSFORM FUNCTION macros.zerowhennull(x INT) IS NULL;
```

**COMMENT ON VIEW**

Adds, revises, or removes a comment on a view. Each object can have one comment. Comments are stored in the system table `COMMENTS`. 
Syntax

```sql
COMMENT ON VIEW [[database.]schema.]view IS { 'comment' | NULL }
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>view</code></td>
<td>The name of the view with which to associate the comment.</td>
</tr>
<tr>
<td><code>comment</code></td>
<td>Specifies the text of the comment to add. If a comment already exists for this view, this comment overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.</td>
</tr>
<tr>
<td><code>NULL</code></td>
<td>Removes an existing comment.</td>
</tr>
</tbody>
</table>

Privileges

Non-superuser: object owner

Examples

The following example adds a comment from the `curr_month_ship` view:

```sql
=> COMMENT ON VIEW curr_month_ship IS 'Shipping data for the current month';
```

The following example removes a comment from the `curr_month_ship` view:

```sql
=> COMMENT ON VIEW curr_month_ship IS NULL;
```
COMMIT

Ends the current transaction and makes all changes that occurred during the transaction permanent and visible to other users.

COMMIT is a synonym for END

Syntax

COMMIT [ WORK | TRANSACTION ]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WORK</td>
<td>Optional keywords for readability only.</td>
</tr>
<tr>
<td>TRANSACTION</td>
<td></td>
</tr>
</tbody>
</table>

Privileges

None

Examples

This example shows how to commit an insert.

```
=> CREATE TABLE sample_table (a INT);
=> INSERT INTO sample_table (a) VALUES (1);
OUTPUT
--------
1
=> COMMIT;
```

START TRANSACTION

CONNECT TO VERTICA

Connects to another Vertica database to enable importing and exporting data across Vertica databases, with COPY FROM VERTICA and EXPORT TO VERTICA, respectively.

After you establish a connection to another database, the connection remains open in the current session until you explicitly close it with DISCONNECT. You can have only one connection to another database at a time. However, you can establish successive connections to different databases in the same session.

By default, invoking CONNECT TO VERTICA occurs over the Vertica private network. For information about creating a connection over a public network, see Using Public and Private IP Networks.

Important:
Copy and export operations can fail if either side of the connection is a single-node cluster installed to localhost.

Syntax
CONNECT TO VERTICA db-spec USER username PASSWORD 'password' ON 'host', port [TLSMODE PREFER]

Parameters

<table>
<thead>
<tr>
<th>db-spec</th>
<th>The target database, either the database name or DEFAULT.</th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>The username to use when connecting to the other database.</td>
</tr>
<tr>
<td>password</td>
<td>A string containing the password to use to connect to the target database.</td>
</tr>
<tr>
<td></td>
<td>If the target database has no password, and you supply one, the connection succeeds; however, Vertica returns no indication that you supplied an incorrect password.</td>
</tr>
<tr>
<td>host</td>
<td>A string containing the host name of one of the nodes in the other</td>
</tr>
</tbody>
</table>
### Privileges

None

### Security Requirements

When importing from or exporting to a Vertica database, you can connect only to a database that uses trusted (username only) or password-based authentication, as described in Security and Authentication. SSL authentication is not supported.

If configured with a certificate, Vertica encrypts data during transmission using TLS and attempts to encrypt plan metadata. You can set configuration parameter `ImportExportTLSMode` to require encryption for plan metadata.

### Example

```sql
=> CONNECT TO VERTICA ExampleDB USER dbadmin PASSWORD 'Password123' ON 'VerticaHost01',5433;
CONNECT
```

### COPY

COPY bulk-loads data into a Vertica database. By default, COPY automatically commits itself and any current transaction except when loading temporary tables. If COPY is terminated or interrupted Vertica rolls it back.

COPY reads data as UTF-8 encoding.

For information on loading one or more files or pipes on a cluster host or on a client system, see `COPY LOCAL`. 

<table>
<thead>
<tr>
<th><strong>port</strong></th>
<th>The port number of the other database as an integer.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TLSMODE PREFER</strong></td>
<td>Overrides the value of configuration parameter <code>ImportExportTLSMode</code> for this connection to PREFER. If <code>ImportExportTLSMode</code> is set to * _FORCE* you cannot override it.</td>
</tr>
</tbody>
</table>
Syntax

COPY [[database.]schema-name.]target-table

\end{align*}
\]

Parameters

See COPY Parameters
Privileges

Superusers have full COPY privileges. The following requirements apply to non-superusers:

- INSERT privilege on table
- USAGE privilege on schema
- USER-accessible storage location
- Applicable READ or WRITE privileges granted to the storage location where files are read or written

COPY can specify a path to store rejected data and exceptions. If the path resolves to a storage location, the following privileges apply to non-superusers:

- The storage location was created with the USER option (see CREATE LOCATION).
- The user must have READ access to the storage location, as described in GRANT (Storage Location)

COPY Parameters

Parameters and their descriptions are divided into the following sections:

- Target Options
- Column Options
- Input Options
- Handling Options
- Parser-Specific Options

Target Options

The following parameters apply to the target tables and their columns:

<table>
<thead>
<tr>
<th>[database.]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td>myschema.dbobject</td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><strong>COPY ignores schema-name when used in CREATE EXTERNAL TABLE or CREATE FLEX EXTERNAL TABLE statements.</strong></td>
<td></td>
</tr>
<tr>
<td>---</td>
<td></td>
</tr>
<tr>
<td><strong>target-table</strong></td>
<td>The target columnar or flexible table for loading new data. Vertica loads the data into all projections that include columns from the schema table.</td>
</tr>
<tr>
<td><strong>column-as-expression</strong></td>
<td>Specifies the expression used to compute values for the target column. For example:</td>
</tr>
<tr>
<td></td>
<td>=&gt; COPY t(year AS TO_CHAR(k, 'YYYY')) FROM 'myfile.dat'</td>
</tr>
<tr>
<td></td>
<td>Use this option to transform data when it is loaded into the target database.</td>
</tr>
<tr>
<td></td>
<td>For details, see Transforming Data During Loads.</td>
</tr>
<tr>
<td><strong>column</strong></td>
<td>Restricts the load to one or more specified columns in the table. If you omit specifying columns, COPY loads all columns by default. Table columns that you omit from the column list are assigned their DEFAULT or SET USING values, if any; otherwise, COPY inserts NULL.</td>
</tr>
<tr>
<td></td>
<td>If you leave the column parameter blank to load all columns in the table, you can use the optional parameter COLUMN OPTION to specify parsing options for specific columns.</td>
</tr>
<tr>
<td></td>
<td>The data file must contain the same number of columns as the COPY command's column list. For example, in a table T1 with nine columns (C1 through C9), the following statement loads the three columns of data in each record to columns C1, C6, and C9, respectively:</td>
</tr>
<tr>
<td></td>
<td>=&gt; COPY T1 (C1, C6, C9);</td>
</tr>
<tr>
<td><strong>COLUMN OPTION</strong></td>
<td>Specifies load metadata for one or more columns declared in the table column list. For example, you can specify that a column has its own DELIMITER, ENCLOSED BY, NULL as 'NULL' expression, and so on. You do not have to specify every column name explicitly in the COLUMN OPTION list,</td>
</tr>
</tbody>
</table>
but each column you specify must correspond to a column in the table column list.

**Column Options**

Depending on how they are specified, the following COPY options can qualify specific columns or all columns. Some parser-specific options can also apply to either specific columns or all columns. See [Global and Column-Specific Options](#) for details about these two modes.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENFORCELENGTH</td>
<td>If specified, COPY rejects data rows of type char, varchar, binary, and varbinary, or elements of those types in collections, if they are larger than the declared size. By default, COPY truncates offending rows of these data types and elements of these types in collections, but does not reject the rows. For more details, see <a href="#">Handling Messy Data</a>. If a collection does not fit with all of its elements, COPY rejects the row without truncating. It does not reduce the number of elements. This can happen if each element is individually within limits but the number of elements causes the collection to exceed the maximum size for the column.</td>
</tr>
</tbody>
</table>
| FILLER datatype | Specifies not to copy the data of an input column, one of the following:  
- Ignore data of the input column.  
- Transform input column data before loading it into the target table. For details, see [Transforming Data During Loads](#). |
| FORMAT 'format' | Specifies the input formats to use when loading date/time and binary columns, where format can be one of the following: These are the valid input formats when loading binary columns:  
- octal  
- hex  
- bitstream |
See [Binary (Native) Data](#) to learn more about these formats.

When loading `date/time` columns, using `FORMAT` significantly improves load performance. `COPY` supports the same formats as the `TO_DATE` function.

See the following topics for additional information:

- [Template Patterns for Date/Time Formatting](#)
- [Template Pattern Modifiers for Date/Time Formatting](#)

If you specify invalid format strings, the `COPY` operation returns an error.

### NULL [AS]

The string representing a null value. The default is an empty string (`''`). You can specify a null value as any ASCII value in the range `E'\000'` to `E'\177'` inclusive. You cannot use the same character for both the DELIMITER and NULL options. For details, see [Delimited Data](#).

---

**Input Options**

The following options are available for specifying source data:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCAL</td>
<td>Specifies to load a data file on a client system, rather than on a cluster host. LOCAL can qualify the STDIN and <code>path-to-data</code> parameters. For details, see <a href="#">COPY LOCAL</a>. <strong>Restrictions</strong>: Invalid for CREATE EXTERNAL TABLE AS COPY.</td>
</tr>
<tr>
<td>STDIN</td>
<td>Reads from the client a standard input instead of a file. STDIN takes one input source only. To load multiple input sources, use <code>path-to-data</code>. <strong>Restrictions</strong>: Invalid for CREATE EXTERNAL TABLE AS COPY. User must have INSERT privileges on the table and USAGE privileges on its schema.</td>
</tr>
</tbody>
</table>
**path-to-data** Specifies the absolute path of the file (or files) containing the data, which can be from multiple input sources.

- If the file is stored in HDFS, *path-to-data* is a URI in the `webhdfs` scheme, typically `[[s]web]hdfs://[nameservice]/path`. See HDFS File System.
- If the file is stored in an S3 bucket, *path-to-data* is a URI in the format `s3://bucket/path`. See S3 Object Store.
- If the file is stored in Google Cloud Storage, *path-to-data* is a URI in the format `gs://bucket/path`. See Google Cloud Storage (GCS) Object Store.
- If the file is stored in Azure Blob Storage, *path-to-data* is a URI in the format `azb://account/container/path`. See Azure Blob Storage Object Store.
- If the file is on the local disk or an NFS mount, *path-to-data* is a local (Linux) file path.

*path-to-data* can optionally contain wildcards to match more than one file. The file or files must be accessible to the local client or the host on which the COPY statement runs. COPY skips empty files in the file list. A file list that includes directories causes the query to fail. See Specifying Where to Load Data From. The supported patterns for wildcards are specified in the Linux Manual Page for Glo (7), and for ADO.net platforms, through the .NET Directory.GetFiles method.

You can use variables to construct the pathname as described in Using Load Scripts.

If *path-to-data* resolves to a storage location on a local file system, and the user invoking COPY is not a superuser, the following requirements apply:

- The storage location was created with `CREATE LOCATION...USAGE USER`.
- The user must already have READ access to the file storage location.
Further, if a user has privileges but is not a superuser, and invokes COPY from that storage location, Vertica ensures that symbolic links do not result in unauthorized access.

**ON nodename**

Specifies the node on which the data to copy resides and the node that should parse the load file. If you omit *nodename*, the location of the input file defaults to the initiator node. Use *nodename* to copy and parse a load file from a node other than the COPY initiator node.

**Note:** *nodename* is invalid with STDIN and LOCAL.

**ON (nodeset)**

Specifies a set of nodes on which to perform the load. The same data must be available for load on all named nodes. *nodeset* is a comma-separated list of node names in parentheses. For example:

```sql
=> COPY t FROM 'file1.txt' ON (v_vmart_node0001, v_vmart_node0002);
```

Vertica apportions the load among all of the specified nodes. If you also specify ERROR TOLERANCE or REJECTMAX, Vertica instead chooses a single node on which to perform the load.

If the data is available on all nodes, you usually use ON ANY NODE. However, you can use ON *nodeset* to do manual load-balancing among concurrent loads.

**ON ANY NODE**

Specifies that the source file to load is available on all nodes, so COPY opens the file and parses it from any node in the cluster. For an Eon Mode database, COPY uses nodes within the same subcluster as the initiator.

**Caution:**

The file must be the same on all nodes. If the file differs on two nodes, an incorrect or incomplete result is returned, with no error or warning.

Vertica attempts to apportion the load among several nodes if the file is large enough to benefit from
apportioning. It chooses a single node if ERROR TOLERANCE or REJECTMAX is specified.

You can use a wildcard or glob (such as *.dat) to load multiple input files, combined with the ON ANY NODE clause. If you use a glob, COPY distributes the list of files to all cluster nodes and spreads the workload.

ON ANY NODE is invalid with STDIN and LOCAL. STDIN can only use the client host, and LOCAL indicates a client node.

ON ANY NODE is the default for HDFS and S3 paths and does not need to be specified.

### input-format

Specifies the input format, one of the following:

- UNCOMPRESSED (default)
- BZIP
- GZIP
- LZO
- ZSTD

Input files can be of any format. If you use wildcards, all qualifying input files must be in the same format. To load different file formats, specify the format types specifically.

The following requirements and restrictions apply:

- When using concatenated BZIP or GZIP files, verify that all source files terminate with a record terminator before concatenating them.
- Concatenated BZIP and GZIP files are not supported for NATIVE (binary) and NATIVE VARCHAR formats.
- LZO files are assumed to be compressed with lzop. Vertica supports the following lzop arguments:
  - --no-checksum / -F
  - --crc32
  - --adler32
  - --no-name / -n
  - --name / -N
- --no-mode
- --no-time
- --fast
- --best
- Numbered compression levels
- BZIP, GZIP, ZSTD, and LZO compression cannot be used with ORC format.

VERTICA

See COPY FROM VERTICA.

[WITH] UDL-clause[...]

Specifies one or more user-defined load functions—one source, and optionally one or more filters and one parser, as follows:

```sql
SOURCE source( [arg=value[,...] ]
FILTER filter( [arg=value[,...] ] ) ]
PARSER parser( [arg=value[,...] ] ) ]
```

To use a flex table parser for column tables, use the PARSER parameter followed by a flex table parser argument. For supported flex table parsers, see Bulk Loading Data into Flex Tables.

### Handling Options

The following parameters provide various options for controlling how COPY handles different contingencies:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABORT ON ERROR</td>
<td>Specifies that COPY stops if any row is rejected. The statement is rolled back and no data is loaded.</td>
</tr>
<tr>
<td>COLSIZES (integer[,...])</td>
<td>Specifies column widths when loading fixed-width data. COPY requires that you specify the COLSIZES when using the FIXEDWIDTH parser. COLSIZES and the list of integers must correspond to the columns listed in the table column list. For details, see Fixed-Width Format Data.</td>
</tr>
<tr>
<td>ERROR TOLERANCE</td>
<td>Specifies that COPY treats each source during execution independently when loading data. The statement is not rolled back if a single source is invalid. The invalid source is skipped and the load</td>
</tr>
</tbody>
</table>
Using this parameter disables apportioned load.

**Restrictions:** Invalid for ORC or Parquet data

### EXCEPTIONS

Specifies the file name or absolute path of the file in which to write exceptions, as follows:

```sql
EXCEPTIONS 'path' [ ON nodename[, ...]]
```

Exceptions describe why each rejected row was rejected. Each exception describes the corresponding record in the file specified by the `REJECTED DATA` option.

Files are written on the node or nodes executing the load. If the file already exists, it is overwritten.

To collect all exceptions in one place, use the `REJECTED DATA AS TABLE` clause and exceptions are automatically listed in the table's `rejected_reason` column.

**Note:**

EXCEPTIONS is incompatible with `REJECTED DATA AS TABLE`.

The ON `nodename` clause moves existing exceptions files on `nodename` to the indicated `path` on the same node. For details, see Saving Load Exceptions (EXCEPTIONS).

If you use this parameter with `COPY...ON ANY NODE`, you must still specify the individual nodes for the exception files, as in the following example:

```sql
EXCEPTIONS '/home/ex01.txt' on v_db_node0001,'/home/ex02.txt' on v_db_node0002,'/home/ex03.txt' on v_db_node0003
```

If `path` resolves to a storage location, the following privileges apply to non-superusers:

- The storage location must be created with the
| USER option (see CREATE LOCATION). | The user must have READ access to the storage location where the files exist, as described in GRANT (Storage Location). |

| REJECTED DATA | Specifies where to write each row that failed to load. If this parameter is specified, records that failed due to parsing errors are always written. Records that failed due to an error during a transformation are written only if configuration parameter CopyFaultTolerantExpressions is set. |

The syntax for this parameter is:

```sql
REJECTED DATA
{ 'path' [ ON nodename ] [, ... ] | AS TABLE reject-table }
```

Vertica can write rejected data to the specified path or to a table:

- `'path' [ ON nodename ]`: Copies the rejected row data to the specified path on the node executing the load. If qualified by ON `nodename`, Vertica moves existing rejected data files on `nodename` to `path` on the same node.

The value of `path` can be a directory or a file prefix. If there are multiple load sources, `path` is always treated as a directory. If there are not multiple load sources but `path` ends with `'/', or if a directory of that name already exists, it is also treated as a directory. Otherwise, `path` is treated as a file prefix.

Files are written on the node or nodes executing the load. If the file already exists, it is overwritten.

When this parameter is used with LOCAL, the output is written to the client.

**Note:**
Do not qualify `path` with ON ANY NODE. To collect all rejected data in one
Place regardless of how the load is distributed, use a table.

- **AS TABLE reject-table**: Saves rejected rows to `reject-table`.

**Note:** `REJECTED DATA AS TABLE` is incompatible with `EXCEPTIONS`.

For details about both options, see [Handling Messy Data](#).

<table>
<thead>
<tr>
<th><strong>REJECTMAX integer</strong></th>
<th>The maximum number of logical records that can be rejected before a load fails. For details, see <a href="#">Handling Messy Data</a>. REJECTMAX disables apportioned load.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th><strong>SKIP integer</strong></th>
<th>The number of records to skip in a load file. For example, you can use the SKIP option to omit table header information.</th>
</tr>
</thead>
</table>

**Restrictions:** Invalid for ORC or Parquet data

<table>
<thead>
<tr>
<th><strong>STREAM NAME</strong></th>
<th>Supplies a COPY load stream identifier. Using a stream name helps to quickly identify a particular load. The STREAM NAME value that you supply in the load statement appears in the STREAM_NAME column of system tables <code>LOAD_STREAMS</code> and <code>LOAD_SOURCES</code>. A valid stream name can contain any combination of alphanumeric or special characters up to 128 bytes in length. By default, Vertica names streams by table and file name. For example, if you are loading two files (<code>f1</code>, <code>f2</code>) into <code>TableA</code>, their default stream names are <code>TableA-f1</code>, <code>TableA-f2</code>, respectively. For example:</th>
</tr>
</thead>
</table>

```sql
=> COPY mytable FROM myfile
   DELIMITER '|' STREAM NAME 'My stream name';
```
<table>
<thead>
<tr>
<th>WITH <code>parser</code></th>
<th>Specifies the parser to use when bulk loading columnar tables, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• NATIVE</td>
</tr>
<tr>
<td></td>
<td>• NATIVE VARCHAR</td>
</tr>
<tr>
<td></td>
<td>• FIXEDWIDTH</td>
</tr>
<tr>
<td></td>
<td>• ORC (Parser)</td>
</tr>
<tr>
<td></td>
<td>• PARQUET (Parser)</td>
</tr>
<tr>
<td></td>
<td>By default, COPY uses the DELIMITER parser for UTF-8 format, delimited text input data. You do not specify the DELIMITER parser directly; absence of a specific parser indicates the default.</td>
</tr>
<tr>
<td></td>
<td>To use a flex table parser for column tables, use the PARSER parameter followed by a flex table parser argument. For supported flex table parsers, see Bulk Loading Data into Flex Tables.</td>
</tr>
<tr>
<td></td>
<td>When loading into flex tables, you must use a compatible parser. For supported flex table parsers, see Bulk Loading Data into Flex Tables.</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>For parser support for complex data types, see the documentation of the specific parser.</td>
</tr>
<tr>
<td></td>
<td>For parser details, see Data Formats in Getting Data into Vertica.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>NO COMMIT</th>
<th>Prevents the COPY statement from committing its transaction automatically when it finishes copying data. This option must be the last COPY statement parameter.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>For details, see Using Transactions to Stage a Load.</td>
</tr>
<tr>
<td><strong>Restrictions:</strong></td>
<td>Invalid for ORC or Parquet data, ignored by CREATE EXTERNAL TABLE AS COPY</td>
</tr>
</tbody>
</table>
**Parser-Specific Options**

The following parameters apply only when using specific parsers.

**DELIMITED Parser**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DELIMITER</strong></td>
<td>Indicates the single ASCII character used to separate columns within each record of a file. You can use any ASCII value in the range E'000' to E'177', inclusive. You cannot use the same character for both the DELIMITER and NULL parameters. For more information, see <em>Delimited Data</em>. <strong>Default:</strong> Vertical bar ('</td>
</tr>
<tr>
<td><strong>ENCLOSED [BY]</strong></td>
<td>Sets the quote character within which to enclose data, allowing delimiter characters to be embedded in string values. You can choose any ASCII value in the range E'001' to E'177' inclusive (any ASCII character except NULL: E'000'). By default, ENCLOSED BY has no value, meaning data is not enclosed by any sort of quote character.</td>
</tr>
</tbody>
</table>
| **ESCAPE [AS]** | Sets the escape character. Once set, the character following the escape character is interpreted literally, rather than as a special character. You can define an escape character using any ASCII value in the range E\'001' to E\'177', inclusive (any ASCII character except NULL: E\'000'). The COPY statement does not interpret the data it reads in as *String Literals*. It also does not follow the same escape rules as other SQL statements (including the COPY parameters). When reading data, COPY interprets only the characters defined by these options as special values:  
  - ESCAPE [AS]  
  - DELIMITER  
  - ENCLOSED [BY]  
  - RECORD TERMINATOR  
  - All COLLECTION options |
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>NO ESCAPE</strong></td>
<td>Eliminates escape-character handling. Use this option if you do not need any escape character and you want to prevent characters in your data from being interpreted as escape sequences.</td>
</tr>
<tr>
<td><strong>RECORD TERMINATOR</strong></td>
<td>Specifies the literal character string indicating the end of a data file record. For more information about using this parameter, see Delimited Data.</td>
</tr>
<tr>
<td><strong>TRAILING NULLCOLS</strong></td>
<td>Specifies that if Vertica encounters a record with insufficient data to match the columns in the table column list, COPY inserts the missing columns with NULL values. For other information and examples, see Fixed-Width Format Data</td>
</tr>
<tr>
<td><strong>COLLECTIONDELIMITER</strong></td>
<td>For columns of collection types, indicates the single ASCII character used to separate elements within each collection. You can use any ASCII value in the range E'\000' to E'\177', inclusive. No COLLECTION option may have the same value as any other COLLECTION option. For more information, see Delimited Data.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> Comma (',').</td>
</tr>
<tr>
<td><strong>COLLECTIONOPEN, COLLECTIONCLOSE</strong></td>
<td>For columns of collection types, these options indicate the characters that mark the beginning and end of the collection. It is an error to use these characters elsewhere within the list of elements without escaping them. No COLLECTION option may have the same value as any other COLLECTION option.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> Square brackets ('[' and ']').</td>
</tr>
<tr>
<td><strong>COLLECTIONNULLELEMENT</strong></td>
<td>The string representing a null element value in a collection. You can specify a null value as any ASCII value in the range E'\001' to E'\177' inclusive (any ASCII value except NULL: E'\000'). No COLLECTION option may have the same value as any other COLLECTION option. For more information, see Delimited Data.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> 'null'</td>
</tr>
<tr>
<td><strong>Default:</strong> Backslash ('').</td>
<td></td>
</tr>
</tbody>
</table>
COLLECTIONENCLOSE

For columns of collection types, sets the quote character within which to enclose individual elements, allowing delimiter characters to be embedded in string values. You can choose any ASCII value in the range E'\001' to E'\177' inclusive (any ASCII character except NULL: E'\000').

No COLLECTION option may have the same value as any other COLLECTION option.

Default: double quote (""")

FIXEDWIDTH Parser

<table>
<thead>
<tr>
<th>SKIP BYTES</th>
<th>integer</th>
<th>The total number of bytes in a record to skip.</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRIM</td>
<td></td>
<td>Trims the number of bytes you specify from a column. This option is only available when loading fixed-width data. You can set TRIM at the table level for a column, or as part of the COLUMN OPTION parameter.</td>
</tr>
</tbody>
</table>

DELIMITED (Parser)

Use the DELIMITED parser, which is the default, to load delimited text data using COPY. You can specify the delimiter, escape characters, how to handle null values, and other parameters.

The DELIMITED parser supports reading one-dimensional collections (arrays or sets) of scalar types.

COPY Options

The following options are specific to this parser. See COPY Parameters for other applicable options.

<p>| DELIMITER | Indicates the single ASCII character used to separate columns within each record of a file. You can use any ASCII value in the range E'\000' to E'\177', inclusive. You cannot |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>use the same character for both the DELIMITER and NULL parameters. For more information, see Delimited Data.</td>
<td></td>
</tr>
<tr>
<td><strong>Default:</strong> Vertical bar ('</td>
<td>').</td>
</tr>
<tr>
<td>ENCLOSED [BY]</td>
<td>Sets the quote character within which to enclose data, allowing delimiter characters to be embedded in string values. You can choose any ASCII value in the range \E\001 to \E\177 inclusive (any ASCII character except NULL: \E\000). By default, ENCLOSED BY has no value, meaning data is not enclosed by any sort of quote character.</td>
</tr>
<tr>
<td>ESCAPE [AS]</td>
<td>Sets the escape character. Once set, the character following the escape character is interpreted literally, rather than as a special character. You can define an escape character using any ASCII value in the range \E\001 to \E\177, inclusive (any ASCII character except NULL: \E\000). The COPY statement does not interpret the data it reads in as String Literals. It also does not follow the same escape rules as other SQL statements (including the COPY parameters). When reading data, COPY interprets only the characters defined by these options as special values:</td>
</tr>
<tr>
<td></td>
<td>- ESCAPE [AS]</td>
</tr>
<tr>
<td></td>
<td>- DELIMITER</td>
</tr>
<tr>
<td></td>
<td>- ENCLOSED [BY]</td>

<tr>
<td></td>
<td>- RECORD TERMINATOR</td>
</tr>
<tr>
<td></td>
<td>- All COLLECTION options</td>
</tr>
<tr>
<td><strong>Default:</strong> Backslash ('').</td>
<td></td>
</tr>
<tr>
<td>NO ESCAPE</td>
<td>Eliminates escape-character handling. Use this option if you do not need any escape character and you want to prevent characters in your data from being interpreted as escape sequences.</td>
</tr>
<tr>
<td>RECORD TERMINATOR</td>
<td>Specifies the literal character string indicating the end of a data file record. For more information about using this parameter, see Delimited Data.</td>
</tr>
<tr>
<td>TRAILING NULLCOLS</td>
<td>Specifies that if Vertica encounters a record with insufficient data to match the columns in the table column list, COPY inserts the missing columns with NULL values.</td>
</tr>
</tbody>
</table>
other information and examples, see [Fixed-Width Format Data](#)

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COLLECTIONDELIMITER</td>
<td>For columns of collection types, indicates the single ASCII character used to separate elements within each collection. You can use any ASCII value in the range E'\000' to E'\177', inclusive. No COLLECTION option may have the same value as any other COLLECTION option. For more information, see <a href="#">Delimited Data</a>.</td>
</tr>
<tr>
<td><strong>Default</strong>: Comma (',').</td>
<td></td>
</tr>
<tr>
<td>COLLECTIONOPEN,</td>
<td>For columns of collection types, these options indicate the characters that mark the beginning and end of the collection. It is an error to use these characters elsewhere within the list of elements without escaping them. No COLLECTION option may have the same value as any other COLLECTION option.</td>
</tr>
<tr>
<td>COLLECTIONCLOSE</td>
<td><strong>Default</strong>: Square brackets ('[ and ']').</td>
</tr>
<tr>
<td>COLLECTIONNULLELEMENT</td>
<td>The string representing a null element value in a collection. You can specify a null value as any ASCII value in the range E'\001' to E'\177' inclusive (any ASCII value except NULL: E'\000'). No COLLECTION option may have the same value as any other COLLECTION option. For more information, see <a href="#">Delimited Data</a>.</td>
</tr>
<tr>
<td><strong>Default</strong>: 'null'</td>
<td></td>
</tr>
<tr>
<td>COLLECTIONENCLOSE</td>
<td>For columns of collection types, sets the quote character within which to enclose individual elements, allowing delimiter characters to be embedded in string values. You can choose any ASCII value in the range E'\001' to E'\177' inclusive (any ASCII character except NULL: E'\000'). No COLLECTION option may have the same value as any other COLLECTION option.</td>
</tr>
<tr>
<td><strong>Default</strong>: double quote (&quot;&quot;&quot;)</td>
<td></td>
</tr>
</tbody>
</table>
Examples

The following example shows the default behavior, in which the delimiter character is '|'...

```sql
=> CREATE TABLE employees (id INT, name VARCHAR(50), department VARCHAR(50));
CREATE TABLE

=> COPY employees FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 42|Sheldon Cooper|Physics
>> 17|Howard Wolowitz|Astronomy
>> \.

=> SELECT * FROM employees;
id | name | department
--- |------|-------------------
17 | Howard Wolowitz | Astrophysics
42 | Sheldon Cooper | Physics
(2 rows)
```

The following example shows loading array values with the default options.

```sql
=> CREATE TABLE researchers (id INT, name VARCHAR, grants ARRAY[VARCHAR], values ARRAY[INT]);
CREATE TABLE

=> COPY researchers FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 42|Sheldon Cooper|[US-7376,DARPA-1567]|[65000,135000]
>> 17|Howard Wolowitz|[NASA-1683,NASA-7867,SPX-76]|[16700,85000,45000]
>> \.

=> SELECT * FROM researchers;
id | name | grants | values
--- |------|--------|-------
17 | Howard Wolowitz | ["NASA-1683","NASA-7867","SPX-76"] | [16700,85000,45000]
42 | Sheldon Cooper | ["US-7376","DARPA-1567"] | [65000,135000]
(2 rows)
```

In the following example, collections are enclosed in braces and delimited by periods, and the arrays contain null values.

```sql
=> COPY researchers FROM STDIN COLLECTIONOPEN '{' COLLECTIONCLOSE '}'
COLLECTIONDELIMITER '.';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 19|Leonard|["us-1672".null."darpa-1963"]|{16200.null.16700}
>> \.

=> SELECT * FROM researchers;
id | name | grants | values
--- |------|--------|-------
--- |------|--------|-------
19 | Leonard | ["us-1672".null"darpa-1963"] | {16200,null,16700}
ORC (Parser)

Use the ORC clause with the COPY statement to load data in the ORC format.

When loading data into native tables, the ORC parser supports all primitive types and one-dimensional arrays of primitive types.

When loading data into native tables you can read all primitive types, UUIDs, and arrays of primitive types. When creating an external table you can additionally read structs, arrays, and maps. See Complex Types for Parquet and ORC Formats.

When loading ORC data, you must account for all columns in the data; you cannot select only some columns.

The ORC clause can be used alone or with optional parameters.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hive_partition_cols</td>
<td>Comma-separated list of columns that are partition columns in the data. See Using Partition Columns.</td>
</tr>
<tr>
<td>allow_no_match</td>
<td>Whether to accept a path containing a glob with no matching files and report zero rows in query results. If this parameter is not set, Vertica returns an error if the path in the FROM clause does not match at least one file.</td>
</tr>
</tbody>
</table>

### Examples

Use the ORC clause without parameters if your data is not partitioned:

```sql
=> CREATE EXTERNAL TABLE orders
   (orderkey INT,
    custkey INT,
    prodkey ARRAY[VARCHAR(10)],
    orderprices ARRAY[DECIMAL(12,2)],
```
In the following example, the "id" and "name" columns are included in the data and the "created" and "region" columns are partition columns. Partition columns must be listed last when defining columns:

```sql
=> CREATE EXTERNAL TABLE stores
(id INT,
 name VARCHAR(50),
 created DATE,
 region VARCHAR(50))
 AS COPY FROM 'webhdfs:///path/*/*/*'
 ORC(hive_partition_cols='created,region');
```

You can read a map column as an array of rows, as in the following example:

```sql
=> CREATE EXTERNAL TABLE orders
(orderkey INT,
 custkey INT,
 prods ARRAY[ROW(key VARCHAR(10), value DECIMAL(12,2))],
 orderdate DATE)
 AS COPY FROM '...' ORC;
```

## PARQUET (Parser)

Use the PARQUET parser with the COPY statement to load data in the Parquet format. When loading data into Vertica you can read all primitive types, UUIDs, and arrays of primitive types. When creating an external table you can additionally read structs and multi-dimensional arrays (arrays of arrays). See Complex Types for Parquet and ORC Formats.

By default, the Parquet parser uses strong schema matching, meaning that columns in the data must exactly match the columns in the table using the data. You can optionally use Loose Schema Matching.

When loading Parquet data, Vertica caches the Parquet metadata to improve efficiency. This cache uses local TEMP storage and is not used if TEMP is remote. See the ParquetMetadataCacheSizeMB configuration parameter to change the size of the cache.

Vertica does not support Parquet files that were written using the DATA_PAGE_V2 page type.
Parameters

All parameters are optional.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hive_partition_cols</td>
<td>Comma-separated list of columns that are partition columns in the data. See Using Partition Columns.</td>
</tr>
<tr>
<td>allow_no_match</td>
<td>Boolean. Whether to accept a path containing a glob with no matching files and report zero rows in query results. If this parameter is not set, Vertica returns an error if the path in the FROM clause does not match at least one file.</td>
</tr>
<tr>
<td>allow_long_varbinary_match_complex_type</td>
<td>Boolean. Whether to enable flexible column types (see Using Flexible Complex Types). If true, the Parquet parser allows a complex type in the data to match a table column defined as LONG VARBINARY. If false, the Parquet parser requires strong typing of complex types. With the parameter set you can still use strong typing. Set this parameter to false if you want use of flexible columns to be treated as an error.</td>
</tr>
<tr>
<td>do_soft_schema_match_by_name</td>
<td>Boolean. Whether to enable loose schema matching (true) instead of the strict matching based on column order in the table definition and parquet file (false, default). See Loose Schema Matching for more information.</td>
</tr>
<tr>
<td>reject_on_materialized_type_error</td>
<td>Boolean, applies only if do_soft_schema_match_by_name is true. Specifies what to do when loose schema matching is being used and a value cannot be coerced from the data to the target column type. A value of true (default) means to reject the row; a value of false means to use NULL for the value or, for strings that are too long, truncate. See the table of type coercions for coercible type mappings.</td>
</tr>
</tbody>
</table>

Loose Schema Matching

By default, the Parquet parser uses strong schema matching. This means that all columns in the Parquet data must be loaded, in the same order as in the data. However, there are times when you only want to pull certain columns, or you want to be able to accommodate future changes in the Parquet schema.
Use the `do_soft_schema_match_by_name` parameter to enable soft schema matching. This setting has the following effects:

- Columns in the data are matched to columns in the table by their names. Names must exactly match but are case-insensitive.
- Columns that exist in the Parquet data but are not part of the table definition are ignored.
- Columns that exist in the table definition but not the Parquet data are filled with NULL. The parser logs an `UNMATCHED_TABLE_COLUMNS_PARQUETPARSER` event in `QUERY_EVENTS`.
- If the same case-insensitive column name occurs more than once in the Parquet data, the parser uses the last one. (This situation can arise when using data written by tools that are case-sensitive.)
- Hive partition columns do not need to appear last in the table definition like they do with strong schema matching. If a partition column specified in the table definition does not exist in the data path, the parser uses a value of NULL and logs a `MISSING_HIVE_PARTITION` event in the `QUERY_EVENTS` table.
- Column types do not need to exactly match, so long as the data type in the Parquet file can be coerced to the type used by the table. If a type cannot be coerced, the parser logs a `TYPE_MISMATCH_COLUMNS_PARQUETPARSER` event in `QUERY EVENTS`. If `reject_on_materialized_type_error` is true then the parser rejects the row. If it is false, the parser uses NULL or, for string values that are too long, truncates the value.
- Columns using complex types (other than one-dimensional arrays of primitive types) can be defined but not queried.

## Data Types

The Parquet parser maps Parquet data types to Vertica data types as follows.

<table>
<thead>
<tr>
<th>Parquet Logical Type</th>
<th>Vertica Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>StringLogicalType</td>
<td>VARCHAR</td>
</tr>
<tr>
<td>MapLogicalType</td>
<td>ARRAY[ROW]</td>
</tr>
<tr>
<td>ListLogicalType</td>
<td>ARRAY/SET</td>
</tr>
<tr>
<td>IntLogicalType</td>
<td>INT/NUMERIC</td>
</tr>
<tr>
<td>DecimalLogicalType</td>
<td>NUMERIC</td>
</tr>
<tr>
<td>Parquet Logical Type</td>
<td>Vertica Data Type</td>
</tr>
<tr>
<td>---------------------------</td>
<td>------------------</td>
</tr>
<tr>
<td>DateLogicalType</td>
<td>DATE</td>
</tr>
<tr>
<td>TimeLogicalType</td>
<td>TIME</td>
</tr>
<tr>
<td>TimestampLogicalType</td>
<td>TIMESTAMP</td>
</tr>
<tr>
<td>UUIDLogicalType</td>
<td>UUID</td>
</tr>
</tbody>
</table>

The following logical types are not supported:

- EnumLogicalType
- IntervalLogicalType
- JSONLogicalType
- BSONLogicalType
- UnknownLogicalType

The Parquet parser supports the following mappings of physical types:

<table>
<thead>
<tr>
<th>Parquet Physical Type</th>
<th>Vertica Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOLEAN</td>
<td>BOOLEAN</td>
</tr>
<tr>
<td>INT32/INT64</td>
<td>INT</td>
</tr>
<tr>
<td>INT96</td>
<td>Supported only for TIMESTAMP</td>
</tr>
<tr>
<td>FLOAT</td>
<td>DOUBLE</td>
</tr>
<tr>
<td>DOUBLE</td>
<td>DOUBLE</td>
</tr>
<tr>
<td>BYTE_ARRAY</td>
<td>VARBINARY</td>
</tr>
<tr>
<td>FIXED_LEN_BYTE_ARRAY</td>
<td>BINARY</td>
</tr>
</tbody>
</table>

The following mappings are supported with type coercion and loose schema matching.

<table>
<thead>
<tr>
<th>Parquet Physical Type</th>
<th>Coercible to Vertica Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOLEAN</td>
<td>BOOLEAN</td>
</tr>
<tr>
<td>INT32, INT64, BOOLEAN</td>
<td>INT</td>
</tr>
</tbody>
</table>
### Parquet Physical Type

<table>
<thead>
<tr>
<th>Physical Type</th>
<th>Coercible to Vertica Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>FLOAT, DOUBLE</td>
<td>DOUBLE</td>
</tr>
<tr>
<td>INT32, INT96</td>
<td>DATE</td>
</tr>
<tr>
<td>INT64, INT96</td>
<td>TIMESTAMP, TIMESTAMPTZ</td>
</tr>
<tr>
<td>INT64</td>
<td>Numeric</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>BYTE_ARRAY</td>
<td>CHAR, VARCHAR, LONG VARCHAR, BINARY, VARBINARY, LONG VARBINARY</td>
</tr>
<tr>
<td>FIXED_LEN_BYTE_ARRAY</td>
<td>UUID</td>
</tr>
</tbody>
</table>

Vertica supports only 3-level-encoded arrays, not 2-level-encoded.

### Examples

Use the PARQUET clause without parameters if your data is not partitioned.

```sql
=> COPY t FROM 's3://AWS_DataLake/sales.parquet' PARQUET;
```

In the following example, the "id" and "name" columns are included in the data and the "created" and "region" columns are partition columns. Partition columns must be listed last when defining columns with strong schema matching (the default).

```sql
=> CREATE EXTERNAL TABLE t (id int, name varchar(50), created date, region varchar(50)) AS COPY FROM 'webhdfs://path/*/*/*' PARQUET(hive_partition_cols='created,region');
```

In the following example, the data directory contains no files.

```sql
=> CREATE EXTERNAL TABLE customers (...) AS COPY FROM 'webhdfs://data/*.parquet' PARQUET;
=> SELECT COUNT(*) FROM customers;
ERROR 7869: No files match when expanding glob: [webhdfs://data/*.parquet]
```

To read zero rows instead of producing an error, use the allow_no_match parameter with PARQUET:

```sql
=> CREATE EXTERNAL TABLE customers (...) AS COPY FROM 'webhdfs://data/*.parquet' PARQUET allow_no_match;
```
AS COPY FROM 'webhdfs:///data/*.parquet' PARQUET(allow_no_match='true');

=> SELECT COUNT(*) FROM customers;
count
--------
0
(1 row)

To allow reading a complex type (menu, in this example) as a flexible column type, use the allow_long_varbinary_match_complex_type parameter:

=> CREATE EXTERNAL TABLE restaurants
   (name VARCHAR, cuisine VARCHAR, location_city ARRAY[VARCHAR], menu LONG VARBINARY)
   AS COPY FROM '/data/rest*.parquet'
   PARQUET(allow_long_varbinary_match_complex_type='True');

To read only some columns from the restaurant data, use loose schema matching:

=> CREATE EXTERNAL TABLE restaurants(name VARCHAR, cuisine VARCHAR)
   AS COPY FROM '/data/rest*.parquet'
   PARQUET(allow_long_varbinary_match_complex_type='True',
            do_soft_schema_match_by_name='True');

=> SELECT * from restaurant;
   name      | cuisine
-------------|--------
Bob's pizzeria | Italian
Bakersfield Tacos | Mexican
(2 rows)

FJSONPARSER (Parser)

Parses and loads a JSON file. This file can contain either repeated JSON data objects (including nested maps), or an outer list of JSON elements.

For a flex table, the parser stores the JSON data in a single-value VMap. For a hybrid or columnar table, the parser loads data directly in any table column with a column name that matches a key in the JSON source data.

For materialized columns in a columnar table, the parser supports all scalar types, one-dimensional arrays of scalar types, and complex types loaded as VMap columns. To load complex types as VMap columns, specify a column type of LONG VARBINARY. To preserve the indexing in complex types, set flatten_maps to false.

Syntax

FJSONPARSER ( [parameter-name='value'][,...] )
## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flatten_maps</td>
<td>Boolean, specifies whether to flatten sub-maps within the JSON data, separating map levels with a period (.). This parameter applies only to flex tables or VMap columns.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> true</td>
</tr>
<tr>
<td>flatten_arrays</td>
<td>Boolean, specifies whether to convert lists to sub-maps with integer keys. When lists are flattened, key names are concatenated as for maps. Lists are not flattened by default.</td>
</tr>
<tr>
<td></td>
<td>This parameter applies only to flex tables or VMap columns. It does not apply to 1D arrays of primitive types that are declared as such.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> false</td>
</tr>
<tr>
<td>reject_on_duplicate</td>
<td>Boolean, specifies whether to ignore duplicate records (false), or to reject duplicates (true). In either case, the load continues.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> false</td>
</tr>
<tr>
<td>reject_on_empty_key</td>
<td>Boolean, specifies whether to reject any row containing a field key without a value.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> false</td>
</tr>
<tr>
<td>omit_empty_keys</td>
<td>Boolean, specifies whether to omit any field key from the load data that does not have a value.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> false</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>record_terminator</td>
<td>When set, any invalid JSON records are skipped and parsing continues with the next record. Records must be terminated uniformly. For example, if your input file has JSON records terminated by newline characters, set this parameter to E'\n'). If any invalid JSON records exist, parsing continues after the next record_terminator. When you omit this parameter, parsing ends at the first invalid JSON record.</td>
</tr>
<tr>
<td>reject_on_materialized_type_error</td>
<td>Boolean, specifies whether to reject a data row that contains a materialized column value that cannot be coerced into a compatible data type.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> false</td>
</tr>
<tr>
<td>start_point</td>
<td>String that specifies the name of a key in the JSON load data at which to begin parsing. The parser ignores all data before the start_point value. The value is loaded for each object in the file. The parser processes data after the first instance, and up to the second, ignoring any remaining data.</td>
</tr>
<tr>
<td>start_point_occurrence</td>
<td>Integer that indicates the nth occurrence of the value you specify with start_point. Use in conjunction with start_point when load data has multiple start values and you know the occurrence at which to begin parsing.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> 1</td>
</tr>
<tr>
<td>suppress_nonalphanumeric_key_chars</td>
<td>Boolean, specifies whether to suppress non-alphanumeric characters in JSON key values. The parser replaces these characters with an underscore (_) when this parameter is true.</td>
</tr>
</tbody>
</table>
key_separator

Specifies a non-default character for the parser to use when concatenating key names.

Default: period (.)

Examples

The following example loads JSON data from STDIN using the default parameters.

```sql
=> CREATE TABLE super(age INT, name VARCHAR);
CREATE TABLE

=> COPY super FROM STDIN PARSER FJSONPARSER();
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> {"age": 5, "name": "Tim"}
>> {"age": 3}
>> {"name": "Fred"}
>> {"name": "Bob", "age": 10}
>> \.
=> SELECT * FROM super;
  age | name
  ----|-------
   5  | Fred
   3  | Bob
   5  | Tim

(4 rows)
```

The following example loads array data.

```bash
$ cat addr.json
{"number": 301, "street": "Grant", "attributes": [1, 2, 3, 4]}

=> CREATE EXTERNAL TABLE customers(number INT, street VARCHAR, attributes ARRAY[INT])
   AS COPY FROM 'addr.json' PARSER fjsonparser();

=> SELECT number, street, attributes FROM customers;
  num | street | attributes
     |       | ------------------------------
301  | Grant  | [1,2,3,4]

(1 row)
```

The following example loads a complex type, rejecting rows that are missing keys within the nested records. Notice that while the data has two restaurants, only one is loaded.
$ cat rest1.json
{
  "name" : "Bob's pizzeria",
  "cuisine" : "Italian",
  "location_city" : ["Cambridge", "Pittsburgh"],
  "menu" : [
    {"item" : "cheese pizza", "price" : "$8.25"},
    {"item" : "spinach pizza", "price" : "$10.50"}
  ]
}
{
  "name" : "Bakersfield Tacos",
  "cuisine" : "Mexican",
  "location_city" : ["Pittsburgh"],
  "menu" : [
    {"item" : "veggie taco", "price" : "$9.95"},
    {"item" : "steak taco", "price" : "$10.95"}
  ]
}

CREATE TABLE rest (name VARCHAR, cuisine VARCHAR, location_city LONG VARBINARY, menu LONG VARBINARY);

COPY rest FROM '/data/rest1.json' PARSER fjsonparser(flatten_maps=false, reject_on_empty_key=true);
Rows Loaded
-----------
1

(1 row)

=> SELECT maptostring(location_city), maptostring(menu) FROM rest;

<table>
<thead>
<tr>
<th>maptostring</th>
<th>maptostring</th>
</tr>
</thead>
<tbody>
<tr>
<td>{ &quot;0&quot;: &quot;Pittsburgh&quot; }</td>
<td></td>
</tr>
<tr>
<td>{ &quot;0&quot;: {</td>
<td></td>
</tr>
<tr>
<td>&quot;item&quot;: &quot;veggie taco&quot;,</td>
<td></td>
</tr>
<tr>
<td>&quot;price&quot;: &quot;$9.95&quot;</td>
<td></td>
</tr>
<tr>
<td>},</td>
<td></td>
</tr>
<tr>
<td>{ &quot;1&quot;: {</td>
<td></td>
</tr>
<tr>
<td>&quot;item&quot;: &quot;steak taco&quot;,</td>
<td></td>
</tr>
<tr>
<td>&quot;price&quot;: &quot;$10.95&quot;</td>
<td></td>
</tr>
<tr>
<td>}</td>
<td></td>
</tr>
</tbody>
</table>

(1 row)

To instead load partial data, use omit_empty_keys to bypass the missing keys while loading everything else:

COPY rest FROM '/data/rest1.json' PARSER fjsonparser(flatten_maps=false, omit_empty_keys=true);
Rows Loaded
-----------
2

(1 row)

=> SELECT maptostring(location_city), maptostring(menu) from rest;

<table>
<thead>
<tr>
<th>maptostring</th>
<th>maptostring</th>
</tr>
</thead>
<tbody>
<tr>
<td>{ &quot;0&quot;: &quot;Pittsburgh&quot; }</td>
<td></td>
</tr>
<tr>
<td>{ &quot;0&quot;: {</td>
<td></td>
</tr>
<tr>
<td>&quot;item&quot;: &quot;veggie taco&quot;,</td>
<td></td>
</tr>
<tr>
<td>&quot;price&quot;: &quot;$9.95&quot;</td>
<td></td>
</tr>
<tr>
<td>},</td>
<td></td>
</tr>
<tr>
<td>{ &quot;1&quot;: {</td>
<td></td>
</tr>
<tr>
<td>&quot;item&quot;: &quot;steak taco&quot;,</td>
<td></td>
</tr>
<tr>
<td>&quot;price&quot;: &quot;$10.95&quot;</td>
<td></td>
</tr>
<tr>
<td>}</td>
<td></td>
</tr>
</tbody>
</table>

(1 row)
For other examples, see JSON Data.

FAVROPARSER (Parser)

Parses data from an Avro file. The input file must use binary serialization encoding. Use this parser to load data into columnar, flex, and hybrid tables.

For materialized columns in a columnar table, the parser supports all scalar types, one-dimensional arrays of scalar types, and complex types loaded as VMap columns. To load complex types as VMap columns, specify a column type of LONG VARBINARY. To preserve the indexing in complex types, set flatten_maps to false.

Note:
The parser favroparser does not support Avro files with separate schema files. The Avro file must have its related schema in the file you are loading.

Syntax

FAVROPARSER ( [parameter-name='value'[, ...]] )
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>flatten_arrays</td>
<td>Boolean, specifies whether to flatten all Avro arrays. Key names are concatenated with nested levels. This parameter applies only to flex tables or VMap columns. It does not apply to 1D arrays of primitive types that are declared as such.</td>
<td>false</td>
</tr>
<tr>
<td>flatten_maps</td>
<td>Boolean, specifies whether to flatten all Avro maps. Key names are concatenated with nested levels. This parameter applies only to flex tables or VMap columns.</td>
<td>true</td>
</tr>
<tr>
<td>flatten_records</td>
<td>Boolean, specifies whether to flatten all Avro records. Key names are concatenated with nested levels.</td>
<td>true</td>
</tr>
<tr>
<td>reject_on_materialized_type_error</td>
<td>Boolean, specifies whether to reject any row value for a materialized column that the parser cannot coerce into a compatible data type. See Using Flex Table Parsers.</td>
<td>false</td>
</tr>
</tbody>
</table>

Examples

This example shows how to create and load a flex table with Avro data using favroparser. After loading the data, you can query virtual columns.

```sql
=> CREATE FLEX TABLE avro_basic();
```
CREATE TABLE

=> COPY avro_basic FROM '/home/dbadmin/data/weather.avro' PARSER FAVROPARSER();
Rows Loaded
-------------
5
(1 row)

=> SELECT station, temp, time FROM avro_basic;

station | temp | time
---------+-------+--------
mohali  | 0     | -619524000000
lucknow | 22    | -619506000000
norwich | -11   | -619484400000
ams     | 111   | -655531200000
baddi   | 78    | -655509600000
(5 rows)

For more information, see Avro Data.

COPY Restrictions

Invalid Data

COPY considers the following data invalid:

- Missing columns (an input line has fewer columns than the recipient table).
- Extra columns (an input line has more columns than the recipient table).
- Empty columns for an INTEGER or DATE/TIME data type. If a column is empty for either of these types, COPY does not use the default value that was defined by CREATE TABLE. However, if you do not supply a column option as part of the COPY statement, the default value is used.
- Incorrect representation of a data type. For example, trying to load a non-numeric value into an INTEGER column is invalid.

Constraint Violations

If any primary key, unique key, or check constraints are enabled for automatic enforcement, Vertica enforces those constraints when you insert values into a table. If a violation occurs, Vertica rolls back the SQL statement and returns an error. This behavior occurs for INSERT, UPDATE, COPY, and MERGE SQL statements.
Note: Automatic constraint enforcement requires that you have SELECT privileges on the table containing the constraint.

**Empty Line Handling**

When COPY encounters an empty line while loading data, the line is neither inserted nor rejected, but COPY increments the line record number. Consider this behavior when evaluating rejected records. If you return a list of rejected records and COPY encountered an empty row while loading data, the position of rejected records is not incremented by one, as demonstrated in the following example.

--- Load these values into a table that defines the first column as INT.
--- Errors on lines 3, 4, and 8:
  => \! cat -n /home/dbadmin/test.txt
  1 1|A|2
  2 2|B|4
  3 A|D|7
  4 A|E|7
  5
  6
  7 6|A|3
  8 B|A|3

--- Empty rows 5 and 6 shift the reporting of the error on row 8.
  => SELECT row_number, rejected_data, rejected_reason FROM test_bad;

<table>
<thead>
<tr>
<th>row_number</th>
<th>rejected_data</th>
<th>rejected_reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>A</td>
<td>D</td>
</tr>
<tr>

(3 rows)

**Compressed File Errors**

When loading compressed files, COPY might abort and report an error, if the file seems to be corrupted. For example, this behavior can occur if reading the header block fails.
COPY Examples

For additional examples, see the reference pages for specific parsers: DELIMITED (Parser), ORC (Parser), and PARQUET (Parser).

Specifying String Options

Use COPY with FORMAT, DELIMITER, NULL, and ENCLOSED BY options:

```sql
=> COPY public.customer_dimension (customer_since FORMAT 'YYYY')
   FROM STDIN
   DELIMITER ','
   NULL AS 'null'
   ENCLOSED BY '"';
```

Use COPY with DELIMITER and NULL options. This example sets and references a vsql variable input_file:

```sql
=> \set input_file ../myCopyFromLocal/large_table.gzip
=> COPY store.store_dimension
    FROM :input_file
    DELIMITER '|'
    NULL ''
    RECORD TERMINATOR E'\f';
```

Including Multiple Source Files

Create table sampletab, and then copy multiple source files to the table:

```sql
=> CREATE TABLE sampletab (a int);
CREATE TABLE
=> COPY sampletab FROM '/home/dbadmin/one.dat', 'home/dbadmin/two.dat';
Rows Loaded
-------------
  2
(1 row)
```

Use wildcards to indicate a group of files:

```sql
=> COPY myTable FROM 'webhdfs:///mydirectory/ofmanyfiles/*.dat';
```

Wildcards can include regular expressions:

```sql
=> COPY myTable FROM 'webhdfs:///mydirectory/*_[0-9]';
```
Specify multiple paths in a single COPY statement:

```sql
=> COPY myTable FROM 'webhdfs:///data/sales/01/*.dat', 'webhdfs:///data/sales/02/*.dat', 'webhdfs:///data/sales/historical.dat';
```

## Distributing a Load

Load data that is shared across all nodes. Vertica distributes the load across all nodes, if possible:

```sql
=> COPY sampletab FROM '/data/file.dat' ON ANY NODE;
```

Load data from two files. Because the first load file does not specify nodes (or ON ANY NODE), the initiator performs the load. Loading the second file is distributed across all nodes.

```sql
=> COPY sampletab FROM '/data/file1.dat', '/data/file2.dat' ON ANY NODE;
```

Specify different nodes for each load file. COPY specifies to distribute the load of two files as follows:

- file1.dat on nodes v_vmart_node0001 and v_vmart_node0002
- file2.dat on nodes v_vmart_node0003 and v_vmart_node0004

```sql
=> COPY sampletab FROM '/data/file1.dat' ON (v_vmart_node0001, v_vmart_node0002), '/data/file2.dat' ON (v_vmart_node0003, v_vmart_node0004);
```

## Loading Data from Shared Storage

To load data from HDFS, S3, Google Cloud, or Azure, use URLs in the corresponding schemes, `webhdfs:///path`, `s3://bucket/path`, `gs://bucket/path`, and `azb://bucket/path`, respectively.

**Note:**
Loads from HDFS, S3, GCS, and Azure default to ON ANY NODE; you do not need to specify it.

Load a file stored in HDFS using the default name node or name service. See [HDFS File System](#) for more information about HDFS URLs.

```sql
=> COPY t FROM 'webhdfs:///opt/data/file1.dat';
```
Load data from a particular HDFS name service (testNS). You specify a name service if your database is configured to read from more than one HDFS cluster.

```sql
=> COPY t FROM 'webhdfs://testNS/opt/data/file2.csv';
```

Load data from an S3 bucket. See S3 Object Store for more information.

```sql
=> COPY t FROM 's3://AWS_DataLake/*' ORC;
```

**Loading Hadoop Native Formats**

Load data in the ORC format from HDFS:

```sql
=> COPY t FROM 'webhdfs:///opt/data/sales.orc' ORC;
```

Load Parquet data from an S3 bucket:

```sql
=> COPY t FROM 's3://AWS_DataLake/sales.parquet' PARQUET;
```

**Loading Data into a Flex Table**

Create a Flex table and copy JSON data into it, using the flex table parser `fjsonparser`:

```sql
=> CREATE FLEX TABLE darkdata();
CREATE TABLE
=> COPY tweets FROM '/myTest/Flexible/DATA/tweets_12.json' parser fjsonparser();
Rows Loaded
----------
 12
(1 row)
```

**Using Named Pipes**

COPY supports named pipes that follow the same naming conventions as file names on the given file system. Permissions are open, write, and close.

Create named pipe `pipe1` and set two vsql variables, `dir` and `file`:

```sql
=> \\ mkfifo pipe1
=> \set dir 'pwd'/
=> \set file '''':dir'pipe1'''```
Copy an uncompressed file from the named pipe:

```bash
=> \! cat pf1.dat > pipe1 &
=> COPY large_tbl FROM :file delimiter '|';
=> SELECT * FROM large_tbl;
=> COMMIT;
```

## Loading Compressed Data

Copy a GZIP file from a named pipe and uncompress it:

```bash
=> \! gzip pf1.dat
=> \! cat pf1.dat.gz > pipe1 &
=> COPY large_tbl FROM :file ON site01 GZIP delimiter '|';
=> SELECT * FROM large_tbl;
=> COMMIT;
=> \! gunzip pf1.dat.gz
```

Copy a BZIP file from a named pipe and then uncompress it:

```bash
=> \! bzip2 pf1.dat
=> \! cat pf1.dat.bz2 > pipe1 &
=> COPY large_tbl FROM :file ON site01 BZIP delimiter '|';
=> SELECT * FROM large_tbl;
=> COMMIT;
=> \! bunzip2 pf1.dat.bz2
```

Copy an LZO file from a named pipe and then uncompress it:

```bash
=> \! lzop pf1.dat
=> \! cat pf1.dat.lzo > pipe1 &
=> COPY large_tbl FROM :file ON site01 LZO delimiter '|';
=> SELECT * FROM large_tbl;
=> COMMIT;
=> \! lzop -d pf1.dat.lzo
```

## COPY LOCAL

Using the COPY statement with its LOCAL option lets you load a data file on a client system, rather than on a cluster host. COPY LOCAL supports the STDIN and 'pathToData' parameters, but not the [ON nodename] clause. COPY LOCAL does not support multiple file batches in NATIVE or NATIVE VARCHAR formats. COPY LOCAL does not support reading ORC or Parquet files; use ON NODE instead. COPY LOCAL does not support CURRENT_LOAD_SOURCE().
The COPY LOCAL option is platform-independent. The statement works in the same way across all supported Vertica platforms and drivers. For more details about using COPY LOCAL with supported drivers, see the Connecting to Vertica section for your platform.

COPY LOCAL must be the first statement in any multi-statement query you make with the ODBC client library. Using it as the second or later statement results in an error. When using other client libraries, such as JDBC, COPY LOCAL should always be the first statement in a multi-statement query. Also, do not use it multiple times in the same query.

**Note:**
On Windows clients, the path you supply for the COPY LOCAL file is limited to 216 characters due to limitations in the Windows API.

COPY LOCAL does not automatically create exceptions and rejections files, even if exceptions occur.

### Privileges
User must have INSERT privilege on the table and USAGE privilege on the schema.

### How Copy Local Works
COPY LOCAL loads data in a platform-neutral way. The COPY LOCAL statement loads all files from a local client system to the Vertica host, where the server processes the files. You can copy files in various formats: uncompressed, compressed, fixed-width format, in bzip or gzip format, or specified as a bash glob. Files of a single format (such as all bzip, or gzip) can be comma-separated in the list of input files. You can also use any of the applicable COPY statement options (as long as the data format supports the option). For instance, you can define a specific delimiter character, or how to handle NULLs, and so forth.

**Note:**
The Linux `glob` command returns files that match the pattern you enter, as specified in the [Linux Manual Page for Glob](7). For ADO.net platforms, specify patterns and wildcards as described in the .NET [Directory.GetFiles Method](7).

For more information about using the COPY LOCAL option to load data, see COPY for syntactical descriptions, and Specifying Where to Load Data From for detailed examples.

The Vertica host uncompresses and processes the files as necessary, regardless of file format or the client platform from which you load the files. Once the server has the copied
files, Vertica maintains performance by distributing file parsing tasks, such as encoding, compressing, uncompressing, across nodes.

**Viewing Copy Local Operations in a Query Plan**

When you use the `COPY LOCAL` option, the GraphViz query plan includes a label for `Load-Client-File`, rather than `Load-File`. Following is a section from a sample query plan:

```
PLAN: BASE BULKLOAD PLAN (GraphViz Format)

digraph G {
  graph [rankdir=BT, label = "BASE BULKLOAD PLAN \nAll Nodes Vector:
  \n  node[0]=initiator (initiator) Up\n", labelloc=t, labeljust=l ordering=out]

  10[label = "Load-Client-File(/tmp/diff) \nOutBlk=\[UncTuple]\", color = "green", shape = "ellipse"];
```

**Examples**

The following example shows a load from a local file.

```
$ cat > t.dat
12
17
9
^C

=> CREATE TABLE numbers (value INT);
CREATE TABLE

=> COPY numbers FROM LOCAL 't.dat';
Rows Loaded
-------------
  3
(1 row)

=> SELECT * FROM numbers;
value
-------
  12
  17
   9
(3 rows)
```
COPY FROM VERTICA

Imports data from another Vertica database. COPY FROM VERTICA is similar to COPY, but supports only a subset of its parameters.

Important:
The source database must be no more than one major release behind the target database.

Syntax

COPY [[database.]schema-name.]target-table
[( target-columns )]
FROM VERTICA source-database.[schema.]source-table
[( source-columns )]
[STREAM NAME 'stream name']
[NO COMMIT]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>target-table</td>
<td>The target table for the imported data. Vertica loads the data into all projections that include columns from the schema table.</td>
</tr>
<tr>
<td>target-columns</td>
<td>A comma-delimited list of columns in target-table to store the copied data. See Mapping Between Target and Source Columns below.</td>
</tr>
<tr>
<td>Note:</td>
<td>You cannot use column fillers as part of the column definition.</td>
</tr>
</tbody>
</table>
**source-database**  
The source database of the data to import. A connection to this database must already exist in the current session before starting the copy operation; otherwise Vertica returns an error. For details, see CONNECT TO VERTICA.

**[schema.]source-table**  
The table that is the source of the imported data. If `schema` is any schema other than `public`, you must supply the schema name.

**source-columns**  
A comma-delimited list of the columns in the source table to import. If omitted, all columns are exported. See Mapping Between Target and Source Columns below.

**STREAM NAME**  
Specifies a COPY load stream identifier. Using a stream name helps to quickly identify a particular load. The STREAM NAME value that you specify in the load statement appears in the stream column of the LOAD_STREAMS system table.

**NO COMMIT**  
Prevents COPY from committing its transaction automatically when it finishes copying data. For details, see Using Transactions to Stage a Load.

### Privileges

- Source table: SELECT
- Source table schema: USAGE
- Target table: INSERT
- Target table schema: USAGE

### Mapping Between Target and Source Columns

If you copy all table data from one database to another, COPY FROM VERTICA can omit specifying column lists if column definitions in both tables comply with the following conditions:

- Same number of columns
- Identical column names
- Same sequence of columns
- Matching or compatible column data types
If any of these conditions is not true, the COPY FROM VERTICA statement must include column lists that explicitly map target and source columns to each other, as follows:

- Contain the same number of columns.
- List source and target columns in the same order.
- Pair columns with the same (or compatible) data types.

### Node Failure During COPY

See [Handling Node Failure During Copy/Export](#).

### Examples

The following example copies the contents of an entire table from the `vmart` database to an identically-defined table in the current database:

```sql
=> CONNECT TO VERTICA vmart USER dbadmin PASSWORD 'myPassword' ON 'VertTest01',5433;
CONNECTION
=> COPY customer_dimension FROM VERTICA vmart.customer_dimension;
Rows Loaded
-----------
    500000
(1 row)
=> DISCONNECT vmart;
DISCONNECT
```

For more examples, see [Copying Data from Another Vertica Database](#).

[EXPORT TO VERTICA](#)

### CREATE Statements

CREATE statements let you create new database objects such as tables and users.
CREATE ACCESS POLICY

Creates an access policy that filters access to table data to users and roles. You can create access policies for table rows and columns. Vertica applies the access policy filters with each query and returns only the data that is permissible for the current user or role.

Syntax

CREATE ACCESS POLICY ON [[database.]schema.]table
    { FOR COLUMN column | FOR ROWS WHERE } expression [GRANT TRUSTED] { ENABLE | DISABLE }

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject</td>
</tr>
<tr>
<td>table</td>
<td>The table with the target column or rows.</td>
</tr>
<tr>
<td>FOR COLUMN column</td>
<td>The column on which to apply this access policy. Must not be a column with an external data type (see Complex Types).</td>
</tr>
<tr>
<td>FOR ROWS WHERE</td>
<td>The rows on which to apply this access policy.</td>
</tr>
<tr>
<td>expression</td>
<td>An SQL expression that specifies conditions for accessing row or column data:</td>
</tr>
<tr>
<td></td>
<td>- Row access policies limits access to specific rows in a table, as specified by the policy's WHERE expression. Only rows that satisfy this expression are fetched from the table. For details and sample usage, see Creating Row Access Policies.</td>
</tr>
<tr>
<td></td>
<td>- Column access policies limit access to specific table columns. The access policy expression can also specify how to render column data to specific users and roles. For</td>
</tr>
<tr>
<td>Clause</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>GRANT TRUSTED</td>
<td>Specifies that GRANT statements take precedence over the access policy in determining whether users can perform DML operations on the target table. If omitted, users can only modify table data if the access policy allows them to see the stored data in its original, unaltered state. For more information, see Access Policies and DML Operations.</td>
</tr>
<tr>
<td>ENABLE</td>
<td>DISABLE</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser

**See Also**

- Access Policies
- ALTER ACCESS POLICY
- DROP ACCESS POLICY

**CREATE AUTHENTICATION**

Creates and enables an authentication method associated with users or roles. Vertica enables the authentication method automatically.
Syntax

CREATE AUTHENTICATION auth-method-name METHOD 'auth-type' access-method

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auth-method-name</td>
<td>Name of the authentication method to create, where auth-method-name conforms to conventions described in Identifiers.</td>
</tr>
<tr>
<td>auth-type</td>
<td>Name of the authentication method to use, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• gss</td>
</tr>
<tr>
<td></td>
<td>• ident</td>
</tr>
<tr>
<td></td>
<td>• ldap</td>
</tr>
<tr>
<td></td>
<td>• hash</td>
</tr>
<tr>
<td></td>
<td>• reject</td>
</tr>
<tr>
<td></td>
<td>• trust</td>
</tr>
<tr>
<td></td>
<td>• tls</td>
</tr>
<tr>
<td>access-method</td>
<td>The access method the client uses to connect, specified in one of the following ways:</td>
</tr>
<tr>
<td></td>
<td>• LOCAL</td>
</tr>
<tr>
<td></td>
<td>Matches connection attempts made using local domain sockets.</td>
</tr>
<tr>
<td></td>
<td>• HOST [ TLS</td>
</tr>
<tr>
<td></td>
<td>Matches connection attempts made using TCP/IP, where host-ip-address can be an IPv4 or IPv6 address. You can qualify HOST with one of the following options</td>
</tr>
<tr>
<td></td>
<td>• TLS (default): Match an SSL/TLS-wrapped TCP socket.</td>
</tr>
<tr>
<td></td>
<td>• NO TLS: Match a plain (non-SSL/TLS) socket only.</td>
</tr>
</tbody>
</table>

Privileges

DBADMIN
Examples

See Creating Authentication Records.

See Also

- ALTER AUTHENTICATION
- DROP AUTHENTICATION
- GRANT (Authentication)
- REVOKE (Authentication)

CREATE CA BUNDLE

Creates a certificate authority (CA) bundle. These contain root CA certificates.

Syntax

CREATE CA BUNDLE name [CERTIFICATES ca_cert[, ca_cert[, ...]]]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the CA bundle.</td>
</tr>
<tr>
<td>ca_cert</td>
<td>The name of the CA certificate. If no certificates are specified, the bundle will be empty.</td>
</tr>
</tbody>
</table>

Privileges

Ownership of the CA certificates in the CA bundle.

Examples

See Managing CA Bundles.
See Also

- ALTER CA BUNDLE
- DROP CA BUNDLE

CREATE CERTIFICATE

Creates or imports a certificate, Certificate Authority (CA), or intermediate CA. These certificates can be used with ALTER TLS CONFIGURATION to set up client-server TLS, LDAPLink TLS, LDAPAuth TLS, etc.

Syntax

CREATE [CA] CERTIFICATE certificate_name
    {AS 'cert' [KEY key_name]
    | SUBJECT = 'subject_name'
    [SIGNED BY 'ca_cert_name']
    [VALID FOR days]
    [EXTENSIONS 'ext' = 'val',...]
    [ KEY key_name ]}

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CA</td>
<td>Specifies the certificate as a CA or intermediate certificate. Excluding this argument will create a normal certificate.</td>
</tr>
<tr>
<td>certificate_name</td>
<td>The name of the certificate.</td>
</tr>
<tr>
<td>'cert'</td>
<td>The contents of the imported certificate.</td>
</tr>
<tr>
<td></td>
<td>This parameter should include the entire chain of certificates, excluding the CA certificate.</td>
</tr>
<tr>
<td>key_name</td>
<td>The name of the key.</td>
</tr>
<tr>
<td></td>
<td>This parameter only needs to be set for client/server certificates and CA certificates that you intend to sign other certificates with while in</td>
</tr>
<tr>
<td></td>
<td>Vertica. If your imported CA certificate will only be used for validating other certificates, you do not need to specify a key.</td>
</tr>
<tr>
<td>subject_name</td>
<td>The entity to issue the certificate to.</td>
</tr>
<tr>
<td>-----------------------</td>
<td>----------------------------------------</td>
</tr>
<tr>
<td>ca_cert_name</td>
<td>The name of the CA that signed the certificate.</td>
</tr>
<tr>
<td></td>
<td>When adding a CA certificate, this parameter is optional. Specifying it will create an intermediate CA that cannot be used to sign other CA certificates.</td>
</tr>
<tr>
<td></td>
<td>When creating a certificate, this parameter is required.</td>
</tr>
<tr>
<td>days</td>
<td>The number of days that the certificate is valid.</td>
</tr>
<tr>
<td>'ext' = 'val'</td>
<td>Specifies certificate extensions. For a full list of extensions, see the OpenSSL documentation.</td>
</tr>
<tr>
<td>key_name</td>
<td>The name of the certificate's private key.</td>
</tr>
<tr>
<td></td>
<td>When importing a certificate, this parameter is required.</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser

**Default Extensions**

CREATE CERTIFICATE includes several extensions by default. These differ based on the type of certificate you create

**CA Certificate**

- 'basicConstraints' = 'critical, CA:true'
- 'keyUsage' = 'critical, digitalSignature, keyCertSign'
- 'nsComment' = Vertica generated [CA] certificate'
- 'subjectKeyIdentifier' = 'hash'

**Certificate**

- 'basicConstraints' = 'CA:false'
- 'keyUsage' = 'critical, digitalSignature, keyEncipherment'

**Examples**

See Generating TLS Certificates and Keys.

- CREATE KEY

CREATE DIRECTED QUERY

Saves an association between an input query and a query that is annotated with optimizer hints.

Syntax

Optimizer-generated

CREATE DIRECTED QUERY OPT[IMIZER] directedqueryID [COMMENT 'comments'] input-query

User-defined (custom)

CREATE DIRECTED QUERY CUSTOM directedqueryID [COMMENT 'comments'] annotated-query

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPT[IMIZER]</td>
<td>Directs the query optimizer to generate an annotated query from <code>input-query</code>, and associate both in the new directed query.</td>
</tr>
<tr>
<td>CUSTOM</td>
<td>Specifies to associate <code>annotated-query</code> with the query previously specified by <code>SAVE QUERY</code>.</td>
</tr>
<tr>
<td><code>directedqueryID</code></td>
<td>A unique identifier for the directed query, a string that conforms to conventions described in <code>Identifiers</code>.</td>
</tr>
<tr>
<td>COMMENT <code>comments'</code></td>
<td>Comments about the directed query, up to 128 characters. Comments can be useful for future reference—for example, explain why a given directed query was created.</td>
</tr>
<tr>
<td></td>
<td>If you omit this argument, Vertica inserts one of the following comments:</td>
</tr>
<tr>
<td></td>
<td>- Optimizer-generated directed query</td>
</tr>
<tr>
<td></td>
<td>- Custom directed query</td>
</tr>
</tbody>
</table>
The input query to associate with an optimizer-generated directed query. The input query supports only one optimizer hint, :v (alias IGNORECONST).

A query with embedded optimizer hints to associate with the input query most recently saved with SAVE QUERY.

Privileges

Superuser

Description

CREATE DIRECTED QUERY associates an input query with a query annotated with optimizer hints. It stores the association under a unique identifier. CREATE DIRECTED QUERY has two variants:

- **CREATE DIRECTED QUERY OPTIMIZER** directs the query optimizer to generate annotated SQL from the specified input query. The annotated query contains hints that the optimizer can use to recreate its current query plan for that input query.
- **CREATE DIRECTED QUERY CUSTOM** specifies an annotated query supplied by the user. Vertica associates the annotated query with the input query specified by the last SAVE QUERY statement.

In both cases, Vertica associates the annotated query and input query, and registers their association in the system table DIRECTED_QUERIES under query_name.

Caution:
Vertica associates a saved query and directed query without checking whether the two are compatible. Be careful to sequence SAVE QUERY and CREATE DIRECTED QUERY CUSTOM so the saved and directed queries are correctly matched.

See Also

Creating Directed Queries
CREATE EXTERNAL TABLE AS COPY

CREATE EXTERNAL TABLE AS COPY creates a table definition for data external to your Vertica database. This statement is a combination of the CREATE TABLE and COPY statements, supporting a subset of each statement's parameters.

Canceling a CREATE EXTERNAL TABLE AS COPY statement can cause unpredictable results. If you need to make a change, allow the statement to complete, drop the table, and then retry.

You can use ALTER TABLE to change the data types of columns instead of dropping and recreating the table.

You can use CREATE EXTERNAL TABLE AS COPY with any types except types from the Place package.

**Note:**
Vertica does not create superprojections for external tables, since external tables are not stored in the database.

**Syntax**

```
CREATE EXTERNAL TABLE [IF NOT EXISTS] [[database.]schema.]table-name (
(column-definition[, ...])
)[{INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES]
AS COPY
  [( ( { column-as-expression | column }
  [DELIMITER [ AS ] 'char']
  [ENCLOSED BY 'char']
  [ENFORCELENGTH]
  [ESCAPE [ AS ] 'char' | NO ESCAPE]
  [FILLER datatype]
  [FORMAT 'format']
  [NULL [ AS ] 'string']
  [TRIM 'byte']
  [, ...] ) ]
  [COLUMN OPTION ( column
  [DELIMITER [ AS ] 'char']
  [ENCLOSED BY 'char']
  [ENFORCELENGTH]
  [ESCAPE [ AS ] 'char' | NO ESCAPE]
  [FORMAT 'format']
  [NULL [ AS ] 'string']
  [TRIM 'byte']
  [, ...] ) ]
FROM ('path-to-data' [ ON { nodename | (nodeset) | ANY NODE } ] [input-format ] [, ...]
| [ WITH ] SOURCE source( [arg=value[, ...] ] )
```

Vertica Analytic Database (11.0.x)
Parameters

For all supported parameters, see the CREATE TABLE and COPY statements. For information on using this statement with UDLs, see User-Defined Load (UDL).

For additional guidance on using COPY parameters, see Specifying Where to Load Data From.

Privileges

Superuser, or non-superuser with the following privileges:

- READ privileges on the USER-accessible storage location, see GRANT (Storage Location)
- Full access (including SELECT) to an external table that the user has privileges to create

ORC and Parquet Data

When using the ORC and Parquet formats, Vertica supports some additional options in the COPY statement and data structures for columns. See ORC (Parser) and PARQUET (Parser).
If ORC or Parquet data is partitioned, Vertica expects Hive-style partitioning. If you see unexpected results when reading data, verify that globs in your file paths correctly align with the partition structure. See Troubleshooting External Tables.

Examples

The following example defines an external table for delimited data stored in HDFS:

```sql
=> CREATE EXTERNAL TABLE sales (itemID INT, date DATE, price FLOAT)
   AS COPY FROM 'hdfs://dat/ext1.csv' DELIMITER ',';
```

The following example uses data in the PARQUET (Parser) format that is stored in S3. The data has two partition columns, represented as directories in the file structure. For more information about partitions, see Using Partition Columns.

```sql
=> CREATE EXTERNAL TABLE transactions (id int, name varchar(50), created date, region varchar(50))
   AS COPY FROM 's3://datalake/sales/*/*/'
   ORC(hive_partition_cols='created,region');
```

The following example shows how you can read from all PARQUET (Parser) files in a local directory, with no partitions and no globs:

```sql
=> CREATE EXTERNAL TABLE sales (itemID INT, date DATE, price FLOAT)
   AS COPY FROM '/data/sales/*.parquet' PARQUET;
```

The following example creates an external table using partitioned data in the ORC format. The table includes four columns. Two columns, "id" and "name", are in the data files. The other two, "created" and "region", are partition columns. For more about partition columns, see Using Partition Columns.

```sql
=> CREATE EXTERNAL TABLE t (id int, name varchar(50), created date, region varchar(50))
   AS COPY FROM 'hdfs://path/*/*/'
   ORC(hive_partition_cols='created,region');
```

The following example creates an external table from data in Google Cloud Storage:

```sql
=> CREATE EXTERNAL TABLE sales (itemID INT, date DATE, price FLOAT)
   AS COPY FROM 'gs://data/sales/*.csv';
```

The following example creates an external table for data containing arrays:

```sql
=> CREATE EXTERNAL TABLE cust (cust_custkey int, cust_custname varchar(50), cust_custstaddress
   ARRAY[varchar(100)],
   cust_custaddressln2 ARRAY[varchar(100)], cust_custcity ARRAY[varchar(50)], cust_custstate ARRAY
   [char(2)], cust_custzip ARRAY[int],
   cust_email varchar(50), cust_phone varchar(30))
   AS COPY FROM ' ' PARQUET;
```
The following examples create external tables from data in the local file system:

```sql
=> CREATE EXTERNAL TABLE ext1 (x integer) AS COPY FROM '/tmp/ext1.dat' DELIMITER ',';
=> CREATE EXTERNAL TABLE ext2 (x integer) AS COPY FROM '/tmp/ext2.dat.bz2' BZIP DELIMITER ',';
=> CREATE EXTERNAL TABLE ext3 (x integer, y integer) AS COPY (x as '5', y) FROM '/tmp/ext3.dat.bz2'
   BZIP DELIMITER ',';
```

To allow users without superuser access to use external tables with data on the local file system, S3, or GCS, create a location for 'user' usage and grant access to it. This example shows granting access to a user named Bob to any external table whose data is located under /tmp (including in subdirectories to any depth):

```sql
=> CREATE LOCATION '/tmp' ALL NODES USAGE 'user';
=> GRANT ALL ON LOCATION '/tmp' to Bob;
```

The following example shows CREATE EXTERNAL TABLE using a user-defined source:

```sql
=> CREATE SOURCE curl AS LANGUAGE 'C++' NAME 'CurlSourceFactory' LIBRARY curllib;
=> CREATE EXTERNAL TABLE curl_table1 as COPY SOURCE CurlSourceFactory;
```

**See Also**

Creating External Tables in the Administrator's Guide

**CREATE FAULT GROUP**

Enterprise Mode only

Creates a fault group, which can contain the following:

- One or more nodes
- One or more child fault groups
- One or more nodes and one or more child fault groups

CREATE FAULT GROUP creates an empty fault group. Use ALTER FAULT GROUP to add nodes or other fault groups to an existing fault group.

**Syntax**

```sql
CREATE FAULT GROUP name
```
**Parameters**

| name | The name of the fault group to create, unique among all fault groups, where name conforms to conventions described in Identifiers. |

**Privileges**

Superuser

**Example**

The following command creates a fault group called parent0:

```
=> CREATE FAULT GROUP parent0;
CREATE FAULT GROUP
```

Use `ALTER FAULT GROUP` to add nodes or other fault groups to the parent0 fault group.

**See Also**

- `FAULT_GROUPS`
- `CLUSTER_LAYOUT`
- Fault Groups
- High Availability with Fault Groups

**CREATE FLEXIBLE TABLE**

Creates a flexible (flex) table in the logical schema.

When you create a flex table, Vertica automatically creates two dependent objects:

- Keys table that is named `flex-table-name_keys`
- View that is named `flex-table-name_view`

The flex table requires the keys table and view. Neither of these objects can exist independently of the flex table.
Syntax

Create with column definitions

CREATE [[ scope ] TEMP[ORARY]] FLEXIBLE TABLE [ IF NOT EXISTS ] [[database.]schema.]table-name
  ( [ column-definition[,..] [, table-constraint ][,..] ]
  [ ORDER BY column[,..] ]
  [ segmentation-spec ]
  [ KSafe [ k-num ] ]
  [ partition-clause ]
  [ {INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES ]

Create from another table

CREATE FLEXIBLE TABLE [[database.]schema.] table-name
  [ ( column-name-list ) ]
  [ {INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES ]
AS query [ ENCODED BY column-ref-list ]

Parameters

For general parameter descriptions, see CREATE TABLE; for parameters specific to temporary flex tables, see CREATE TEMPORARY TABLE and Creating Flex Tables.

You cannot partition a flex table on any virtual column (key).

Privileges

Non-superuser: CREATE privilege on table schema

Default Columns

The CREATE statement can omit specifying any column definitions. CREATE FLEXIBLE TABLE always creates two columns automatically:

<table>
<thead>
<tr>
<th><strong>raw</strong></th>
<th>LONG VARBINARY type column to store unstructured data that you load. By default, this column has a NOT NULL constraint.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>identity</strong></td>
<td>IDENTITY column that is used for segmentation and sorting when no other column is defined.</td>
</tr>
</tbody>
</table>
**Default Projections**

Vertica automatically creates superprojections for both the flex table and keys tables when you create them.

If you create a flex table with one or more of the ORDER BY, ENCODED BY, SEGMENTED BY, or KSAFE clauses, the clause information is used to create projections. If no clauses are in use, Vertica uses the following defaults:

<table>
<thead>
<tr>
<th>Table</th>
<th>Sort order</th>
<th>Encoding</th>
<th>Segmentation</th>
<th>K-safety</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flextable</td>
<td>ORDER BY *.<strong>identity</strong></td>
<td>hash</td>
<td>*.<strong>identity</strong></td>
<td>ALL NODES OFFSET 0</td>
</tr>
<tr>
<td>Keys table</td>
<td>ORDER BY *.<strong>keys_frequency</strong></td>
<td>hash</td>
<td>SEGMENTED ALL NODES</td>
<td>1</td>
</tr>
</tbody>
</table>

**Note:**

When you build a view for a flex table (see `BUILD_FLEXTABLE_VIEW`), the view is ordered by frequency, desc, and key_name.

**Examples**

The following example creates a flex table named `darkdata` without specifying any column information. Vertica creates a default superprojection and buddy projection as part of creating the table:

```
=> CREATE FLEXIBLE TABLE darkdata();
CREATE TABLE
=> \dj darkdata1*

<table>
<thead>
<tr>
<th>Schema</th>
<th>Name</th>
<th>List of projections</th>
<th>Owner</th>
<th>Node</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>darkdata1_b0</td>
<td></td>
<td>dbadmin</td>
<td></td>
</tr>
<tr>
<td>public</td>
<td>darkdata1_b1</td>
<td></td>
<td>dbadmin</td>
<td></td>
</tr>
<tr>
<td>public</td>
<td>darkdata1_keys_super</td>
<td></td>
<td>dbadmin</td>
<td>v_vmart_node0001</td>
</tr>
<tr>
<td>public</td>
<td>darkdata1_keys_super</td>
<td></td>
<td>dbadmin</td>
<td>v_vmart_node0002</td>
</tr>
<tr>
<td>public</td>
<td>darkdata1_keys_super</td>
<td></td>
<td>dbadmin</td>
<td>v_vmart_node0003</td>
</tr>
</tbody>
</table>

(5 rows)

=> SELECT export_objects('', 'darkdata1_b0');
```
CREATE PROJECTION public.darkdata1_b0 /*+basename(darkdata1),createtype(P)*/ 
(  __identity__, 
  __raw__  
)  
AS  
SELECT darkdata1.__identity__,  
       darkdata1.__raw__ 
FROM public.darkdata1  
ORDER BY darkdata1.__identity__  
SEGMENTED BY hash(darkdata1.__identity__) ALL NODES OFFSET 0;

SELECT MARK_DESIGN_KSAFE(1);  
(1 row)

=> select export_objects('','darkdata1_keys_super');
CREATE PROJECTION public.darkdata1_keys_super /*+basename(darkdata1_keys),createtype(P)*/
(  
  key_name,  
  frequency,  
  data_type_guess  
)  
AS  
SELECT darkdata1_keys.key_name,  
       darkdata1_keys.frequency,  
       darkdata1_keys.data_type_guess 
FROM public.darkdata1_keys  
ORDER BY darkdata1_keys.frequency  
UNSEGMENTED ALL NODES;

SELECT MARK_DESIGN_KSAFE(1);  
(1 row)

The following example creates a table called darkdata1 with one column definition (date_col). The statement specifies the partition by clause to partition the data by year. Vertica creates a default superprojection and buddy projections as part of creating the table:

=> CREATE FLEX TABLE darkdata1 (date_col date NOT NULL) partition by  
   extract('year' from date_col);
CREATE TABLE

See Also

- Creating Flex Tables
- CREATE FLEXIBLE EXTERNAL TABLE AS COPY
CREATE FLEXIBLE EXTERNAL TABLE AS COPY

CREATE FLEXIBLE EXTERNAL TABLE AS COPY creates a flexible external table. This statement combines statements CREATE FLEXIBLE TABLE and COPY statements, supporting a subset of each statement's parameters.

You can also use user-defined load functions (UDLs) to create external flex tables. For details about creating and using flex tables, see Using Flex Tables.

**Note:**
Vertica does not create a superprojection for an external table when you create it.

For details about creating and using flex tables, see Creating Flex Tables in Using Flex Tables.

**Caution:**
Canceling a CREATE FLEX EXTERNAL TABLE AS COPY statement can cause unpredictable results. Vertica recommends that you allow the statement to finish, then use DROP TABLE after the table exists.

**Syntax**

```
CREATE FLEXIBLE [ABLE] EXTERNAL TABLE [ IF NOT EXISTS ] [[database.]schema.]table-name
   ( [ column-definition[,...] ] )
   [ INCLUDE | EXCLUDE [SCHEMA] PRIVILEGES ]
AS COPY [ ( { column-as-expression | column } [ FILLER datatype ] )
   | WITH ] UDL-clause[,...]
FROM
   'path-to-data' [ ON nodename | ON ANY NODE | ON (nodeset) ] input-format[,...]
   | [ WITH ] UDL-clause[,...]
   ]
   [ ABORT ON ERROR ]
   [ DELIMITER [ AS ] 'char' ]
   [ ENCLOSED BY 'char' ]
   [ ENFORCELENGTH ]
   [ ESCAPE [ AS ] 'char' | NO ESCAPE ]
   [ EXCEPTIONS 'path' [ ON nodename ][,...] ]
   [ NULL [ AS ] 'string' ]
   [ RECORD TERMINATOR 'string' ]
   [ REJECTED DATA 'path' [ ON nodename ][,...] ]
   [ REJECTMAX integer ]
   [ SKIP integer ]
   [ SKIP BYTES integer ]
   [ TRAILING NULLCOLS ]
   [ TRIM 'byte' ]
```
Parameters

For parameter descriptions, see CREATE TABLE and COPY Parameters.

**Note:**
CREATE FLEXIBLE EXTERNAL TABLE AS COPY supports only a subset of CREATE TABLE and COPY parameters.

Privileges

Superuser, or non-superuser with the following privileges:

- READ privileges on the USER-accessible storage location, see GRANT (Storage Location)
- Full access (including SELECT) to an external table that the user has privileges to create

Examples

To create an external flex table:

```sql
=> CREATE flex external table mountains() AS COPY FROM 'home/release/KData/kmm_mountains.json' PARSER fjsonparser();
CREATE TABLE
```

As with other flex tables, creating an external flex table produces two regular tables: the named table and its associated _keys table. The keys table is not an external table:

```sql
=> \dt mountains
List of tables
<table>
<thead>
<tr>
<th>Schema</th>
<th>Name</th>
<th>Kind</th>
<th>Owner</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>mountains</td>
<td>table</td>
<td>release</td>
<td></td>
</tr>
</tbody>
</table>
(1 row)
```

You can use the helper function, COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW, to compute keys and create a view for the external table:

```sql
=> SELECT compute_flextable_keys_and_build_view ('appLog');
compute_flextable_keys_and_build_view
```

Please see public.appLog_keys for updated keys
The view `public.appLog_view` is ready for querying
(1 row)

1. Check the keys from the `_keys` table for the results of running the helper application:

```
=> SELECT * FROM appLog_keys;

key_name          | frequency | data_type_guess
--------------------|-----------|------------------------
contributors       | 8         | varchar(28)            
coordinates        | 8         | varchar(28)            
created_at         | 8         | varchar(60)            
entities.hashtags  | 8         | long varbinary         
...                | ...       | ...                    
retweeted_status.user.timezone | 1 | varchar(20)            
retweeted_status.user.url         | 1 | varchar(68)            
retweeted_status.user.utc_offset     | 1 | varchar(20)            
retweeted_status.user.verified      | 1 | varchar(20)            
(125 rows)
```

2. Query from the external flex table view:

```
=> SELECT "user.lang" FROM appLog_view;

user.lang
----------
it
en
es
en
es
tr
en
(12 rows)
```

See Also

- CREATE EXTERNAL TABLE AS COPY

CREATE FUNCTION Statements

Vertica provides CREATE statements for each type of user-defined extension. Each CREATE statement adds a user-defined function to the Vertica catalog:
CREATE statement | Extension
--- | ---
CREATE FUNCTION (Scalar) | User-defined scalar functions (UDSFs)
CREATE AGGREGATE FUNCTION | User-defined aggregate functions (UDAFs)
CREATE ANALYTIC FUNCTION | User-defined analytic functions (UDAnF)
CREATE TRANSFORM FUNCTION | User-defined transform functions (UDTFs)

CREATE statements for user-defined load:

- CREATE SOURCE | Load source functions
- CREATE FILTER | Load filter functions
- CREATE PARSER | Load parser functions

Vertica also provides CREATE FUNCTION (SQL), which stores SQL expressions as functions that you can invoke in a query.

**CREATE AGGREGATE FUNCTION**

Adds to the catalog a user-defined aggregate function (UDAF) that is stored in a shared Linux library. CREATE AGGREGATE FUNCTION automatically determines the function parameters and return value from data supplied by the factory class. Vertica supports overloading aggregate functions. When you call the SQL function, Vertica passes the input table to the function in the library to process.

**Syntax**

```sql
CREATE [ OR REPLACE ] AGGREGATE FUNCTION [[database.]schema.]function-name AS
[ LANGUAGE 'language'
NAME 'factory'
LIBRARY Library
[ FENCED | NOT FENCED ]
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OR REPLACE</td>
<td>Specifies to overwrite an existing function of the same name and matching arguments; otherwise the CREATE statement returns with a rollback error.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>function-name</td>
<td>Identifies the function to create, where function conforms to conventions described in Identifiers.</td>
</tr>
<tr>
<td></td>
<td>Tip: This name does not need to match the name of the factory, but it is less confusing if they are the same or similar.</td>
</tr>
<tr>
<td>LANGUAGE 'Language'</td>
<td>The language used to develop this function, currently C++ only (the default).</td>
</tr>
<tr>
<td>NAME 'factory'</td>
<td>Name of the shared library factory class that generates the object to handle function processing.</td>
</tr>
<tr>
<td>LIBRARY library</td>
<td>Name of the shared library that contains the C++ object to process this function. This library must already be loaded by CREATE LIBRARY.</td>
</tr>
<tr>
<td>FENCED</td>
<td>NOT FENCED</td>
</tr>
</tbody>
</table>

Privileges

Non-superuser:
CREATE privilege on the function's schema
USAGE privilege on the function's library

Examples

The following example demonstrates loading a library named AggregateFunctions then defining a function named ag_avg and ag_cat that are mapped to the ag_cat AverageFactory and ConcatenateFactory classes in the library:

```sql
=> CREATE LIBRARY AggregateFunctions AS '/opt/vertica/sdk/examples/build/AggregateFunctions.so';
CREATE LIBRARY
=> CREATE AGGREGATE FUNCTION ag_avg AS LANGUAGE 'C++' NAME 'AverageFactory'
   library AggregateFunctions;
CREATE AGGREGATE FUNCTION
=> CREATE AGGREGATE FUNCTION ag_cat AS LANGUAGE 'C++' NAME 'ConcatenateFactory'
   library AggregateFunctions;
CREATE AGGREGATE FUNCTION
=> \x
Expanded display is on.
select * from user_functions;
```

<table>
<thead>
<tr>
<th>RECORD 1</th>
<th></th>
<th>RECORD 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>public</td>
<td>schema_name</td>
</tr>
<tr>
<td>function_name</td>
<td>ag_avg</td>
<td>function_name</td>
</tr>
<tr>
<td>procedure_type</td>
<td>User Defined Aggregate</td>
<td>procedure_type</td>
</tr>
<tr>
<td>function_return_type</td>
<td>Numeric</td>
<td>function_return_type</td>
</tr>
<tr>
<td>function_argument_type</td>
<td>Numeric</td>
<td>function_argument_type</td>
</tr>
<tr>
<td>function_definition</td>
<td>Class 'AverageFactory' in Library 'public.AggregateFunctions'</td>
<td>function_definition</td>
</tr>
<tr>
<td>volatility</td>
<td></td>
<td>volatility</td>
</tr>
<tr>
<td>is_strict</td>
<td>f</td>
<td>is_strict</td>
</tr>
<tr>
<td>is_fenced</td>
<td>f</td>
<td>is_fenced</td>
</tr>
<tr>
<td>comment</td>
<td></td>
<td>comment</td>
</tr>
</tbody>
</table>

Developing User-Defined Extensions (UDxs)
Aggregate Functions (UDAfs)

**CREATE ANALYTIC FUNCTION**

Adds to the catalog a *user-defined analytic function* (UDAnF) that is stored in a shared Linux library. CREATE ANALYTIC FUNCTION automatically determines the function parameters and return value from data supplied by the factory class. Vertica supports overloading analytic functions. When you call the SQL function, Vertica passes the input table to the function in the library to process.

**Syntax**

```
CREATE [ OR REPLACE ] ANALYTIC FUNCTION function-name AS
    [ LANGUAGE 'language' ]
    NAME 'factory'
    LIBRARY library
    [ FENCED | NOT FENCED ]
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OR REPLACE</td>
<td>Specifies to overwrite an existing function of the same name and matching arguments; otherwise the CREATE statement returns with a rollback error.</td>
</tr>
<tr>
<td>function-name</td>
<td>Identifies the function to create, where function conforms to conventions described in Identifiers.</td>
</tr>
<tr>
<td><strong>Tip:</strong></td>
<td>This name does not need to match the name of the factory, but it is less confusing if they are the same or similar.</td>
</tr>
<tr>
<td>LANGUAGE 'Language'</td>
<td>Language used to develop this function, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• C++ (default)</td>
</tr>
<tr>
<td></td>
<td>• Java</td>
</tr>
</tbody>
</table>
NAME 'factory'

Name of the C++ factory class in the shared library that generates the object to handle function processing.

LIBRARY library

Name of the shared library that contains the C++ object to process this function. This library must already be loaded by CREATE LIBRARY.

FENCED | NOT FENCED

Enables or disables fenced mode for this function.

Default: FENCED

Privileges

Non-superuser:

- CREATE privilege on the function's schema
- USAGE privilege on the function's library

Examples

This example shows how to create an analytic function named an_rank based on the factory class named RankFactory in the AnalyticFunctions library.

```sql
=> CREATE ANALYTIC FUNCTION an_rank AS LANGUAGE 'C++'
   NAME 'RankFactory' LIBRARY AnalyticFunctions;
```

See Also

Analytic Functions (UDAnFs)

**CREATE FILTER**

Adds a user-defined load filter function to the catalog. CREATE FILTER automatically determines the function parameters and return value from data supplied by the factory class. Vertica supports overloading load filter functions. When you call the SQL function, Vertica passes the input table to the function in the library to process.
**Important:**
Installing an untrusted UDL function can compromise the security of the server. U Dx's can contain arbitrary code. In particular, UD source functions can read data from any arbitrary location. It is up to the developer of the function to enforce proper security limitations. Superusers must not grant access to U Dx's to untrusted users.

**Syntax**

CREATE [ OR REPLACE ] FILTER [[database.]schema.]function-name AS
[ LANGUAGE 'Language' ]
NAME 'factory' LIBRARY library
[ FENCED | NOT FENCED ]

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OR REPLACE</td>
<td>Specifies to overwrite an existing function of the same name and matching arguments; otherwise the CREATE statement returns with a rollback error.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td><strong>Specifies a schema</strong>, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td>function-name</td>
<td>Identifies the function to create, where function conforms to conventions described in Identifiers.</td>
</tr>
<tr>
<td>LANGUAGE 'Language'</td>
<td>The language used to develop this function, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- C++ (default)</td>
</tr>
</tbody>
</table>

If you specify a database, it must be the current database.
### NAME 'factory'
Name of the shared library factory class that generates the object to handle function processing. This is the same name used by the RegisterFactory class.

### LIBRARY library
Name of the shared library that contains the object to process this function. This library must already be loaded by `CREATE LIBRARY`.

### FENCED | NOT FENCED
Enables or disables fenced mode for this function.

**Default:** FENCED

---

## Privileges

**Superuser**

## Example

The following example demonstrates loading a library named iConverterLib, then defining a function named Iconverter that is mapped to the IConverterFactory factory class in the library:

```sql
=> CREATE LIBRARY iConverterLib as '/opt/vertica/sdk/examples/build/IconverterLib.so';
CREATE LIBRARY
=> CREATE FILTER Iconverter AS LANGUAGE 'C++' NAME 'IConverterFactory' LIBRARY IconverterLib;
CREATE FILTER FUNCTION
=> \
Expanded display is on.
=> SELECT * FROM user_functions;
-[ RECORD 1 ]-----------------------------------------
schema_name | public
function_name | Iconverter
procedure_type | User Defined Filter
function_return_type |
function_argument_type |
function_definition |
volatility |
is_strict | f
is_fenced | f
comment |
```
See Also

- CREATE LIBRARY
- DROP FILTER
- USER_FUNCTIONS
- User-Defined Load (UDL)

**CREATE FUNCTION (SQL)**

Stores SQL expressions as functions for use in queries. User-defined SQL functions are useful for executing complex queries and combining Vertica built-in functions. You simply call the function in a given query. If multiple SQL functions with same name and argument type are in the search path, Vertica calls the first match that it finds.

SQL functions are flattened in all cases, including DDL.

Syntax

```
CREATE [ OR REPLACE ] FUNCTION
  [[database.]schema.]function-name( [ arg-list ] )
RETURN return-type
AS
BEGIN
  RETURN expression;
END;
```

Parameters

<table>
<thead>
<tr>
<th>OR REPLACE</th>
<th>Specifies to overwrite an existing function of the same name and arguments. If you only change the function arguments, Vertica ignores this option and maintains both functions under the same name.</th>
</tr>
</thead>
<tbody>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
</tbody>
</table>
If you specify a database, it must be the current database.

**function-name**
Names the SQL function to create, where *function-name* conforms to conventions described in Identifiers.

**arg-list**
A comma-delimited list of argument names and their data types, specified in this format:

```
argname argtype[,…]
```

where:

- *argname* is the name of an argument passed to *function-name*.
- *argtype* is *argname*’s data type.

**return-type**
The data type that this function returns.

**RETURN expression**
Specifies the SQL function (function body), where *expression* can contain built-in functions, operators, and argument names specified in the CREATE FUNCTION statement.

A semicolon at the end of the expression is required.

**Note:**
The CREATE FUNCTION definition allows only one RETURN expression. Return expressions do not support the following:

- FROM, WHERE, GROUP BY, ORDER BY, and LIMIT clauses
- Aggregation, analytics, and meta functions

### Privileges

**Non-superuser:**

- CREATE privilege on the function's schema
- USAGE privilege on the function's library
Strictness and Volatility

Vertica infers the strictness and volatility (stable, immutable, or volatile) of an SQL function from its definition. Vertica then determines the correctness of usage, such as where an immutable function is expected but a volatile function is provided.

SQL Functions and Views

You can create views on the queries that use SQL functions and then query the views. When you create a view, an SQL function replaces a call to the user-defined function with the function body in a view definition. Therefore, when the body of the user-defined function is replaced, the view should also be replaced.

Examples

See Creating User-Defined SQL Functions

See Also

- ALTER FUNCTION (Scalar)
- DROP FUNCTION
- User-Defined SQL Functions

CREATE FUNCTION (Scalar)

Adds a user-defined scalar function (UDSF) to the catalog. UDSFs take in a single row of data and return a single value. The returned value can be any primitive type or a ROW of primitive types. These functions can be used anywhere a native Vertica function or statement can be used, except CREATE TABLE with its PARTITION BY or any segmentation clause.

CREATE FUNCTION automatically determines the function parameters and return value from data supplied by the factory class. Vertica supports overloading analytic functions.
When you call the SQL function, Vertica passes the parameters to the function in the library to process.

Syntax

```
CREATE [ OR REPLACE ] FUNCTION [[database.]schema.]function-name AS
    [ LANGUAGE 'Language' ]
    NAME 'factory'
    LIBRARY library
    [ FENCED | NOT FENCED ]
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OR REPLACE</td>
<td>Specifies to overwrite an existing function of the same name and matching arguments; otherwise the CREATE statement returns with a rollback error.</td>
</tr>
<tr>
<td><code>[database.]schema</code></td>
<td><strong>Specifies a schema</strong>, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>function-name</code></td>
<td>Identifies the function to create, where <code>function</code> conforms to conventions described in Identifiers.</td>
</tr>
<tr>
<td><strong>Tip:</strong></td>
<td>This name does not need to match the name of the factory, but it is less confusing if they are the same or similar.</td>
</tr>
<tr>
<td><code>LANGUAGE 'language'</code></td>
<td>Language used to develop this function, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- C++ (default)</td>
</tr>
<tr>
<td></td>
<td>- Python</td>
</tr>
<tr>
<td></td>
<td>- Java</td>
</tr>
<tr>
<td></td>
<td>- R</td>
</tr>
<tr>
<td><code>NAME 'factory'</code></td>
<td>Name of the shared library factory class that generates the object to handle function processing.</td>
</tr>
<tr>
<td><code>LIBRARY library</code></td>
<td>Name of the file that contains the C++ library, Python file, Java Jar file, or R functions file to process this function. This library must already be</td>
</tr>
</tbody>
</table>
FENCED | NOT FENCED
--- | ---
Enables or disables fenced mode for this function. Functions written in Java and R always run in fenced mode.

**Default:** FENCED

### Privileges

- CREATE privilege on the function's schema
- USAGE privilege on the function's library

### Examples

The following example demonstrates loading a library named `scalarfunctions`, then defining a function named `Add2Ints` that is mapped to the `Add2IntsInfo` factory class in the library:

```
=> CREATE LIBRARY ScalarFunctions AS '/opt/vertica/sdk/examples/build/ScalarFunctions.so';
CREATE LIBRARY
=> CREATE FUNCTION Add2Ints AS LANGUAGE 'C++' NAME 'Add2IntsFactory' LIBRARY ScalarFunctions;
CREATE FUNCTION
=> \x
Expanded display is on.
=> SELECT * FROM USER_FUNCTIONS;

- [ RECORD 1 ]---------------------------------------------------------------------------------------
schema_name | public
function_name | Add2Ints
procedure_type | User Defined Function
function_return_type | Integer
function_argument_type | Integer, Integer
function_definition | Class 'Add2IntsFactory' in Library 'public.ScalarFunctions'
volatility | volatile
is_strict | f
is_fenced | t
comment | 

=> \x
Expanded display is off.
=> -- Try a simple call to the function
=> SELECT Add2Ints(23,19);
Add2Ints
--------
42
(1 row)
```

The following example uses a scalar function that returns a ROW.
CREATE FUNCTION div_with_rem AS LANGUAGE 'C++' NAME 'DivFactory' LIBRARY ScalarFunctions;

=> SELECT div_with_rem(18,5);
   div_with_rem
   -----------------------------
   {"quotient":3,"remainder":3}
(1 row)

Developing User-Defined Extensions (UDxs)

CREATE PARSER

Adds a user-defined load parser function to the catalog. CREATE PARSER automatically determines the function parameters and return value from data supplied by the factory class. Vertica supports overloading load parser functions. When you call the SQL function, Vertica passes the input table to the function in the library to process.

Important:
Installing an untrusted UDL function can compromise the security of the server. UDx's can contain arbitrary code. In particular, UD source functions can read data from any arbitrary location. It is up to the developer of the function to enforce proper security limitations. Superusers must not grant access to UDx's to untrusted users.

Syntax

CREATE [ OR REPLACE ] PARSER [[database.]schema.]function-name AS
[ LANGUAGE 'Language' ]
NAME 'factory'
LIBRARY Library
[ FENCED | NOT FENCED ]
# Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OR REPLACE</td>
<td>Specifies to overwrite an existing function of the same name and matching arguments; otherwise the CREATE statement returns with a rollback error.</td>
</tr>
<tr>
<td>[database.] schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>

- User-Defined Load (UDL)

CREATE SOURCE

Adds a user-defined load source function to the catalog. CREATE SOURCE automatically determines the function parameters and return value from data supplied by the factory
class. Vertica supports overloading load source functions. When you call the SQL function, Vertica passes the input table to the function in the library to process.

**Important:**
Installing an untrusted UDL function can compromise the security of the server. UDx's can contain arbitrary code. In particular, UD source functions can read data from any arbitrary location. It is up to the developer of the function to enforce proper security limitations. Superusers must not grant access to UDx's to untrusted users.

### Syntax

```sql
CREATE [ OR REPLACE ] SOURCE [[database.]schema.]function-name AS
  [ LANGUAGE 'Language' ]
  NAME 'factory'
  LIBRARY Library
  [ FENCED | NOT FENCED ]
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OR REPLACE</td>
<td>Specifies to overwrite an existing function of the same name and matching arguments; otherwise the CREATE statement returns with a rollback error.</td>
</tr>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
</tbody>
</table>
|                         | ```
|                         | myschema.thisDbObject
<p>|                         | ```                                                                                                                                 |
|                         | If you specify a database, it must be the current database.                                                                                  |
| <code>function-name</code>         | Identifies the function to create, where <code>function</code> conforms to conventions described in Identifiers.                                          |
| <strong>Tip:</strong>                | This name does not need to match the name of the factory, but it is less confusing if they are the same or similar.                        |</p>
<table>
<thead>
<tr>
<th>LANGUAGE</th>
<th>Language used to develop this function, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td></td>
<td>• Java</td>
</tr>
<tr>
<td>NAME</td>
<td>Name of the shared library factory class that generates the</td>
</tr>
<tr>
<td></td>
<td>object to handle function processing. This is the same name</td>
</tr>
<tr>
<td></td>
<td>used by the RegisterFactory class.</td>
</tr>
<tr>
<td>LIBRARY</td>
<td>Name of the shared library that contains the object to</td>
</tr>
<tr>
<td></td>
<td>process this function. This library must already be loaded</td>
</tr>
<tr>
<td></td>
<td>by CREATE LIBRARY.</td>
</tr>
<tr>
<td>FENCED</td>
<td>Enables or disables fenced mode for this function.</td>
</tr>
<tr>
<td>NOT FENCED</td>
<td>Default: FENCED</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser

**Example**

The following example demonstrates loading a library named curlib, then defining a function named curl that is mapped to the CurlSourceFactory factory class in the library:

```sql
=> CREATE LIBRARY curlib as '/opt/vertica/sdk/examples/build/cURLib.so';
CREATE LIBRARY
=> CREATE SOURCE curl AS LANGUAGE 'C++' NAME 'CurlSourceFactory' LIBRARY curlib;
CREATE SOURCE
=> \

- User-Defined Load (UDL)

**CREATE TRANSFORM FUNCTION**

Adds to the catalog a user-defined transform function (UDTF) that is stored in a shared Linux library. CREATE TRANSFORM FUNCTION automatically determines the function parameters and return value from data supplied by the factory class. Vertica supports overloading transform functions. When you call the SQL function, Vertica passes the input table to the transform function in the library to process.

**Syntax**

```
CREATE [ OR REPLACE ] TRANSFORM FUNCTION function-name AS
    [ LANGUAGE 'language' ]
    NAME 'factory'
    LIBRARY Library
    [ FENCED | NOT FENCED ]
```

**Parameters**

<table>
<thead>
<tr>
<th>OR REPLACE</th>
<th>Specifies to overwrite an existing function of the same name and matching arguments; otherwise the CREATE statement returns with a rollback error.</th>
</tr>
</thead>
<tbody>
<tr>
<td>function-name</td>
<td>Identifies the function to create, where function conforms to conventions described in Identifiers.</td>
</tr>
</tbody>
</table>

Tip: This name does not need to match the
<table>
<thead>
<tr>
<th><strong>NAME  <code>factory</code></strong></th>
<th>Name of the shared library factory class or R factory function that generates the object to handle function processing.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>LIBRARY <code>library</code></strong></td>
<td>Name of the shared library that contains the object to process this function. This library must already be loaded by <code>CREATE LIBRARY</code>.</td>
</tr>
<tr>
<td>**FENCED</td>
<td>NOT FENCED**</td>
</tr>
</tbody>
</table>

**Privileges**

Non-superuser:

- CREATE privilege on the function's schema
- USAGE privilege on the function's library

**Restrictions**

A query that includes a UDTF cannot:

- Include statements other than the SELECT statement that calls this UDTF and a PARTITION BY expression
- Call an analytic function
- Call another UDTF
Include one of the following clauses:

- TIMESERIES
- Pattern matching
- Gap filling and interpolation

Examples

This example shows how to add a UDTF to the catalog.

```sql
=> CREATE TRANSFORM FUNCTION transFunct AS LANGUAGE 'C++' NAME 'myFactory' LIBRARY myFunction;
```

See Also

- DROP FUNCTION
- Developing User-Defined Extensions (UDxs)

CREATE HCATALOG SCHEMA

Define a schema for data stored in a Hive data warehouse using the HCatalog Connector. For more information, see Using the HCatalog Connector in Integrating with Apache Hadoop.

Most of the optional parameters are read out of Hadoop configuration files if available. If you copied the Hadoop configuration files as described in Configuring Vertica for HCatalog, you can omit most parameters. By default this statement uses the values specified in those configuration files. If the configuration files are complete, the following is a valid statement:

```sql
=> CREATE HCATALOG SCHEMA hcat;
```

If a value is not specified in the configuration files and a default is shown in the parameter list, then that default value is used.

Some parameters apply only if you are using HiveServer2 (the default). Others apply only if you are using WebHCat, a legacy Hadoop service. When using HiveServer2, use HIVESERVER2_HOSTNAME to specify the server host. When using WebHCat, use WEBSERVICE_HOSTNAME to specify the server host.
If you need to use WebHCat you must also set the HCatalogConnectorUseHiveServer2 configuration parameter to 0. See Apache Hadoop Parameters.

After creating the schema, you can change many (but not all) parameters using ALTER HCATALOG SCHEMA.

Syntax

CREATE HCATALOG SCHEMA [IF NOT EXISTS] schemaName
[AUTHORIZATION user-id]
[WITH [param=value [,...] ] ]

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[IF NOT EXISTS]</td>
<td>If given, the statement exits without an error when the schema named in schemaName already exists.</td>
</tr>
<tr>
<td>schemaName</td>
<td>The name of the schema to create in the Vertica catalog. The tables in the Hive database will be available through this schema.</td>
</tr>
<tr>
<td>AUTHORIZATION user-id</td>
<td>The name of a Vertica account to own the schema being created. This parameter is ignored if Kerberos authentication is being used; in that case the current vsq1 user is used.</td>
</tr>
</tbody>
</table>

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOSTNAME</td>
<td>The hostname, IP address, or URI of the database server that stores the Hive data warehouse's metastore information.</td>
</tr>
<tr>
<td></td>
<td>If you specify this parameter and do not also specify PORT, then this value must be in the URI format used for hive.metastore.uris in hive-site.xml.</td>
</tr>
<tr>
<td></td>
<td>If the Hive metastore supports High Availability,</td>
</tr>
<tr>
<td><strong>you can specify a comma-separated list of URIs for this value.</strong></td>
<td></td>
</tr>
<tr>
<td>---</td>
<td></td>
</tr>
<tr>
<td><strong>PORT</strong></td>
<td>The port number on which the metastore database is running. If you specify this parameter, you must also specify HOSTNAME and it must be a name or IP address (not a URI).</td>
</tr>
<tr>
<td><strong>HIVESERVER2_HOSTNAME</strong></td>
<td>The hostname or IP address of the HiveServer2 service. This parameter is optional if in hive-site.xml you set one of the following properties:</td>
</tr>
<tr>
<td></td>
<td>• hive.server2.thrift.bind.host to a valid host</td>
</tr>
<tr>
<td></td>
<td>• hive.server2.support.dynamic.service.discovery to true</td>
</tr>
<tr>
<td></td>
<td>This parameter is ignored if you are using WebHCat.</td>
</tr>
<tr>
<td><strong>WEBSERVICE_HOSTNAME</strong></td>
<td>The hostname or IP address of the WebHCat service, if using WebHCat instead of HiveServer2. If this value is not specified, webhcat-site.xml must be available.</td>
</tr>
<tr>
<td><strong>WEBSERVICE_PORT</strong></td>
<td>The port number on which the WebHCat service is running, if using WebHCat instead of HiveServer2. If this value is not specified, webhcat-site.xml must be available.</td>
</tr>
<tr>
<td><strong>WEBHDFS_ADDRESS</strong></td>
<td>The host and port (&quot;host:port&quot;) for the WebHDFS service. This parameter is used only for reading ORC and Parquet files. If this value is not set, hdfs-site.xml must be available to read these file types through the HCatalog Connector.</td>
</tr>
<tr>
<td><strong>HCATALOG_SCHEMA</strong></td>
<td>The name of the Hive schema or database that the Vertica schema is being mapped to. The default is schemaName.</td>
</tr>
<tr>
<td><strong>CUSTOM_PARTITIONS</strong></td>
<td>Whether the Hive schema uses custom partition</td>
</tr>
</tbody>
</table>
locations ('YES' or 'NO'). If the schema uses custom partition locations, then Vertica queries Hive to get those locations when executing queries. These additional Hive queries can be expensive, so use this parameter only if you need to. The default is 'NO' (disabled). For more information, see Using Partitioned Data in Integrating with Apache Hadoop.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HCATALOG_USER</td>
<td>The username of the HCatalog user to use when making calls to the HiveServer2 or WebHCat server. The default is the current database user.</td>
</tr>
<tr>
<td>HCATALOG_CONNECTION_TIMEOUT</td>
<td>The number of seconds the HCatalog Connector waits for a successful connection to the HiveServer or WebHCat server. A value of 0 means wait indefinitely.</td>
</tr>
<tr>
<td>HCATALOG_SLOW_TRANSFER_LIMIT</td>
<td>The lowest data transfer rate (in bytes per second) from the HiveServer2 or WebHCat server that the HCatalog Connector accepts. See HCATALOG_SLOW_TRANSFER_TIME for details.</td>
</tr>
<tr>
<td>HCATALOG_SLOW_TRANSFER_TIME</td>
<td>The number of seconds the HCatalog Connector waits before enforcing the data transfer rate lower limit. After this time has passed, the HCatalog Connector tests whether the data transfer rate is at least as fast as the value set in HCATALOG_SLOW_TRANSFER_LIMIT. If it is not, then the HCatalog Connector breaks the connection and terminates the query.</td>
</tr>
<tr>
<td>SSL_CONFIG</td>
<td>The path of the Hadoop ssl-client.xml configuration file. This parameter is required if you are using HiveServer2 and it uses SSL wire encryption. This parameter is ignored if you are using WebHCat.</td>
</tr>
</tbody>
</table>

The default values for HCATALOG_CONNECTOR_TIMEOUT, HCATALOG_SLOW_TRANSFER_LIMIT, and HCATALOG_SLOW_TRANSFER_TIME are set by the database configuration parameters HCatConnectionTimeout, HCatSlowTransferLimit, and HCatSlowTransferTime. See Apache Hadoop Parameters in the Administrator's Guide for more information.
Configuration Files

The HCatalog Connector uses the following values from the Hadoop configuration files if you do not override them when creating the schema.

<table>
<thead>
<tr>
<th>File</th>
<th>Properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>hive-site.xml</td>
<td>hive.server2.thrift.bind.host (used for HIVESERVER2_HOSTNAME)</td>
</tr>
<tr>
<td></td>
<td>hive.server2.thrift.port</td>
</tr>
<tr>
<td></td>
<td>hive.server2.transport.mode</td>
</tr>
<tr>
<td></td>
<td>hive.server2.authentication</td>
</tr>
<tr>
<td></td>
<td>hive.server2.authentication.kerberos.principal</td>
</tr>
<tr>
<td></td>
<td>hive.server2.support.dynamic.service.discovery</td>
</tr>
<tr>
<td></td>
<td>hive.zookeeper.quorum (used as HIVESERVER2_HOSTNAME if dynamic</td>
</tr>
<tr>
<td></td>
<td>service discovery is enabled)</td>
</tr>
<tr>
<td></td>
<td>hive.zookeeper.client.port</td>
</tr>
<tr>
<td></td>
<td>hive.server2.zookeeper.namespace</td>
</tr>
<tr>
<td></td>
<td>hive.metastore.uris (used for HOSTNAME and PORT)</td>
</tr>
<tr>
<td>ssl-client.xml</td>
<td>ssl.client.truststore.location</td>
</tr>
<tr>
<td></td>
<td>ssl.client.truststore.password</td>
</tr>
</tbody>
</table>

Privileges

The user must be a superuser or be granted all permissions on the database to use this statement.

The user also requires access to Hive data in one of the following ways:

- Have USAGE permissions on `hcatalog_schema`, if Hive does not use an authorization service (Sentry or Ranger) to manage access.
- Have permission through an authorization service, if Hive uses it to manage access. In this case you must either set EnableHCatImpersonation to 0, to access data as the
Vertica principal, or grant users access to the HDFS data. For Sentry, you can use ACL synchronization to manage HDFS access.

- Be the dbadmin user, with or without an authorization service.

### Examples

The following example shows how to use CREATE HCATALOG SCHEMA to define a new schema for tables stored in a Hive database and then query the system tables that contain information about those tables:

```sql
=> CREATE HCATALOG SCHEMA hcat WITH HOSTNAME='hcathost' PORT=9083
    HCATALOG_SCHEMA='default' HIVESERVER2_HOSTNAME='hs.example.com'
    SSL_CONFIG='/etc/hadoop/conf/ssl-client.xml' HCATALOG_USER='admin';
CREATE_SCHEMA
=> \
x
Expanded display is on.

=> SELECT * FROM v_catalog.hcatalog_schemata;
- [ RECORD 1 ]-----------------------------------------------
schema_id | 45035996273748224
schema_name | hcat
schema_owner_id | 45035996273704962
schema_owner | admin
create_time | 2017-12-05 14:43:03.353404-05
hostname | hcathost
port | -1
hiveserver2_hostname | hs.example.com
webservice_hostname | |
webservice_port | 50111
webhdfs_address | hs.example.com:50070
hcatalog_schema_name | default
ssl_config | /etc/hadoop/conf/ssl-client.xml
hcatalog_user_name | admin
hcatalog_connection_timeout | -1
hcatalog_slow_transfer_limit | -1
hcatalog_slow_transfer_time | -1
custom_partitions | f

=> SELECT * FROM v_catalog.hcatalog_table_list;
- [ RECORD 1 ]-----------------------------------------------
table_schema_id | 45035996273748224
table_schema | hcat
table_hcatalog_schema | default
table_name | nation
table_hcatalog_user_name | admin
- [ RECORD 2 ]-----------------------------------------------
table_schema_id | 45035996273748224
table_schema | hcat
table_hcatalog_schema | default
table_name | raw
table_hcatalog_user_name | admin
- [ RECORD 3 ]-----------------------------------------------
table_schema_id | 45035996273748224
table_schema | hcat
The following example shows how to specify more than one metastore host:

```sql
=> CREATE HCATALOG SCHEMA hcat
    WITH HOSTNAME='thrift://node1.example.com:9083,thrift://node2.example.com:9083';
```

The following example shows how to include custom partition locations:

```sql
=> CREATE HCATALOG SCHEMA hcat WITH HCATALOG_SCHEMA='default'
   HIVESERVER2_HOSTNAME='hs.example.com'
   CUSTOM_PARTITIONS='yes';
```

## CREATE KEY

Creates a private key.

### Syntax

```sql
CREATE KEY key_name TYPE 'key_type'
    [PASSWORD 'password']
    {LENGTH key_length | AS 'key'}
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>key_name</code></td>
<td>The name of the key.</td>
</tr>
<tr>
<td><code>key_type</code></td>
<td>The type of key: AES, RSA</td>
</tr>
<tr>
<td><code>password</code></td>
<td>Sets a password for the key.</td>
</tr>
<tr>
<td><code>key_length</code></td>
<td>Specifies the size of the key in bits.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>2048</strong></td>
</tr>
</tbody>
</table>
'key'

Specifies and imports an existing key.

Example: -----BEGIN RSA PRIVATE KEY-------ABCD1234...-----END RSA PRIVATE KEY-------

Privileges

Superuser

Examples

See Generating TLS Certificates and Keys.

See Also

- CREATE CERTIFICATE

CREATE LIBRARY

Loads a library containing user defined extensions (UDxs) into the Vertica catalog. Vertica automatically distributes copies of the library file and supporting libraries to all cluster nodes. UDxs defined in the catalog that reference the updated library automatically start using the new library file.

Because libraries are added to the database catalog, they persist across database restarts.

After loading a library in the catalog, you can use statements such as CREATE FUNCTION to define the extensions contained in the library. See Developing User-Defined Extensions (UDxs) in Extending Vertica for details.

Syntax

```
CREATE [OR REPLACE] LIBRARY
   [[database.]schema.]library-name
   AS 'library-path'
   [ DEPENDS 'support-path']
   [ LANGUAGE 'language' ]
```
## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>OR REPLACE</strong></td>
<td>Specifies to replace the current library loaded as <code>library-name</code>. If omitted, <code>library-name</code> must be unique in the schema, otherwise the statement returns with an error.</td>
</tr>
<tr>
<td><code>[ database .]schema</code></td>
<td>Specifies a schema, by default <code>public</code>. If <code>schema</code> is any schema other than <code>public</code>, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a a database, it must be the current database.</td>
</tr>
<tr>
<td><code>library-name</code></td>
<td>A name to assign to this library, where <code>library-name</code> conforms to conventions described in Identifiers. Use this name in a CREATE FUNCTION statement to enable user defined functions stored in the library. <strong>Tip:</strong> While not required, it is good practice to match <code>library-name</code> to the library file name.</td>
</tr>
<tr>
<td><strong>AS</strong> <code>library-path</code></td>
<td>The absolute path on the initiator node file system of the library to load.</td>
</tr>
<tr>
<td><code>DEPENDS 'support-path'</code></td>
<td>Indicates that the UDx library depends on one or more files or libraries, where <code>support-path</code> specifies one or more absolute paths to these dependencies on the initiator node. <strong>Note:</strong> <code>DEPENDS</code> is ignored for R, as R packages must be installed locally on each node, including external dependencies. For example, the following statement specifies a single dependency: <code>sql =&gt; CREATE LIBRARY mylib AS '/path/to/java_udx' DEPENDS '/path/to/jar/this.jar' LANGUAGE 'Java'; </code> <code>DEPENDS</code> can specify multiple support paths as follows:  - Separate multiple paths with colons (<code>:</code>). For example: <code>sql =&gt; CREATE LIBRARY mylib AS '/path/to/java_udx' </code></td>
</tr>
</tbody>
</table>
DEPENDS '/path/to/jars/this.jar:/path/to/jars/that.jar'
LANGUAGE 'Java';

- Specify a directory that contains multiple libraries with a trailing slash (/), optionally followed by asterisk wildcard (*). For example, the following DEPENDS clauses are identical:

  DEPENDS '/home/mydir/mylibs/'
  DEPENDS '/home/mydir/mylibs/*'

DEPENDS can specify libraries with multiple directory levels. For details, see Multi-level Library Dependencies.

- **Important:**
  The performance of CREATE LIBRARY is liable to degrade in Eon Mode, in proportion to the number and depth of dependencies specified by the DEPENDS clause.

If your Java library depends on native libraries (SO files), use DEPENDS to specify the path and call `System.loadLibrary()` in your U Dx to load the native libraries from that path.

<table>
<thead>
<tr>
<th>LANGUAGE</th>
<th>The programming language used to develop the function, where Language is one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>'Language'</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- C++ (default)</td>
</tr>
<tr>
<td></td>
<td>- Python</td>
</tr>
<tr>
<td></td>
<td>- Java</td>
</tr>
<tr>
<td></td>
<td>- R</td>
</tr>
</tbody>
</table>

### Privileges

Superuser

### Requirements

- Vertica makes its own copies of the library files. Later modification or deletion of the original files specified in the statement does not affect the library defined in the catalog. To update the library, use `ALTER LIBRARY`.
- Loading a library does not guarantee that it functions correctly. CREATE LIBRARY performs some basic checks on the library file to verify it is compatible with Vertica. The statement fails if it detects that the library was not correctly compiled or it finds
other basic incompatibilities. However, CREATE LIBRARY cannot detect many other issues in shared libraries.

**Multi-level Library Dependencies**

If a DEPENDS clause specifies a library with multiple directory levels, Vertica follows the library path to include all subdirectories of that library. For example, the following CREATE LIBRARY statement enables UDx library mylib to import all Python packages and modules that it finds in subdirectories of site-packages:

```sql
=> CREATE LIBRARY mylib AS '/path/to/python_udx' DEPENDS '/path/to/python/site-packages' LANGUAGE 'Python';
```

**Important:**
DEPENDS can specify Java library dependencies that are up to 100 levels deep.

**Examples**

Load library MyFunctions in the home directory of the dbadmin account:

```sql
=> CREATE LIBRARY MyFunctions AS 'home/dbadmin/my_functions.so';
```

Load library MyOtherFunctions located in the directory where you started vsql:

```sql
=> \set libfile '\''pwd'''/MyOtherFunctions.so'';
=> CREATE LIBRARY MyOtherFunctions AS :libfile;
```

Load a Java library named JavaLib.jar that depends on multiple support JAR files in the /home/dbadmin/mylibs subdirectory:

```sql
=> CREATE LIBRARY DeleteVowelsLib AS '/home/dbadmin/JavaLib.jar'
   DEPENDS '/home/dbadmin/mylibs/*' LANGUAGE 'JAVA';
```

**CREATE LOAD BALANCE GROUP**

Creates a group of network addresses that can be targeted by a load balancing routing rule. You create a group either using a list of network addresses, or basing it on one or more fault groups or subclusters.
**Note:**
You cannot add multiple network addresses for one node to the same load balancing group.

**Syntax**

```sql
CREATE LOAD BALANCE GROUP group_name WITH {
    ADDRESS address[,...]
    | FAULT GROUP fault_group[,...] FILTER 'IP_range'
    | SUBCLUSTER subcluster[,...] FILTER 'IP_range'
}
[ POLICY 'policy_setting' ]
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>group_name</code></td>
<td>Name of the group to create. You use this name later when defining load balancing rules.</td>
</tr>
<tr>
<td><code>address[,...]</code></td>
<td>Comma-delimited list of network addresses you created earlier.</td>
</tr>
<tr>
<td><code>fault_group[,...]</code></td>
<td>Comma-delimited list of fault groups to use as the basis of the load balance group.</td>
</tr>
<tr>
<td><code>subcluster[,...]</code></td>
<td>Comma-delimited list of subclusters to use as the basis of the load balance group.</td>
</tr>
<tr>
<td><code>IP_range</code></td>
<td>Range of IP addresses in CIDR notation to include in the load balance group.</td>
</tr>
</tbody>
</table>

**Note:**
Before you create your load balance group from a fault group, you must create network addresses on the nodes you want in your load balance group. Load balance groups only work with the network addresses you define on nodes, rather than IP addresses. See `CREATE NETWORK ADDRESS`.

**Note:**
As with fault groups, you must create network addresses on the nodes in the subcluster you want to be part of the load balance group.
balance group from the fault groups or subclusters. This range can be either IPv4 or IPv6. Only nodes that have a network address with an IP address that falls within this range are added to the load balancing group.

<table>
<thead>
<tr>
<th>policy_setting</th>
<th>Determines how the initially-contacted node chooses a target from the group, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROUNDROBIN</td>
<td>(default) rotates among the available members of the load balancing group. The initially-contacted node keeps track of which node it chose last time, and chooses the next one in the cluster.</td>
</tr>
<tr>
<td>RANDOM</td>
<td>chooses an available node from the group randomly.</td>
</tr>
<tr>
<td>NONE</td>
<td>disables load balancing.</td>
</tr>
</tbody>
</table>

Note:
Each node in the cluster maintains its own round-robin pointer that indicates which node it should pick next for each load-balancing group. Therefore, if clients connect to different initial nodes, they may be redirected to the same node.

Privileges
Superuser

Examples
The following statement demonstrates creating a load balance group that contains several network addresses:

```sql
=> CREATE NETWORK ADDRESS addr01 ON v_vmart_node0001 WITH '10.20.110.21';
CREATE NETWORK ADDRESS
=> CREATE NETWORK ADDRESS addr02 ON v_vmart_node0002 WITH '10.20.110.22';
CREATE NETWORK ADDRESS
=> CREATE NETWORK ADDRESS addr03 on v_vmart_node0003 WITH '10.20.110.23';
CREATE NETWORK ADDRESS
=> CREATE NETWORK ADDRESS addr04 on v_vmart_node0004 WITH '10.20.110.24';
CREATE NETWORK ADDRESS
=> CREATE LOAD BALANCE GROUP group_1 WITH ADDRESS addr01, addr02;
```
CREATE LOAD BALANCE GROUP
=> CREATE LOAD BALANCE GROUP group_2 WITH ADDRESS addr03, addr04;
CREATE LOAD BALANCE GROUP

=> SELECT * FROM LOAD_BALANCE_GROUPS;

<table>
<thead>
<tr>
<th>name</th>
<th>policy</th>
<th>filter</th>
<th>type</th>
<th>object_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_1</td>
<td>ROUNDROBIN</td>
<td>Network Address Group</td>
<td>addr01</td>
<td></td>
</tr>
<tr>
<td>group_2</td>
<td>ROUNDROBIN</td>
<td>Network Address Group</td>
<td>addr02</td>
<td></td>
</tr>
<tr>
<td>group_2</td>
<td>ROUNDROBIN</td>
<td>Network Address Group</td>
<td>addr03</td>
<td></td>
</tr>
<tr>
<td>group_3</td>
<td>ROUNDROBIN</td>
<td>Network Address Group</td>
<td>addr04</td>
<td></td>
</tr>
</tbody>
</table>

(4 rows)

This example demonstrates creating a load balancing group using a fault group:

=> CREATE FAULT GROUP fault_1;
CREATE FAULT GROUP
=> ALTER FAULT GROUP fault_1 ADD NODE v_vmart_node0001;
ALTER FAULT GROUP
=> ALTER FAULT GROUP fault_1 ADD NODE v_vmart_node0002;
ALTER FAULT GROUP
=> ALTER FAULT GROUP fault_1 ADD NODE v_vmart_node0003;
ALTER FAULT GROUP
=> ALTER FAULT GROUP fault_1 ADD NODE v_vmart_node0004;
ALTER FAULT GROUP
=> SELECT node_name,node_address,node_address_family,export_address
     FROM v_catalog.nodes;

<table>
<thead>
<tr>
<th>node_name</th>
<th>node_address</th>
<th>node_address_family</th>
<th>export_address</th>
</tr>
</thead>

CREATE LOCAL TEMPORARY VIEW

Creates or replaces a local temporary view. Views are read only, so they do not support insert, update, delete, or copy operations. Local temporary views are session-scoped, so they are visible only to their creator in the current session. Vertica drops the view when the session ends.

Note: Vertica does not support global temporary views.

Syntax

CREATE [OR REPLACE] LOCAL TEMP[ORARY] VIEW view [ (column[,..] ) ] AS query

Parameters

<table>
<thead>
<tr>
<th>OR REPLACE</th>
<th>Specifies to overwrite the existing view view-name. If you omit this option and view-name already exists, CREATE VIEW returns an error.</th>
</tr>
</thead>
<tbody>
<tr>
<td>view</td>
<td>Identifies the view to create, where view conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.</td>
</tr>
<tr>
<td>column[,..]</td>
<td>List of up to 9800 names to use as view column names. Vertica maps view column names to query columns according to the order of their respective lists. By default, the view uses column names as they are specified in the query.</td>
</tr>
<tr>
<td>AS query</td>
<td>A SELECT statement that the temporary view executes. The SELECT statement can reference tables, temporary tables, and other views.</td>
</tr>
</tbody>
</table>

Privileges

See Creating Views
Example

The following `CREATE LOCAL TEMPORARY VIEW` statement creates the temporary view `myview`. This view sums all individual incomes of customers listed in the `store.store_sales_fact` table, and groups results by state:

```sql
CREATE LOCAL TEMP VIEW myview AS
SELECT SUM(annual_income), customer_state FROM public.customer_dimension
WHERE customer_key IN (SELECT customer_key FROM store.store_sales_fact)
GROUP BY customer_state
ORDER BY customer_state ASC;
```

The following example uses the temporary view `myview` with a WHERE clause that limits the results to combined salaries greater than $2 billion:

```sql
SELECT * FROM myview WHERE SUM > 2000000000;
```

<table>
<thead>
<tr>
<th>SUM</th>
<th>customer_state</th>
</tr>
</thead>
<tbody>
<tr>
<td>272341590</td>
<td>AZ</td>
</tr>
<tr>
<td>2925381709</td>
<td>CA</td>
</tr>
<tr>
<td>4907216137</td>

CREATE LOCATION

Creates a storage location where Vertica can store data. After you create the location, you create storage policies that assign the storage location to the database objects that will store data in the location.

Caution:
While no technical issue prevents you from using CREATE LOCATION to add one or more Network File System (NFS) storage locations, Vertica does not support NFS data or catalog storage except for MapR mount points. You will be unable to run queries against any other NFS data. When creating locations on MapR file systems, you must specify ALL NODES SHARED.

If you use HDFS storage locations, the HDFS data must be available when you start Vertica. Your HDFS cluster must be operational, and the ROS files must be present. If you moved data files, or they are corrupted, or your HDFS cluster is not responsive, Vertica cannot start.

Syntax

CREATE LOCATION 'path'
   [NODE 'nodename' | ALL NODES]
   [SHARED]
   [USAGE 'use-type']
   [LABEL 'label']
   [LIMIT 'size']

Arguments

<table>
<thead>
<tr>
<th>path</th>
<th>Specifies where to store this location's data. The type of file system on which the location is based determines the path format. See Location Paths below.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL NODES</td>
<td>Specifies the node or nodes on which the storage location is defined, one of the following:</td>
</tr>
<tr>
<td>NODE 'node-name'</td>
<td>• ALL NODES (default): Create the storage location on all</td>
</tr>
</tbody>
</table>

Caution:
While no technical issue prevents you from using CREATE LOCATION to add one or more Network File System (NFS) storage locations, Vertica does not support NFS data or catalog storage except for MapR mount points. You will be unable to run queries against any other NFS data. When creating locations on MapR file systems, you must specify ALL NODES SHARED.

If you use HDFS storage locations, the HDFS data must be available when you start Vertica. Your HDFS cluster must be operational, and the ROS files must be present. If you moved data files, or they are corrupted, or your HDFS cluster is not responsive, Vertica cannot start.

Syntax

CREATE LOCATION 'path'
   [NODE 'nodename' | ALL NODES]
   [SHARED]
   [USAGE 'use-type']
   [LABEL 'label']
   [LIMIT 'size']

Arguments

<table>
<thead>
<tr>
<th>path</th>
<th>Specifies where to store this location's data. The type of file system on which the location is based determines the path format. See Location Paths below.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL NODES</td>
<td>Specifies the node or nodes on which the storage location is defined, one of the following:</td>
</tr>
<tr>
<td>NODE 'node-name'</td>
<td>• ALL NODES (default): Create the storage location on all</td>
</tr>
<tr>
<td><strong>nodes.</strong></td>
<td></td>
</tr>
<tr>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>• <strong>NODE</strong> 'node-name': Create the storage location on a single node, where <em>node-name</em> identifies the node in system table <strong>NODES</strong>.</td>
<td></td>
</tr>
<tr>
<td><strong>SHARED</strong></td>
<td>Indicates the location set by the <em>path</em> is shared (used by all nodes) rather than local to each node. For details, see Shared Versus Local Storage.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>If <em>path</em> is set to S3 comunal storage, <strong>SHARED</strong> is always implied and can be omitted.</td>
</tr>
<tr>
<td><strong>USAGE</strong> 'use-type'</td>
<td>The type of data the storage location can hold, where <em>use-type</em> is one of the following:</td>
</tr>
<tr>
<td>• <strong>DATA, TEMP</strong> (default): The storage location can store persistent and temporary DML-generated data, and data for temporary tables.</td>
<td></td>
</tr>
<tr>
<td>• <strong>TEMP</strong>: A <em>path</em>-specified location to store DML-generated temporary data. If <em>path</em> is set to S3, then this location is used only when configuration parameter RemoteStorageForTemp is set to 1, and TEMP must be qualified with <strong>ALL NODES</strong> <strong>SHARED</strong>. For details, see S3 Storage of Temporary Data.</td>
<td></td>
</tr>
<tr>
<td>• <strong>DATA</strong>: The storage location can only store persistent data.</td>
<td></td>
</tr>
<tr>
<td>• <strong>USER</strong>: Users with READ and WRITE privileges can access data and external tables of this storage location.</td>
<td></td>
</tr>
<tr>
<td>• <strong>DEPOT</strong>: The storage location is used in <strong>Eon Mode</strong> to store the depot. Only create DEPOT storage locations on local Linux filesystems.</td>
<td></td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Vertica allows a single DEPOT storage location per node. If you want to move your depot to different location (on a different file system, for example) you must first drop the old depot storage location, then create the new location.</td>
</tr>
<tr>
<td><strong>LABEL</strong> 'Label'</td>
<td>A label for the storage location, used when assigning the storage location to data objects. You use this name later when assigning the storage location to data objects.</td>
</tr>
</tbody>
</table>
Important: You must supply a label for depot storage locations.

**LIMIT 'size'**

Valid only if the storage location usage type is set to depot, specifies the maximum amount of disk space that the depot can allocate from the storage location's file system.

You can specify size in two ways:

- `integer%`: Percentage of storage location disk size.
- `integer{K|M|G|T}`: Amount of storage location disk size in kilobytes, megabytes, gigabytes, or terabytes.

Important: The depot size cannot exceed 80 percent of the file system disk space where the depot is stored. If you specify a value that is too large, Vertica issues a warning and automatically changes the value to 80 percent of the file system size.

If you omit this parameter, it is set to 60 percent.

**Privileges**

Superuser

**File System Access**

The Vertica process must have read and write permissions to the location where data is to be stored. Each file system has its own requirements:

<table>
<thead>
<tr>
<th>File system</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux</td>
<td>Database superuser account (usually named dbadmin) must have full read and write access to the directory in the <code>path</code> argument.</td>
</tr>
<tr>
<td>HDFS without Kerberos</td>
<td>Hadoop user whose username matches the Vertica database administrator username (usually dbadmin). This Hadoop user must have read and write access to the HDFS directory specified in the <code>path</code> argument. The <code>UseServerIdentityOverUserIdentity</code> configuration parameter must be set to true</td>
</tr>
</tbody>
</table>
### File system Requirements

<table>
<thead>
<tr>
<th>File system</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>in the user session; otherwise Vertica tries to use the identity associated with the logged-in user.</td>
<td></td>
</tr>
<tr>
<td>HDFS with Kerberos</td>
<td>Hadoop user whose username matches the principal in the keytab file on each Vertica node. This is not the same as the database administrator username. This Hadoop user must have read and write access to the HDFS directory stored in the path argument. The UseServerIdentityOverUserIdentity configuration parameter must be set to true in the user session; otherwise Vertica tries to use the Kerberos principal associated with the logged-in user.</td>
</tr>
<tr>
<td>Object stores (S3, GCS, Azure)</td>
<td>Database-level credentials must be specified and provide full read and write access to the location in the path argument. If session-level credentials are specified they are used, directly overriding the use of the storage location.</td>
</tr>
</tbody>
</table>

### Location Paths

Location path formats vary, depending on the storage location's file system:

- **Linux**: absolute path to the directory where Vertica can write the storage location's data.
- **Shared file systems**: see the URL specifications in HDFS File System, S3 Object Store, Google Cloud Storage (GCS) Object Store, and Azure Blob Storage Object Store.

### Examples

Create a storage location in the local Linux file system for temporary data storage.

```sql
=> CREATE LOCATION '/home/dbadmin/testloc' USAGE 'TEMP' LABEL 'tempfiles';
```

Create a storage location on HDFS in the `/user/dbadmin` directory. The HDFS cluster does not use Kerberos.

```sql
=> CREATE LOCATION 'hdfs://hadoopNS/vertica/colddata' ALL NODES SHARED
   USAGE 'data' LABEL 'coldstorage';
```

Create the same storage location, but on a Hadoop cluster that uses Kerberos. Note the output that reports the principal being used.

```sql
=> CREATE LOCATION 'hdfs://hadoopNS/vertica/colddata' ALL NODES SHARED
   USAGE 'data' LABEL 'coldstorage';
```
CREATE LOCATION 'hdfs://hadoopNS/vertica/colddata' ALL NODES SHARED USE 'data' LABEL 'coldstorage';

NOTICE 0: Performing HDFS operations using kerberos principal [vertica/hadoop.example.com]

CREATE LOCATION '/tmp' ALL NODES USAGE 'user';

CREATE LOCATION

GRANT ALL ON LOCATION '/tmp' to Bob;
GRANT PRIVILEGE

CREATE EXTERNAL TABLE ext1 (x integer) AS COPY FROM '/tmp/data/ext1.dat' DELIMITER ',';

CREATE TABLE

--- set database-level credential (once):
ALTER DATABASE DEFAULT SET AWSAuth = 'myaccesskeyid123456:mysecretaccesskey123456789012345678901234';

CREATE LOCATION 's3://datalake' SHARED USAGE 'USER' LABEL 's3user';

CREATE ROLE ExtUsers;
--- Assign users to this role using GRANT (Role).

GRANT READ ON LOCATION 's3://datalake' TO ExtUsers;

- SET_OBJECT_STORAGE_POLICY

CREATE NETWORK ADDRESS

Creates a network address that can be used as part of a connection load balancing policy. A network address creates a name in the Vertica catalog for an IP address and port number associated with a node. Nodes can have multiple network addresses, up to one for each IP address they have on the network.
# Syntax

```
CREATE NETWORK ADDRESS name ON node WITH 'ip-address' [PORT port-number] [ENABLED | DISABLED]
```

## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>name</code></td>
<td>The name of the new network address. Use this name when creating connection load balancing groups.</td>
</tr>
<tr>
<td><code>node</code></td>
<td>The name of the node on which to create the network address. This should be the name of the node as it appears in the <code>node_name</code> column of system table <code>NODERS</code>.</td>
</tr>
<tr>
<td><code>ip-address</code></td>
<td>The IPv4 or and IPv6 address on the node to associate with the network address.</td>
</tr>
</tbody>
</table>

**Note:**
Vertica does not verify that the IP address you supply in this parameter is actually associated with the specified node. Be sure that the IP address actually belongs to the node. Otherwise, your load balancing policy is liable to send a client connection to the wrong node, or a non-Vertica host. Vertica rejects IP addresses that are invalid for a node. For example, it checks whether the IP address falls in the loopback address range of 127.0.0.0/8. If it finds that the IP address is invalid, CREATE NETWORK ADDRESS returns an error.

| PORT `port-number` | Sets the port number for the network address. You must supply a network address when altering the port number. |
| ENABLED | DISABLED | Enables or disables the network address.|

## Privileges

Superuser
Examples

Create three network addresses, one for each node in a three-node cluster:

```sql
=> SELECT node_name, export_address FROM v_catalog.nodes;

node_name | export_address
----------|-----------------...
v_vmart_br_node0001 | 10.20.100.62
v_vmart_br_node0002 | 10.20.100.63
v_vmart_br_node0003 | 10.20.100.64
(3 rows)
```

```sql
=> CREATE NETWORK ADDRESS node01 ON v_vmart_br_node0001 WITH '10.20.100.62';
CREATE NETWORK ADDRESS
=> CREATE NETWORK ADDRESS node02 ON v_vmart_br_node0002 WITH '10.20.100.63';
CREATE NETWORK ADDRESS
=> CREATE NETWORK ADDRESS node03 ON v_vmart_br_node0003 WITH '10.20.100.64';
```

See Also

CREATE NETWORK INTERFACE

Identifies a network interface to which a node belongs.

**Deprecated:**
This statement has been deprecated. Instead, use CREATE NETWORK ADDRESS.

Use this statement when you want to configure import/export operations from individual nodes to other Vertica clusters. By default, when you install Vertica, it creates interfaces for all connected networks. You would only need CREATE NETWORK INTERFACE in situations where the network topology has changed since you installed Vertica.

**Syntax**

```
CREATE NETWORK INTERFACE network-interface-name ON node-name [WITH] 'node-IP-address' [PORT port_number] [ENABLED | DISABLED]
```

network-interface-name | The name you assign to the network interface, where network-interface-name conforms to conventions
<table>
<thead>
<tr>
<th>Identifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-name</td>
<td>The name of the node.</td>
</tr>
<tr>
<td>node-IP-address</td>
<td>The node's IP address, either a public or private IP address. For more information, see Using Public and Private IP Networks.</td>
</tr>
<tr>
<td>PORT port_number</td>
<td>Sets the port number for the network interface. You must supply a network interface when altering the port number.</td>
</tr>
<tr>
<td>[ENABLED</td>
<td>DISABLED]</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser

**Examples**

Create a network interface:

```sql
=> CREATE NETWORK INTERFACE mynetwork ON v_vmart_node0001 WITH '123.4.5.6' PORT 456 ENABLED;
```

**CREATE NOTIFIER**

Creates a push-based notifier to send event notifications and messages out of Vertica.

**Syntax**

```sql
CREATE NOTIFIER [ IF NOT EXISTS ] notifier-name ACTION 'action-url'
  [ ENABLE | DISABLE ]
  [ MAXPAYLOAD 'max-payload-size' ]
  MAXMEMORYSIZE 'max-memory-size'
  [ TLSMODE 'tls-mode' ]
  [ CA BUNDLE bundle-name [ CERTIFICATE certificate-name ]]
  [ IDENTIFIED BY 'uuid' ]
  [ [NO] CHECK COMMITTED ]
  [ PARAMETERS 'adapter-params' ]
```
## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>IF NOT EXISTS</strong></td>
<td>Specifies to generate an informational message if an object already exists under the specified name. If you omit this option and the object exists, Vertica generates a ROLLBACK error message. In both cases, the object is not created.</td>
</tr>
<tr>
<td></td>
<td>The IF NOT EXISTS clause is useful for SQL scripts where you want to create an object if it does not already exist.</td>
</tr>
<tr>
<td></td>
<td>For related information, see <a href="https://Documentation.Vertica.com/SQL_Reference_Manual/Vertica_Analytic_Database_11.0.x/SQL_Reference_Manual/Command_Reference/Predefined_Notifiers/">ON_ERROR_STOP</a>.</td>
</tr>
<tr>
<td>notifier-name</td>
<td>This notifier's unique identifier.</td>
</tr>
<tr>
<td>ACTION 'action-url'</td>
<td>URL that identifies one or more target Kafka servers, in the following format:</td>
</tr>
<tr>
<td></td>
<td>kafka://kafka-server-ip-address:port-number</td>
</tr>
<tr>
<td></td>
<td>Provide more than one target server as a comma-delimited list to implement failover when a Kafka server is unavailable. For example:</td>
</tr>
<tr>
<td></td>
<td>kafka://192.0.2.0:9092,192.0.2.1:9092,192.0.2.2:9092</td>
</tr>
<tr>
<td>ENABLE</td>
<td>DISABLE</td>
</tr>
<tr>
<td></td>
<td><strong>Default</strong>: If you omit this parameter, Vertica sets this notifier to ENABLE.</td>
</tr>
<tr>
<td>MAXPAYLOAD</td>
<td>The maximum size of the message, up to 2 TB, specified in kilobytes, megabytes, gigabytes, or terabytes as follows:</td>
</tr>
<tr>
<td></td>
<td>MAXPAYLOAD integer(K</td>
</tr>
<tr>
<td></td>
<td>The default setting is adapter-specific—for example, 1 M for Kafka.</td>
</tr>
<tr>
<td>MAXMEMORYSIZE</td>
<td>The maximum size of the internal notifier, up to 2 TB, specified in kilobytes, megabytes, gigabytes, or terabytes as follows:</td>
</tr>
<tr>
<td>MAXMEMORYSIZE integer{K</td>
<td>M</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------</td>
</tr>
<tr>
<td>TLSMODE 'tls-mode'</td>
<td>Specifies the type of connection between the notifier and endpoint, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- disable (default): Plaintext connection.</td>
</tr>
<tr>
<td></td>
<td>- verify-ca: Encrypted connection, and the server's certificate is verified as being signed by a trusted CA.</td>
</tr>
<tr>
<td>CA BUNDLE bundle-name</td>
<td>Specifies a CA bundle. The certificates inside the bundle are used to validate the Kafka server's certificate if the TLSMODE requires it.</td>
</tr>
<tr>
<td></td>
<td>If a CA bundle is specified for a notifier that currently uses disable, which doesn't validate the Kafka server's certificate, the bundle will go unused when connecting to the Kafka server. This behavior persists unless the TLSMODE is changed to one that validates server certificates.</td>
</tr>
<tr>
<td></td>
<td>Changes to contents of the CA bundle take effect either after the notifier is disabled and re-enabled or after the database restarts. However, changes to which CA bundle the notifier uses takes effect immediately.</td>
</tr>
<tr>
<td>CERTIFICATE certificate-name</td>
<td>Specifies a client certificate for validation by the endpoint.</td>
</tr>
<tr>
<td>IDENTIFIED BY uuid</td>
<td>Specifies the notifier's unique identifier. If set, all the messages published by this notifier have this attribute.</td>
</tr>
<tr>
<td>[NO] CHECK COMMITTED</td>
<td>Specifies to wait for delivery confirmation before sending the next message in the queue. Not all messaging systems support delivery confirmation.</td>
</tr>
<tr>
<td>PARAMETERS 'adapter-params'</td>
<td>Specifies one or more optional adapter parameters that are passed as a string to the adapter. Adapter parameters apply only to the adapter associated with the notifier.</td>
</tr>
</tbody>
</table>
Privileges

Superuser

Encrypted Notifiers for SASL_SSL Kafka Configurations

Follow this procedure to create or alter notifiers for Kafka endpoints that use SASL_SSL.
Note that you must repeat this procedure whenever you change the TLSMODE, certificates, or CA bundle for a given notifier.

1. Use CREATE or ALTER to disable the notifier while setting the TLSMODE, certificate, and CA bundle.

```sql
=> ALTER NOTIFIER encrypted_notifier
   DISABLE
   TLSMODE 'verify-ca'
   CA BUNDLE ca_bundle2;
```

2. ALTER the notifier and set the proper rdkafka adapter parameters for SASL_SSL.

```sql
=> ALTER NOTIFIER encrypted_notifier PARAMETERS
   'sasl.username=user;sasl.password=password;sasl.mechanism=PLAIN;security.protocol=SASL_SSL';
```

3. Enable the notifier.

```sql
=> ALTER NOTIFIER encrypted_notifier ENABLE;
```

Examples

Create a Kafka notifier:

```sql
=> CREATE NOTIFIER my_dc_notifier
   ACTION 'kafka://172.16.20.10:9092'
   MAXMEMORYSIZE '1G'
   IDENTIFIED BY '
   NO CHECK COMMITTED;
```

Create a notifier with an adapter-specific parameter:
Create a notifier that uses an encrypted connection and verifies the Kafka server's certificate with the provided **CA bundle**:

```sql
=> CREATE NOTIFIER encrypted_notifier
   ACTION 'kafka://127.0.0.1:9092'
   MAXMEMORYSIZE '10M'
   TLSMODE 'verify-ca'
   CA BUNDLE ca_bundle;
```

### See Also

- ALTER NOTIFIER
- DROP NOTIFIER
- Monitoring Vertica Using Notifiers

### CREATE PROCEDURE (External)

**Enterprise Mode only**

Adds an external procedure to Vertica. See Implementing External Procedures for more information on creating external procedures.

### Syntax

```
CREATE PROCEDURE [[database.]schema.]procedure( [ argument-list ] )
   AS 'executable'
   LANGUAGE 'EXTERNAL'
   USER 'OS-user'
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>database</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td><code>schema</code></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td>Procedure</td>
<td>Specifies a name for the external procedure, where <code>procedure-name</code> conforms to conventions described in Identifiers.</td>
</tr>
<tr>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Argument-list</td>
<td>A comma-delimited list of procedure arguments, where each argument is specified as follows:</td>
</tr>
<tr>
<td></td>
<td><code>[ argname ] argtype</code></td>
</tr>
<tr>
<td></td>
<td>- <code>argname</code> optionally provides a descriptive name for this argument.</td>
</tr>
<tr>
<td></td>
<td>- <code>argtype</code> must be one of the following data types supported by Vertica:</td>
</tr>
<tr>
<td></td>
<td>- BIGINT</td>
</tr>
<tr>
<td></td>
<td>- BOOLEAN</td>
</tr>
<tr>
<td></td>
<td>- DECIMAL</td>
</tr>
<tr>
<td></td>
<td>- DOUBLE PRECISION</td>
</tr>
<tr>
<td></td>
<td>- FLOAT</td>
</tr>
<tr>
<td></td>
<td>- FLOAT8</td>
</tr>
<tr>
<td></td>
<td>- INT</td>
</tr>
<tr>
<td></td>
<td>- INT8</td>
</tr>
<tr>
<td></td>
<td>- INTEGER</td>
</tr>
<tr>
<td></td>
<td>- MONEY</td>
</tr>
<tr>
<td></td>
<td>- NUMBER</td>
</tr>
<tr>
<td></td>
<td>- NUMERIC</td>
</tr>
<tr>
<td></td>
<td>- REAL</td>
</tr>
<tr>
<td></td>
<td>- SMALLINT</td>
</tr>
<tr>
<td></td>
<td>- TINYINT</td>
</tr>
</tbody>
</table>
### Privileges

Non-superuser: CREATE privilege on the schema to contain the procedure.

### System Security

- The procedure file must be owned by the database administrator (OS account) or by a user in the same group as the administrator. The procedure file must also have the set UID attribute enabled, and allow read and execute permission for the group.
- External procedures that you create with `CREATE PROCEDURE (External)` are always run with Linux dbadmin privileges. If a dbadmin or pseudosuperuser grants a non-dbadmin permission to run a procedure using `GRANT (Procedure)`, be aware that the non-dbadmin user runs the procedure with full Linux dbadmin privileges.

### Examples

The following example shows how to create procedure `helloplanet` for external procedure file `helloplanet.sh`. This file accepts one `varchar` argument.

Create the file:

```bash
#!/bin/bash
echo "hello planet argument: $1" >> /tmp/myprocedure.log
```

Create the procedure with the following SQL:

```
=> CREATE PROCEDURE helloplanet(arg1 varchar) AS 'helloplanet.sh' LANGUAGE 'external' USER 'dbadmin';
```
See Also

- DROP PROCEDURE (External)
- Installing External Procedure Executable Files

CREATE PROCEDURE (Stored)

Creates a stored procedure.

Syntax

[ LANGUAGE 'language-name' ]
[ SECURITY { DEFINER | INVOKER } ]
AS $$ source $$;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ database . ]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject. If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>procedure</td>
<td>The name of the stored procedure, where procedure-name conforms to conventions described in Identifiers.</td>
</tr>
<tr>
<td>parameter-list</td>
<td>A comma-delimited list of formal parameters, each specified as follows: [ parameter-mode ] parameter-name parameter-type</td>
</tr>
<tr>
<td></td>
<td>• parameter-name: the name of the parameter.</td>
</tr>
<tr>
<td></td>
<td>• parameter-type: Any SQL data type, with the following exceptions: DECIMAL, NUMERIC, NUMBER, MONEY.</td>
</tr>
</tbody>
</table>
Language-name

Specifies the language of the procedure source. Currently, PLpgSQL is the only available language.

Default: PLpgSQL

SECURITY { DEFINER | INVOKER }

Determines whose privileges to use when the procedure is called and executes it as if the user is one of the following:

- DEFINER: User who defined the procedure
- INVOKER: User who called the procedure

A procedure with SECURITY DEFINER effectively executes the procedure as that user, so changes to the database appear to be performed by the procedure's definer rather than its caller.

Caution:

Improper use of SECURITY DEFINER can lead to the confused deputy problem and introduce vulnerabilities into your system like SQL injection.

For more information, see Executing Stored Procedures.

source

The procedure source code. For details, see Scope and Structure.

Privileges

Non-superuser: CREATE on the procedure's schema

Examples

For more complex examples, see Stored Procedures: Use Cases and Examples

This procedure prints its arguments:

```sql
=> CREATE PROCEDURE raiseXY(IN x INT, y VARCHAR) language PLpgSQL AS $$
BEGIN
  RAISE NOTICE 'x = %', x;
  RAISE NOTICE 'y = %', y;
$$
```
-- some processing statements
END;
$$;

CALL raiseXY(3, 'some string');
NOTICE 2005: x = 3
NOTICE 2005: y = some string

For more information on RAISE NOTICE, see Errors and Diagnostics.

CREATE PROFILE

Creates a profile that controls password requirements for users.

Syntax

CREATE PROFILE profile-name LIMIT [ PASSWORD_LIFE_TIME setting
  PASSWORD_MIN_LIFE_TIME setting
  PASSWORD_GRACE_TIME setting
  FAILED_LOGIN_ATTEMPTS setting
  PASSWORD_LOCK_TIME setting
  PASSWORD_REUSE_MAX setting
  PASSWORD_REUSE_TIME setting
  PASSWORD_MAX_LENGTH setting
  PASSWORD_MIN_LENGTH setting
  PASSWORD_MIN_CHAR_CHANGE setting ]

Parameters

Note:
All parameters that are not explicitly set in a new profile are set to
default, and inherit their settings from the default profile.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile-name</td>
<td>The name of the profile to create, where name conforms to conventions described in Identifiers.</td>
</tr>
<tr>
<td>PASSWORD_LIFE_TIME</td>
<td>Set to an integer value, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• ≥ 1: The number of days a password remains valid.</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: Password remains valid indefinitely.</td>
</tr>
<tr>
<td></td>
<td>After your password's lifetime and grace period expire, you must change your password on your next login, if you have not done so already.</td>
</tr>
<tr>
<td>PASSWORD_MIN_LIFE_TIME</td>
<td>Set to an integer value, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• Default: 0</td>
</tr>
<tr>
<td></td>
<td>• ≥ 1: The number of days a password must be set before it can be changed</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: Password can be reset at any time.</td>
</tr>
<tr>
<td>PASSWORD_GRACE_TIME</td>
<td>Set to an integer value, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• ≥ 1: The number of days a password can be used after it expires.</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: No grace period.</td>
</tr>
<tr>
<td>FAILED_LOGIN_ATTEMPTS</td>
<td>Set to an integer value, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• ≥ 1: The number of consecutive failed login attempts Vertica allows before locking your account.</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: Vertica allows an unlimited number of failed login attempts.</td>
</tr>
<tr>
<td>PASSWORD_LOCK_TIME</td>
<td>Set to an integer value, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• ≥ 1: The number of days your account is locked after too many failed login attempts. The account is automatically unlocked when the lock time elapses.</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: Account remains indefinitely inaccessible until a superuser manually unlocks it.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| REUSE_MAX          | • ≥ 1: The number of times you must change your password before you can reuse an earlier password.  
                        • UNLIMITED: You can reuse an earlier password without any intervening changes.          |
| PASSWORD_REUSE_TIME| Set to an integer value, one of the following:  
                        • ≥ 1: The number of days that must pass after a password is set before you can reuse it.  
                        • UNLIMITED: You can reuse an earlier password immediately.                           |
| PASSWORD_MAX_LENGTH| The maximum number of characters allowed in a password, one of the following:  
                        • Integer between 8 and 512, inclusive  
                        • UNLIMITED: Maximum of 512 characters                                                   |
| PASSWORD_MIN_LENGTH| The minimum number of characters required in a password, one of the following:  
                        • 0 to PASSWORD_MAX_LENGTH  
                        • UNLIMITED: Minimum of PASSWORD_MAX_LENGTH                                              |
| PASSWORD_MIN_LETTERS| Minimum number of letters (a-z and A-Z) that must be in a password, one of the following:  
                        • Integer between 0 and PASSWORD_MAX_LENGTH, inclusive  
                        • UNLIMITED: 0 (no minimum)                                                               |
| PASSWORD_MIN_UPPERCASE_LETTERS| Minimum number of uppercase letters (A-Z) that must be in a password, one of the following:  
                        • Integer between 0 and PASSWORD_MAX_LENGTH, inclusive  
                        • UNLIMITED: 0 (no minimum)                                                               |
| PASSWORD_MIN_LOWERCASE_LETTERS| Minimum number of lowercase letters (a-z) that must be in a password, one of the following:  
                        • Integer between 0 and PASSWORD_MAX_LENGTH, inclusive  
                        • UNLIMITED: 0 (no minimum)                                                               |
<p>| PASSWORD_MIN_DIGITS | Minimum number of digits (0-9) that must be in a password, one of the following:                                                              |</p>
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PASSWORD_MAX_LENGTH</td>
<td>Integer between 0 and PASSWORD_MAX_LENGTH, inclusive</td>
</tr>
<tr>
<td>UNLIMITED: 0 (no minimum)</td>
<td></td>
</tr>
<tr>
<td>PASSWORD_MIN_SYMBOLS</td>
<td>Minimum number of symbols—printable non-letter and non-digit characters such as $, #, @—that must be in a password, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• Integer between 0 and PASSWORD_MAX_LENGTH, inclusive</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: 0 (no minimum)</td>
</tr>
<tr>
<td>PASSWORD_MIN_CHAR_CHANGE</td>
<td>Minimum number of characters that must be different from the previous password:</td>
</tr>
<tr>
<td></td>
<td>• Default: 0</td>
</tr>
<tr>
<td></td>
<td>• Integer between 0 and PASSWORD_MAX_LENGTH, inclusive</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: 0 (no minimum)</td>

</tbody>
</table>

**Privileges**

Superuser

**Profile Settings and Client Authentication**

The following profile settings affect [client authentication methods](https://www.vertica.com/docs/11.0.x/vdm/cr今回は_ cleanse_ new.html), such as LDAP or GSS:

- FAILED_LOGIN_ATTEMPTS
- PASSWORD_LOCK_TIME

All other profile settings are used only by Vertica to manage its passwords.

**Example**

```sql
=> CREATE PROFILE sample_profile LIMIT PASSWORD_MAX_LENGTH 20;
```
CREATE PROJECTION

Creates metadata for a projection in the Vertica catalog. Vertica supports four types of projections:

- **Standard projection**: Stores collection of table data in a format that optimizes execution of certain queries on that table.
- **Live aggregate projection**: Stores the grouped results of queries that invoke aggregate functions (such as SUM) on table columns.
- **Top-K projection**: Stores the top k rows from partitions of selected rows.
- **UDTF projection**: Stores newly-loaded data after it is transformed and/or aggregated by user-defined transformation functions (UDTFs).

**Standard Projection**

Stores a collection of table data in a format that optimizes execution of certain queries on that table. For details, see Physical Schema (Projections).

**Syntax**

```
CREATE PROJECTION [ IF NOT EXISTS ] [[database.]schema.]projection
    ( 
        { projection-column | grouped-clause
            [ ENCODING encoding-type ]
            [ ACCESSRANK integer ] 
        }[,..]
    )
    [ ORDER BY column-expr[,..] ]
    [ segmentation-spec ]
    [ KSAFE [ k-num ] ]
    [ ON PARTITION RANGE BETWEEN min-val AND max-val ]
```
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>IF NOT EXISTS</strong></td>
<td>Specifies to generate an informational message if an object already exists under the specified name. If you omit this option and the object exists, Vertica generates a ROLLBACK error message. In both cases, the object is not created.</td>
</tr>
<tr>
<td></td>
<td>The IF NOT EXISTS clause is useful for SQL scripts where you want to create an object if it does not already exist.</td>
</tr>
<tr>
<td></td>
<td>For related information, see <a href="#">ON_ERROR_STOP</a>.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Specifies the schema for this projection and its anchor table, where schema must be the same for both. If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><strong>projection</strong></td>
<td>Identifies the projection to create, where projection conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.</td>
</tr>
<tr>
<td><strong>projection-column</strong></td>
<td>The name of a projection column. The list of projection columns must match the SELECT list columns and expressions in number, type, and sequence.</td>
</tr>
<tr>
<td></td>
<td>If projection column names are omitted, Vertica uses the anchor table column names specified in the SELECT list.</td>
</tr>
<tr>
<td>grouped-clause</td>
<td>See <a href="#">GROUPED Clause</a>.</td>
</tr>
<tr>
<td><strong>ENCODING encoding-type</strong></td>
<td>Specifies the column encoding type, by default set to AUTO.</td>
</tr>
<tr>
<td><strong>ACCESSRANK integer</strong></td>
<td>Overrides the default access rank for a column. Use this parameter to increase or decrease the speed at which Vertica accesses a column. For more information, see <a href="#">Overriding Default Column Ranking</a>.</td>
</tr>
<tr>
<td><strong>AS SELECT</strong></td>
<td>Specifies the columns or column expressions to select from the specified table, one of the following:</td>
</tr>
<tr>
<td></td>
<td>* (asterisk)                                                                                                                                                Lists all columns in the queried tables.</td>
</tr>
<tr>
<td></td>
<td>expression [ [AS] alias ][,…]</td>
</tr>
</tbody>
</table>
where expression resolves to column data from the queried anchor table.

You can optionally assign an alias to each column expression and reference that alias elsewhere in the SELECT statement—for example, in the ORDER BY or segmentation clause.

**Note:**
If you specify projection column names, the two lists of projection columns and table columns/expressions must exactly match in number and order.

| ORDER BY | Specifies columns from the SELECT list on which to sort the projection. The ORDER BY clause can only be set to ASC (the default). Vertica always stores projection data in ascending sort order.

  If you order by a column with a collection data type (ARRAY or SET), queries that use that column in an ORDER BY clause perform the sort again. This is because projections and queries perform the ordering differently.

  If you omit the ORDER BY clause, Vertica uses the SELECT list to sort the projection.

| segmentation-spec | Specifies how to distribute projection data with one of the following clauses:

  - **hash-segmentation-clause**: Specifies to segment projection data evenly and distribute across cluster nodes:

    SEGM[ENTED BY expression ALL NODES] [ OFFSET offset ]

  - **unsegmented-clause**: Specifies to create an unsegmented projection:

    UNSEGMENTED ALL NODES

  If the anchor table and projection both omit specifying segmentation, the projection is defined with a hash segmentation clause that includes all columns in the SELECT list, as follows:

    SEGM[ENTED BY HASH(column-expr[,…]) ALL NODES OFFSET 0];
<table>
<thead>
<tr>
<th><strong>Tip:</strong></th>
<th>Vertica recommends segmenting large tables.</th>
</tr>
</thead>
</table>
| **KSAFE** \([k\text{-}num]\) | Specifies K-safety for the projection, where \(k\text{-}num\) must be equal to or greater than database K-safety. Vertica ignores this parameter if set for unsegmented projections. If you omit \(k\text{-}num\), Vertica uses database K-safety. 
For general information, see [K-Safety in an Enterprise Mode Database](#). |
| **ON PARTITION RANGE** | Specifies to limit data of this projection to a range of partition keys, specified as follows: 
ON PARTITION RANGE BETWEEN \(min\text{-}range\text{-}value\) AND \(max\text{-}range\text{-}value\) 
where the following requirements apply to \(min\text{-}range\text{-}value\) and \(max\text{-}range\text{-}value\): 
- \(min\text{-}range\text{-}value\) must be \(\leq\) \(max\text{-}range\text{-}value\) 
- They must resolve to a data type that is compatible with the table partition expression. 
- They can be: 
  - String literals—for example, 2021-07-31 
  - Expressions with stable or immutable functions, for example: 
    \[
    \text{date\_trunc('month', now()::timestamp - interval'1 month')}
    \] 
- \(max\text{-}range\text{-}value\) can be set to NULL, to specify that the partition range has no upper bound. 
For other requirements and usage details, see [Partition Range Projections](#). |

### Privileges

Non-superusers: 
- Anchor table owner 
- CREATE privilege on the schema
Live Aggregate Projection

Stores the grouped results of queries that invoke aggregate functions (such as SUM) on table columns. For details, see Live Aggregate Projections.

```
CREATE PROJECTION [ IF NOT EXISTS ] [[database.]schema.]projection
 ( 
   { projection-column | grouped-clause
     [ ENCODING encoding-type ]
     [ ACCESSRANK integer ] [ ,... ]
   ) ]
  GROUP BY column-expr
  [ KSAFE [ k-num ] ]
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>IF NOT EXISTS</strong></td>
<td>Specifies to generate an informational message if an object already exists under the specified name. If you omit this option and the object exists, Vertica generates a ROLLBACK error message. In both cases, the object is not created. The IF NOT EXISTS clause is useful for SQL scripts where you want to create an object if it does not already exist. For related information, see ON_ERROR_STOP.</td>
</tr>
<tr>
<td><strong>[database.]schema</strong></td>
<td>Specifies the schema for this projection and its anchor table, where schema must be the same for both. If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><strong>projection</strong></td>
<td>Identifies the projection to create, where projection conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.</td>
</tr>
</tbody>
</table>
| **projection-column** | The name of a projection column. The list of projection columns must match the SELECT list columns and
expressions in number, type, and sequence.
If projection column names are omitted, Vertica uses the anchor table column names specified in the SELECT list.

$\text{grouped-clause}$
See GROUPED Clause.

$\text{ENCODING encoding-type}$
Specifies the column encoding type, by default set to AUTO.

$\text{ACCESSRANK integer}$
 Overrides the default access rank for a column. Use this parameter to increase or decrease the speed at which Vertica accesses a column. For more information, see Overriding Default Column Ranking.

$\text{AS SELECT}$
Specifies the table data to query:

\[
\{ \text{table-column} | \text{expr-with-table-columns} \} \ [ \text{AS alias} ] [,\ldots]
\]

You can optionally assign an alias to each column expression and reference that alias elsewhere in the SELECT statement.

**Note:**
If you specify projection column names, the two lists of projection columns and table columns/expressions must exactly match in number and order.

$\text{GROUP BY column-expr[,\ldots]}$
One or more column expressions from the SELECT list. The first column-expr must be the first column expression in the SELECT list, the second column-expr must be the second column expression in the SELECT list, and so on.

### Privileges

Non-superusers:
- Anchor table owner
- CREATE privilege on the schema
Requirements and Restrictions

Vertica does not regard live aggregate projections as superprojections, even those that include all table columns. For other requirements and restrictions, see Creating Live Aggregate Projections.

Examples

See Live Aggregate Projection Example.

Top-K Projection

Stores the top $k$ rows from partitions of selected rows. For details, see Top-K Projections.

CREATE PROJECTION [ IF NOT EXISTS ] [[database.]schema.]projection
[ { projection-column | grouped-clause
  [ ENCODING encoding-type ]
  [ ACCESSRANK integer ] }[,...]
] AS SELECT { table-column | expr-with-table-columns }[,...]
FROM [[database.]schema.]table [ [AS] alias]
LIMIT num-rows OVER ( window-partition-clause [window-order-clause] )
[ KSAFE [ k-num ] ]

Parameters

| IF NOT EXISTS | Specifies to generate an informational message if an object already exists under the specified name. If you omit this option and the object exists, Vertica generates a ROLLBACK error message. In both cases, the object is not created.
|              | The IF NOT EXISTS clause is useful for SQL scripts where you want to create an object if it does not already exist.
<p>|              | For related information, see ON_ERROR_STOP. |</p>

<td></td>
</tr>
</tbody>
</table>

Top-K projections support `ORDER BY NULLS FIRST/LAST`.

**Privileges**

**Non-superusers:**

- Anchor table owner
- CREATE privilege on the schema

**Requirements and Restrictions**

Vertica does not regard Top-K projections as superprojections, even those that include all table columns. For other requirements and restrictions, see [Creating Top-K Projections](#).
Examples

See Top-K Projection Examples.

**UDTF Projection**

Stores newly-loaded data after it is transformed and/or aggregated by user-defined transformation functions (UDTFs). For details and examples, see Pre-Aggregating UDTF Results.

**Important:**
Currently, projections can only reference UDTFs developed in C++.

**Syntax**

```sql
CREATE PROJECTION [ IF NOT EXISTS ] [[database.]schema.]projection
 [ ( 
   { projection-column | grouped-clause
   [ ENCODING encoding-type ]
   [ ACCESSRANK integer ] ][,..]
 ) ]
AS { batch-query FROM { prepass-query sq-ref | table [[AS] alias] }
  | prepass-query }

batch-query
SELECT { table-column | expr-with-table-columns }[,.], batch-udtf(batch-args)
   OVER (PARTITION BATCH BY partition-column-expr[,.])
   [ AS (batch-output-columns) ]

prepass-query
SELECT { table-column | expr-with-table-columns }[,.], prepass-udtf(prepass-args)
   OVER (PARTITION PREPASS BY partition-column-expr[,.])
   [ AS (prepass-output-columns) ] FROM table
```

**Parameters**

| IF NOT EXISTS | Specifies to generate an informational message if an object already exists under the specified name. |
If you omit this option and the object exists, Vertica generates a ROLLBACK error message. In both cases, the object is not created.

The IF NOT EXISTS clause is useful for SQL scripts where you want to create an object if it does not already exist.

For related information, see `ON_ERROR_STOP`.

<table>
<thead>
<tr>
<th><code>[database.]schema</code></th>
<th>Specifies the schema for this projection and its anchor table, where <code>schema</code> must be the same for both. If you specify a database, it must be the current database.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>projection</code></td>
<td>Identifies the projection to create, where <code>projection</code> conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.</td>
</tr>
<tr>
<td><code>projection-column</code></td>
<td>The name of a projection column. The list of projection columns must match the SELECT list columns and expressions in number, type, and sequence. If projection column names are omitted, Vertica uses the anchor table column names specified in the SELECT list.</td>
</tr>
<tr>
<td><code>grouped-clause</code></td>
<td>See GROUPED Clause.</td>
</tr>
<tr>
<td><code>ENCODING encoding-type</code></td>
<td>Specifies the column encoding type, by default set to AUTO.</td>
</tr>
<tr>
<td><code>ACCESSRANK integer</code></td>
<td>Overrides the default access rank for a column. Use this parameter to increase or decrease the speed at which Vertica accesses a column. For more information, see Overriding Default Column Ranking.</td>
</tr>
<tr>
<td><code>AS SELECT</code></td>
<td>Specifies the table data to query:</td>
</tr>
</tbody>
</table>
|                     | `{table-column | expr-with-table-columns} [ [AS] alias ]} [,..]"
You can optionally assign an alias to each column expression and reference that alias elsewhere in the SELECT statement.

**Note:**
If you specify projection column names, the two lists of projection columns and table columns/expressions must exactly match in number and order.

| batch-udtf(batch-args) | The **batch UDTF** to invoke each time the following events occur:
| | • Tuple mover mergeout  
| | • Queries on the projection  
| | • If invoked singly, on data load operations  

**Important:**
If the projection definition includes a pre-pass subquery, *batch-args* must exactly match the pre-pass UDTF output columns, in name and order.

| prepass-udtf(prepass-args) | The **pre-pass UDTF** to invoke on each load operation such as COPY or INSERT.  
| | If specified in a subquery, the pre-pass UDTF returns transformed data to the batch query for further processing. Otherwise, the pre-pass query results are added to projection data storage.  

| OVER (PARTITION  
| { BATCH | PREPASS }  
| BY partition-column-expr[,…]) | Specifies the UDTF type and how to partition the data it returns:
| | • BATCH identifies the UDTF as a [batch UDTF](#).  
| | • PREPASS identifies the UDTF as a [pre-pass UDTF](#).  

In both cases, the OVER clause specifies partitioning with one or more column expressions from the SELECT list. The first *partition-column-expr* is the first column expression in the SELECT list, the second *partition-column-expr* is the second column expression in the
Note:

The projection is implicitly segmented and ordered on PARTITION BY columns.

| AS (batch-output-columns) AS (prepass-output-columns) | Optionally names columns that are returned by the UDTF.
|                                                      | If a pre-pass subquery omits this clause, the outer batch query UDTF arguments (batch-args) must reference the column names as they are defined in the pre-pass UDTF.
| table [[AS] alias]                                   | Specifies the projection's anchor table, optionally qualified by an alias.
| sq-results                                           | Subquery result set that is returned to the outer batch UDTF.

**Privileges**

Non-superusers:

- Anchor table owner
- CREATE privilege on the schema
- EXECUTE privileges on all UDTFs that are referenced by the projection

**Examples**

See Pre-Aggregating UDTF Results.

**Encoding Types**

Vertica supports various encoding and compression types, specified by the following ENCODING parameter arguments:

- AUTO (default)
- BLOCK_DICT
- BLOCKDICT_COMP
- BZIP_COMP
- COMMONDELTA_COMP
- DELTARANGE_COMP
- DELTAVAL
- GCDDELTA
- GZIP_COMP
- RLE
- Zstandard Compression

**Note:**
Vertica supports the following encoding for numeric data types:

- Precision $\leq$ 18: AUTO, BLOCK_DICT, BLOCKDICT_COMP, COMMONDELTA_COMP, DELTAVAL, GCDDELTA, and RLE
- Precision $>$ 18: AUTO, BLOCK_DICT, BLOCKDICT_COMP, RLE

You can set encoding types on a projection column when you [create the projection](#). You can also change the encoding of one or more projection columns for a given table with `ALTER TABLE...ALTER COLUMN`.

**AUTO (default)**

AUTO encoding is ideal for sorted, many-valued columns such as primary keys. It is also suitable for general purpose applications for which no other encoding or compression scheme is applicable. Therefore, it serves as the default if no encoding/compression is specified.

<table>
<thead>
<tr>
<th>Column data type</th>
<th>Default encoding type</th>
</tr>
</thead>
<tbody>
<tr>
<td>BINARY/VARBINARY BOOLEAN</td>
<td>Lempel-Ziv-Oberhumer-based (LZO) compression</td>
</tr>
<tr>
<td>CHAR/VARCHAR FLOAT</td>
<td></td>
</tr>
<tr>
<td>DATE/TIME/TIMESTAMP Integer INTERVAL</td>
<td>Compression scheme based on the delta between consecutive column values.</td>
</tr>
</tbody>
</table>

The CPU requirements for this type are relatively small. In the worst case, data might expand by eight percent (8%) for LZO and twenty percent (20%) for integer data.
**BLOCK_DICT**

For each block of storage, Vertica compiles distinct column values into a dictionary and then stores the dictionary and a list of indexes to represent the data block.

BLOCK_DICT is ideal for few-valued, unsorted columns where saving space is more important than encoding speed. Certain kinds of data, such as stock prices, are typically few-valued within a localized area after the data is sorted, such as by stock symbol and timestamp, and are good candidates for BLOCK_DICT. By contrast, long CHAR/VARCHAR columns are not good candidates for BLOCK_DICT encoding.

CHAR and VARCHAR columns that contain 0x00 or 0xFF characters should not be encoded with BLOCK_DICT. Also, BINARY/VARBINARY columns do not support BLOCK_DICT encoding.

BLOCK_DICT encoding requires significantly higher CPU usage than default encoding schemes. The maximum data expansion is eight percent (8%).

**BLOCKDICT_COMP**

This encoding type is similar to BLOCK_DICT except dictionary indexes are entropy coded. This encoding type requires significantly more CPU time to encode and decode and has a poorer worst-case performance. However, if the distribution of values is extremely skewed, using BLOCK_DICT_COMP encoding can lead to space savings.

**BZIP_COMP**

BZIP_COMP encoding uses the bzip2 compression algorithm on the block contents. See bzip web site for more information. This algorithm results in higher compression than the automatic LZO and gzip encoding; however, it requires more CPU time to compress. This algorithm is best used on large string columns such as VARCHAR, VARBINARY, CHAR, and BINARY. Choose this encoding type when you are willing to trade slower load speeds for higher data compression.
COMMONDELTA_COMP

This compression scheme builds a dictionary of all deltas in the block and then stores indexes into the delta dictionary using entropy coding.

This scheme is ideal for sorted FLOAT and INTEGER-based (DATE/TIME/TIMESTAMP/INTERVAL) data columns with predictable sequences and only occasional sequence breaks, such as timestamps recorded at periodic intervals or primary keys. For example, the following sequence compresses well: 300, 600, 900, 1200, 1500, 600, 1200, 1800, 2400. The following sequence does not compress well: 1, 3, 6, 10, 15, 21, 28, 36, 45, 55.

If delta distribution is excellent, columns can be stored in less than one bit per row. However, this scheme is very CPU intensive. If you use this scheme on data with arbitrary deltas, it can cause significant data expansion.

DELTARANGE_COMP

This compression scheme is primarily used for floating-point data; it stores each value as a delta from the previous one.

This scheme is ideal for many-valued FLOAT columns that are sorted or confined to a range. Do not use this scheme for unsorted columns that contain NULL values, as the storage cost for representing a NULL value is high. This scheme has a high cost for both compression and decompression.

To determine if DELTARANGE_COMP is suitable for a particular set of data, compare it to other schemes. Be sure to use the same sort order as the projection, and select sample data that will be stored consecutively in the database.

DELTAVAL

For INTEGER and DATE/TIME/TIMESTAMP/INTERVAL columns, data is recorded as a difference from the smallest value in the data block. This encoding has no effect on other data types.

DELTAVAL is best used for many-valued, unsorted integer or integer-based columns. CPU requirements for this encoding type are minimal, and data never expands.
GCDDELTA

For INTEGER and DATE/TIME/TIMESTAMP/INTERVAL columns, and NUMERIC columns with 18 or fewer digits, data is recorded as the difference from the smallest value in the data block divided by the greatest common divisor (GCD) of all entries in the block. This encoding has no effect on other data types.

ENCODING GCDDELTA is best used for many-valued, unsorted, integer columns or integer-based columns, when the values are a multiple of a common factor. For example, timestamps are stored internally in microseconds, so data that is only precise to the millisecond are all multiples of 1000. The CPU requirements for decoding GCDDELTA encoding are minimal, and the data never expands, but GCDDELTA may take more encoding time than DELTAVAL.

GZIP_COMP

This encoding type uses the gzip compression algorithm. See gzip web site for more information. This algorithm results in better compression than the automatic LZO compression, but lower compression than BZIP_COMP. It requires more CPU time to compress than LZO but less CPU time than BZIP_COMP. This algorithm is best used on large string columns such as VARCHAR, VARBINARY, CHAR, and BINARY. Use this encoding when you want a better compression than LZO, but at less CPU time than bzip2.

RLE

RLE (run length encoding) replaces sequences (runs) of identical values with a single pair that contains the value and number of occurrences. Therefore, it is best used for low cardinality columns that are present in the ORDER BY clause of a projection.

The Vertica execution engine processes RLE encoding run-by-run and the Vertica optimizer gives it preference. Use it only when run length is large, such as when low-cardinality columns are sorted.

Zstandard Compression

Vertica supports three ZSTD compression types:
- ZSTD_COMP provides high compression ratios. This encoding type has a higher compression than gzip. Use this when you want a better compression than gzip. For general use cases, use this or the ZSTD_FAST_COMP encoding type.
- ZSTD_FAST_COMP uses the fastest compression level that the zstd library provides. It is the fastest encoding type of the zstd library, but takes up more space than the other two encoding types. For general use cases, use this or the ZSTD_COMP encoding type.
- ZSTD_HIGH_COMP offers the best compression in the zstd library. It is slower than the other two encoding types. Use this type when you need the best compression, with slower CPU time.

**GROUPED Clause**

Enterprise Mode only

Groups two or more columns into a single disk file. This minimizes file I/O for work loads that:

- Read a large percentage of the columns in a table.
- Perform single row look-ups.
- Query against many small columns.
- Frequently update data in these columns.

If you have data that is always accessed together and it is not used in predicates, you can increase query performance by grouping these columns. Once grouped, queries can no longer independently retrieve from disk all records for an individual column independent of the other columns within the group.

**Note:**

RLE encoding is reduced when an RLE column is grouped with one or more non-RLE columns.

When grouping columns you can:

- Group some of the columns:
  \( (a, \text{GROUPED}(b, c), d) \)
- Group all of the columns:
  \( \text{GROUPED}(a, b, c, d) \)
- Create multiple groupings in the same projection:

  \[(\text{GROUPED}(a, b), \text{GROUPED}(c, d))\]

**Note:**
Vertica performs dynamic column grouping. For example, to provide better read and write efficiency for small loads, Vertica ignores any projection-defined column grouping (or lack thereof) and groups all columns together by default.

### Grouping Correlated Columns

The following example shows how to group highly correlated columns `bid` and `ask`. The `stock` column is stored separately.

```sql
=> CREATE TABLE trades (stock CHAR(5), bid INT, ask INT);
=> CREATE PROJECTION tradeproj (stock ENCODING RLE, GROUPED(bid ENCODING DELTAVAL, ask)) AS (SELECT * FROM trades) KSAFE 1;
```

The following example show how to create a projection that uses expressions in the column definition. The projection contains two integer columns `a` and `b`, and a third column `product_value` that stores the product of `a` and `b`:

```sql
=> CREATE TABLE values (a INT, b INT);
=> CREATE PROJECTION product (a, b, product_value) AS SELECT a, b, a*b FROM values ORDER BY a KSAFE;
```

### Hash Segmentation Clause

Specify how to segment projection data for distribution across all cluster nodes. You can specify segmentation for a table and a projection. If a table definition specifies segmentation, Vertica uses it for that table's auto-projections.

It is strongly recommended that you use Vertica’s built-in `HASH` function, which distributes data evenly across the cluster, and facilitates optimal query execution.

### Syntax

```sql
SEGMENTED BY expression ALL NODES [ OFFSET offset ]
```
## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SEGMENTED BY <em>expression</em></td>
<td>A general SQL expression. Hash segmentation is the preferred method of segmentation. Vertica recommends using its built-in <code>HASH</code> function, whose arguments resolve to table columns. If you use an expression other than <code>HASH</code>, Vertica issues a warning. The segmentation expression should specify columns with a large number of unique data values and acceptable skew in their data distribution. In general, primary key columns that meet these criteria are good candidates for hash segmentation. For details, see Expression Requirements below.</td>
</tr>
<tr>
<td>ALL NODES</td>
<td>Automatically distributes data evenly across all nodes when the projection is created. Node ordering is fixed.</td>
</tr>
<tr>
<td>OFFSET <em>offset</em></td>
<td>A zero-based offset that indicates on which node to start segmentation distribution. This option is not valid for CREATE TABLE and CREATE TEMPORARY TABLE.</td>
</tr>
</tbody>
</table>

**Important:**

If you create a projection for a table with the OFFSET option, be sure to create enough copies of each projection segment to satisfy system K-safety; otherwise, Vertica regards the projection as unsafe and cannot use it to query the table. You can ensure K-safety compliance when you create projections by combining OFFSET and KSAFE options in the CREATE PROJECTION statement. On executing this statement, Vertica automatically creates the necessary number of projection copies.
Expression Requirements

A segmentation expression must specify table columns as they are defined in the source table. Projection column names are not supported.

The following restrictions apply to segmentation expressions:

- All leaf expressions must be constants or column references to a column in the CREATE PROJECTION's SELECT list.
- The expression must return the same value over the life of the database.
- Aggregate functions are not allowed.
- The expression must return non-negative INTEGER values in the range $0 \leq x < 2^{63}$, and values are generally distributed uniformly over that range.

**Note:**
If the expression produces a value outside the expected range—for example, a negative value—no error occurs, and the row is added to the projection's first segment.

Examples

The following CREATE PROJECTION statement creates projection public.employee_dimension_super. It specifies to include all columns in table public.employee_dimension. The hash segmentation clause invokes the Vertica HASH function to segment projection data on the column employee_key; it also includes the ALL NODES clause, which specifies to distribute projection data evenly across all nodes in the cluster:

```
=> CREATE PROJECTION public.employee_dimension_super
   AS SELECT * FROM public.employee_dimension
   ORDER BY employee_key
   SEGMENTED BY hash(employee_key) ALL NODES;
```

Unsegmented Clause

Specifies to distribute identical copies of table or projection data on all nodes across the cluster. Use this clause to facilitate distributed query execution on tables and projections that are too small to benefit from segmentation.
Vertica uses the same name to identify all instances of an unsegmented projection. For more information about projection name conventions, see Projection Naming.

### Syntax

**UNSEGMENTED ALL NODES**

### Example

This example creates an unsegmented projection for table `store.store_dimension`:

```sql
=> CREATE PROJECTION store.store_dimension_proj (storekey, name, city, state) AS SELECT store_key, store_name, store_city, store_state FROM store.store_dimension UNSEGMENTED ALL NODES;
CREATE PROJECTION
=> SELECT anchor_table_name anchor_table, projection_name, node_name FROM PROJECTIONS WHERE projection_basename='store_dimension_proj';
+----------+----------------+----------+
| anchor_table | projection_name | node_name |
| store_dimension | store_dimension_proj | v_vmart_node0001 |
| store_dimension | store_dimension_proj | v_vmart_node0002 |
| store_dimension | store_dimension_proj | v_vmart_node0003 |
+----------+----------------+----------+
(3 rows)

### CREATE RESOURCE POOL

Creates a custom resource pool and sets one or more resource pool parameters.

### Syntax

```sql
CREATE RESOURCE POOL pool-name [ FOR { SUBCLUSTER subcluster-name | CURRENT SUBCLUSTER } ] [ parameter-name setting ]...
```

### Parameters

<p>| pool-name       | The name of the resource pool. Built-in pool names cannot be used for user-defined pools. |</p>
<table>
<thead>
<tr>
<th><strong>Note:</strong></th>
<th>If you specify a resource pool name with uppercase letters, Vertica converts them to lowercase letters.</th>
</tr>
</thead>
<tbody>
<tr>
<td>**[ SUBCLUSTER subcluster-name</td>
<td>CURRENT SUBCLUSTER ]**</td>
</tr>
<tr>
<td></td>
<td>• <strong>SUBCLUSTER</strong> — Use this keyword to create the resource pool for a subcluster with the name <em>subcluster-name</em> if you are not connected to it, and it exists.</td>
</tr>
<tr>
<td></td>
<td>• <strong>CURRENT SUBCLUSTER</strong> — Creates the resource pool for the subcluster that you are currently connected to.</td>
</tr>
<tr>
<td><strong>parameter-name</strong></td>
<td>The parameter to set, listed below.</td>
</tr>
<tr>
<td><strong>setting</strong></td>
<td>The value to set on <em>parameter-name</em>. To reset this parameter to its default value, specify DEFAULT.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Default values specified in this table pertain only to user-defined resource pools. For built-in pool default values, see <a href="#">Built-In Resource Pools Configuration</a>, or query system table <code>RESOURCE_POOL_DEFAULTS</code>.</td>
</tr>
<tr>
<td><strong>CASCADE TO</strong></td>
<td>Specifies a secondary resource pool for executing queries that exceed the <code>RUNTIMECAP</code> setting of their assigned resource pool:</td>
</tr>
<tr>
<td></td>
<td>CASCADE TO <em>secondary-pool</em></td>
</tr>
<tr>
<td><strong>CPUAFFINITYMODE</strong></td>
<td>Specifies whether the resource pool has exclusive or shared use of the CPUs specified in <code>CPUAFFINITYSET</code>:</td>
</tr>
<tr>
<td></td>
<td>`CPUAFFINITYMODE { SHARED</td>
</tr>
<tr>
<td></td>
<td>• <strong>SHARED</strong>: Queries that run in this pool share its <code>CPUAFFINITYSET</code> CPUs with other Vertica...</td>
</tr>
</tbody>
</table>
resource pools.

- **EXCLUSIVE**: Dedicates CPUAFFINITYSET CPUs to this resource pool only, and excludes other Vertica resource pools. If CPUAFFINITYSET is set as a percentage, then that percentage of CPU resources available to Vertica is assigned solely for this resource pool.
- **ANY** (default): Queries in this resource pool can run on any CPU, invalid if CPUAFFINITYSET designates CPU resources.

### Important:

CPUAFFINITYMODE and CPUAFFINITYSET must be set together in the same statement.

### CPUAFFINITYSET

Specifies which CPUs are available to this resource pool. All cluster nodes must have the same number of CPUs. The CPU resources assigned to this set are unavailable to general resource pools.

```sql
CPUAFFINITYSET {
  'cpu-index[,..]' | '{cpu-index}_{cpu-index}_n' | 'integer%'
  | NONE
}
```

- **cpu-index[,..]**: Dedicates one or more comma-delimited CPUs to this pool.
- **cpu-index_{cpu-index}_n**: Dedicates a range of contiguous CPU indexes to this pool
- **integer%**: Percentage of all available CPUs to use for this pool. Vertica rounds this percentage down to include whole CPU units.
- **NONE** (default): No affinity set is assigned to this resource pool. The queries associated with this pool are executed on any CPU.

### Important:

CPUAFFINITYSET and CPUAFFINITYMODE must be set together in the same statement.

### EXECUTIONPARALLELISM

Limits the number of threads used to process any single query issued in this resource pool.
**EXECUTIONPARALLELISM** \{ *limit* | *AUTO* \}

- *limit*: An integer value between 1 and the number of cores. Setting this parameter to a reduced value increases throughput of short queries issued in the pool, especially if the queries are executed concurrently.
- *AUTO* or 0 (default): Vertica calculates the setting from the number of cores, available memory, and amount of data in the system. Unless memory is limited, or the amount of data is very small, Vertica sets this parameter to the number of cores on the node.

**MAXCONCURRENCY**

Sets the maximum number of concurrent execution slots available to the resource pool, across the cluster:

**MAXCONCURRENCY** \{ *integer* | *NONE* \}

*NONE* (default) specifies unlimited number of concurrent execution slots.

**MAXMEMORYSIZE**

The maximum size per node the resource pool can grow by borrowing memory from the **GENERAL** pool:

**MAXMEMORYSIZE**

- *integer%*: Percentage of total memory
- *integer{K|M|G|T}*: Amount of memory in kilobytes, megabytes, gigabytes, or terabytes
- *NONE* (default): Unlimited, pool can borrow any amount of available memory from the **GENERAL** pool.

**MAXQUERYMEMORYSIZE**

The maximum amount of memory that this pool can allocate at runtime to process a query. If the query requires more memory than this setting, Vertica stops execution and returns an error.

Set this parameter as follows:

**MAXQUERYMEMORYSIZE**

- *integer%*
- *integer{K|M|G|T}*
The amount of total memory available to the Vertica resource manager that is allocated to this pool per node:

```plaintext
MEMORYSIZE {
    'integer%'
    | 'integer{K|M|G|T}'
}
```

- `integer%`: Percentage of total memory
- `integer{K|M|G|T}`: Amount of memory in kilobytes, megabytes, gigabytes, or terabytes

**Default:** 0%. No memory allocated, the resource pool borrows memory from the `GENERAL` pool.

This setting applies to the entire cluster:

```plaintext
PLANNEDCONCURRENCY { num-queries | AUTO }
```

- `num-queries`: Integer value ≥ 1, specifies the preferred number of concurrently executing queries. When possible, query resource budgets are limited to allow this level of concurrent execution.
- `AUTO` (default): Value is calculated automatically at query runtime. Vertica sets this parameter to the lower of these two calculations, but never less than 4:
  - Number of logical cores
  - Memory divided by 2GB
For clusters where the number of logical cores differs on different nodes, AUTO can apply differently on each node. Distributed queries run like the minimal effective planned concurrency. Single node queries run with the planned concurrency of the initiator.

**Tip:** Change this parameter only after evaluating performance over a period of time.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRIORITY</td>
<td>Specifies priority of queries in this pool when they compete for resources in the [GENERAL] pool:</td>
</tr>
<tr>
<td></td>
<td>PRIORITY { integer</td>
</tr>
<tr>
<td></td>
<td>• integer: A negative or positive integer value, where higher numbers denote higher priority:</td>
</tr>
<tr>
<td></td>
<td>• User-defined pools: -100 to 100</td>
</tr>
<tr>
<td></td>
<td>• Built-in pools [SYSQUERY, RECOVERY, and TM]: -110 to 110</td>
</tr>
<tr>
<td></td>
<td>• HOLD: Sets priority to -999. Queries in this pool are queued until [QUEUETIMEOUT] is reached.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> 0</td>
</tr>
<tr>
<td>QUEUETIMEOUT</td>
<td>Species how long a request can wait for pool resources before it is rejected:</td>
</tr>
<tr>
<td></td>
<td>QUEUETIMEOUT { integer</td>
</tr>
<tr>
<td></td>
<td>• integer: Maximum wait time in seconds</td>
</tr>
<tr>
<td></td>
<td>• NONE: No maximum wait time, request can be queued indefinitely.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> 300 seconds</td>
</tr>
<tr>
<td>RUNTIMECAP</td>
<td>Prevents runaway queries by setting the maximum time a query in the pool can execute. If a query exceeds this setting, it tries to cascade to a secondary pool:</td>
</tr>
<tr>
<td></td>
<td>RUNTIMECAP { 'interval'</td>
</tr>
<tr>
<td></td>
<td>• interval: An [interval] of 1 minute or 100 seconds; should not exceed one year.</td>
</tr>
<tr>
<td></td>
<td>• NONE (default): No time limit on queries running</td>
</tr>
</tbody>
</table>
in this pool. To specify a value in days, provide an integer value. To provide a value less than one day, provide the interval in the format hours:minutes:seconds. For example a value of 1:30:00 would equal 90 minutes.

If the user or session also has a RUNTIMECAP, the shorter limit applies.

| RUNTIMEPRIORITY | Determines how the resource manager should prioritize dedication of run-time resources (CPU, I/O bandwidth) to queries already running in this resource pool:
| RUNTIMEPRIORITY { HIGH | MEDIUM | LOW } |
| Default: MEDIUM |

| RUNTIMEPRIORITYTHRESHOLD | Specifies in seconds a time limit in which a query must finish before the resource manager assigns to it the resource pool's RUNTIMEPRIORITY. All queries begin running at a HIGH priority. When a query's duration exceeds this threshold, it is assigned the RUNTIMEPRIORITY of the resource pool.
| RUNTIMEPRIORITYTHRESHOLD seconds |
| Default: 2 |

| SINGLEINITIATOR | By default, set to false for backward compatibility. Do not change this setting. |

**Privileges**

Superuser

**Examples**

This example shows how to create a resource pool with MEMORYSIZE of 1800 MB.

```sql
=> CREATE RESOURCE POOL ceo_pool MEMORYSIZE '1800M' PRIORITY 10;
CREATE RESOURCE POOL
```
Assuming the CEO report user already exists, associate this user with the preceding resource pool using ALTER USER statement.

```
=> GRANT USAGE ON RESOURCE POOL ceo_pool to ceo_user;
GRANT PRIVILEGE
=> ALTER USER ceo_user RESOURCE POOL ceo_pool;
ALTER USER
```

Issue the following command to confirm that the ceo_user is associated with the ceo_pool:

```
=> SELECT * FROM users WHERE user_name = 'ceo_user';
- [ RECORD 1 ]-----------------------------------------------
user_id         | 45035996273733402
user_name       | ceo_user
is_super_user   | f
profile_name    | default
is_locked       | f
lock_time       | 
resource_pool   | ceo_pool
memory_cap_kb   | unlimited
temp_space_cap_kb| unlimited
run_time_cap    | unlimited
all_roles       | 
default_roles   | 
search_path     | "$user", public, v_catalog, v_monitor, v_internal
```

This example shows how to create and designate secondary resource pools.

```
=> CREATE RESOURCE POOL rp3 RUNTIMECAP '5 minutes';
=> CREATE RESOURCE POOL rp2 RUNTIMECAP '3 minutes' CASCADE TO rp3;
=> CREATE RESOURCE POOL rp1 RUNTIMECAP '1 minute' CASCADE TO rp2;
=> SET SESSION RESOURCE_POOL = rp1;
```

This Eon Mode example confirms the current subcluster name, then creates a resource pool for the current subcluster:

```
=> SELECT CURRENT_SUBCLUSTER_NAME();
CURRENT_SUBCLUSTER_NAME-------------------------------
analytics_1
(1 row)
=> CREATE RESOURCE POOL dashboard FOR SUBCLUSTER analytics_1;
CREATE RESOURCE POOL
```

- ALTER RESOURCE POOL
- CREATE USER
- DROP RESOURCE POOL
**Built-In Pools**

Vertica is preconfigured with built-in pools for various system tasks:

- GENERAL
- BLOBDATA
- DBD
- JVM
- METADATA
- RECOVERY
- REFRESH
- SYSQUERY
- TM

For details on resource pool settings, see ALTER RESOURCE POOL.

**GENERAL**

Catch-all pool used to answer requests that have no specific resource pool associated with them. Any memory left over after memory has been allocated to all other pools is automatically allocated to the GENERAL pool. The MEMORYSIZE parameter of the GENERAL pool is undefined (variable), however, the GENERAL pool must be at least 1GB in size and cannot be smaller than 25% of the memory in the system.

The MAXMEMORYSIZE parameter of the GENERAL pool has special meaning; when set as a % value it represents the percent of total physical RAM on the machine that the Resource Manager can use for queries. By default, it is set to 95%. MAXMEMORYSIZE governs the total amount of RAM that the Resource Manager can use for queries, regardless of whether it is set to a percent or to a specific value (for example, '10GB').

User-defined pools can borrow memory from the GENERAL pool to satisfy requests that need extra memory until the MAXMEMORYSIZE parameter of that pool is reached. If the pool is configured to have MEMORYSIZE equal to MAXMEMORYSIZE, it cannot borrow any memory from the GENERAL pool. When multiple pools request memory from the GENERAL pool, they are granted access to general pool memory according to their priority setting. In
this manner, the GENERAL pool provides some elasticity to account for point-in-time deviations from normal usage of individual resource pools.

Vertica recommends reducing the GENERAL pool MAXMEMORYSIZE if your catalog uses over 5 percent of overall memory. You can calculate what percentage of GENERAL pool memory the catalog uses as follows:

```sql
=> WITH memory_use_metadata AS (SELECT node_name, memory_size_kb FROM resource_pool_status WHERE pool_name='metadata'),
    memory_use_general AS (SELECT node_name, memory_size_kb FROM resource_pool_status WHERE pool_name='general')
SELECT m.node_name, ((m.memory_size_kb/g.memory_size_kb) * 100)::NUMERIC(4,2) pct_catalog_usage
FROM memory_use_metadata m JOIN memory_use_general g ON m.node_name = g.node_name;
```

<table>
<thead>
<tr>
<th>node_name</th>
<th>pct_catalog_usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_vmart_node0001</td>
<td>0.41</td>
</tr>
<tr>
<td>v_vmart_node0002</td>
<td>0.37</td>
</tr>
<tr>
<td>v_vmart_node0003</td>
<td>0.36</td>
</tr>
</tbody>
</table>

(3 rows)

BLOBDATA

Controls resource usage for in-memory blobs. In-memory blobs are objects used by a number of the machine learning SQL functions. You should adjust this pool if you plan on processing large machine learning workloads. For information about tuning the pool, see Tuning for Machine Learning.

If a query using the BLOBDATA pool exceeds its query planning budget, then it spills to disk. For more information about tuning your query budget, see Query Budgeting.

DBD

Controls resource usage for Database Designer processing. Use of this pool is enabled by configuration parameter `DBDUseOnlyDesignerResourcePool`, by default set to false.

By default, QUEUETIMEOUT is set to 0 for this pool. When resources are under pressure, this setting causes the DBD to time out immediately, and not be queued to run later. Database Designer then requests the user to run the designer later, when resources are more available.

**Important:**

Do not change QUEUETIMEOUT or any DBD resource pool parameters.
JVM

Controls Java Virtual Machine resources used by Java User Defined Extensions. When a Java UDx starts the JVM, it draws resources from the those specified in the JVM resource pool. Vertica does not reserve memory in advance for the JVM pool. When needed, the pool can expand to 10% of physical memory or 2 GB of memory, whichever is smaller. If you are buffering large amounts of data, you may need to increase the size of the JVM resource pool.

You can adjust the size of your JVM resource pool by changing its configuration settings. Unlike other resource pools, the JVM resource pool does not release resources until a session is closed.

METADATA

Tracks memory allocated for catalog data and storage data structures. This pool increases in size as Vertica metadata consumes additional resources. Memory assigned to the METADATA pool is subtracted from the GENERAL pool, enabling the Vertica resource manager to make more effective use of available resources. If the METADATA resource pool reaches 75% of the GENERAL pool, Vertica stops updating METADATA memory size and displays a warning message in vertica.log. You can enable or disable the METADATA pool with configuration parameter EnableMetadataMemoryTracking.

If you created a "dummy" or "swap" resource pool to protect resources for use by your operating system, you can replace that pool with the METADATA pool.

Users cannot change the parameters of the METADATA resource pool.

RECOVERY

Used by queries issued when recovering another node of the database. The MAXCONCURRENCY parameter is used to determine how many concurrent recovery threads to use. You can use the PLANNEDCONCURRENCY parameter (by default, set to twice the MAXCONCURRENCY) to tune how to apportion memory to recovery queries.

See Tuning for Recovery.
REFRESH

Used by queries issued by PROJECTION_REFRESHES operations. Refresh does not currently use multiple concurrent threads; thus, changes to the MAXCONCURRENCY values have no effect.

See Scenario: Tuning for Refresh.

SYSQUERY

Runs queries against all system monitoring and catalog tables. The SYSQUERY pool reserves resources for system table queries so that they are never blocked by contention for available resources.

TM

The Tuple Mover (TM) pool. You can set the MAXCONCURRENCY parameter for the TM pool to allow concurrent TM operations.

See Tuning Tuple Mover Pool Settings.

Built-In Resource Pools Configuration

To view the current and default configuration for built-in resource pools, query the system tables RESOURCE_POOLS and RESOURCE_POOL_DEFAULTS, respectively. The sections below provide this information, and also indicate which built-in pool parameters can be modified with ALTER RESOURCE POOL:

- GENERAL
- BLOBDATA
- DBD
- JVM
- METADATA
- RECOVERY
- REFRESH
### GENERAL

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMORYSIZE</td>
<td>Empty / cannot be set</td>
</tr>
<tr>
<td>MAXMEMORYSIZE</td>
<td>The maximum memory to use for all resource pools, one of the following:</td>
</tr>
<tr>
<td>MAXQUERYMEMORYSIZE</td>
<td>The maximum amount of memory allocated by this pool to process any query:</td>
</tr>
</tbody>
</table>

#### MAXMEMORYSIZE

- `integer%`: Percentage of total system RAM, must be \( \geq 25\% \)
- `integer{K|M|G|T}`: Amount of memory in kilobytes, megabytes, gigabytes, or terabytes, must be \( \geq 1\)GB

**Caution:**

- Setting this parameter to 100% generates a warning of potential swapping.
- For example, if your node has 64GB of memory, setting MAXMEMORYSIZE to 50% allocates half of available memory. Thus, the maximum amount of memory available to all resource pools is 32GB.

**Default:** 95%

- `integer%`: Percentage of MAXMEMORYSIZE for this pool.

**Caution:** Must be set \( \geq 1 \), otherwise Vertica generates a warning that system queries might be unable to execute, and diagnosing problems might be difficult.
### Parameter | Default Setting
--- | ---
| **SINGLEINITIATOR** | False.  
**Important:** Included for backwards compatibility. Do not change.  

| **CPUAFFINITYSET** | Empty / cannot be set  
| **CPUAFFINITYMODE** |  
| **CASCADETO** |  

### TM

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Setting</th>
</tr>
</thead>
</table>
| **MEMORYSIZE** | 5% (of the **GENERAL** pool's MAXMEMORYSIZE setting) + 2GB  
**Important:** You can estimate the optimal amount of RAM for the TM resource pool as follows:  
\[ \text{GbRAM} / (6 \times \#table-cols) > 10 \]  
where **#table-cols** is the number of columns in the largest database table. For example, given a 100-column table, **MEMORYSIZE** needs least 6GB of RAM:  
\[ 6144 \text{MB} / (6 \times 100) = 10.24 \] |

**CREATE ROLE**

Creates a role. After creating a role, use [GRANT statements](#) to specify role permissions.
Syntax
CREATE ROLE role

Parameters

| role | The name for the new role, where role conforms to conventions described in Identifiers. |

Privileges
Superuser

Examples
This example shows to create an empty role called roleA.

```sql
=> CREATE ROLE roleA;
CREATE ROLE
```

See Also
- ALTER ROLE
- DROP ROLE

CREATE ROUTING RULE

Creates a load balancing routing rule that directs incoming client connections from an IP address range to a group of Vertica nodes. This group of Vertica nodes is defined by a load balance group. Once you create a routing rule, any client connection originating from the rule's IP address range is redirected to one of the nodes in the load balance group if the client opts into load balancing.
Syntax

CREATE ROUTING RULE rule_name ROUTE 'address_range' TO group_name

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>A name for the routing rule.</td>
</tr>
<tr>
<td>address_range</td>
<td>The IP address range of incoming client connections to redirect. This range must be in CIDR format.</td>
</tr>
<tr>
<td>group_name</td>
<td>The name of the load balance group to handle the client connections from the address range. You create this group using the CREATE LOAD BALANCE GROUP statement.</td>
</tr>
</tbody>
</table>

Privileges

The user must be a superuser.

Examples

The following example creates a routing rule that routes all client connections from 192.168.1.0 to 192.168.1.255 to a load balance group named internal_clients:

```sql
=> CREATE ROUTING RULE internal_clients ROUTE '192.168.1.0/24' TO group_internal;
CREATE ROUTING RULE
```

See Also

CREATE SCHEMA

Defines a schema.
**Syntax**

```sql
CREATE SCHEMA [ IF NOT EXISTS ] [ database. ]schema
[ AUTHORIZATION username]
[ DEFAULT { INCLUDE | EXCLUDE } [ SCHEMA ] PRIVILEGES ]
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF NOT EXISTS</td>
<td>Specifies to generate an informational message if an object already exists under the specified name. If you omit this option and the object exists, Vertica generates a ROLLBACK error message. In both cases, the object is not created.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Identifies the schema to create, where <code>schema</code> conforms to conventions described in Identifiers. The following naming requirements also apply:</td>
</tr>
<tr>
<td></td>
<td>- The name must be unique among all other schema names in the database.</td>
</tr>
<tr>
<td></td>
<td>- It must comply with keyword restrictions.</td>
</tr>
<tr>
<td></td>
<td>- It cannot begin with <code>v_</code>; this prefix is reserved for Vertica system tables.</td>
</tr>
<tr>
<td></td>
<td>- If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>AUTHORIZATION username</td>
<td>Valid only for superusers, assigns ownership of the schema to another user. By default, the user who creates a schema is also assigned ownership.</td>
</tr>
<tr>
<td></td>
<td>After you create a schema, you can reassign ownership to another user with <code>ALTER SCHEMA</code>.</td>
</tr>
<tr>
<td>DEFAULT {INCLUDE</td>
<td>EXCLUDE} [SCHEMA] PRIVILEGES</td>
</tr>
<tr>
<td></td>
<td>- EXCLUDE SCHEMA PRIVILEGES (default): Disables inheritance of schema privileges.</td>
</tr>
</tbody>
</table>
INCLUDE SCHEMA PRIVILEGES: Specifies to grant tables in the specified schema the same privileges granted to that schema. This option has no effect on existing tables in the schema.

If you omit INCLUDE PRIVILEGES, you must explicitly grant schema privileges on the desired tables.

For more information see Enabling Schema Inheritance.

Privileges

- Superuser
- CREATE privilege for the database

Supported Sub-statements

CREATE SCHEMA can include one or more sub-statements—for example, to create tables or projections within the new schema. Supported sub-statements include:

- CREATE TABLE / CREATE TEMPORARY TABLE
- GRANT Statements
- CREATE PROJECTION
- CREATE SEQUENCE
- CREATE TEXT INDEX
- CREATE VIEW

CREATE SCHEMA statement and all sub-statements are treated as a single transaction. If any statement fails, Vertica rolls back the entire transaction. The owner of the new schema is assigned ownership of all objects that are created within this transaction.

For example, the following CREATE SCHEMA statement also grants privileges on the new schema, and creates a table and view of that table:

```sql
=> \c - Joan
You are now connected as user "Joan".
=> CREATE SCHEMA s1
    GRANT USAGE, CREATE ON SCHEMA s1 TO public
    CREATE TABLE s1.t1 (a varchar)
    CREATE VIEW s1.t1v AS SELECT * FROM s1.t1;
CREATE SCHEMA
=> \dtv s1.*
  List of tables
  Schema | Name | Kind | Owner | Comment
```
Examples

Create schema s1:

=> CREATE SCHEMA s1;

Create schema s2 if it does not already exist:

=> CREATE SCHEMA IF NOT EXISTS s2;

If the schema already exists, Vertica returns a rollback message:

=> CREATE SCHEMA IF NOT EXISTS s2;
NOTICE 4214: Object "s2" already exists; nothing was done

Create table t1 in schema s1, then grant users Fred and Aniket access to all existing tables and all privileges on table t1:

=> CREATE TABLE s1.t1 (c INT);
CREATE TABLE
=> GRANT USAGE ON SCHEMA s1 TO Fred, Aniket;
GRANT PRIVILEGE
=> GRANT ALL PRIVILEGES ON TABLE s1.t1 TO Fred, Aniket;
GRANT PRIVILEGE

Enable inheritance on new schema s3 so all tables created in it automatically inherit its privileges. In this case, new table s3.t2 inherits USAGE, CREATE, and SELECT privileges, which are automatically granted to all database users:

=> CREATE SCHEMA s3 DEFAULT INCLUDE SCHEMA PRIVILEGES;
CREATE SCHEMA
=> GRANT USAGE, CREATE, SELECT, INSERT ON SCHEMA S3 TO PUBLIC;
GRANT PRIVILEGE
=> CREATE TABLE s3.t2(i int);
WARNING 6978: Table "t2" will include privileges from schema "s3"
CREATE TABLE
See Also

- ALTER SCHEMA
- DROP SCHEMA

CREATE SEQUENCE

Defines a new named sequence number generator object. Like AUTO_INCREMENT and IDENTITY sequences, named sequences let you set the default values of primary key columns. Sequences guarantee uniqueness, and avoid constraint enforcement problems and overhead.

For more information about sequence types and their usage, see Sequences.

Syntax

CREATE SEQUENCE [ IF NOT EXISTS ] [[database.]schema.]sequence
   [ INCREMENT [ BY ] integer ]
   [ MINVALUE integer | NO MINVALUE ]
   [ MAXVALUE maxvalue | NO MAXVALUE ]
   [ START [ WITH ] integer ]
   [ CACHE integer | NO CACHE ]
   [ CYCLE | NO CYCLE ]

Parameters

<table>
<thead>
<tr>
<th>IF NOT EXISTS</th>
<th>Specifies to generate an informational message if an object already exists under the specified name. If you omit this option and the object exists, Vertica generates a ROLLBACK error message. In both cases, the object is not created. The IF NOT EXISTS clause is useful for SQL scripts where you want to create an object if it does not already exist. For related information, see ON_ERROR_STOP.</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ database .]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject</td>
</tr>
<tr>
<td><strong>sequence</strong></td>
<td>Identifies the sequence to create, where <em>sequence</em> conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.</td>
</tr>
<tr>
<td><strong>INCREMENT [BY] integer</strong></td>
<td>A positive or negative integer that specifies how much to increment or decrement the sequence on each call to NEXTVAL, by default set to 1.</td>
</tr>
<tr>
<td><strong>Note:</strong> Setting this parameter to <em>integer</em> guarantees that column values always increment by at least <em>integer</em>. However, column values can sometimes increment by more than <em>integer</em> unless you also set the NO CACHE parameter.</td>
<td></td>
</tr>
<tr>
<td><strong>MINVALUE integer NO MINVALUE (default)</strong></td>
<td>Determines the minimum value a sequence can generate. If you omit this clause or specify NO MINVALUE, default values are used: 1 and -2^{63}-1 for ascending and descending sequences, respectively.</td>
</tr>
<tr>
<td><strong>MAXVALUE integer NO MAXVALUE (default)</strong></td>
<td>Determines the maximum value for the sequence. If you omit this clause or specify NO MAXVALUE, default values are used: 2^{63}.1 and -1 for ascending and descending sequences, respectively.</td>
</tr>
<tr>
<td><strong>START [WITH] integer</strong></td>
<td>Sets the sequence start value to <em>integer</em>. The next call to NEXTVAL returns <em>integer</em>. If you omit this clause, the sequence start value is set to MINVALUE for ascending sequences, and MAXVALUE for descending sequences.</td>
</tr>
<tr>
<td><strong>CACHE integer NO CACHE</strong></td>
<td>Specifies whether to cache unique sequence numbers on each node for faster access. CACHE takes an integer argument as follows:</td>
</tr>
<tr>
<td></td>
<td>• &gt;1 specifies how many unique numbers each node caches per session.</td>
</tr>
<tr>
<td></td>
<td>• 0 or 1 specifies to disable caching (equivalent to NO CACHE).</td>
</tr>
<tr>
<td></td>
<td>If you omit this clause, the sequence cache is set to 250,000.</td>
</tr>
<tr>
<td></td>
<td>For details, see Sequence Caching in the Administrator's Guide.</td>
</tr>
<tr>
<td><strong>CYCLE</strong></td>
<td>Specifies whether the sequence can wrap when its minimum or</td>
</tr>
<tr>
<td>NO CYCLE (default)</td>
<td>maximum values are reached:</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td></td>
<td>CYCLE: The sequence wraps as follows:</td>
</tr>
<tr>
<td></td>
<td>- When an incrementing sequence reaches its upper limit, it is reset to its minimum value.</td>
</tr>
<tr>
<td></td>
<td>- When a decrementing sequence reaches its lower limit, it is reset to its maximum value.</td>
</tr>
<tr>
<td></td>
<td>NO CYCLE (default): Calls to NEXTVAL return an error after the sequence reaches its maximum or minimum value.</td>
</tr>
</tbody>
</table>

**Privileges**

Non-superusers: CREATE privilege on the schema

**Examples**

**See Also**

- ALTER SEQUENCE
- DROP SEQUENCE

**CREATE SUBNET**

Identifies the subnet to which the nodes of a Vertica database belong. Use this statement to configure import/export from a database to other Vertica clusters.

**Syntax**

```
CREATE SUBNET subnet-name WITH 'subnet-prefix'
```

**Parameters**

| subnet-name | A name you assign to the subnet, where subnet-name conforms to conventions described in Identifiers. |
**subnet-prefix**  
The routing prefix expressed in quad-dotted decimal representation.  
Refer to system table `NETWORK_INTERFACES` to get the prefix of all available IP networks.

You can then configure the database to use the subnet for import/export. For details, see  
*Identify the Database or Nodes Used for Import/Export* in the Administrator’s Guide.

**Privileges**

Superuser

**Examples**

```
=> CREATE SUBNET mySubnet WITH '123.4.5.6';
```

**CREATE TABLE**

Creates a table in the logical schema.

**Syntax**

**Create with column definitions**

```
CREATE TABLE [ IF NOT EXISTS ] [[database.]schema.]table (  
  column-definition[,–] [, table-constraint ][,–] )  
[ ORDER BY column[,–] ]  
[ segmentation-spec ]  
[ KSAFE [k-num] ]  
[ partition-clause]  
[ {INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES ]
```

**Create from another table**

```
CREATE TABLE [ IF NOT EXISTS ] [[database.]schema.]table { AS-clause | LIKE-clause }
```

**AS-clause**

```
[ { column-name-list } ]  
[ {INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES ]  
AS [ /*+ LABEL */ ] [ AT epoch ] query [ ENCODED BY column-ref-list ] [ segmentation-spec ]
```

**LIKE-clause**

```
LIKE [[database.]schema.]existing-table  
[ {INCLUDING | EXCLUDING} PROJECTIONS ]  
[ {INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES ]
```
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>IF NOT EXISTS</strong></td>
<td>Specifies to generate an informational message if an object already exists under the specified name. If you omit this option and the object exists, Vertica generates a ROLLBACK error message. In both cases, the object is not created. The IF NOT EXISTS clause is useful for SQL scripts where you want to create an object if it does not already exist. For related information, see ON_ERROR_STOP.</td>
</tr>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td><code>myschema.thisDbObject</code></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>table</code></td>
<td>Identifies the table to create, where <code>table</code> conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.</td>
</tr>
<tr>
<td><code>column-definition</code></td>
<td>Defines a table column. A table can have up to 9800 columns.</td>
</tr>
<tr>
<td><code>table-constraint</code></td>
<td>Adds a constraint to table metadata.</td>
</tr>
<tr>
<td><strong>ORDER BY <code>column[,...]</code></strong></td>
<td>Invalid for external tables, specifies columns from the SELECT list on which to sort the superprojection that is automatically created for this table. The ORDER BY clause cannot include qualifiers ASC or DESC. Vertica always stores projection data in ascending sort order. If you omit the ORDER BY clause, Vertica uses the</td>
</tr>
</tbody>
</table>
**SELECT list order as the projection sort order.**

**segmentation-spec**

Invalid for external tables, specifies how to distribute data for auto-projections of this table. Supply one of the following clauses:

- **hash-segmentation-clause**: Specifies to segment data evenly and distribute across cluster nodes. Vertica recommends segmenting large tables.
- **unsegmented-clause**: Specifies to create an unsegmented projection.

If this clause is omitted, Vertica generates auto-projections with default hash segmentation.

**KSAFE [k-num]**

Invalid for external tables, specifies K-safety of auto-projections created for this table, where *k-num* must be equal to or greater than system K-safety. If you omit this option, the projection uses the system K-safety level.

**partition-clause**

Invalid for external tables, logically divides table data storage through a PARTITION BY clause:

```
PARTITION BY partition-expression
    [ GROUP BY group-expression ] [ ACTIVEPARTITIONCOUNT integer ]
```

**column-name-list**

Valid only when creating a table from a query (AS query), defines column names that map to the query output. If you omit this list, Vertica uses the query output column names. The names in *column-name-list* and queried columns must be the same in number.

For example:

```
CREATE TABLE customer_occupations (name, profession)
    AS SELECT customer_name, occupation FROM customer_dimension;
```

This clause and the ENCODED BY clause are mutually exclusive. Column name lists are invalid for external tables.
### INCLUDE | EXCLUDE

[SCHEMA] PRIVILEGES

Specifies default inheritance of schema privileges for this table:

- **INCLUDE PRIVILEGES** specifies that the table inherits privileges that are set on its schema. This is the default behavior if privileges inheritance is enabled for the schema.
- **EXCLUDE PRIVILEGES** disables inheritance of privileges from the schema.

For details, see Inherited Privileges.

### AS query

**AS** *query*

Creates and loads a table from the results of a query, specified as follows:

```
AS [ /*+ LABEL */ ] [ AT epoch ] query
```

You cannot use **SELECT AS** to query tables containing complex types, even if you do not select the columns with those types. Complex types are supported only in external tables. See Complex Types.

For details, see Creating a Table from a Query.

### ENCODED BY *column-ref-list*

A comma-delimited list of columns from the source table, where each column is qualified by one or both of the following encoding options:

- **ACCESSRANK** *integer*: Overrides the default access rank for a column, useful for prioritizing access to a column. See Prioritizing Column Access Speed.
- **ENCODING** *encoding-type*: Specifies the type of encoding to use on the column. The default encoding type is AUTO.

This option and *column-name-list* are mutually exclusive. This option is invalid for external tables.

### LIKE *existing-table*

Creates the table by replicating an existing table.

You can qualify the **LIKE** clause with one of the following options:
EXCLUDING PROJECTIONS (default): Do not copy projections from the source table.

INCLUDING PROJECTIONS: Copy current projections from the source table for the new table.

{INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES: See description above.

Privileges

Non-superuser:

- CREATE privileges on the table schema
- If creating a table that includes a named sequence:
  - SELECT privilege on sequence object
  - USAGE privilege on sequence schema
- If creating a table with the LIKE clause, source table owner

Examples

See:

- Creating Tables
- Replicating a Table
- Creating a Table from a Query

See Also

- CREATE TEMPORARY TABLE
- CREATE EXTERNAL TABLE AS COPY
- CREATE FLEXIBLE TABLE

Column-Definition

Specifies the name, data type, and constraints to be applied to a column.
## Syntax

```sql
column-name data-type
  [ column-constraint ]
  [ ENCODING encoding-type ]
  [ ACCESSRANK integer ]
```

## Parameters

<table>
<thead>
<tr>
<th><strong>column-name</strong></th>
<th>The name of a column to be created or added.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>data-type</strong></td>
<td>A Vertica-supported data type.</td>
</tr>
<tr>
<td><strong>Tip:</strong></td>
<td>When specifying the maximum column width in a CREATE TABLE statement, use the width in bytes (octets) for any of the string types. Each UTF-8 character might require four bytes, but European languages generally require a little over one byte per character, while Oriental languages generally require a little under three bytes per character.</td>
</tr>
<tr>
<td><strong>column-constraint</strong></td>
<td>A constraint type that Vertica supports—for example, NOT NULL or UNIQUE. For general information, see Constraints.</td>
</tr>
<tr>
<td><strong>ENCODING encoding-type</strong></td>
<td>Specifies the column encoding type, by default set to AUTO.</td>
</tr>
<tr>
<td><strong>ACCESSRANK integer</strong></td>
<td>Overrides the default access rank for a column. Use this parameter to increase or decrease the speed at which Vertica accesses a column. For more information, see Overriding Default Column Ranking.</td>
</tr>
</tbody>
</table>
Example

The following example creates a table named Employee_Dimension and its associated superprojection in the Public schema. The Employee_key column is designated as a primary key, and RLE encoding is specified for the Employee_gender column definition:

```sql
=> CREATE TABLE Public.Employee_Dimension (  
  Employee_key integer PRIMARY KEY NOT NULL,  
  Employee_gender varchar(8) ENCODING RLE,  
  Courtesy_title varchar(8),  
  Employee_first_name varchar(64),  
  Employee_middle_initial varchar(8),  
  Employee_last_name varchar(64)  
);  
```

**Column-Name-List**

Used to rename columns when creating a table or temporary table from a query (CREATE TABLE AS SELECT); also used to specify the column's encoding type and access rank.

**Syntax**

```
column-name-list  
... [ ENCODING encoding-type ]  
... [ ACCESSRANK integer ]  
... [ GROUPED ( column-reference[,..] ) ]
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column-name</td>
<td>Specifies the new name for the column.</td>
</tr>
<tr>
<td>ENCODING encoding-type</td>
<td>Specifies the type of encoding to use on the column. The default encoding type is AUTO.</td>
</tr>
<tr>
<td>ACCESSRANK integer</td>
<td>Overrides the default access rank for a column, useful for prioritizing access to a column. See Prioritizing Column Access Speed in the Administrator's Guide.</td>
</tr>
</tbody>
</table>
GROUPED

Groups two or more columns. For detailed information, see GROUPED Clause.

Requirements

- A column in the list can not specify the column's data type or any constraint. These are derived from the queried table.
- If the query output has expressions other than simple columns (for example, constants or functions) then an alias must be specified for that expression, or the column name list must include all queried columns.
- CREATE TABLE can specify encoding types and access ranks in the column name list or the query's ENCODED BY clause, but not in both. For example, the following CREATE TABLE statement sets encoding and access rank on two columns in the column name list:

  ```sql
  => CREATE TABLE promo1 (state ENCODING RLE ACCESSRANK 1, zip ENCODING RLE,...)
     AS SELECT * FROM customer_dimension ORDER BY customer_state;
  ```

  The next statement specifies the same encoding and access rank in the query's ENCODED BY clause.

  ```sql
  => CREATE TABLE promo2
     AS SELECT * FROM customer_dimension ORDER BY customer_state
     ENCODED BY customer_state ENCODING RLE ACCESSRANK 1, customer_zip ENCODING RLE;
  ```

Column-Constraint

Adds a constraint to a column's metadata. For details, see Constraints.

Syntax

```sql
[ { AUTO_INCREMENT | identity } [ (args) ] ]
[ CONSTRAINT constraint-name ] {
  [ CHECK (expression) [ enabled | disabled ] ]
  [ DEFAULT expression ] [ SET USING expression ] | DEFAULT USING expression ]
  [ NULL | NOT NULL ]
  [ { PRIMARY KEY [ enabled | disabled ] REFERENCES table [ ( column ) ] } ]
  [ UNIQUE [ enabled | disabled ] ]
}
```
### Parameters

#### AUTO_INCREMENT | IDENTITY

Creates a table column whose values are automatically generated by and managed by the database. You cannot change or load values in this column. You can set this constraint on only one table column.

AUTO_INCREMENT and IDENTITY are synonyms. For details on this constraint and optional arguments, see AUTO_INCREMENT and IDENTITY Sequences.

These options are invalid for temporary tables.

#### CONSTRAINT constraint-name

Assigns a name to the constraint, valid for the following constraints:

- PRIMARY KEY
- REFERENCES (foreign key)
- CHECK
- UNIQUE

If you omit assigning a name to these constraints, Vertica assigns its own name. For details, see Naming Constraints.

Vertica recommends that you name all constraints.

#### CHECK (expression)

Adds check condition expression, which returns a Boolean value.

#### DEFAULT

Specifies this column's default value:

```
DEFAULT default-expr
```

Vertica evaluates the DEFAULT expression and sets
<table>
<thead>
<tr>
<th>the column on load operations, if the operation omits a value for the column. For details about valid expressions, see Defining Column Values.</th>
</tr>
</thead>
<tbody>
<tr>
<td>SET USING</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Vertica evaluates the SET USING expression and refreshes column values only when the function <strong>REFRESH_COLUMNS</strong> is invoked. For details about valid expressions, see Defining Column Values.</td>
</tr>
<tr>
<td>DEFAULT USING</td>
</tr>
<tr>
<td>NULL</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>PRIMARY KEY</td>
</tr>
<tr>
<td>REFERENCES</td>
</tr>
<tr>
<td>UNIQUE</td>
</tr>
</tbody>
</table>

**Privileges**

Table owner or user WITH GRANT OPTION is grantor.

- REFERENCES privilege on table to create foreign key constraints that reference this table
- USAGE privilege on schema that contains the table

**Enforcing Constraints**

The following constraints can be qualified with the keyword ENABLED or DISABLED:

- PRIMARY KEY
- UNIQUE
- CHECK

If you omit ENABLED or DISABLED, Vertica determines whether to enable the constraint automatically by checking the appropriate configuration parameter:

- EnableNewPrimaryKeysByDefault
- EnableNewUniqueKeysByDefault
- EnableNewCheckConstraintsByDefault

For details, see Constraint Enforcement.
# Partition Clause

Specifies partitioning of table data, through a PARTITION BY clause in the table definition:

\[
\text{PARTITION BY partition-expression [ GROUP BY group-expression ] [ ActivePartitionCountExpr ]}
\]

<table>
<thead>
<tr>
<th><strong>PARTITION BY partition-expression</strong></th>
<th>For each table row, resolves to a partition key that is derived from one or more table columns.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Caution:</strong></td>
<td>Avoid partitioning tables on LONG VARBINARY and LONG VARCHAR columns. Doing so can adversely impact performance.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>GROUP BY group-expression</strong></th>
<th>For each table row, resolves to a partition group key that is derived from the partition key. Vertica uses group keys to merge partitions into separate partition groups. GROUP BY must use the same expression as PARTITION BY. For example:</th>
</tr>
</thead>
</table>
|                                      | ```sql
...PARTITION BY (i+j) GROUP BY (CASE WHEN (i+j) < 5 THEN 1 WHEN (i+j) < 10 THEN 2 ELSE 3);
``` |
|                                      | For details on partitioning table data by groups, see [Partition Grouping](#) and [Hierarchical Partitioning](#). |

<table>
<thead>
<tr>
<th><strong>ActivePartitionCountExpr</strong></th>
<th>Specifies how many partitions are active for this table, specified as follows:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• In partition clause of CREATE TABLE:</td>
</tr>
</tbody>
</table>
|                                      | ```sql
ACTIVEPARTITIONCOUNT integer
``` |
|                                      | • In partition clause of ALTER TABLE: |
Partitioning Requirements and Restrictions

PARTITION BY expressions can specify leaf expressions, functions, and operators. The following requirements and restrictions apply:

- All table projections must include all columns referenced in the expression; otherwise, Vertica cannot resolve the expression.
- The expression can reference multiple columns, but it must resolve to a single non-null value for each row.

**Note:**
You can avoid null-related errors with the function `ZEROIFNULL`. This function can check a PARTITION BY expression for null values and evaluate them to 0. For example:

```sql
CREATE TABLE t1 (a int, b int) PARTITION BY (ZEROIFNULL(a));
CREATE TABLE
```

- All leaf expressions must be constants or table columns.
- All other expressions must be functions and operators. The following restrictions apply to functions:
  - They must be **immutable**—that is, they return the same value regardless of time and locale and other session- or environment-specific conditions.
  - They cannot be **aggregate functions**.
  - They cannot be **Vertica meta-functions**.
- The expression cannot include queries.
- The expression cannot include user-defined data types such as `Geometry`.

GROUP BY expressions do not support **modulo** (%) operations.
Examples

See Defining Partitions and Hierarchical Partitioning

See Also

Partitioning Tables

**Table-Constraint**

Adds a constraint to table metadata. You can specify table constraints with CREATE TABLE, or add a constraint to an existing table with ALTER TABLE. For details, see Setting Constraints in the Administrator's Guide.

**Note:**

Adding a constraint to a table that is referenced in a view does not affect the view.

Syntax

```
[ CONSTRAINT constraint-name ]
{
... PRIMARY KEY (column[,... ]) [ ENABLED | DISABLED ]
... | FOREIGN KEY (column[,... ] ) REFERENCES table [ (column[,...]) ]
... | UNIQUE (column[,...]) [ ENABLED | DISABLED ]
... | CHECK (expression) [ ENABLED | DISABLED ]
}
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONSTRAINT</td>
<td>Assigns a name to the constraint. Vertica recommends that you name all constraints.</td>
</tr>
<tr>
<td>constraint-name</td>
<td>PRIMARY KEY</td>
</tr>
</tbody>
</table>

Vertica Analytic Database (11.0.x)
<table>
<thead>
<tr>
<th>Constraint Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| PRIMARY KEY | Adds a primary key constraint to a column or group of columns, as follows:  
| PRIMARY KEY (column[,...]) [ENABLED | DISABLED] | You can qualify this constraint with the keyword ENABLED or DISABLED. See Enforcing Constraints below.  
| If you do not name a primary key constraint, Vertica assigns the name C_PRIMARY. |
| FOREIGN KEY | Adds a referential integrity constraint defining one or more columns as foreign keys, as follows:  
| FOREIGN KEY (column[,...]) REFERENCES table [(column[,...])] | If you omit column, Vertica references the primary key in table.  
| If you do not name a foreign key constraint, Vertica assigns the name C_FOREIGN. |
| UNIQUE | Specifies that the data in a column or group of columns is unique with respect to all table rows, as follows:  
| UNIQUE (column[,...]) [ENABLED | DISABLED] | You can qualify this constraint with the keyword ENABLED or DISABLED. See Enforcing Constraints below.  
| If you do not name a unique constraint, Vertica assigns the name C_UNIQUE. |
| CHECK | Specifies a check condition as an expression that returns a Boolean value, as follows:  
| CHECK (expression) [ENABLED | DISABLED] | You can qualify this constraint with the keyword ENABLED or DISABLED. See Enforcing Constraints below. |
If you do not name a check constraint, Vertica assigns the name C_CHECK.

Privileges

Non-superusers: table owner, or the following privileges:

- USAGE on schema
- ALTER on table
- SELECT on table to enable or disable constraint enforcement

Enforcing Constraints

A table can specify whether Vertica automatically enforces a primary key, unique key or check constraint with the keyword ENABLED or DISABLED. If you omit ENABLED or DISABLED, Vertica determines whether to enable the constraint automatically by checking the appropriate configuration parameter:

- EnableNewPrimaryKeysByDefault
- EnableNewUniqueKeysByDefault
- EnableNewCheckConstraintsByDefault

For details, see Constraint Enforcement.

Examples

The following example creates a table (t01) with a primary key constraint.

```
CREATE TABLE t01 (id int CONSTRAINT sampleconstraint PRIMARY KEY);
```

This example creates the same table without the constraint, and then adds the constraint with ALTER TABLE ADD CONSTRAINT

```
CREATE TABLE t01 (id int);
ALTER TABLE t01 ADD CONSTRAINT sampleconstraint PRIMARY KEY(id);
```
The following example creates a table (`addapk`) with two columns, adds a third column to the table, and then adds a primary key constraint on the third column.

```sql
=> CREATE TABLE addapk (col1 INT, col2 INT);
CREATE TABLE

=> ALTER TABLE addapk ADD COLUMN col3 INT;
ALTER TABLE

=> ALTER TABLE addapk ADD CONSTRAINT col3constraint PRIMARY KEY (col3) ENABLED;
WARNING 2623: Column "col3" definition changed to NOT NULL

ALTER TABLE
```

Using the sample table `addapk`, check that the primary key constraint is enabled (`is_enabled` is `t`).

```sql
=> SELECT constraint_name, column_name, constraint_type, is_enabled FROM PRIMARY_KEYS WHERE table_name IN ('addapk');

<table>
<thead>
<tr>
<th>constraint_name</th>
<th>column_name</th>
<th>constraint_type</th>
<th>is_enabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>col3constraint</td>
<td>col3</td>
<td>p</td>
<td>t</td>
</tr>
</tbody>
</table>
(1 row)
```

This example disables the constraint using `ALTER TABLE ALTER CONSTRAINT`.

```sql
=> ALTER TABLE addapk ALTER CONSTRAINT col3constraint DISABLED;
```

Check that the primary key is now disabled (`is_enabled` is `f`).

```sql
=> SELECT constraint_name, column_name, constraint_type, is_enabled FROM PRIMARY_KEYS WHERE table_name IN ('addapk');

<table>
<thead>
<tr>
<th>constraint_name</th>
<th>column_name</th>
<th>constraint_type</th>
<th>is_enabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>col3constraint</td>
<td>col3</td>
<td>p</td>
<td>f</td>
</tr>
</tbody>
</table>
(1 row)
```

For a general discussion of constraints, see [Constraints](#). For additional examples of creating and naming constraints, see [Naming Constraints](#).
CREATE TEMORARY TABLE

Creates a table whose data persists only during the current session. Temporary table data is not visible to other sessions.

Syntax

Create with column definitions

```
   ( column-definition[,...] )
   [ table-constraint ]
   [ ON COMMIT { DELETE | PRESERVE } ROWS ]
   [ NO PROJECTION ]
   [ ORDER BY table-column[,...] ]
   [ segmentation-spec ]
   [ KSAFE [k-num] ]
   [ {INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES ]
```

Create from another table

```
CREATE TEMP[ORARY] TABLE [ IF NOT EXISTS ] [[database.]schema.]table-name
   ( { column-name-list } )
   [ ON COMMIT { DELETE | PRESERVE } ROWS ]
   AS [ /*+ hint[, hint]*/ ] [ AT epoch ] query [ ENCODED BY column-ref-list ]
```

Parameters

<table>
<thead>
<tr>
<th>scope</th>
<th>Specifies visibility of the table definition:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• GLOBAL: The table definition is visible to all sessions, and persists until you explicitly drop the table.</td>
</tr>
<tr>
<td></td>
<td>• LOCAL: the table definition is visible only to the session in which it is created, and is dropped when the session ends.</td>
</tr>
</tbody>
</table>

If no scope is specified, Vertica uses the default that is set by configuration parameter DefaultTempTableLocal.

Regardless of this setting, retention of temporary table data is set by the keywords ON COMMIT DELETE and ON COMMIT PRESERVE (see below).
For more information, see [Creating Temporary Tables](#).

**IF NOT EXISTS**

Specifies to generate an informational message if an object already exists under the specified name. If you omit this option and the object exists, Vertica generates a ROLLBACK error message. In both cases, the object is not created.

The **IF NOT EXISTS** clause is useful for SQL scripts where you want to create an object if it does not already exist.

For related information, see [ON_ERROR_STOP](#).

<table>
<thead>
<tr>
<th><strong>[database.]schema</strong></th>
<th>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td></td>
<td>If you do not specify a schema, the table is created in the default schema.</td>
</tr>
</tbody>
</table>

**table-name**

Identifies the table to create, where `table-name` conforms to conventions described in [Identifiers](#). It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.

**column-definition**

Defines a table column. A table can have up to 9800 columns.

**table-constraint**

Adds a constraint to table metadata.

**ON COMMIT**

Specifies whether data is transaction- or session-scoped:

```
ON COMMIT {PRESERVE | DELETE} ROWS
```

- DELETE (default) marks the temporary table for transaction-scoped data. Vertica removes all table data after each commit.
- PRESERVE marks the temporary table for session-scoped data, which is preserved beyond the lifetime of a single transaction. Vertica removes all table data when the session ends.

**NO PROJECTION**

Prevents Vertica from creating auto-projections for this table. A
superprojection is created only when data is explicitly loaded into this table.

**NO PROJECTION** is invalid with the following clauses:

- ORDER BY
- KSAFE
- Any segmentation clause (**hash-segmentation-clause** or **unsegmented-clause**).

### {INCLUDE} | {EXCLUDE} [SCHEMA] PRIVILEGES

Specifies default inheritance of schema privileges for this table:

- INCLUDE PRIVILEGES specifies that the table inherits privileges that are set on its schema. This is the default behavior if privileges inheritance is enabled for the schema.
- EXCLUDE PRIVILEGES disables inheritance of privileges from the schema.

For details, see Inherited Privileges.

### ORDER BY `table-column[,...]`

Invalid for external tables, specifies columns from the SELECT list on which to sort the superprojection that is automatically created for this table. The ORDER BY clause cannot include qualifiers ASC or DESC. Vertica always stores projection data in ascending sort order.

If you omit the ORDER BY clause, Vertica uses the SELECT list order as the projection sort order.

### `segmentation-spec`

Invalid for external tables, specifies how to distribute data for auto-projections of this table. Supply one of the following clauses:

- **hash-segmentation-clause**: Specifies to segment data evenly and distribute across cluster nodes. Vertica recommends segmenting large tables.
- **unsegmented-clause**: Specifies to create an unsegmented projection.

If this clause is omitted, Vertica generates auto-projections with default hash segmentation.

### KSAFE `[k-num]`

Invalid for external tables, specifies K-safety of auto-projections created for this table, where `k-num` must be equal to or greater
than system K-safety. If you omit this option, the projection uses the system K-safety level.

**Eon Mode:** K-safety of temporary tables is always set to 0, regardless of system K-safety. If a CREATE TEMPORARY TABLE statement sets $k$-*num* greater than 0, Vertica returns an warning.

<table>
<thead>
<tr>
<th>column-name-list</th>
<th>Valid only when creating a table from a query (AS query), defines column names that map to the query output. If you omit this list, Vertica uses the query output column names. The names in column-name-list and queried columns must be the same in number. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>CREATE TABLE customer_occupations (name, profession) AS SELECT customer_name, occupation FROM customer_dimension;</td>
</tr>
<tr>
<td></td>
<td>This clause and the ENCODED BY clause are mutually exclusive. Column name lists are invalid for external tables</td>
</tr>
<tr>
<td>AS query</td>
<td>Creates and loads a table from the results of a query, specified as follows:</td>
</tr>
<tr>
<td></td>
<td>AS [ /*+ LABEL */ ] [ AT epoch ] query</td>
</tr>
<tr>
<td></td>
<td>You cannot use SELECT AS to query tables containing complex types, even if you do not select the columns with those types. Complex types are supported only in external tables. See Complex Types. For details, see Creating a Table from a Query.</td>
</tr>
<tr>
<td>ENCODED BY</td>
<td>A comma-delimited list of columns from the source table, where each column is qualified by one or both of the following encoding options:</td>
</tr>
<tr>
<td>column-ref-list</td>
<td>• ACCESSRANK  <em>integer</em>: Overrides the default access rank for a column, useful for prioritizing access to a column. See Prioritizing Column Access Speed.</td>
</tr>
<tr>
<td></td>
<td>• ENCODING  <em>encoding-type</em>: Specifies the type of encoding to use on the column. The default encoding type is AUTO.</td>
</tr>
</tbody>
</table>
This option and column-name-list are mutually exclusive.
This option is invalid for external tables

Privileges

The following privileges are required:

- CREATE privileges on the table schema
- If creating a temporary table that includes a named sequence:
  - SELECT privilege on sequence object
  - USAGE privilege on sequence schema

Restrictions

- Queries on temporary tables are subject to the same restrictions on SQL support as persistent tables.
- You cannot add projections to non-empty, global temporary tables (ON COMMIT PRESERVE ROWS). Make sure that projections exist before you load data. See Auto-Projections in the Administrator’s Guide.
- While you can add projections for temporary tables that are defined with ON COMMIT DELETE ROWS specified, be aware that you might lose all data.
- Mergeout operations cannot be used on session-scoped temporary data.
- In general, session-scoped temporary table data is not visible using system (virtual) tables.
- Temporary tables do not recover. If a node fails, queries that use the temporary table also fail. Restart the session and populate the temporary table.

See Also

- Creating Temporary Tables
- ALTER TABLE
- CREATE TABLE

CREATE TEXT INDEX

Creates a text index used to perform text searches. If data within a table is partitioned, then an extra column appears in the text index, showing the partition.
## Syntax

```sql
CREATE TEXT INDEX [[database.]schema.]txtindex-name
ON [schema.]source-table (unique-id, text-field [, column-name,...])
[STEMMER (stemmer-name(stemmer-input-data-type)| NONE])
[TOKENIZER tokenizer-name(tokenizer-input-data-type)];
```

## Parameters

<table>
<thead>
<tr>
<th><strong>Parameter</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td></td>
<td>If you do not specify a schema, the table is created in the default schema.</td>
</tr>
<tr>
<td><code>txtindex-name</code></td>
<td>The text index name.</td>
</tr>
<tr>
<td><code>source-table</code></td>
<td>The source table to index.</td>
</tr>
<tr>
<td><code>unique-id</code></td>
<td>The name of the column in the source table that contains a unique identifier. Any data type is permissible. The column must be the primary key in</td>
</tr>
<tr>
<td></td>
<td>the source table.</td>
</tr>
<tr>
<td><code>text-field</code></td>
<td>The name of the column in the source table that contains the text field. Valid data types are:</td>
</tr>
<tr>
<td></td>
<td>- CHAR</td>
</tr>
<tr>
<td></td>
<td>- VARCHAR</td>
</tr>
<tr>
<td></td>
<td>- LONG VARCHAR</td>
</tr>
<tr>
<td></td>
<td>- VARBINARY</td>
</tr>
<tr>
<td></td>
<td>- LONG VARBINARY</td>
</tr>
<tr>
<td></td>
<td>Nulls are allowed.</td>
</tr>
<tr>
<td><code>column-name</code></td>
<td>The name of a column or columns to be included as additional columns.</td>
</tr>
<tr>
<td>stemmer-name</td>
<td>The name of the stemmer.</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------</td>
</tr>
<tr>
<td>stemmer-input-data-type</td>
<td>The input data type of the stemmer-name function.</td>
</tr>
<tr>
<td>tokenizer-name</td>
<td>Specifies the name of the tokenizer.</td>
</tr>
<tr>
<td>tokenizer-input-data-type</td>
<td>This value is the input data type of the tokenizer-name function. It can accept any number of arguments.</td>
</tr>
<tr>
<td></td>
<td>If a Vertica Tokenizers is used, then this parameter can be omitted.</td>
</tr>
</tbody>
</table>

**Privileges**

The index automatically inherits the query permissions of its parent table. The table owner and dbadmin will be allowed to create and/or modify the indices.

**Important:**

Do not alter the contents or definitions of the text index. If the contents or definitions of the text index are altered, then the results will not appropriately match the source table.

**Requirements**

- Requires there be a column with a unique identifier set as the primary key.
- The source table must have an associated projection, and must be both sorted and segmented by the primary key.

**Examples**

The following example shows how to create a text index with an additional unindexed column on the table t_log using the CREATE TEXT INDEX statement:

```
=> CREATE TEXT INDEX t_log_index ON t_log (id, text, day_of_week);
CREATE INDEX
=> SELECT * FROM t_log_index;
   token | doc_id | day_of_week
--------|-------|-------------
'catalog'  | 1     | Monday
'dbadmin'  | 2     | Monday
```
The following example shows a text index, `tpart_index`, created from a partitioned source table:

```sql
=> SELECT * FROM tpart_index;

<table>
<thead>
<tr>
<th>token</th>
<th>doc_id</th>
<th>partition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>4</td>
<td>2014</td>
</tr>
<tr>
<td>0</td>
<td>5</td>
<td>2014</td>
</tr>
<tr>
<td>11:00:49.568</td>
<td>4</td>
<td>2014</td>
</tr>
<tr>
<td>11:00:49.568</td>
<td>5</td>
<td>2014</td>
</tr>
<tr>
<td>11:00:49.569</td>
<td>6</td>
<td>2014</td>
</tr>

</tr>
</tbody>
</table>
```

(89 rows)
CREATE USER

Adds a name to the list of authorized database users.

Note:
New users lack default access to schema PUBLIC. Be sure to assign new users USAGE privileges to the PUBLIC schema (GRANT USAGE ON SCHEMA PUBLIC)

Syntax

CREATE USER user-name [ account-parameter value[,] ]

Parameters

<table>
<thead>
<tr>
<th>user-name</th>
<th>Name of the new user. Names that contain special characters must be double-quoted. To enforce case-sensitivity, use double-quotes.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>For details on name requirements, see Creating a Database Name and Password.</td>
</tr>
<tr>
<td>account-parameter value</td>
<td>One or more user account parameter settings (see below).</td>
</tr>
</tbody>
</table>

User Account Parameters

Specify one or more user account parameters as a comma-delimited list:

account-parameter setting[,]
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCOUNT</td>
<td>Locks or unlocks user access to the database, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- UNLOCK (default)</td>
</tr>
<tr>
<td></td>
<td>- LOCK prevents a new user from logging in. This can be useful when creating an account for a user who does not need immediate access.</td>
</tr>
<tr>
<td></td>
<td><strong>Tip:</strong></td>
</tr>
<tr>
<td></td>
<td>To automate account locking, set a maximum number of failed login attempts with CREATE PROFILE.</td>
</tr>
<tr>
<td>GRACEPERIOD</td>
<td>Specifies how long a user query can block on any session socket, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- NONE (default): Removes any grace period previously set on session queries.</td>
</tr>
<tr>
<td></td>
<td>- 'interval': Specifies as an interval the maximum grace period for current session queries, up to 20 days.</td>
</tr>
<tr>
<td></td>
<td>For details, see Handling Session Socket Blocking.</td>
</tr>
<tr>
<td>IDENTIFIED BY</td>
<td>Sets the user's password as follows:</td>
</tr>
<tr>
<td></td>
<td>IDENTIFIED BY { `'[password]'</td>
</tr>
<tr>
<td></td>
<td>- <strong>password</strong>: ASCII password that Vertica then hashes for internal storage. An empty string enables this user to access the database with no password.</td>
</tr>
<tr>
<td></td>
<td>- <strong>hashed-password</strong>: A pre-hashed password and its associated hex string hash-salt. Setting a password this way bypasses all password complexity requirements.</td>
</tr>
<tr>
<td></td>
<td><strong>Important:</strong></td>
</tr>
<tr>
<td></td>
<td>If you omit this parameter, this user can access the database with no password.</td>
</tr>
<tr>
<td></td>
<td>For details, see Password Guidelines and Creating a Database Name and Password.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Settings</td>
</tr>
<tr>
<td>------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>IDLESESSIONTIMEOUT</td>
<td>The length of time the system waits before disconnecting an idle session, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• NONE (default): No limit set for this user. If you omit this parameter, no limit is set for this user.</td>
</tr>
<tr>
<td></td>
<td>• 'interval': An interval value, up to one year.</td>
</tr>
<tr>
<td></td>
<td>For details, see Managing Client Connections.</td>
</tr>
<tr>
<td>MAXCONNECTIONS</td>
<td>Sets the maximum number of connections the user can have to the server, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• NONE (default): No limit set. If you omit this parameter, the user can have an unlimited number of connections across the database cluster.</td>
</tr>
<tr>
<td></td>
<td>• integer ON DATABASE: Sets to integer the maximum number of connections across the database cluster.</td>
</tr>
<tr>
<td></td>
<td>• integer ON NODE: Sets to integer the maximum number of connections to each node.</td>
</tr>
<tr>
<td></td>
<td>For details, see Managing Client Connections.</td>
</tr>
<tr>
<td>MEMORYCAP</td>
<td>Sets how much memory can be allocated to user requests, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• NONE (default): No limit</td>
</tr>
<tr>
<td></td>
<td>• A string value that specifies the memory limit, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• 'int%' expresses the maximum as a percentage of total memory available to the Resource Manager, where int is an integer value between 0 and 100. For example:</td>
</tr>
<tr>
<td></td>
<td>MEMORYCAP '40%'</td>
</tr>
<tr>
<td></td>
<td>• 'int{K</td>
</tr>
<tr>
<td></td>
<td>MEMORYCAP '10G'</td>

<td>PASSWORD EXPIRE</td>
<td>Forces immediate expiration of the user's password. The</td>
</tr>
<tr>
<td>Parameter</td>
<td>Settings</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------</td>
</tr>
<tr>
<td>user</td>
<td>user must change the password on the next login.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>PASSWORD EXPIRE has no effect when using external password authentication methods such as LDAP or Kerberos.</td>
</tr>
<tr>
<td>PROFILE</td>
<td>Assigns a profile that controls password requirements for this user, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- DEFAULT (default): Assigns the default database profile to this user.</td>
</tr>
<tr>
<td></td>
<td>- profile-name: A profile that is defined by CREATE PROFILE.</td>
</tr>
<tr>
<td></td>
<td>If you omit this parameter, the user is assigned the default profile.</td>
</tr>
<tr>
<td>RESOURCE_POOL</td>
<td>Assigns a default resource pool to this user. The user must also be granted privileges to this pool, unless privileges to the pool are set to PUBLIC.</td>
</tr>
<tr>
<td>RUNTIMECAP</td>
<td>Sets how long this user's queries can execute, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- NONE (default): No limit set for this user. If you omit this parameter, no limit is set for this user.</td>
</tr>
<tr>
<td></td>
<td>- 'interval': An interval value, up to one year.</td>
</tr>
<tr>
<td></td>
<td>A query's runtime limit can be set at three levels: the user's runtime limit, the user's resource pool, and the session setting. For more information, see Setting a Runtime Limit for Queries.</td>
</tr>
<tr>
<td>SEARCH_PATH</td>
<td>Specifies the user's default search path, that tells Vertica which schemas to search for unqualified references to tables and UDFs, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- DEFAULT (default): Sets the search path as follows:</td>
</tr>
<tr>
<td></td>
<td>&quot;$user&quot;, public, v_catalog, v_monitor, v_internal</td>
</tr>
<tr>
<td></td>
<td>- Comma-delimited list of schemas.</td>
</tr>
<tr>
<td></td>
<td>For details, see <a href="#">Setting Search Paths</a></td>
</tr>
<tr>
<td>Parameter</td>
<td>Settings</td>
</tr>
<tr>
<td>-----------------</td>
<td>--------------------------------------------------------------------------</td>
</tr>
<tr>
<td>TEMPSPACECAP</td>
<td>Sets how much temporary file storage is available for user requests, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- NONE (default): No limit</td>
</tr>
<tr>
<td></td>
<td>- A string value that specifies the memory limit, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- ( int % ) expresses the maximum as a percentage of total memory available to the Resource Manager, where ( int ) is an integer value between 0 and 100. For example:</td>
</tr>
<tr>
<td></td>
<td>MEMORYCAP ( '40%' )</td>
</tr>
<tr>
<td></td>
<td>- ( int{k</td>
</tr>
<tr>
<td></td>
<td>TEMPSPACECAP ( '10G' )</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser

**User Name Best Practices**

Vertica database user names are logically separate from user names of the operating system in which the server runs. If all the users of a particular server also have accounts on the server's machine, it makes sense to assign database user names that match their operating system user names. However, a server that accepts remote connections might many database users with no local operating system account. In this case, there is no need to connect database and system user names.

**Examples**

```sql
=> CREATE USER Fred IDENTIFIED BY 'Mxyzptlk';
=> GRANT USAGE ON SCHEMA PUBLIC to Fred;
```
CREATE VIEW

Defines a view. Views are read only, so they do not support insert, update, delete, or copy operations.

Syntax

CREATE [ OR REPLACE ] VIEW [[database.]schema.]view [ (column[,…]) ]
{INCLUDE|EXCLUDE} [SCHEMA] PRIVILEGES ] AS query

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OR REPLACE</td>
<td>Specifies to overwrite the existing view view-name. If you omit this option and view-name already exists, CREATE VIEW returns an error.</td>
</tr>
<tr>
<td></td>
<td>Any grants assigned to the view before you execute a CREATE OR REPLACE remain on the updated view. See GRANT (View).</td>
</tr>
<tr>
<td>[database]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>view</td>
<td>Identifies the view to create, where view conforms to conventions described in Identifiers. It must also be unique among all names of</td>
</tr>
<tr>
<td></td>
<td>sequences, tables, projections, views, and models within the same schema.</td>
</tr>
<tr>
<td><strong>column[,...]</strong></td>
<td>List of up to 9800 names to use as view column names. Vertica maps view column names to query columns according to the order of their respective lists. By default, the view uses column names as they are specified in the query.</td>
</tr>
<tr>
<td>-----------------</td>
<td>--------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>query</strong></td>
<td>A <code>SELECT</code> statement that the temporary view executes. The <code>SELECT</code> statement can reference tables, temporary tables, and other views.</td>
</tr>
<tr>
<td>**{INCLUDE</td>
<td>EXCLUDE} [SCHEMA] PRIVILEGES**</td>
</tr>
<tr>
<td></td>
<td>• INCLUDE PRIVILEGES specifies that the view inherits privileges that are set on its schema. This is the default behavior if privileges inheritance is enabled for the schema.</td>
</tr>
<tr>
<td></td>
<td>• EXCLUDE PRIVILEGES disables inheritance of privileges from the schema.</td>
</tr>
<tr>
<td></td>
<td>For details, see <em>Inherited Privileges</em> in the Administrator's Guide.</td>
</tr>
</tbody>
</table>

**Privileges**

See *Creating Views*

**Examples**

The following example shows how to create a view that contains data from multiple tables.

```
=> CREATE VIEW temp_t0 AS SELECT * from t0_p1 UNION ALL
   SELECT * from t0_p2 UNION ALL
   SELECT * from t0_p3 UNION ALL
   SELECT * from t0_p4 UNION ALL
   SELECT * from t0_p5;
```

**See Also**

- ALTER VIEW
- CREATE LOCAL TEMPORARY VIEW
- Creating Views
- DROP VIEW
GRANT (View)
REVOKE (View)

DEACTIVATE DIRECTED QUERY

Deactivates one or more directed queries previously activated by ACTIVATE DIRECTED QUERY.

Syntax

DEACTIVATE DIRECTED QUERY { query-name | input-query }

Arguments

<table>
<thead>
<tr>
<th>query-name</th>
<th>Identifies the directed query to deactivate. To obtain identifiers for directed queries, use GET DIRECTED QUERY, or query the system table DIRECTED_QUERIES.</th>
</tr>
</thead>
<tbody>
<tr>
<td>input-query</td>
<td>The input query of the directed queries to deactivate. Use this argument to deactivate multiple direct queries that map to the same input query.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

DELETE

Removes the specified rows from a table and returns a count of the deleted rows. A count of 0 is not an error, but indicates that no rows matched the condition. An unqualified DELETE statement (omits a WHERE clause) removes all rows but leaves intact table columns, projections, and constraints.

DELETE supports subqueries and joins, so you can delete values in a table based on values in other tables.
Important:
Vertica’s implementation of DELETE differs from traditional databases: it does not delete data from disk storage; it marks rows as deleted so they are available for historical queries.

Syntax

`DELETE [ /*+ LABEL */ ] FROM [[[database.]schema.]table [ where-clause ]]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>LABEL</strong></td>
<td>Assigns a label to a statement in order to identify it for profiling and debugging.</td>
</tr>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td><code>table</code></td>
<td>Any table, including temporary tables.</td>
</tr>
<tr>
<td><code>where-clause</code></td>
<td>Specifies which rows to mark for deletion. If you omit this clause, DELETE behavior varies depending on whether the table is persistent or temporary. See below for details.</td>
</tr>
</tbody>
</table>

Privileges

Table owner or user with GRANT OPTION is grantor.

- DELETE privilege on table
- USAGE privilege on the schema of the target table
- SELECT privilege on a table when the DELETE statement includes a WHERE or SET clause that specifies columns from that table.

Restrictions

You cannot execute DELETE on a projection.
Committing INSERT, UPDATE, and DELETE

Vertica follows the SQL-92 transaction model, so successive INSERT, UPDATE, and DELETE statements are included in the same transaction. You do not need to explicitly start this transaction; however, you must explicitly end it with COMMIT, or implicitly end it with COPY; otherwise Vertica discards all changes that were made within the transaction.

Deleting from Persistent Tables

DELETE removes data directly from the ROS.

Deleting from a Temporary Table

DELETE execution on temporary tables varies, depending on whether the table was created with ON COMMIT DELETE ROWS (default) or ON COMMIT PRESERVE ROWS:

- If DELETE contains a WHERE clause that specifies which rows to remove, behavior is identical: DELETE marks the rows for deletion. In both cases, you cannot roll back to an earlier savepoint.
- If DELETE omits a WHERE clause and the table was created with ON COMMIT PRESERVE ROWS, Vertica marks all table rows for deletion. If the table was created with ON COMMIT DELETE ROWS, DELETE behaves like TRUNCATE TABLE and removes all rows from storage.

Note:
If you issue an unqualified DELETE statement on a temporary table created with ON COMMIT DELETE ROWS, Vertica removes all rows from storage but does not end the transaction.

Examples

The following command removes all rows from temporary table temp1:

```sql
=> DELETE FROM temp1;
```

The following command deletes all records from anchor table T where C1 = C2 - C1.
The following command deletes all records from the customer table in the retail schema where the state attribute is in MA or NH:

```sql
DELETE FROM T WHERE C1=C2-C1;
```

For examples that show how to nest a subquery within a DELETE statement, see Subqueries in UPDATE and DELETE in Analyzing Data.

### See Also

- DROP TABLE
- TRUNCATE TABLE
- Removing Table Data
- Best Practices for DELETE and UPDATE

### DISCONNECT

Closes a connection to another Vertica database that was opened in the same session with CONNECT TO VERTICA.

**Note:**

Closing your session also closes the database connection. However, it is a good practice to explicitly close the connection to the other database, both to free up resources and to prevent issues with other SQL scripts that might be running in your session. Always closing the connection prevents potential errors if you run a script in the same session that attempts to open a connection to the same database, since each session can only have one connection to a given database at a time.

### Syntax

```sql
DISCONNECT db-spec
```
**Parameters**

| db-spec | Specifies the target database, either the database name or DEFAULT. |

**Privileges**

None

**Example**

```sql
=> DISCONNECT DEFAULT;
DISCONNECT
```

**DO**

Executes an anonymous (unnamed) stored procedure without saving it.

**Syntax**

```sql
DO [ LANGUAGE 'language-name' ] $$
source $$;
```

**Parameters**

<table>
<thead>
<tr>
<th>Language-name</th>
<th>Specifies the language of the source. Currently, PLpgSQL is the only supported language.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Default:</strong> PLpgSQL</td>
</tr>
<tr>
<td>source</td>
<td>The source code of the procedure.</td>
</tr>
</tbody>
</table>

**Privileges**

None
Examples

For more complex examples, see Stored Procedures: Use Cases and Examples

This procedure prints the variables in the DECLARE block:

```sql
DO LANGUAGE PLpgSQL $$
DECLARE
  x int := 3;
  y varchar := 'some string';
BEGIN
  RAISE NOTICE 'x = %', x;
  RAISE NOTICE 'y = %', y;
END;
$$;

NOTICE 2005: x = 3
NOTICE 2005: y = some string
```

For more information on RAISE NOTICE, see Errors and Diagnostics.

See Also

- Stored Procedures
- PL/pgSQL
- CREATE PROCEDURE (Stored)

DROP Statements

DROP statements let you delete database objects such as schemas, tables, and users.

DROP ACCESS POLICY

Removes an access policy from a column or row.

Syntax

```
DROP ACCESS POLICY ON table FOR { COLUMN column | ROWS }
```
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>table</code></td>
<td>Name of the table that contains the column access policy to remove</td>
</tr>
<tr>
<td><code>column</code></td>
<td>Name of the column that contains the access policy to remove</td>
</tr>
</tbody>
</table>

### Privileges

Superuser

### Examples

These examples show various cases where you can drop an access policy.

**Drop column access policy:**

```sql
=> DROP ACCESS POLICY ON customer FOR COLUMN Customer_Number;
```

**Drop row access policy on a table:**

```sql
=> DROP ACCESS POLICY ON customer_info FOR ROWS;
```

### DROP AGGREGATE FUNCTION

Drops a user-defined aggregate function (UDAnF) from the Vertica catalog.

### Syntax

```
DROP AGGREGATE FUNCTION [ IF EXISTS ] [[database.]schema.]function( [ arglist ] )
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>IF EXISTS</code></td>
<td>Specifies not to report an error if the function to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.</td>
</tr>
</tbody>
</table>
### database/schema

Specifies a schema, by default public. If `schema` is any schema other than public, you must supply the schema name. For example:

```
myschema.thisDbObject
```

If you specify a database, it must be the current database.

### function

Specifies a name of the SQL function to drop. If the function name is schema-qualified, the function is dropped from the specified schema (as noted above).

### arglist

A comma delimited list of argument names and data types that are passed to the function, formatted as follows:

```
{ [argname] argtype }[,..]
```

- `argname` optionally specifies the argument name, typically a column name.
- `argtype` specifies the argument's data type, where `argtype` matches a Vertica [data type](https://www.vertica.com/docs/11.0.x/rman/sql-ref_manual.html).

## Privileges

Non-superuser: Owner

## Requirements

- To drop a function, you must specify the argument types because several functions might share the same name with different parameters.
- Vertica does not check for dependencies, so if you drop a SQL function where other objects reference it (such as views or other SQL functions), Vertica returns an error when those objects are used and not when the function is dropped.

## Example

The following command drops the `ag_avg` function:

```
=> DROP AGGREGATE FUNCTION ag_avg(numeric);
DROP AGGREGATE FUNCTION
```
See Also

Aggregate Functions (UDAFs)

DROP ANALYTIC FUNCTION

Drops a user-defined analytic function from the Vertica catalog.

Syntax

```
DROP ANALYTIC FUNCTION [ IF EXISTS ] [[database.]schema.]function( [ arglist ] )
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF EXISTS</td>
<td>Specifies not to report an error if the function to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>function</td>
<td>Specifies a name of the SQL function to drop. If the function name is schema-qualified, the function is dropped from the specified schema (as noted above).</td>
</tr>
</tbody>
</table>
| arglist           | A comma delimited list of argument names and data types that are passed to the function, formatted as follows: `{ [argname] argtype }[,...]`  

- `argname` optionally specifies the argument name, typically a column name.  
- `argtype` specifies the argument's data type, where `argtype` matches a Vertica data type.
Privileges

Non-superuser: Owner

Requirements

- To drop a function, you must specify the argument types because several functions might share the same name with different parameters.
- Vertica does not check for dependencies, so if you drop a SQL function where other objects reference it (such as views or other SQL functions), Vertica returns an error when those objects are used and not when the function is dropped.

Example

The following command drops the analytic_avg function:

```sql
=> DROP ANALYTIC FUNCTION analytic_avg(numeric);
DROP ANALYTIC FUNCTION
```

See Also

Analytic Functions (UDAnFs)

DROP AUTHENTICATION

Drops an authentication method.

Syntax

```
DROP AUTHENTICATION [ IF EXISTS ] auth-method-name [ CASCADE ]
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| IF EXISTS     | Specifies not to report an error if the authentication method to
drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

<table>
<thead>
<tr>
<th>auth-method-name</th>
<th>Name of the authentication method to drop.</th>
</tr>
</thead>
<tbody>
<tr>
<td>CASCADE</td>
<td>Required if the authentication method to drop is granted to users. In this case, omission of this option causes the drop operation to fail.</td>
</tr>
</tbody>
</table>

## Privileges

Superuser

## Examples

Delete authentication method md5_auth:

```sql
=> DROP AUTHENTICATION md5_auth;
```

Use CASCADE to drop authentication method that was granted to a user:

```sql
=> CREATE AUTHENTICATION localpwd METHOD 'password' LOCAL;
=> GRANT AUTHENTICATION localpwd TO jsmith;
=> DROP AUTHENTICATION localpwd CASCADE;
```

## See Also

- ALTER AUTHENTICATION
- CREATE AUTHENTICATION
- GRANT (Authentication)
- REVOKE (Authentication)

## DROP CA BUNDLE

Drops a certificate authority (CA) bundle.
**Syntax**

```sql
DROP CA BUNDLE [ IF EXISTS ] name [,..] [ CASCADE ]
```

**Parameters**

<table>
<thead>
<tr>
<th>IF EXISTS</th>
<th>Vertica does not report an error if the CA bundle to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the CA bundle.</td>
</tr>
<tr>
<td>CASCADE</td>
<td>Drops dependent objects before dropping the CA bundle.</td>
</tr>
</tbody>
</table>

**Privileges**

Ownership of the CA bundle

**Examples**

See Managing CA Bundles.

**See Also**

- CREATE CA BUNDLE
- ALTER CA BUNDLE

**DROP CERTIFICATE**

Drops a TLS certificate from the database.

To view existing certificates, query CERTIFICATES.

**Syntax**

```sql
DROP CERTIFICATE [ IF EXISTS ] certificate-name [,..] [ CASCADE ]
```
**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF EXISTS</td>
<td>Vertica does not report an error if the certificate to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.</td>
</tr>
<tr>
<td>certificate-name</td>
<td>The name of the certificate to drop.</td>
</tr>
<tr>
<td>CASCADE</td>
<td>Drops dependent objects before dropping the certificate.</td>
</tr>
</tbody>
</table>

**Privileges**

Ownership of the certificate

**Examples**

Drop server_cert, if it exists:

```sql
=> DROP CERTIFICATE server_cert;
DROP CERTIFICATE;
```

Drop a CA certificate and its dependencies (typically the certificates that it has signed):

```sql
=> DROP CERTIFICATE ca_cert CASCADE;
DROP CERTIFICATE;
```

**See Also**

- CREATE CERTIFICATE
- DROP KEY

**DROP DIRECTED QUERY**

Removes a directed query from the database. If the directed query is active, Vertica deactivates it before removal.
Syntax

DROP DIRECTED QUERY directed-query-id

Arguments

| directed-query-id | Identifies the directed query to remove from the database. To obtain identifiers for directed queries, use GET DIRECTED QUERY, or query the system table DIRECTED_QUERIES. |

Privileges

Superuser

DROP FAULT GROUP

Removes the specified fault group and its child fault groups, placing all nodes under the parent of the dropped fault group.

To drop all fault groups, use ALTER DATABASE..DROP ALL FAULT GROUP.

To add an orphaned node back to a fault group, you must manually reassign it to a new or existing fault group with CREATE FAULT GROUP and ALTER FAULT GROUP...ADD NODE.

Tip:
For a list of all fault groups defined in the cluster, query system table FAULT_GROUPS.

Syntax

DROP FAULT GROUP [ IF EXISTS ] fault-group
Parameters

| IF EXISTS | Specifies not to report an error if fault-group does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them. |
| fault-group | Specifies the name of the fault group to drop. |

Privileges

Superuser

Examples

```sql
=> DROP FAULT GROUP group2;
DROP FAULT GROUP
```

See Also

- Fault Groups
- High Availability with Fault Groups
- CLUSTER_LAYOUT

DROP FILTER

Drops a User Defined Load Filter function from the Vertica catalog.

Syntax

```
DROP FILTER [[database.]schema.]filter()
```
Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>database ( . ) schema</td>
<td>Specifies a schema, by default public. If \textit{schema} is any schema other than public, you must supply the schema name. For example: &lt;br&gt; \texttt{myschema.thisDbObject} &lt;br&gt; If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>

| filter() | Specifies the filter function to drop. You must append empty parentheses to the function name. |

Privileges

Non-superuser:

- Owner or \texttt{DROP} privilege
- USAGE privilege on schema

Example

The following command drops the \texttt{Iconverter} filter function:

```sql
=> drop filter Iconverter();
DROP FILTER
```

See Also

- \texttt{ALTER FUNCTION (Scalar)}
- \texttt{CREATE FILTER}
- \texttt{USER_FUNCTIONS}
- User-Defined Load (UDL)
# DROP FUNCTION

Drops an SQL function or user-defined functions (UDFs) from the Vertica catalog.

## Syntax

```
DROP FUNCTION [ IF EXISTS ] [[database.]schema.]function[,..] ( [ arg-list ] )
```

## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>IF EXISTS</strong></td>
<td>Specifies not to report an error if the function to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.</td>
</tr>
<tr>
<td><strong>[database.]schema</strong></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than <code>public</code>, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>
| **function**       | The SQL or user-defined function (UDF) to drop, where UDFs can be one of the following types:  
  - Scalar function ([UDSF])  
  - Analytic function ([UDAnF])  
  - Load ([UDL]) functions: `source`, `filter`, and `parser`  
  

Note: You drop aggregate and transformation functions with `DROP AGGREGATE FUNCTION` and `DROP TRANSFORM FUNCTION`, respectively.

| **arg-list**       | A comma-delimited list of arguments as defined for this function when it was created, specified as follows:  
  
  ```
  [arg-name] arg-type[..]
  ```  

where arg-name optionally qualifies arg-type:

- arg-name is typically a column name.
- arg-type is the name of an SQL data type supported by Vertica.

## Privileges

Non-superuser, one of the following:

- Owner or [DROP privilege](#)
- USAGE privilege on schema

## Requirements

- To drop a function, you must specify the argument types because several functions might share the same name with different parameters.
- Vertica does not check for dependencies when you drop a SQL function, so if other objects reference it (such as views or other SQL functions), Vertica returns an error only when those objects are used.

## Example

The following command drops the zerowhennull function in the macros schema:

```sql
=> DROP FUNCTION macros.zerowhennull(x INT);
DROP FUNCTION
```

## See Also

### DROP KEY

Drops a cryptographic key from the database.

To view existing cryptographic keys, query [CRYPTOGRAPHIC KEYS](#).
### Syntax

```
DROP KEY [ IF EXISTS ] key-name [, ...] [ CASCADE ]
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF EXISTS</td>
<td>Vertica does not report an error if the key to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.</td>
</tr>
<tr>
<td>key-name</td>
<td>The name of the cryptographic key to drop.</td>
</tr>
<tr>
<td>CASCADE</td>
<td>Drops dependent objects before dropping the key.</td>
</tr>
</tbody>
</table>

### Privileges

Ownership of the key

### Examples

Drop `k_ca`, if it exists:

```
=> DROP KEY k_ca IF EXISTS;
DROP KEY;
```

Drop `k_client` and its dependencies (the certificate it's associated with):

```
=> DROP KEY k_client CASCADE;
DROP KEY;
```

### See Also

- CREATE KEY
- DROP CERTIFICATE
# DROP LIBRARY

Removes a shared library from the database. The library file is deleted from managed directories on the Vertica nodes. The user defined functions (UDFs) in the library are no longer available. See Developing User-Defined Extensions (UDxs) in Extending Vertica for details.

## Syntax

```
DROP LIBRARY [ IF EXISTS ] [[database.]schema.]library [ CASCADE]
```

## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF EXISTS</td>
<td>Specifies not to report an error if the library to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.</td>
</tr>
<tr>
<td>[database .]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject</td>
</tr>
<tr>
<td>library</td>
<td>The name of the library to drop, the same name used in CREATE LIBRARY to load the library.</td>
</tr>
<tr>
<td>CASCADE</td>
<td>Drops any functions that were defined using the library. DROP LIBRARY fails if CASCADE is omitted and one or more UDFs use the target library.</td>
</tr>
</tbody>
</table>

## Privileges

Superuser

## Examples

```
=> DROP LIBRARY MyFunctions CASCADE;
```
DROP LOAD BALANCE GROUP

Deletes a load balancing group.

Syntax

DROP LOAD BALANCE GROUP [ IF EXISTS ] group_name [ CASCADE ]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF EXISTS</td>
<td>Specifies not to report an error if the load balance group to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.</td>
</tr>
<tr>
<td>group_name</td>
<td>The name of the group to drop.</td>
</tr>
<tr>
<td>[CASCADE]</td>
<td>Also drops all load balancing routing rules that target this group. If you do not supply this keyword and one or more routing rules target group_name, this statement fails with an error message.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

Examples

The following statement demonstrates the error you get if the load balancing group has a dependent routing rule, and the use of the CASCADE keyword:

```sql
=> DROP LOAD BALANCE GROUP group_all;
NOTICE 4927: The RoutingRule catch_all depends on LoadBalanceGroup group_all
ROLLBACK 3128: DROP failed due to dependencies
DETAIL: Cannot drop LoadBalanceGroup group_all because other objects depend on it
HINT: Use DROP ... CASCADE to drop the dependent objects too

=> DROP LOAD BALANCE GROUP group_all CASCADE;
DROP LOAD BALANCE GROUP
```
See Also

DROP MODEL

Removes one or more models from the Vertica database.

Syntax

DROP MODEL [ IF EXISTS ] [[database.]schema.]model[, ...]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF EXISTS</td>
<td>Specifies not to report an error if the models to drop do not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>model</td>
<td>The model to drop.</td>
</tr>
</tbody>
</table>

Privileges

One of the following:

- Superuser
- Non-superuser: model owner

Examples

See Dropping Models in Analyzing Data.
DROP NETWORK ADDRESS

Deletes a network address from the catalog. A network address is a name for a IP address and port on a node for use in connection load balancing policies.

Syntax

DROP NETWORK ADDRESS [ IF EXISTS ] address-name [ CASCADE ]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF EXISTS</td>
<td>Specifies not to report an error if the network address to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.</td>
</tr>
<tr>
<td>address-name</td>
<td>Name of the network address to drop.</td>
</tr>
<tr>
<td>CASCADE</td>
<td>Removes the network address from any load balancing groups that target it. If you do not supply this keyword and one or more load balance groups include this address, this statement fails with an error message.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

Examples

The following statement demonstrates the error you get if the network address has a dependent load balance group, and the use of the CASCADE keyword:

```
=> DROP NETWORK ADDRESS node01;
NOTICE 4927:  The LoadBalanceGroup group_1 depends on NetworkInterface node01
NOTICE 4927:  The LoadBalanceGroup group_random depends on NetworkInterface node01
ROLLBACK 3128:  DROP failed due to dependencies
DETAIL:  Cannot drop NetworkInterface node01 because other objects depend on it
HINT:   Use DROP ... CASCADE to drop the dependent objects too
=> DROP NETWORK ADDRESS node01 CASCADE;
```
DROP NETWORK INTERFACE

Removes a network interface from Vertica. You can use the CASCADE option to also remove the network interface from any node definition. (See Identify the Database or Nodes Used for Import/Export for more information.)

Syntax

DROP NETWORK INTERFACE [ IF EXISTS ] network-interface-name [ CASCADE ]

Parameters

The parameters are defined as follows:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF EXISTS</td>
<td>Specifies not to report an error if the network interface to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.</td>
</tr>
<tr>
<td>network-interface-name</td>
<td>The network interface to remove.</td>
</tr>
<tr>
<td>CASCADE</td>
<td>Removes the network interface from all node definitions.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

Examples

=> DROP NETWORK INTERFACE myNetwork;
DROP NOTIFIER

Drops a push-based notifier created by `CREATE NOTIFIER`.

**Syntax**

```
DROP NOTIFIER [ IF EXISTS ] notifier-name
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>IF EXISTS</strong></td>
<td>Specifies not to report an error if notifier to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.</td>
</tr>
<tr>
<td><strong>notifier-name</strong></td>
<td>The notifier's unique identifier.</td>
</tr>
</tbody>
</table>

DROP PARSER

Drops a User Defined Load Parser function from the Vertica catalog.

**Syntax**

```
DROP PARSER([database.]schema.]parser()
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>database</strong></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td><strong>schema</strong></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td><strong>parser()</strong></td>
<td>The name of the parser function to drop. You must append empty parentheses to the function name.</td>
</tr>
</tbody>
</table>

If you specify a database, it must be the current database.
Privileges

Non-superuser:

- Owner or **DROP privilege**
- USAGE privilege on schema

Examples

```sql
=> DROP PARSER BasicIntegerParser();
DROP PARSER
```

See Also

- **ALTER FUNCTION (Scalar)**
- **CREATE PARSER**
- **GRANT (User Defined Extension)**
- **REVOKE (User Defined Extension)**
- **USER_FUNCTIONS**
- **User-Defined Load (UDL)**

DROP PROCEDURE (External)

Enterprise Mode only

Removes an external procedure from Vertica. Only the reference to the procedure inside
Vertica is removed. The external file remains in the `database/procedures` directory of
each database node.

Syntax

```
DROP PROCEDURE [ IF EXISTS ] [[database.]schema.]procedure( [ parameter-list ] )
```

Parameters

<table>
<thead>
<tr>
<th>IF EXISTS</th>
<th>Specifies not to report an error if the procedure to drop does not</th>
</tr>
</thead>
</table>
exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

| database | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:
|          | myschema.thisDbObject
|          | If you specify a database, it must be the current database.

| procedure | Specifies the procedure to drop.
| parameter-list | A comma-delimited list of formal parameters defined for this procedure, specified as follows:
|              | [parameter-name] parameter-type[, …]
|              | where parameter-name optionally qualifies parameter-type.

## Privileges

Non-superuser:

- Owner or DROP privilege
- USAGE privilege on schema

## Example

```sql
=> DROP PROCEDURE helloplanet(arg1 varchar);
```

## See Also

CREATE PROCEDURE (External)

DROP PROCEDURE (STORED)

Drops a stored procedure.
Syntax

DROP PROCEDURE [[database.]schema.]procedure( [ parameter-type-list] );

Parameters

<table>
<thead>
<tr>
<th>[ database .]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>procedure</th>
<th>The name of the stored procedure, where procedure conforms to conventions described in Identifiers.</th>
</tr>
</thead>
</table>

| parameter-type-list | A comma-delimited list of the IN parameters' types. |

Privileges

Non-superuser:

- Owner or DROP privilege
- USAGE privilege on schema

Example

Given the following procedure:

```
=> CREATE PROCEDURE raiseXY(IN x INT, y VARCHAR) language PLpgSQL AS $$
BEGIN
   RAISE NOTICE 'x = %', x;
   RAISE NOTICE 'y = %', y;
   -- some processing statements
END;
$$;

CALL raiseXY(3, 'some string');
NOTICE 2005:  x = 3
NOTICE 2005:  y = some string
```

You can drop it with:
DROP PROCEDURE raiseXY(INT, VARCHAR);

For more information on RAISE NOTICE, see Errors and Diagnostics.

See Also

- CREATE PROCEDURE (Stored)
- DROP PROCEDURE (External)

DROP PROFILE

Removes a user-defined profile (created by CREATE PROFILE) from the database. You cannot drop the DEFAULT profile.

Syntax

DROP PROFILE [ IF EXISTS ] profile-name[,…] [ CASCADE ]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF EXISTS</td>
<td>Specifies not to report an error if the profile to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.</td>
</tr>
<tr>
<td>profile-name</td>
<td>The profile to drop.</td>
</tr>
<tr>
<td>CASCADE</td>
<td>Moves all users assigned to the dropped profiles to the DEFAULT profile. If you omit this option and a targeted profile has users assigned to it, Vertica returns an error.</td>
</tr>
</tbody>
</table>

Privileges

Superuser
Example

=> DROP PROFILE sample_profile;

DROP PROJECTION

Marks a projection to drop from the catalog so it is unavailable to user queries.

Syntax

DROP PROJECTION [ IF EXISTS ] { [[database.]schema.]projection[,..] } [ RESTRICT | CASCADE ]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF EXISTS</td>
<td>Specifies not to report an error if the projection to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>projection</td>
<td>Specifies a projection to drop:</td>
</tr>
<tr>
<td></td>
<td>• If the projection is unsegmented, all projection replicas in the database cluster are dropped.</td>
</tr>
<tr>
<td></td>
<td>• If the projection is segmented, drop all buddy projections by specifying the projection base name. You can also specify the name of a specific buddy projection as long as dropping it so does not violate system K-safety.</td>
</tr>
</tbody>
</table>
See Projection Naming for projection name conventions.

<table>
<thead>
<tr>
<th>RESTRICT</th>
<th>CASCADE</th>
<th>Specifies whether to drop the projection when it contains objects:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>• RESTRICT (default): Drop the projection only if it contains no objects.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• CASCADE: Drop the projection even if it contains objects.</td>
</tr>
</tbody>
</table>

**Privileges**

Non-superuser: owner of the anchor table

**Restrictions**

The following restrictions apply to dropping a projection:

- The projection cannot be the anchor table's superprojection.
- You cannot drop a buddy projection if doing so violates system K-safety.
- Another projection must be available to enforce the same primary or unique key constraint.

**See Also**

- CREATE PROJECTION
- GET_PROJECTIONS

**DROP RESOURCE POOL**

Drops a user-created resource pool. All memory allocated to the pool is returned back to the GENERAL pool.

**Syntax**

DROP RESOURCE POOL pool-name [ FOR { SUBCLUSTER subcluster-name | CURRENT SUBCLUSTER } ]
## Parameters

<table>
<thead>
<tr>
<th>pool-name</th>
<th>Specifies the resource pool to drop.</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ SUBCLUSTER subcluster-name</td>
<td>CURRENT SUBCLUSTER ]</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

## Privileges

Superuser

### Dropping a Secondary Pool

If you try to drop a resource pool that is a secondary pool for another resource pool, Vertica returns an error. The error lists the resource pools that depend on the secondary pool you tried to drop. To drop a secondary resource pool, first set the CASCADE TO DEFAULT on the primary resource pool, and then drop the secondary pool.

For example, you can drop resource pool rp2, which is a secondary pool for rp1, as follows:

```sql
=> ALTER RESOURCE POOL rp1 CASCADE TO DEFAULT;
=> DROP RESOURCE POOL rp2;
```

### Transferring Resource Requests

Any requests queued against the pool are transferred to the GENERAL pool according to the priority of the pool compared to the GENERAL pool. If the pool’s priority is higher than the
GENERAL pool, the requests are placed at the head of the queue; otherwise the requests are placed at the end of the queue.

Any users who are using the pool are switched to use the GENERAL pool with a NOTICE:

```
NOTICE: Switched the following users to the General pool: username
```

DROP RESOURCE POOL returns an error if the user does not have permission to use the GENERAL pool. Existing sessions are transferred to the GENERAL pool regardless of whether the session's user has permission to use the GENERAL pool. This can result in additional user privileges if the pool being dropped is more restrictive than the GENERAL pool. To prevent giving users additional privileges, follow this procedure to drop restrictive pools:

1. Revoke the permissions on the pool for all users.
2. Close any sessions that had permissions on the pool.
3. Drop the resource pool.

**Examples**

This example drops a user-defined resource pool:

```
=> DROP RESOURCE POOL ceo_pool;
```

This Eon Mode example returns the current subcluster, then drops a user-defined resource pool for the current subcluster:

```
=> SELECT CURRENT_SUBCLUSTER_NAME();
CURRENT_SUBCLUSTER_NAME
---------------------------
analytics_1
(1 row)

=> DROP RESOURCE POOL dashboard FOR CURRENT SUBCLUSTER;
DROP RESOURCE POOL
```

**See Also**

- ALTER RESOURCE POOL
- CREATE RESOURCE POOL
- Managing Workloads
# DROP ROLE

Removes a role from the database.

You cannot use DROP ROLE on a role added to the Vertica database with the LDAPLink service.

## Syntax

```
DROP ROLE [ IF EXISTS ] role-name[, ...] [ CASCADE ]
```

## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF EXISTS</td>
<td>Specifies not to report an error if the roles to drop do not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.</td>
</tr>
<tr>
<td>role-name</td>
<td>The name of the role to drop</td>
</tr>
<tr>
<td>CASCADE</td>
<td>Revoke the role from users and other roles before dropping the role</td>
</tr>
</tbody>
</table>

## Privileges

Superuser

## Examples

```
=> DROP ROLE appadmin;
NOTICE: User bob depends on Role appadmin
ROLLBACK: DROP ROLE failed due to dependencies
DETAIL: Cannot drop Role appadmin because other objects depend on it
HINT: Use DROP ROLE ... CASCADE to remove granted roles from the dependent users/roles
=> DROP ROLE appadmin CASCADE;
DROP ROLE
```
See Also

- ALTER ROLE
- CREATE ROLE

DROP ROUTING RULE

Deletes a routing rule from the catalog. Dropping the routing rule

Syntax

DROP ROUTING RULE [ IF EXISTS ] rule-name

Parameters

| IF EXISTS       | Specifies not to report an error if the routing rule to drop does not exist.  
|                 | Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them. |

| rule-name       | Name of the rule to drop. |

Privileges

Superuser

Examples

```sql
=> DROP ROUTING RULE internal_clients;
DROP ROUTING RULE
```
DROP SCHEMA

Permanently removes a schema from the database. Be sure that you want to remove the schema before you drop it, because DROP SCHEMA is an irreversible process. Use the CASCADE parameter to drop a schema containing one or more objects.

Syntax

```sql
DROP SCHEMA [ IF EXISTS ] [database.]schema[,..] [ CASCADE | RESTRICT ]
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF EXISTS</td>
<td>Specifies not to report an error if the schemas to drop do not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.</td>
</tr>
<tr>
<td>[ database.]schema</td>
<td>Name of the schema to drop. If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>CASCADE</td>
<td>Specifies to drop the schema and all objects in it, regardless of who owns those objects.</td>
</tr>
<tr>
<td>RESTRICT</td>
<td>Drops the schema only if it is empty (default).</td>
</tr>
</tbody>
</table>

Caution:

Objects in other schemas that depend on objects in the dropped schema—for example, user-defined functions—also are silently dropped.

Privileges

Non-superuser: schema owner
Restrictions

- You cannot drop the PUBLIC schema.
- If a user is accessing an object within a schema that is in the process of being dropped, the schema is not deleted until the transaction completes.
- Canceling a DROP SCHEMA statement can cause unpredictable results.

Examples

The following example drops schema S1 only if it doesn't contain any objects:

```sql
=> DROP SCHEMA S1;
```

The following example drops schema S1 whether or not it contains objects:

```sql
=> DROP SCHEMA S1 CASCADE;
```

DROP SEQUENCE

Removes the specified named sequence number generator.

Syntax

DROP SEQUENCE [ IF EXISTS ] [[database.]schema.]sequence[, …]

Parameters

| IF EXISTS | Specifies not to report an error if the sequences to drop do not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them. |
| database .]schema | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: |
| myschema.thisDbObject | If you specify a database, it must be the current database. |
| sequence | Name of the sequence to drop. |

**Privileges**

Non-superusers: sequence or schema owner

**Restrictions**

- For sequences specified in a table's default expression, the default expression fails the next time you try to load data. Vertica does not check for these instances.
- `DROP SEQUENCE` does not support the CASCADE keyword. Sequences used in a default expression of a column cannot be dropped until all references to the sequence are removed from the default expression.

**Example**

The following command drops the sequence named `sequential`.

```
=> DROP SEQUENCE sequential;
```

**See Also**

- `ALTER SEQUENCE`
- `CREATE SEQUENCE`
- `CURRVAL`
- `GRANT (Sequence)`
- `NEXTVAL`
- `Sequences`

**DROP SOURCE**

Drops a User Defined Load Source function from the Vertica catalog.

**Syntax**

```
DROP SOURCE [[database.]schema.]source()
```
Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[database .]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: <code>&lt;myschema.thisDbObject&gt;</code>&lt;br&gt; If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>source()</td>
<td>Specifies the source function to drop. You must append empty parentheses to the function name.</td>
</tr>
</tbody>
</table>

Privileges

Non-superuser:

- Owner or DROP privilege
- USAGE privilege on schema

Example

The following command drops the curl source function:

```sql
=> DROP SOURCE curl();
DROP SOURCE
```

See Also

- ALTER FUNCTION (Scalar)
- CREATE SOURCE
- GRANT (User Defined Extension)
- REVOKE (User Defined Extension)
- USER_FUNCTIONS
- User-Defined Load (UDL)

DROP SUBNET

Removes a subnet from Vertica.
Caution:
Before removing a subnet, be sure your database is not configured to allow export on the public subnet.

Syntax

DROP SUBNET [ IF EXISTS ] subnet-name[, ...] [ CASCADE ]

Parameters

The parameters are defined as follows:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF EXISTS</td>
<td>Specifies not to report an error if the subnets to drop do not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.</td>
</tr>
<tr>
<td>subnet-name</td>
<td>A subnet to remove.</td>
</tr>
<tr>
<td>CASCADE</td>
<td>Removes the specified subnets from all database definitions.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

Examples

=> DROP SUBNET mySubnet;

See Also

Identify the Database or Nodes Used for Import/Export

DROP TABLE

Removes one or more tables and their projections. When you run DROP TABLE, the change is auto-committed.
### Syntax

```
DROP TABLE [ IF EXISTS ] [ [database.]schema.]table[,..] [ CASCADE ]
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF EXISTS</td>
<td>Specifies not to report an error if one or more of the tables to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code>&lt;br&gt;If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>table</td>
<td>The table to drop.</td>
</tr>
<tr>
<td>CASCADE</td>
<td>Specifies to drop all projections of the target tables. CASCADE is optional if the target tables have only auto-projections. If you omit this option and any of the tables has non-superprojections, Vertica returns an error and rolls back the entire drop operation.&lt;br&gt;This option is not valid for external tables.</td>
</tr>
</tbody>
</table>

### Privileges

Non-superuser:

- Table: owner, or [DROP privilege](#)
- Table schema: owner, or [USAGE privilege](#)

### Requirements

- Do not cancel an executing DROP TABLE. Doing so can leave the database in an inconsistent state.
- Check that the target table is not in use, either directly or indirectly—for example, in a view.
If you drop and restore a table that is referenced by a view, the new table must have the same name and column definitions.

Examples
See Dropping Tables

See Also
- DROP PROJECTION
- TRUNCATE TABLE

DROP TEXT INDEX

Drops a text index used to perform text searches.

Note:
When a source table is dropped that has a text index associated with it, the text index is also dropped.

Syntax
DROP TEXT INDEX [ IF EXISTS ] [[database.]schema.]idx-table

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF EXISTS</td>
<td>Specifies not to report an error if the text index to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.</td>
</tr>
<tr>
<td>database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>
### idx-table
Specifies the text index name. When using more than one schema, specify the schema that contains the index in the DROP TEXT INDEX statement.

### Privileges
- dbadmin
- Table owner
- DROP privileges on the source table

### Examples

```sql
=> DROP TEXT INDEX t_text_index;
DROP INDEX
```

### See Also
- Using Text Search
- CREATE TEXT INDEX

## DROP TRANSFORM FUNCTION

Drops a user-defined transform function (UDTF) from the Vertica catalog.

### Syntax

```sql
DROP TRANSFORM FUNCTION [ IF EXISTS ] [[database.]schema.]function( [ arg-list ] )
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF EXISTS</td>
<td>Specifies not to report an error if the function to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.</td>
</tr>
<tr>
<td>[database]</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
</tbody>
</table>
If you specify a database, it must be the current database.

**function**

Specifies the transform function to drop.

**arg-list**

A comma-delimited list of arguments as defined for this function when it was created, specified as follows:

```
[arg-name] arg-type[, ...]
```

where *arg-name* optionally qualifies *arg-type*:

- *arg-name* is typically a column name.
- *arg-type* is the name of an **SQL data type** supported by Vertica.

**Note:**

You can omit *arg-list* when dropping a polymorphic function.

---

### Privileges

One of the following:

- Superuser
- Schema or function owner

---

### Example

The following command drops the *tokenize* UDTF in the *macros* schema:

```
=> DROP TRANSFORM FUNCTION macros.tokenize(varchar);
DROP TRANSFORM FUNCTION
```

The following command drops the *Pagerank* polymorphic function in the *online* schema:

```
=> DROP TRANSFORM FUNCTION online.Pagerank();
DROP TRANSFORM FUNCTION
```

---

### See Also

CREATE TRANSFORM FUNCTION
DROP USER

Removes a name from the list of authorized database users.

DROP USER can not remove a user that was added to the Vertica database with the LDAPLink service.

Syntax

DROP USER [ IF EXISTS ] user-name[,...] [ CASCADE ]

Parameters

| IF EXISTS | Specifies not to report an error if the users to drop do not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them. |
| user-name | The name of a user to drop. |
| CASCADE   | Drops all user-defined objects created by the user dropped, including schema, table and all views that reference the table, and the table's associated projections. |

Privileges

Superuser

Examples

DROP USER fails if objects exist that were created by the user, such as schemas, and tables and their associated projections:

```sql
=> DROP USER user1;
NOTICE: Table T_tbd1 depends on User user1
ROLLBACK: DROP failed due to dependencies
DETAIL: Cannot drop User user1 because other objects depend on it
HINT: Use DROP ... CASCADE to drop the dependent objects too
```
DROP USER CASCADE succeeds regardless of any pre-existing user-defined objects. The statement forcibly drops all user-defined objects, such as schemas, tables and their associated projections:

```sql
=> DROP USER user1 CASCADE;
```

**Caution:**
Tables owned by the user being dropped cannot be recovered after you issue DROP USER CASCADE.

DROP USER succeeds if no user-defined objects exist (no schemas, tables or projections defined by the user):

```sql
=> CREATE USER user2;
CREATE USER
=> DROP USER user2;
DROP USER
```

**See Also**

- ALTER USER
- CREATE USER

**DROP VIEW**

Removes the specified view. Vertica does not check for dependencies on the dropped view. After dropping a view, other views that reference it fail.

If you drop a view and replace it with another view or table with the same name and column names, other views that reference that name use the new view. If you change the column data type in the new view, the server coerces the old data type to the new one if possible; otherwise, it returns an error.

**Syntax**

```
DROP VIEW [ IF EXISTS ] [[database.]schema.]view[, ...]
```
**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF EXISTS</td>
<td>Specifies not to report an error if the views to drop do not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.</td>
</tr>
<tr>
<td><code>[ database .]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>view</code></td>
<td>Name of a view to drop.</td>
</tr>
</tbody>
</table>

**Privileges**

One of the following

- View owner and USAGE privileges
- Schema owner

**Examples**

```
=> DROP VIEW myview;
```

**END**

Ends the current transaction and makes all changes that occurred during the transaction permanent and visible to other users.

**Note:**

`COMMIT` is a synonym for `END`.

**Syntax**

```
END [ WORK | TRANSACTION ]
```
Parameters

| WORK | TRANSACTION | Optional keywords that have no effect, for readability only. |

Privileges

None

Examples

```sql
=> BEGIN TRANSACTION ISOLATION LEVEL READ COMMITTED READ WRITE;
BEGIN
=> CREATE TABLE sample_table (a INT);
CREATE TABLE
=> INSERT INTO sample_table (a) VALUES (1);
OUTPUT
-------
1
(1 row)
=> END;
COMMIT
```

See Also

- Transactions
- Creating and Rolling Back Transactions
- BEGIN
- ROLLBACK
- START TRANSACTION

**EXPLAIN**

Returns a formatted description of the Vertica optimizer's plan for executing the specified statement.
Syntax

EXPLAIN [/*+ ALLNODES */] [explain-options] sql-statement

Parameters

| /*+ALLNODES*/ | Specifies to create a query plan that assumes all nodes are active, not valid with LOCAL option. |
| explain-options | One or more EXPLAIN options, specified in the order shown: [ LOCAL ] [ VERBOSE ] [ JSON ] [ ANNOTATED ] |
|                 | - LOCAL: On a multi-node database, shows the local query plans assigned to each node, which together comprise the total (global) query plan. If you omit this option, Vertica shows only the global query plan. Local query plans are shown only in DOT language source, which can be rendered in Graphviz. This option is incompatible with the hint /*+ALL NODES*/. If you specify both, EXPLAIN returns with an error. |
|                 | - VERBOSE: Increases the level of detail in the rendered query plan. |
|                 | - JSON: Renders the query plan in JSON format. This option is compatible only with VERBOSE. |
|                 | - ANNOTATED: Embeds optimizer hints that encapsulate the query plan for this query. Vertica uses these hints to create directed queries. For more information, see Directed Queries in the Administrator's Guide. This option is compatible with LOCAL and VERBOSE. |
| sql-statement   | A query or DML statement—for example, SELECT, INSERT, UPDATE, COPY, and MERGE. |

Privileges

The same privileges required by the specified statement.
Requirements

The following requirements apply to EXPLAIN's ability to produce useful information:

- EXPLAIN produces useful output only if projections are available for the queried tables.
- Qualifier options must be specified in the order shown earlier, otherwise EXPLAIN returns with an error. If an option is incompatible with any preceding options, EXPLAIN ignores them.

Viewing Query Plans in the Administrator's Guide

**EXPORT TO DELIMITED**

Exports a table, columns from a table, or query results to delimited files. The files can be read back in using DELIMITED (Parser). Several exporter parameters have corresponding parser parameters, allowing you to change delimiters, null indicators, and other formatting.

You can use an OVER() clause to partition the data before export. Partitioning data can improve query performance by enabling partition pruning. See Improving Query Performance.

There are some limitations on the queries you can use in an export statement. See Query Restrictions.

You can export data stored in Vertica in ROS format and data from external tables.

This statement returns the number of rows written and logs information about exported files in a system table. See Monitoring Exports.

During an export to HDFS or an NFS mount point, Vertica writes files to a temporary directory in the same location as the destination and renames the directory when the export is complete. Do not attempt to use the files in the temporary directory. During an export to S3, GCS, or Azure, Vertica writes files directly to the destination path, so you must
wait for the export to finish before reading the files. For more information, see Exporting to Object Stores.

**Syntax**

```
EXPORT TO DELIMITED ( directory = 'path'
    [, param=value [,...]] )
[ OVER (over-clause ) ]
AS SELECT query-expression;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>The destination directory for the output files. The directory must not exist, and the current user must have permission to write it. The destination can be on any of the following file systems:</td>
</tr>
<tr>
<td></td>
<td>• HDFS File System</td>
</tr>
<tr>
<td></td>
<td>• S3 Object Store</td>
</tr>
<tr>
<td></td>
<td>• Google Cloud Storage (GCS) Object Store</td>
</tr>
<tr>
<td></td>
<td>• Azure Blob Storage Object Store</td>
</tr>
<tr>
<td></td>
<td>• Linux file system, either an NFS mount or local storage on each node</td>
</tr>
<tr>
<td>addHeader</td>
<td>Whether to add a header row to the beginning of each file.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> false</td>
</tr>
<tr>
<td>delimiter</td>
<td>Column delimiter character. To produce CSV in accordance with RFC 4180, specify ',', (comma).</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong></td>
</tr>
<tr>
<td>recordTerminator</td>
<td>Character that marks the end of a record.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> \n</td>
</tr>
<tr>
<td>enclosedBy</td>
<td>Character to use to enclose string and date/time data. If you omit this parameter, no character encloses these data types.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> &quot; (empty string)</td>
</tr>
<tr>
<td>escapeAs</td>
<td>Character to use to escape values in exported data that must be escaped, including the enclosedBy value.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>nullAs</td>
<td>String to represent null values in the data. If this parameter is included, the exporter exports all null values as this value. Otherwise, the exporter exports null values as zero-length strings.</td>
</tr>
<tr>
<td>binaryTypesFormat</td>
<td>Format for exported BINARY, VARBINARY, and LONG VARBINARY values (Binary Data Types), one of the following:</td>
</tr>
<tr>
<td></td>
<td>- Default: printable ASCII characters where possible and escaped octal representations of the non-printable bytes. The DELIMITED parser reads this format.</td>
</tr>
<tr>
<td></td>
<td>- Hex: Base 16 (hexadecimal) representation; value is preceded by '0x' and bytes are not escaped.</td>
</tr>
<tr>
<td></td>
<td>- Octal: Base 8 (octal) representation, without escaping.</td>
</tr>
<tr>
<td></td>
<td>- Bitstring: binary representation, without escaping.</td>
</tr>
<tr>
<td></td>
<td>For example, the value 'a\000b\001c' would be exported as follows:</td>
</tr>
<tr>
<td></td>
<td>- Default (assuming an escape character of ''):</td>
</tr>
<tr>
<td></td>
<td>a\000b\001c</td>
</tr>
<tr>
<td></td>
<td>- Hex: 0x6100620063</td>
</tr>
<tr>
<td></td>
<td>- Octal: 141000142001143</td>
</tr>
<tr>
<td></td>
<td>- Bitstring:</td>
</tr>
<tr>
<td></td>
<td>01100001000000000110001000000000101100011</td>
</tr>
<tr>
<td>default</td>
<td><strong>Default:</strong> Default</td>
</tr>
<tr>
<td>compression</td>
<td>Compression type, one of BZip, GZip, or Uncompressed.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> Uncompressed</td>
</tr>
<tr>
<td>fileExtension</td>
<td>Output file extension. If using compression, a compression-specific extension (such as '.bz2') is appended.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> 'csv'</td>
</tr>
<tr>
<td>fileSizeMB</td>
<td>The maximum file size of a single output file. This value is a hint, not a hard limit. A value of 0 means there is no limit.</td>
</tr>
<tr>
<td></td>
<td>This value affects the size of individual output files, not the total output size. For smaller values Vertica divides the output into more files; all data is still exported.</td>
</tr>
</tbody>
</table>
Default: 10GB

**fileMode**

For writes to HDFS only, permission to apply to all exported files. You can specify the value in Unix octal format (such as '665') or "user-group-other" format (such as 'rwxr-xr-x'). The value must be formatted as a string even if using the octal format.

Valid octal values range from '0' to '1777'. See [HDFS Permissions](#) in the Apache Hadoop documentation.

When writing files to any destination other than HDFS, this parameter has no effect.

**Default:** '660', regardless of the value of fs.permissions.umask-mode in hdfs-site.xml.

**dirMode**

For writes to HDFS only, permission to apply to all exported directories. Values follow the same rules as those for *fileMode*. Further, you must give the Vertica HDFS user full permission (at least 'rwx------' or '700').

When writing files to any destination other than HDFS, this parameter has no effect.

**Default:** '755', regardless of the value of fs.permissions.umask-mode in hdfs-site.xml.

---

**Arguments**

*over-clause*

Specifies how to partition table data using PARTITION BY. Within partitions you can sort by using ORDER BY. See [SQL Analytics](#). This clause may contain column references but not expressions.

If you partition data, Vertica creates a Hive-style partition directory structure, transforming column names to lowercase. See [Using Partition Columns](#) for a description of the directory structure.

If you omit this clause, Vertica optimizes for maximum parallelism.
**query-expression** Specifies the data to be exported. See SELECT for the syntax. See Query Restrictions for important limitations.

## Privileges

- SELECT privileges on the source table
- USAGE privileges on source table schema
- Write privileges for the destination directory

## Query Restrictions

You must provide an alias column label for selected column targets that are expressions.

The query can contain only a single outer SELECT statement. For example, you cannot use UNION as in the following example.

```sql
=> EXPORT TO DELIMITED(directory = '/mnt/shared_nfs/accounts/rm')
   OVER(PARTITION BY hash)
   AS
   SELECT 1 as account_id, '{}' as json, 0 hash
   UNION ALL
   SELECT 2 as account_id, '{}' as json, 1 hash;
ERROR 8975: Only a single outer SELECT statement is supported
HINT: Please use a subquery for multiple outer SELECT statements
```

Instead, rewrite the query to use a subquery:

```sql
=> EXPORT TO DELIMITED(directory = '/mnt/shared_nfs/accounts/rm')
   OVER(PARTITION BY hash)
   AS
   SELECT account_id, json
   FROM
   (SELECT 1 as account_id, '{}' as json, 0 hash
   UNION ALL
   SELECT 2 as account_id, '{}' as json, 1 hash
   ) a;
Rows Exported
----------
2
(1 row)
```

To use composite statements such as UNION, INTERSECT, and EXCEPT, rewrite them as subqueries.
Data Types

This operation exports raw Flex columns as binary data.

You cannot export data from an external table that contains external, non-native data types, such as ROW. See Complex Types. This restriction applies even if your SELECT statement does not include those columns.

Output Files

Output file names follow the pattern: [8-character hash]-[node name]-[thread_id].fileExtension. Column names in partition directories are lowercase.

This operation always creates the output directory, even if the query produces zero rows.

Be careful to avoid concurrent exports to the same output destination. Doing so is an error on any file system and can produce incorrect results.

You must use a shared file location for output. If you use a directory in the local file system, it must be an NFS-mounted directory.

For output to the local file system, you must have a USER storage location.

When exporting to the local file system, the permission mode is 700 for directories and 600 for files. You cannot override these values.

Files exported to a local file system by any Vertica user are owned by the Vertica superuser. Files exported to HDFS or object stores are owned by the Vertica user who exported the data.

For additional restrictions specific to object stores (S3, GCS, or Azure), see Exporting to Object Stores.

Examples

The following example exports uncompressed comma-separated values (CSV) with a header row in each file:

```sql
=> EXPORT TO DELIMITED(directory='webhdfs:///user1/data', delimiter=',', addHeader='true')
    AS SELECT * FROM public.sales;
```
EXPORT TO ORC

Exports a table, columns from a table, or query results to files in the ORC format.

You can use an OVER() clause to partition the data before export. Partitioning data can improve query performance by enabling partition pruning. See Improving Query Performance.

There are some limitations on the queries you can use in an export statement. See Query Restrictions.

You can export data stored in Vertica in ROS format and data from external tables.

This statement returns the number of rows written and logs information about exported files in a system table. See Monitoring Exports.

During an export to HDFS or an NFS mount point, Vertica writes files to a temporary directory in the same location as the destination and renames the directory when the export is complete. Do not attempt to use the files in the temporary directory. During an export to S3, GCS, or Azure, Vertica writes files directly to the destination path, so you must wait for the export to finish before reading the files. For more information, see Exporting to Object Stores.

Syntax

```
EXPORT TO ORC ( directory = 'path' 
                [, param=value [,...] ]
                [ OVER (over-clause) ]
               AS SELECT query-expression;
```

Parameters

<table>
<thead>
<tr>
<th>directory</th>
<th>The destination directory for the output files. The directory must not exist, and the current user must have permission to write it. The destination can be on any of the following file systems:</th>
</tr>
</thead>
<tbody>
<tr>
<td>HDFS File System</td>
<td></td>
</tr>
<tr>
<td>S3 Object Store</td>
<td></td>
</tr>
<tr>
<td>Google Cloud Storage (GCS) Object Store</td>
<td></td>
</tr>
</tbody>
</table>
- **Azure Blob Storage Object Store**
- Linux file system, either an NFS mount or local storage on each node

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>compression</td>
<td>Column compression type, one of Zlib or Uncompressed.</td>
<td>Zlib</td>
</tr>
<tr>
<td>stripeSizeMB</td>
<td>The uncompressed size of exported stripes, in MB (integer). The minimum value is 1 and the maximum value is 1024.</td>
<td>250</td>
</tr>
<tr>
<td>rowIndexStride</td>
<td>How frequently to build indexing statistics in the output. The exporter builds statistics after every rowIndexStride rows in each stripe (or once, for stripes that are smaller than this threshold). The maximum value is 1,000,000. A value of 0 disables indexing.</td>
<td>1000</td>
</tr>
<tr>
<td>fileSizeMB</td>
<td>The maximum file size of a single output file. This value is a hint, not a hard limit. A value of 0 means there is no limit. This value affects the size of individual output files, not the total output size. For smaller values Vertica divides the output into more files; all data is still exported.</td>
<td>10GB</td>
</tr>
<tr>
<td>fileMode</td>
<td>For writes to HDFS only, permission to apply to all exported files. You can specify the value in Unix octal format (such as '665') or &quot;user-group-other&quot; format (such as 'rwxr-xr-x'). The value must be formatted as a string even if using the octal format. Valid octal values range from '0' to '1777'. See HDFS Permissions in the Apache Hadoop documentation. When writing files to any destination other than HDFS, this parameter has no effect.</td>
<td>'660', regardless of the value of fs.permissions.umask-mode in hdfs-site.xml.</td>
</tr>
</tbody>
</table>
| dirMode            | For writes to HDFS only, permission to apply to all exported
directories. Values follow the same rules as those for fileMode. Further, you must give the Vertica HDFS user full permission (at least 'rwx------' or '700').

When writing files to any destination other than HDFS, this parameter has no effect.

**Default:** '755', regardless of the value of fs.permissions.umask-mode in hdfs-site.xml.

### Arguments

**over-clause**  
Specifies how to partition table data using PARTITION BY. Within partitions you can sort by using ORDER BY. See [SQL Analytics](#). This clause may contain column references but not expressions.

If you partition data, Vertica creates a Hive-style partition directory structure, transforming column names to lowercase. See [Using Partition Columns](#) for a description of the directory structure.

If you omit this clause, Vertica optimizes for maximum parallelism.

**query-expression**  
Specifies the data to be exported. See [SELECT](#) for the syntax. See [Query Restrictions](#) for important limitations.

### Privileges

- SELECT privileges on the source table
- USAGE privileges on source table schema
- Write privileges for the destination directory

### Query Restrictions

You must provide an alias column label for selected column targets that are expressions.

The query can contain only a single outer SELECT statement. For example, you cannot use UNION as in the following example.
Instead, rewrite the query to use a subquery:

```
=> EXPORT TO ORC(directory = '/mnt/shared_nfs/accounts/rm')
    OVER(PARTITION BY hash)
    AS
    account_id, json
    FROM
    (  
    SELECT 1 as account_id, '{}' as json, 0 hash 
    UNION ALL
    SELECT 2 as account_id, '{}' as json, 1 hash
    ) a;
```

To use composite statements such as UNION, INTERSECT, and EXCEPT, rewrite them as subqueries.

### Data Types

EXPORT TO ORC converts Vertica data types to Hive data types as shown in the following table.

<table>
<thead>
<tr>
<th>Vertica Data Type</th>
<th>Hive Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTEGER, BIGINT</td>
<td>BIGINT</td>
</tr>
<tr>
<td>FLOAT, DECIMAL, SMALLINT, TINYINT, CHAR, BOOLEAN</td>
<td>Corresponding Hive type</td>
</tr>
<tr>
<td>VARCHAR, LONG VARCHAR</td>
<td>VARCHAR (max 64KB) or STRING (can be read as either)</td>
</tr>
<tr>
<td>BINARY, VARBINARY, LONG VARBINARY</td>
<td>BINARY</td>
</tr>
<tr>
<td>Vertica Data Type</td>
<td>Hive Data Type</td>
</tr>
<tr>
<td>-------------------</td>
<td>----------------</td>
</tr>
<tr>
<td>DATE</td>
<td>DATE if supported by your version of Hive, otherwise INT96 (can be read as TIMESTAMP)</td>
</tr>
<tr>
<td>TIMESTAMP, TIMESTAMPTZ</td>
<td>TIMESTAMP. Vertica does not convert TIMESTAMP values to UTC. To avoid problems arising from time zones, use TIMESTAMPTZ instead of TIMESTAMP.</td>
</tr>
<tr>
<td>TIME, TIMEZ, INTERVAL, UUID</td>
<td>Not supported</td>
</tr>
<tr>
<td>ARRAY</td>
<td>ARRAY</td>
</tr>
<tr>
<td>SET, ROW</td>
<td>Not supported</td>
</tr>
</tbody>
</table>

Decimal precision must be <= 38.

The exported Hive types might not be identical to the Vertica types. For example, a Vertica INT is exported as a Hive BIGINT. When defining Hive external tables to read exported data, you might have to adjust column definitions.

This operation exports raw Flex columns as binary data.

You cannot export data from an external table that contains external, non-native data types, such as ROW. See Complex Types. This restriction applies even if your SELECT statement does not include those columns.

## Output Files

Output file names follow the pattern: [8-character hash]-[node name]-[thread_id].orc. Column names in partition directories are lowercase.

This operation always creates the output directory, even if the query produces zero rows.

Be careful to avoid concurrent exports to the same output destination. Doing so is an error on any file system and can produce incorrect results.

You must use a shared file location for output. If you use a directory in the local file system, it must be an NFS-mounted directory.

For output to the local file system, you must have a USER storage location.

When exporting to the local file system, the permission mode is 700 for directories and 600 for files. You cannot override these values.
Files exported to a local file system by any Vertica user are owned by the Vertica superuser. Files exported to HDFS or object stores are owned by the Vertica user who exported the data.

For additional restrictions specific to object stores (S3, GCS, or Azure), see Exporting to Object Stores.

**Examples**

The following example demonstrates partitioning and exporting data. EXPORT TO ORC first partitions the data on region and then, within each partition, sorts by store.

```sql
=> EXPORT TO ORC(directory='gs://DataLake/user2/data')
   OVER(PARTITION BY store.region ORDER BY store.ID)
   AS SELECT sale.price, sale.date, store.ID
   FROM public.sales sale
   JOIN public.vendor store ON sale.distribID = store.ID;
```

Aside from a few parameters, EXPORT TO ORC behaves the same way as EXPORT TO PARQUET. See there for more examples of export queries.

**EXPORT TO PARQUET**

Exports a table, columns from a table, or query results to files in the Parquet format.

You can use an OVER() clause to partition the data before export. Partitioning data can improve query performance by enabling partition pruning. See Improving Query Performance.

There are some limitations on the queries you can use in an export statement. See Query Restrictions.

You can export data stored in Vertica in ROS format and data from external tables.

This statement returns the number of rows written and logs information about exported files in a system table. See Monitoring Exports.

During an export to HDFS or an NFS mount point, Vertica writes files to a temporary directory in the same location as the destination and renames the directory when the export is complete. Do not attempt to use the files in the temporary directory. During an export to S3, GCS, or Azure, Vertica writes files directly to the destination path, so you must wait for the export to finish before reading the files. For more information, see Exporting to Object Stores.
After you export data, you can use the `GET_METADATA` function to inspect the results.

**Syntax**

```sql
EXPORT TO PARQUET ( directory = 'path'
    [, param=value [,...]]
) [ OVER (over-clause) ]
AS SELECT query-expression;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>The destination directory for the output files. The directory must not exist, and the current user must have permission to write it. The destination can be on any of the following file systems:</td>
</tr>
<tr>
<td>compression</td>
<td>Column compression type, one of Snappy, GZIP, Brotli, ZSTD, or Uncompressed. Default: Snappy</td>
</tr>
<tr>
<td>rowGroupSizeMB</td>
<td>The uncompressed size of exported row groups, in MB (integer). The minimum value is 1 and the maximum value is <code>fileSizeMB</code> (or unlimited if <code>fileSizeMB</code> is 0). The row groups in the exported files are smaller than this value because Parquet files are compressed on write. For best performance when exporting to HDFS, set size to be smaller than the HDFS block size. Row-group size affects memory consumption during export. An export thread consumes at least double the row-group size. The default value of 512MB is a compromise between writing larger row groups and allowing enough free memory for other Vertica operations. If you perform exports when the database is not otherwise under heavy load, you can improve read performance</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>on the exported data by increasing row-group size on export. However, row groups that span multiple blocks on HDFS decrease read performance by requiring more I/O, so do not set the row-group size to be larger than your HDFS block size.</td>
<td><strong>Default:</strong> 512</td>
</tr>
<tr>
<td><strong>fileSizeMB</strong></td>
<td>The maximum file size of a single output file. This value is a hint, not a hard limit. A value of 0 means there is no limit. This value affects the size of individual output files, not the total output size. For smaller values Vertica divides the output into more files; all data is still exported.</td>
</tr>
<tr>
<td><strong>fileMode</strong></td>
<td>For writes to HDFS only, permission to apply to all exported files. You can specify the value in Unix octal format (such as '665') or &quot;user-group-other&quot; format (such as 'rwxr-xr-'). The value must be formatted as a string even if using the octal format. Valid octal values range from '0' to '1777'. See <a href="https://hadoop.apache.org/docs/current/hadoop-project-dist/hadoop-hdfs/hdfs-site.html#Security">HDFS Permissions</a> in the Apache Hadoop documentation. When writing files to any destination other than HDFS, this parameter has no effect. <strong>Default:</strong> '660', regardless of the value of fs.permissions.umask-mode in hdfs-site.xml.</td>
</tr>
<tr>
<td><strong>dirMode</strong></td>
<td>For writes to HDFS only, permission to apply to all exported directories. Values follow the same rules as those for fileMode. Further, you must give the Vertica HDFS user full permission (at least 'rwx------' or '700'). When writing files to any destination other than HDFS, this parameter has no effect. <strong>Default:</strong> '755', regardless of the value of fs.permissions.umask-mode in hdfs-site.xml.</td>
</tr>
<tr>
<td><strong>int96AsTimestamp</strong></td>
<td>Whether to export timestamps as int96 physical type (true) or int64 physical type (false).</td>
</tr>
</tbody>
</table>
Arguments

| over-clause  | Specifies how to partition table data using PARTITION BY. Within partitions you can sort by using ORDER BY. See SQL Analytics. This clause may contain column references but not expressions.
|             | If you partition data, Vertica creates a Hive-style partition directory structure, transforming column names to lowercase. See Using Partition Columns for a description of the directory structure.
|             | If you omit this clause, Vertica optimizes for maximum parallelism. |

| query-expression | Specifies the data to be exported. See SELECT for the syntax. See Query Restrictions for important limitations. |

Privileges

- SELECT privileges on the source table
- USAGE privileges on source table schema
- Write privileges for the destination directory

Query Restrictions

You must provide an alias column label for selected column targets that are expressions.

The query can contain only a single outer SELECT statement. For example, you cannot use UNION as in the following example.

```sql
=> EXPORT TO PARQUET(directory = '/mnt/shared_nfs/accounts/rm')
   OVER(PARTITION BY hash)
AS
  SELECT 1 as account_id, '{}' as json, 0 hash
UNION ALL
  SELECT 2 as account_id, '{}' as json, 1 hash;
ERROR 8975: Only a single outer SELECT statement is supported
HINT: Please use a subquery for multiple outer SELECT statements
```

Instead, rewrite the query to use a subquery:

```sql
=> EXPORT TO PARQUET(directory = '/mnt/shared_nfs/accounts/rm')
```
OVER(PARTITION BY hash) 
AS 
SELECT 
    account_id, 
    json 
FROM 
    ( 
        SELECT 1 as account_id, '{ }' as json, 0 hash 
        UNION ALL 
        SELECT 2 as account_id, '{ }' as json, 1 hash 
    ) a;

To use composite statements such as UNION, INTERSECT, and EXCEPT, rewrite them as subqueries.

Data Types

EXPORT TO PARQUET converts Vertica data types to Hive data types as shown in the following table.

<table>
<thead>
<tr>
<th>Vertica Data Type</th>
<th>Hive Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTEGER, BIGINT</td>
<td>BIGINT</td>
</tr>
<tr>
<td>FLOAT, DECIMAL, SMALLINT, TINYINT, CHAR, BOOLEAN</td>
<td>Corresponding Hive type</td>
</tr>
<tr>
<td>VARCHAR, LONG VARCHAR</td>
<td>VARCHAR (max 64KB) or STRING (can be read as either)</td>
</tr>
<tr>
<td>BINARY, VARBINARY, LONG VARBINARY</td>
<td>BINARY</td>
</tr>
<tr>
<td>DATE</td>
<td>DATE if supported by your version of Hive, otherwise INT96 (can be read as TIMESTAMP)</td>
</tr>
<tr>
<td>TIMESTAMP, TIMESTAMPTZ</td>
<td>TIMESTAMP. Vertica does not convert TIMESTAMP values to UTC. To avoid problems arising from time zones, use TIMESTAMPTZ instead of TIMESTAMP.</td>
</tr>
<tr>
<td>TIME, TIMEZ, INTERVAL</td>
<td>Not supported</td>
</tr>
</tbody>
</table>
Vertica Data Type | Hive Data Type
---|---
ARRAY | ARRAY
SET, ROW | Not supported

Decimal precision must be $\leq 38$.

The exported Hive types might not be identical to the Vertica types. For example, a Vertica INT is exported as a Hive BIGINT. When defining Hive external tables to read exported data, you might have to adjust column definitions.

This operation exports raw Flex columns as binary data.

You cannot export data from an external table that contains external, non-native data types, such as ROW. See Complex Types. This restriction applies even if your SELECT statement does not include those columns.

**Output Files**

Output file names follow the pattern: [8-character hash]-[node name]-[thread_id].parquet. Column names in partition directories are lowercase.

This operation always creates the output directory, even if the query produces zero rows.

Be careful to avoid concurrent exports to the same output destination. Doing so is an error on any file system and can produce incorrect results.

You must use a shared file location for output. If you use a directory in the local file system, it must be an NFS-mounted directory.

For output to the local file system, you must have a USER storage location.

When exporting to the local file system, the permission mode is 700 for directories and 600 for files. You cannot override these values.

Files exported to a local file system by any Vertica user are owned by the Vertica superuser. Files exported to HDFS or object stores are owned by the Vertica user who exported the data.

For additional restrictions specific to object stores (S3, GCS, or Azure), see Exporting to Object Stores.
Examples

The following example demonstrates exporting all columns from the T1 table in the public schema, using GZIP compression.

=> EXPORT TO PARQUET(directory='webhdfs:///user1/data', compression='gzip')
   AS SELECT * FROM public.T1;

The following example demonstrates exporting the results of a query using more than one table.

=> EXPORT TO PARQUET(directory='s3://DataLake/sales_by_region')
   AS SELECT sale.price, sale.date, store.region
       FROM public.sales sale
       JOIN public.vendor store ON sale.distribID = store.ID;

The following example demonstrates partitioning and exporting data. EXPORT TO PARQUET first partitions the data on region and then, within each partition, sorts by store.

=> EXPORT TO PARQUET(directory='gs://DataLake/user2/data')
   OVER(PARTITION BY store.region ORDER BY store.ID)
   AS SELECT sale.price, sale.date, store.ID
       FROM public.sales sale
       JOIN public.vendor store ON sale.distribID = store.ID;

The following example uses an alias column label for a selected column target that is an expression.

=> EXPORT TO PARQUET(directory='webhdfs:///user3/data')
   OVER(ORDER BY col1) AS SELECT col1 + col1 AS A, col2
       FROM public.T3;

The following example sets permissions for the output.

=> EXPORT TO PARQUET(directory='webhdfs:///user1/data',
   FileMode='432', dirMode='rwxrw-r-x')
   AS SELECT * FROM public.T1;

EXPORT TO VERTICA

Exports table data from one Vertica database to another.
Important:
The source database must be no more than one major release behind the target database.

Syntax

```
EXPORT TO VERTICA

    database.[schema.]target-table [ ( target-columns ) ]
    { AS SELECT query-expression | FROM [schema.]source-table[ ( source-columns ) ] };
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>database</code></td>
<td>The target database of the data to export. A connection to this database must already exist in the current session before starting the copy operation; otherwise Vertica returns an error. For details, see CONNECT TO VERTICA.</td>
</tr>
<tr>
<td><code>[schema.]target-table</code></td>
<td>The table to store the exported data.</td>
</tr>
<tr>
<td><code>target-columns</code></td>
<td>A comma-delimited list of columns in <code>target-table</code> to store the exported data. See Mapping Between Source and Target Columns, below.</td>
</tr>
<tr>
<td><code>query-expression</code></td>
<td>Specifies the data to export.</td>
</tr>
<tr>
<td><code>[schema.]source-table</code></td>
<td>The table that contains the data to export.</td>
</tr>
<tr>
<td><code>source-columns</code></td>
<td>A comma-delimited list of the columns in the source table to export. If omitted, all columns are exported. See Mapping Between Source and Target Columns, below.</td>
</tr>
</tbody>
</table>

Privileges

- Source table: SELECT
- Source table schema: USAGE
- Target table: INSERT
- Target table schema: USAGE
Mapping Between Source and Target Columns

If you export all table data from one database to another, EXPORT TO VERTICA can omit specifying column lists if column definitions in both tables comply with the following conditions:

- Same number of columns
- Identical column names
- Same sequence of columns
- Matching or compatible column data types

If any of these conditions is not true, the EXPORT TO VERTICA statement must include column lists that explicitly map source and target columns to each other, as follows:

- Contain the same number of columns.
- List source and target columns in the same order.
- Pair columns with the same (or compatible) data types.

Examples

See Exporting Data to Another Vertica Database.

See Also

- Handling Node Failure During Copy/Export
- COPY FROM VERTICA

GET DIRECTED QUERY

Queries system table DIRECTED_QUERIES on the specified input query, and returns details of all directed queries that map to the input query. For details about output, see Getting Directed Queries.

Syntax

GET DIRECTED QUERY  input-query
**Parameters**

| input-query | An input query that is associated with one or more directed queries. |

**Privileges**

None

**Examples**

See [Getting Directed Queries](#).
GRANT Statements

GRANT statements grant privileges on database objects to users and roles.

Important:
In a database with trust authentication, GRANT statements appear to work as expected but have no real effect on database security.

GRANT (Authentication)

Associates an authentication record to one or more users and roles.

Syntax

GRANT AUTHENTICATION auth-method-name TO grantee[,...]

Parameters

<table>
<thead>
<tr>
<th>auth-method-name</th>
<th>Name of the authentication method to associate with one or more users or roles.</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>Specifies who is associated with the authentication method, one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- User name</td>
</tr>
<tr>
<td></td>
<td>- Role</td>
</tr>
<tr>
<td></td>
<td>- PUBLIC: The default role of all users.</td>
</tr>
</tbody>
</table>

Privileges

Superuser
Examples

- Associate v ldap authentication with user jsmith:

  => GRANT AUTHENTICATION v_ldap TO jsmith;

- Associate v_gss authentication to the role DBprogrammer:

  => CREATE ROLE DBprogrammer;
  => GRANT AUTHENTICATION v_gss TO DBprogrammer;

- Associate client authentication method v_localpwd with role PUBLIC, which is assigned by default to all users:

  => GRANT AUTHENTICATION v_localpwd TO PUBLIC;

See Also

- REVOKE (Authentication)
- Granting and Revoking Privileges

GRANT (Database)

Grants database privileges to users and roles.

Syntax

```sql
GRANT { privilege[,..] | ALL [ PRIVILEGES ] } 
ON DATABASE db-spec
TO grantee[,..]
[ WITH GRANT OPTION ]
```

Parameters

<table>
<thead>
<tr>
<th>privilege</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE:</td>
<td>Create schemas.</td>
</tr>
<tr>
<td>TEMP:</td>
<td>Create temporary tables. By default, all users are granted this privilege through their DEFAULT role.</td>
</tr>
</tbody>
</table>
Grants all database privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack.

The optional keyword PRIVILEGES conforms with the SQL standard.

db-spec

Specifies the current database, set to the database name or DEFAULT.

grantee

Specifies who is granted privileges, one of the following:

- user-name
- role
- PUBLIC: Default role of all users

WITH GRANT OPTION

Gives grantee the privilege to grant the same privileges to other users or roles, and also revoke them. For details, see Granting Privileges.

Privileges

Non-superuser: Privileges grantee given the option (WITH GRANT OPTION) of granting privileges to other users or roles.

Example

The following example grants user Fred the right to create schemas in the current database.

```
=> GRANT CREATE ON DATABASE DEFAULT TO Fred;
```

See Also

- REVOKE (Database)
- Granting and Revoking Privileges

GRANT (Library)

Grants usage privileges on one or more libraries to users and roles.
For example, when working with the Connector Framework Service, you might need to grant a user usage privileges to a library to be able to set UDSession parameters. For more information see Implementing CFS.

**Syntax**

```sql
GRANT { USAGE | ALL [ PRIVILEGES ] } | ON LIBRARY ([database.]schema.]library[,]
TO grantee[,]
[ WITH GRANT OPTION ]
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>USAGE</strong></td>
<td>Enables grantees access to functions in the specified libraries.</td>
</tr>
<tr>
<td><strong>ALL [PRIVILEGES]</strong></td>
<td>Grants all library privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard.</td>
</tr>
<tr>
<td><strong>[database.]schema</strong></td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td><strong>library</strong></td>
<td>The target library.</td>
</tr>
<tr>
<td><strong>grantee</strong></td>
<td>Specifies who is granted privileges, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- <em>user-name</em></td>
</tr>
<tr>
<td></td>
<td>- <em>role</em></td>
</tr>
<tr>
<td></td>
<td>- <em>PUBLIC</em>: Default role of all users</td>
</tr>
</tbody>
</table>
WITH GRANT OPTION | Gives *grantee* the privilege to grant the same privileges to other users or roles, and also revoke them. For details, see [*Granting Privileges*](#).

---

### Privileges

Non-superusers require [USAGE on the schema](#) and one of the following:

- Owner
- Privileges *grantee* given the option (*WITH GRANT OPTION*) of granting privileges to other users or roles.

---

### Example

Grant USAGE privileges on the *MyFunctions* library to *Fred*:

```
=> GRANT USAGE ON LIBRARY MyFunctions TO Fred;
```

---

### See Also

- [REVOKE (Library)](#)
- [*Granting and Revoking Privileges*](#)

---

### GRANT (Model)

Grants usage privileges on a model to *users* and *roles*.

---

### Syntax

```
GRANT { privilege[,...] | ALL [ PRIVILEGES ] [ EXTEND ] } 
  ON { [database.]schema.]model-name[,...] 
  TO grantee[,...] 
  [ WITH GRANT OPTION ]
```

---
# Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `privilege` | The following privileges are valid for models:  
  - USAGE  
  - ALTER  
  - DROP |
| `ALL [PRIVILEGES][EXTEND]` | Grants all model privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack.  
  You can qualify `ALL` with two optional keywords:  
  - PRIVILEGES conforms with the SQL standard.  
  - EXTEND extends the semantics of `ALL` to include ALTER and DROP privileges. An unqualified `ALL` excludes these two privileges. This option enables backward compatibility with `GRANT ALL` usage in pre-9.2.1 Vertica releases. |
| `[database.].schema` | Specifies a schema, by default public. If `schema` is any schema other than `public`, you must supply the schema name. For example:  
  ```sql  
  myschema.thisDbObject  
  ```  
  If you specify a database, it must be the current database. |
| `model-name` | The model on which to grant the privilege. |
| `grantee` | Specifies who is granted privileges, one of the following:  
  - `user-name`  
  - `role`  
  - `PUBLIC`: Default role of all users |
| `WITH GRANT OPTION` | Gives `grantee` the privilege to grant the same privileges to other users or roles, and also revoke them. For details, see Granting Privileges. |
Privileges

Non-superusers require `USAGE on the schema` and one of the following:

- Owner
- Privileges grantee given the option (WITH GRANT OPTION) of granting privileges to other users or roles.

Example

This example grants USAGE privileges on the mySvmClassModel model to user1:

```
=> GRANT USAGE ON MODEL mySvmClassModel TO user1;
```

See Also

- `REVOKE (Model)`
- Managing Model Security

GRANT (Procedure)

Grants privileges on a `stored procedure` or `external procedure` to a `user` or `role`.

**Important:**

External procedures that you create with `CREATE PROCEDURE (External)` are always run with Linux dbadmin privileges. If a dbadmin or pseudosuperuser grants a non-dbadmin permission to run a procedure using `GRANT (Procedure)`, be aware that the non-dbadmin user runs the procedure with full Linux dbadmin privileges.

Syntax

```
GRANT { EXECUTE | ALL [ PRIVILEGES ] } 
ON PROCEDURE [[database.]schema.]procedure( [arg-list] ) [,..] 
TO grantee[,...] 
[ WITH GRANT OPTION ]
```
## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXECUTE</td>
<td>Enables grantees to run the specified procedure.</td>
</tr>
<tr>
<td>ALL [PRIVILEGES]</td>
<td>Grants all procedure privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>procedure</td>
<td>The target procedure.</td>
</tr>
<tr>
<td>arg-List</td>
<td>A comma-delimited list of procedure arguments, where each argument is specified as follows:</td>
</tr>
<tr>
<td></td>
<td><code>[ argname ] argtype</code></td>
</tr>
<tr>
<td></td>
<td>If the procedure is defined with no arguments, supply an empty argument list.</td>
</tr>
<tr>
<td>grantee</td>
<td>Specifies who is granted privileges, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- [user-name]</td>
</tr>
<tr>
<td></td>
<td>- role</td>
</tr>
<tr>
<td></td>
<td>- PUBLIC: Default role of all users</td>
</tr>
<tr>
<td>WITH GRANT OPTION</td>
<td>Gives grantee the privilege to grant the same privileges to other users or roles, and also revoke them. For details, see Granting Privileges.</td>
</tr>
</tbody>
</table>

## Privileges

Non-superuser, one of the following:
Owner
Privileges grantee given the option (WITH GRANT OPTION) of granting privileges to other users or roles

**Example**

Grant EXECUTE privileges on the `tokenize` procedure to users Bob and Jules, and to the role Operator:

```sql
=> GRANT EXECUTE ON PROCEDURE tokenize(varchar) TO Bob, Jules, Operator;
```

**See Also**

- `REVOKE (Procedure)`
- Granting and Revoking Privileges

**GRANT (Resource Pool)**

Grants USAGE privileges on resource pools to users and roles. Users can access their resource pools with `ALTER USER` or `SET SESSION RESOURCE POOL`.

**Syntax**

```sql
GRANT USAGE
ON RESOURCE POOL resource-pool[,..]
[FOR SUBCLUSTER subcluster | FOR CURRENT SUBCLUSTER]
TO grantee[,..]
[ WITH GRANT OPTION ]
```

**Parameters**

<table>
<thead>
<tr>
<th>USAGE</th>
<th>Enables grantees to access the specified resource pools.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL [PRIVILEGES]</td>
<td>Grants all resource pool privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack.</td>
</tr>
</tbody>
</table>
The optional keyword PRIVILEGES conforms with the SQL standard.

**resource-pool**
A resource pool on which to grant the specified privileges.

**subcluster**
The subcluster for the resource pool.

**grantee**
Specifies who is granted privileges, one of the following:

- `user-name`
- `role`
- `PUBLIC`: Default role of all users

**WITH GRANT OPTION**
Gives *grantee* the privilege to grant the same privileges to other users or roles, and also revoke them. For details, see Granting Privileges.

---

**Privileges**

Non-superuser, one of the following:

- Ownership
- [GRANT OPTION](#) on the object

---

**Examples**

Grant user Joe USAGe privileges on resource pool Joe_pool.

```sql
=> CREATE USER Joe;
CREATE USER
=> CREATE RESOURCE POOL Joe_pool;
CREATE RESOURCE POOL
=> GRANT USAGE ON RESOURCE POOL Joe_pool TO Joe;
GRANT PRIVILEGE
```

Grant user Joe USAGE privileges on resource pool Joe_pool for subcluster sub1.

```sql
=> GRANT USAGE on RESOURCE POOL Joe_pool FOR SUBCLUSTER sub1 TO Joe;
GRANT PRIVILEGE
```
See Also

- `REVOKE (Resource Pool)`
- `Granting and Revoking Privileges`

**GRANT (Role)**

Assigns roles to users or other roles.

![Note]

Granting a role does not activate the role automatically; you must enable it with SET ROLE command.

**Syntax**

```
GRANT role[,..] TO grantee[,..] [ WITH ADMIN OPTION ]
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>role</code></td>
<td>A role to grant</td>
</tr>
<tr>
<td><code>grantee</code></td>
<td>Designates users to be granted the specified roles, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- User name</td>
</tr>
<tr>
<td></td>
<td>- Role</td>
</tr>
<tr>
<td></td>
<td>- PUBLIC: The default role of all users.</td>
</tr>
</tbody>
</table>

**WITH ADMIN OPTION**

Gives `grantee` the privilege to grant the specified roles to other users or roles. For details, see `Granting Privileges`.

**Privileges**

Non-superuser: Roles grantee given the option (WITH GRANT OPTION) of granting the same roles to other users or roles.
Examples
See Granting Database Roles.

See Also
REVOKE (Role)

GRANT (Schema)

Grants schema privileges to users and roles. By default, only superusers and the schema owner have the following schema privileges:

- Create objects within a schema.
- Alter and drop a schema.

Note:
By default, new users cannot access schema PUBLIC. You must explicitly grant all new users USAGE privileges on the PUBLIC schema.

Syntax
```
GRANT { privilege[,..] | ALL [ PRIVILEGES ] [ EXTEND ] } 
ON SCHEMA [database.]schema[,..] 
TO grantee[,..] 
[ WITH GRANT OPTION ]
```

Parameters

<table>
<thead>
<tr>
<th>privilege</th>
<th>One of the following privileges:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>USAGE: Enables access to objects in the specified schemas. Grantees can then be granted privileges on individual objects in these schemas in order to access them, for example, with GRANT TABLE and GRANT VIEW.</td>
</tr>
<tr>
<td></td>
<td>CREATE: Create and rename objects in the</td>
</tr>
</tbody>
</table>
You can also grant the following privileges on a schema, to be inherited by tables and their projections, and by views of that schema. If inheritance is enabled for the database and schema, these privileges are automatically granted to those objects on creation:

- **SELECT**: Query tables and views. SELECT privileges are granted by default to the PUBLIC role.
- **INSERT**: Insert rows, or and load data into tables with `COPY`.

    **Note:**
    COPY FROM STDIN is allowed for users with INSERT privileges, while COPY FROM file requires admin privileges.

- **UPDATE**: Update table rows.
- **DELETE**: Delete table rows.
- **REFERENCES**: Create foreign key constraints on this table. This privilege must be set on both referencing and referenced tables.
- **TRUNCATE**: Truncate table contents. Non-owners of tables can also execute the following partition operations on them:
  - `DROP_PARTITIONS`
  - `SWAP_PARTITIONS_BETWEEN_TABLES`
  - `MOVE_PARTITIONS_TO_TABLE`
- **ALTER**: Modify the DDL of tables and views with `ALTER TABLE` and `ALTER VIEW`, respectively.
- **DROP**: Drop tables and views.

<table>
<thead>
<tr>
<th>ALL [PRIVILEGES][EXTEND]</th>
<th>Grants USAGE AND CREATE privileges. Inherited privileges must be granted explicitly.</th>
</tr>
</thead>
</table>

You can qualify ALL with two optional keywords:

- **PRIVILEGES** conforms with the SQL standard.
- **EXTEND** extends the semantics of ALL to include ALTER and DROP privileges. An unqualified ALL excludes these two privileges. This option
enables backward compatibility with GRANT ALL usage in pre-9.2.1 Vertica releases.

<table>
<thead>
<tr>
<th>[database.]schema</th>
<th>Specifies a target schema. If you specify a database, it must be the current database.</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>Specifies who is granted privileges, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- user-name</td>
</tr>
<tr>
<td></td>
<td>- role</td>
</tr>
<tr>
<td></td>
<td>- PUBLIC: Default role of all users</td>
</tr>
<tr>
<td>WITH GRANT OPTION</td>
<td>Gives grantee the privilege to grant the same privileges to other users or roles, and also revoke them. For details, see Granting Privileges.</td>
</tr>
</tbody>
</table>

**Privileges**

Non-superusers, one of the following:

- Schema owner
- Privileges grantee given the option (WITH GRANT OPTION) of granting privileges to other users or roles.

**Examples**

Grant user Joe USAGE privilege on schema online_sales.

```sql
=> CREATE USER Joe;
CREATE USER
=> GRANT USAGE ON SCHEMA online_sales TO Joe;
GRANT PRIVILEGE
```

**See Also**

- REVOKE (Schema)
- Granting and Revoking Privileges
GRANT (Sequence)

Grants sequence privileges to users and roles.

Syntax

```
GRANT { privilege[,...] | ALL [ PRIVILEGES ] [ EXTEND ] } 
ON { 
    SEQUENCE [[database.]schema.]sequence[,..] 
    | ALL SEQUENCES IN SCHEMA [database.]schema[,..] } 
TO grantee[,..] 
[ WITH GRANT OPTION ]
```

Parameters

<table>
<thead>
<tr>
<th>privilege</th>
<th>The following privileges are valid for sequences:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• SELECT: Execute functions CURRVAL and NEXTVAL on the specified sequences.</td>
</tr>
<tr>
<td></td>
<td>• ALTER: Modify a sequence's DDL with ALTER SEQUENCE</td>
</tr>
<tr>
<td></td>
<td>• DROP: Drop this sequence with DROP SEQUENCE.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>ALL [PRIVILEGES][EXTEND]</th>
<th>Grants all sequence privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>You can qualify ALL with two optional keywords:</td>
</tr>
<tr>
<td></td>
<td>• PRIVILEGES conforms with the SQL standard.</td>
</tr>
<tr>
<td></td>
<td>• EXTEND extends the semantics of ALL to include ALTER and DROP privileges. An unqualified ALL excludes these two privileges. This option enables backward compatibility with GRANT ALL usage in</td>
</tr>
<tr>
<td></td>
<td>pre-9.2.1 Vertica releases.</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td><strong>[database.]schema</strong></td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td>If you specify a database, it must be the current database.</td>
<td></td>
</tr>
<tr>
<td><strong>SEQUENCE sequence</strong></td>
<td>Specifies the sequence on which to grant privileges.</td>
</tr>
<tr>
<td><strong>ALL SEQUENCES IN SCHEMA schema</strong></td>
<td>Grants the specified privileges on all sequences in schema schema.</td>
</tr>
<tr>
<td><strong>grantee</strong></td>
<td>Specifies who is granted privileges, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- user-name</td>
</tr>
<tr>
<td></td>
<td>- role</td>
</tr>
<tr>
<td></td>
<td>- PUBLIC: Default role of all users</td>
</tr>
<tr>
<td><strong>WITH GRANT OPTION</strong></td>
<td>Gives grantee the privilege to grant the same privileges to other users or roles, and also revoke them. For details, see Granting Privileges.</td>
</tr>
</tbody>
</table>

### Privileges

Non-superusers require **USAGE on the schema** and one of the following:

- Owner
- Privileges grantee given the option (**WITH GRANT OPTION**) of granting privileges to other users or roles.

### Examples

This example shows how to grant user Joe all privileges on sequence my_seq.
CREATE SEQUENCE my_seq START 100;
CREATE SEQUENCE

=> GRANT ALL PRIVILEGES ON SEQUENCE my_seq TO Joe;
GRANT PRIVILEGE

See Also

- REVOKE (Sequence)
- Granting and Revoking Privileges

GRANT (Storage Location)

Grants privileges to users and roles on a USER-defined storage location. For details, see Creating Storage Locations.

Syntax

GRANT { privilege[,] | ALL [ PRIVILEGES ] }  
  ON LOCATION 'path' [ ON node ]  
  TO grantee[,]  
  [ WITH GRANT OPTION ]

Parameters

<table>
<thead>
<tr>
<th>privilege</th>
<th>The following privileges are valid for storage locations:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- READ: Copy data from files in the storage location into a table.</td>
</tr>
<tr>
<td></td>
<td>- WRITE: Export data from the database to the storage location. With WRITE privileges, grantees can also save COPY statement rejected data and exceptions files to the storage location.</td>
</tr>
</tbody>
</table>

| ALL [PRIVILEGES]        | Grants all storage location privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack. |
The optional keyword PRIVILEGES conforms with the SQL standard.

ON LOCATION 'path' [ ON node]

Specifies the path name mount point of the storage location. If qualified by ON NODE, Vertica grants access to the storage location residing on node.

If no node is specified, the grant operation applies to all nodes on the specified path. All nodes must be on the specified path; otherwise, the entire grant operation rolls back.

grantee

Specifies who is granted privileges, one of the following:
- user-name
- role
- PUBLIC: Default role of all users

WITH GRANT OPTION

Gives grantee the privilege to grant the same privileges to other users or roles, and also revoke them. For details, see Granting Privileges.

Privileges

Non-superuser, one of the following:
- Ownership
- GRANT OPTION on the object

Note:
Only a superuser can add, alter, retire, drop, and restore a location.

Examples

Create a storage location:

```sql
=> CREATE LOCATION '/home/dbadmin/UserStorage/BobStore' NODE 'v_mcdb_node0007' USAGE 'USER';
```
Create Location

Grant user Bob all available privileges to the /BobStore location:

```sql
=> GRANT ALL ON LOCATION '/home/dbadmin/UserStorage/BobStore' TO Bob;
GRANT PRIVILEGE
```

Revoke all storage location privileges from Bob:

```sql
=> REVOKE ALL ON LOCATION '/home/dbadmin/UserStorage/BobStore' FROM Bob;
REVOKE PRIVILEGE
```

Grant privileges to Bob on the BobStore location again, specifying a node:

```sql
=> GRANT ALL ON LOCATION '/home/dbadmin/UserStorage/BobStore' ON v_mcdb_node0007 TO Bob;
GRANT PRIVILEGE
```

Revoke all storage location privileges from Bob:

```sql
=> REVOKE ALL ON LOCATION '/home/dbadmin/UserStorage/BobStore' ON v_mcdb_node0007 FROM Bob;
REVOKE PRIVILEGE
```

See Also

- Storage Management Functions
- REVOKE (Storage Location)
- Granting and Revoking Privileges

Grant (Table)

Grants table privileges to users and roles. Users must also be granted USAGE on the table schema.

**Syntax**

```sql
GRANT { privilege[,...] | ALL [ PRIVILEGES ] [ EXTEND ] }
ON {
  [ TABLE ] [[database.]schema.]table[,...]
  | ALL TABLES IN SCHEMA [database.]schema[,]... }
TO grantee[,...]
[ WITH GRANT OPTION ]
```
## Parameters

### privilege

The following privileges are valid for tables:

#### Important:
Only SELECT privileges are valid for system tables.

- **SELECT**: Query tables. SELECT privileges are granted by default to the PUBLIC role.
- **INSERT**: Insert table rows with `INSERT`, and load data with `COPY`.

#### Note:
COPY FROM STDIN is allowed for users with INSERT privileges, while COPY FROM `file` requires admin privileges.

- **UPDATE**: Update table rows.
- **DELETE**: Delete table rows.
- **REFERENCES**: Create foreign key constraints on this table. This privilege must be set on both referencing and referenced tables.
- **TRUNCATE**: Truncate table contents.
  
  Non-owners of tables can also execute the following partition operations on them:
  
  - DROP_PARTITIONS
  - SWAP_PARTITIONS_BETWEEN_TABLES
  - MOVE_PARTITIONS_TO_TABLE
  
  - **ALTER**: Modify a table's DDL with `ALTER TABLE`.
  - **DROP**: Drop a table.

### ALL [PRIVILEGES][EXTEND]

Invalid for system tables, grants all table privileges that also belong to the grantor.

Grantors cannot grant privileges that they
themselves lack.

You can qualify `ALL` with two optional keywords:

- `PRIVILEGES` conforms with the SQL standard.
- `EXTEND` extends the semantics of `ALL` to include `ALTER` and `DROP` privileges. An unqualified `ALL` excludes these two privileges. This option enables backward compatibility with `GRANT ALL` usage in pre-9.2.1 Vertica releases.

**[database.]schema**

Specifies a schema, by default public. If `schema` is any schema other than `public`, you must supply the schema name. For example:

```sql
myschema.thisDbObject
```

One exception applies: you can specify system tables without their schema name.

If you specify a database, it must be the current database.

**TABLE table**

Specifies the table on which to grant privileges.

**Note:**

The table can be a global temporary table, but not a local temporary table. See [Creating Temporary Tables](#) in the Administrator's Guide.

**ON ALL TABLES IN SCHEMA schema**

Grants the specified privileges on all tables and views in schema `schema`.

**grantee**

Specifies who is granted privileges, one of the following:

- `user-name`
- `role`
PUBLIC: Default role of all users

**WITH GRANT OPTION**

Gives *grantee* the privilege to grant the same privileges to other users or roles, and also revoke them. For details, see [Granting Privileges](#).

## Privileges

Non-superusers require [USAGE on the schema](#) and one of the following:

- Owner
- Privileges grantee given the option (WITH GRANT OPTION) of granting privileges to other users or roles.

## Examples

Grant user *Joe* all privileges on table *customer_dimension*:

```sql
=> CREATE USER Joe;
CREATE USER
=> GRANT ALL PRIVILEGES ON TABLE customer_dimension TO Joe;
GRANT PRIVILEGE
```

Grant user *Joe* SELECT privileges on all system tables:

```sql
=> GRANT SELECT on all tables in schema V_MONITOR, V_CATALOG TO Joe;
GRANT PRIVILEGE
```

## See Also

- [REVOKE (Table)](#)
- [Granting and Revoking Privileges](#)

## GRANT (User Defined Extension)

Grants privileges on a [user-defined extensions](#) (UDx) to [users](#) and [roles](#).
## Syntax

```sql
GRANT { privilege[,...] | ALL [ PRIVILEGES ] [ EXTEND ] }
ON {
    U Dx-type [[database.]schema.]function-name[ [arg-list] ][,...]
    | ALL FUNCTIONS IN SCHEMA schema[,...] }
TO grantee[,...]
[ WITH GRANT OPTION ]
```

## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `privilege`     | The following privileges are valid for user-defined extensions:  
|                 | - EXECUTE  
|                 | - ALTER  
|                 | - DROP  

**Note:**  
Users can only call a UDx function on which they have EXECUTE privilege, and USAGE privilege on its schema.

| `ALL [PRIVILEGES][EXTEND]` | Grants all function privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack.  
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------|
|                             | You can qualify ALL with two optional keywords:  
|                             | - PRIVILEGES conforms with the SQL standard.  
|                             | - EXTEND extends the semantics of ALL to include ALTER and DROP privileges. An unqualified ALL excludes these two privileges. This option enables backward compatibility with GRANT ALL usage in pre-9.2.1 Vertica releases.  

| `ON UDx-type` | Specifies the function's user-defined
extension (UDx) type, where **UDx-type** is one of the following:

- FUNCTION
- AGGREGATE FUNCTION
- ANALYTIC FUNCTION
- TRANSFORM FUNCTION
- FILTER
- PARSER
- SOURCE

| database.schema | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: 

```sql```

```sql
myschema.thisDbObject```

If you specify a database, it must be the current database.

| function-name | Name of the user-defined function on which to grant privileges.

| ON ALL FUNCTIONS IN SCHEMA schema | Grants privileges on all functions in the specified schema.

| arg-list | Required for all polymorphic functions, a comma-delimited list of function arguments, where each argument is specified as follows:

```sql```

```sql
[ argname ] argtype```

If the procedure is defined with no arguments, supply an empty argument list.

| grantee | Specifies who is granted privileges, one of the following:

- **user-name**
- **role**
- **PUBLIC**: Default role of all users
Privileges

Non-superusers require USAGE on the schema and one of the following:

- Owner
- Privileges grantee given the option (WITH GRANT OPTION) of granting privileges to other users or roles.

Examples

Grant EXECUTE privileges on the myzeroifnull SQL function to users Bob and Jules, and to the role Operator. The function takes one integer argument:

```sql
=> GRANT EXECUTE ON FUNCTION myzeroifnull (x INT) TO Bob, Jules, Operator;
```

Grant EXECUTE privileges on all functions in the zero-schema schema to user Bob:

```sql
=> GRANT EXECUTE ON ALL FUNCTIONS IN SCHEMA zero-schema TO Bob;
```

Grant EXECUTE privileges on the tokenize transform function to user Bob and the role Operator:

```sql
=> GRANT EXECUTE ON TRANSFORM FUNCTION tokenize(VARCHAR) TO Bob, Operator;
```

Grant EXECUTE privileges on the ExampleSource() source to user Alice:

```sql
=> CREATE USER Alice;
=> GRANT USAGE ON SCHEMA hdfs TO Alice;
=> GRANT EXECUTE ON SOURCE ExampleSource() TO Alice;
```

Grant all privileges on the ExampleSource() source to user Alice:

```sql
=> GRANT ALL ON SOURCE ExampleSource() TO Alice;
```
Grant all privileges on polymorphic function Pagerank to the dbadmin role:

```sql
=> GRANT ALL ON TRANSFORM FUNCTION Pagerank(z varchar) to dbadmin;
```

**See Also**

- REVOKE (User Defined Extension)
- Granting and Revoking Privileges
- Developing User-Defined Extensions (UDxs)

**GRANT (View)**

Grants view privileges to users and roles.

**Syntax**

```sql
GRANT { privilege[,...] | ALL [ PRIVILEGES ] [ EXTEND ] } 
ON [[database.]schema.]view[,...] 
TO grantee[,...] 
[ WITH GRANT OPTION ]
```

**Parameters**

<table>
<thead>
<tr>
<th>privilege</th>
<th>The following privileges are valid for views:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• SELECT</td>
</tr>
<tr>
<td></td>
<td>• ALTER</td>
</tr>
<tr>
<td></td>
<td>• DROP</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>ALL [PRIVILEGES][EXTEND]</th>
<th>Grants all view privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack. You can qualify ALL with two optional keywords:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• PRIVILEGES conforms with the SQL standard.</td>
</tr>
<tr>
<td></td>
<td>• EXTEND extends the semantics of ALL to include ALTER and DROP privileges. An unqualified ALL excludes these two privileges. This option enables backward compatibility with</td>
</tr>
</tbody>
</table>

Vertica Analytic Database (11.0.x) Page 4187 of 6730
GRANT ALL usage in pre-9.2.1 Vertica releases.

**[database.]schema**

Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example:

```
myschema.thisDbObject
```

If you specify a database, it must be the current database.

**view**

The target view.

**grantee**

Specifies who is granted privileges, one of the following:

- *user-name*
- *role*
- **PUBLIC**: Default role of all users

**WITH GRANT OPTION**

Gives *grantee* the privilege to grant the same privileges to other users or roles, and also revoke them. For details, see [Granting Privileges](#).

---

**Privileges**

Non-superusers require **USAGE on the schema** and one of the following:

- Owner
- Privileges grantee given the option (WITH GRANT OPTION) of granting privileges to other users or roles.

**Note:**

As view owner, you can grant other users SELECT privilege on the view only if one of the following is true:

- You own the view's base table.
- You have SELECT...WITH GRANT OPTION privilege on the view's base table.
Examples

Grant user Joe all privileges on view ship.

```
=> CREATE VIEW ship AS SELECT * FROM public.shipping_dimension;
CREATE VIEW
=> GRANT ALL PRIVILEGES ON ship TO Joe;
GRANT PRIVILEGE
```

See Also

REVOKE (View)

INSERT

Inserts values into all projections of the specified table. You must insert one complete tuple at a time. If no projections are associated with the target table, Vertica creates a superprojection to store the inserted values.

INSERT works for flex tables as well as regular database tables.

Syntax

```
INSERT [ /*+ LABEL */ ] INTO [ [database.]schema.]table-name
[( column-list )]
{ DEFAULT VALUES | VALUES ( values-list ) | SELECT query-expression }
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LABEL</td>
<td>Assigns a label to a statement in order to identify it for profiling and debugging.</td>
</tr>
</tbody>
</table>
| [database.]schema    | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:  
|                      | myschema.thisDbObject                                                      |
If you specify a database, it must be the current database.

<table>
<thead>
<tr>
<th><strong>table-name</strong></th>
<th>The target table. You cannot invoke INSERT on a projection. This can be a flex table.</th>
</tr>
</thead>
</table>
| **column-list** | A comma-delimited list of one or more target columns in this table, listed in any order. VALUES clause values are mapped to columns in the same order. If you omit this list, Vertica maps VALUES clause values to columns according to column order in the table definition.  
A list of target columns is invalid with DEFAULT VALUES. |
| **DEFAULT VALUES** | Fills all columns with their default values as specified in the table definition.  
You cannot specify a list of target columns with this option. |
| **VALUES (values-list)** | A comma-delimited list of one or more values to insert in the target columns, where each value is one of the following:  
  - *expression* resolves to a value to insert in the target column. The expression must not nest other expressions or include Vertica meta-functions.  
  - DEFAULT inserts the default value as specified in the table definition.  
If no value is supplied for a column, Vertica implicitly adds a DEFAULT value, if defined. Otherwise Vertica inserts a NULL value. If the column is defined as NOT NULL, INSERT returns an error. |
| **SELECT query-expression** | Specifies a query that returns the rows to insert. Isolation level applies only to the SELECT clauses and works like any query. |

**Privileges**

- Table owner or user with GRANT OPTION is grantor
- INSERT privilege on table
- USAGE privilege on schema that contains the table
Committing INSERT, UPDATE, and DELETE

Vertica follows the SQL-92 transaction model, so successive INSERT, UPDATE, and DELETE statements are included in the same transaction. You do not need to explicitly start this transaction; however, you must explicitly end it with COMMIT, or implicitly end it with COPY; otherwise Vertica discards all changes that were made within the transaction.

Restrictions

- Vertica does not support subqueries as the target of an INSERT statement.

- If any primary key, unique key, or check constraints are enabled for automatic enforcement, Vertica enforces those constraints when you insert values into a table. If a violation occurs, Vertica rolls back the SQL statement and returns an error. This behavior occurs for INSERT, UPDATE, COPY, and MERGE SQL statements.

  Note:
  Automatic constraint enforcement requires that you have SELECT privileges on the table containing the constraint.

Examples

```sql
=> INSERT INTO t1 VALUES (101, 102, 103, 104);
=> INSERT INTO customer VALUES (10, 'male', 'DPR', 'MA', 35);
=> INSERT INTO retail.t1 (C0, C1) VALUES (1, 1001);
=> INSERT INTO films SELECT * FROM tmp_films WHERE date_prod < '2004-05-07';
```

Vertica does not support subqueries or nested expressions as the target of an INSERT statement. For example, the following query returns an error message:

```sql
=> INSERT INTO t1 (col1, col2) VALUES ('abc', (SELECT mycolumn FROM mytable));
ERROR 4821: Subqueries not allowed in target of insert
```

You can rewrite the above query as follows:

```sql
=> INSERT INTO t1 (col1, col2) (SELECT 'abc', mycolumn FROM mytable);
OUTPUT
-------
0
```
The following example shows how to use `INSERT...VALUES` with flex tables:

```sql
=> CREATE FLEX TABLE flex1();
CREATE TABLE
=> INSERT INTO flex1(a,b) VALUES (1, 'x');
OUTPUT
--------
1
(1 row)
=> SELECT MapToString(__raw__) FROM flex1;
MapToString
-----------------------------
{
  "a" : "1",
  "b" : "x"
}
(1 row)
```

The next example shows how to use `INSERT...SELECT` with flex tables:

```sql
=> CREATE FLEX TABLE flex2();
CREATE TABLE
=> INSERT INTO flex2(a, b) SELECT a, b, '2016-08-10 11:10' c, 'Hello' d, 3.1415 e, f from flex1;
OUTPUT
--------
1
(1 row)
=> SELECT MapToString(__raw__) FROM flex2;
MapToString
-----------------------------
{
  "a" : "1",
  "b" : "x",
  "c" : "2016-08-10",
  "d" : "Hello",
  "e" : 3.1415,
  "f" : null
}
(1 row)
```

**MERGE**

Performs update and insert operations on a target table based on the results of a join with another data set, such as a table or view. The join can match a source row with only one target row; otherwise, Vertica returns an error.

For details, see [Merging Table Data](#).
Syntax

MERGE [ /*+ LABEL */ ]
   USING source-dataset
   ON  join-condition matching-clause[ matching-clause ]

Returns

Number of target table rows updated or inserted

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LABEL</td>
<td>Assigns a label to a statement in order to identify it for profiling and debugging.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>target-table</td>
<td>The table on which to perform update and insert operations. MERGE takes an X (exclusive) lock on the target table during the operation.</td>
</tr>
<tr>
<td></td>
<td><strong>Important:</strong> The total number of target table columns cannot exceed 831.</td>
</tr>
<tr>
<td>source-dataset</td>
<td>The data to join to <code>target-table</code>, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- [[database.]schema.]table [ [AS] alias ]</td>
</tr>
<tr>
<td></td>
<td>- [[database.]schema.]view [ [AS] alias ]</td>
</tr>
<tr>
<td></td>
<td>- (subquery) sq-alias</td>
</tr>
</tbody>
</table>
The specified data set typically supplies the data used to update the target table and populate new rows. You can specify an external table.

<table>
<thead>
<tr>
<th><strong>ON join-condition</strong></th>
<th>The conditions on which to join the target table and source data set.</th>
</tr>
</thead>
</table>

**Tip:**

The Vertica query optimizer can create an optimized query plan for a MERGE statement only if the target table join column has a unique or primary key constraint. For details, see [MERGE Optimization](#) in the Administrator's Guide.

<table>
<thead>
<tr>
<th><strong>matching-clause</strong></th>
<th>One of the following clauses:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- <strong>WHEN MATCHED THEN UPDATE</strong></td>
</tr>
<tr>
<td></td>
<td>- <strong>WHEN NOT MATCHED THEN INSERT</strong></td>
</tr>
</tbody>
</table>

MERGE supports one instance of each clause, and must include at least one.

<table>
<thead>
<tr>
<th><strong>WHEN MATCHED THEN UPDATE</strong></th>
<th>For each target-table row that is joined (matched) to source-dataset, specifies to update one or more columns:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>WHEN MATCHED [ AND update-filter ] THEN UPDATE SET { column = expression }[,…]</td>
</tr>
</tbody>
</table>

**update-filter** optionally filters the set of matching rows. The update filter can specify any number of conditions. Vertica evaluates each matching row against this filter, and updates only the rows that evaluate to true. For details, see [Update and Insert Filters](#) in the Administrator's Guide.

**Note:**

Vertica also supports Oracle syntax for specifying update filters:

```
WHEN MATCHED THEN UPDATE
    SET column = value
```

 Vertica also supports Oracle syntax for specifying update filters:
WHEN MATCHED THEN UPDATE

```
SET { column = expression }[,-]
[ WHERE update-filter ]
```

The following requirements apply:

- A MERGE statement can contain only one WHEN MATCHED clause.
- `target-column` can only specify a column name in the target table. It cannot be qualified with a table name.

For details, see Merging Table Data in the Administrator's Guide.

WHEN NOT MATCHED THEN INSERT

For each `source-dataset` row that is not joined (not matched) to `target-table`, specifies to:

- Insert a new row into `target-table`.
- Populate each new row with the values specified in `values-list`.

```
WHEN NOT MATCHED [ AND insert-filter ] THEN INSERT
[ ( column-list ) ] VALUES ( values-list )
```

column-list is a comma-delimited list of one or more target columns in the target table, listed in any order. MERGE maps column-list columns to values-list values in the same order, and each column-value pair must be compatible. If you omit column-list, Vertica maps values-list values to columns according to column order in the table definition.

insert-filter optionally filters the set of non-matching rows. The insert filter can specify any number of conditions. Vertica evaluates each non-matching source row against this filter. For each row that evaluates to true, Vertica inserts a new row in the target table. For details, see Update and Insert Filters in the Administrator's Guide.
Note:
Vertica also supports Oracle syntax for specifying insert filters:

```
WHEN NOT MATCHED THEN INSERT
[ ( column-list ) ] VALUES ( values-list
[ WHERE insert-filter ]
```

The following requirements apply:

- A MERGE statement can contain only one WHEN NOT MATCHED clause.
- `column-list` can only specify column names in the target table. It cannot be qualified with a table name.
- Insert filter conditions can only reference the source data. If any condition references the target table, Vertica returns an error.

For details, see Merging Table Data in the Administrator's Guide.

**Privileges**

MERGE requires the following privileges:

- SELECT permissions on the source data and INSERT, UPDATE, and DELETE permissions on the target table.
- Automatic constraint enforcement requires SELECT permissions on the table containing the constraint.
- SELECT permissions on the target table if the condition in the syntax reads data from the target table. The following example grants user1 access to target table t2:

For example, the following GRANT statement grants user1 access to target table t2. This allows user1 to run the MERGE statement that follows:

```
=> GRANT SELECT, INSERT, UPDATE, DELETE ON TABLE t2 to user1;
GRANT PRIVILEGE
=>
c - user1
You are now connected as user "user1".

=> MERGE INTO t2 USING t1 ON t1.a = t2.a
WHEN MATCHED THEN UPDATE SET b = t1.b
WHEN NOT MATCHED THEN INSERT (a, b) VALUES (t1.a, t1.b);
```
Improving MERGE Performance

You can improve MERGE performance in several ways:

- Design projections for optimal MERGE performance.
- Facilitate creation of optimized query plans.
- Use a source data set that is smaller than the target table.

For details, see MERGE Optimization in the Administrator's Guide.

Constraint Enforcement

MERGE respects all enforced constraints in the target table. If the merge operation attempts to copy values that violate those constraints, MERGE returns with an error and rolls back the merge operation.

Caution:
If you run MERGE multiple times using the same target and source table, each iteration is liable to introduce duplicate values into the target columns and return with an error.

Columns Prohibited from Merge

The following columns cannot be specified in a merge operation; attempts to do so return with an error:

- Identity/auto-increment columns, or columns whose default value is set to a named sequence.
- Vmap columns such as __raw__ in flex tables.

Examples

See:
Basic MERGE Example
MERGE Source Options
MERGE Matching Clauses
Update and Insert Filters

PROFILE

Profiles a single SQL statement.

Syntax

PROFILE { sql-statement }

Parameters

| sql-statement | A query (SELECT) statement or DML statement--for example, you can profile INSERT, UPDATE, COPY, and MERGE. |

Output

 Writes profile summary to stderr, saves details to system catalog V_MONITOR.EXECUTION_ENGINE_PROFILES.

Privileges

The same privileges required to run the profiled statement

Description

PROFILE generates detailed information about how the target statement executes, and saves that information in the system catalog V_MONITOR.EXECUTION_ENGINE_PROFILES. Query output is preceded by a profile summary: profile identifiers transaction_id and statement_id, initiator memory for the query, and total memory required. For example:
Use profile identifiers to query the table for profile information on a given query.

See Also

Profiling Single Statements

RELEASE SAVEPOINT

Destroys a savepoint without undoing the effects of commands executed after the savepoint was established.

Syntax

RELEASE [ SAVEPOINT ] savepoint_name

Parameters

| savepoint_name | Specifies the name of the savepoint to destroy. |

Privileges

None
Notes

Once destroyed, the savepoint is unavailable as a rollback point.

Example

The following example establishes and then destroys a savepoint called my_savepoint. The values 101 and 102 are both inserted at commit.

```sql
=> INSERT INTO product_key VALUES (101);
=> SAVEPOINT my_savepoint;
=> INSERT INTO product_key VALUES (102);
=> RELEASE SAVEPOINT my_savepoint;
=> COMMIT;
```

See Also

- `SAVEPOINT`
- `ROLLBACK TO SAVEPOINT`
**REVOKE Statements**

REVOKE statements let you revoke privileges on database objects from users and roles.

**Important:**
In a database with trust authentication, REVOKE statements appear to work as expected but have no real effect on database security.

**REVOKE (Authentication)**

Revolves privileges on an authentication method from users and roles.

**Syntax**

```
REVOKE AUTHENTICATION auth-method-name FROM grantee[,..]
```

**Parameters**

<table>
<thead>
<tr>
<th>auth-method-name</th>
<th>Name of the target authentication method.</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>Specifies whose privileges are revoked, one of the following:</td>
</tr>
<tr>
<td>User name</td>
<td>Role</td>
</tr>
<tr>
<td>PUBLIC:</td>
<td>The default role of all users</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser
Examples

- Revoke v_ldap authentication from user jsmith:
  => REVOKE AUTHENTICATION v_ldap FROM jsmith;

- Revoke v_gss authentication from the role DBprogrammer:
  => REVOKE AUTHENTICATION v_gss FROM DBprogrammer;

- Revoke localpwd as the default client authentication method:
  => REVOKE AUTHENTICATION localpwd FROM PUBLIC;

See Also

- ALTER AUTHENTICATION
- CREATE AUTHENTICATION
- DROP AUTHENTICATION
- GRANT (Authentication)

REVOKE (Database)

Revolves database privileges from users and roles.

Syntax

REVOKE [ GRANT OPTION FOR ] { privilege[s] } [ ALL [ PRIVILEGES ] ]
  ON DATABASE db-spec
  FROM grantee[s]
  [ CASCADE ]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT OPTION FOR</td>
<td>Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.</td>
</tr>
</tbody>
</table>
**privilege**

The database privilege to revoke, one of the following:

- **CREATE**: Create schemas.
- **TEMP**: Create temporary tables.

**ALL [PRIVILEGES]**

Revokes all database privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack.

The optional keyword **PRIVILEGES** is supported to comply with the SQL standard.

**ON DATABASE**  
**db-spec**

Specifies the current database, set to the database name or **DEFAULT**.

**grantee**

Specifies whose privileges are revoked, one of the following:

- **User name**
- **Role**
- **PUBLIC**: The default role of all users

**CASCADE**

If the target grantees have a grant option to extend the specified privileges to other users, **CASCADE** specifies to search for these users and revoke the privileges from them also.

---

**Privileges**

Non-superuser, one of the following:

- Ownership
- **GRANT OPTION** on the object

---

**Examples**

Revoke user Fred's privilege to create schemas in the current database:

```sql
=> REVOKE CREATE ON DATABASE DEFAULT FROM Fred;
```

Revoke user Fred's privilege to create temporary tables in the current database:

```sql
=> REVOKE TEMP ON DATABASE DEFAULT FROM Fred;
```
See Also

- GRANT (Database)
- Granting and Revoking Privileges

REVOKE (Library)

Revokes library privileges from users and roles.

Syntax

```
REVOKE [ GRANT OPTION FOR ] { USAGE | ALL [ PRIVILEGES ] }
    ON LIBRARY [[database.]schema.]library[,..]
    FROM grantee[,..]
    [ CASCADE ]
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT OPTION FOR</td>
<td>Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.</td>
</tr>
<tr>
<td>USAGE</td>
<td>Revokes access to the specified libraries.</td>
</tr>
<tr>
<td>ALL [PRIVILEGES]</td>
<td>Revokes all library privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
</tbody>
</table>

```sql
myschema.thisDbObject
```
If you specify a database, it must be the current database.

**library**
The target library.

**grantee**
Specifies whose privileges are revoked, one of the following:

- **User name**
- **Role**
- **PUBLIC**: The default role of all users

**CASCADE**
If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.

### Examples

These commands show how to create a new library, and then grant and revoke user Fred's USAGE privilege on that library.

```sql
=> CREATE LIBRARY MyFunctions AS 'home/dbadmin/my_functions.so';
=> GRANT USAGE ON LIBRARY MyFunctions TO Fred;
=> REVOKE USAGE ON LIBRARY MyFunctions FROM Fred;
```

### See Also

- **GRANT (Library)**
- **Granting and Revoking Privileges**

### REVOKE (Model)

Revolves model privileges from users and roles.

### Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[,..] | ALL [ PRIVILEGES ] } 
ON MODEL [[database.]schema.]model-name [,..]
FROM grantees[,..]
[ CASCADE ]
```
## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>GRANT OPTION FOR</strong></td>
<td>Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.</td>
</tr>
<tr>
<td><strong>USAGE</strong></td>
<td>One of the following privileges:</td>
</tr>
<tr>
<td></td>
<td>- USAGE: Usage of the specified models</td>
</tr>
<tr>
<td></td>
<td>- ALTER</td>
</tr>
<tr>
<td></td>
<td>- DROP</td>
</tr>
<tr>
<td><strong>ALL [PRIVILEGES]</strong></td>
<td>Revokes all model privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard.</td>
</tr>
<tr>
<td><strong>[database.]schema</strong></td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><strong>model-name</strong></td>
<td>Name of the target model.</td>
</tr>
<tr>
<td><strong>grantee</strong></td>
<td>Specifies whose privileges are revoked, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- User name</td>
</tr>
<tr>
<td></td>
<td>- Role</td>
</tr>
<tr>
<td></td>
<td>- PUBLIC: The default role of all users</td>
</tr>
<tr>
<td><strong>CASCADE</strong></td>
<td>If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.</td>
</tr>
</tbody>
</table>

## Privileges

Non-superuser, one of the following:
Ownership

**GRANT OPTION** on the object

## Example

Revoke user Fred's USAGE privilege on model `mySvmClassModel`:

```sql
=> REVOKE USAGE ON mySvmClassModel FROM Fred;
```

## See Also

- **GRANT (Model)**
- **Managing Model Security**

## REVOKE (Procedure)

Revoke procedure privileges from **users** and **roles**.

### Syntax

```
REVOKE [ GRANT OPTION FOR ] { EXECUTE | ALL PRIVILEGES }
ON PROCEDURE [[database.]schema.]procedure( [argument-list] ][,...]
FROM grantee[,...]
[ CASCADE ]
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>GRANT OPTION FOR</strong></td>
<td>Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.</td>
</tr>
<tr>
<td><strong>EXECUTE</strong></td>
<td>Revokes grantees ability to run the specified procedures.</td>
</tr>
<tr>
<td><strong>ALL [PRIVILEGES]</strong></td>
<td>Revokes all procedure privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack.</td>
</tr>
</tbody>
</table>
The optional keyword PRIVILEGES conforms with the SQL standard.

<table>
<thead>
<tr>
<th>database. ]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>procedure</th>
<th>The target procedure.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>argument-list</th>
<th>A comma-delimited list of procedure arguments, where each argument is specified as follows:</th>
</tr>
</thead>
<tbody>
<tr>
<td>[argname] argtype</td>
<td>If the procedure is defined with no arguments, supply an empty argument list.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>grantee</th>
<th>Specifies whose privileges are revoked, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• User name</td>
</tr>
<tr>
<td></td>
<td>• Role</td>
</tr>
<tr>
<td></td>
<td>• PUBLIC: The default role of all users</td>
</tr>
</tbody>
</table>

| CASCADE | If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also. |

### Privileges

Non-superuser, one of the following:

- Ownership
- GRANT OPTION on the object

### Examples

This example revokes user Bob's execute privilege on the tokenize procedure.

```sql
=> REVOKE EXECUTE ON PROCEDURE tokenize(varchar) FROM Bob;
```
REVOKE (Resource Pool)

Revokes resource pool access privileges from users and roles.

Vertica checks resource pool privileges at runtime. Revoking a user's privileges for a resource pool can have an immediate effect on the user's current session. For example, a user query might require USAGE privileges on a resource pool. If you revoke those privileges from that user, subsequent attempts by the user to execute that query fail and return with an error message.

Syntax

```
REVOKE [ GRANT OPTION FOR ] { USAGE | ALL PRIVILEGES }
ON RESOURCE POOL resource-pool[,]...
[ FOR SUBCLUSTER subcluster | FOR CURRENT SUBCLUSTER]
FROM grantee[,]...
[ CASCADE ]
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT OPTION FOR</td>
<td>Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.</td>
</tr>
<tr>
<td>USAGE</td>
<td>Revokes grantee's access to the specified resource pool.</td>
</tr>
<tr>
<td>ALL PRIVILEGES</td>
<td>Revokes all resource pool privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard.</td>
</tr>
<tr>
<td>resource-pool</td>
<td>The target resource pool.</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------</td>
</tr>
<tr>
<td>subcluster</td>
<td>The subcluster for the resource pool.</td>
</tr>
<tr>
<td>grantee</td>
<td>Specifies whose privileges are revoked, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- User name</td>
</tr>
<tr>
<td></td>
<td>- Role</td>
</tr>
<tr>
<td></td>
<td>- PUBLIC: The default role of all users</td>
</tr>
<tr>
<td>CASCADE</td>
<td>If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.</td>
</tr>
</tbody>
</table>

**Privileges**

Non-superuser, one of the following:

- Ownership
- **GRANT OPTION** on the object

**Examples**

Revoke user Joe's USAGE privileges on resource pool Joe_pool.

```
=> REVOKE USAGE ON RESOURCE POOL Joe_pool FROM Joe;
REVOKE PRIVILEGE
```

Revoke user Joe's USAGE privileges on resource pool Joe_pool for subcluster sub1.

```
=> REVOKE USAGE ON RESOURCE POOL Joe_pool FOR SUBCLUSTER sub1 FROM Joe;
REVOKE PRIVILEGE
```

**See Also**

- **GRANT (Resource Pool)**
- Granting and Revoking Privileges
REVOKE (Role)

Revokes a role from users and roles.

Syntax

REVOKE [ ADMIN OPTION FOR ] role[,...] 
FROM grantee[,...] 
[ CASCADE ]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADMIN OPTION FOR</td>
<td>Revokes from the grantees the authority to assign the specified roles to other users or roles. Current roles for grantees remain unaffected. If you omit this clause, Vertica revokes role assignment privileges and the current roles.</td>
</tr>
<tr>
<td>role</td>
<td>Role to revoke.</td>
</tr>
<tr>
<td>grantee</td>
<td>Specifies whose privileges are revoked, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- User name</td>
</tr>
<tr>
<td></td>
<td>- Role</td>
</tr>
<tr>
<td></td>
<td>- PUBLIC: The default role of all users</td>
</tr>
<tr>
<td>CASCADE</td>
<td>If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.</td>
</tr>
</tbody>
</table>

Privileges

One of the following:

- Superuser
- Privileges grantee who was given the option (WITH ADMIN OPTION) of extending these privileges to other users
Examples

This example shows the revocation of the pseudosuperuser role from the dbadmin user:

```sql
=> REVOKE pseudosuperuser from dbadmin;
```

This example shows the revocation of administration access from the dbadmin user for the pseudosuperuser role. The ADMIN OPTION command does not remove the pseudosuperuser role.

```sql
=> REVOKE ADMIN OPTION FOR pseudosuperuser FROM dbadmin;
```

Notes

If the role you are trying to revoke was not already granted to the user, Vertica returns a NOTICE:

```sql
=> REVOKE commentor FROM Sue;
NOTICE 2022: Role "commentor" was not already granted to user "Sue"
REVOKE ROLE
```

See Also

- GRANT (Role)
- Granting and Revoking Privileges

REVOKE (Schema)

Revolves schema privileges from users and roles.

Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[,...] | ALL [ PRIVILEGES ] } ON SCHEMA [database. ]schema[, ...]
FROM grantee[, ...]
[ CASCADE ]
```
Parameters

<table>
<thead>
<tr>
<th>GRANT OPTION FOR</th>
<th>Revotes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The schema privilege to revoke, one of the following:</td>
</tr>
</tbody>
</table>
|                   | - USAGE: Access objects in the specified schemas.  
|                   | - CREATE: Create objects in the specified schemas.                                                                                                                                                                                                         |

You can also revoke privileges from tables and views that they inherited on creation from this schema. When you revoke inherited privileges at the schema level, Vertica automatically applies the revocation to all tables and views that inherited these privileges.

- SELECT: Query tables and views. SELECT privileges are granted by default to the PUBLIC role.
- INSERT: Insert rows, or and load data into tables with COPY.

**Note:**

COPY FROM STDIN is allowed for users with INSERT privileges, while COPY FROM file requires admin privileges.

- UPDATE: Update table rows.
- DELETE: Delete table rows.
- REFERENCES: Create foreign key constraints on this table. This privilege must be set on both referencing and referenced tables.
- TRUNCATE: Truncate table contents. Non-owners of tables can also execute the following partition operations on them:
  - DROP_PARTITIONS
  - SWAP_PARTITIONS_BETWEEN_TABLES
  - MOVE_PARTITIONS_TO_TABLE
- ALTER: Modify the DDL of tables and views with ALTER TABLE and ALTER VIEW, respectively.
- DROP: Drop tables and views.
### Privileges

Non-superuser, one of the following:

- Ownership
- **GRANT OPTION** on the object

### Examples

Revoke user Joe's USAGE privilege on schema online_sales.

```sql
=> REVOKE USAGE ON SCHEMA online_sales FROM Joe;
REVOKE PRIVILEGE
```

### See Also

- **GRANT (Schema)**
- Granting and Revoking Privileges
REVOKE (Sequence)

Revoke sequence privileges from users and roles.

Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[,..] | ALL [ PRIVILEGES ] }
ON { sequence | ALL SEQUENCES IN SCHEMA [ database ] [ schema ] }
FROM grantee[,..]
[ CASCADE ]
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>GRANT OPTION FOR</strong></td>
<td>Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.</td>
</tr>
<tr>
<td><strong>privilege</strong></td>
<td>One of the following privileges:</td>
</tr>
<tr>
<td></td>
<td>- SELECT: Execute functions CURRVAL and NEXTVAL on the specified sequences.</td>
</tr>
<tr>
<td></td>
<td>- ALTER: Modify a sequence's DDL with ALTER SEQUENCE.</td>
</tr>
<tr>
<td></td>
<td>- DROP: Drop this sequence with DROP SEQUENCE.</td>
</tr>
<tr>
<td><strong>ALL [PRIVILEGES]</strong></td>
<td>Revokes all sequence privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack.</td>
</tr>
<tr>
<td></td>
<td>The optional keyword PRIVILEGES is supported to comply with the SQL standard.</td>
</tr>
<tr>
<td><strong>[database.]schema</strong></td>
<td>Specifies a schema, by default public. If schema is any schema other than public,</td>
</tr>
</tbody>
</table>
you must supply the schema name. For example:

`myschema.thisDbObject`

If you specify a database, it must be the current database.

**SEQUENCE** *sequence*

Specifies the sequence on which to revoke privileges.

**ALL SEQUENCES IN SCHEMA** *schema*

Revokes the specified privileges on all sequences in schema *schema*.

**grantee**

Specifies whose privileges are revoked, one of the following:

- **User name**
- **Role**
- **PUBLIC**: The default role of all users

**CASCADE**

If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.

---

**Privileges**

Non-superuser, one of the following:

- Ownership
- **GRANT OPTION** on the object

---

**Examples**

Revoke user Joe's privileges on sequence *my_seq*.

```sql
=> REVOKE ALL PRIVILEGES ON SEQUENCE my_seq FROM Joe;
REVOKE PRIVILEGE
```
**See Also**

- GRANT (Sequence)
- Granting and Revoking Privileges

**REVOKE (Storage Location)**

Revolves privileges on a USER-defined storage location from users and roles. For more information, see Creating Storage Locations in the Administrator’s Guide.

**Note:**

If the storage location is dropped, Vertica automatically revokes all privileges on it.

**Syntax**

```sql
REVOKE [ GRANT OPTION FOR ] { privilege[,..] | ALL [ PRIVILEGES ] }
ON LOCATION 'path' [ ON node ]
FROM grantee[,..]
[ CASCADE ]
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>GRANT OPTION FOR</strong></td>
<td>Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.</td>
</tr>
</tbody>
</table>

privilege

One of the following privileges:

- **READ**: Copy data from files in the storage location into a table.
- **WRITE**: Export data from the database to the storage location. With WRITE privileges, grantees can also save COPY statement rejected data and exceptions files to the storage location.
<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL [PRIVILEGES]</td>
<td>Revokes all storage location privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack.</td>
</tr>
<tr>
<td></td>
<td>The optional keyword PRIVILEGES is supported to comply with the SQL standard.</td>
</tr>
<tr>
<td>ON LOCATION 'path'</td>
<td>Specifies the path name mount point of the storage location. If qualified by ON NODE, Vertica revokes access to the storage location residing on node.</td>
</tr>
<tr>
<td>[ ON node ]</td>
<td>If no node is specified, the revoke operation applies to all nodes on the specified path. All nodes must be on the specified path; otherwise, the entire revoke operation rolls back.</td>
</tr>
<tr>
<td><strong>grantee</strong></td>
<td>Specifies whose privileges are revoked, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• User name</td>
</tr>
<tr>
<td></td>
<td>• Role</td>
</tr>
<tr>
<td></td>
<td>• PUBLIC: The default role of all users</td>
</tr>
<tr>
<td>CASCADE</td>
<td>If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.</td>
</tr>
</tbody>
</table>

**Privileges**

Non-superuser, one of the following:

- Ownership
- **GRANT OPTION** on the object

**Examples**

See GRANT (Storage Location).

**See Also**

Granting and Revoking Privileges
REVOKE (Table)

Revoke table privileges from users and roles.

**Syntax**

```sql
REVOKE [ GRANT OPTION FOR ] { privilege[,...] | ALL [ PRIVILEGES ] }
ON
  [ TABLE ] [(database.)schema.]table[,..]
  | ALL TABLES IN SCHEMA [database.]schema[,..]
FROM grantee[,..]
[ CASCADE ]
```

**Parameters**

<table>
<thead>
<tr>
<th>GRANT OPTION FOR</th>
<th>Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.</th>
</tr>
</thead>
</table>
| `privilege`      | One of the following privileges:  
|                  |   • SELECT: Query tables. SELECT privileges are granted by default to the PUBLIC role.  
|                  |   • INSERT: Insert table rows with INSERT, and load data with COPY.  
|                  |     **Note:** COPY FROM STDIN is allowed for users with INSERT privileges, while COPY FROM file requires admin privileges.  
|                  |   • UPDATE: Update table rows.  
|                  |   • DELETE: Delete table rows.  
|                  |   • REFERENCES: Create foreign key constraints on this table. This privilege must be set on both referencing and referenced tables. |
|                  |                                                                                               |
- **TRUNCATE**: Truncate table contents. Non-owners of tables can also execute the following partition operations on them:
  - DROP_PARTITIONS
  - SWAP_PARTITIONS_BETWEEN_TABLES
  - MOVE_PARTITIONS_TO_TABLE
- **ALTER**: Modify a table's DDL with ALTER TABLE.
- **DROP**: Drop a table.

### ALL [PRIVILEGES]
Revoke all table privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack.

The optional keyword PRIVILEGES is supported to comply with the SQL standard.

### [database.]schema
Specifies a schema, by default public. If `schema` is any schema other than public, you must supply the schema name. For example:

```sql
myschema.thisDbObject
```

One exception applies: you can specify system tables without their schema name.

If you specify a database, it must be the current database.

### TABLE `table`
Specifies the table on which to revoke privileges.

### ON ALL TABLES IN SCHEMA `schema`
Revoke the specified privileges on all tables and views in schema `schema`.

### grantee
Specifies whose privileges are revoked, one of the following:

- **User name**
- **Role**
- **PUBLIC**: The default role of all users
### Privileges

Non-superuser, one of the following:

- Ownership
- **GRANT OPTION** on the object

### Examples

Revoke user Joe's privileges on table `customer_dimension`.

```sql
=> REVOKE ALL PRIVILEGES ON TABLE customer_dimension FROM Joe;
REVOKE PRIVILEGE
```

### See Also

- **GRANT (Table)**
- Granting and Revoking Privileges

### REVOKE (User Defined Extension)

Revoke privileges on one or more user-defined extensions from users and roles.

#### Syntax

```
REVOKE [ GRANT OPTION FOR ] { EXECUTE | ALL PRIVILEGES }
ON {  
  U Dx-type [[database.]schema.]function-name{ [argument-list] }[,...]
  | ALL FUNCTIONS IN SCHEMA schema[,...] }
FROM grantee[,...]
```
# Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>GRANT OPTION FOR</strong></td>
<td>Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.</td>
</tr>
<tr>
<td><strong>EXECUTE</strong></td>
<td>Revokes grantees ability to run the specified functions.</td>
</tr>
<tr>
<td><strong>ALL [PRIVILEGES]</strong></td>
<td>Revokes all function privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard.</td>
</tr>
<tr>
<td><strong>ON UDx-type</strong></td>
<td>Specifies the function's user-defined extension (UDx) type, where UDx-type is one of the following:</td>
</tr>
<tr>
<td></td>
<td>• FUNCTION</td>
</tr>
<tr>
<td></td>
<td>• AGGREGATE FUNCTION</td>
</tr>
<tr>
<td></td>
<td>• ANALYTIC FUNCTION</td>
</tr>
<tr>
<td></td>
<td>• TRANSFORM FUNCTION</td>
</tr>
<tr>
<td></td>
<td>• FILTER</td>
</tr>
<tr>
<td></td>
<td>• PARSER</td>
</tr>
<tr>
<td></td>
<td>• SOURCE</td>
</tr>
<tr>
<td><strong>[database.]schema</strong></td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td><strong>function-name</strong></td>
<td>The name of the user-defined function on which to revoke privileges.</td>
</tr>
<tr>
<td><strong>ON ALL FUNCTIONS IN SCHEMA</strong></td>
<td>Revokes privileges on all functions in the specified schema.</td>
</tr>
</tbody>
</table>
**schema**

- **schema.**

**argument-list**

- Required for all polymorphic functions, a comma-delimited list of function arguments, where each argument is specified as follows:

  - `argname argtype`

  - If the procedure is defined with no arguments, supply an empty argument list.

**grantee**

- Specifies whose privileges are revoked, one of the following:
  - **User name**
  - **Role**
  - **PUBLIC**: The default role of all users

**CASCADE**

- If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.

### Privileges

Non-superuser, one of the following:

- Owner of the target function
- Privileges grantee who was given the option (WITH GRANT OPTION) of extending these privileges to other users

### Examples

Revoke EXECUTE privileges from user Bob on function myzeroifnull:

```
=> REVOKE EXECUTE ON FUNCTION myzeroifnull (x INT) FROM Bob;
```

Revoke all privileges from user Doug on function Pagerank:

```
=> REVOKE ALL ON TRANSFORM FUNCTION Pagerank (t float) FROM Doug;
```

Revoke EXECUTE privileges on all functions in the zero-schema schema from user Bob:
Revoke EXECUTE privileges from user Bob on the tokenize function:

```sql
=> REVOKE EXECUTE ON TRANSFORM FUNCTION tokenize(VARCHAR) FROM Bob;
```

Revoke all privileges on the ExampleSource() source from user Alice:

```sql
=> REVOKE ALL ON SOURCE ExampleSource() FROM Alice;
```

**See Also**

- [GRANT (User Defined Extension)]
- [Granting and Revoking Privileges](#) in the Administrator's Guide
- [Developing User-Defined Extensions (UDxs)](#) in Extending Vertica

---

**REVOKE (View)**

Revolves privileges on a view from *users* and *roles*.

**Syntax**

```sql
REVOKE [ GRANT OPTION FOR ] { privilege[,..] | ALL [ PRIVILEGES ] } 
ON [ [[database.]schema.]view[,..] ] 
FROM grantees[,..] 
[ CASCADE ]
```

**Parameters**

<table>
<thead>
<tr>
<th>GRANT OPTION FOR</th>
<th>Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>privilege</em></td>
<td>One of the following:</td>
</tr>
<tr>
<td></td>
<td>- SELECT: Query the specified views.</td>
</tr>
<tr>
<td></td>
<td>- ALTER: Modify a view's DDL with ALTER VIEW</td>
</tr>
<tr>
<td></td>
<td>- DROP: Drop this view with DROP VIEW.</td>
</tr>
</tbody>
</table>
**ALL PRIVILEGES**
Revokes all privileges that pertain to views that also belong to the revoker. Users cannot revoke privileges that they themselves lack.

The optional keyword PRIVILEGES conforms with the SQL standard.

**[database.]schema**
Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example:

```
myschema.thisDbObject
```

If you specify a database, it must be the current database.

**view**
The view on which to revoke privileges.

**grantee**
Specifies whose privileges are revoked, one of the following:

- **User name**
- **Role**
- **PUBLIC**: The default role of all users

**CASCADE**
If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.

## Examples

Revoke SELECT privileges from user Joe on view test_view.

```
=> REVOKE SELECT ON test_view FROM Joe;
REVOKE PRIVILEGE
```

## See Also

- **GRANT (View)**
- **Granting and Revoking Privileges**
**ROLLBACK**

Ends the current transaction and discards all changes that occurred during the transaction.

**Syntax**

ROLLBACK [ WORK | TRANSACTION ]

**Parameters**

| WORK | TRANSACTION | Have no effect; they are optional keywords for readability. |

**Privileges**

None

**Notes**

When an operation is rolled back, any locks that are acquired by the operation are also rolled back.

ABORT is a synonym for ROLLBACK.

**Examples**

This example shows how to roll back from a DELETE transaction.

```sql
=> SELECT * FROM sample_table;
  a
  ---
  1 (1 row)
=> DELETE FROM sample_table WHERE a = 1;
=> SELECT * FROM sample_table;
  a
```
---
(0 rows)
=> ROLLBACK;
=> SELECT * FROM sample_table;
---
1
(1 row)

This example shows how to roll back the changes you made since the BEGIN statement.

=> BEGIN TRANSACTION ISOLATION LEVEL READ COMMITTED READ ONLY;
BEGIN
=> ROLLBACK TRANSACTION;
ROLLBACK

See Also

- Transactions
- Creating and Rolling Back Transactions
- BEGIN
- COMMIT
- END
- START TRANSACTION

ROLLBACK TO SAVEPOINT

Rolls back all commands that have been entered within the transaction since the given savepoint was established.

Syntax

ROLLBACK TO [SAVEPOINT] savepoint_name

Parameters

| savepoint_name | Specifies the name of the savepoint to roll back to. |
Privileges

None

Notes

- The savepoint remains valid and can be rolled back to again later if needed.
- When an operation is rolled back, any locks that are acquired by the operation are also rolled back.
- ROLLBACK TO SAVEPOINT implicitly destroys all savepoints that were established after the named savepoint.

Example

The following example rolls back the values 102 and 103 that were entered after the savepoint, my_savepoint, was established. Only the values 101 and 104 are inserted at commit.

```sql
=> INSERT INTO product_key VALUES (101);
=> SAVEPOINT my_savepoint;
=> INSERT INTO product_key VALUES (102);
=> INSERT INTO product_key VALUES (103);
=> ROLLBACK TO SAVEPOINT my_savepoint;
=> INSERT INTO product_key VALUES (104);
=> COMMIT;
```

See Also

- RELEASE SAVEPOINT
- SAVEPOINT

SAVE QUERY

Saves an input query to associate with a custom directed query.

Syntax

```
SAVE QUERY input-query
```

### Parameters

| input-query | The input query to associate with a custom directed query. The input query supports only one optimizer hint, :v. |

### Privileges

**Superuser**

### Description

SAVE QUERY saves the specified input query for use by the next invocation of [CREATE DIRECTED QUERY CUSTOM](#). CREATE DIRECTED QUERY CUSTOM pairs the saved query with its annotated query argument to create a directed query. Both statements must be issued in the same user session.

The saved query remains available until the one of the following events occurs:

- The next invocation of CREATE DIRECTED QUERY, whether invoked with CUSTOM or OPTIMIZER.
- Another invocation of SAVE QUERY.
- The session ends.

**Caution:**

Vertica associates a saved query with a directed query without checking whether the input and annotated queries are compatible. Be careful to sequence SAVE QUERY and CREATE DIRECTED QUERY CUSTOM so the saved and directed queries are correctly matched.

### Examples

See [Custom Directed Queries](#).

SAVEPONT

Creates a special mark, called a savepoint, inside a transaction. A savepoint allows all commands that are executed after it was established to be rolled back, restoring the transaction to the state it was in at the point in which the savepoint was established.

Tip:
Savepoints are useful when creating nested transactions. For example, a savepoint could be created at the beginning of a subroutine. That way, the result of the subroutine could be rolled back if necessary.

Syntax

```
SAVEPOINT savepoint_name
```

Parameters

| savepoint_name | Specifies the name of the savepoint to create. |

Privileges

None

Notes

- Savepoints are local to a transaction and can only be established when inside a transaction block.
- Multiple savepoints can be defined within a transaction.
- If a savepoint with the same name already exists, it is replaced with the new savepoint.
Example

The following example illustrates how a savepoint determines which values within a transaction can be rolled back. The values 102 and 103 that were entered after the savepoint, my_savepoint, was established are rolled back. Only the values 101 and 104 are inserted at commit.

```sql
=> INSERT INTO T1 (product_key) VALUES (101);
=> SAVEPOINT my_savepoint;
=> INSERT INTO T1 (product_key) VALUES (102);
=> INSERT INTO T1 (product_key) VALUES (103);
=> ROLLBACK TO SAVEPOINT my_savepoint;
=> INSERT INTO T1 (product_key) VALUES (104);
=> COMMIT;
=> SELECT product_key FROM T1;
 .
 .
101
104
(2 rows)
```

See Also

- RELEASE SAVEPOINT
- ROLLBACK TO SAVEPOINT

SELECT

Returns a result set from one or more data sources—tables, views, joined tables, and named subqueries.

Syntax

```
[ AT epoch ] [ WITH-clause ]  SELECT [ /*+ LABEL(label-name)*/ ] [ ALL | DISTINCT ]
  [ * | expression [ [ AS ] alias ] ][,...]
[ into-table-clause ]
[ from-clause ]
[ where-clause ]
[ time-series-clause ]
[ group-by-clause][,...]
[ having-clause][,...]
[ match-clause ]
[ union-clause ]
```
[ intersect-clause ]
[ except-clause ]
[ order-by-clause ][ offset-clause ]
[ limit-clause ]
[ FOR UPDATE [ OF table-name[, ...] ] ]

**Parameters**

**Note:**
SELECT clauses such as INTO and WHERE are discussed on separate pages.

<table>
<thead>
<tr>
<th>AT epoch</th>
<th>Returns data from the specified epoch, where <em>epoch</em> is one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• EPOCH LATEST: Return data up to but not including the current epoch. The result set includes data from the latest committed DML transaction.</td>
</tr>
<tr>
<td></td>
<td>• EPOCH integer: Return data up to and including the <em>integer</em>-specified epoch.</td>
</tr>
<tr>
<td></td>
<td>• TIME 'timestamp': Return data from the <em>timestamp</em>-specified epoch.</td>
</tr>
</tbody>
</table>

**Note:**
These options are ignored if used to query temporary or external tables.

See Epochs for additional information about how Vertica uses epochs.
For details, see Historical Queries.

**WITH-clause**
Defines one or more named common table expressions (CTEs). Each CTE encapsulates a result set that can be referenced by another CTE in the same WITH clause, or by the primary query of the WITH clause.
For details, see WITH Clause.

/*+LABEL (label-name)*/
Assigns a label to a query so you can identify it for profiling and debugging.
In a UNION statement, only the first SELECT statement can be labeled; Vertica ignores labels in subsequent
<table>
<thead>
<tr>
<th>ALL</th>
<th>DISTINCT</th>
<th><strong>SELECT statements.</strong></th>
</tr>
</thead>
</table>
|     |           | • ALL (default): Retains duplicate rows in result set or group.  
|     |           | • DISTINCT: Removes duplicate rows from the result set or group.  
|     |           | The ALL or DISTINCT qualifier must immediately follow the SELECT keyword. Only one instance of this keyword can appear in the select list. |
| *   |           | **Lists all columns in the queried tables.**  
|     |           | **Caution:** Selecting all columns from the queried tables can produce a very large wide set, which can adversely affect performance. |
| **expression [[AS] alias]** | **An expression that typically resolves to column data from the queried tables—for example, names of columns that are specified in the FROM clause; also:**  
|     |           | • **Literals** (constants)  
|     |           | • **Aggregate expressions**  
|     |           | • **CASE expressions**  
|     |           | • **SQL functions**  
|     |           | • Subqueries in the SELECT list  
|     |           | You can optionally assign a temporary alias to each column expression and reference that alias elsewhere in the SELECT statement—for example, in the query predicate or ORDER BY clause. Vertica uses the alias as the column heading in query output. |
| **FOR UPDATE** | **Specifies to obtain an X lock on all tables specified in the query, most often used from READ COMMITTED isolation.**  
|     |           | **FOR UPDATE requires update/delete permissions on the queried tables and cannot be issued from a read-only transaction.** |
Privileges

Non-superusers:

- USAGE on the schema
- SELECT on the table or view

**Note:**
As view owner, you can grant other users SELECT privilege on the view only if one of the following is true:

- You own the view's base table.
- You have SELECT...WITH GRANT OPTION privilege on the view's base table.

Example

When multiple clients run transactions as in the following example query, deadlocks can occur if FOR UPDATE is not used. Two transactions acquire an S lock, and when both attempt to upgrade to an X lock, they encounter deadlocks:

```
=> SELECT balance FROM accounts WHERE account_id=3476 FOR UPDATE;
...
=> UPDATE accounts SET balance = balance+10 WHERE account_id=3476;
=> COMMIT;
```

- Subqueries
- Joins
EXCEPT Clause

Combines two or more SELECT queries. EXCEPT returns distinct results of the left-hand query that are not also found in the right-hand query.

**Note:**
MINUS is an alias for EXCEPT.

Syntax

```
SELECT EXCEPT except-query[...]
    [ ORDER BY { column-name | ordinal-number } [ ASC | DESC ] [,..] ]
    [ LIMIT { integer | ALL } ]
    [ OFFSET integer ]
```

Notes

- Use the EXCEPT clause to filter out specific results from a SELECT statement. The EXCEPT query operates on the results of two or more SELECT queries. It returns only those rows in the left-hand query that are not also present in the right-hand query.
- Vertica evaluates multiple EXCEPT clauses in the same SELECT query from left to right, unless parentheses indicate otherwise.
- You cannot use the ALL keyword with an EXCEPT query.
- The results of each SELECT statement must be union compatible. Each statement must return the same number of columns, and the corresponding columns must have compatible data types. For example, you cannot use the EXCEPT clause on a column of type INTEGER and a column of type VARCHAR. If statements do not meet these criteria, Vertica returns an error.

**Note:**
The Data Type Coercion Chart lists the data types that can be cast to other data types. If one data type can be cast to the other, those two data types are compatible.

- You can use EXCEPT in FROM, WHERE, and HAVING clauses.
- You can order the results of an EXCEPT operation by including an ORDER BY operation in the statement. When you write the ORDER BY list, specify the column
names from the leftmost SELECT statement, or specify integers that indicate the position of the columns by which to sort.

- The rightmost ORDER BY, LIMIT, or OFFSET clauses in an EXCEPT query do not need to be enclosed in parentheses, because the rightmost query specifies that Vertica perform the operation on the results of the EXCEPT operation. Any ORDER BY, LIMIT, or OFFSET clauses contained in SELECT queries that appear earlier in the EXCEPT query must be enclosed in parentheses.
- Vertica supports EXCEPT noncorrelated subquery predicates. For example:

```sql
=> SELECT * FROM T1
    WHERE T1.x IN
        (SELECT MAX(c1) FROM T2
            EXCEPT
                SELECT MAX(cc1) FROM T3
                EXCEPT
                    SELECT MAX(d1) FROM T4);
```

## Examples

Consider the following three tables:

### Company_A

<table>
<thead>
<tr>
<th>Id</th>
<th>emp_lname</th>
<th>dept</th>
<th>sales</th>
</tr>
</thead>
<tbody>
<tr>
<td>1234</td>
<td>Stephen</td>
<td>auto parts</td>
<td>1000</td>
</tr>
<tr>
<td>5678</td>
<td>Alice</td>
<td>auto parts</td>
<td>2500</td>
</tr>
<tr>
<td>9012</td>
<td>Katherine</td>
<td>floral</td>
<td>500</td>
</tr>
<tr>
<td>3214</td>
<td>Smithson</td>
<td>sporting goods</td>
<td>1500</td>
</tr>
</tbody>
</table>

(4 rows)

### Company_B

<table>
<thead>
<tr>
<th>Id</th>
<th>emp_lname</th>
<th>dept</th>
<th>sales</th>
</tr>
</thead>
<tbody>
<tr>
<td>4321</td>
<td>Marvin</td>
<td>home goods</td>
<td>250</td>
</tr>
<tr>
<td>8765</td>
<td>Bob</td>
<td>electronics</td>
<td>20000</td>
</tr>
<tr>
<td>9012</td>
<td>Katherine</td>
<td>home goods</td>
<td>500</td>
</tr>
<tr>
<td>3214</td>
<td>Smithson</td>
<td>home goods</td>
<td>1500</td>
</tr>
</tbody>
</table>

(4 rows)

### Company_C

<table>
<thead>
<tr>
<th>Id</th>
<th>emp_lname</th>
<th>dept</th>
<th>sales</th>
</tr>
</thead>
<tbody>
<tr>
<td>3214</td>
<td>Smithson</td>
<td>sporting goods</td>
<td>1500</td>
</tr>
<tr>
<td>5432</td>
<td>Madison</td>
<td>sporting goods</td>
<td>400</td>
</tr>
<tr>
<td>7865</td>
<td>Cleveland</td>
<td>outdoor</td>
<td>1500</td>
</tr>
<tr>
<td>1234</td>
<td>Stephen</td>
<td>floral</td>
<td>1000</td>
</tr>
</tbody>
</table>
The following query returns the IDs and last names of employees that exist in Company_A, but not in Company_B:

```sql
=> SELECT id, emp_lname FROM Company_A
    EXCEPT
    SELECT id, emp_lname FROM Company_B;
```

<table>
<thead>
<tr>
<th>id</th>
<th>emp_lname</th>
</tr>
</thead>
<tbody>
<tr>
<td>1234</td>
<td>Stephen</td>
</tr>
<tr>
<td>5678</td>
<td>Alice</td>
</tr>
</tbody>
</table>

(2 rows)

The following query sorts the results of the previous query by employee last name:

```sql
=> SELECT id, emp_lname FROM Company_A
    EXCEPT
    SELECT id, emp_lname FROM Company_B
    ORDER BY emp_lname ASC;
```

<table>
<thead>
<tr>
<th>id</th>
<th>emp_lname</th>
</tr>
</thead>
<tbody>
<tr>
<td>5678</td>
<td>Alice</td>
</tr>
<tr>
<td>1234</td>
<td>Stephen</td>
</tr>
</tbody>
</table>

(2 rows)

If you order by the column position, the query returns the same results:

```sql
=> SELECT id, emp_lname FROM Company_A
    EXCEPT
    SELECT id, emp_lname FROM Company_B
    ORDER BY 2 ASC;
```

<table>
<thead>
<tr>
<th>id</th>
<th>emp_lname</th>
</tr>
</thead>
<tbody>
<tr>
<td>5678</td>
<td>Alice</td>
</tr>
<tr>
<td>1234</td>
<td>Stephen</td>
</tr>
</tbody>
</table>

(2 rows)

The following query returns the IDs and last names of employees that exist in Company_A, but not in Company_B or Company_C:

```sql
=> SELECT id, emp_lname FROM Company_A
    EXCEPT
    SELECT id, emp_lname FROM Company_B
    EXCEPT
    SELECT id, emp_lname FROM Company_C;
```

<table>
<thead>
<tr>
<th>id</th>
<th>emp_lname</th>
</tr>
</thead>
<tbody>
<tr>
<td>5678</td>
<td>Alice</td>
</tr>
</tbody>
</table>

(1 row)

The following query shows the results of mismatched data types:
Using the VMart example database, the following query returns information about all Connecticut-based customers who bought items through stores and whose purchases amounted to more than $500, except for those customers who paid cash:

```
=> SELECT customer_key, customer_name FROM public.customer_dimension
   WHERE customer_key IN (SELECT customer_key FROM store.store_sales_fact
                           WHERE sales_dollar_amount > 500
                           EXCEPT
                           SELECT customer_key FROM store.store_sales_fact
                           WHERE tender_type = 'Cash')
   AND customer_state = 'CT';
```

<table>
<thead>
<tr>
<th>customer_key</th>
<th>customer_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>15084</td>
<td>Doug V. Lampert</td>
</tr>
<tr>
<td>21730</td>
<td>Juanita F. Peterson</td>
</tr>
<tr>
<td>24412</td>
<td>Mary U. Garnett</td>
</tr>
<tr>
<td>25840</td>
<td>Ben Z. Taylor</td>
</tr>
<tr>
<td>29940</td>
<td>Brian B. Dobisz</td>
</tr>
<tr>
<td>32225</td>
<td>Ruth T. McNulty</td>
</tr>
<tr>
<td>33127</td>
<td>Darlene Y. Rodriguez</td>
</tr>
<tr>
<td>40000</td>
<td>Steve L. Lewis</td>
</tr>
<tr>
<td>44383</td>
<td>Amy G. Jones</td>
</tr>
<tr>
<td>46495</td>
<td>Kevin H. Taylor</td>
</tr>
</tbody>
</table>

(10 rows)

See Also

- SELECT
- INTERSECT Clause
- UNION Clause
- Subqueries

FROM Clause

A comma-separated list of data sources to query.

Syntax

```
FROM dataset[,..] [ TABLESAMPLE(percent) ]
```
Parameters

<table>
<thead>
<tr>
<th>dataset</th>
<th>A set of data to query, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Table reference</td>
</tr>
<tr>
<td></td>
<td>• Joined tables</td>
</tr>
<tr>
<td></td>
<td>• View</td>
</tr>
<tr>
<td></td>
<td>• Named subquery: subquery [AS] name</td>
</tr>
</tbody>
</table>

| TABLESAMPLE(percent) | Specifies to return a random sampling of records, where percent specifies the approximate sampling size. The percent value must be between 0 and 100, exclusive, and can include decimal values. The number of records returned is not guaranteed to be the exact percentage specified. All rows of the data have equal opportunities to be selected. Vertica performs sampling before applying other query filters. |

Examples

Count all records in customer_dimension table:

```sql
=> SELECT COUNT(*) FROM customer_dimension;
COUNT
-------
50000
(1 row)
```

Return a small sampling of rows in table customer_dimension:

```sql
=> SELECT customer_name, customer_state FROM customer_dimension TABLESAMPLE(0.5) WHERE customer_state='IL';
 customer_name   | customer_state |
-----------------|----------------|
 Amy Y. McNulty   | IL             |
 Daniel C. Nguyen | IL             |
 Midori O. Greenwood | IL          |
 Meghan U. Lampert | IL            |
 Tiffany Y. Lang  | IL             |
 Laura S. King    | IL             |
 Steve T. Nguyen  | IL             |
 Craig S. Webber  | IL             |
 Luigi A. Lewis   | IL             |
 Mark W. Williams | IL             |
```
Table-Reference

Syntax

```
[[database.]schema.]table [AS alias]
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>database</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>schema</code></td>
<td>A table in the logical schema.</td>
</tr>
<tr>
<td><code>table</code></td>
<td>A table in the logical schema.</td>
</tr>
<tr>
<td><code>AS alias</code></td>
<td>A temporary name used for references to <code>table</code>.</td>
</tr>
</tbody>
</table>

Joined-Table

Specifies how to join tables.

Syntax

```
table-reference [join-type] JOIN table-reference [ TABLESAMPLE(sampling-pct) ] [ ON join-predicate ]
```
### Parameters

<table>
<thead>
<tr>
<th><strong>table-reference</strong></th>
<th>A table or another <em>joined-table</em>.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>join-type</strong></td>
<td>Valid Values:</td>
</tr>
<tr>
<td></td>
<td>- <strong>INNER</strong> (default). INNER JOIN is equivalent to a query that specifies its join predicate in a WHERE clause.</td>
</tr>
<tr>
<td></td>
<td>- <strong>LEFT [ OUTER ]</strong></td>
</tr>
<tr>
<td></td>
<td>- <strong>RIGHT [ OUTER ]</strong></td>
</tr>
<tr>
<td></td>
<td>- <strong>FULL [ OUTER ]</strong></td>
</tr>
<tr>
<td></td>
<td>- <strong>NATURAL</strong></td>
</tr>
<tr>
<td></td>
<td>- <strong>CROSS</strong></td>
</tr>
<tr>
<td><strong>TABLESAMPLE</strong></td>
<td>Specifies to use simple random sampling to return an approximate percentage of records. All rows in the total potential return set are equally eligible to be included in the sampling. Vertica performs this sampling before other filters in the query are applied. The number of records returned is not guaranteed to be the exact percentage of records defined by <strong>sampling-pct</strong>. The <strong>TABLESAMPLE</strong> option is valid only with user-defined tables and Data Collector (DC) tables. Views and system tables are not supported.</td>
</tr>
<tr>
<td><strong>sampling-pct</strong></td>
<td>Specifies the percentage of records to be returned as a part of sampling. The value must be greater than 0 and less than 100.</td>
</tr>
<tr>
<td><strong>ON join-predicate</strong></td>
<td>An equi-join based on one or more columns in the joined tables. invalid for NATURAL and CROSS joins, required for all other join types.</td>
</tr>
</tbody>
</table>

### Alternative JOIN Syntax Options

Vertica supports two older join syntax conventions:

- Table joins specified by join predicate in a WHERE clause
- Table joins specified by a USING clause

For details, see [Join Syntax](#) in Analyzing Data.
Examples

The following SELECT statement qualifies its JOIN clause with the TABLESAMPLE option:

```sql
=> SELECT user_id.id, user_name.name FROM user_name TABLESAMPLE(50)
     JOIN user_id TABLESAMPLE(50) ON user_name.id = user_id.id;
```

<table>
<thead>
<tr>
<th>id</th>
<th>name</th>
</tr>
</thead>
<tbody>
<tr>
<td>489</td>
<td>Markus</td>
</tr>
<tr>
<td>2234</td>
<td>Cato</td>
</tr>
<tr>
<td>763</td>
<td>Pompey</td>
</tr>
</tbody>
</table>

(3 rows)

GROUP BY Clause

Use the GROUP BY clause with aggregate functions in a SELECT statement to collect data across multiple records. Vertica groups the results into one or more sets of rows that match an expression.

The GROUP BY clause without aggregates is similar to using SELECT DISTINCT.

ROLLUP is an extension to the GROUP BY clause. ROLLUP performs subtotal aggregations.

Syntax

GROUP BY [/*+GBYTYPE(algorithm)*] { expression | aggregate-expression }[,..]

Arguments

/*+GBYTYPE (algorithm)*/

Specifies which algorithm has precedence for implementing this GROUP BY clause, over the algorithm the Vertica query optimizer might otherwise choose. You can set algorithm to one of the following values:

- HASH: GROUPBY HASH algorithm
- PIPE: GROUPBY PIPELINED algorithm

For more information about both algorithms, see GROUP BY Implementation Options.
<table>
<thead>
<tr>
<th>expression</th>
<th>Any expression, including constants and column references in the tables specified in the FROM clause. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>column, column, (expression)</td>
</tr>
<tr>
<td>aggregate-expression</td>
<td>An ordered list of columns, expressions, CUBE, GROUPING SETS, or ROLLUP aggregates.</td>
</tr>
<tr>
<td></td>
<td>You can include CUBE and ROLLUP aggregates within a GROUPING SETS aggregate. CUBE and ROLLUP aggregates can result in a large amount of output. In that case, use GROUPING SETS to return only certain results.</td>
</tr>
<tr>
<td></td>
<td>You cannot include any aggregates within a CUBE or ROLLUP expression.</td>
</tr>
<tr>
<td></td>
<td>You can append multiple GROUPING SETS, CUBE, or ROLLUP aggregates in the same query. Examples:</td>
</tr>
<tr>
<td></td>
<td>GROUP BY a,b,c,d, ROLLUP(a,b)</td>
</tr>
<tr>
<td></td>
<td>GROUP BY a,b,c,d, CUBE((a,b),c,d)</td>
</tr>
<tr>
<td></td>
<td>GROUP BY a,b,c,d, CUBE(a,b), ROLLUP (c,d)</td>
</tr>
<tr>
<td></td>
<td>GROUP BY ROLLUP(a), CUBE(b), GROUPING SETS(c)</td>
</tr>
<tr>
<td></td>
<td>GROUP BY a,b,c,d, GROUPING SETS ((a,d),(b,c),CUBE(a,b))</td>
</tr>
<tr>
<td></td>
<td>GROUP BY a,b,c,d, GROUPING SETS ((a,d),(b,c),(a,b),(a),(b),())</td>
</tr>
</tbody>
</table>

**Usage Considerations**

- *expression* cannot include aggregate functions. However, you can use the GROUP BY clause with CUBE, GROUPING SETS, and ROLLUP to return summary values for each group.
- When you create a GROUP BY clause, you must include all non-aggregated columns that appear in the SELECT list.
- If the GROUP BY clause includes a WHERE clause, Vertica ignores all rows that do not satisfy the WHERE clause.

**Examples**

This example shows how to use the WHERE clause with GROUP BY. In this case, the example retrieves all employees whose last name begins with S, and ignores all rows that do not meet this criteria. The GROUP BY clause uses the ILIKE function to retrieve only last
