INSTRB ( string, substring [, position [, occurrence ] ] )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>Is the text expression to search.</td>
</tr>
<tr>
<td>substring</td>
<td>Is the string to search for.</td>
</tr>
<tr>
<td>position</td>
<td>Is a nonzero integer indicating the character of string where Vertica begins the search. If position is negative, then Vertica counts backward from the end of string and then searches backward from the resulting position. The first byte of string occupies the default position 1, and position cannot be 0.</td>
</tr>
<tr>
<td>occurrence</td>
<td>Is an integer indicating which occurrence of string Vertica searches. The value of occurrence must be positive (greater than 0), and the default is 1.</td>
</tr>
</tbody>
</table>

Notes

Both position and occurrence must be of types that can resolve to an integer. The default values of both parameters are 1, meaning Vertica begins searching at the first byte of string for the first occurrence of substring. The return value is relative to the beginning of string, regardless of the value of position, and is expressed in octets.

If the search is unsuccessful (that is, if substring does not appear occurrence times after the position character of string, then the return value is 0.

Example

```sql
=> SELECT INSTRB('straße', 'ß');
INSTRB
-------
5
```
See Also

- `INSTR`

**ISUTF8**

Tests whether a string is a valid UTF-8 string. Returns true if the string conforms to UTF-8 standards, and false otherwise. This function is useful to test strings for UTF-8 compliance before passing them to one of the regular expression functions, such as `REGEXP_LIKE`, which expect UTF-8 characters by default.

ISUTF8 checks for invalid UTF8 byte sequences, according to UTF-8 rules:

- invalid bytes
- an unexpected continuation byte
- a start byte not followed by enough continuation bytes
- an Overload Encoding

The presence of an invalid UTF8 byte sequence results in a return value of false.

**Syntax**

```
ISUTF8( string );
```

**Parameters**

- `string` The string to test for UTF-8 compliance.

**Examples**

```
=> SELECT ISUTF8(E'\xC2\xBF'); -- UTF-8 INVERTED QUESTION MARK ISUTF8
---------
```
t
(1 row)
=> SELECT ISUTF8(E'\xC2\xC0'); -- UNDEFINED UTF-8 CHARACTER
ISUTF8
-------
F
(1 row)

LEAST

Returns the smallest value in a list of expressions.

Behavior Type

Stable

Syntax

LEAST ( expression1, expression2, ... expression-n )

Parameters

expression1, expression2, and expression-n are the expressions to be evaluated.

Notes

- Works for all data types, and implicitly casts similar types. See Examples below.
- A NULL value in any one of the expressions returns NULL.

Examples

This example returns 5 as the least:

=> SELECT LEAST(7, 5, 9);
LEAST
-------
  5
(1 row)
Putting quotes around the integer expressions returns the same result as the first example:

```sql
=> SELECT LEAST('7', '5', '9');
LEAST
-----
5
(1 row)
```

In the above example, the values are being compared as strings, so '10' would be less than '2'.

The next example returns 1.5, as INTEGER 2 is implicitly cast to FLOAT:

```sql
=> SELECT LEAST(2, 1.5);
LEAST
-----
1.5
(1 row)
```

The following example returns 'analytic' as the least:

```sql
=> SELECT LEAST('vertica', 'analytic', 'database');
LEAST
-----
analytic
(1 row)
```

Notice this next command returns NULL:

```sql
=> SELECT LEAST('vertica', 'analytic', 'database', null);
LEAST
-----
(1 row)
```

And one more:

```sql
=> SELECT LEAST('sit', 'site', 'sight');
LEAST
-----
sight
(1 row)
```

**See Also**

- [GREATEST](#)
- [LEAST](#)
- [LEASTB](#)

**LEASTB**

Returns the function's least argument, using binary ordering, not UTF-8 character ordering.
Behavior Type

Immutable

Syntax

LEASTB ( expression1, expression2, ... expression-n )

Parameters

expression1, expression2, and expression-n are the expressions to be evaluated.

Notes

- Works for all data types, and implicitly casts similar types. See Examples below.
- A NULL value in any one of the expressions returns NULL.

Examples

The following command selects strasse as the least in the series of inputs:

```sql
=> SELECT LEASTB('straße', 'strasse');
 LEASTB
 --------
 strasse
 (1 row)
```

This example returns 5 as the least:

```sql
==> SELECT LEASTB(7, 5, 9);
 LEASTB
 --------
 5
 (1 row)
```

Putting quotes around the integer expressions returns the same result as the first example:

```sql
=> SELECT LEASTB('7', '5', '9');
 LEASTB
 --------
 5
```
In the above example, the values are being compared as strings, so '10' would be less than '2'.

The next example returns 1.5, as INTEGER 2 is implicitly cast to FLOAT:

```sql
=> SELECT LEASTB(2, 1.5);
LEASTB
------
 1.5
(1 row)
```

The following example returns 'analytic' as the least in the series of inputs:

```sql
=> SELECT LEASTB('vertica', 'analytic', 'database');
LEASTB
------
analytic
(1 row)
```

Notice this next command returns NULL:

```sql
=> SELECT LEASTB('vertica', 'analytic', 'database', null);
LEASTB
------
(1 row)
```

See Also

- [GREATESTB](#)

LEFT

Returns the specified characters from the left side of a string.

Behavior Type

Immutable

Syntax

`LEFT ( string-expr, Length )`
Parameters

<table>
<thead>
<tr>
<th>string-expr</th>
<th>The string expression to return.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Length</td>
<td>An integer value that specifies how many characters to return.</td>
</tr>
</tbody>
</table>

Examples

```sql
=> SELECT LEFT('vertica', 3);
LEFT
-----
ver
(1 row)
```

```sql
SELECT DISTINCT(
    LEFT(customer_name, 4)) FnameTruncated
FROM customer_dimension ORDER BY FnameTruncated LIMIT 10;
FnameTruncated
--------------
Alex
Amer
Amy
Anna
Barb
Ben
Bett
Bria
Carl
Crai
(10 rows)
```

See Also

SUBSTR

LENGTH

Returns the length of a string. The behavior of LENGTH varies according to the input data type:

- CHAR and VARCHAR: Identical to CHARACTER_LENGTH, returns the string length in UTF-8 characters.
- CHAR: Strips padding.
- BINARY and VARBINARY: Identical to OCTET_LENGTH, returns the string length in bytes (octets).

**Behavior Type**

Immutable

**Syntax**

```
LENGTH ( expression )
```

**Parameters**

| expression | String to evaluate, one of the following: CHAR, VARCHAR, BINARY or VARBINARY. |

**Examples**

<table>
<thead>
<tr>
<th>Statement</th>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELECT LENGTH('1234'::CHAR(10));</td>
<td>4</td>
</tr>
<tr>
<td>SELECT LENGTH('1234'::VARCHAR(10));</td>
<td>6</td>
</tr>
<tr>
<td>SELECT LENGTH('1234'::BINARY(10));</td>
<td>10</td>
</tr>
<tr>
<td>SELECT LENGTH('1234'::VARBINARY(10));</td>
<td>6</td>
</tr>
<tr>
<td>SELECT LENGTH(NULL::CHAR(10)) IS NULL;</td>
<td>t</td>
</tr>
</tbody>
</table>

**See Also**

BIT_LENGTH

**LOWER**

Returns a VARCHAR value containing the argument converted to lowercase letters.
LOWER treats the string argument as a UTF-8 encoded string, rather than depending on the collation setting of the locale (for example, collation=binary) to identify the encoding.

**Behavior Type**

stable

**Syntax**

`LOWER ( expression )`

**Parameters**

| expression | CHAR or VARCHAR string to convert |

**Notes**

LOWER is restricted to 32500 octet inputs, since it is possible for the UTF-8 representation of result to double in size.

**Examples**

```sql
=> SELECT LOWER('AbCdEfG');
   LOWER
      -------
     abcdefg
    (1 row)
=> SELECT LOWER('The Bat In The Hat');
   LOWER
      -----------------
     the bat in the hat
    (1 row)
=> SELECT LOWER('ÉTUDIANT');
   LOWER
      -------
     étudiant
    (1 row)
```
LOWEB

Returns a character string with each ASCII character converted to lowercase. Multi-byte characters are skipped and not converted.

Behavior Type

Immutable

Syntax

LOWEB ( expression )

Parameters

expression | CHAR or VARCHAR string to convert

Examples

In the following example, the multi-byte UTF-8 character É is not converted to lowercase:

```
=> SELECT LOWEB('ÉTUDIANT');
LOWEB
------------
Étudiant
(1 row)
=> SELECT LOWEB('ÉTUDIANT');
LOWEB
------------
etudiant
(1 row)
=> SELECT LOWEB('AbCdEFG');
LOWEB
----------
abcdefg
(1 row)
=> SELECT LOWEB('The Vertica Database');
LOWEB
------------------------
the vertica database
(1 row)
```
LPAD

Returns a VARCHAR value representing a string of a specific length filled on the left with specific characters.

Behavior Type

Immutable

Syntax

LPAD( expression , length [ , fill ] )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>(CHAR OR VARCHAR) specifies the string to fill</td>
</tr>
<tr>
<td>length</td>
<td>(INTEGER) specifies the number of characters to return</td>
</tr>
<tr>
<td>fill</td>
<td>(CHAR OR VARCHAR) specifies the repeating string of characters with which to fill the output string. The default is the space character.</td>
</tr>
</tbody>
</table>

Examples

=> SELECT LPAD('database', 15, 'xyz');

```
  LPAD
    ------------
    xyzxyzdatabase
  (1 row)
```

If the string is already longer than the specified length it is truncated on the right:

```sql
=> SELECT LPAD('establishment', 10, 'abc');

```

```
  LPAD
    ------------
    establishm
  (1 row)
```
LTRIM

Returns a VARCHAR value representing a string with leading blanks removed from the left side (beginning).

Behavior Type

Immutable

Syntax

LTRIM ( expression [, characters ] )

Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>(CHAR or VARCHAR) is the string to trim</th>
</tr>
</thead>
<tbody>
<tr>
<td>characters</td>
<td>(CHAR or VARCHAR) specifies the characters to remove from the left side of expression. The default is the space character.</td>
</tr>
</tbody>
</table>

Examples

```sql
=> SELECT LTRIM('zzyyyyyyyyyyyyyyyyytrim', 'xyz');
LTRIM
--------
trim
(1 row)
```

See Also

- BTRIM
- RTRIM
- TRIM
MD5

Calculates the MD5 hash of string, returning the result as a VARCHAR string in hexadecimal.

Behavior Type

Immutable

Syntax

MD5 ( string )

Parameters

<table>
<thead>
<tr>
<th>string</th>
<th>Is the argument string.</th>
</tr>
</thead>
</table>

Examples

```sql
=> SELECT MD5('123');
MD5
202cb962ac59075b964b07152d234b70
(1 row)
=> SELECT MD5('Vertica'::bytea);
MD5
fc45b815747d8236f9f6fdb9c2c3f676
(1 row)
```

See Also

- SHA1
- SHA224
- SHA256
- SHA384
- SHA512

**OCTET_LENGTH**

Takes one argument as an input and returns the string length in octets for all string types.

**Behavior Type**

Immutable

**Syntax**

```
OCTET_LENGTH ( expression )
```

**Parameters**

| expression | (CHAR or VARCHAR or BINARY or VARBINARY) is the string to measure. |

**Notes**

- If the data type of `expression` is a CHAR, VARCHAR or VARBINARY, the result is the same as the actual length of `expression` in octets. For CHAR, the length does not include any trailing spaces.

- If the data type of `expression` is BINARY, the result is the same as the fixed-length of `expression`.

- If the value of `expression` is NULL, the result is NULL.

**Examples**

<table>
<thead>
<tr>
<th>Expression</th>
<th>Result</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>SQL</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SELECT OCTET_LENGTH(CHAR(10)'1234');</code></td>
<td>4</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(CHAR(10)'1234');</code></td>
<td>4</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(CHAR(10)' 1234');</code></td>
<td>6</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(VARCHAR(10)'1234 ');</code></td>
<td>6</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(VARCHAR(10)'1234 ');</code></td>
<td>5</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(VARCHAR(10)'1234 ');</code></td>
<td>4</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(VARCHAR(10)' 1234 ');</code></td>
<td>7</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH('abc':VARBINARY);</code></td>
<td>3</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(VARBINARY 'abc');</code></td>
<td>3</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(VARBINARY 'abc ');</code></td>
<td>5</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(BINARY(6)'abc');</code></td>
<td>6</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(VARBINARY '');</code></td>
<td>0</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH('':BINARY);</code></td>
<td>1</td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(null::VARBINARY);</code></td>
<td></td>
</tr>
<tr>
<td><code>SELECT OCTET_LENGTH(null::BINARY);</code></td>
<td></td>
</tr>
</tbody>
</table>

**See Also**

- `BIT_LENGTH`
- `CHARACTER_LENGTH`
- `LENGTH`

**OVERLAY**

Returns a VARCHAR value representing a string having had a substring replaced by another string.

**Behavior Type**

Immutable if using OCTETS, Stable otherwise
Syntax

OVERLAY ( expression1 PLACING expression2 FROM position
... [ FOR extent ]
... [ USING { CHARACTERS | OCTETS } ] )

Parameters

| expression1 | (CHAR or VARCHAR) is the string to process |
| expression2 | (CHAR or VARCHAR) is the substring to overlay |
| position    | (INTEGER) is the character or octet position (counting from one) at which to begin the overlay |
| extent      | (INTEGER) specifies the number of characters or octets to replace with the overlay |
| USING CHARACTERS | OCTETS | Determines whether OVERLAY uses characters (the default) or octets |

Examples

=> SELECT OVERLAY('123456789' PLACING 'xxx' FROM 2);
   overlay
   -----------
   1xxx56789
   (1 row)
=> SELECT OVERLAY('123456789' PLACING 'XXX' FROM 2 USING OCTETS);
   overlayb
   -----------
   1XXX56789
   (1 row)
=> SELECT OVERLAY('123456789' PLACING 'xxx' FROM 2 FOR 4);
   overlay
   -----------
   1xxx6789
   (1 row)
=> SELECT OVERLAY('123456789' PLACING 'xxx' FROM 2 FOR 5);
   overlay
   -----------
   1xxx789
   (1 row)
OVERLAYB

Returns an octet value representing a string having had a substring replaced by another string.

Behavior Type
Immutable

Syntax
OVERLAYB ( expression1, expression2, position [ , extent ] )

Parameters

<table>
<thead>
<tr>
<th>expression1</th>
<th>(CHAR or VARCHAR) is the string to process</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression2</td>
<td>(CHAR or VARCHAR) is the substring to overlay</td>
</tr>
<tr>
<td>position</td>
<td>(INTEGER) is the octet position (counting from one) at which to begin the overlay</td>
</tr>
<tr>
<td>extent</td>
<td>(INTEGER) specifies the number of octets to replace with the overlay</td>
</tr>
</tbody>
</table>

Notes

The OVERLAYB function treats the multibyte character string as a string of octets (bytes) and use octet numbers as incoming and outgoing position specifiers and lengths. The strings themselves are type VARCHAR, but they treated as if each byte was a separate character.
Examples

=> SELECT OVERLAYB('123456789', 'ééé', 2);
OVERLAYB
--------
1ééë89
(1 row)

=> SELECT OVERLAYB('123456789', 'ßßß', 2);
OVERLAYB
--------
1ßßß89
(1 row)

=> SELECT OVERLAYB('123456789', 'xxx', 2);
OVERLAYB
--------
1xxx56789
(1 row)

=> SELECT OVERLAYB('123456789', 'xxx', 2, 4);
OVERLAYB
--------
1xxx6789
(1 row)

=> SELECT OVERLAYB('123456789', 'xxx', 2, 5);
OVERLAYB
--------
1xxx789
(1 row)

=> SELECT OVERLAYB('123456789', 'xxx', 2, 6);
OVERLAYB
--------
1xxx89
(1 row)

POSITION

Returns an INTEGER value representing the character location of a specified substring with a string (counting from one).

Behavior Type

Immutable

Syntax 1

POSITION ( substring IN string [ USING { CHARACTERS | OCTETS } ] )
Parameters

| substring  | (CHAR or VARCHAR) is the substring to locate |
| string     | (CHAR or VARCHAR) is the string in which to locate the substring |
| USING CHARACTERS | OCTETS | Determines whether the position is reported by using characters (the default) or octets. |

Syntax 2

POSITION ( substring IN string )

Parameters

| substring  | (VARBINARY) is the substring to locate |
| string     | (VARBINARY) is the string in which to locate the substring |

Notes

- When the string and substring are CHAR or VARCHAR, the return value is based on either the character or octet position of the substring.

- When the string and substring are VARBINARY, the return value is always based on the octet position of the substring.

- The string and substring must be consistent. Do not mix VARBINARY with CHAR or VARCHAR.

- POSITION is similar to STRPOS although POSITION allows finding by characters and by octet.

- If the string is not found, the return value is zero.
Examples

```sql
=> SELECT POSITION('é' IN 'étudiant' USING CHARACTERS);
position
---------
   1
(1 row)
=> SELECT POSITION('ß' IN 'straße' USING OCTETS);
position
---------
   5
(1 row)
=> SELECT POSITION('c' IN 'abcd' USING CHARACTERS);
position
---------
   3
(1 row)
=> SELECT POSITION(VARBINARY '456' IN VARBINARY '123456789');
position
---------
   4
(1 row)
SELECT POSITION('n' in 'León') as 'default',
    POSITION('León', 'n') as 'POSITIONB',
    POSITION('n' in 'León' USING CHARACTERS) as 'pos_chars',
    POSITION('n' in 'León' USING OCTETS) as 'pos_oct',
    INSTR('León', 'n'),
    INSTRB('León', 'n'),
    REGEXP_INSTR('León', 'n');
```

<table>
<thead>
<tr>
<th>default</th>
<th>POSITIONB</th>
<th>pos_chars</th>
<th>pos_oct</th>
<th>INSTR</th>
<th>INSTRB</th>
<th>REGEXP_INSTR</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>5</td>
<td>4</td>
<td>5</td>
<td>4</td>
<td>5</td>
<td>4</td>
</tr>
</tbody>
</table>

(1 row)

### POSITIONB

Returns an INTEGER value representing the octet location of a specified substring with a string (counting from one).

### Behavior Type

Immutable

### Syntax

```sql
POSITIONB ( string, substring )
```
Parameters

<table>
<thead>
<tr>
<th>string</th>
<th>(CHAR or VARCHAR) is the string in which to locate the substring</th>
</tr>
</thead>
<tbody>
<tr>
<td>substring</td>
<td>(CHAR or VARCHAR) is the substring to locate</td>
</tr>
</tbody>
</table>

Examples

```sql
=> SELECT POSITIONB('straße', 'ße');
  POSITIONB
     --------
      5
(1 row)
=> SELECT POSITIONB('étudiant', 'é');
  POSITIONB
     --------
       1
(1 row)
```

QUOTE_IDENT

Returns the given string, suitably quoted, to be used as an identifier in a SQL statement string. Quotes are added only if necessary; that is, if the string contains non-identifier characters, is a SQL keyword, such as '1time', 'Next week' and 'Select'. Embedded double quotes are doubled.

Behavior Type

Immutable

Syntax

QUOTE_IDENT( string )

Parameters

| string | String to quote. |
Notes

- SQL identifiers, such as table and column names, are stored as created, and references to them are resolved using case-insensitive compares. Thus, you do not need to double-quote mixed-case identifiers.

- Vertica quotes all currently-reserved keywords, even those not currently being used.

Examples

Quoted identifiers are case-insensitive, and Vertica does not supply the quotes:

```sql
=> SELECT QUOTE_IDENT('VerIcA');
QUOTE_IDENT
-----------
VerIcA
(1 row)
```

```sql
=> SELECT QUOTE_IDENT('Vertica database');
QUOTE_IDENT
-----------------
"Vertica database"
(1 row)
```

Embedded double quotes are doubled:

```sql
=> SELECT QUOTE_IDENT('Vertica "!" database');
QUOTE_IDENT
-----------------
"Vertica "!" database"
(1 row)
```

The following example uses the SQL keyword, SELECT; results are double quoted:

```sql
=> SELECT QUOTE_IDENT('select');
QUOTE_IDENT
--------
"select"
(1 row)
```

QUOTE_LITERAL

Returns the given string, suitably quoted, to be used as a string literal in a SQL statement string. Embedded single quotes and backslashes are doubled.
Behavior Type

Immutable

Syntax

QUOTE_LITERAL ( string )

Parameters

| string | String to convert to a string literal. |

Notes

Vertica recognizes two consecutive single quotes within a string literal as one single quote character. For example, 'You''re here!'. This is the SQL standard representation and is preferred over the form, 'You\'re here!', as backslashes are not parsed as before.

Examples

```sql
=> SELECT QUOTE_LITERAL('You''re here!');
QUOTE_LITERAL
---------------
'You''re here!'
(1 row)
```

See Also

- Character String Literals

REPEAT

Replicates a string the specified number of times, and concatenates the replicated values as a single string. The return value can be up to 65000 bytes in length. If the length of string * count is greater than 65000 bytes, Vertica silently truncates the results.
Behavior Type

Immutable

Syntax

REPEAT ('string', count)

Parameters

<table>
<thead>
<tr>
<th>string</th>
<th>The string to repeat, one of the following: CHAR, VARCHAR, BINARY or VARBINARY.</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>An integer expression that specifies how many times to repeat string.</td>
</tr>
</tbody>
</table>

Examples

The following example repeats vmart three times:

```sql
=> SELECT REPEAT ('vmart', 3);
REP
---------------
vmartvmartvmart
(1 row)
```

REPLACE

Replaces all occurrences of characters in a string with another set of characters.

Behavior Type

Immutable

Syntax

REPLACE ('string', 'target', 'replacement')
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>The string to modify.</td>
</tr>
<tr>
<td>target</td>
<td>The characters in string to replace.</td>
</tr>
<tr>
<td>replacement</td>
<td>The characters to replace target.</td>
</tr>
</tbody>
</table>

Examples

```sql
=> SELECT REPLACE('Documentation%20Library', '%20', ' ');
     REPLACE
-----------
Documentation Library
(1 row)

=> SELECT REPLACE('This &amp; That', '&amp;', 'and');
     REPLACE
-----------
This and That
(1 row)

=> SELECT REPLACE('straße', 'ß', 'ss');
     REPLACE
--------
strasse
(1 row)
```

RIGHT

Returns the specified characters from the right side of a string.

Behavior Type

Immutable

Syntax

```sql
RIGHT ( string-expr, Length )
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string-expr</td>
<td>The string expression to return.</td>
</tr>
<tr>
<td>Length</td>
<td>An integer value that specifies how many characters to return.</td>
</tr>
</tbody>
</table>

Examples

The following query returns the last three characters of the string 'vertica':

```sql
=> SELECT RIGHT('vertica', 3);
   RIGHT
  ------
     ica
(1 row)
```

The following query queries date column date_ordered from table store.store_orders_fact. It coerces the dates to strings and extracts the last five characters from each string. It then returns all distinct strings:

```sql
SELECT DISTINCT(
    RIGHT(date_ordered::varchar, 5)) MonthDays
FROM store.store_orders_fact ORDER BY MonthDays;

MonthDays
--------
01-01
01-02
01-03
01-04
01-05
01-06
01-07
01-08
01-09
01-10
02-01
02-02
02-03
...
11-08
11-09
11-10
12-01
12-02
12-03
12-04
12-05
12-06
12-07
12-08
```
See Also

SUBSTR

RPAD

Returns a VARCHAR value representing a string of a specific length filled on the right with specific characters.

Behavior Type

Immutable

Syntax

RPAD ( expression, length [, fill ] )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>(CHAR OR VARCHAR) specifies the string to fill</td>
</tr>
<tr>
<td>length</td>
<td>(INTEGER) specifies the number of characters to return</td>
</tr>
<tr>
<td>fill</td>
<td>(CHAR OR VARCHAR) specifies the repeating string of characters with which to fill the output string. The default is the space character.</td>
</tr>
</tbody>
</table>

Examples

```sql
=> SELECT RPAD('database', 15, 'xyz');
RPAD
-----------------
databasexyzxyzx
(1 row)
```

If the string is already longer than the specified length it is truncated on the right:
RTRIM

Returns a VARCHAR value representing a string with trailing blanks removed from the right side (end).

Behavior Type

Immutable

Syntax

RTRIM ( expression [ , characters ] )

Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>(CHAR or VARCHAR) is the string to trim</th>
</tr>
</thead>
<tbody>
<tr>
<td>characters</td>
<td>(CHAR or VARCHAR) specifies the characters to remove from the right side of expression. The default is the space character.</td>
</tr>
</tbody>
</table>

Examples

=> SELECT RTRIM('trimzzzyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyy

SHA1

Uses the US Secure Hash Algorithm 1 to calculate the SHA1 hash of string. Returns the result as a VARCHAR string in hexadecimal.

Behavior Type

Immutable

Syntax

SHA1 ( string )

Parameters

| string | The VARCHAR or VARBINARY string to be calculated.

Examples

The following examples calculate the SHA1 hash of the provided strings:

```
=> SELECT SHA1('123');
   SHA1
----------
40bd001563085fc35165329ea1ff5c5ecbdbeef
(1 row)
```
See Also

- `MD5`
- `SHA224`
- `SHA256`
- `SHA384`
- `SHA512`

**SHA224**

Uses the US Secure Hash Algorithm 2 to calculate the SHA224 hash of string. Returns the result as a VARCHAR string in hexadecimal.

**Behavior Type**

Immutable

**Syntax**

```
SHA224 ( string )
```

**Parameters**

<table>
<thead>
<tr>
<th><code>string</code></th>
<th>The VARCHAR or VARBINARY string to be calculated.</th>
</tr>
</thead>
</table>

```sql
=> SELECT SHA1('Vertica'::bytea);

SHA1--------------------------------------
ee2cff8d3444995c6c301546c4fc5ee152d77c11
(1 row)
```
Examples

The following examples calculate the SHA224 hash of the provided strings:

```sql
=> SELECT SHA224('abc');

SHA224
--------------------
78d8045d684abd2eece923758f3cd781489df3a48e1278982466017f
(1 row)
```

```sql
=> SELECT SHA224('Vertica '::bytea);

SHA224
--------------------
135ac268f64ff3124aeeebc3cc0af0a29fd600a3be8e29ed97e45e25
(1 row)
```

```sql
=> SELECT sha224('''::varbinary) = 'd14a028c2a3a2bc9476102bb288234c415a2b01f828ea62ac5b3e42f' AS "TRUE";

TRUE
-----
t
(1 row)
```

See Also

- SHA1
- SHA256
- SHA384
- SHA512

SHA256

Uses the US Secure Hash Algorithm 2 to calculate the SHA256 hash of string. Returns the result as a VARCHAR string in hexadecimal.

Behavior Type

Immutable
Syntax

SHA256 ( string )

Parameters

| string | The VARCHAR or VARBINARY string to be calculated. |

Examples

The following examples calculate the SHA256 hash of the provided strings:

```sql
=> SELECT SHA256('abc');
          SHA256
----------
a665a45920422f9d417e4867efdc4fb8a04a1f3ff1fa07e998e86f7f7a27ae3
(1 row)

=> SELECT SHA256('Vertica'::bytea);
          SHA256
----------
9981b0b7df9f5be06e9e1a7f4ae2336a7868d9ab522b9a6ca6a87cd9ed95ba53
(1 row)

=> SELECT sha256('') = 'e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855' AS "TRUE";
                    TRUE
                   ----
                        t
(1 row)
```

See Also

- MD5
- SHA1
- SHA224
- SHA384
- SHA512
SHA384

Uses the US Secure Hash Algorithm 2 to calculate the SHA384 hash of string. Returns the result as a VARCHAR string in hexadecimal.

Behavior Type

Immutable

Syntax

SHA384 ( string )

Parameters

| string | The VARCHAR or VARBINARY string to be calculated. |

Examples

The following examples calculate the SHA384 hash of the provided strings:

=> SELECT SHA384('123');

<table>
<thead>
<tr>
<th>SHA384</th>
</tr>
</thead>
<tbody>
<tr>
<td>9a0a82f0c0cf31470d7affede3406cc9aa8410671520b727044eda15b4c25532a9b5cd8aaf9cecc4919d76255b6bfb00f</td>
</tr>
</tbody>
</table>

(1 row)

=> SELECT SHA384('Vertica':bytea);

<table>
<thead>
<tr>
<th>SHA384</th>
</tr>
</thead>
<tbody>
<tr>
<td>3431a717dc3289862bbd636a064d26980b47ebe4684b00cfff4756f0c24985866ef97763eaf548fedb0ce28722c96bb</td>
</tr>
</tbody>
</table>

(1 row)
See Also
- MD5
- SHA1
- SHA224
- SHA256
- SHA512

SHA512
Uses the US Secure Hash Algorithm 2 to calculate the SHA512 hash of string. Returns the result as a VARCHAR string in hexadecimal.

Behavior Type
Immutable

Syntax
SHA512 ( string )

Parameters
| string | The VARCHAR or VARBINARY string to be calculated. |

Examples
The following examples calculate the SHA512 hash of the provided strings:

```sql
=> SELECT SHA512('123');
       SHA512
         ---
        447d2f38a3b6a82d6bc2f558429f3f66f8649b774345609c237e2424a11d634b62f3400a7eb24bab8f07f9e
```
See Also

- **MD5**
- **SHA1**
- **SHA224**
- **SHA256**
- **SHA384**

**SPACE**

Returns the specified number of blank spaces, typically for insertion into a character string.

**Behavior Type**

Immutable

**Syntax**

```
SPACE(n)
```
Parameters

\[ n \] An integer argument that specifies how many spaces to insert.

Example

The following example concatenates strings \( x \) and \( y \) with 10 spaces inserted between them:

\[
\text{SELECT } 'x' \ || \ \text{SPACE}(10) \ || \ 'y' \ \text{AS Ten_spaces;}
\]

<table>
<thead>
<tr>
<th>Ten_spaces</th>
</tr>
</thead>
<tbody>
<tr>
<td>( x )</td>
</tr>
<tr>
<td>( y )</td>
</tr>
</tbody>
</table>

SPLIT_PART

Splits string on the delimiter and returns the string at the location of the beginning of the specified field (counting from 1).

Behavior Type

Immutable

Syntax

\[
\text{SPLIT_PART ( string, delimiter, field )}
\]

Parameters

<table>
<thead>
<tr>
<th>string</th>
<th>Argument string</th>
</tr>
</thead>
<tbody>
<tr>
<td>delimiter</td>
<td>Delimiter</td>
</tr>
<tr>
<td>field</td>
<td>(INTEGER) Number of the part to return</td>
</tr>
</tbody>
</table>
Notes

Use this with the character form of the subfield.

Examples

The specified integer of 2 returns the second string, or def.

```sql
=> SELECT SPLIT_PART('abc-@-def-@-ghi', '@-', 2);
SPLIT_PART
----------
def
(1 row)
```

In the next example, specify 3, which returns the third string, or 789.

```sql
=> SELECT SPLIT_PART('123-|~456-|~789', '|~', 3);
SPLIT_PART
----------
789
(1 row)
```

The tildes are for readability only. Omitting them returns the same results:

```sql
=> SELECT SPLIT_PART('123|456|789', '|', 3);
SPLIT_PART
----------
789
(1 row)
```

See what happens if you specify an integer that exceeds the number of strings: The result is not null, it is an empty string.

```sql
=> SELECT SPLIT_PART('123|456|789', '|', 4);
SPLIT_PART
--------
(1 row)
=> SELECT SPLIT_PART('123|456|789', '|', 4) IS NULL;
?column?
--------
f
(1 row)
```

If SPLIT_PART had returned NULL, LENGTH would have returned 0.

```sql
=> SELECT LENGTH (SPLIT_PART('123|456|789', '|', 4));
LENGTH
```
If the locale of your database is BINARY, SPLIT_PART calls SPLIT_PARTB:

```sql
=> SHOW LOCALE;
+----------+-------+
| locale   | setting                  |
|----------+--------------------------|
| en_US    | 'en_US@collation=binary' |

(1 row)
```

```sql
=> SELECT SPLIT_PART('123456789', '5', 1);
split_partb
----------
1234
(1 row)
```

```sql
=> SET LOCALE TO 'en_US@collation=standard';
```

```sql
INFO 2567: Canonical locale: 'en_US@collation=standard'
Standard collation: 'LEN'
English (United States, collation=standard)
```

```sql
=> SELECT SPLIT_PART('123456789', '5', 1);
split_part
----------
1234
(1 row)
```

See Also

- **SPLIT_PARTB**

**SPLIT_PARTB**

Splits string on the delimiter and returns the string at the location of the beginning of the specified field (counting from 1). The VARCHAR arguments are treated as octets rather than UTF-8 characters.

**Behavior Type**

Immutable

**Syntax**

```
SPLIT_PARTB ( string , delimiter , field )
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>(VARCHAR) Is the argument string.</td>
</tr>
<tr>
<td>delimiter</td>
<td>(VARCHAR) Is the given delimiter.</td>
</tr>
<tr>
<td>field</td>
<td>(INTEGER) is the number of the part to return.</td>
</tr>
</tbody>
</table>

Notes

Use this function with the character form of the subfield.

Examples

The specified integer of 3 returns the third string, or soupçon.

```sql
=> SELECT SPLIT_PARTB('straße~@~café~@~soupçon', '~@~', 3);
SPLIT_PARTB
------------
soupçon
(1 row)
```

The tildes are for readability only. Omitting them returns the same results:

```sql
=> SELECT SPLIT_PARTB('straße café soupçon', '@', 3);
SPLIT_PARTB
------------
soupçon
(1 row)
```

See what happens if you specify an integer that exceeds the number of strings: The result is not null, it is an empty string.

```sql
=> SELECT SPLIT_PARTB('straße café soupçon', '@', 4);
SPLIT_PARTB
------------
(1 row)
=> SELECT SPLIT_PARTB('straße café soupçon', '@', 4) IS NULL;
?column?
-------
false
(1 row)
```

If the locale of your database is BINARY, SPLIT_PART calls SPLIT_PARTB:
SHOW LOCALE;

<table>
<thead>
<tr>
<th>name</th>
<th>setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>locale</td>
<td>en_US@collation=binary (LEN_KBINARY)</td>
</tr>
</tbody>
</table>

(1 row)

=> SELECT SPLIT_PART('123456789', '5', 1);

split_partb

1234

(1 row)

=> SET LOCALE TO 'en_US@collation=standard';

INFO 2567: Canonical locale: 'en_US@collation=standard'

Standard collation: 'LEN'

English (United States, collation=standard)

SET

=> SELECT SPLIT_PART('123456789', '5', 1);

split_part

------------------

1234

(1 row)

See Also

- SPLIT_PART

STRPOS

Returns an INTEGER value representing the character location of a specified substring within a string (counting from one).

Behavior Type

Immutable

Syntax

STRPOS ( string , substring )

Parameters

| string | (CHAR or VARCHAR) is the string in which to locate the substring
### Notes

STRPOS is similar to `POSITION` although `POSITION` allows finding by characters and by octet. If the string is not found, the return value is zero.

### Examples

```sql
=> SELECT STRPOS('abcd', 'c');
  STRPOS
  ---------
    3
(1 row)
```

### STRPOSB

Returns an INTEGER value representing the location of a specified substring within a string, counting from one, where each octet in the string is counted (as opposed to characters).

#### Behavior Type

Immutable

#### Syntax

`STRPOSB (string, substring)`

#### Parameters

<table>
<thead>
<tr>
<th>string</th>
<th>(CHAR or VARCHAR) is the string in which to locate the substring</th>
</tr>
</thead>
<tbody>
<tr>
<td>substring</td>
<td>(CHAR or VARCHAR) is the substring to locate</td>
</tr>
</tbody>
</table>
Notes

STRPOSB is identical to POSITIONB except for the order of the arguments.

Examples

```sql
=> SELECT STRPOSB('straße', 'e');
  STRPOSB
--------
    7
(1 row)
=> SELECT STRPOSB('étudiant', 'tud');
  STRPOSB
--------
    3
(1 row)
```

SUBSTR

Returns VARCHAR or VARBINARY value representing a substring of a specified string.

Behavior Type

Immutable

Syntax

`SUBSTR ( string , position [ , extent ] )`

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>string</code></td>
<td>(CHAR/VARCHAR or BINARY/VARBINARY) is the string from which to extract a substring. If null, Vertica returns no results.</td>
</tr>
<tr>
<td><code>position</code></td>
<td>(INTEGER or DOUBLE PRECISION) is the starting position of the substring (counting from one by characters). If 0 or negative, Vertica returns no results.</td>
</tr>
<tr>
<td><code>extent</code></td>
<td>(INTEGER or DOUBLE PRECISION) is the length of the substring to extract (in characters)</td>
</tr>
</tbody>
</table>
characters). The default is the end of the string.

Notes

SUBSTR truncates DOUBLE PRECISION input values.

Examples

```sql
=> SELECT SUBSTR('abc'::binary(3),1);
       substr
---------
       abc
(1 row)

=> SELECT SUBSTR('123456789', 3, 2);
       substr
---------
        34
(1 row)

=> SELECT SUBSTR('123456789', 3);
       substr
---------
      3456789
(1 row)

=> SELECT SUBSTR(TO_BITSTRING(HEX_TO_BINARY('0x10')), 2, 2);
       substr
---------
       00
(1 row)

=> SELECT SUBSTR(TO_HEX(10010), 2, 2);
       substr
---------
       71
(1 row)
```

SUBSTRB

Returns an octet value representing the substring of a specified string.

Behavior Type

Immutable
Syntax

```
SUBSTRB ( string, position [ , extent ] )
```

Parameters

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>string</code></td>
<td>(CHAR/VARCHAR) is the string from which to extract a substring.</td>
</tr>
<tr>
<td><code>position</code></td>
<td>(INTEGER or DOUBLE PRECISION) is the starting position of the substring (counting from one in octets).</td>
</tr>
<tr>
<td><code>extent</code></td>
<td>(INTEGER or DOUBLE PRECISION) is the length of the substring to extract (in octets). The default is the end of the string.</td>
</tr>
</tbody>
</table>

Notes

- This function treats the multibyte character string as a string of octets (bytes) and uses octet numbers as incoming and outgoing position specifiers and lengths. The strings themselves are type VARCHAR, but they treated as if each octet were a separate character.
- `SUBSTRB` truncates DOUBLE PRECISION input values.

Examples

```sql
=> SELECT SUBSTRB('soupçon', 5);
SUBSTRB
----------
çon
(1 row)

=> SELECT SUBSTRB('soupçon', 5, 2);
SUBSTRB
----------
ç
(1 row)
```

Vertica returns the following error message if you use BINARY/VARBINARY:

```sql
=>SELECT SUBSTRB('abc':::binary(3),1);
ERROR: function substrb(binary, int) does not exist, or permission is denied for substrb(binary, int)
HINT: No function matches the given name and argument types. You may need to add explicit type casts.
```
SUBSTRING

Returns a value representing a substring of the specified string at the given position, given a value, a position, and an optional length. SUBSTRING truncates DOUBLE PRECISION input values.

Behavior Type

Immutable if USING OCTETS, stable otherwise.

Syntax

```
SUBSTRING (string, position [ , Length ]
... [USING {CHARACTERS | OCTETS } ] )
SUBSTRING (string FROM position [ FOR length ]
... [USING { CHARACTERS | OCTETS } ] )
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>(CHAR/VARCHAR or BINARY/VARBINARY) is the string from which to extract a substring</td>
</tr>
<tr>
<td>position</td>
<td>(INTEGER or DOUBLE PRECISION) is the starting position of the substring (counting from one by either characters or octets). (The default is characters.) If position is greater than the length of the given value, an empty value is returned.</td>
</tr>
<tr>
<td>length</td>
<td>(INTEGER or DOUBLE PRECISION) is the length of the substring to extract in either characters or octets. (The default is characters.) The default is the end of the string. If a length is given the result is at most that many bytes. The maximum length is the length of the given value less the given position. If no length is given or if the given length is greater than the maximum length then the length is set to the maximum length.</td>
</tr>
<tr>
<td>USING CHARACTERS</td>
<td>OCTETS</td>
</tr>
</tbody>
</table>
Examples

```sql
=> SELECT SUBSTRING('abc':binary(3),1);
  substring
   --------
    abc
  (1 row)

=> SELECT SUBSTRING('soupçon', 5, 2 USING CHARACTERS);
  substring
    -------
    ço
  (1 row)

=> SELECT SUBSTRING('soupçon', 5, 2 USING OCTETS);
  substring
   -------
    ç
  (1 row)
```

If you use a negative position, then the function starts at a non-existent position. In this example, that means counting eight characters starting at position -4. So the function starts at the empty position -4 and counts five characters, including a position for zero which is also empty. This returns three characters.

```sql
=> SELECT SUBSTRING('1234567890', -4, 8);
  substring
    --------
     123
  (1 row)
```

**TO_BITSTRING**

Returns a VARCHAR that represents the given VARBINARY value in bitstring format. This function is the inverse of `BITSTRING_TO_BINARY`.

**Behavior Type**

Immutable

**Syntax**

```
TO_BITSTRING ( expression )
```
Parameters

| expression | The VARCHAR string to process. |

Examples

```sql
=> SELECT TO_BITSTRING('ab'::BINARY(2));
    to_bitstring
-----------------------
0110000101100010
(1 row)

=> SELECT TO_BITSTRING(HEX_TO_BINARY('0x10'));
    to_bitstring
-----------------------
00010000
(1 row)

=> SELECT TO_BITSTRING(HEX_TO_BINARY('0xF0'));
    to_bitstring
-----------------------
11110000
(1 row)
```

See Also

BITCOUNT

TO_HEX

Returns a VARCHAR or VARBINARY representing the hexadecimal equivalent of a number. This function is the inverse of HEX_TO_BINARY.

Behavior Type

Immutable

Syntax

```
TO_HEX ( number )
```
Parameters

| number     | An INTEGER or VARBINARY value to convert to hexadecimal. If you supply a VARBINARY argument, the function's return value is not preceded by 0x. |

Examples

```sql
=> SELECT TO_HEX(123456789);
  TO_HEX
----------
75bcd15
(1 row)
```

For VARBINARY inputs, the returned value is not preceded by 0x. For example:

```sql
=> SELECT TO_HEX('ab':binary(2));
  TO_HEX
----------
6162
(1 row)
```

TRANSLATE

Replaces individual characters in `string_to_replace` with other characters.

Behavior Type

Immutable

Syntax

```sql
TRANSLATE ( string_to_replace , from_string , to_string );
```

Parameters

<table>
<thead>
<tr>
<th>string_to_replace</th>
<th>String to be translated.</th>
</tr>
</thead>
<tbody>
<tr>
<td>from_string</td>
<td>Contains characters that should be replaced in string_to_replace.</td>
</tr>
</tbody>
</table>
to_string | Any character in string_to_replace that matches a character in from_string is replaced by the corresponding character in to_string.

Example

```sql
=> SELECT TRANSLATE('straße', 'ß', 'ss');
TRANSLATE
-----------
strase
(1 row)
```

TRIM

Combines the BTRIM, LTRIM, and RTRIM functions into a single function.

Behavior Type

Immutable

Syntax

```
TRIM ([ [ LEADING | TRAILING | BOTH ] characters FROM ] expression )
```

Parameters

<table>
<thead>
<tr>
<th>LEADING</th>
<th>Removes the specified characters from the left side of the string</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRAILING</td>
<td>Removes the specified characters from the right side of the string</td>
</tr>
<tr>
<td>BOTH</td>
<td>Removes the specified characters from both sides of the string (default)</td>
</tr>
<tr>
<td>characters</td>
<td>(CHAR or VARCHAR) specifies the characters to remove from expression. The default is the space character.</td>
</tr>
<tr>
<td>expression</td>
<td>(CHAR or VARCHAR) is the string to trim</td>
</tr>
</tbody>
</table>
Examples

=> SELECT '-' || TRIM(LEADING 'x' FROM 'xxdatabasexx') || '-';
 ?column?
------------------------
-databasexx-
(1 row)
=> SELECT '-' || TRIM(TRAILING 'x' FROM 'xxdatabasexx') || '-';
 ?column?
------------------------
-xxdatabase-
(1 row)
=> SELECT '-' || TRIM(BOTH 'x' FROM 'xxdatabasexx') || '-';
 ?column?
------------------------
-database-
(1 row)
=> SELECT '-' || TRIM('x' FROM 'xxdatabasexx') || '-';
 ?column?
------------------------
-database-
(1 row)
=> SELECT '-' || TRIM(LEADING FROM ' database ') || '-';
 ?column?
------------------------
-database-
(1 row)
=> SELECT '-' || TRIM( database ') || '-'; ?column?
------------------------
-database-
(1 row)

See Also

- BTRIM
- LTRIM
- RTRIM

UPPER

Returns a VARCHAR value containing the argument converted to uppercase letters.
Starting in Release 5.1, this function treats the string argument as a UTF-8 encoded string, rather than depending on the collation setting of the locale (for example, collation=binary) to identify the encoding.

**Behavior Type**

stable

**Syntax**

`UPPER ( expression )`

**Parameters**

| `expression` | CHAR or VARCHAR containing the string to convert |

**Notes**

UPPER is restricted to 32500 octet inputs, since it is possible for the UTF-8 representation of result to double in size.

**Examples**

```sql
=> SELECT UPPER('AbCdEfG');
  UPPER
----------
 ABCDEFG
(1 row)
=> SELECT UPPER('étudiant');
  UPPER
----------
 ÉTUDIANT
(1 row)
```

**UPPERB**

Returns a character string with each ASCII character converted to uppercase. Multibyte characters are not converted and are skipped.
Behavior Type

Immutable

Syntax

UPPERB ( expression )

Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>(CHAR or VARCHAR) is the string to convert</th>
</tr>
</thead>
</table>

Examples

In the following example, the multibyte UTF-8 character é is not converted to uppercase:

```sql
=> SELECT UPPERB('étudiant');
UPPERB
----------
éTUDIANT
(1 row)

=> SELECT UPPERB('AbCdEfG');
UPPERB
----------
ABCDEFG
(1 row)

=> SELECT UPPERB('The Vertica Database');
UPPERB
--------------------------
THE VERTICA DATABASE
(1 row)
```

V6_ATON

Converts an IPv6 address represented as a character string to a binary string.

Behavior Type

Immutable
**Syntax**

\texttt{V6\_ATON\ (\ expression\ )}

**Parameters**

| expression | (VARCHAR) is the string to convert. |

**Notes**

The following syntax converts an IPv6 address represented as the character string \texttt{A} to a binary string \texttt{B}.

\texttt{V6\_ATON} trims any spaces from the right of \texttt{A} and calls the Linux function \texttt{inet\_pton}.

\[ \Rightarrow \texttt{V6\_ATON(VARCHAR A) -> VARBINARY(16) B} \]

If \texttt{A} has no colons it is prepended with '\::ffff:'. If \texttt{A} is NULL, too long, or if \texttt{inet\_pton} returns an error, the result is NULL.

**Examples**

\[ \Rightarrow \texttt{SELECT V6\_ATON('2001:DB8::8:000:200C:417A');} \]

\texttt{v6\_aton}

\begin{verbatim}
\001\015\270\000\000\000\000\010\010\000 \014Az
\end{verbatim}

(1 row)

\[ \Rightarrow \texttt{SELECT V6\_ATON('1.2.3.4');} \]

\texttt{v6\_aton}

\begin{verbatim}
\000\000\000\000\000\000\000\000\000\377\377\001\002\003\004
\end{verbatim}

(1 row)

\[ \texttt{SELECT TO\_HEX(V6\_ATON('2001:DB8::8:000:200C:417A'));} \]

\texttt{to\_hex}

\begin{verbatim}
2001db8000000000000000000000000200c417a
\end{verbatim}

(1 row)

\[ \Rightarrow \texttt{SELECT V6\_ATON('::1.2.3.4');} \]

\texttt{v6\_aton}

\begin{verbatim}
\000\000\000\000\000\000\000\000\000\001\002\003\004
\end{verbatim}

(1 row)
See Also

- V6_NTOA

V6_NTOA

Converts an IPv6 address represented as varbinary to a character string.

Behavior Type

Immutable

Syntax

V6_NTOA ( expression )

Parameters

| expression | (VARBINARY) is the binary string to convert. |

Notes

The following syntax converts an IPv6 address represented as VARBINARY B to a string A.

V6_NTOA right-pads B to 16 bytes with zeros, if necessary, and calls the Linux function inet_ntop.

=> V6_NTOA(VARBINARY B) -> VARCHAR A

If B is NULL or longer than 16 bytes, the result is NULL.

Vertica automatically converts the form '::ffff:1.2.3.4' to '1.2.3.4'.
Examples

=> SELECT V6_NTOA('\001\015\270\000\000\000\000\010\010\000 \014Az');

v6_ntoa
------------------------
2001:db8::8:800:200c:417a
(1 row)

=> SELECT V6_NTOA(V6_ATON('1.2.3.4'));

v6_ntoa
--------
1.2.3.4
(1 row)

=> SELECT V6_NTOA(V6_ATON('::1.2.3.4'));

v6_ntoa
--------
::1.2.3.4
(1 row)

See Also

- V6_ATON

V6_SUBNETA

Calculates a subnet address in CIDR (Classless Inter-Domain Routing) format from a binary or alphanumeric IPv6 address.

Behavior Type

Immutable

Syntax

V6_SUBNETA ( expression1, expression2 )

Parameters

| expression1 | (VARBINARY or VARCHAR) is the string to calculate. |
expression2 (INTEGER) is the size of the subnet.

Notes

The following syntax calculates a subnet address in CIDR format from a binary or varchar IPv6 address.

V6_SUBNETA masks a binary IPv6 address B so that the N leftmost bits form a subnet address, while the remaining rightmost bits are cleared. It then converts to an alphanumeric IPv6 address, appending a slash and N.

=> V6_SUBNETA(BINARY B, INT8 N) -> VARCHAR C

The following syntax calculates a subnet address in CIDR format from an alphanumeric IPv6 address.

=> V6_SUBNETA(VARCHAR A, INT8 N) -> V6_SUBNETA(V6_ATON(A), N) -> VARCHAR C

Examples

=> SELECT V6_SUBNETA(V6_ATON('2001:db8::8:800:200c:417a'), 28);

<table>
<thead>
<tr>
<th>v6_subneta</th>
</tr>
</thead>
<tbody>
<tr>
<td>2001:db0::/28</td>
</tr>
</tbody>
</table>

(1 row)

See Also

- V6_SUBNETN

V6_SUBNETN

Calculates a subnet address in CIDR (Classless Inter-Domain Routing) format from a varbinary or alphanumeric IPv6 address.

Behavior Type

Immutable
## Syntax

V6_SUBNETN ( expression1, expression2 )

### Parameters

| expression1   | (VARBINARY or VARCHAR) is the string to calculate.  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Notes:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• V6_SUBNETN(&lt;VARBINARY&gt;, &lt;INTEGER&gt;) returns VARBINARY.</td>
</tr>
<tr>
<td></td>
<td>OR</td>
</tr>
<tr>
<td></td>
<td>• V6_SUBNETN(&lt;VARCHAR&gt;, &lt;INTEGER&gt;) returns VARBINARY, after using V6_ATON to convert the &lt;VARCHAR&gt; string to &lt;VARBINARY&gt;.</td>
</tr>
</tbody>
</table>

| expression2   | (INTEGER) is the size of the subnet.                                                              |

### Notes

The following syntax masks a BINARY IPv6 address B so that the N left-most bits of S form a subnet address, while the remaining right-most bits are cleared.

V6_SUBNETN right-pads B to 16 bytes with zeros, if necessary and masks B, preserving its N-bit subnet prefix.

```
=> V6_SUBNETN(VARBINARY B, INT8 N) -> VARBINARY(16) S
```

If B is NULL or longer than 16 bytes, or if N is not between 0 and 128 inclusive, the result is NULL.

\[ S = [B]/N \] in **Classless Inter-Domain Routing** notation (CIDR notation).

The following syntax masks an alphanumeric IPv6 address A so that the N leftmost bits form a subnet address, while the remaining rightmost bits are cleared.

```
=> V6_SUBNETN(VARCHAR A, INT8 N) -> V6_SUBNETN(V6_ATON(A), N) -> VARBINARY(16) S
```
Example

This example returns VARBINARY, after using V6_ATON to convert the VARCHAR string to VARBINARY:

```sql
=> SELECT V6_SUBNETN(V6_ATON('2001:db8::8:800:200c:417a'), 28);

v6_subnetn
\001\015\260\000\000\000\000\000\000\000\000\000\000\000\000\000\000\000\000
```

See Also

- V6_ATON
- V6_SUBNETA

V6_TYPE

Characterizes a binary or alphanumerical IPv6 address B as an integer type.

Behavior Type

Immutable

Syntax

```sql
V6_TYPE ( expression )
```

Parameters

<table>
<thead>
<tr>
<th>expression</th>
</tr>
</thead>
<tbody>
<tr>
<td>(VARBINARY or VARCHAR) is the type to convert.</td>
</tr>
</tbody>
</table>

Notes

V6_TYPE(VARBINARY B) returns INT8 T.
The IPv6 types are defined in the Network Working Group's IP Version 6 Addressing Architecture memo.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GLOBAL</td>
<td>Global unicast addresses</td>
</tr>
<tr>
<td>LINKLOCAL</td>
<td>Link-Local unicast (and Private-Use) addresses</td>
</tr>
<tr>
<td>LOOPBACK</td>
<td>Loopback</td>
</tr>
<tr>
<td>UNSPECIFIED</td>
<td>Unspecified</td>
</tr>
<tr>
<td>MULTICAST</td>
<td>Multicast</td>
</tr>
</tbody>
</table>

IPv4-mapped and IPv4-compatible IPv6 addresses are also interpreted, as specified in IPv4 Global Unicast Address Assignments.

- For IPv4, Private-Use is grouped with Link-Local.
- If B is VARBINARY, it is right-padded to 16 bytes with zeros, if necessary.
- If B is NULL or longer than 16 bytes, the result is NULL.

Details

IPv4 (either kind):

<table>
<thead>
<tr>
<th>IPv4</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0.0.0/8</td>
<td>UNSPECIFIED</td>
</tr>
<tr>
<td>127.0.0.0/8</td>
<td>LOOPBACK</td>
</tr>
<tr>
<td>169.254.0.0/16</td>
<td>LINKLOCAL</td>
</tr>
<tr>
<td>172.16.0.0/12</td>
<td>LINKLOCAL</td>
</tr>
<tr>
<td>192.168.0.0/16</td>
<td>LINKLOCAL</td>
</tr>
<tr>
<td>224.0.0.0/4</td>
<td>MULTICAST</td>
</tr>
<tr>
<td>others</td>
<td>GLOBAL</td>
</tr>
</tbody>
</table>

IPv6:

<table>
<thead>
<tr>
<th>IPv6</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>::/128</td>
<td>UNSPECIFIED</td>
</tr>
<tr>
<td>fe80::/10</td>
<td>LINKLOCAL</td>
</tr>
<tr>
<td>ff00::/8</td>
<td>MULTICAST</td>
</tr>
<tr>
<td>others</td>
<td>GLOBAL</td>
</tr>
</tbody>
</table>

Examples

```sql
=> SELECT V6_TYPE(V6_ATON('192.168.2.10'));

v6_type
--------
1
(1 row)
```
=> SELECT V6_TYPE(V6_ATON('2001:db8::8:800:200c:417a'));
  v6_type
---------
   0
(1 row)

System Information Functions

These functions provide system information regarding user sessions. A superuser has unrestricted access to all system information, but users can view only information about their own, current sessions.

CURRENT_DATABASE

Returns a VARCHAR value containing the name of the database to which you are connected.

Behavior Type

Immutable

Syntax

CURRENT_DATABASE()

Notes

- The parentheses following the CURRENT_DATABASE function are optional.
- This function is equivalent to DBNAME.

Examples

```
=> SELECT CURRENT_DATABASE();
CURRENT_DATABASE
--------------
VMart
(1 row)
```

The following command returns the same results without the parentheses:

```
=> SELECT CURRENT_DATABASE;
CURRENT_DATABASE
```
CURRENT_SCHEMA

Returns the name of the current schema.

Behavior Type

Stable

Syntax

CURRENT_SCHEMA()

Note: You can call this function without parentheses.

Privileges

None

Examples

The following command returns the name of the current schema:

```sql
=> SELECT CURRENT_SCHEMA();
 current_schema
 --------------
 public
 (1 row)
```

The following command returns the same results without the parentheses:

```sql
=> SELECT CURRENT_SCHEMA;
 current_schema
 --------------
 public
 (1 row)
```
The following command shows the current schema, listed after the current user, in the search path:

```sql
=> SHOW SEARCH_PATH;
   name | setting
-------+------------------------------------------
search_path | "$user", public, v_catalog, v_monitor, v_internal
(1 row)
```

See Also

- SET SEARCH_PATH

CURRENT_USER

Returns a VARCHAR containing the name of the user who initiated the current database connection.

Behavior Type

Stable

Syntax

`CURRENT_USER()`

Notes

- The CURRENT_USER function does not require parentheses.
- This function is useful for permission checking.
- CURRENT_USER is equivalent to `SESSION_USER`, `USER`, and `USERNAME`.

Examples

```sql
=> SELECT CURRENT_USER();
CURRENT_USER
```

Vertica Analytic Database (9.1.x) Page 2965 of 6174
The following command returns the same results without the parentheses:

```sql
=> SELECT CURRENT_USER;
CURRENT_USER
--------------
dbadmin
(1 row)
```

**DBNAME (function)**

Returns a VARCHAR value containing the name of the database to which you are connected. DBNAME is equivalent to `CURRENT_DATABASE`.

**Behavior Type**

Immutable

**Syntax**

`DBNAME()`

**Examples**

```sql
=> SELECT DBNAME();
  dbname
--------------
  VMart
(1 row)
```

**HAS_TABLE_PRIVILEGE**

Indicates whether a user can access a table in a particular way. The function returns a true (t) or false (f) value.
Behavior Type

Stable

Syntax

HAS_TABLE_PRIVILEGE ( [ user, ] [[database.]schema.]table, privilege )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>Specifies the name or OID of a database user. The default is the CURRENT_USER.</td>
</tr>
<tr>
<td>[ database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td>If you specify a database, it must be the current database.</td>
<td></td>
</tr>
<tr>
<td>table</td>
<td>Specifies the name or OID of a table in the logical schema. If necessary, specify the database and schema, as noted above.</td>
</tr>
<tr>
<td>privilege</td>
<td>- SELECT Allows the user to SELECT from any column of the specified table.</td>
</tr>
<tr>
<td></td>
<td>- INSERT Allows the user to INSERT records into the specified table and to use the COPY command to load the table.</td>
</tr>
<tr>
<td></td>
<td>- UPDATE Allows the user to UPDATE records in the specified table.</td>
</tr>
<tr>
<td></td>
<td>- DELETE Allows the user to delete a row from the specified table.</td>
</tr>
<tr>
<td></td>
<td>- REFERENCES Allows the user to create a foreign key constraint (privileges required on both the referencing and referenced tables).</td>
</tr>
</tbody>
</table>
Privileges

A superuser can check all other user's table privileges.

Users without superuser privileges can use HAS_TABLE_PRIVILEGE to check:

- Any tables they own.
- Tables in a schema to which they have been granted USAGE privileges, and at least one other table privilege, as described in GRANT (Table).

Examples

```sql
=> SELECT HAS_TABLE_PRIVILEGE('store.store_dimension', 'SELECT');

<table>
<thead>
<tr>
<th>HAS_TABLE_PRIVILEGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>t</td>
</tr>
<tr>
<td>(1 row)</td>
</tr>
</tbody>
</table>

=> SELECT HAS_TABLE_PRIVILEGE('release', 'store.store_dimension', 'INSERT');

<table>
<thead>
<tr>
<th>HAS_TABLE_PRIVILEGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>t</td>
</tr>
<tr>
<td>(1 row)</td>
</tr>
</tbody>
</table>

=> SELECT HAS_TABLE_PRIVILEGE('store.store_dimension', 'UPDATE');

<table>
<thead>
<tr>
<th>HAS_TABLE_PRIVILEGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>t</td>
</tr>
<tr>
<td>(1 row)</td>
</tr>
</tbody>
</table>

=> SELECT HAS_TABLE_PRIVILEGE('store.store_dimension', 'REFERENCES');

<table>
<thead>
<tr>
<th>HAS_TABLE_PRIVILEGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>t</td>
</tr>
<tr>
<td>(1 row)</td>
</tr>
</tbody>
</table>

=> SELECT HAS_TABLE_PRIVILEGE(45035996273711159, 45035996273711160, 'select');

<table>
<thead>
<tr>
<th>HAS_TABLE_PRIVILEGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>t</td>
</tr>
<tr>
<td>(1 row)</td>
</tr>
</tbody>
</table>
```

LIST_ENABLED_CIPHERS

Returns a list of ciphers enabled on your server.
Syntax

list_enabled_ciphers()

Example

=> list_enabled_ciphers()
SSL_RSA_WITH_RC4_128_MD5
SSL_RSA_WITH_RC4_128_SHA
TLS_RSA_WITH_AES_128_CBC_SHA

SESSION_USER

Returns a VARCHAR containing the name of the user who initiated the current database session.

Behavior Type

Stable

Syntax

SESSION_USER()

Notes

- The SESSION_USER function does not require parentheses.
- SESSION_USER is equivalent to CURRENT_USER, USER, and USERNAME.
Examples

=> SELECT SESSION_USER();
  session_user
  -----------
  dbadmin
(1 row)

The following command returns the same results without the parentheses:

=> SELECT SESSION_USER;
  session_user
  -----------
  dbadmin
(1 row)

USER

Returns a VARCHAR containing the name of the user who initiated the current database connection.

Behavior Type

Stable

Syntax

USER()

Notes

- The USER function does not require parentheses.
- USER is equivalent to CURRENT_USER, SESSION_USER, and USERNAME.
Examples

=> SELECT USER();
    current_user
    -----------
    dbadmin
(1 row)

The following command returns the same results without the parentheses:

=> SELECT USER;
    current_user
    -----------
    dbadmin
(1 row)

USERNAME

Returns a VARCHAR containing the name of the user who initiated the current database connection.

Behavior Type

Stable

Syntax

USERNAME()
Examples

=> SELECT USERNAME();
username
------------
dbadmin
(1 row)

VERSION

Returns a VARCHAR containing a Vertica node's version information.

Behavior Type

Stable

Syntax

VERSION()

Note: The parentheses are required.

Examples

=> SELECT VERSION();

<table>
<thead>
<tr>
<th>VERSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>---------------</td>
</tr>
<tr>
<td>Vertica Analytic Database v9.1.0-9</td>
</tr>
<tr>
<td>(1 row)</td>
</tr>
</tbody>
</table>
**Timeseries Functions**

Timeseries aggregate functions evaluate the values of a given set of variables over time and group those values into a window for analysis and aggregation.

One output row is produced per time slice—or per partition per time slice—if partition expressions are present.

**TS_FIRST_VALUE**

Processes the data that belongs to each time slice. A time series aggregate (TSA) function, TS_FIRST_VALUE returns the value at the start of the time slice, where an interpolation scheme is applied if the timeslice is missing, in which case the value is determined by the values corresponding to the previous (and next) timeslices based on the interpolation scheme of const (linear).

TS_FIRST_VALUE returns one output row per time slice, or one output row per partition per time slice if partition expressions are specified.

**Behavior Type**

Immutable

**Syntax**

```
TS_FIRST_VALUE ( expression [ IGNORE NULLS ] [, [ 'CONST' | 'LINEAR' ] ] )
```

**Parameters**

<table>
<thead>
<tr>
<th>expression</th>
<th>An INTEGER or FLOAT expression on which to aggregate and interpolate.</th>
</tr>
</thead>
<tbody>
<tr>
<td>IGNORE NULLS</td>
<td>The IGNORE NULLS behavior changes depending on a CONST or LINEAR interpolation scheme. See <a href="#">When Time Series Data Contains Nulls</a> in Analyzing Data for details.</td>
</tr>
</tbody>
</table>
| 'CONST' | 'LINEAR'  | Specifies the interpolation value as constant or linear:  
|-----------------|-----------------|---------------------------------------------------|
|                |                | - CONST (default): New value is interpolated based on previous input records.  
|                |                | - LINEAR: Values are interpolated in a linear slope based on the specified time slice.  

### Requirements

You must use an ORDER BY clause with a TIMESTAMP column.

### Multiple Time Series Aggregate Functions

The same query can call multiple time series aggregate functions. They share the same gap-filling policy as defined by the TIMESERIES Clause; however, each time series aggregate function can specify its own interpolation policy. For example:

```sql
=> SELECT slice_time, symbol,
    TS_FIRST_VALUE(bid, 'const') fv_c,
    TS_FIRST_VALUE(bid, 'linear') fv_l,
    TS_LAST_VALUE(bid, 'const') lv_c
FROM TickStore
TIMESERIES slice_time AS '3 seconds'
OVER(PARTITION BY symbol ORDER BY ts);
```

### Examples

See Gap Filling and Interpolation in Analyzing Data.

### See Also

- [TS_LAST_VALUE](#)
- [Time Series Analytics](#)
TS_LAST_VALUE

Processes the data that belongs to each time slice. A time series aggregate (TSA) function, TS_LAST_VALUE returns the value at the end of the time slice, where an interpolation scheme is applied if the timeslice is missing. In this case the value is determined by the values corresponding to the previous (and next) timeslices based on the interpolation scheme of const (linear).

TS_LAST_VALUE returns one output row per time slice, or one output row per partition per time slice if partition expressions are specified.

Behavior Type

Immutable

Syntax

TS_LAST_VALUE ( expression [ IGNORE NULLS ] [, { 'CONST' | 'LINEAR' } ] )

Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>An INTEGER or FLOAT expression on which to aggregate and interpolate.</th>
</tr>
</thead>
<tbody>
<tr>
<td>IGNORE NULLS</td>
<td>The IGNORE NULLS behavior changes depending on a CONST or LINEAR interpolation scheme. See When Time Series Data Contains Nulls in Analyzing Data for details.</td>
</tr>
<tr>
<td>'CONST'</td>
<td>'LINEAR'</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Requirements

You must use the ORDER BY clause with a TIMESTAMP column.

Multiple Time Series Aggregate Functions

The same query can call multiple time series aggregate functions. They share the same gap-filling policy as defined by the TIMESERIES Clause; however, each time series aggregate function can specify its own interpolation policy. For example:

```sql
=> SELECT slice_time, symbol,
    TS_FIRST_VALUE(bid, 'const') fv_c,
    TS_FIRST_VALUE(bid, 'linear') fv_l,
    TS_LAST_VALUE(bid, 'const') lv_c
FROM TickStore
TIMESERIES slice_time AS '3 seconds'
OVER(PARTITION BY symbol ORDER BY ts);
```

Examples

See Gap Filling and Interpolation in Analyzing Data.

- TS_FIRST_VALUE
- Time Series Analytics
URI Encode/Decode Functions

The functions in this section follow the RFC 3986 standard for percent-encoding a Universal Resource Identifier (URI).

URI_PERCENT_DECODE

Decodes a percent-encoded Universal Resource Identifier (URI) according to the RFC 3986 standard.

Syntax

URI_PERCENT_DECODE (expression)

Behavior Type

Immutable

Parameters

expression (VARCHAR) is the string to convert.

Examples

The following example invokes uri_percent_decode on the Websites column of the URI table and returns a decoded URI:

```sql
=> SELECT URI_PERCENT_DECODE(Websites) from URI;
```

```sql
------------------------------------------------------------------
URI_PERCENT_DECODE
---------------------
http://www.faqs.org/rfc/rfc3986.html x j%a%  
(1 row)
```

The following example returns the original URI in the Websites column and its decoded version:
=> SELECT Websites, URI_PERCENT_DECODE (Websites) from URI;

<table>
<thead>
<tr>
<th>Websites</th>
<th>URI_PERCENT_DECODE</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://www.faqs.org/rfc3986.html+x%20x%6a%25">http://www.faqs.org/rfc3986.html+x%20x%6a%</a></td>
<td><a href="http://www.faqs.org/rfc3986.html">http://www.faqs.org/rfc3986.html</a> x j%a%</td>
</tr>
</tbody>
</table>

(1 row)

**URI_PERCENT_ENCODE**

Encodes a Universal Resource Identifier (URI) according to the RFC 3986 standard for percent encoding. In addition, for compatibility with older encoders this function converts '+' to space; space is converted to %20 by uri_percent_encode.

**Syntax**

`URI_PERCENT_ENCODE (expression)`

**Behavior Type**

Immutable

**Parameters**

- `expression` (VARCHAR) is the string to convert.

**Examples**

The following example shows how the `uri_percent_encode` function is invoked on a the Websites column of the URI table and returns an encoded URI:

```sql
=> SELECT URI_PERCENT_ENCODE(Websites) from URI;

URI_PERCENT_ENCODE

-------------------------------------
http%3A%2F%2Fexample.com%2F%3F%3D11%2F15

(1 row)
```

The following example returns the original URI in the Websites column and it's encoded form:
UUID Functions

Currently, Vertica provides one function to support UUID data types, UUID_GENERATE.

UUID_GENERATE

Returns a new universally unique identifier (UUID) that is generated based on high-quality randomness from /dev/urandom.

Behavior Type
Volatile

Syntax
UUID_GENERATE()

Example

```sql
=> CREATE TABLE Customers(
    cust_id UUID DEFAULT(SELECT uuid_generate()),
    lname VARCHAR(36),
    fname VARCHAR(24));
CREATE TABLE
=> INSERT INTO Customers VALUES (DEFAULT, 'Kearney', 'Thomas');
OUTPUT
---------
  1
(1 row)
=> INSERT INTO Customers VALUES (DEFAULT, 'Pham', 'Duc');
OUTPUT
---------
  1
(1 row)
```
=> COMMIT;
COMMIT
=> SELECT * FROM Customers;

<table>
<thead>
<tr>
<th>cust_id</th>
<th>lname</th>
<th>fname</th>
</tr>
</thead>
<tbody>
<tr>
<td>34462732-ed56-4983-8f3b-e735b0c32d50</td>
<td>Kearney</td>
<td>Thomas</td>
</tr>
<tr>
<td>cede66b7-3d29-4da6-b700-871fc0ac57be</td>
<td>Pham</td>
<td>Duc</td>
</tr>
</tbody>
</table>

(2 rows)
Vertica Meta-Functions

Vertica built-in (meta) functions access the internal state of Vertica and are used in SELECT queries with the function name and an argument (where required). These functions are not part of the SQL standard and take the following form:

```
SELECT <meta-function-name>(<args>);
```

Note: The query cannot contain other clauses, such as FROM or WHERE.

The behavior type of Vertica meta-functions is immutable.

Alphabetical List of Vertica Meta-Functions

The following list shows all of the Vertica meta-functions in alphabetical order.

Jump to letter: A - B - C - D - E - F - G - H - I - K - L - M - N - P - R - S - V

ADVANCE_EPOCH  
Manually closes the current epoch and begins a new epoch.

ALTER_LOCATION_LABEL  
Adds a label to a storage location, or changes or removes an existing label.

ALTER_LOCATION_SIZE  
Changes the size of the depot location on one node or all of the nodes in a database running in Eon Mode.

ALTER_LOCATION_USE  
Alters the type of files that can be stored at the specified storage location.

ANALYZE_CONSTRAINTS  
Analyzes and reports on constraint violations within the specified scope.

ANALYZE_CORRELATIONS  
Analyzes the specified tables for pairs of columns that are strongly correlated.

ANALYZE_EXTERNAL_ROW_COUNT  
Calculates the exact number of rows in an external table.

ANALYZE_STATISTICS  
Collects and aggregates data samples and storage information from all nodes that store projections associated with the specified table.
ANALYZE_WORKLOAD
   Runs the Workload Analyzer (WLA), a utility that analyzes system information held in system tables.

AUDIT
   Returns the raw data size (in bytes) of a database, schema, or table as it is counted in an audit of the database size.

AUDIT_FLEX
   Returns the estimated ROS size of __raw__ columns, equivalent to the export size of the flex data in the audited objects.

AUDIT_LICENSE_SIZE
   Triggers an immediate audit of the database size to determine if it is in compliance with the raw data storage allowance included in your Vertica licenses.

AUDIT_LICENSE_TERM
   Triggers an immediate audit to determine if the Vertica license has expired.

AWS_GET_CONFIG
   Returns the current Amazon Web Services (AWS) credentials set by AWS_SET_CONFIG or ALTER SESSION.

AWS_SET_CONFIG
   Sets the values of AWS Library User-Defined Session Parameters for the current session.

BUILD_FLEXTABLE_VIEW
   Creates, or re-creates, a view for a default or user-defined _keys table, ignoring any empty keys.

CALENDAR_HIERARCHY_DAY
   Specifies to group DATE partition keys into a hierarchy of years, months, and days.

CANCEL_REBALANCE_CLUSTER
   Stops any rebalance task that is currently in progress or is waiting to execute.

CANCEL_REFRESH
   Cancels refresh-related internal operations initiated by START_REFRESH and REFRESH.

CHANGE_CURRENT_STATEMENT_RUNTIME_PRIORITY
   Changes the run-time priority of an active query.

CHANGE_RUNTIME_PRIORITY
   Changes the run-time priority of a query that is actively running.

CLEAN_COMMUNAL_STORAGE
   Deletes files on communal (shared) storage that have leaked due to an event that led Vertica cleanup mechanisms to fail.

CLEAR_CACHES
   Clears the Vertica internal cache files.
CLEAR_DATA_COLLECTOR
Cleans all memory and disk records on the Data Collector tables and functions and resets collection statistics in the system table DATA_COLLECTOR.

CLEAR_DATA_DEPOT
Deletes the specified data from depots when running in Eon Mode.

CLEAR_HDFS_CACHES
Clears the configuration information copied from HDFS and any cached connections.

CLEAR_OBJECT_STORAGE_POLICY
Removes a user-defined storage policy from the specified database, schema or table.

CLEAR_PROFILING
Clears from memory data for the specified profiling type.

CLEAR_PROJECTION_REFRESHES
Clears information in system table PROJECTION_REFRESHES of projection refresh history.

CLEAR_RESOURCE_REJECTIONS
Clears the content of the RESOURCE_REJECTIONS and DISK_RESOURCE_REJECTIONS system tables.

CLOSE_ALL_RESULTSETS
Closes all result set sessions within Multiple Active Result Sets (MARS) and frees the MARS storage for other result sets.

CLOSE_ALL_SESSIONS
Closes all external sessions except the one that issues this function.

CLOSE_RESULTSET
Closes a specific result set within Multiple Active Result Sets (MARS) and frees the MARS storage for other result sets.

CLOSE_SESSION
Interrupts the specified external session, rolls back the current transaction if any, and closes the socket.

CLOSE_USER_SESSIONS
Stops the session for a user, rolls back any transaction currently running, and closes the connection.

COMPACT_STORAGE
Bundles existing data (.fdb) and index (.pidx) files into the .gt file format.

COMPUTE_FLEXTABLE_KEYS
Computes the virtual columns (keys and values) from the flex table VMap data.

COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW
Combines the functionality of BUILD_FLEXTABLE_VIEW and COMPUTE_FLEXTABLE_KEYS to compute virtual columns (keys) from the VMap data of a flex table and construct a view.
COPY_PARTITIONS_TO_TABLE
Copies partitions from one table to another.

COPY_TABLE
Copies one table to another.

CURRENT_SCHEMA
Returns the name of the current schema.

DATA_COLLECTOR_HELP
Returns online usage instructions about the Data Collector, the V_MONITOR.DATA_COLLECTOR system table, and the Data Collector control functions.

DELETE_TOKENIZER_CONFIG_FILE
Deletes a tokenizer configuration file.

DESIGNER_ADD дизайн_QUESTIONS
Reads and evaluates queries from an input file, and adds the queries that it accepts to the specified design.

DESIGNER_ADD дизайн_QUESTIONS_FROM_RESULTS
Executes the specified query and evaluates results in the following columns:

DESIGNER_ADD дизайн_QUERY
Reads and parses the specified query, and if accepted, adds it to the design.

DESIGNER_ADD дизайн_TABLES
Adds the specified tables to a design.

DESIGNER_CANCEL Populate дизайн
Cancels population or deployment operation for the specified design if it is currently running.

DESIGNER_CREATE дизайн
Creates a design with the specified name.

DESIGNER дизайн_PROJECTION_ENCODINGS
Analyzes encoding in the specified projections, creates a script to implement encoding recommendations, and optionally deploys the recommendations.

DESIGNER_DROP_ALL дизайнS
Removes all Database Designer-related schemas associated with the current user.

DESIGNER DROP дизайн
Removes the schema associated with the specified design and all its contents.

DESIGNER дизайн_OUTPUT_ALL дизайн_PROJECTIONS
Displays the DDL statements that define the design projections to standard output.

DESIGNER дизайн_OUTPUT_DEPLOYMENT_SCRIPT
Displays the deployment script for the specified design to standard output.
**DESIGNER_RESET_DESIGN**
Discards all run-specific information of the previous Database Designer build or deployment of the specified design but keeps its configuration.

**DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY**
Populates the design and creates the design and deployment scripts.

**DESIGNER_SET_ANALYZE_CORRELATIONS_MODE**
Specifies how Database Designer handles column correlations in a design.

**DESIGNER_SET_DESIGN_KSAFETY**
Sets K-safety for a comprehensive design and stores the K-safety value in the DESIGNS table.

**DESIGNER_SET_DESIGN_TYPE**
Specifies whether Database Designer should create a comprehensive or incremental design.

**DESIGNER_SET_OPTIMIZATION_OBJECTIVE**
Valid only for comprehensive database designs, specifies the optimization objective Database Designer uses.

**DESIGNER_SET_PROPOSE_UNSEGMENTED_PROJECTIONS**
Specifies whether a design can include unsegmented projections.

**DESIGNER_WAIT_FOR_DESIGN**
Waits for completion of operations that are populating and deploying the design.

**DISABLE_DUPLICATE_KEY_ERROR**
Disables error messaging when Vertica finds duplicate primary or unique key values at run time (for use with key constraints that are not automatically enabled).

**DISABLE_ELASTIC_CLUSTER**
Disables elastic cluster scaling, which prevents Vertica from bundling data into chunks that are easily transportable to other nodes when performing cluster resizing.

**DISABLE_LOCAL_SEGMENTS**
Disables local data segmentation, which breaks projections segments on nodes into containers that can be easily moved to other nodes.

**DISABLE_PROFILING**
Disables for the current session collection of profiling data of the specified type.

**DISPLAY_LICENSE**
Returns the terms of your Vertica license.

**DO_TM_TASK**
Runs a Tuple Mover operation on the specified table or projection and commits any current transaction.

**DROP_EXTERNAL_ROW_COUNT**
Removes external table row count statistics compiled by ANALYZE_EXTERNAL_ROW_COUNT.
DROP_LICENSE
   Drops a license key from the global catalog.

DROP_LOCATION
   Removes the specified storage location.

DROP_PARTITION Keys
   Drops the specified table partition keys.

DROP_STATISTICS
   Removes statistical data on database projections previously generated by ANALYZE_STATISTICS.

DUMP_CATALOG
   Returns an internal representation of the Vertica catalog.

DUMP_LOCKTABLE
   Returns information about deadlocked clients and the resources they are waiting for.

DUMP_PARTITION_KEYS
   Dumps the partition keys of all projections in the system.

DUMP_PROJECTION_PARTITION_KEYS
   Dumps the partition keys of the specified projection.

DUMP_TABLE_PARTITION_KEYS
   Dumps the partition keys of all projections for the specified table.

EMPTYMAP
   Constructs a new VMap with one row but without keys or data.

ENABLE_ELASTIC_CLUSTER
   Enables elastic cluster scaling, which makes enlarging or reducing the size of your database cluster more efficient by segmenting a node's data into chunks that can be easily moved to other hosts.

ENABLE_LOCAL_SEGMENTS
   Enables local storage segmentation, which breaks projections segments on nodes into containers that can be easily moved to other nodes.

ENABLE_PROFILING
   Enables for the current session collection of profiling data of the specified type.

ENFORCE_OBJECT_STORAGE_POLICY
   Applies storage policies of the specified object immediately.

EVALUATE_DELETE_PERFORMANCE
   Evaluates projections for potential DELETE performance issues.

EXPORT_CATALOG
   Generates a SQL script for recreating a physical schema design on another cluster.
**EXPORT_DIRECTED_QUERIES**
Generates SQL for creating directed queries from a set of input queries, and writes the SQL to the specified file or to standard output.

**EXPORT_OBJECTS**
Generates a SQL script you can use to recreate non-virtual catalog objects on another cluster.

**EXPORT_STATISTICS**
Generates database statistics in XML format from data previously collected by ANALYZE_STATISTICS.

**EXPORT_TABLES**
Generates a SQL script that can be used to recreate a logical schema—schemas, tables, constraints, and views—on another cluster.

**FINISH_FETCHING_FILES**
Fetches all the files that are queued for fetching from the communal storage.

**FLUSH_DATA_COLLECTOR**
Waits until memory logs are moved to disk and then flushes the Data Collector, synchronizing the log with the disk storage.

**FLUSH_REAPER_QUEUE**
Deletes all of the data marked for deletion in the database.

**GET_AHM_EPOCH**
Returns the number of the epoch in which the Ancient History Mark is located.

**GET_AHM_TIME**
Returns a TIMESTAMP value representing the Ancient History Mark.

**GET_AUDIT_TIME**
Reports the time when the automatic audit of database size occurs.

**GET_CLIENT_LABEL**
Returns the client connection label for the current session.

**GET_COMPLIANCE_STATUS**
Displays whether your database is in compliance with your Vertica license agreement.

**GET_CURRENT_EPOCH**
The epoch into which data (COPY, INSERT, UPDATE, and DELETE operations) is currently being written.

**GET_DATA_COLLECTOR_NOTIFY_POLICY**
Lists any notification policies set on a Data Collector component.

**GET_DATA_COLLECTOR_POLICY**
Retrieves a brief statement about the retention policy for the specified component.

**GET_LAST_GOOD_EPOCH**
Returns the last good epoch number.

**GET_NUM_ACCEPTED_ROWS**

Returns the number of rows loaded into the database for the last completed load for the current session.

**GET_NUM_REJECTED_ROWS**

Returns the number of rows that were rejected during the last completed load for the current session.

**GET_PROJECTIONS**

Returns the following information about projections of the specified anchor table:

**GET_PROJECTION_STATUS**

Returns information relevant to the status of a projection:

**GET_TOKENIZER_PARAMETER**

Returns the configuration parameter for a given tokenizer.

**HAS_ROLE**

Indicates, with a Boolean value, whether a role has been assigned to a user.

**IMPORT_DIRECTED_QUERIES**

Imports to the database catalog directed queries from a SQL file that was generated by **EXPORT_DIRECTED_QUERIES**.

**IMPORT_STATISTICS**

Imports statistics from the XML file that was generated by **EXPORT_STATISTICS**.

**INSTALL_LICENSE**

Installs the license key in the global catalog.

**INTERRUPT_STATEMENT**

Interrupts the specified statement in a user session, rolls back the current transaction, and writes a success or failure message to the log file.

**KERBEROS_CONFIG_CHECK**

Tests the Kerberos configuration of a Vertica cluster.

**KERBEROS_HDFS_CONFIG_CHECK**

Tests the Kerberos configuration of a Vertica cluster that uses HDFS.

**LAST_INSERT_ID**

Returns the last value of an AUTO_INCREMENT/IDENTITY column.

**LDAP_LINK_SYNC_START**

Begins the synchronization between the LDAP server and Vertica immediately rather than waiting for the interval set in LDAPLinkInterval.

**MAKE_AHM_NOW**

Sets the Ancient History Mark (AHM) to the greatest allowable value.
MAPAGGREGATE
   Returns a LONG VARBINARY VMap with keys and value pairs supplied from two VARCHAR input columns of an existing columnar table.

MAPCONTAINSKEY
   Determines whether a VMap contains a virtual column (key).

MAPCONTAINSVALUE
   Determines whether a VMap contains a specific value.

MAPDELIMITEDEXTRACTOR
   Extracts data with a delimiter character, and other optional arguments, returning a single VMap value.

MAPITEMS
   Returns information about items in a VMap.

MAPJSONEXTRACTOR
   Extracts content of repeated JSON data objects, including nested maps, or data with an outer list of JSON elements.

MAPKEYS
   Returns the virtual columns (and values) present in any VMap data.

MAPKEYSINFO
   Returns virtual column information from a given map.

MAPLOOKUP
   Returns single-key values from VMAP data.

MAPPUT
   Accepts a VMap and one or more key/value pairs and returns a new VMap with the key/value pairs added.

MAPREGEXEXTRACTOR
   Extracts data from a regular expression and returns the results as a VMap.

MAPSIZE
   Returns the number of virtual columns present in any VMap data.

MAPTOSTRING
   Recursively builds a string representation VMap data, including nested JSON maps.

MAPVALUES
   Returns a string representation of the top-level values from a VMap.

MAPVERSION
   Returns the version or invalidity of any map data.

MARK_DESIGN_KSAFE
   Enables or disables high availability in your environment, in case of a failure.
MATERIALIZE_FLEXTABLE_COLUMNS
Materializes virtual columns listed as key_names in the flextable_keys table you compute using either COMPUTE_FLEXTABLE_KEYS or COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW.

MEASURE_LOCATION_PERFORMANCE
Measures disk performance for the location specified.

MOVE_PARTITIONS_TO_TABLE
Moves partitions from one table to another.

MOVE RETIRED_LOCATION_DATA
Moves all data from the specified retired storage location or from all retired storage locations in the database.

MOVE_STATEMENT_TO_RESOURCE_POOL
Attempts to move the specified query to the specified target pool.

NOTIFY
Specifies the text message to include with a notification.

PARTITION_PROJECTION
Splits ROS containers for a specified projection.

PARTITION_TABLE
Invokes the Tuple Mover to reorganize ROS storage containers as needed to conform with the current partitioning policy.

PURGE
Permanently removes delete vectors from ROS storage containers so disk space can be reused.

PURGE_PARTITION
Purges a table partition of deleted rows.

PURGE_PROJECTION
Permanently removes deleted data from physical storage so disk space can be reused.

PURGE_TABLE
Permanently removes deleted data from physical storage so disk space can be reused.

READ_CONFIG_FILE
Reads and returns the key-value pairs of all the parameters of a given tokenizer.

REALIGN_CONTROL_NODES
Chooses control nodes (spread hosts) from all cluster nodes and assigns the rest of the nodes in the cluster to a control node.

REBALANCE_CLUSTER
Rebalances the database cluster synchronously as a session foreground task.

REBALANCE_SHARDS
Rebalances shard assignments across a cluster in Eon Mode.

**REBALANCE_TABLE**
Synchronously rebalances data in the specified table.

**REENABLE_DUPLICATE_KEY_ERROR**
Restores the default behavior of error reporting by reversing the effects of DISABLE_DUPLICATE_KEY_ERROR.

**REFRESH**
Synchronously refreshes one or more table projections in the foreground, and updates system table PROJECTION_REFRESHES.

**REFRESH_COLUMNS**
Refreshes table columns that are defined with the constraint SET USING.

**RELEASE_ALL_JVM_MEMORY**
Forces all sessions to release the memory consumed by their Java Virtual Machines (JVM).

**RELEASE_JVM_MEMORY**
Terminates a Java Virtual Machine (JVM), making available the memory the JVM was using.

**RELEASE_SYSTEM_TABLES_ACCESS**
Opens access to non-superuser-only tables that are not accessible during lockdown.

**RELOAD_SPREAD**
Updates cluster changes to the catalog's spread configuration file.

**RESERVE_SESSION_RESOURCE**
Reserves memory resources from the general resource pool for the exclusive use of the Vertica backup and restore process.

**RESET_LOAD_BALANCE_POLICY**
Resets the counter each host in the cluster maintains, to track which host it will refer a client to when the native connection load balancing scheme is set to ROUNDROBIN.

**RESET_SESSION**
Applies your default connection string configuration settings to your current session.

**RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW**
Restores the _keys table and the _view.

**RESTORE_LOCATION**
Restores a storage location that was previously retired with RETIRE_LOCATION.

**RESTRICT_SYSTEM_TABLES_ACCESS**
Restricts access to non-superuser-only tables that are not accessible during lockdown.

**RETIRE_LOCATION**
Inactivates the specified storage location.

**RUN_INDEX_TOOL**
Runs the Index tool on a Vertica database to perform one of these tasks:

**S3EXPORT**
Exports data to an Amazon S3 bucket from your Vertica cluster.

**S3EXPORT_PARTITION**
The S3EXPORT_PARTITION function allows Vertica output to be used by Amazon's Elastic MapReduce (EMR) feature.

**SET_AHM_EPOCH**
Sets the Ancient History Mark (AHM) to the specified epoch.

**SET_AHM_TIME**
Sets the Ancient History Mark (AHM) to the epoch corresponding to the specified time on the initiator node.

**SET_AUDIT_TIME**
Sets the time that Vertica performs automatic database size audit to determine if the size of the database is compliant with the raw data allowance in your Vertica license.

**SET_CLIENT_LABEL**
Assigns a label to a client connection for the current session.

**SET_CONFIG_PARAMETER**
Specifies the value of a configuration parameter at the database level, or for a specific node.

**SET_CONTROL_SET_SIZE**
Specifies the number of cluster nodes on which to deploy control messaging (spread).

**SET_DATA_COLLECTOR_NOTIFY_POLICY**
Enables or disables automatically sending notifications of Data Collector component changes.

**SET_DATA_COLLECTOR_POLICY**
Sets a size restraint (memory and disk space in kilobytes) for the specified Data Collector table on all nodes.

**SET_DATA_COLLECTOR_TIME_POLICY**
Sets a time capacity for individual Data Collector tables on all nodes.

**SET_LOAD_BALANCE_POLICY**
Sets how native connection load balancing chooses a host to handle a client connection.

**SET_LOCATION_PERFORMANCE**
Sets disk performance for the location specified.

**SET_OBJECT_STORAGE_POLICY**
Creates or changes the storage policy of a database object by assigning it a labeled storage location.

**SET_SCALING_FACTOR**
Sets the scaling factor that determines the number of storage containers used when rebalancing the database and when using local data segmentation is enabled.

**SET_TOKENIZER_PARAMETER**
- Configures the tokenizer parameters.

**SHOW_PROFILING_CONFIG**
- Shows whether profiling is enabled.

**SHUTDOWN**
- Forces a database to shut down, even if there are users connected.

**SLEEP**
- Waits a specified number of seconds before executing another statement or command.

**START_REBALANCE_CLUSTER**
- Asynchronously rebalances the database cluster as a background task.

**START_REFRESH**
- Refreshes projections in the current schema with the latest data of their respective anchor tables.

**SWAP_PARTITIONST_BETWEEN_TABLES**
- Swaps partitions between two tables.

**SYNC_CATALOG**
- Synchronizes the catalog to shared storage to allow revive as of the current catalog version in the case of an imminent crash.

**SYNC_WITH_HCATALOG_SCHEMA**
- Copies the structure of a Hive database schema available through the HCatalog Connector to a Vertica schema.

**SYNC_WITH_HCATALOG_SCHEMA_TABLE**
- Copies the structure of a single table in a Hive database schema available through the HCatalog Connector to a Vertica table.

**VALIDATE_STATISTICS**
- Validates statistics in the XML file generated by the EXPORT_STATISTICS command.

**VERIFY_HADOOP_CONF_DIR**
- Verifies that the Hadoop configuration that is used to access HDFS is valid on all Vertica nodes.

**AWS Library Functions**

This section contains the functions associated with the Vertica library for Amazon Web Services (AWS).
AWS_GET_CONFIG

Returns the current Amazon Web Services (AWS) credentials set by AWS_SET_CONFIG or ALTER SESSION.

Syntax

AWS_GET_CONFIG( 'parameter' )

**parameter**

aws_id
aws_secret
aws_session_token
aws_region
aws_ca_path
aws_ca_bundle
aws_proxy
aws_verbose
aws_max_send_speed
aws_max_recv_speed

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aws_id</td>
<td>Retrieves the value for the 20-character AWS access key used to authenticate your account</td>
</tr>
<tr>
<td>aws_secret</td>
<td>Retrieves the value for the 40-character AWS secret access key used to authenticate your account</td>
</tr>
<tr>
<td>aws_session_token</td>
<td>The AWS temporary security token generated by running the AWS STS command get-session-token. This AWS STS command generates temporary credentials you can use to implement multi-factor authentication for security purposes. For more information on get-session-token see the <a href="#">AWS documentation</a>.</td>
</tr>
<tr>
<td>aws_region</td>
<td>Retrieves the region where your AWS bucket is located. See the <a href="#">AWS Documentation</a> for the full list of values.</td>
</tr>
<tr>
<td></td>
<td><strong>Default value: us-east-1</strong></td>
</tr>
<tr>
<td>aws_ca_path</td>
<td>Retrieves the path Vertica uses to look up SSL server certificates.</td>
</tr>
<tr>
<td>aws_ca_bundle</td>
<td>Retrieves the path Vertica uses to look up an SSL server certificate bundle.</td>
</tr>
</tbody>
</table>
### AWS_proxy

A string value that lets you set an HTTP/HTTPS proxy for the AWS library.

### aws_verbose

When enabled, logs libcurl debug messages to dbLog.

### aws_max_send_speed

Retrieves the value for the maximum transfer speed when sending data to AWS S3, in bytes per second.

### aws_max_recv_speed

Retrieves the value for the maximum transfer speed for receiving data to AWS S3, in bytes per second.

### Examples

This example retrieves a stored AWS access key in a session.

```sql
=> SELECT AWS_GET_CONFIG('aws_id');
    aws_get_config
------------------------
AKABCOEXAMPLEPKPXYZQ
(1 row)
```

### See Also

- AWS Library Parameters
- Vertica AWS Library

### AWS_SET_CONFIG

Sets the values of AWS Library User-Defined Session Parameters for the current session. This function is designed to be used with a table that contains those values, rather than by setting values explicitly in the function call.

#### Syntax

```sql
AWS_SET_CONFIG( 'parameter', 'value' )
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aws_id</td>
<td>The 20-character AWS access key used to authenticate your</td>
</tr>
</tbody>
</table>
account.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>aws_secret</strong></td>
<td>The 40-character AWS secret access key used to authenticate your account.</td>
</tr>
<tr>
<td><strong>aws_session_token</strong></td>
<td>The AWS temporary security token generated by running the AWS STS command <code>get-session-token</code>. This AWS STS command generates temporary credentials you can use to implement multi-factor authentication for security purposes. For more information on <code>get-session-token</code> see the AWS documentation.</td>
</tr>
<tr>
<td><strong>aws_region</strong></td>
<td>Specifies the region where your AWS bucket is located. See the AWS Documentation for the full list of values.</td>
</tr>
<tr>
<td></td>
<td>You can configure <code>aws_region</code> with only one region. To access buckets in multiple regions, reset the parameter each time you change regions.</td>
</tr>
<tr>
<td></td>
<td><strong>Default value:</strong> <code>us-east-1</code></td>
</tr>
<tr>
<td><strong>aws_ca_path</strong></td>
<td>The path Vertica uses to look up SSL server certificates.</td>
</tr>
<tr>
<td></td>
<td><strong>Default value:</strong> System-dependent</td>
</tr>
<tr>
<td><strong>aws_ca_bundle</strong></td>
<td>The path Vertica uses to look up an SSL server certificate bundle.</td>
</tr>
<tr>
<td></td>
<td><strong>Default value:</strong> System-dependent</td>
</tr>
<tr>
<td><strong>aws_proxy</strong></td>
<td>A string value that lets you set an HTTP/HTTPS proxy for the AWS library.</td>
</tr>
<tr>
<td><strong>aws_verbose</strong></td>
<td>When enabled, logs libcurl debug messages to dbLog.</td>
</tr>
<tr>
<td></td>
<td><strong>Default value:</strong> false</td>
</tr>
<tr>
<td><strong>aws_max_send_speed</strong></td>
<td>The maximum transfer speed for sending data to AWS S3, in bytes per second.</td>
</tr>
<tr>
<td></td>
<td><strong>Default value:</strong> unlimited</td>
</tr>
<tr>
<td><strong>aws_max_recv_speed</strong></td>
<td>The maximum transfer speed when receiving data to AWS S3, in bytes per second.</td>
</tr>
<tr>
<td></td>
<td><strong>Default value:</strong> unlimited</td>
</tr>
</tbody>
</table>
Examples

Configure session parameters for an AWS access key and secret access key with credentials in the keychain table:

```
=> SELECT AWS_SET_CONFIG('aws_id', accesskey),
     AWS_SET_CONFIG('aws_secret', secretaccesskey)
  FROM keychain;
```

- Vertica AWS Library

S3EXPORT

Exports data to an Amazon S3 bucket from your Vertica cluster.

If your bucket name contains a period, you must specify a file extension in your export syntax or enable the prepend_hash parameter in s3export.

Syntax

```
S3EXPORT(expression USING PARAMETERS { parameter=setting } [,...]
```

Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>Specifies the source of the export operation.</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>The URL of the S3 bucket and object base name. This value can be either the HTTPS URL or the S3 URL. URL length is limited to a maximum of 236 characters. URLs should contain only ASCII characters, 0x01 to 0x7F.</td>
</tr>
<tr>
<td>delimiter</td>
<td>Specifies the column delimiter character.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Default value</td>
</tr>
<tr>
<td>-------------------</td>
<td>--------------------------------</td>
</tr>
<tr>
<td>multipart</td>
<td></td>
</tr>
<tr>
<td>chunksize</td>
<td>Specifies in bytes the maximum size of each part. Valid settings can range between 5 MB and 5 GB. The maximum number of chunks allowed in an export is 10000.</td>
</tr>
<tr>
<td>record_terminator</td>
<td>Specifies what character marks the end of a record.</td>
</tr>
<tr>
<td>from_charset</td>
<td>Specifies the character set in which your data is currently encoded.</td>
</tr>
<tr>
<td>to_charset</td>
<td>Specifies the character set in which you want to encode your export.</td>
</tr>
<tr>
<td>prepend_hash</td>
<td>Prepends the unique hash values assigned to exported objects instead of the standard appendation. If your S3 bucket contains a period in its path, set the prepend_hash parameter to true.</td>
</tr>
</tbody>
</table>

**from_charset and to_charset** values are system-dependent. Refer to your operating system documentation for more details.

### Examples

Export column1 data from exampleTable:

```sql
=> SELECT s3export(column1 USING PARAMETERS
    url='s3://exampleBucket/object',
    delimiter=',',
    chunksize='10485760',
    record_terminator='\n',
    from_charset='ASCII',
    to_charset='UTF-8',
    prepend_hash='true')
OVER () FROM exampleTable;
```

- AWS Library Parameters
- Vertica AWS Library

S3EXPORT_PARTITION

The S3EXPORT_PARTITION function allows Vertica output to be used by Amazon's Elastic MapReduce (EMR) feature. Since EMR stores and consumes data from S3 using the partition key included in the key of the S3 file, S3EXPORT_PARTITION exports data by adding the partition key in the url/filename.

Syntax

S3EXPORT_PARTITION ( expression USING PARAMETERS { parameter=setting } [, ... ] )

<table>
<thead>
<tr>
<th>expression</th>
<th>Specifies the source of the export operation.</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>The URL of the S3 bucket and object base name. Also include the partition key as part of the URL to export data so it is usable by EMR. The URL can be either the HTTPS URL or the S3 URL. URL length is limited to a maximum of 236 characters. URLs should contain only ASCII characters, 0x01 to 0x7F.</td>
</tr>
<tr>
<td>delimiter</td>
<td>Specifies the column delimiter character. <strong>Default value:</strong></td>
</tr>
<tr>
<td>chunksize</td>
<td>Determines the buffer size used to send bytes to S3. Valid settings can range between 5 MB and 5 GB. The maximum number of chunks allowed in an export is 10000. <strong>Default value:</strong> 10485760</td>
</tr>
<tr>
<td>record_terminator</td>
<td>Specifies what character marks the end of a record.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>from_charset</td>
<td>Specifies the character set in which your data is currently encoded.</td>
</tr>
<tr>
<td>to_charset</td>
<td>Specifies the character set in which you want to encode your export.</td>
</tr>
<tr>
<td>prepend_hash</td>
<td>Prepends the unique hash values assigned to exported objects instead of the standard appandation. If your S3 bucket contains a period in its path, set the prepend_hash parameter to true. Default value: false</td>
</tr>
</tbody>
</table>

from_charset and to_charset values are system-dependent. Refer to your operating system documentation for more details.

**Examples**

In the following example, `st` and `yr` are the partition keys:

```sql
=> select s3export_partition (* using parameters url='https://s3.amazonaws.com/db001/bystate.date;)
OVER (PARTITION by st, yr) from T;

rows | url
-----------------------------------------------
184647 | https://s3.amazonaws.com/db001/st=MA/yr=2005/bystate.77fcab9836b93a04.dat
282633 | https://s3.amazonaws.com/db001/st=VA/yr=2007/bystate.77fcab9836b93a05.dat
282633 | https://s3.amazonaws.com/db001/st=VA/yr=2009/bystate.77fcab9836b93a05.dat
```

**Catalog Management Functions**

This section contains catalog management functions specific to Vertica.
DROP_LICENSE

Drops a license key from the global catalog. Dropping expired keys is optional. Vertica automatically ignores expired license keys if a valid, alternative license key is installed.

Syntax

DROP_LICENSE( 'license-name' )

Parameters

| license-name | The name of the license to drop. Use the name (or long license key) in the NAME column of system table LICENSES. |

Privileges

Superuser

Examples

=> SELECT DROP_LICENSE('9b2d81e2-aab1-4cfb-bc07-fa9a696e8f5e');

See Also

Managing Licenses

DUMP_CATALOG

Returns an internal representation of the Vertica catalog. This function is used for diagnostic purposes.

DUMP_CATALOG returns only the objects that are visible to the user.

Syntax

DUMP_CATALOG()
Privileges

None

Examples

The following query obtains an internal representation of the Vertica catalog:

```sql
=> SELECT DUMP_CATALOG();
```

The output is written to the specified file:

```sql
\o /tmp/catalog.txt
SELECT DUMP_CATALOG();
\o
```

**EXPORT_CATALOG**

Generates a SQL script for recreating a physical schema design on another cluster. This function always attempts to recreate projection statements with KSAFE clauses, if they exist in the original definitions, or OFFSET clauses if they do not.

**Syntax**

```sql
EXPORT_CATALOG ('[destination]' [, 'scope' ] )
```

**Parameters**

If you omit all parameters, EXPORT_CATALOG exports to standard output all schemas, tables, constraints, views, and projections to which the user has access.

| **destination** | Specifies where to send output, one of the following:
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• An empty string ('') writes the script to standard output.</td>
</tr>
<tr>
<td></td>
<td>• The path and name of a SQL output file. This option is valid only for superusers. If you specify a file that does not exist, the function creates one. If you specify only a file name, Vertica creates it in the catalog directory. If the file already exists, the function silently overwrites its contents.</td>
</tr>
</tbody>
</table>
### Scope

Determines what to export:

- **DESIGN (default):** Exports schemas, tables, constraints, views, projections, and SQL macros to which the user has access. See also [EXPORT_OBJECTS](#).

- **DESIGN_ALL:** Exports all design objects plus system objects created in Database Designer—for example, design contexts and their tables. Exported objects are those to which the user has access.

- **TABLES:** Exports all tables and constraints for which the user has access. See also [EXPORT_TABLES](#).

- **DIRECTED_QUERIES:** Exports all directed queries that are stored in the database. For more information, see [Managing Directed Queries](#) in the Administrator's Guide.

### Privileges

None

### Example

See [Exporting the Catalog](#).

### See Also

- [EXPORT_OBJECTS](#)
- [EXPORT_TABLES](#)
- Exporting the Catalog

### EXPORT_OBJECTS

Generates a SQL script you can use to recreate non-virtual catalog objects on another cluster. The following requirements apply:
- `EXPORT_OBJECTS` only exports objects to which the user has access.

- `EXPORT_OBJECTS` exports objects in order dependency for correct recreation. When you run the script on another cluster, Vertica creates all referenced objects before their dependent objects.

- `EXPORT_OBJECTS` always tries to recreate projection statements with their KSAFE clause, if any, otherwise with their OFFSET clause.

**Syntax**

```
EXPORT_OBJECTS( '[destination]' [, 'scope' ] [, 'ksafe' ] )
```

**Parameters**

<table>
<thead>
<tr>
<th><strong>destination</strong></th>
<th>Specifies where to send output, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- An empty string (' ') writes the script to standard output.</td>
</tr>
<tr>
<td></td>
<td>- The path and name of a SQL output file. This option is valid only for superusers. If you specify a file that does not exist, the function creates one. If you specify only a file name, Vertica creates it in the catalog directory. If the file already exists, the function silently overwrites its contents.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>scope</strong></th>
<th>Specifies one or more objects to export, as follows:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>[database.]schema.[object][,..]</code></td>
</tr>
<tr>
<td></td>
<td>If set to an empty string, Vertica exports all objects to which the user has access, including constraints.</td>
</tr>
<tr>
<td></td>
<td>If you specify a schema, Vertica exports all objects in that schema.</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>ksafe</strong></th>
<th>Specifies whether to include a MARK DESIGN KSAFE statement in the generated script with the correct K-safe value for the database:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- <code>true</code> (default): Include the MARK DESIGN KSAFE statement at the end of the output script.</td>
</tr>
<tr>
<td></td>
<td>- <code>false</code>: Omit the MARK DESIGN KSAFE statement from the script.</td>
</tr>
</tbody>
</table>
Privileges
None

Example
See Exporting Objects.

See Also
- EXPORT_CATALOG
- EXPORT_TABLES

EXPORT_TABLES
Generates a SQL script that can be used to recreate a logical schema—schemas, tables, constraints, and views—on another cluster. EXPORT_OBJECTS only exports objects to which the user has access.

Syntax
EXPORT_TABLES( '[destination]' [, 'scope' ] )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination</td>
<td>Specifies where to send output, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- An empty string ('') writes the script to standard output.</td>
</tr>
<tr>
<td></td>
<td>- The path and name of a SQL output file. This option is valid only for superusers. If you specify a file that does not exist, the function creates one. If you specify only a file name, Vertica creates it in the catalog directory. If the file already exists, the function silently overwrites its contents.</td>
</tr>
<tr>
<td>scope</td>
<td>Specifies one or more tables to export, as follows:</td>
</tr>
<tr>
<td></td>
<td>[database.]schema.table[,...]</td>
</tr>
</tbody>
</table>
If set to an empty string, Vertica exports all non-virtual table objects to which the user has access, including table schemas, sequences, and constraints.

If you specify a schema, Vertica exports all non-virtual table objects in that schema.

If you specify a database, it must be the current database.

Privileges

None

Example

See Exporting Tables.

The following example exports to standard output all tables in the store schema:

```sql
=> SELECT EXPORT_TABLES('', 'store');

EXPORT_TABLES

CREATE SCHEMA store;

CREATE TABLE store.store_dimension
(
  store_key int NOT NULL,
  store_name varchar(64),
  store_number int,
  store_address varchar(256),
  store_city varchar(64),
  store_state char(2),
  store_region varchar(64),
  floor_plan_type varchar(32),
  photo_processing_type varchar(32),
  financial_service_type varchar(32),
  selling_square_footage int,
  total_square_footage int,
  first_open_date date,
  last_remodel_date date,
  number_of_employees int,
  annual_shrinkage int,
  foot_traffic int,
  monthly_rent_cost int
);

ALTER TABLE store.store_dimension ADD CONSTRAINT C_PRIMARY PRIMARY KEY (store_key) DISABLED;

CREATE TABLE store.store_sales_fact
(
  date_key int NOT NULL,
  product_key int NOT NULL,
  product_version int NOT NULL,
```
store_key int NOT NULL,
promotion_key int NOT NULL,
customer_key int NOT NULL,
employee_key int NOT NULL,
pos_transaction_number int NOT NULL,
sales_quantity int,
sales_dollar_amount int,
cost_dollar_amount int,
gross_profit_dollar_amount int,
transaction_type varchar(16),
transaction_time time,
tender_type varchar(8))
);

CREATE TABLE store.store_orders_fact
(
    product_key int NOT NULL,
    product_version int NOT NULL,
    store_key int NOT NULL,
    vendor_key int NOT NULL,
    employee_key int NOT NULL,
    order_number int NOT NULL,
    date_ordered date,
    date_shipped date,
    expected_delivery_date date,
    date_delivered date,
    quantity_ordered int,
    quantity_delivered int,
    shipper_name varchar(32),
    unit_price int,
    shipping_cost int,
    total_order_cost int,
    quantity_in_stock int,
    reorder_level int,
    overstock_ceiling int
);
ALTER TABLE store.store_sales_fact ADD CONSTRAINT fk_store_sales_date FOREIGN KEY (date_key)
    references public.date_dimension (date_key);
ALTER TABLE store.store_sales_fact ADD CONSTRAINT fk_store_sales_product FOREIGN KEY (product_key,
    product_version) references public.product_dimension (product_key, product_version);
ALTER TABLE store.store_sales_fact ADD CONSTRAINT fk_store_sales_store FOREIGN KEY (store_key)
    references store.store_dimension (store_key);
ALTER TABLE store.store_sales_fact ADD CONSTRAINT fk_store_sales_promotion FOREIGN KEY (promotion_key)
    references public.promotion_dimension (promotion_key);
ALTER TABLE store.store_sales_fact ADD CONSTRAINT fk_store_sales_customer FOREIGN KEY (customer_key)
    references public.customer_dimension (customer_key);
ALTER TABLE store.store_sales_fact ADD CONSTRAINT fk_store_sales_employee FOREIGN KEY (employee_key)
    references public.employee_dimension (employee_key);
ALTER TABLE store.store_orders_fact ADD CONSTRAINT fk_store_orders_product FOREIGN KEY (product_key,
    product_version) references public.product_dimension (product_key, product_version);
ALTER TABLE store.store_orders_fact ADD CONSTRAINT fk_store_orders_store FOREIGN KEY (store_key)
    references store.store_dimension (store_key);
ALTER TABLE store.store_orders_fact ADD CONSTRAINT fk_store_orders_vendor FOREIGN KEY (vendor_key)
    references public.vendor_dimension (vendor_key);
ALTER TABLE store.store_orders_fact ADD CONSTRAINT fk_store_orders_employee FOREIGN KEY (employee_key)
    references public.employee_dimension (employee_key);

(1 row)
See Also

- EXPORT_CATALOG
- EXPORT_OBJECTS

INSTALL_LICENSE

Installs the license key in the global catalog.

Syntax

```
INSTALL_LICENSE( 'filename' )
```

Parameters

| filename | The absolute path name of a valid license file. |

Privileges

Superuser

Examples

```
=> SELECT INSTALL_LICENSE('/tmp/vlicense.dat');
```

See Also

Managing Licenses

MARK_DESIGN_KSAFE

Enables or disables high availability in your environment, in case of a failure. Before enabling recovery, MARK_DESIGN_KSAFE queries the catalog to determine whether a cluster's physical schema design meets the following requirements:
Small, unsegmented tables are replicated on all nodes.

Large table superprojections are segmented with each segment on a different node.

Each large table projection has at least one buddy projection for K-safety=1 (or two buddy projections for K-safety=2).

Buddy projections are also segmented across database nodes, but the distribution is modified so segments that contain the same data are distributed to different nodes. See High Availability With Projections in Vertica Concepts.

MARK_DESIGN_KSAFE does not change the physical schema.

Syntax

MARK_DESIGN_KSAFE ( k )

Parameters

<table>
<thead>
<tr>
<th>k</th>
<th>Specifies the level of K-safety, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Enables high availability if the schema design meets requirements for K-safety=2</td>
</tr>
<tr>
<td>1</td>
<td>Enables high availability if the schema design meets requirements for K-safety=1</td>
</tr>
<tr>
<td>0</td>
<td>Disables high availability</td>
</tr>
</tbody>
</table>

Return Messages

If you specify a k value of 1 or 2, Vertica returns one of the following messages.

**Success:**

Marked design n-safe

**Failure:**

The schema does not meet requirements for K=n.
Fact table projection projection-name has insufficient "buddy" projections.

where n is a K-safety setting.
Privileges

Superuser

Notes

- The database's internal recovery state persists across database restarts but it is not checked at startup time.

- When one node fails on a system marked K-safe=1, the remaining nodes are available for DML operations.

Examples

```sql
=> SELECT MARK DESIGN KSAFE(1);
mark_design_ksafe
-----------------------
Marked design 1-safe
(1 row)
```

If the physical schema design is not K-safe, messages indicate which projections do not have a buddy:

```sql
=> SELECT MARK DESIGN KSAFE(1);
The given K value is not correct;
the schema is 0-safe
Projection pp1 has 0 buddies,
which is smaller that the given K of 1
Projection pp2 has 0 buddies,
which is smaller that the given K of 1
...
(1 row)
```

See Also

- Identical Segmentation

- Failure Recovery

Client Connection Management Functions

This section contains client connection management functions specific to Vertica.
GET_CLIENT_LABEL

Returns the client connection label for the current session.

Syntax

GET_CLIENT_LABEL()

Privileges

None

Examples

Return the current client connection label:

```sql
=> SELECT GET_CLIENT_LABEL();
  GET_CLIENT_LABEL
---------------------
data_load_application
(1 row)
```

See Also

Setting a Client Connection Label

RESET_LOAD_BALANCE_POLICY

Resets the counter each host in the cluster maintains, to track which host it will refer a client to when the native connection load balancing scheme is set to ROUNDROBIN. To reset the counter, run this function on all cluster nodes.

Syntax

RESET_LOAD_BALANCE_POLICY()
Example

```sql
=> SELECT RESET_LOAD_BALANCE_POLICY();

RESET_LOAD_BALANCE_POLICY

Successfully reset stateful client load balance policies: "roundrobin".
(1 row)
```

**SET_CLIENT_LABEL**

Assigns a label to a client connection for the current session. You can use this label to distinguish client connections.

Labels appear in the `v_monitor.sessions` table. However, they are not updated in Data Collector tables because the change occurs after Vertica makes the connection.

**Syntax**

`SET_CLIENT_LABEL('label-name')`

**Parameters**

| label-name | VARCHAR name assigned to the client connection label. |

**Privileges**

None

**Examples**

Assign label `data_load_application` to the current client connection:

```sql
=> SELECT SET_CLIENT_LABEL('data_load_application');

SET_CLIENT_LABEL

client_label set to data_load_application
(1 row)
```

**See Also**

[Setting a Client Connection Label](#)
**SET_LOAD_BALANCE_POLICY**

Sets how native connection load balancing chooses a host to handle a client connection.

**Syntax**

`SET_LOAD_BALANCE_POLICY('policy')`

**Parameters**

<table>
<thead>
<tr>
<th>policy</th>
<th>The name of the load balancing policy to use, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• NONE (default): Disables native connection load balancing.</td>
<td></td>
</tr>
<tr>
<td>• ROUNDROBIN: Chooses the next host from a circular list of hosts in the cluster that are up—for example, in a three-node cluster, iterates over node1, node2, and node3, then wraps back to node1. Each host in the cluster maintains its own pointer to the next host in the circular list, rather than there being a single cluster-wide state.</td>
<td></td>
</tr>
<tr>
<td>• RANDOM: Randomly chooses a host from among all hosts in the cluster that are up.</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** Even if the load balancing policy is set on the server to something other than NONE, clients must indicate they want their connections to be load balanced by setting a connection property.

**Privileges**

Superuser

**Example**

The following example demonstrates enabling native connection load balancing on the server by setting the load balancing scheme to ROUNDROBIN:

```sql
=> SELECT SET_LOAD_BALANCE_POLICY('ROUNDROBIN');
SET_LOAD_BALANCE_POLICY
-----------------------------------------------------------------------------------------
Successfully changed the client initiator load balancing policy to: roundrobin
```
Cluster Management Functions

This section contains functions that manage spread deployment on large, distributed database clusters.

**REALIGN_CONTROL_NODES**

Chooses control nodes (spread hosts) from all cluster nodes and assigns the rest of the nodes in the cluster to a control node. Calling this function respects existing fault groups, which you can view by querying the `V_CATALOG.CLUSTER_LAYOUT` system table. This view also lets you see the proposed new layout for nodes in the cluster.

Syntax

```
REALIGN_CONTROL_NODES()
```

Privileges

Superuser

Example

Choose control nodes from all cluster nodes and assign the remaining nodes to a control node:

```
=> SELECT REALIGN_CONTROL_NODES;
```

See Also

*Defining and Realigning Control Nodes on an Existing Cluster*
**REBALANCE_CLUSTER**

Rebalances the database cluster synchronously as a session foreground task. REBALANCE_CLUSTER returns only after the rebalance operation is complete. If the current session ends, the operation immediately aborts. To rebalance the cluster as a background task, call **START_REBALANCE_CLUSTER**.

On large cluster arrangements, you typically call REBALANCE_CLUSTER in a flow (see Defining and Realigning Control Nodes in the Administrator's Guide). After you change the number and distribution of control nodes (spread hosts), you must run REBALANCE_CLUSTER() for fault tolerance to be realized.

For detailed information about rebalancing tasks, see Rebalancing Data Across Nodes.

**Tip:** By default, before performing a rebalance, Vertica queries system tables to compute the size of all projections involved in the rebalance task. This query can add significant overhead to the rebalance operation. To disable this query, set projection configuration parameter **RebalanceQueryStorageContainers** to 0.

**Syntax**

```
REBALANCE_CLUSTER()
```

**Privileges**

Superuser

**Example**

```
=> SELECT REBALANCE_CLUSTER();
REBALANCE_CLUSTER
-----------------------
REBALANCED
(1 row)
```

**RELOAD_SPREAD**

Updates cluster changes to the catalog's spread configuration file. These changes include:
New or realigned control nodes

New spread hosts or fault group

New or dropped cluster nodes

This function is often used in a multi-step process for large and elastic cluster arrangements. Calling it might require you to restart the database. You must then rebalance the cluster to realize fault tolerance. For details, see Defining and Realigning Control Nodes in the Administrator's Guide.

Syntax

```
RELOAD_SPREAD( true )
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>Updates cluster changes related to control message responsibilities to the spread configuration file.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

Example

Update the cluster with changes to control messaging:

```
=> SELECT reload_spread(true);
reload_spread
---------------------
reloaded
(1 row)
```

See Also

`REBALANCE_CLUSTER`
SET_CONTROL_SET_SIZE

Specifies the number of cluster nodes on which to deploy control messaging (spread). You can call this function only on a running database.

To determine whether the current spread hosts and the control designations in the catalog match, query system table LARGE_CLUSTER_CONFIGURATION_STATUS

Note: This function is equivalent to:
install_vertica --large cluster integer
For details, see Installing a Large Cluster in the Administrator's Guide.

Syntax

SET_CONTROL_SET_SIZE( integer )

Parameters

integer The number of cluster hosts from the database cluster on which spread runs.

Privileges

Superuser

Example

Run spread on two cluster nodes:

=> SELECT set_control_set_size(2);
SET_CONTROL_SET_SIZE
---------------------
Control size set
(1 row)

See Also

Defining and Realigning Control Nodes on an Existing Cluster
Cluster Scaling Functions

This section contains functions that control how the cluster organizes data for rebalancing.

CANCEL_REBALANCE_CLUSTER

Stops any rebalance task that is currently in progress or is waiting to execute.

Syntax

```
CANCEL_REBALANCE_CLUSTER()
```

Privileges

Superuser

Example

```
=> SELECT CANCEL_REBALANCE_CLUSTER();
CANCELED
```

See Also

- `START_REBALANCE_CLUSTER`
- `REBALANCE_CLUSTER`

DISABLE_ELASTIC_CLUSTER

Disables elastic cluster scaling, which prevents Vertica from bundling data into chunks that are easily transportable to other nodes when performing cluster resizing. The main reason to disable elastic clustering is if you find that the slightly unequal data distribution in your cluster caused by grouping data into discrete blocks results in performance issues.
Syntax

DISABLE_ELASTIC_CLUSTER()

Privileges

Superuser

Example

=> SELECT DISABLE_ELASTIC_CLUSTER();
DISABLE_ELASTIC_CLUSTER
------------------------
DISABLED
(1 row)

See Also

- ENABLE_ELASTIC_CLUSTER

DISABLE_LOCAL_SEGMENTS

Disables local data segmentation, which breaks projections segments on nodes into containers that can be easily moved to other nodes. See Local Data Segmentation in the Administrator's Guide for details.

Syntax

DISABLE_LOCAL_SEGMENTS()

Privileges

Superuser

Example

=> SELECT DISABLE_LOCAL_SEGMENTS();
DISABLE_LOCAL_SEGMENTS
------------------------
DISABLED
ENABLE_ELASTIC_CLUSTER

Enables elastic cluster scaling, which makes enlarging or reducing the size of your database cluster more efficient by segmenting a node's data into chunks that can be easily moved to other hosts.

Syntax

ENABLE_ELASTIC_CLUSTER()

Privileges

Superuser

Example

```
=> SELECT ENABLE_ELASTIC_CLUSTER();
ENABLE_ELASTIC_CLUSTER
------------------------
  ENABLED
(1 row)
```

See Also

- DISABLE_ELASTIC_CLUSTER

ENABLE_LOCAL_SEGMENTS

Enables local storage segmentation, which breaks projections segments on nodes into containers that can be easily moved to other nodes. See Local Data Segmentation in the Administrator's Guide for more information.

Syntax

ENABLE_LOCAL_SEGMENTS()
**Privileges**
Superuser

**Example**

```sql
=> SELECT ENABLE_LOCAL_SEGMENTS();
ENABLE_LOCAL_SEGMENTS
------------------------
ENABLED
(1 row)
```

**SET_SCALING_FACTOR**

Sets the scaling factor that determines the number of storage containers used when rebalancing the database and when using local data segmentation is enabled. See [Cluster Scaling](https://www.vertica.com/docs/9.0.x/HTML/OnlineBook/index.html#Vertica-Documentation-1) for details.

**Syntax**

```sql
SET_SCALING_FACTOR( factor )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>factor</code></td>
<td>An integer value between 1 and 32. Vertica uses this value to calculate the number of storage containers each projection is broken into when rebalancing or when local data segmentation is enabled.</td>
</tr>
</tbody>
</table>

**Privileges**
Superuser

**Best Practices**

The scaling factor determines the number of storage containers that Vertica uses to store each projection across the database during rebalancing when local segmentation is enabled. When setting the scaling factor, follow these guidelines:
The number of storage containers should be greater than or equal to the number of partitions multiplied by the number of local segments:

\[ \text{num-storage-containers} \geq (\text{num-partitions} \times \text{num-local-segments}) \]

Set the scaling factor high enough so rebalance can transfer local segments to satisfy the skew threshold, but small enough so the number of storage containers does not result in too many ROS containers, and cause ROS pushback. The maximum number of ROS containers is 1024.

Example

```sql
=> SELECT SET_SCALING_FACTOR(12);
SET_SCALING_FACTOR
-----------------------
SET
(1 row)
```

**START_REBALANCE_CLUSTER**

Asynchronously rebalances the database cluster as a background task. This function returns immediately after the rebalancing operation is complete. Rebalancing persists until the operation is complete, even if you close the current session or the database shuts down. In the case of shutdown, rebalancing resumes after the cluster restarts. To stop the rebalance operation, call `CANCEL_REBALANCE_CLUSTER`.

For detailed information about rebalancing tasks, see [Rebalancing Data Across Nodes](#).

**Syntax**

`START_REBALANCE_CLUSTER()`

**Privileges**

Superuser

**Example**

```sql
=> SELECT START_REBALANCE_CLUSTER();
START_REBALANCE_CLUSTER
------------------------
```
Communications Functions

This section contains communication functions specific to Vertica.

NOTIFY

Specifies the text message to include with a notification.

Syntax

```
NOTIFY ( 'message', 'notifier', 'target-topic' )
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>The message to send to the end point.</td>
</tr>
<tr>
<td>notifier</td>
<td>The name of the notifier used to deliver the message.</td>
</tr>
<tr>
<td>target-topic</td>
<td>The name of the destination Kafka topic for the message.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

Examples

Send a message to confirm that an ETL job is complete:

```
=> SELECT NOTIFY('ETL Done!', 'my_notifier', 'DB_activity_topic');
```
Constraint Management Functions

This section contains constraint management functions specific to Vertica.
See also SQL system table V_CATALOG.TABLE_CONSTRAINTS.

ANALYZE_CONSTRAINTS

Analyzes and reports on constraint violations within the specified scope.
You can enable automatic enforcement of primary key, unique key, and check constraints when INSERT, UPDATE, MERGE, or COPY statements execute. Alternatively, you can use ANALYZE_CONSTRAINTS to validate constraints after issuing these statements. Refer to Constraint Enforcement for more information.

ANALYZE_CONSTRAINTS performs a lock in the same way that SELECT * FROM t1 holds a lock on table t1. See LOCKS for additional information.

Syntax

```
ANALYZE_CONSTRAINTS ('[[[database.]schema.]table ] [ , 'column[ , ...] ]
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[ database . ]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>table</code></td>
<td>Identifies the table to analyze. If you omit specifying a schema, Vertica uses the current schema search path. If set to an empty string, Vertica analyzes all tables in the current schema.</td>
</tr>
<tr>
<td><code>column</code></td>
<td>The column in <code>table</code> to analyze. You can specify multiple comma-delimited columns. Vertica narrows the scope of the analysis to the specified columns. If you omit specifying a column, Vertica analyzes all columns in <code>table</code>.</td>
</tr>
</tbody>
</table>
Privileges

- SELECT privilege on table
- USAGE privilege on schema

Detecting Constraint Violations During a Load Process

Vertica checks for constraint violations when queries are run, not when data is loaded. To detect constraint violations as part of the load process, use a COPY statement with the NO COMMIT option. By loading data without committing it, you can run a post-load check of your data using the ANALYZE_CONSTRAINTS function. If the function finds constraint violations, you can roll back the load because you have not committed it.

If ANALYZE_CONSTRAINTS finds violations, such as when you insert a duplicate value into a primary key, you can correct errors using the following functions. Effects last until the end of the session only:

- DISABLE_DUPLICATE_KEY_ERROR
- REENABLE_DUPLICATE_KEY_ERROR

Important: If a check constraint SQL expression evaluates to an unknown for a given row because a column within the expression contains a null, the row passes the constraint condition.

Return Values

ANALYZE_CONSTRAINTS returns results in a structured set (see table below) that lists the schema name, table name, column name, constraint name, constraint type, and the column values that caused the violation.

If the result set is empty, then no constraint violations exist; for example:

```
> SELECT ANALYZE_CONSTRAINTS ('public.product_dimension', 'product_key');
```

```
<table>
<thead>
<tr>
<th>Schema Name</th>
<th>Table Name</th>
<th>Column Names</th>
<th>Constraint Name</th>
<th>Constraint Type</th>
<th>Column Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>--------------</td>
<td>------------</td>
<td>--------------</td>
<td>-----------------</td>
<td>-----------------</td>
<td>--------------</td>
</tr>
</tbody>
</table>
(0 rows)
```

The following result set shows a primary key violation, along with the value that caused the violation (‘10’):
```
=> SELECT ANALYZE_CONSTRAINTS ('');

<table>
<thead>
<tr>
<th>Schema Name</th>
<th>Table Name</th>
<th>Column Names</th>
<th>Constraint Name</th>
<th>Constraint Type</th>
<th>Column Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>store</td>
<td>t1</td>
<td>c1</td>
<td>pk_t1</td>
<td>PRIMARY</td>
<td>('10')</td>
</tr>
</tbody>
</table>

(1 row)
```

The result set columns are described in further detail in the following table:

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schema Name</td>
<td>VARCHAR</td>
<td>The name of the schema.</td>
</tr>
<tr>
<td>Table Name</td>
<td>VARCHAR</td>
<td>The name of the table, if specified.</td>
</tr>
<tr>
<td>Column Names</td>
<td>VARCHAR</td>
<td>A list of comma-delimited columns that contain constraints.</td>
</tr>
<tr>
<td>Constraint Name</td>
<td>VARCHAR</td>
<td>The given name of the primary key, foreign key, unique, check, or not null constraint, if specified.</td>
</tr>
<tr>
<td>Constraint Type</td>
<td>VARCHAR</td>
<td>Identified by one of the following strings:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- PRIMARY KEY</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- FOREIGN KEY</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- UNIQUE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- CHECK</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- NOT NULL</td>
</tr>
<tr>
<td>Column Values</td>
<td>VARCHAR</td>
<td>Value of the constraint column, in the same order in which Column Names contains the value of that column in the violating row.</td>
</tr>
</tbody>
</table>

When interpreted as SQL, the value of this column forms a list of values of the same type as the columns in Column Names; for example:

('1'), ('1', 'z')

**Examples**

See Detecting Constraint Violations in the Administrator's Guide.
ANALYZE_CORRELATIONS

Analyzes the specified tables for pairs of columns that are strongly correlated. ANALYZE_CORRELATIONS stores the 20 pairs with the strongest correlation. ANALYZE_CORRELATIONS also analyzes statistics.

ANALYZE_CORRELATIONS analyzes only pairwise single-column correlations.

For example, state name and country name columns are strongly correlated because the city name usually, but perhaps not always, identifies the state name. The city of Conshohoken is uniquely associated with Pennsylvania, while the city of Boston exists in Georgia, Indiana, Kentucky, New York, Virginia, and Massachusetts. In this case, city name is strongly correlated with state name.

Behavior Type

Immutable

Syntax

ANALYZE_CORRELATIONS ("[[[database.]schema.]table ]" [, 'recalculate' ] )

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ database . ]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>table-name</td>
<td>Identifies the table to analyze. If you omit specifying a schema, Vertica uses the current schema search path. If set to an empty string, Vertica analyzes all tables in the current schema.</td>
</tr>
<tr>
<td>recalculate</td>
<td>Boolean that specifies whether to analyze correlated columns that were previously analyzed.</td>
</tr>
</tbody>
</table>

Note: Column correlation analysis typically needs to be done only once.

Default: false
Privileges

One of the following:

- Superuser
- User with USAGE privilege on the design schema

Analysis Follow-Up

To take advantage of the correlations that ANALYZE_CORRELATIONS discovers, run Database Designer programmatically. Run `DESIGNER_SET_ANALYZE_CORRELATIONS_MODE` to specify that Database Designer consider existing column correlations. Be sure to specify that Database Designer not analyze statistics so it does not override existing statistics.

Example

In the following example, ANALYZE_CORRELATIONS analyzes column correlations for all tables in the public schema, even if they currently exist. The correlations that ANALYZE_CORRELATIONS finds are saved, so Database Designer can use them the next time it runs on the VMart database:

```sql
=> SELECT ANALYZE_CORRELATIONS ('public.*', 'true');
ANALYZE_CORRELATIONS
----------------------
0
(1 row)
```

**DISABLE_DUPLICATE_KEY_ERROR**

Disables error messaging when Vertica finds duplicate primary or unique key values at run time (for use with key constraints that are not automatically enabled). Queries execute as though no constraints are defined on the schema. Effects are session scoped.

Syntax

```sql
DISABLE_DUPLICATE_KEY_ERROR();
```

Privileges

Superuser
Examples

When you call DISABLE_DUPLICATE_KEY_ERROR, Vertica issues warnings letting you know that duplicate values will be ignored, and incorrect results are possible. DISABLE_DUPLICATE_KEY_ERROR is for use only for key constraints that are not automatically enabled.

```sql
=> select DISABLE_DUPLICATE_KEY_ERROR();
WARNING 3152: Duplicate values in columns marked as UNIQUE will now be ignored for the remainder of your session or until reenable_duplicate_key_error() is called
WARNING 3539: Incorrect results are possible. Please contact Vertica Support if unsure
disable_duplicate_key_error
Duplicate key error disabled
(1 row)
```

See Also

ANALYZE_CONSTRAINTS

LAST_INSERT_ID

Returns the last value of an AUTO_INCREMENT/IDENTITY column. If multiple sessions concurrently load the same table with an AUTO_INCREMENT/IDENTITY column, the function returns the last value generated for that column.

Note: This function works only with AUTO_INCREMENT/IDENTITY columns. It does not work with named sequences.

Behavior Type

Volatile

Syntax

LAST_INSERT_ID()

Privileges

- Table owner
- USAGE privileges on the table schema
Examples

See AUTO_INCREMENT and IDENTITY Sequences in the Administrator's Guide.

**REENABLE_DUPLICATE_KEY_ERROR**

Restores the default behavior of error reporting by reversing the effects of DISABLE_DUPLICATE_KEY_ERROR. Effects are session-scoped.

**Syntax**

REENABLE_DUPLICATE_KEY_ERROR();

**Privileges**

Superuser

**Examples**

```sql
=> SELECT REENABLE_DUPLICATE_KEY_ERROR();
REENABLE_DUPLICATE_KEY_ERROR
-----------------------------
Duplicate key error enabled
(1 row)
```

**See Also**

ANALYZE_CONSTRAINTS
Data Collector Functions

The Vertica Data Collector is a utility that extends system table functionality by providing a framework for recording events. It gathers and retains monitoring information about your database cluster and makes that information available in system tables, requiring few configuration parameter tweaks, and having negligible impact on performance.

Collected data is stored on disk in the DataCollector directory under the Vertica /catalog path. You can use the information the Data Collector retains to query the past state of system tables and extract aggregate information, as well as do the following:

- See what actions users have taken
- Locate performance bottlenecks
- Identify potential improvements to Vertica configuration

Data Collector works in conjunction with an advisor tool called Workload Analyzer, which intelligently monitors the performance of SQL queries and workloads and recommends tuning actions based on observations of the actual workload history.

By default, Data Collector is on and retains information for all sessions. If performance issues arise, a superuser can disable Data Collector. See Data Collector Parameters and Enabling and Disabling Data Collector in the Administrator's Guide.

This section describes the Data Collection control functions.

See Also

- Retaining Monitoring Information
- Analyzing Workloads

CLEAR_DATA_COLLECTOR

Clears all memory and disk records on the Data Collector tables and functions and resets collection statistics in the system table DATA_COLLECTOR. A superuser can clear Data Collector data for all components or specify an individual component.

After you clear the Data Collector log, the information is no longer available for querying.
Syntax

CLEAR_DATA_COLLECTOR( [ 'component' ] )

Parameters

<table>
<thead>
<tr>
<th>component</th>
<th>Clears memory and disk records for the specified component only. If you provide no argument, the function clears all Data Collector memory and disk records for all components. For the current list of component names, query the system table DATA_COLLECTOR.</th>
</tr>
</thead>
</table>

Privileges

Superuser

Examples

The following command clears memory and disk records for the ResourceAcquisitions component:

`
=> SELECT clear_data_collector('ResourceAcquisitions');
clear_data_collector
----------------------
  CLEAR
  (1 row)
`

The following command clears data collection for all components on all nodes:

`
=> SELECT clear_data_collector();
clear_data_collector
----------------------
  CLEAR
  (1 row)
`

See Also

- DATA_COLLECTOR
- Retaining Monitoring Information
DATA_COLLECTOR_HELP

Returns online usage instructions about the Data Collector, the DATA_COLLECTOR system table, and the Data Collector control functions.

Syntax

DATA_COLLECTOR_HELP()

Privileges

None

Returns

The DATA_COLLECTOR_HELP() function returns the following information:

```
=> SELECT DATA_COLLECTOR_HELP();
```

Usage Data Collector

The data collector retains history of important system activities. This data can be used as a reference of what actions have been taken by users, but it can also be used to locate performance bottlenecks, or identify potential improvements to the Vertica configuration. This data is queryable via Vertica system tables.

Access a list of data collector components, and some statistics, by running:

```
SELECT * FROM v_monitor.data_collector;
```

The amount of data retained by size and time can be controlled with several functions.

To just set the size amount:

```
set_data_collector_policy(<component>,
<memory retention (KB)>,
<disk retention (KB)>);
```

To set both the size and time amounts (the smaller one will dominate):

```
set_data_collector_policy(<component>,
<memory retention (KB)>,
<disk retention (KB)>,
<interval>);
```

To set just the time amount:

```
set_data_collector_time_policy(<component>,
<interval>);
```

To set the time amount for all tables:

```
set_data_collector_time_policy(<interval>);
```
The current retention policy for a component can be queried with:
   `get_data_collector_policy(<component>);`

Data on disk is kept in the "DataCollector" directory under the Vertica `\catalog` path. This directory also contains instructions on how to load the monitoring data into another Vertica database.

To move the data collector logs and instructions to other storage locations, create labeled storage locations using `add_location` and then use:
   `set_data_collector_storage_location(<storage_label>);`

Additional commands can be used to configure the data collection logs.

The log can be cleared with:
   `clear_data_collector([<optional component>]);`

The log can be synchronized with the disk storage using:
   `flush_data_collector([<optional component>]);`

See Also

- DATA_COLLECTOR
- TUNING_RECOMMENDATIONS
- Analyzing Workloads
- Retaining Monitoring Information

**FLUSH_DATA_COLLECTOR**

Waits until memory logs are moved to disk and then flushes the Data Collector, synchronizing the log with the disk storage. A superuser can flush Data Collector information for an individual component or for all components.

**Syntax**

`FLUSH_DATA_COLLECTOR( [ 'component' ] )`

**Parameters**

| `component` | Flushes the specified component. If you provide no argument, the function flushes the Data Collector in full. |

For the current list of component names, query the `V_MONITOR.DATA_`
COLLECTOR system table.

Privileges
Superuser

Examples

The following command flushes the Data Collector for the ResourceAcquisitions component:

```
=> SELECT flush_data_collector('ResourceAcquisitions');
flush_data_collector
------------------------
FLUSH
(1 row)
```

The following command flushes data collection for all components:

```
=> SELECT flush_data_collector();
flush_data_collector
------------------------
FLUSH
(1 row)
```

See Also

- DATA_COLLECTOR
- Retaining Monitoring Information

## GET_DATA_COLLECTOR_NOTIFY_POLICY

Lists any notification policies set on a Data Collector component.

### Syntax

```
GET_DATA_COLLECTOR_NOTIFY_POLICY('component')
```

<table>
<thead>
<tr>
<th>component</th>
<th>String containing the name of the Data Collector component to check for notification policies.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>For the current list of component names, query the system table DATA_COLLECTOR.</td>
</tr>
</tbody>
</table>
Example

```sql
=> SELECT GET_DATA_COLLECTOR_NOTIFY_POLICY('LoginFailures');
---
GET_DATA_COLLECTOR_NOTIFY_POLICY
Notifiable; Notifier: vertica_stats; Channel: vertica_notifications
(1 row)
```

The following example shows the output from the function when there is no notification policy for the component:

```sql
=> SELECT GET_DATA_COLLECTOR_NOTIFY_POLICY('LoginFailures');
---
GET_DATA_COLLECTOR_NOTIFY_POLICY
Not notifiable;
(1 row)
```

See Also

- **SET_DATA_COLLECTOR_NOTIFY_POLICY**
- **Producing Kafka Messages Using Notifiers**

**GET_DATA_COLLECTOR_POLICY**

Retrieves a brief statement about the retention policy for the specified component.

Syntax

```
GET_DATA_COLLECTOR_POLICY( 'component' )
```

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>component</code></td>
<td>Returns the retention policy for the specified component. For a current list of component names, query the V_MONITOR.DATA_COLLECTOR system table</td>
</tr>
</tbody>
</table>

Privileges

None
Example

The following query returns the history of all resource acquisitions by specifying the ResourceAcquisitions component:

```sql
=> SELECT get_data_collector_policy('ResourceAcquisitions');
get_data_collector_policy
---------------------------------------------------------------
100KB kept in memory, 10000KB kept on disk.
(1 row)
```

See Also

- DATA_COLLECTOR
- Retaining Monitoring Information

SET_DATA_COLLECTOR_NOTIFY_POLICY

Enables or disables automatically sending notifications of Data Collector component changes.

Syntax

```
SET_DATA_COLLECTOR_NOTIFY_POLICY('component', 'notifier', 'topic', 'enabled')
```

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>component</td>
<td>String containing the name of the component whose change will be reported via the notifier. For the current list of component names, query the system table DATA_COLLECTOR.</td>
</tr>
<tr>
<td>notifier</td>
<td>String containing the name of the notifier that will send the message.</td>
</tr>
<tr>
<td>topic</td>
<td>String containing the name of the Kafka topic that will receive the notification message.</td>
</tr>
<tr>
<td>enabled</td>
<td>Boolean value indicating whether this policy is enabled. Set to TRUE to enable reporting component changes. Set to FALSE to disable the notifier.</td>
</tr>
</tbody>
</table>
Example

The following example demonstrates creating a notifier, then sends it notifications each time the LoginFailures component updates. This component updates every time there is a failed attempt to log into the Vertica database.

```sql
=> CREATE NOTIFIER vertica_stats
   ACTION 'kafka://kafka01.example.com:9092'
   MAXMEMORYSIZE '10M';
CREATE NOTIFIER
=> SELECT SET_DATA_COLLECTOR_NOTIFY_POLICY('LoginFailures',
   'vertica_stats',
   'vertica_notifications', True);
```

The following example shows how to disable the policy created in the prior example:

```sql
=> SELECT SET_DATA_COLLECTOR_NOTIFY_POLICY('LoginFailures',
   'vertica_stats',
   'vertica_notifications', False);
```

See Also

- `GET_DATA_COLLECTOR_NOTIFY_POLICY`
- Producing Kafka Messages Using Notifiers
- `SET_DATA_COLLECTOR_NOTIFY_POLICY`

**SET_DATA_COLLECTOR_POLICY**

Sets a size restraint (memory and disk space in kilobytes) for the specified Data Collector table on all nodes. If nodes are down, the failed nodes receive the setting when they rejoin the cluster.

You can use this function to set a size restraint only, or you can include the optional `interval` argument to set disk capacity for both size and time in a single command.
If you specify `interval`, Vertica enforces the setting that is exceeded first (size or time). Before you include a time restraint, verify that the disk size capacity is sufficiently large.

If you want to specify just a time restraint, or you want to turn off a time restraint you set using this function, see `SET_DATA_COLLECTOR_TIME_POLICY()`.

**Syntax**

```sql
SET_DATA_COLLECTOR_POLICY('component', 'memoryKB', 'diskKB' [, 'interval'] )
```

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>component</td>
<td>Configures the retention policy for the specified component.</td>
</tr>
<tr>
<td>memoryKB</td>
<td>Specifies the memory size to retain in kilobytes.</td>
</tr>
<tr>
<td>diskKB</td>
<td>Specifies the disk size in kilobytes.</td>
</tr>
<tr>
<td>interval</td>
<td>[Default off] Takes an optional <code>interval</code> argument to specify how long to retain the specified component on disk. To disable a time restraint, set <code>interval</code> to -1.</td>
</tr>
</tbody>
</table>

**Note:** Any negative input turns off the time restraint

**Privileges**

Superuser

**Notes**

- Before you change a retention policy, view its current setting by calling the `GET_DATA_COLLECTOR_POLICY()` function.
- If you don't know the name of a component, query the `V_MONITOR.DATA_COLLECTOR` system table for a list; for example:

```sql
=> SELECT DISTINCT component, description FROM data_collector ORDER BY 1 ASC;
```
Examples

The following command returns the retention policy for the ResourceAcquisitions component:

```
=> SELECT get_data_collector_policy('ResourceAcquisitions');
  get_data_collector_policy
  ----------------------------------------
  1000KB kept in memory, 10000KB kept on disk.
(1 row)
```

This command changes the memory and disk setting for ResourceAcquisitions from its current setting of 1,000 KB memory and 10,000 KB disk space to 1500 KB and 25000 KB, respectively:

```
=> SELECT set_data_collector_policy('ResourceAcquisitions', '1500', '25000');
  set_data_collector_policy
  ---------------------------
  SET
(1 row)
```

This command sets the RequestsIssued component to 1500 KB memory and 11000 KB on disk, and includes a 3-minute time restraint:

```
=> SELECT set_data_collector_policy('RequestsIssued', '1500', '11000', '3 minutes'::interval);
  set_data_collector_policy
  ---------------------------
  SET
(1 row)
```

The following command disables the 3-minute retention policy for the RequestsIssued component, using SET_DATA_COLLECTOR_TIME_POLICY:

```
=> SELECT set_data_collector_time_policy('RequestsIssued', '-1');
  set_data_collector_time_policy
  ---------------------------
  SET
(1 row)
```

See Also

- GET_DATA_COLLECTOR_POLICY
- SET_DATA_COLLECTOR_TIME_POLICY()
- DATA_COLLECTOR
- Retaining Monitoring Information in the Administrator's Guide

**SET_DATA_COLLECTOR_TIME_POLICY**

Sets a time capacity for individual Data Collector tables on all nodes. If nodes are down, the failed nodes receive the setting when they rejoin the cluster.

If you specify *interval*, Vertica enforces the setting that is exceeded first (size or time). Before you include a time restraint, verify that the disk size capacity is sufficiently large.

If you want to configure both time and size restraints at the same time, see **SET_DATA_COLLECTOR_POLICY**.

**Syntax**

```sql
SET_DATA_COLLECTOR_TIME_POLICY( [ 'component', ] 'interval' )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>component</em></td>
<td>[Optional] Configures the time retention policy for the specified component. If you omit the <em>component</em> argument, Vertica sets the specified time capacity for all Data Collector tables.</td>
</tr>
<tr>
<td><em>interval</em></td>
<td>Specifies the time restraint on disk using an INTERVAL type. To disable a time restraint, set <em>interval</em> to -1.</td>
</tr>
</tbody>
</table>

**Note:** Any negative input turns off the time restraint

**Privileges**

Superuser

**Usage Considerations**

- Before you change a retention policy, view its current setting by calling the **GET_DATA_COLLECTOR_POLICY** function.
If you don’t know the name of a component, query the V_MONITOR.DATA_COLLECTOR system table for a list. For example:

```sql
=> SELECT DISTINCT component, description FROM data_collector
    ORDER BY 1 ASC;
```

### Setting the Time Interval for System Tables

You can also use the *interval* argument to query system tables the same way you query Data Collector tables; for example:

```sql
set_data_collector_time_policy('system-table', '<interval>');
```

To illustrate, the following command in the left column is equivalent to running the series of commands on the right:

<table>
<thead>
<tr>
<th>Run one command</th>
<th>Instead of a series of commands</th>
</tr>
</thead>
</table>
| `SELECT set_data_collector_time_policy ('v_monitor.query_requests',
  '3 minutes':interval);`                                                      | `SELECT set_data_collector_time_policy ('RequestsIssued',
  '3 minutes':interval);`
|                                                                                 | `SELECT set_data_collector_time_policy ('RequestsCompleted',
  '3 minutes':interval);`                                                                  |
|                                                                                 | `SELECT set_data_collector_time_policy ('Errors',
  '3 minutes':interval);`                                                                   |
|                                                                                 | `SELECT set_data_collector_time_policy ('ResourceAcquisitions',
  '3 minutes':interval);`                                                                  |

The *SET_DATA_COLLECTOR_TIME_POLICY* function updates the time capacity for all Data Collector tables in the V_MONITOR.QUERY_REQUESTS view. The new setting overrides any previous settings for every Data Collector table in that view.

### Examples

The following command configures the Backups component to be retained on disk for 1 day:

```sql
=> SELECT set_data_collector_time_policy('Backups', '1 day':interval);
set_data_collector_time_policy
-----------------------------
SET
(1 row)
```

This command disables the 1-day restraint for the Backups component:
This command sets a 30-minute time capacity for all Data Collector tables in a single command:

```sql
=> SELECT set_data_collector_time_policy('Backups', '-1');
set_data_collector_time_policy
--------------------------
SET
(1 row)
```

To view current retention policy settings for each Data Collector table, call the `GET_DATA_COLLECTION_POLICY()` function. In the next example, the time restraint is included.

```sql
=> SELECT get_data_collector_policy('RequestsIssued');
get_data_collector_policy
-----------------------------------------------
2000KB kept in memory, 50000KB kept on disk. 2 years 3 days 15:08 hours kept on disk.
(1 row)
```

If the time policy setting is disabled, the output of `GET_DATA_COLLECTION_POLICY()` returns "Time based retention disabled."

```sql
2000KB kept in memory, 50000KB kept on disk. Time based retention disabled.
```

- `DATA_COLLECTOR`
Database Designer Functions

Database Designer functions perform the following operations, generally performed in the following order:

1. **Create a design.**
2. **Set design properties.**
3. **Populate a design.**
4. **Create design and deployment scripts.**
5. **Get design data.**
6. **Clean up.**

For detailed information, see *Workflow for Running Database Designer Programmatically*. For information on required privileges, see *Privileges for Running Database Designer Functions* in the Administrator's Guide.

Create a design

**DESIGNER_CREATE DESIGN** directs Database Designer to create a design.

Set design properties

The following functions let you specify properties of a particular design:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DESIGNER_SET_DESIGN_TYPE</strong></td>
<td>Specifies whether the design is comprehensive or incremental.</td>
</tr>
<tr>
<td><strong>DESIGNER_DESIGN_PROJECTION_ENCODINGS</strong></td>
<td>Analyzes encoding in the specified projections and creates a script that implements encoding recommendations.</td>
</tr>
<tr>
<td><strong>DESIGNER_SET_DESIGN_KSAFETY</strong></td>
<td>Sets the K-safety value for a comprehensive design.</td>
</tr>
<tr>
<td><strong>DESIGNER_SET_OPTIMIZATION_OBJECTIVE</strong></td>
<td>Specifies whether the design optimizes for query or load performance.</td>
</tr>
</tbody>
</table>
**DESIGNER_SET_PROPOSE_UNSEGMENTED_PROJECTIONS** Enables inclusion of unsegmented projections in the design.

**DESIGNER_SET_ANALYZE_CORRELATIONS_MODE** Determines how the design handles column correlations.

---

**Populate a design**

The following functions let you add tables and queries to your Database Designer design:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DESIGNER_ADD_DESIGN_TABLES</td>
<td>Adds the specified tables to a design.</td>
</tr>
<tr>
<td>DESIGNER_ADD_DESIGN_QUERY</td>
<td>Adds queries to the design and weights them.</td>
</tr>
<tr>
<td>DESIGNER_ADD_DESIGN_QUERIES</td>
<td></td>
</tr>
<tr>
<td>DESIGNER_ADD_DESIGN_QUERIES_FROM_RESULTS</td>
<td></td>
</tr>
</tbody>
</table>

---

**Create design and deployment scripts**

The following functions populate the Database Designer workspace and create design and deployment scripts. You can also analyze statistics, deploy the design automatically, and drop the workspace after the deployment:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY</td>
<td>Populates the design and creates design and deployment scripts.</td>
</tr>
<tr>
<td>DESIGNER_WAIT_FOR_DESIGN</td>
<td>Waits for a currently running design to complete.</td>
</tr>
</tbody>
</table>

---

**Reset a design**

**DESIGNER_RESET_DESIGN** discards all the run-specific information of the previous Database Designer build or deployment of the specified design but retains its configuration.

---

**Get design data**

The following functions display information about projections and scripts that the Database Designer created:
**DESIGNER_OUTPUT_ALL_DESIGN_PROJECTIONS**  
Sends to standard output DDL statements that define design projections.

**DESIGNER_OUTPUT_DEPLOYMENT_SCRIPT**  
Sends to standard output a design's deployment script.

---

## Clean up

The following functions cancel any running Database Designer operation or drop a Database Designer design and all its contents:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DESIGNER_CANCEL_POPULATE Design</strong></td>
<td>Cancels population or deployment operation for the specified design if it is currently running.</td>
</tr>
<tr>
<td><strong>DESIGNER_DROP Design</strong></td>
<td>Removes the schema associated with the specified design and all its contents.</td>
</tr>
<tr>
<td><strong>DESIGNER_DROP_ALL DESIGNS</strong></td>
<td>Removes all Database Designer-related schemas associated with the current user.</td>
</tr>
</tbody>
</table>

---

**DESIGNER_ADD_DESIGN_QUERIES**

Reads and evaluates queries from an input file, and adds the queries that it accepts to the specified design. All accepted queries are assigned a weight of 1 (see **DESIGNER_ADD_DESIGN_QUERIES**).

The following requirements apply:

- All queried tables must previously be added to the design with **DESIGNER_ADD_DESIGN_TABLES**.

- If the **design type** is incremental, the Database Designer reads only the first 100 queries in the input file, and ignores all queries beyond that number.

All accepted queries are added to the system table **DESIGN_QUERIES**.

**Behavior Type**

Immutable
**Syntax**

`DESIGNER_ADD DESIGN QUERIES ( 'design-name', 'input-file' [, return-results] )`

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>design-name</code></td>
<td>Name of the target design.</td>
</tr>
<tr>
<td><code>input-file</code></td>
<td>Absolute path to the queries file.</td>
</tr>
<tr>
<td><code>return-results</code></td>
<td>Boolean, optionally specifies whether to return results of the add operation to standard output. If set to true, Database Designer returns the following results:</td>
</tr>
<tr>
<td></td>
<td>- Number of accepted queries</td>
</tr>
<tr>
<td></td>
<td>- Number of queries referencing non-design tables</td>
</tr>
<tr>
<td></td>
<td>- Number of unsupported queries</td>
</tr>
<tr>
<td></td>
<td>- Number of illegal queries</td>
</tr>
</tbody>
</table>

**Privileges**

Read access to the input file, and one of the following:

- Superuser
- Design creator with all privileges that pertain to the input file queries (see Privileges Required for Common Database Operations).

**Errors**

Database Designer returns an error in the following cases:

- The query contains illegal syntax.
- The query references:
  - External or system tables only
  - Local temporary or other non-design tables
DELETE or UPDATE query has one or more subqueries.

INSERT query does not include a SELECT clause.

Database Designer cannot optimize the query.

Examples

The following example adds queries from vmart_queries.sql to the VMART_DESIGN design. This file contains nine queries. The statement includes a third argument of true, so Database Designer returns results of the add operation:

```sql
=> SELECT DESIGNER_ADD DESIGN QUERIES ('VMART_DESIGN', '/tmp/examples/vmart_queries.sql', 'true');
...
DESIGNER_ADD DESIGN QUERIES
-----------------------------------------------------------------------
Number of accepted queries = 9
Number of queries referencing non-design tables = 0
Number of unsupported queries = 0
Number of illegal queries = 0
(1 row)
```

See Also

Running Database Designer Programatically

**DESIGNER_ADD DESIGN QUERIES_FROM_RESULTS**

Executes the specified query and evaluates results in the following columns:

- **QUERY_TEXT** (required): Text of potential design queries.

- **QUERY_WEIGHT** (optional): The weight assigned to each query that indicates its importance relative to other queries, a real number >0 and ≤1. Database Designer uses this setting when creating the design to prioritize the query. If DESIGNER_ADD DESIGN QUERIES_FROM_RESULTS returns any results that omit this value, Database Designer sets their weight to 1.

After evaluating the queries in QUERY_TEXT, DESIGNER_ADD DESIGN QUERIES_FROM_RESULTS adds all accepted queries to the design. An unlimited number of queries can be added to the design.

Before you add queries to a design, you must add the queried tables with DESIGNER_ADD DESIGN_TABLES.
Behavior Type
Immutable

Syntax

```sql
DESIGNER_ADD_DESIGN_QUERIES_FROM_RESULTS ( 'design-name', 'query' )
```

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>design-name</td>
<td>Name of the target design.</td>
</tr>
<tr>
<td>query</td>
<td>A valid SQL query whose results contain columns named QUERY_TEXT and, optionally, QUERY_WEIGHT.</td>
</tr>
</tbody>
</table>

Privileges

- Superuser
- Design creator with all privileges that pertain to the specified query and all queries that this function returns (see Privileges Required for Common Database Operations).

Errors

Database Designer returns an error in the following cases:

- The query contains illegal syntax.
- The query references:
  - External or system tables only
  - Local temporary or other non-design tables
- DELETE or UPDATE query has one or more subqueries.
- INSERT query does not include a SELECT clause.
- Database Designer cannot optimize the query.
Example

The following example queries the system table QUERY_REQUESTS for all long-running queries (> 1 million microseconds) and adds them to the VMART_DESIGN design. The query returns no information on query weights, so all queries are assigned a weight of 1:

```plaintext
>= SELECT DESIGNER_ADD_DESIGN_QUERIES FROM RESULTS ('VMART_DESIGN',
   'SELECT request as query_text FROM query_requests where request_duration_ms > 1000000 AND request_type = ''QUERY'';');
```

See Also

Running Database Designer Programmatically

**DESIGNER_ADD_DESIGN_QUERY**

Reads and parses the specified query, and if accepted, adds it to the design. Before you add queries to a design, you must add the queried tables with DESIGNER_ADD_DESIGN_TABLES. All accepted queries are added to the system table DESIGN_QUERIES.

**Behavior Type**

Immutable

**Syntax**

```
DESIGNER_ADD_DESIGN_QUERY ( 'design-name', 'design-query' [, query-weight] )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>design-name</code></td>
<td>Name of the target design.</td>
</tr>
<tr>
<td><code>design-query</code></td>
<td>Executable SQL query.</td>
</tr>
<tr>
<td><code>query-weight</code></td>
<td>Optionally assigns a weight to each query that indicates its importance</td>
</tr>
<tr>
<td></td>
<td>relative to other queries, a real number &gt;0 and ≤ 1. Database Designer</td>
</tr>
<tr>
<td></td>
<td>uses this setting to prioritize queries in the design.</td>
</tr>
<tr>
<td></td>
<td>If you omit this parameter, Database Designer assigns a weight of 1.</td>
</tr>
</tbody>
</table>
Privileges

One of the following:

- Superuser
- Design creator with all privileges that pertain to the specified query (see Privileges Required for Common Database Operations).

Errors

Database Designer returns an error in the following cases:

- The query contains illegal syntax.
- The query references:
  - External or system tables only
  - Local temporary or other non-design tables
- DELETE or UPDATE query has one or more subqueries.
- INSERT query does not include a SELECT clause.
- Database Designer cannot optimize the query.

Examples

The following example adds the specified query to the VMART_DESIGN design and assigns that query a weight of 0.5:

```sql
=> SELECT DESIGNER_ADDDESIGN_QUERY ( 'VMART_DESIGN',
  'SELECT customer_name, customer_type FROM customer_dimension ORDER BY customer_name ASC;', 0.5 );
```

See Also

Running Database Designer Programmatically
DESIGNER_ADD DESIGN TABLES

Adds the specified tables to a design. You must run DESIGNER_ADD DESIGN TABLES before adding design queries to the design. If no tables are added to the design, Vertica does not accept design queries.

Behavior Type
Immutable

Syntax

DESIGNER_ADD дизайн TABLES ( 'design-name', '[ table-spec[,..] ]' [, 'analyze-statistics'] )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>design-name</td>
<td>Name of the Database Designer design.</td>
</tr>
<tr>
<td>table-spec[,..]</td>
<td>One or more comma-delimited arguments that specify which tables to add to the design, where each table-spec argument can specify tables as follows:</td>
</tr>
<tr>
<td></td>
<td>- [schema.]table Add table to the design.</td>
</tr>
<tr>
<td></td>
<td>- schema.* Add all tables in schema.</td>
</tr>
<tr>
<td></td>
<td>If set to an empty string, Vertica adds all tables in the database to which the user has access.</td>
</tr>
<tr>
<td>analyze-statistics</td>
<td>Boolean that optionally specifies whether to run ANALYZE STATISTICS after adding the specified tables to the design, by default set to false.</td>
</tr>
<tr>
<td></td>
<td>Accurate statistics help Database Designer optimize compression and query performance. Updating statistics takes time and resources.</td>
</tr>
</tbody>
</table>
Privileges

One of the following:

- Superuser
- DBDUSER who created the design, has USAGE privilege on the design table schema, and owns the design table.

Examples

The following example adds to design VMART_DESIGN all tables from schemas online_sales and store, and analyzes statistics for those tables:

```sql
=> SELECT DESIGNER_ADD DESIGN TABLES('VMART_DESIGN', 'online_sales.*, store.*','true');
DESIGNER_ADD DESIGN TABLES
-------------------------
7
(1 row)
```

See Also

Running Database Designer Programmatically

**DESIGNER_CANCEL_POPULATE_DESIGN**

Cancels population or deployment operation for the specified design if it is currently running. When you cancel a deployment, the Database Designer cancels the projection refresh operation. It does not roll back projections that it already deployed and refreshed.

Behavior Type

Immutable

Syntax

`DESIGNER_CANCEL_POPULATE_DESIGN ( 'design-name' )`

Parameters

| design-name | Name of the design operation to cancel. |
Privileges

One of the following:

- Superuser
- Design creator

Examples

The following example cancels a currently running design for VMART_DESIGN and then drops the design:

```sql
=> SELECT DESIGNER_CANCEL_POPULATE_DESIGN ('VMART_DESIGN');
=> SELECT DESIGNER_DROP_DESIGN ('VMART_DESIGN', 'true');
```

See Also

Running Database Designer Programmatically

**DESIGNER_CREATE_DESIGN**

Creates a design with the specified name.

*Note: Be sure to back up the current design using the function `EXPORT_CATALOG` before running the Database Designer functions on an existing schema. You must explicitly back up the existing design when using Database Designer programmatically.*

If any of the following `V_MONITOR` tables do not already exist from previous designs, `DESIGNER_CREATE_DESIGN` creates them:

- DESIGNS
- DESIGN_TABLES
- DEPLOYMENT_PROJECTIONS
- DEPLOYMENT_PROJECTION_STATEMENTS
- DESIGN_QUERIES
OUTPUT_DEPLOYMENT_STATUS

OUTPUT_EVENT_HISTORY

Behavior Type

Immutable

Syntax

DESIGNER_CREATE_DESIGN ( 'design-name' )

Parameters

| design-name | Name of the design to create, can contain only alphanumeric and underscore (_) characters. Two users cannot have designs with the same name at the same time. |

Privileges

One of the following:

- Superuser
- DBDUSER

Examples

The following example creates the design VMART_DESIGN:

```sql
=> SELECT DESIGNER_CREATE_DESIGN('VMART_DESIGN');
DESIGNER_CREATE_DESIGN
--------------------
0
(1 row)
```

See Also

Running Database Designer Programmatically
DESIGNER_DESIGN_PROJECTION_ENCODINGS

Analyzes encoding in the specified projections, creates a script to implement encoding recommendations, and optionally deploys the recommendations.

Behavior Type

Immutable

Syntax

DESIGNER_DESIGN_PROJECTION_ENCODINGS ('[ proj-spec[, ... ]]', '[destination]' [, 'deploy'] [, 'reanalyze-encodings'] )

Parameters

<table>
<thead>
<tr>
<th>proj-spec[, ...]</th>
<th>One or more comma-delimited projections to add to the design. Each projection can be specified in one of the following ways:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• [[schema.]<em>table.</em>]projection</td>
</tr>
<tr>
<td></td>
<td>Specifies to analyze projection.</td>
</tr>
<tr>
<td></td>
<td>• schema.*</td>
</tr>
<tr>
<td></td>
<td>Specifies to analyze all projections in the named schema.</td>
</tr>
<tr>
<td></td>
<td>• [schema.]*table</td>
</tr>
<tr>
<td></td>
<td>Specifies to analyze all projections of the named table.</td>
</tr>
<tr>
<td></td>
<td>If set to an empty string, Vertica analyzes all projections in the database to which the user has access.</td>
</tr>
<tr>
<td></td>
<td>For example, the following statement specifies to analyze all projections in schema private, and send the results to the file encodings.sql:</td>
</tr>
<tr>
<td></td>
<td>=&gt; SELECT DESIGNER_DESIGN_PROJECTION_ENCODINGS ('mydb.private.*','encodings.sql');</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>destination</th>
<th>Specifies where to send output, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• An empty string ('') writes the script to standard output.</td>
</tr>
</tbody>
</table>
• The path and name of a SQL output file. If you specify a file that does not exist, the function creates one. If you specify only a file name, Vertica creates it in the catalog directory. If the file already exists, the function silently overwrites its contents.

<table>
<thead>
<tr>
<th>deploy</th>
<th>Boolean that optionally specifies whether to deploy encoding changes, by default set to false.</th>
</tr>
</thead>
<tbody>
<tr>
<td>reanalyze-encodings</td>
<td>Boolean that optionally specifies whether DESIGNER_DESIGN_PROJECTION_ENCODINGS analyzes encodings in a projection where all columns are already encoded:</td>
</tr>
<tr>
<td></td>
<td>• false (default): Analyzes no columns and generates no recommendations if all columns are encoded.</td>
</tr>
<tr>
<td></td>
<td>• true: Ignores existing encodings and generates recommendations.</td>
</tr>
</tbody>
</table>

Privileges

The following requirements pertain to the target projections:

• OWNER of all projections to analyze

• USAGE privilege on the schema for the specified projections

Examples

The following example requests that Database Designer analyze encodings of all projections in the schema online_sales, as follows:

• The second parameter destination is set to an empty string, so the script is sent to standard output (shown truncated below).

• The last two parameters deploy and reanalyze-encodings are omitted, so Database Designer does not execute the script or reanalyze existing encodings:

```sql
=> SELECT DESIGNER_DESIGN_PROJECTION_ENCODINGS ('online_sales.*','');

CREATE PROJECTION online_page_dimension_DBD_1_seg_EncodingDesign /*+createtype(D)*/ (  
  online_page_key ENCODING COMMONDELTA_COMP,  
  start_date ENCODING DELTAVALE,
```
end_date ENCODING DELTAVAL,  
page_number ENCODING DELTAVAL,  
page_description,  
page_type )  
AS  
SELECT online_page_dimension.online_page_key,  
online_page_dimension.start_date,  
online_page_dimension.end_date,  
online_page_dimension.page_number,  
online_page_dimension.page_description,  
online_page_dimension.page_type  
FROM online_sales.online_page_dimension  
ORDER BY online_page_dimension.online_page_key  
SEGMENTED BY hash(online_page_dimension.online_page_key) ALL NODES KSAFE 1;

select refresh('online_sales.online_page_dimension');
select make_ahm_now();
DROP PROJECTION online_sales.online_page_dimension CASCADE;
ALTER PROJECTION online_sales.online_page_dimension_DBD_1_seg_EncodingDesign RENAME TO online_page_dimension;
...
(1 row)

See Also

Running Database Designer Programatically

**DESIGNER_DROP_ALL_DESIGNS**

Removes all Database Designer-related schemas associated with the current user. Use this function to remove database objects after one or more Database Designer sessions complete execution.

**Behavior Type**

Immutable

**Syntax**

DESIGNER_DROP_ALL_DESIGNS()
Parameters

None.

Privileges

One of the following:

- Superuser: Drops all designs.
- Design creator: Drops all designs created by this user.

Example

The following example removes all schema and their contents associated with the current user. DESIGNER_DROP_ALL DESIGNS returns the number of designs dropped:

```sql
=> SELECT DESIGNER_DROP_ALL DESIGNS();
DESIGNER_DROP_ALL DESIGNS
-------------------------
  2
(1 row)
```

See Also

- DESIGNER_CANCEL_POPULATE DESIGN
- DESIGNER_DROP DESIGN

DESIGNER_DROP DESIGN

Removes the schema associated with the specified design and all its contents. Use DESIGNER_DROP DESIGN after a Database Designer design or deployment completes successfully. You must also use it to drop a design before creating another one under the same name.

To drop all designs that you created, use DESIGNER_DROP_ALL DESIGNS.

Behavior Type

Immutable
Syntax

```sql
DESIGNER_DROP_DESIGN ( 'design-name' [, force-drop ] )
```

Parameters

<table>
<thead>
<tr>
<th><code>design-name</code></th>
<th>Name of the design to drop.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>force-drop</code></td>
<td>Boolean that overrides any dependencies that otherwise prevent Vertica from executing this function—for example, the design is in use or is currently being deployed. If you omit this parameter, Vertica sets it to false.</td>
</tr>
</tbody>
</table>

Privileges

One of the following:

- Superuser
- Design creator

Example

The following example deletes the Database Designer design VMART_DESIGN and all its contents:

```sql
=> SELECT DESIGNER_DROP_DESIGN ('VMART_DESIGN');
```

See Also

- [Running Database Designer Programatically](#)

**DESIGNER_OUTPUT_ALL DESGN_PROJECTIONS**

Displays the DDL statements that define the design projections to standard output.

Behavior Type

Immutable
Syntax

DESIGNER_OUTPUT_ALL DESIGN PROJECTIONS ('design-name')

Parameters

| design-name | Name of the target design. |

Privileges

One of the following:

- Superuser
- DBDUSER role

Examples

The following example returns the design projection DDL statements for `vmart_design`:

```sql
=> SELECT DESIGNER_OUTPUT_ALL DESIGN PROJECTIONS('vmart_design');
CREATE PROJECTION customer_dimension_DBD_1_rep_VMART DESIGN /*+createtype(D)*/
(
    customer_key ENCODING DELTAVAL,
    customer_type ENCODING AUTO,
    customer_name ENCODING AUTO,
    customer_gender ENCODING REL,
    title ENCODING AUTO,
    household_id ENCODING DELTAVAL,
    customer_address ENCODING AUTO,
    customer_city ENCODING AUTO,
    customer_state ENCODING AUTO,
    customer_region ENCODING AUTO,
    marital_status ENCODING AUTO,
    customer_age ENCODING DELTAVAL,
    number_of_children ENCODING BLOCKDICT_COMP,
    annual_income ENCODING DELTARANGE_COMP,
    occupation ENCODING AUTO,
    largest_bill_amount ENCODING DELTAVAL,
    store_membership_card ENCODING BLOCKDICT_COMP,
    customer_since ENCODING DELTAVAL,
    deal_stage ENCODING AUTO,
    deal_size ENCODING DELTARANGE_COMP,
    last_deal_update ENCODING DELTARANGE_COMP
)
AS
SELECT customer_key,
    customer_type,
    customer_name,
```
customer_gender, title, household_id, customer_address, customer_city, customer_state, customer_region, marital_status, customer_age, number_of_children, annual_income, occupation, largest_bill_amount, store_membership_card, customer_since, deal_stage, deal_size, last_deal_update
FROM public.customer_dimension
ORDER BY customer_gender, annual_income
UNSEGMENTED ALL NODES;
CREATE PROJECTION product_dimension_DBD_2_rep_VMARTDESIGN /**createType(D)*/
(
...
Parameters

| design-name | Name of the target design. |

Privileges

One of the following:

- Superuser
- Design creator

Examples

The following example displays the deployment script for VMART_DESIGN:

```sql
=> SELECT DESIGNER_OUTPUT_DEPLOYMENT_SCRIPT('VMART_DESIGN');
CREATE PROJECTION customer_dimension_DBD_1_rep_VMART_DESIGN /*+createtype(D)*/
...  
CREATE PROJECTION product_dimension_DBD_2_rep_VMART_DESIGN /*+createtype(D)*/
...  
select refresh('public.customer_dimension,
               public.product_dimension,
               public.promotion.dimension,
               public.date_dimension');
select make_ahm_now();
DROP PROJECTION public.customer_dimension_super CASCADE;
DROP PROJECTION public.product_dimension_super CASCADE;
...  
```

See Also

DESIGNER_OUTPUT_ALL_DESIGN_PROJECTIONS

DESIGNER_RESET_DESIGN

Discards all run-specific information of the previous Database Designer build or deployment of the specified design but keeps its configuration. You can make changes to the design as needed, for example, by changing parameters or adding additional tables and/or queries, before running the design again.

Behavior Type

Immutable
Syntax

DESIGNER_RESET_DESIGN ( 'design-name' )

Parameters

| design-name | Name of the design to reset. |

Privileges

- Superuser
- Design creator

Example

The following example resets the Database Designer design VMART_DESIGN:

```sql
=> SELECT DESIGNER_RESET_DESIGN ( 'VMART_DESIGN');
```

DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY

Populates the design and creates the design and deployment scripts. DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY can also analyze statistics, deploy the design, and drop the workspace after the deployment.

Caution: DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY does not create a backup copy of the current design before deploying the new design. Before running this function, back up the existing schema design with EXPORT_CATALOG.

Behavior Type

Immutable

Syntax

DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY (  
    'design-name',  
    'output-design-file',  
    'output-deployment-file'  
)
[ , 'analyze-statistics']
[ , 'deploy']
[ , 'drop-design-workspace']
[ , 'continue-after-error']
)

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>design-name</strong></td>
<td>Name of the design to populate and deploy.</td>
</tr>
<tr>
<td><strong>output-design-filename</strong></td>
<td>The file to contain DDL statements that create design projections, where <code>output-design-filename</code> includes the full path on the node where the session is connected.</td>
</tr>
<tr>
<td><strong>output-deployment-filename</strong></td>
<td>The file to contain the deployment script, where <code>output-deployment-filename</code> includes the full path on the node where the session is connected.</td>
</tr>
<tr>
<td><strong>analyze-statistics</strong></td>
<td>Specifies whether to collect or refresh statistics for the tables before populating the design. If set to true, Vertica invokes <code>ANALYZE_STATISTICS</code>. Accurate statistics help Database Designer optimize compression and query performance. However, updating statistics requires time and resources. Default: false</td>
</tr>
<tr>
<td><strong>deploy</strong></td>
<td>Specifies whether to deploy the Database Designer design using the deployment script created by this function.</td>
</tr>
<tr>
<td><strong>drop-design-workspace</strong></td>
<td>Specifies whether to drop the design</td>
</tr>
</tbody>
</table>
workspace after the design is deployed.

**Default:** true

| continue-after-error | Specifies whether DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY continues to run after an error occurs. By default, an error causes this function to terminate. | **Default:** false |

### Privileges

- Superuser
- Design creator with WRITE privileges on storage locations of design and deployment scripts; otherwise DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY cannot save the design and deployment scripts.

### Requirements

Before calling this function, you must:

- Create a design, a logical schema with tables.
- Associate tables with the design.
- Load queries to the design.
- Set design properties (K-safety level, mode, and policy).

### Examples

The following example creates projections for and deploys the VMART_DESIGN design, and analyzes statistics about the design tables.

```
=> SELECT DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY (  
    'VMART_DESIGN',  
    '/tmp/examples/vmart_design_files/design_projections.sql',  
    '/tmp/examples/vmart_design_files/design_deploy.sql',  
    'true',  
    'true',  
)  
```
DESIGNER_SET_ANALYZE_CORRELATIONS_MODE

Specifies how Database Designer handles column correlations in a design. A design's mode determines whether Database Designer analyzes or re-analyzes existing column correlations and considers them in the design that it creates.

The following recommendations apply:

- You typically need to analyze column correlations only once.

- Analyze correlations when the table row count is at least \( DBDCorrelationSampleRowCount \)—by default, 4000.

Important: Database Designer analyzes column correlations for a design only if you enable analysis with this function.

Behavior Type

Immutable

Syntax

\[
\text{DESIGNER\_SET\_ANALYZE\_CORRELATIONS\_MODE ( 'design-name', mode )}
\]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>design-name</td>
<td>Name of the design that specifies how Database Designer handles correlated columns.</td>
</tr>
<tr>
<td>mode</td>
<td>Specifies how to handle correlations in the design tables, one of the following integer settings:</td>
</tr>
<tr>
<td></td>
<td>Ignore column correlations in the design tables.</td>
</tr>
<tr>
<td>---</td>
<td>------------------------------------------------</td>
</tr>
<tr>
<td>1</td>
<td>Consider existing correlations in tables when creating the design. If no existing correlations exist, Database Designer sets none in the design.</td>
</tr>
<tr>
<td>2</td>
<td>Analyze column correlations on tables where correlation analysis was not previously performed. When creating the design, consider all column correlations, new and existing.</td>
</tr>
<tr>
<td>3</td>
<td>Analyze all tables for column correlations and consider them when creating the design. If correlations already exist for a table, ignore them and re-analyze the table.</td>
</tr>
</tbody>
</table>

Setting the correlation analysis mode does not affect whether Database Designer analyzes statistics when creating a design.

Privileges

One of the following:

- Superuser
- DBDUSER role with USAGE privilege on the design schema.

Example

The following example specifies that Database Designer analyze all tables for correlated columns and consider them when creating a design:

```sql
=> SELECT DESIGNER_SET_ANALYZE_CORRELATIONS_MODE ("VMART_DESIGN", 3);
DESIGNER_SET_ANALYZE_CORRELATIONS_MODE
-----------------------------
3
(1 row)
```

See Also

- `ANALYZE_CORRELATIONS`
- `Running Database Designer Programmatically`
DESIGNER_SET_DESIGN_KSAFETY

Sets **K-safety** for a comprehensive design and stores the K-safety value in the DESIGNS table. Database Designer ignores this function for incremental designs.

**Behavior Type**

Immutable

**Syntax**

DESIGNER_SET_DESIGN_KSAFETY ( 'design-name' [, k-level ] )

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>design-name</td>
<td>Name of the design for which you want to set the K-safety value, type VARCHAR.</td>
</tr>
<tr>
<td>k-level</td>
<td>An integer between 0 and 2 that specifies the level of K-safety for the target design. This value must be compatible with the number of nodes in the database cluster:</td>
</tr>
<tr>
<td></td>
<td>• <strong>k-level</strong> = 0: ≥ 1 nodes</td>
</tr>
<tr>
<td></td>
<td>• <strong>k-level</strong> = 1: ≥ 3 nodes</td>
</tr>
<tr>
<td></td>
<td>• <strong>k-level</strong> = 2: ≥ 5 nodes</td>
</tr>
</tbody>
</table>

If you omit this parameter, Vertica sets K-safety for this design to 0 or 1, according to the number of nodes: 1 if the cluster contains ≥ 3 nodes, otherwise 0.

If you are a DBADMIN user and **k-level** differs from system K-safety, Vertica changes system K-safety as follows:

• If **k-level** is less than system K-safety, Vertica changes system K-safety to the lower level after the design is deployed.

• If **k-level** is greater than system K-safety and is valid for the database cluster, Vertica creates the required number of buddy...
projections for the tables in this design. If the design applies to all database tables, or all tables in the database have the required number of buddy projections, Database Designer changes system K-safety to \textit{k-level}.

If the design excludes some database tables and the number of their buddy projections is less than \textit{k-level}, Database Designer leaves system K-safety unchanged. Instead, it returns a warning and indicates which tables need new buddy projections in order to adjust system K-safety.

If you are a DBDUSER, Vertica ignores this parameter.

Privileges

One of the following:

- Superuser
- Design creator

Examples

The following example set K-safety for the VMART\_DESIGN design to 1:

```sql
=> SELECT DESIGNER\_SET\_DESIGN\_KSAFETY('VMART\_DESIGN', 1);
```

See Also

Running Database Designer Programmatically

\textbf{DESIGNER\_SET\_DESIGN\_TYPE}

Specifies whether Database Designer should create a comprehensive or incremental design. \texttt{DESIGNER\_SET\_DESIGN\_TYPE} stores the design mode in the \texttt{DESIGNS} table.

If you do not explicitly set a design mode with this function, Database Designer creates a comprehensive design.
Behavior Type
Immutable

Syntax

`DESIGNER_SET_DESIGN_TYPE ( 'design-name', 'mode' )`

Parameters

<table>
<thead>
<tr>
<th><code>design-name</code></th>
<th>Name of the target design.</th>
</tr>
</thead>
</table>
| `mode`        | Name of the mode that Database Designer should use when designing the database, one of the following:

- **COMPREHENSIVE**: Creates an initial or replacement design for all tables in the specified schemas. You typically create a comprehensive design for a new database.

- **INCREMENTAL**: Modifies an existing design with additional projection that are optimized for new or modified queries.

For more information, see Design Types in the Administrator's Guide.

Privileges

One of the following:

- Superuser
- Design creator

Notes

Incremental designs always inherit the K-safety value of the database.

Examples

The following examples show the two design mode options for the VMART_DESIGN design:
See Also

Running Database Designer Programmatically

**DESIGNER_SET_OPTIMIZATION_OBJECTIVE**

Valid only for comprehensive database designs, specifies the optimization objective Database Designer uses. Database Designer ignores this function for incremental designs.

**DESIGNER_SET_OPTIMIZATION_OBJECTIVE** stores the optimization objective in the **DESIGNS** table.

**Behavior Type**

Immutable

**Syntax**

```
DESIGNER_SET_OPTIMIZATION_OBJECTIVE ( 'design-name', 'policy' )
```

**Parameters**

<table>
<thead>
<tr>
<th><strong>design-name</strong></th>
<th>Name of the target design.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>policy</strong></td>
<td>Specifies the design's optimization policy, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- QUERY: Optimize for query performance. This can result in a larger database storage footprint because additional projections might be created.</td>
</tr>
</tbody>
</table>
- LOAD: Optimize for load performance so database size is minimized. This can result in slower query performance.
- BALANCED: Balance the design between query performance and database size.

**Privileges**

One of the following:

- Superuser
- Design creator

**Examples**

The following example sets the optimization objective option for the VMART_DESIGN design: to QUERY:

```sql
=> SELECT DESIGNER_SET_OPTIMIZATION_OBJECTIVE( 'VMART_DESIGN', 'QUERY');
DESIGNER_SET_OPTIMIZATION_OBJECTIVE
-----------------------------
 0
(1 row)
```

**See Also**

*Running Database Designer Programatically*

---

**DESIGNER_SET_PROPOSE_UNSEGMENTED_PROJECTIONS**

Specifies whether a design can include unsegmented projections. Vertica ignores this function on a one-node cluster, where all projections must be unsegmented.

**Behavior Type**

Immutable

**Syntax**

```sql
DESIGNER_SET_PROPOSE_UNSEGMENTED_PROJECTIONS ( 'design-name', unsegmented )
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>design-name</td>
<td>Name of the target design.</td>
</tr>
<tr>
<td>unsegmented</td>
<td>Boolean that specifies whether Database Designer can propose unsegmented projections for tables in this design. When you create a design, the propose_unsegmented_projections value in system table DESIGNS for this design is set to true. If DESIGNER_SET_PROPOSE_UNSEGMENTED_PROJECTIONS sets this value to false, Database Designer only proposes segmented projections for the design.</td>
</tr>
</tbody>
</table>

Privileges

One of the following:

- Superuser
- Design creator

Example

The following example specifies that Database Designer can propose only segmented projections for tables in the design VMART_DESIGN:

```
=> SELECT DESIGNER_SET_PROPOSE_UNSEGMENTED_PROJECTIONS('VMART_DESIGN', false);
```

See Also

Running Database Designer Programmatically

DESIGNER_WAIT_FOR_DESIGN

Waits for completion of operations that are populating and deploying the design. Ctrl+C cancels this operation and returns control to the user.

Behavior Type

Immutable
Syntax

DESIGNER_WAIT_FOR_DESIGN ( 'design-name' )

Parameters

| design-name | Name of the running design. |

Privileges

One of the following:

- Superuser
- DBDUSER role with USAGE privilege on the design schema.

Examples

The following example requests to wait for the currently running design of VMART_DESIGN to complete:

```sql
=> SELECT DESIGNER_WAIT_FOR_DESIGN ('VMART_DESIGN');
```

See Also

- DESIGNER_CANCEL_POPULATE_DESIGN
- DESIGNER_DROP_ALL_DESIGNS
- DESIGNER_DROP_DESIGN
Database Management Functions

This section contains the database management functions specific to Vertica.

CLEAR_RESOURCE_REJECTIONS

Clears the content of the RESOURCE_REJECTIONS and DISKRESOURCE_REJECTIONS system tables. Normally, these tables are only cleared during a node restart. This function lets you clear the tables whenever you need. For example, you might want to clear the system tables after you resolved a disk space issue that was causing disk resource rejections.

Syntax

CLEAR_RESOURCE_REJECTIONS();

Privileges

Superuser

Example

The following command clears the content of the RESOURCE_REJECTIONS and DISKRESOURCE_REJECTIONS system tables:

```sql
=> SELECT clear_resource_rejections();
clear_resource_rejections
-----------------------------
OK
(1 row)
```

See Also

- DISKRESOURCE_REJECTIONS
- RESOURCE_REJECTIONS

CURRENT_SCHEMA

Returns the name of the current schema.
Behavior Type
Stable

Syntax
CURRENT_SCHEMA()

Note: You can call this function without parentheses.

Privileges
None

Examples
The following command returns the name of the current schema:

```
=> SELECT CURRENT_SCHEMA();
current_schema
--------------
  public
(1 row)
```

The following command returns the same results without the parentheses:

```
=> SELECT CURRENT_SCHEMA;
current_schema
--------------
  public
(1 row)
```

The following command shows the current schema, listed after the current user, in the search path:

```
=> SHOW SEARCH_PATH;
 name | setting
---------+---------------------------------------------
  search_path | "$user", public, v_catalog, v_monitor, v_internal
(1 row)
```

See Also
- SET SEARCH_PATH
DUMP_LOCKTABLE

Returns information about deadlocked clients and the resources they are waiting for.

Syntax

DUMP_LOCKTABLE()

Privileges

None

Notes

Use DUMP_LOCKTABLE if Vertica becomes unresponsive:

1. Open an additional vsq1 connection.
2. Execute the query:

```sql
=> SELECT DUMP_LOCKTABLE();
```

The output is written to vsq1. See Monitoring the Log Files.

You can also see who is connected using the following command:

```sql
=> SELECT * FROM SESSIONS;
```

Close all sessions using the following command:

```sql
=> SELECT CLOSE_ALL_SESSIONS();
```

Close a single session using the following command:

```sql
=> SELECT CLOSE_SESSION('session_id');
```

You get the session_id value from the V_MONITOR_SESSIONS system table.
See Also

- CLOSE_ALL_SESSIONS
- CLOSE_SESSION
- LOCKS
- SESSIONS

**DUMP_PARTITION_KEYS**

Dumps the partition keys of all projections in the system.

**Syntax**

```sql
DUMP_PARTITION_KEYS( )
```

**Note:** The ROS objects of partitioned tables without partition keys are ignored by the tuple mover and are not merged during automatic tuple mover operations.

**Privileges**

User must have select privileges on the table or usage privileges on the schema.

**Example**

```sql
=> SELECT DUMP_PARTITION_KEYS( );
Partition keys on node v_vmart_node0001
  Projection 'states_b0'
    Storage [ROS container]
      No of partition keys: 1
      Partition keys: NH
    Storage [ROS container]
      No of partition keys: 1
      Partition keys: MA
  Projection 'states_b1'
    Storage [ROS container]
      No of partition keys: 1
      Partition keys: VT
    Storage [ROS container]
      No of partition keys: 1
      Partition keys: ME
    Storage [ROS container]
      No of partition keys: 1
```
Partition keys: CT

See Also

- DUMP_PROJECTION_PARTITION_KEYS
- DUMP_TABLE_PARTITION_KEYS
- PARTITION_PROJECTION
- PARTITION_TABLE
- PARTITIONS
- Partitioning Tables in the Administrator's Guide

HAS_ROLE

Indicates, with a Boolean value, whether a role has been assigned to a user. This function is useful for letting you check your own role membership.

Behavior Type

Stable

Syntax 1

HAS_ROLE( [ 'user_name' ], 'role_name' );

Syntax 2

HAS_ROLE( 'role_name' );

Parameters

| user_name | [Optional] The name of a user to look up. Currently, only a superuser can supply the user_name argument. |
| role_name | The name of the role you want to verify has been granted. |
Privileges

Users can check their own role membership by calling HAS_ROLE('role_name'), but only a superuser can look up other users' memberships using the optional user_name parameter.

Notes

You can query V_CATALOG system tables ROLES, GRANTS, and USERS to show any directly-assigned roles; however, these tables do not indicate whether a role is available to a user when roles may be available through other roles (indirectly).

Examples

User Bob wants to see if he has been granted the commentor role:

=> SELECT HAS_ROLE('commentor');

Output t for true indicates that Bob has been assigned the commentor role:

<table>
<thead>
<tr>
<th>HAS_ROLE</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>t</td>
<td>(1 row)</td>
</tr>
</tbody>
</table>

In the following function call, a superuser checks if the logadmin role has been granted to user Bob:

=> SELECT HAS_ROLE('Bob', 'logadmin');

<table>
<thead>
<tr>
<th>HAS_ROLE</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>t</td>
<td>(1 row)</td>
</tr>
</tbody>
</table>

To view the names of all roles users can access, along with any roles that have been assigned to those roles, query the V_CATALOG.ROLES system table. An asterisk in the output means role granted WITH ADMIN OPTION.

=> SELECT * FROM roles;

<table>
<thead>
<tr>
<th>role_id</th>
<th>name</th>
<th>assigned_roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>45035996273704964</td>
<td>public</td>
<td></td>
</tr>
<tr>
<td>45035996273704966</td>
<td>dbduser</td>
<td></td>
</tr>
<tr>
<td>45035996273704968</td>
<td>dbadmin</td>
<td>dbduser*</td>
</tr>
<tr>
<td>45035996273704972</td>
<td>pseudosuperuser</td>
<td>dbadmin*</td>
</tr>
<tr>
<td>45035996273704974</td>
<td>logreader</td>
<td></td>
</tr>
<tr>
<td>45035996273704976</td>
<td>logwriter</td>
<td></td>
</tr>
<tr>
<td>45035996273704978</td>
<td>logadmin</td>
<td>logreader,</td>
</tr>
</tbody>
</table>
See Also

- GRANTS
- ROLES
- USERS
- Database Users and Privileges
- Viewing a User's Role

KERBEROS_CONFIG_CHECK

Tests the Kerberos configuration of a Vertica cluster. The function succeeds if it can access the keytab file and use it to kinit, and reports errors otherwise.

Syntax

KERBEROS_CONFIG_CHECK( )

Parameters

This function has no parameters.

Privileges

This function does not require privileges.

Examples

The following example shows the results when the Kerberos configuration is valid.

```
=> SELECT KERBEROS_CONFIG_CHECK();
  kerberos_config_check
---------------------------------------------------------------
 ok: krb5 exists at [/etc/krb5.conf]
 ok: Vertica Keytab file is set to [/etc/vertica.keytab]
 ok: Vertica Keytab file exists at [/etc/vertica.keytab]
```
Kerberos configuration parameters set in the database
   KerberosServiceName : [vertica]
   KerberosHostname : [data.hadoop.com]
   KerberosRealm : [EXAMPLE.COM]
   KerberosKeytabFile : [/etc/vertica.keytab]
Vertica Principal: [vertica/data.hadoop.com@EXAMPLE.COM]
ok: Vertica can kinit using keytab file

(1 row)

RUN_INDEX_TOOL

Runs the Index tool on a Vertica database to perform one of these tasks:

- Run a per-block cyclic redundancy check (CRC) on data storage to verify data integrity.
- Check that the sort order in ROS containers is correct.

The function writes summary information about its operation to standard output; detailed information on results is logged in vertica.log on the current node. For more about evaluating tool output, see:

- Evaluating CRC Errors
- Evaluating Sort Order Errors

You can also run the Index tool on a database that is down, from the Linux command line. For details, see CRC and Sort Order Check.

Caution: Use this function only under guidance from Vertica Support.

Syntax

RUN_INDEX_TOOL ( 'task', global, '[projection]' [, num-threads ] );

Parameters

<table>
<thead>
<tr>
<th>task</th>
<th>Specifies the operation to run, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>checkcrc</td>
<td>Run a cyclic redundancy check (CRC) on each block of existing data storage to check the data integrity of ROS data blocks.</td>
</tr>
<tr>
<td>checksort</td>
<td>Evaluate each ROS row to determine</td>
</tr>
</tbody>
</table>
whether it is sorted correctly. If ROS data is not sorted correctly in the projection's order, query results that rely on sorted data will be incorrect.

<table>
<thead>
<tr>
<th>global</th>
<th>Boolean, specifies whether to run the specified task on all nodes (true), or the current one (false).</th>
</tr>
</thead>
</table>
| projection | Specifies the scope of the operation:
  * Empty string (''): Run the check on all projections.
  * A string that specifies one or more projections as follows:
    - `proj-name`: Run the check on this projection
    - `proj-prefix*`: Run the check on all projections that begin with the string `proj-prefix`.
| num-threads | An unsigned (positive) or signed (negative) integer that specifies the number of threads used to run this operation:
  * `n`: Number of threads, ≥ 1
  * `-n`: Negative integer, denotes a fraction of all CPU cores as follows:
    
    \[
    \text{num-cores} / n
    \]

    Thus, -1 specifies all cores, -2, half the cores, -3, a third of all cores, and so on.

    Default: 1

Privileges

Superuser

Optimizing Performance

You can optimize meta-function performance by setting two parameters:

* `projection`: Narrows the scope of the operation to one or more projections.
* `num-threads`: Specifies the number of threads used to execute the function.
SET_CONFIG_PARAMETER

Specifies the value of a configuration parameter at the database level, or for a specific node.

Important: Vertica encourages use of ALTER NODE, ALTER DATABASE, and ALTER SESSION statements to set and clear configuration parameters. See Managing Configuration Parameters: VSQL for more information.

Caution: Vertica is designed to operate with minimal configuration changes, so use this capability sparingly. Carefully follow any documented guidelines for the parameter you wish to configure.

Syntax

SET_CONFIG_PARAMETER( 'parameter-name', value, [ 'node-name' ])

Parameters

<table>
<thead>
<tr>
<th>parameter-name</th>
<th>The parameter value to set. See Configuration Parameters in the Administrator's Guide for a list of supported parameters, their purposes, and usage examples.</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>The value to set for parameter-name. Syntax for this argument varies depending upon the parameter and its expected data type. For strings, enclose the argument in single quotes; integer arguments can be unquoted. If value is specified as NULL, the parameter is cleared.</td>
</tr>
<tr>
<td>node-name</td>
<td>The name of the node whose parameter value you wish to set. If you omit this parameter or set it to NULL, the parameter is set at the database level. If a parameter is explicitly set for a node, the node setting supersedes the database-level setting.</td>
</tr>
</tbody>
</table>

Note: Some parameters require restart for the value to take effect.

Privileges

Superuser
Examples

The following examples show how to use SET_CONFIG_PARAMETER in various situations.

Set a Configuration Parameter at Database Level

Set the AnalyzeRowCountInterval parameter to 3600 at the database level:

```sql
=> SELECT SET_CONFIG_PARAMETER ('AnalyzeRowCountInterval', 3600);
```

Find Details on All Configuration Parameters

Find all configuration parameters and information about them, including their current and default values:

```sql
=> SELECT * FROM CONFIGURATION_PARAMETERS;
```

See Also

- Managing Configuration Parameters: VSQL
- CONFIGURATION_PARAMETERS

SHUTDOWN

Forces a database to shut down, even if there are users connected.

Syntax

```sql
SHUTDOWN ( [ 'false' | 'true' ])
```

Parameters

| false | [Default] Returns a message if users are connected. Has the same effect as supplying no parameters. |
| true  | Performs a moveout operation and forces the database to shut down, disallowing further connections. |

Privileges

Superuser
Notes

- Quotes around the `true` or `false` arguments are optional.
- Issuing the `shutdown` command without arguments or with the default (`false`) argument returns a message if users are connected, and the shutdown fails. If no users are connected, the database performs a moveout operation and shuts down.
- Issuing the `SHUTDOWN('true')` command forces the database to shut down whether users are connected or not.
- You can check the status of the shutdown operation in the `vertica.log` file:

```plaintext
2010-03-09 16:51:52.625 unknown:0x7fc6d6d2e700
[Init] <INFO> Shutdown complete. Exiting.
```

- As an alternative to `SHUTDOWN()`, you can also temporarily set `MaxClientSessions` to 0 and then use `CLOSE_ALL_SESSIONS()`. New client connections cannot connect unless they connect using the `dbadmin` account. See `CLOSE_ALL_SESSIONS` for details.

Examples

The following command attempts to shut down the database. Because users are connected, the command fails:

```sql
=> SELECT SHUTDOWN('false');
NOTICE: Cannot shut down while users are connected
SHUTDOWN
-----------------------------------------------
Shutdown: aborting shutdown
(1 row)
```

`SHUTDOWN()` and `SHUTDOWN('false')` perform the same operation:

```sql
=> SELECT SHUTDOWN();
NOTICE: Cannot shut down while users are connected
SHUTDOWN
-----------------------------------------------
Shutdown: aborting shutdown
(1 row)
```

Using the `'true'` parameter forces the database to shut down, even though clients might be connected:

```sql
=> SELECT SHUTDOWN('true');
SHUTDOWN
```
See Also

- SESSIONS

Directed Queries Functions

The following meta-functions let you batch export query plans as directed queries from one Vertica database, and import those directed queries to another database.

**EXPORT_DIRECTED_QUESTIES**

Generates SQL for creating directed queries from a set of input queries, and writes the SQL to the specified file or to standard output.

Syntax

```sql
EXPORT_DIRECTED_QUESTIES('input-file', '[output-file]')
```

Parameters

<table>
<thead>
<tr>
<th><strong>input-file</strong></th>
<th>A SQL file that contains one or more input queries. See <a href="#">Input Format</a> below for details on format requirements.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>output-file</strong></td>
<td>Specifies where to write the generated SQL for creating directed queries. If the file name already exists, EXPORT_DIRECTED_QUESTIES returns with an error. If you supply an empty string, Vertica writes the SQL to standard output. See <a href="#">Output Format</a> below for details.</td>
</tr>
</tbody>
</table>

Privileges

Superuser
Input Format

The input file that you supply to EXPORT_DIRECTED_QUERIES contains one or more input queries. For each input query, you can optionally specify two fields that are used in the generated directed query:

- DirQueryName provides the directed query's unique identifier, a string that conforms to conventions described in Identifiers.
- DirQueryComment specifies a quote-delimited string, up to 128 characters.

You format each input query as follows:

```
--DirQueryName=query-name
--DirQueryComment='comment'
input-query
```

Output Format

EXPORT_DIRECTED_QUERIES generates SQL for creating directed queries, and writes the SQL to the specified file or to standard output. In both cases, output conforms to the following format:

```
/* Query: directed-query-name */
/* Comment: directed-query-comment */
SAVE QUERY input-query;
CREATE DIRECTED QUERY CUSTOM 'directed-query-name'
COMMENT 'directed-query-comment'
OPTVER 'vertica-release-num'
PSDATE 'timestamp'
annotated-query
```

Error Handling

If any errors or warnings occur during EXPORT_DIRECTED_QUERIES execution, it returns with a message like this one:

```
1 queries successfully exported.
1 warning message was generated.
Queries exported to /home/dbadmin/outputQueries.
See error report, /home/dbadmin/outputQueries.err for details.
```

EXPORT_DIRECTED_QUERIES writes all errors and warnings to a file that it creates on the same path as the output file, and uses the output file's base name.

For example:
WARNING: Name field not supplied. Using auto-generated name: 'Autoname:2016-04-25 15:03:32.115317.0'
Input Query: SELECT employee_dimension.employee_first_name, employee_dimension.employee_last_name, employee_dimension.job_title FROM public.employee_dimension WHERE (employee_dimension.employee_city = 'Boston'::varchar(6)) ORDER BY employee_dimension.job_title;
END

Examples

See Batch Query Plan Export in the Administrator's Guide.

See Also

- Batch Query Plan Export
- IMPORT_DIRECTED_QUERIES

IMPORT_DIRECTED_QUERIES

Imports to the database catalog directed queries from a SQL file that was generated by EXPORT_DIRECTED_QUERIES. If no directed queries are specified, Vertica lists all directed queries in the SQL file.

Syntax

IMPORT_DIRECTED_QUERIES( 'export-file'[, 'directed-query-name[,...]' ] )

Parameters

| export-file | A SQL file generated by EXPORT_DIRECTED_QUERIES. When you run this file, Vertica creates the specified directed queries in the current database catalog. |
| directed-query-name | The name of a directed query that is defined in export-file. You can specify multiple comma-delimited directed query names. If you omit this parameter, Vertica lists the names of all directed queries in export-file. |
Privileges
Superuser

See Also

- Batch Query Plan Export
- EXPORT_DIRECTED_QUERIES

Eon Functions
The following functions are meant to be used in Eon Mode.

**ALTER_LOCATION_SIZE**
Changes the size of the depot location on one node or all of the nodes in a database running in Eon Mode. If you decrease the depot size, Vertica might evict data if necessary to make space available.

**Syntax**

`ALTER_LOCATION_SIZE( path, node_name, new_size)`

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>path</em></td>
<td>Where Vertica stores the depot. The type of filesystem on which the location is based determines the format of this argument. For depot locations on the Linux filesystem, <em>path</em> must be an absolute path to the directory where Vertica writes the depot's data.</td>
</tr>
<tr>
<td><em>node_name</em></td>
<td>The node on which you want to alter the depot's size. To alter the depot size of all nodes, pass an empty string.</td>
</tr>
<tr>
<td><em>new_size</em></td>
<td>The new size of the depot:</td>
</tr>
<tr>
<td></td>
<td>- <em>integer%</em>: Percentage of total disk space</td>
</tr>
</tbody>
</table>
- $\text{integer}\{K|M|G|T\}$: Amount of disk space in kilobytes, megabytes, gigabytes, or terabytes.

**Default Value:** 80% of the disk space on the node. If it was not set at creation time.

**Privileges**

Superuser

**Examples**

Change the depot size on all the nodes in the database to 60 gigabytes:

```sql
=> SELECT ALTER_LOCATION_SIZE('/home/dbadmin/depot/', '', '60G');

ALTER_LOCATION_SIZE

/home/dbadmin/depotSize changed.

(1 row)
```

Change the depot size of one node in the database to 50% of the total disk space on the node:

```sql
=> SELECT ALTER_LOCATION_SIZE('/home/dbadmin/depot/', 'v_eon_walkthrough_db_node0001', '50%');

ALTER_LOCATION_SIZE

/home/dbadmin/depotSize changed.

(1 row)
```

**See Also**

- Eon Mode Architecture

**CLEAN_COMMUNAL_STORAGE**

Deletes files on communal (shared) storage that have leaked due to an event that led Vertica cleanup mechanisms to fail.

Invoke `CLEAN_COMMUNAL_STORAGE` after a node crash to clean up temporary data files in Eon Mode. These files are no longer valid data files, and need to be removed. Pass `'true'` to actually queue the files for deletion. `CLEAN_COMMUNAL_STORAGE` does not wait for the reaper queue to flush and the files to be actually deleted from the filesystem before returning.

You can cancel `CLEAN_COMMUNAL_STORAGE` during execution.
To verify that the files that were queued for deletion have actually been deleted, run FLUSH_REAPER_QUEUE.

Vertica supports this function only in Eon Mode.

Syntax

CLEAN_COMMUNAL_STORAGE ( 'actually_delete' )

Parameters

| actually_delete | BOOLEAN that indicates whether or not to delete temporary data files in the communal storage. |

Privileges

Superuser

Examples

Deletes:

```sql
=> SELECT CLEAN_COMMUNAL_STORAGE('true');
  clean_communal_storage
---------------------------
CLEAN_COMMUNAL_STORAGE
Total leaked files: 10
Total size: 2313
Files have not been queued for deletion.
Run clean_communal_storage(true) to queue files for deletion.
Check dc_communal_cleanup_records for more information.
(1 row)
```

See Also

FLUSH_REAPER_QUEUE

CLEAR_DATA_DEPOT

Deletes the specified data from depots when running in Eon Mode. If you use a table name with the function, then the data for that table is deleted from the depots. Clearing data from depots does not affect communal storage.
Syntax

CLEAR_DATA_DEPOT( [ table_name ] )

Parameters

| table_name | (Optional) The name of the table to delete from all of the depots in the cluster. |

Privileges

Superuser

Examples

Delete all of the data in the depots in the database:

```
=> SELECT CLEAR_DATA_DEPOT();
CLEAR_DATA_DEPOT
---------------------
Cache cleared
(1 row)
```

Delete the User_Experience_Data table from all of the depots in the cluster:

```
=> SELECT CLEAR_DATA_DEPOT('User_Experience_Data');
CLEAR_DATA_DEPOT
---------------------
Cache cleared
(1 row)
```

See Also

- Eon Mode Concepts

FINISH_FETCHING_FILES

Fetches all the files that are queued for fetching from the communal storage.

Syntax

FINISH_FETCHING_FILES()
Privileges
Superuser

Examples

Get all the files queued from communal storage:

```sql
=> SELECT FINISH_FETCHING_FILES();
FINISH_FETCHING_FILES
--------------------
Finished fetching all the files
(1 row)
```

See Also

- Eon Mode Concepts

**FLUSH_REAPER_QUEUE**

Deletes all of the data marked for deletion in the database. Use this function when you want to remove all of the data marked for deletion before the reaper performs its task.

**Note:** The reaper is a service task that deletes disk files.

Syntax

```
FLUSH_REAPER_QUEUE()
```

Privileges

Superuser

Examples

Removes all of the files that have been marked for deletion in the database:

```sql
=> SELECT FLUSH_REAPER_QUEUE();
FLUSH_REAPER_QUEUE
----------------------------------
Finished deleting all the files in the reaper queue
```
REBALANCE_SHARDS

Rebalances shard assignments across a cluster in Eon Mode. If the current session ends, the operation immediately aborts.

Run REBALANCE_SHARDS after you modify your cluster using ALTER NODE.

Syntax

REBALANCE_SHARDS()

Privileges

Superuser

Examples

The following example rebalances the shards of all the nodes in the database:

```sql
=> SELECT REBALANCE_SHARDS();
REBALANCE_SHARDS
--------------
REBALANCED_SHARDS
(1 row)
```

After running REBALANCE_SHARDS check the subscription status by querying the SESSION_SUBSCRIPTIONS table, for example:

```sql
=> SELECT * from session_subscriptions where is_participating='t' order by node_name, shard_name;
```

<table>
<thead>
<tr>
<th>node_id</th>
<th>node_name</th>
<th>shard_id</th>
<th>shard_name</th>
<th>is_participating</th>
</tr>
</thead>
<tbody>
<tr>
<td>45035996273704978</td>
<td>node01</td>
<td>45035996273704980</td>
<td>replica</td>
<td>t</td>
</tr>
<tr>
<td>45035996273704978</td>
<td>node01</td>
<td>45035996273704992</td>
<td>segment003</td>
<td>t</td>
</tr>
<tr>
<td>45035996273705124</td>
<td>node02</td>
<td>45035996273704980</td>
<td>replica</td>
<td>t</td>
</tr>
<tr>
<td>45035996273705124</td>
<td>node02</td>
<td>45035996273704988</td>
<td>segment002</td>
<td>t</td>
</tr>
<tr>
<td>45035996273946332</td>
<td>node04</td>
<td>45035996273704984</td>
<td>segment001</td>
<td>t</td>
</tr>
</tbody>
</table>

- Eon Mode Concepts

SYNC_CATALOG

Synchronizes the catalog to shared storage to allow revive as of the current catalog version in the case of an imminent crash. Vertica synchronizes all pending Checkpoint Epoch and Transaction Logs to shared storage.

Syntax

```
SYNC_CATALOG( [ 'node-name' ] )
```

Parameters

<table>
<thead>
<tr>
<th>node-name</th>
<th>The name of the node to synchronize. An empty argument list specifies to synchronize the catalog on all nodes.</th>
</tr>
</thead>
</table>

Privileges

Superuser

Examples

Synchronize the catalog on all nodes:

```
=> SELECT SYNC_CATALOG();
```

Synchronize the catalog on a specific node:

```
=> SELECT SYNC_CATALOG( 'node001' );
```
Epoch Management Functions

This section contains the epoch management functions specific to Vertica.

ADVANCE_EPOCH

Manually closes the current epoch and begins a new epoch.

Syntax

ADVANCE_EPOCH ([ integer ])

Parameters

| integer | Specifies the number of epochs to advance. |

Privileges

Superuser

Notes

This function is primarily maintained for backward compatibility with earlier versions of Vertica.

Example

The following command increments the epoch number by 1:

```sql
=> SELECT ADVANCE_EPOCH(1);
```

GET_AHM_EPOCH

Returns the number of the epoch in which the Ancient History Mark is located. Data deleted up to and including the AHM epoch can be purged from physical storage.
Syntax

GET_AHM_EPOCH()

Note: The AHM epoch is 0 (zero) by default (purge is disabled).

Privileges

None

Examples

=> SELECT GET_AHM_EPOCH();
       GET_AHM_EPOCH
--------------------------------------------
Current AHM epoch: 0
(1 row)

GET_AHM_TIME

Returns a TIMESTAMP value representing the Ancient History Mark. Data deleted up to and including the AHM epoch can be purged from physical storage.

Syntax

GET_AHM_TIME()

Privileges

None

Examples

=> SELECT GET_AHM_TIME();
       GET_AHM_TIME
--------------------------------------------
(1 row)
GET_CURRENT_EPOCH

The epoch into which data (COPY, INSERT, UPDATE, and DELETE operations) is currently being written.

Returns the number of the current epoch.

Syntax

GET_CURRENT_EPOCH()

Privileges

None

Examples

=> SELECT GET_CURRENT_EPOCH();
  GET_CURRENT_EPOCH
  ----------------------
       683
(1 row)

GET_LAST_GOOD_EPOCH

Returns the last good epoch number. If the database has no projections, the function returns an error.

Syntax

GET_LAST_GOOD_EPOCH()

Privileges

None
Examples

```sql
=> SELECT GET_LASTGOOD_EPOCH();
GET_LASTGOOD_EPOCH
------------------------
  682
(1 row)
```

**MAKE_AHM_NOW**

Sets the Ancient History Mark (AHM) to the greatest allowable value. This lets you purge all deleted data.

**Caution:** After running this function, you cannot query historical data that precedes the current epoch. Only database administrators should use this function.

MAKE_AHM_NOW performs the following operations:

- Advances the epoch.
- Performs a moveout operation on all projections.
- Sets the AHM to the last good epoch (LGE) — at least to the epoch that is current when you execute MAKE_AHM_NOW.

**Syntax**

`MAKE_AHM_NOW ( [ true ] )`

**Parameters**

<table>
<thead>
<tr>
<th>true</th>
<th>Allows AHM to advance when one of the conditions is true:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- One or more nodes are down.</td>
</tr>
<tr>
<td></td>
<td>- One projection is being refreshed from another (retentive refresh).</td>
</tr>
</tbody>
</table>

In either case, you must supply this argument to MAKE_AHM_NOW, otherwise Vertica returns an error. If you execute `MAKE_AHM_NOW(true)` during retentive refresh, Vertica rolls back the refresh operation and advances the AHM.
Privileges
Superuser

Setting AHM When Nodes Are Down

If you run MAKE_AHM_NOW while any node is down, you must supply an argument of true; otherwise, Vertica returns an error. In the following example, MAKE_AHM_NOW advances the AHM even though a node is down:

```
=> SELECT MAKE_AHM_NOW(true);
WARNING: Received no response from v_vmartdb_node0002 in get cluster LGE
WARNING: Received no response from v_vmartdb_node0002 in get cluster LGE
WARNING: Received no response from v_vmartdb_node0002 in set AHM
MAKE_AHM_NOW
AHM set (New AHM Epoch: 684)
(1 row)
```

Caution: If the AHM is advanced beyond the last good epoch of the failed nodes, those nodes must recover all data from scratch.

See Also

- `SET_AHM_EPOCH`
- `SET_AHM_TIME`

**SET_AHM_EPOCH**

Sets the Ancient History Mark (AHM) to the specified epoch. This function allows deleted data up to and including the AHM epoch to be purged from physical storage.

`SET_AHM_EPOCH` is normally used for testing purposes. Instead, consider using `SET_AHM_TIME` which is easier to use.

**Syntax**

```
SET_AHM_EPOCH ( epoch, [ true ])
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>epoch</td>
<td>Specifies one of the following:</td>
</tr>
<tr>
<td></td>
<td>- The number of the epoch in which to set the AHM</td>
</tr>
<tr>
<td></td>
<td>- Zero (0) (the default) disables PURGE</td>
</tr>
<tr>
<td>true</td>
<td>Allows the AHM to advance when nodes are down.</td>
</tr>
</tbody>
</table>

Note: If the AHM is advanced after the last good epoch of the failed nodes, those nodes must recover all data from scratch. Use with care.

Privileges
Superuser

Restrictions

The number of the specified epoch must be:

- Greater than the current AHM epoch
- Less than the current epoch
- Less than or equal to the cluster last good epoch (the minimum of the last good epochs of the individual nodes in the cluster)

Use the SYSTEM table to see current values of various epochs related to the AHM, For example:

```sql
=> SELECT * from SYSTEM;
- [ RECORD 1 ]-----------------------------------
current_timestamp | 2009-08-11 17:09:54.651413
current_epoch     | 1512
ahm_epoch         | 961
last_good_epoch   | 1510
refresh_epoch     | -1
designed_fault_tolerance | 1
node_count        | 4
node_down_count   | 0
current_fault_tolerance | 1
catalog_revision_number | 1590
wos_used_bytes    | 0
wos_row_count     | 0
```
All nodes must be up. You cannot use SET_AHM_EPOCH when any node in the cluster is down, except by using the optional true parameter.

When a node is down and you use MAKE_AHM_NOW, the following error is printed to the vertica.log:

```
Some nodes were excluded from setAHM. If their LGE is before the AHM they will perform full recovery.
```

Examples

The following command sets the AHM to a specified epoch of 12:

```
=> SELECT SET_AHM_EPOCH(12);
```

The following command sets the AHM to a specified epoch of 2 and allows the AHM to advance despite a failed node:

```
=> SELECT SET_AHM_EPOCH(2, true);
```

See Also

- **MAKE_AHM_NOW**
- **SET_AHM_TIME**
- **SYSTEM**

**SET_AHM_TIME**

Sets the Ancient History Mark (AHM) to the epoch corresponding to the specified time on the initiator node. This function allows historical data up to and including the AHM epoch to be purged from physical storage.

Syntax

```
SET_AHM_TIME ( time, [ true ] )
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>time</code></td>
<td>Is a <code>TIMESTAMP/TIMESTAMPZ</code> value that is automatically converted to the appropriate epoch number.</td>
</tr>
<tr>
<td><code>true</code></td>
<td>[Optional] Allows the AHM to advance when nodes are down. Note: If the AHM is advanced after the last good epoch of the failed nodes, those nodes must recover all data from scratch.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

Notes

- `SET_AHM_TIME` returns a `TIMESTAMP WITH TIME ZONE` value representing the end point of the AHM epoch.

- You cannot change the AHM when any node in the cluster is down, except by using the optional `true` parameter.

- When a node is down and you issue `SELECT MAKE_AHM_NOW()`, the following error is printed to the `vertica.log`:

```
Some nodes were excluded from setAHM. If their LGE is before the AHM they will perform full recovery.
```

Examples

Epochs depend on a configured epoch advancement interval. If an epoch includes a three-minute range of time, the purge operation is accurate only to within minus three minutes of the specified timestamp:

```sql
=> SELECT SET_AHM_TIME('2008-02-27 18:13');
set_ahm_time
------------------------------------------
AHM set to '2008-02-27 18:11:50-05'
(1 row)
```
Note: The –05 part of the output string is a time zone value, an offset in hours from UTC (Universal Coordinated Time, traditionally known as Greenwich Mean Time, or GMT).

In the previous example, the actual AHM epoch ends at 18:11:50, roughly one minute before the specified timestamp. This is because SET_AHM_TIME selects the epoch that ends at or before the specified timestamp. It does not select the epoch that ends after the specified timestamp because that would purge data deleted as much as three minutes after the AHM.

For example, using only hours and minutes, suppose that epoch 9000 runs from 08:50 to 11:50 and epoch 9001 runs from 11:50 to 15:50. SET_AHM_TIME('11:51') chooses epoch 9000 because it ends roughly one minute before the specified timestamp.

In the next example, suppose that a node went down at 11:00:00 AM on January 1st 2017. At noon, you want to advance the AHM to 11:15:00, but the node is still down.

Suppose you try to set the AHM using this command:

```
=> SELECT SET_AHM_TIME('2017-01-01 11:15:00');
```

Then you will receive an error message. Vertica prevents you from moving the AHM past the point where a node went down. Vertica returns this error to prevent the AHM from advancing past the down node's last good epoch. You can force the AHM to advance by supplying the optional second parameter:

```
=> SELECT SET_AHM_TIME('2017-01-01 11:15:00', true);
```

However, if you force the AHM past the last good epoch, the failed node will have to recover from scratch.

Flex Table Functions

This section contains helper functions for use in working with flex tables.
Note: While the functions are available to all users, they are applicable only to flex table, their associated flex_table_keys table and flex_table_view views. By computing keys and creating views from flex table data, the functions facilitate SELECT queries. One function restores the original keys table and view that were made when you first created the flex table. For more information, see Using Flex Tables.

BUILD_FLEXTABLE_VIEW

Creates, or re-creates, a view for a default or user-defined _keys table, ignoring any empty keys.

Syntax

BUILD_FLEXTABLE_VIEW('[[database.]schema.]flex-table' [ [,view-name'] [,'user-keys-table'] ])

Arguments

| [database.]schema | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>flex-table</td>
<td>The flex table name. By default, this function builds or rebuilds a view for the input table with the current contents of the associated flex_table_keys table.</td>
</tr>
<tr>
<td>view-name</td>
<td>A custom view name. Use this option to build a new view for flex-table with the name you specify.</td>
</tr>
<tr>
<td>user-keys-table</td>
<td>Specifies a keys table from which to create the view. Use this option if you created a custom user_keys table from the flex table map data, rather than from the default flex_table_keys table. The function builds a view from the keys in user_keys table, rather than from the flex_table_keys table.</td>
</tr>
</tbody>
</table>
Examples

The following examples show how to call build_flextable_view with 1, 2, or 3 arguments.

Creating a Default View

To create, or re-create, a default view:

1. Call the function with an input flex table, darkdata:

   ```sql
   => SELECT BUILD_FLEXTABLE_VIEW('darkdata');
   build_flextable_view
   ---------------------------
   The view public.darkdata_view is ready for querying
   (1 row)
   ```

   The function creates a view with the default name (darkdata_view) from the darkdata_keys table.

2. Query a key name (user.id) from the new or updated view:

   ```sql
   => SELECT "user.id" FROM darkdata_view;
   user.id
   -------
   340857907
   727774963
   390498773
   288187825
   164464905
   125434448
   601328899
   352494946
   (12 rows)
   ```

Creating a Custom Name View

To create, or re-create, a view with a custom name:

1. Call the function with two arguments, an input flex table, darkdata, and the name of the view to create, dd_view:

   ```sql
   => SELECT BUILD_FLEXTABLE_VIEW('darkdata', 'dd_view');
   build_flextable_view
   ---------------------------
   The view public.dd_view is ready for querying
   (1 row)
   ```

2. Query a key name (user.lang) from the new or updated view (dd_view):
Creating a View from a Custom Keys Table

To create a view from a custom _keys table with build_flextable_view, the custom table must have the same schema and table definition as the default table (darkdata_keys).

Create a custom keys table, using any of these three approaches:

1. Create a columnar table with all keys from the default keys table for a flex table (darkdata_keys):

```sql
=> CREATE TABLE new_darkdata_keys AS SELECT * FROM darkdata_keys;
CREATE TABLE
```

2. Create a columnar table without content (LIMIT 0) from the default keys table for a flex table (darkdata_keys):

```sql
=> CREATE TABLE new_darkdata_keys AS SELECT * FROM darkdata_keys LIMIT 0;
CREATE TABLE
```

```sql
kdb=> SELECT * FROM new_darkdata_keys;
key_name | frequency | data_type_guess
---------+-----------+----------------
(0 rows)
```

3. Create a columnar table without content (LIMIT 0) from the default keys table, and insert two values ('user.lang', 'user.name') into the key_name column:

```sql
=> CREATE TABLE dd_keys AS SELECT * FROM darkdata_keys limit 0;
CREATE TABLE
=> INSERT INTO dd_keys (key_name) values ('user.lang');
OUTPUT
-------
1
(1 row)
=> INSERT INTO dd_keys (key_name) values ('user.name');
OUTPUT
-------
```
1
(1 row)
=> SELECT * FROM dd_keys;
key_name | frequency | data_type_guess
----------+-----------+------------------
user.lang |           |                  
user.name |           |                  
(2 rows)

4. After creating a custom keys table, call build_flextable_view with all arguments (an input flex table, the new view name, the custom keys table):

```sql
=> SELECT BUILD_FLEXTABLE_VIEW('darkdata', 'dd_view', 'dd_keys');
build_flextable_view
--------------------------------------------
The view public.dd_view is ready for querying
(1 row)
```

5. Query the new view:

```sql
=> SELECT * FROM dd_view;
```

See Also

- `COMPUTE_FLEXTABLE_KEYS`
- `COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW`
- `MATERIALIZE_FLEXTABLE_COLUMNS`
- `RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW`

### COMPUTE_FLEXTABLE_KEYS

Computes the virtual columns (keys and values) from the flex table VMap data. Use this function to compute keys without creating an associated table view. To also build a view, use `COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW`.

The function stores its results in the associated flex _keys table, which has the following columns:

- `key_name`
- `frequency`
data_type_guess

For more information, see Computing Flex Table Keys.

Syntax

COMPUTE_FLEXTABLE_KEYS('[[database.]schema.]flex-table')

Arguments

<table>
<thead>
<tr>
<th>[database.]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject</th>
</tr>
</thead>
<tbody>
<tr>
<td>flex-table</td>
<td>The name of a flex table.</td>
</tr>
</tbody>
</table>

Using Data Type Guessing

The results of the flex_keys table data_type_guess column depend on the EnableBetterFlexTypeGuessing configuration parameter. By default, the parameter is 1 (ON). This setting results in the function returning all non-string keys in the data_type_guess column as one of the following types (and others listed in SQL Data Types):

- BOOLEAN
- INTEGER
- FLOAT
- TIMESTAMP
- DATE

Setting the configuration parameter to 0 (OFF), results in the function returning only string types ([[LONG]VARCHAR] or [[LONG] VARBINARY) for all values in the data_type_guess column of the flex_keys table.
Assigning Flex Key Data Types

Use the sample CSV data in this section to compare the results of using or not using the EnableBetterFlexTypeGuessing configuration parameter. When the parameter is ON, the function determines key non-string data types in your map data more accurately. The default for the parameter is 1 (ON).

Year,Quarter,Region,Species,Grade,Pond Value,Number of Quotes,Available
2015,1,2 - Northwest Oregon & Willamette,Douglas-fir,1P,$615.12 ,12,No
2015,1,2 - Northwest Oregon & Willamette,Douglas-fir,SM,$610.78 ,12,Yes
2015,1,2 - Northwest Oregon & Willamette,Douglas-fir,2S,$596.00 ,20,Yes
2015,1,2 - Northwest Oregon & Willamette,Hemlock,P,$520.00 ,6,Yes
2015,1,2 - Northwest Oregon & Willamette,Hemlock,SM,$510.00 ,6,No
2015,1,2 - Northwest Oregon & Willamette,Hemlock,2S,$490.00 ,14,No

To compare the data type assignment results, complete the following steps:

1. Save the CSV data file (here, as trees.csv).

2. Create a flex table (trees) and load trees.csv using the fcsvparser:

```sql
=> CREATE FLEX TABLE trees();
=> COPY trees FROM '/home/dbadmin/tempdat/trees.csv' PARSER fcsvparser();
```

3. Use COMPUTE_FLEXTABLE KEYS with the trees flex table.

```sql
=> SELECT COMPUTE_FLEXTABLE KEYS('trees');
COMPUTE_FLEXTABLE KEYS
-----------------------------------------------
Please see public.trees_keys for updated keys
(1 row)
```

4. Query the trees_keys table output:

```sql
=> SELECT * FROM trees_keys;
key_name   | frequency | data_type_guess
-----------|-----------|------------------
Year       | 6         | Integer
Quarter    | 6         | Integer
Region     | 6         | Varchar(66)
Available  | 6         | Boolean
Number of Quotes | 6     | Integer
Grade      | 6         | Varchar(20)
Species    | 6         | Varchar(22)
Pond Value | 6         | Numeric(8,3)
(8 rows)
```

5. Set the EnableBetterFlexTypeGuessing parameter to 0 (OFF).
6. Call `COMPUTE_FLEXTABLE KEYS` with the `trees` flex table again.

7. Query the `trees_keys` table to compare the `data_type_guess` values with the previous results. Without the configuration parameter set, all of the non-string data types are `VARCHAR`S of various lengths:

```
=> SELECT * FROM trees_keys;
key_name | frequency | data_type_guess
---------|-----------|-------------------
Year      | 6         | varchar(20)       
Quarter   | 6         | varchar(20)       
Region    | 6         | varchar(66)       
Available | 6         | varchar(20)       
Grade     | 6         | varchar(20)       
Number of Quotes | 6 | varchar(20) 
Pond Value | 6   | varchar(20)       
Species   | 6         | varchar(22)       
(8 rows)
```

8. To maintain accurate results for non-string data types, set the `EnableBetterFlexTypeGuessing` parameter back to 1 (ON).

For more information about setting the `EnableBetterFlexTypeGuessing` configuration parameter, see Setting Flex Table Configuration Parameters.

See Also

- `BUILD_FLEXTABLE_VIEW`
- `COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW`
- `MATERIALIZE_FLEXTABLE_COLUMNS`
- `RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW`

**COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW**

Combines the functionality of `BUILD_FLEXTABLE_VIEW` and `COMPUTE_FLEXTABLE_KEYS` to compute virtual columns (keys) from the VMap data of a flex table and construct a view. Creating a view with this function ignores empty keys. If you do not need to perform both operations together, use one of the single-operation functions instead.

**Syntax**

```
COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW( 'flex_table' )
```
Arguments

| flex_table | The name of a flex table. |

Examples

This example shows how to call the function for the darkdata flex table.

```sql
=> SELECT COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW('darkdata');
compute_flextable_keys_and_build_view
-----------------------------------------------------------------------------------
Please see public.darkdata_keys for updated keys
The view public.darkdata_view is ready for querying
(1 row)
```

See Also

- `BUILD_FLEXTABLE_VIEW`
- `COMPUTE_FLEXTABLE_KEYS`
- `MATERIALIZE_FLEXTABLE_COLUMNS`
- `RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW`

EMPTYMAP

Constructs a new VMap with one row but without keys or data. Use this transform function to populate a map without using a flex parser. Instead, you use either from SQL queries or from map data present elsewhere in the database.

Syntax

```sql
EMPTYMAP()
```

Arguments

None
Examples

Create an Empty Map

=> SELECT EMPTYMAP();

emptymap

\001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000\000

(1 row)

Create an Empty Map from an Existing Flex Table

If you create an empty map from an existing flex table, the new map has the same number of rows as the table from which it was created.

This example shows the result if you create an empty map from the `darkdata` table, which has 12 rows of JSON data:

=> SELECT EMPTYMAP() FROM darkdata;

emptymap

\001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000\000\000
\001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000\000\000
\001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000\000\000
\001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000\000\000
\001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000\000\000
\001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000\000\000
\001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000\000\000
\001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000\000\000
\001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000\000\000
\001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000\000\000
\001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000\000\000
\001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000\000\000
\001\000\000\000\004\000\000\000\000\000\000\000\000\000\000\000\000\000

MAPAGGREGATE

Returns a LONG VARBINARY VMap with keys and value pairs supplied from two VARCHAR input columns of an existing columnar table. Using this function requires specifying an over() clause for the source table.

Syntax

MAPAGGREGATE(source_column1, source_column2)

Arguments

<table>
<thead>
<tr>
<th>source_column1</th>
<th>Table column with values to use as the keys of the key/value pair of the returned VMap data.</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_column2</td>
<td>Table column with values to use as the values in the key/value pair of the returned VMap data.</td>
</tr>
</tbody>
</table>

Examples

This example creates a columnar table btest, with two VARCHAR columns, named keys and values, and adds three sets of values:

```sql
=> CREATE TABLE btest(keys varchar(10), values varchar(10));
CREATE TABLE
=> COPY btest FROM stdin;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> one|1
>> two|2
>> three|3
>> \.```

```sql
Vertica Analytic Database (9.1.x)  Page 3116 of 6174
```
After populating the btest table, call `mapaggregate()`, using the `over (PARTITION BEST)` clause. This call returns the `raw_map` data:

```sql
=> SELECT MAPAGGREGATE(keys, values) OVER(PARTITION BEST) FROM btest;
```

```
raw_map

{ "one": "1",
  "three": "3",
  "two": "2"
}
```

The next example illustrates using `MAPTOSTRING()` with the returned `raw_map` from `mapaggregate()` to see the values:

```sql
=> SELECT MAPTOSTRING(raw_map) FROM (SELECT MAPAGGREGATE(keys, values) OVER(PARTITION BEST) FROM btest) bit;
```

```
maptoString

{ "one": "1",
  "three": "3",
  "two": "2"
}
```

- `MAPSIZE`
- `MAPTOSTRING`
- `MAPVALUES`
- `MAPVERSION`
MAPCONTAINSKEY

Determines whether a VMap contains a virtual column (key). This scalar function returns true (t), if the virtual column exists, or false (f) if it does not. Determining that a key exists before calling maplookup() lets you distinguish between NULL returns. The maplookup() function uses for both a non-existent key and an existing key with a NULL value.

Syntax

MAPCONTAINSKEY(VMap_data, 'virtual_column_name')

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VMap_data</td>
<td>Any VMap data. The VMap can exist as:</td>
</tr>
<tr>
<td></td>
<td>• The <strong>raw</strong> column of a flex table</td>
</tr>
<tr>
<td></td>
<td>• Data returned from a map function such as</td>
</tr>
<tr>
<td></td>
<td>maplookup()</td>
</tr>
<tr>
<td></td>
<td>• Other database content</td>
</tr>
<tr>
<td>virtual_column_name</td>
<td>The name of the key to check.</td>
</tr>
</tbody>
</table>

Examples

This example shows how to use the mapcontainskey() functions with maplookup(). View the results returned from both functions. Check whether the empty fields that maplookup() returns indicate a NULL value for the row (t) or no value (f):

You can use mapcontainskey( ) to determine that a key exists before calling maplookup(). The maplookup() function uses both NULL returns and existing keys with NULL values to indicate a non-existent key.

```sql
=> SELECT MAPLOOKUP(__raw__, 'user.location'), MAPCONTAINSKEY(__raw__, 'user.location')
FROM darkdata ORDER BY 1;
maplookup | mapcontainskey
-----------|----------------|
 | t
 | t
 | t
 | t
```
### MAPCONTAINSVALUE

Determines whether a VMap contains a specific value. Use this scalar function to return true (t), if the value exists, or false (f), if it does not.

**Syntax**

```
MAPCONTAINSVALUE(VMap_data, 'virtual_column_value')
```

- **MAPVALUES**
- **MAPVERSION**
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VMap_data</td>
<td>Any VMap data. The VMap can exist as:</td>
</tr>
<tr>
<td></td>
<td>- The <strong>raw</strong> column of a flex table</td>
</tr>
<tr>
<td></td>
<td>- Data returned from a map function such as maplookup()</td>
</tr>
<tr>
<td></td>
<td>- Other database content</td>
</tr>
<tr>
<td>virtual_column_value</td>
<td>The value whose existence you want to confirm.</td>
</tr>
</tbody>
</table>

Examples

This example shows how to use mapcontainsvalue() to determine whether or not a virtual column contains a particular value. Create a flex table (ftest), and populate it with some virtual columns and values. Name both virtual columns one:

```sql
=> CREATE FLEX TABLE ftest();
CREATE TABLE
=> copy ftest from stdin parser fjsonparser();
Enter data to be copied followed by a newline. End with a backslash and a period on a line by itself.
>> {"one":1, "two":2}
>> {"one":"one", "two":2}
>> .
```

Call mapcontainsvalue() on the ftest map data. The query returns false (f) for the first virtual column, and true (t) for the second, which contains the value one:

```sql
=> SELECT MAPCONTAINSVALUE(__raw__, 'one') FROM ftest;
mapcontainsvalue
----------------------
f
| t                     |
(2 rows)
```

- [EMPTYMAP](#)
- [MAPAGGREGATE](#)
- [MAPCONTAINSKEY](#)
MAPDELIMITEDEXTRACTOR

Extracts data with a delimiter character, and other optional arguments, returning a single VMap value. The USING PARAMETERS phrase specifies optional parameters for the function.

Syntax

```
MAPDELIMITEDEXTRACTOR (record_value USING PARAMETERS delimiter=character
[,header_names= value,]
[trim= value,]
[treat_empty_val_as_null = value,])
```

Arguments

| record_value | VARCHAR | String containing a JSON or delimited format record on which the expression will be applied. |

Parameters

<table>
<thead>
<tr>
<th>delimiter</th>
<th>VARCHAR</th>
<th>Single delimiter character.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Default value:</td>
</tr>
<tr>
<td>header_names</td>
<td>VARCHAR</td>
<td>[Optional] Specifies header names for columns.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default value: ucoln</td>
</tr>
</tbody>
</table>
Where \( n \) is the column offset number, starting with 0 for the first column. The function uses default values if you do not specify values for the header_names parameter.

<table>
<thead>
<tr>
<th>trim</th>
<th>BOOLEAN</th>
<th>[Optional] Trims white space from header names and field values.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td><strong>Default value:</strong> true</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>treat_empty_val_as_null</th>
<th>BOOLEAN</th>
<th>[Optional] Specifies that empty fields become NULLs, rather than empty strings (' ').</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td><strong>Default value:</strong> true</td>
</tr>
</tbody>
</table>

**Examples**

These examples use a short set of delimited data:

```
<table>
<thead>
<tr>
<th>Name</th>
<th>CITY</th>
<th>New city</th>
<th>State</th>
<th>zip</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tom</td>
<td>BOSTON</td>
<td>boston</td>
<td>MA</td>
<td>01</td>
</tr>
<tr>
<td>Eric</td>
<td>Burlington</td>
<td>BURLINGTON</td>
<td>MA</td>
<td>02</td>
</tr>
<tr>
<td>Jamie</td>
<td>cambridge</td>
<td>CAMBRIDGE</td>
<td>MA</td>
<td>08</td>
</tr>
</tbody>
</table>
```

To begin, save this data as `delim.dat`.

1. **Create a flex table, dflex:**

   ```
   => CREATE FLEX TABLE dflex();
   CREATE TABLE
   ```

2. **Use COPY to load the delim.dat file. Use the flex tables fdelimitedparser with the header='false' option:**

   ```
   => COPY dflex FROM '/home/release/kmm/flextables/delim.dat' parser fdelimitedparser (header='false');
   Rows Loaded
   ------------
   4
   (1 row)
   ```

3. **Create a columnar table, dtab, with an identity id column, a delim column, and a column to hold a VMap, named vmap:**

   ```
   => CREATE TABLE dtab (id IDENTITY(1,1), delim varchar(128), vmap long varbinary(512));
   CREATE TABLE
   ```
4. Use COPY to load the delim.dat file into the dtab table. For the mapdelimitedextractor function, add a header row with USING PARAMETERS header_names= option to specify the header row for the sample data, along with delimiter '!':

```sql
=> COPY dtab(delim, vmap AS MAPDELIMITEDEXTRACTOR (delim
                    USING PARAMETERS header_names='Name|CITY|New City|State|Zip')) FROM
'/home/dbadmin/data/delim.dat'
DE delimiter '!
Rows Loaded
----------
4
(1 row)
```

5. Use maptostring for the flex table dflex to view the __raw__ column contents. Notice the default header names in use (ucol0 – ucol4), since you specified header='false' when you loaded the flex table:

```sql
=> SELECT MAPTOSTRING(__raw__) FROM dflex limit 10;
maptostring

{  
  "ucol0" : "Jamie",
  "ucol1" : "cambridge",
  "ucol2" : "CAMBRIDGE",
  "ucol3" : "MA",
  "ucol4" : "08"
}

{  
  "ucol0" : "Name",
  "ucol1" : "CITY",
  "ucol2" : "New city",
  "ucol3" : "State",
  "ucol4" : "zip"
}

{  
  "ucol0" : "Tom",
  "ucol1" : "BOSTON",
  "ucol2" : "boston",
  "ucol3" : "MA",
  "ucol4" : "01"
}

{  
  "ucol0" : "Eric",
  "ucol1" : "Burlington",
  "ucol2" : "BURLINGTON",
  "ucol3" : "MA",
  "ucol4" : "02"
}
```
6. Use mapTostring again, this time with the dtab table's vmap column. Compare the results of this output to those for the flex table. Note that mapTostring returns the header_name parameter values you specified when you loaded the data:

```sql
=> SELECT MAPTOSTRING(vmap) FROM dtab;
```

```
maptoString
-------------------
{  
"CITY" : "CITY",
"Name" : "Name",
"New City" : "New city",
"State" : "State",
"Zip" : "zip"
}
{  
"CITY" : "BOSTON",
"Name" : "Tom",
"New City" : "boston",
"State" : "MA",
"Zip" : "02121"
}
{  
"CITY" : "Burlington",
"Name" : "Eric",
"New City" : "BURLINGTON",
"State" : "MA",
"Zip" : "02482"
}
{  
"CITY" : "cambridge",
"Name" : "Jamie",
"New City" : "CAMBRIDGE",
"State" : "MA",
"Zip" : "02811"
}
```

(4 rows)

7. Query the delim column to view the contents differently:

```sql
=> SELECT delim FROM dtab;
```

```
delim
--------
Name|CITY|New city|State|zip
Tom|BOSTON|boston|MA|02121
Eric|Burlington|BURLINGTON|MA|02482
Jamie|cambridge|CAMBRIDGE|MA|02811
```

(4 rows)
See Also

- MAPJSONEXTRACTOR
- MAPREGEXEXTRACTOR

MAPITEMS

Returns information about items in a VMap. Use this transform function with one or more optional arguments to access polystructured values within the VMap data. This function requires an OVER() clause.

Syntax

```
MAPITEMS(VMap_data [, passthrough_arg [,...]])
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VMap_data</td>
<td>Any VMap data. The VMap can exist as:</td>
</tr>
<tr>
<td></td>
<td>- The <strong>raw</strong> column of a flex table</td>
</tr>
<tr>
<td></td>
<td>- Data returned from a map function such as maplookup()</td>
</tr>
<tr>
<td></td>
<td>- Other database content</td>
</tr>
<tr>
<td>passthrough_arg</td>
<td>[Optional] One or more arguments indicating keys within the map data in VMap_data</td>
</tr>
</tbody>
</table>

Examples

The following examples illustrate using mapItems() with the over(PARTITION BEST) clause.

This example determines the number of virtual columns in the map data using a flex table, labeled darkmountain. Query using the count() function to return the number of virtual columns in the map data:

```
=> SELECT COUNT(keys) FROM (SELECT MAPITEMS(darkmountain.__raw__) OVER(PARTITION BEST) FROM darkmountain) AS a;
```
count
-------
  19
(1 row)

The next example determines what items exist in the map data:

```sql
=> SELECT * FROM (SELECT MAPITEMS(darkmountain.__raw__) OVER(PARTITION BEST) FROM darkmountain) AS a;

<table>
<thead>
<tr>
<th>keys</th>
<th>values</th>
</tr>
</thead>
<tbody>
<tr>
<td>hike_safety</td>
<td>50.6</td>
</tr>
<tr>
<td>name</td>
<td>Mt Washington</td>
</tr>
<tr>
<td>type</td>
<td>mountain</td>
</tr>
<tr>
<td>height</td>
<td>17000</td>
</tr>
<tr>
<td>hike_safety</td>
<td>12.2</td>
</tr>
<tr>
<td>name</td>
<td>Denali</td>
</tr>
<tr>
<td>type</td>
<td>mountain</td>
</tr>
<tr>
<td>height</td>
<td>29029</td>
</tr>
<tr>
<td>hike_safety</td>
<td>34.1</td>
</tr>
<tr>
<td>name</td>
<td>Everest</td>
</tr>
<tr>
<td>type</td>
<td>mountain</td>
</tr>
<tr>
<td>height</td>
<td>14000</td>
</tr>
<tr>
<td>hike_safety</td>
<td>22.8</td>
</tr>
<tr>
<td>name</td>
<td>Kilimanjaro</td>
</tr>
<tr>
<td>type</td>
<td>mountain</td>
</tr>
<tr>
<td>height</td>
<td>29029</td>
</tr>
<tr>
<td>hike_safety</td>
<td>15.4</td>
</tr>
<tr>
<td>name</td>
<td>Mt St Helens</td>
</tr>
<tr>
<td>type</td>
<td>volcano</td>
</tr>
</tbody>
</table>
```

(19 rows)

Directly Query a Key Value in a VMap

Review the following JSON input file, `simple.json`. In particular, notice the array called `three_Array`, and its four values:

```json
{
    "one": "one",
    "two": 2,
    "three_Array": [
        "three_One",
        "three_Two",
        3,
        "three_Four"
    ],
    "four": 4,
    "five_Map": {
        "five_One": 51,
        "five_Two": "Fifty-two",
        "five_Three": "fifty three",
        "five_Four": 54,
        "five_Five": "5 x 5"
    },
    "six": 6
}
```
1. Create a flex table, mapper:

```sql
=> CREATE FLEX TABLE mapper();
CREATE TABLE
```

1. Load `simple.json` into the flex table mapper:

```sql
=> COPY mapper FROM '/home/dbadmin/data/simple.json' parser fjsonparser (flatten_arrays=false, flatten_maps=false);
Rows Loaded
----------
    1
(1 row)
```

2. Call `mapkeys` on the flex table's `__raw__` column to see the flex table's keys, but not the key submaps. The return values indicate `three_Array` as one of the virtual columns:

```sql
=> SELECT MAPKEYS(__raw__) OVER() FROM mapper;
keys
-----
five_Map
four
one
six
three_Array
two
(6 rows)
```

3. Call `mapitems` on flex table mapper with `three_Array` as a pass-through argument to the function. The call returns these array values:

```sql
=> SELECT __identity__, mapitems(three_Array) OVER(PARTITION BY __identity__) FROM mapper;
__identity__ | keys | values
-------------|------|-------
           1 | @    | three_One
           1 | 1    | three_Two
           1 | 2    | 3
           1 | 3    | three_Four
(4 rows)
```

See Also

- `MAPAGGREGATE`
- `MAPCONTAINSKEY`
- `MAPCONTAINSVALUE`
MAPJSONEXTRACTOR

Extracts content of repeated JSON data objects, including nested maps, or data with an outer list of JSON elements. The USING PARAMETERS phrase specifies optional parameters for the function. Empty input does not generate a Warning or Error.

**Note:** The function fails if the output size of the function is greater than 65000.

Syntax

```
MAPJSONEXTRACTOR (record_value [USING PARAMETERS [flatten_maps=value] [,flatten_arrays = value,] [reject_on_duplicate = value,] [reject_on_empty_key = value,] [omit_empty_keys = value,] [start_point = value]])
```

Arguments

| record_value | VARCHAR | String containing a JSON or delimited format record on which the expression will be applied. |

Parameters

<table>
<thead>
<tr>
<th>flatten_maps</th>
<th>BOOLEAN</th>
<th>[Optional] Flattens sub-maps within the JSON data, separating map levels with a period (.).</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td><strong>Default value:</strong> true</td>
</tr>
</tbody>
</table>
| flatten_arrays | BOOLEAN | [Optional] Converts lists to sub-maps with integer keys. Lists are not flattened by default.  
Default value: false |
| reject_on_duplicate | BOOLEAN | [Optional] Specifies whether to ignore duplicate records (false), or to reject duplicates (true). In either case, the load continues.  
Default value: false |
| reject_on_empty_key | BOOLEAN | [Optional] Rejects any row containing a key without a value (reject_on_empty_key=true).  
Default value: false |
| omit_empty_keys | BOOLEAN | [Optional] Omits any key from the load data that does not have a value (omit_empty_keys=true).  
Default value: false |
| start_point | CHAR | [Optional] Specifies the name of a key in the JSON load data at which to begin parsing. The parser ignores all data before the start_point value. The parser processes data after the first instance, and up to the second, ignoring any remaining data.  
Default value: none |

**Examples**

These examples use the following sample JSON data:

```json

{ "id": "5001", "type": "None" }
{ "id": "5002", "type": "Glazed" }
{ "id": "5005", "type": "Sugar" }
{ "id": "5007", "type": "Powdered Sugar" }
{ "id": "5004", "type": "Maple" }
```

Save this example data as **bake_single.json**, and load that file.

1. Create a flex table, **flexjson**:

   ```sql
   => CREATE FLEX TABLE flexjson();
   CREATE TABLE
   ```

2. Use **COPY** to load the **bake_single.json** file with the **fjsonparser** parser:
3. Create a columnar table, coljson, with an identity column (id), a json column, and 
a column to hold a VMap, called vmap:

```
=> CREATE TABLE coljson(id INT IDENTITY(1,1), json VARCHAR(128), vmap LONG VARBINARY(10000));
CREATE TABLE
```

4. Use COPY to load the bake_single.json file into the coljson table, using the 
mapjsonextractor function:

```
=> COPY coljson (json, vmap AS MapJSONExtractor(json)) FROM '/home/dbadmin/data/bake_single.json';
Rows Loaded
--------------
5
(1 row)
```

5. Use the maptostring function for the flex table flexjson to output the __raw__ column contents as strings:

```
=> SELECT MAPTOSTRING(__raw__) FROM flexjson limit 5;
maptostring
-------------------------------------------------------------

  { "id" : "5001",
    "type" : "None"
  }

  { "id" : "5002",
    "type" : "Glazed"
  }

  { "id" : "5005",
    "type" : "Sugar"
  }

  { "id" : "5007",
    "type" : "Powdered Sugar"
  }

  { "id" : "5004",
    "type" : "Maple"
  }
```
6. Use the maptostring function again, this time with the coljson table's vmap column and compare the results. The element order differs:

```sql
SELECT MAPTOSTRING(vmap) FROM coljson LIMIT 5;
```

```
maptostring

```
```

```json
{ 
  "id" : "5001",
  "type" : "None"
}
```
```

```json
{ 
  "id" : "5002",
  "type" : "Glazed"
}
```
```

```json
{ 
  "id" : "5004",
  "type" : "Maple"
}
```
```

```json
{ 
  "id" : "5005",
  "type" : "Sugar"
}
```
```

```json
{ 
  "id" : "5007",
  "type" : "Powdered Sugar"
}
```
```

(5 rows)
```

See Also

- MAPDELIMITEDEXTRACTOR
- MAPREGEXEXTRACTOR

MAPKEYS

Returns the virtual columns (and values) present in any VMap data. This transform function requires an over(PARTITION BEST) clause.
Syntax

MAPKEYS(VMap_data)

Arguments

<table>
<thead>
<tr>
<th>VMap_data</th>
<th>Any VMap data. The VMap can exist as:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The <strong>raw</strong> column of a flex table</td>
</tr>
<tr>
<td></td>
<td>Data returned from a map function such as maplookup()</td>
</tr>
<tr>
<td></td>
<td>Other database content</td>
</tr>
</tbody>
</table>

Examples

Determine Number of Virtual Columns in Map Data

This example shows how to create a query, using an `over(PARTITION BEST)` clause with a flex table, darkdata to find the number of virtual column in the map data. The table is populated with JSON tweet data.

```sql
=> SELECT COUNT(keys) FROM (SELECT MAPKEYS(darkdata.__raw__) OVER(PARTITION BEST) FROM darkdata) AS a;
      count
-----
     550
(1 row)
```

Query Ordered List of All Virtual Columns in the Map

This example shows a snippet of the return data when you query an ordered list of all virtual columns in the map data:

```sql
=> SELECT * FROM (SELECT MAPKEYS(darkdata.__raw__) OVER(PARTITION BEST) FROM darkdata) AS a;
   keys
------------------
 contributors
coordinates
created_at
delete.status.id
delete.status.id_str
delete.status.user_id
delete.status.user_id_str
entities.hashtags
```

- EMPTYMAP
- MAPAGGREGATE
- MAPCONTAINSKEY
- MAPCONTAINSVALUE
- MAPITEMS
- MAPKEYSINFO
- MAPLOOKUP
- MAPSIZE
- MAPTOSTRING
- MAPVALUES
- MAPVERSION

MAPKEYSINFO

Returns virtual column information from a given map. This transform function requires an over(PARTITION BEST) clause.
Syntax

MAPKEYSINFO(VMap_data)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VMap_data</td>
<td>Any VMap data. The VMap can exist as:</td>
</tr>
<tr>
<td></td>
<td>• The <strong>raw</strong> column of a flex table</td>
</tr>
<tr>
<td></td>
<td>• Data returned from a map function such as</td>
</tr>
<tr>
<td></td>
<td>maplookup()</td>
</tr>
<tr>
<td></td>
<td>• Other database content</td>
</tr>
</tbody>
</table>

Returns

This function is a superset of the MAPKEYS() function. It returns the following information about each virtual column:

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>keys</td>
<td>The virtual column names in the raw data.</td>
</tr>
<tr>
<td>length</td>
<td>The data length of the key name, which can differ from the actual string length.</td>
</tr>
<tr>
<td>type_oid</td>
<td>The OID type into which the value should be converted. Currently, the type is always 116 for a LONG VARCHAR, or 199 for a nested map that is stored as a LONG VARBINARY.</td>
</tr>
<tr>
<td>row_num</td>
<td>The number of rows in which the key was found.</td>
</tr>
<tr>
<td>field_num</td>
<td>The field number in which the key exists.</td>
</tr>
</tbody>
</table>

Examples

This example shows a snippet of the return data you receive if you query an ordered list of all virtual columns in the map data:

```sql
=> SELECT * FROM (SELECT MAPKEYSINFO(darkdata.__raw__) OVER(PARTITION BEST) FROM darkdata) AS a;
keys | length | type_oid | row_num | field_num
-----------------------------------------------+-----+---------+--------+---------
```
| contributors | 0 | 116 | 1 | 0 |
| coordinates | 0 | 116 | 1 | 1 |
| created_at | 30 | 116 | 1 | 2 |
| entities.hashtags | 93 | 199 | 1 | 3 |
| entities.media | 772 | 199 | 1 | 4 |
| entities.urls | 16 | 199 | 1 | 5 |
| entities.user_mentions | 16 | 199 | 1 | 6 |
| favorited | 1 | 116 | 1 | 7 |
| geo | 0 | 116 | 1 | 8 |
| id | 18 | 116 | 1 | 9 |
| id_str | 18 | 116 | 1 | 10 |

MAPLOOKUP

Returns single-key values from VMAP data. This scalar function returns a LONG VARCHAR, with values, or NULL if the virtual column does not have a value.

Using maplookup is case insensitive to virtual column names. To avoid loading same-name values, set the fjsonparser parser reject_on_duplicate parameter to true when data loading.

You can control the behavior for non-scalar values in a VMAP (like arrays), when loading data with the fjsonparser or favroparser parsers and its flatten-arrays argument. See Loading JSON Data and the FJSONPARSER reference.

For information about using maplookup() to access nested JSON data, see Querying Nested Data.

Syntax

MAPLOOKUP(VMap_data, 'virtual_column_name' [USING PARAMETERS [case_sensitive={false | true}] [, buffer_size=n] ] )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VMap_data</td>
<td>Any VMap data. The VMap can exist as:</td>
</tr>
<tr>
<td>virtual_column_name</td>
<td>The name of the virtual column whose values this function returns.</td>
</tr>
<tr>
<td>buffer_size</td>
<td>[Optional parameter] Specifies the maximum length (in bytes) of each value returned for virtual_column_name. To return all values for virtual_column_name, specify a buffer_size equal to or greater than (=&gt;) the number of bytes for any returned value. Any returned values greater in length than buffer_size are rejected. <strong>Default value:</strong> 0 (No limit on buffer_size)</td>
</tr>
<tr>
<td>case_sensitive</td>
<td>[Optional parameter]</td>
</tr>
</tbody>
</table>
Specifies whether to return values for virtual_column_name if keys with different cases exist.

**Example:**

```sql
(... USING PARAMETERS case_sensitive=true)
```

**Default value:** false

**Examples**

This example returns the values of one virtual column, user.location:

```sql
=> SELECT MAPLOOKUP(__raw__, 'user.location') FROM darkdata ORDER BY 1;
```

```

</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>
1. Create a flex table, logs.

2. Load the simple_name.json data into logs, using the fjsonparser. Specify the flatten_arrays option as True:

```sql
=> COPY logs FROM '/home/dbadmin/data/simple_name.json'
    PARSER fjsonparser(flatten_arrays=True);
```

3. Use maplookup with buffer_size=0 for the logs table name key. This query returns all of the values:

```sql
=> SELECT MAPLOOKUP(_raw__, 'name' USING PARAMETERS buffer_size=0) FROM logs;

<table>
<thead>
<tr>
<th>name</th>
</tr>
</thead>
<tbody>
<tr>
<td>sierra</td>
</tr>
<tr>
<td>ben</td>
</tr>
<tr>
<td>janis</td>
</tr>
<tr>
<td>jen</td>
</tr>
</tbody>
</table>

(4 rows)
```

4. Next, call maplookup() three times, specifying the buffer_size parameter as 3, 5, and 6, respectively. Now, maplookup() returns values with a byte length less than or equal to (<=) buffer_size:

```sql
=> SELECT MAPLOOKUP(_raw__, 'name' USING PARAMETERS buffer_size=3) FROM logs;

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

(4 rows)

=> SELECT MAPLOOKUP(_raw__, 'name' USING PARAMETERS buffer_size=6) FROM logs;

<table>
<thead>
<tr>
<th>name</th>
</tr>
</thead>
<tbody>
<tr>
<td>sierra</td>
</tr>
<tr>
<td>janis</td>
</tr>
<tr>
<td>jen</td>
</tr>
<tr>
<td>ben</td>
</tr>
</tbody>
</table>

(4 rows)
Disambiguate Empty Output Rows

This example shows how to interpret empty rows. Using maplookup without first checking whether a key exists can be ambiguous. When you review the following output, 12 empty rows, you cannot determine whether a user.location key has:

- A non-NULL value
- A NULL value
- No value

```
=> SELECT MAPLOOKUP(__raw__, 'user.location') FROM darkdata;
maplookup
-----------

(12 rows)
```

To disambiguate empty output rows, use the mapcontainskey() function in conjunction with maplookup(). When maplookup returns an empty field, the corresponding value from mapcontainskey indicates t for a NULL or other value, or f for no value.

The following example output using both functions lists rows with NULL or a name value as t, and rows with no value as f:

```
=> SELECT MAPLOOKUP(__raw__, 'user.location'), MAPCONTAINSKEY(__raw__, 'user.location')
FROM darkdata ORDER BY 1;
maplookup | mapcontainskey
-----------+-------------------
   t       |                   
   t       |                   
   t       |                   
   t       |                   
     | t              
     | t              
     | f              
     | f              
     | f              
     | f              
     | f              
     | f
(12 rows)
```

Check for Case-Sensitive Virtual Columns
You can use maplookup() with the case_sensitive parameter to return results when key names with different cases exist.

1. Save the following sample content as a JSON file. This example saves the file as repeated_key_name.json:

```json
{
  "test": "lower1"
}
{
  "TEST": "upper1"
}
{
  "TEst": "half1"
}
{
  "test": "lower2",
  "TEst": "half2"
}
{
  "TEST": "upper2",
  "TEst": "half3"
}
{
  "test": "lower3",
  "TEST": "upper3"
}
{
  "TEst": "half4",
  "test": "lower4",
  "TEST": "upper4"
}
{
  "TesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTesttestTest12345": "2"
}
```

2. Create a flex table, dupe, and load the JSON file:

```
=> CREATE FLEX TABLE dupe();
CREATE TABLE
dbt=> COPY dupe FROM '/home/release/KData/repeated_key_name.json' parser fjsonparser();
Rows Loaded
----------
  8
(1 row)
```

- MAPKEYSINFO
- MAPSIZE
- MAPTOSTRING
- MAPVALUES
- MAPVERSION

MAPPUT

Accepts a VMap and one or more key/value pairs and returns a new VMap with the key/value pairs added. Keys must be set using the auxiliary function SetMapKeys(), and can only be constant strings. If the VMap has any of the new input keys, then the original values are replaced by the new ones.

Syntax

MAPPUT(VMap_data, value1 [, value2, value3, ...] using parameters keys=SetMapKeys('key1'[, 'key2', 'key3', ...])

Arguments

<table>
<thead>
<tr>
<th>VMap_data</th>
<th>Any VMap data. The VMap can exist as:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The <strong>raw</strong> column of a flex table</td>
</tr>
</tbody>
</table>
Data returned from a map function such as maplookup()
Other database content

value
One or more values to add to the VMap specified in VMap_data.

Parameters

| keys | The keys parameter must be the result of SetMapKeys(). SetMapKeys() simply takes one or more constant strings as arguments. |

The following example shows how to create a flex table and use COPY to enter some basic JSON data. After creating a second flex table (vmapdata2), insert the new vmap results from mapput(), with additional key/value pairs.

1. Create sample table:

```sql
=> CREATE FLEX TABLE vmapdata1;
CREATE TABLE
```

2. Load sample JSON data from STDIN:

```sql
=> COPY vmapdata1 FROM stdin parser fjsonparser();
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>>{"aaa": 1, "bbb": 2, "ccc": 3}
>>. \.
```

3. Create another flex table and use the function to insert data into it:

```sql
=> CREATE FLEX TABLE vmapdata2();
=> INSERT INTO vmapdata2 SELECT MAPPUT(_raw__, '7','8','9' using parameters keys=SetMapKeys('xxx','yyy','zzz')) from vmapdata1;
```

4. View the difference between the original and the new flex tables:

```sql
=> SELECT MAPTOSTRING(_raw__) FROM vmapdata1;
maptostring
------------------------------------------
{ "aaa" : "1",
  "bbb" : "2",
  "ccc" : "3"
}
(1 row)
=> SELECT MAPSTRING(_raw_) from vmapdata2;

```
{  
  "mapput" : {
    "aaa" : "1",
    "bbb" : "2",
    "ccc" : "3",
    "aaa" : "7",
    "yyy" : "8",
    "zzz" : "9"
  }
}
```

**MAPREGEXEXTRACTOR**

Extracts data from a regular expression and returns the results as a VMap. Use the USING PARAMETERS pattern= phrase, followed by the regular expression.
Syntax

MAPREGELEXTRACTOR (record_value USING PARAMETERS pattern = phrase
    [use_jit = value,]
    [record_terminator = value,]
    [logline_column = value]))

Arguments

| record_value | VARCHAR | String containing a JSON or delimited format record on which the expression will be applied. |

Parameters

| pattern= | VARCHAR | The regular expression as a string. |
|          |         | Default value: An empty string (" "). |
| use_jit  | BOOLEAN | [Optional] Uses just-in-time compiling when parsing the regular expression. |
|          |         | Default value: false. |
| record_terminator | VARCHAR | [Optional] The character used to separate input records. |
|          |         | Default value: \n. |
| logline_column | VARCHAR | [Optional] The destination column containing the full string that the regular expression matched. |
|          |         | Default value: An empty string (" "). |

Examples

These examples use the following regular expression, which searches for information that includes the timestamp, date, thread_name, and thread_id strings.

Caution: For display purposes, this sample regular expression adds new line characters to split long lines of text. To use this expression in a query, first copy and edit the example to remove any new line characters.

This example expression loads any thread_id hex value, regardless of whether it has a 0x prefix, (<thread_id>(?:0x)?[0-9a-f]+).
The following examples may include newline characters for display purposes.

1. Create a flex table, flogs:

```sql
=> CREATE FLEX TABLE flogs();
CREATE TABLE
```

2. Use COPY to load a sample log file (vertica.log), using the flex table fregexparser.
Note that this example includes added line characters for displaying long text lines.

```sql
=> COPY flogs FROM '/home/dbadmin/tempdat/vertica.log' PARSER FREGEXPARSER(pattern='^(?<time>\d\d\d\d-\d\d-\d\d \d\d:\d\d:\d\d\d).+\.(?<thread_name>[A-Za-z]+):(?<thread_id>[0-9a-f]+)-?(?<transaction_id>[0-9a-f])?(?:[(?<component>[A-Za-z]+)]\<(?<level>[A-Z]+)\>:\<(?<elevel>[A-Z]+)\>@(?<enode>[0-9a-f]+):\)\?<(?<text>\*)')
Rows Loaded
---------------------
81399 (1 row)
```

3. Use MapToString to return the results from calling MapRegexExtractor with a regular expression. The output returns the results of the function in string format.

```sql
=> SELECT MAPTOSTRING(MapregexExtractor(E'2014-04-02 04:02:51.011
TM Moveout:0x2aab0000f860-a00000002067 [Txn] <INFO>
Begin Txn: a000000002067 \'Moveout: Tuple Mover\' using PARAMETERS
pattern='^(?<time>\d\d\d\d-\d\d-\d\d \d\d:\d\d:\d\d\d\d).+\.(?<thread_name>[A-Za-z]+):(?<thread_id>[0-9a-f]+)-?(?<transaction_id>[0-9a-f])?(?:[(?<component>[A-Za-z]+)]\<(?<level>[A-Z]+)\>:\<(?<elevel>[A-Z]+)\>@(?<enode>[0-9a-f]+):\)\?<(?<text>\*)') FROM flogs where _identity_ =13;
maptostring
-------------------------------------
--
{ "component" : "Txn",
"level" : "INFO",
"text" : "Begin Txn: a000000002067 'Moveout: Tuple Mover'",
"thread_id" : "0x2aab0000f860",
"thread_name" : "TM Moveout",
"time" : "2014-04-02 04:02:51.011",
"transaction_id" : "a000000002067"
}
(1 row)
```
MAPSIZE

Returns the number of virtual columns present in any VMap data. Use this scalar function to determine the size of keys.

Syntax

MAPSIZE(VMap_data)

Arguments

<table>
<thead>
<tr>
<th>VMap_data</th>
<th>Any VMap data. The VMap can exist as:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The <strong>raw</strong> column of a flex table</td>
</tr>
<tr>
<td></td>
<td>Data returned from a map function such as maplookup()</td>
</tr>
<tr>
<td></td>
<td>Other database content</td>
</tr>
</tbody>
</table>

Examples

This example shows the returned sizes from the number of keys in the flex table darkmountain:

```sql
=> SELECT MAPSIZE(__raw__) FROM darkmountain;
mapsize
---------
3         
4         
4         
4         
4         

(5 rows)
```

- MAPVALUES
- MAPVERSION

MAPTOSTRING

Recursively builds a string representation VMap data, including nested JSON maps. Use this transform function to display the VMap contents in a readable LONG VARCHAR format. Use mptostring to see how map data is nested before querying virtual columns with mapvalues().

Syntax

MAPTOSTRING(VMap_data [using parameters canonical_json={true | false}])

Arguments

<table>
<thead>
<tr>
<th>VMap_data</th>
<th>Any VMap data. The VMap can exist as:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>* The <strong>raw</strong> column of a flex table</td>
</tr>
</tbody>
</table>
Data returned from a map function such as `maplookup()`

- Other database content

### Parameters

<table>
<thead>
<tr>
<th><code>canonical_json</code></th>
<th>=<code>bool</code> [Optional parameter]</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Produces canonical JSON output by default, using the first instance of any duplicate keys in the map data.</td>
</tr>
<tr>
<td></td>
<td>Use this parameter as other UDF parameters, preceded by using parameters, as shown in the examples. Setting this argument to false maintains the previous behavior of <code>maptostring()</code> and returns same-name keys and their values.</td>
</tr>
<tr>
<td></td>
<td><strong>Default value:</strong> canonical-json=true</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to create a sample flex table, darkdata and load JSON data from STDIN. By calling `maptostring()` twice with both values for the `canonical_json` parameter, you can see the different results on the flex table `__raw__` column data.

1. Create sample table:

   ```
   => CREATE FLEX TABLE darkdata();
   CREATE TABLE
   ```

2. Load sample JSON data from STDIN:

   ```
   => COPY darkdata FROM stdin parser fjsonparser();
   Enter data to be copied followed by a newline.
   End with a backslash and a period on a line by itself.
   >> {"aaa": 1, "aaa": 2, "AAA": 3, "bbb": "aaa\"bbb"}
   >> 
   ```

3. Call `maptostring()` with its default behavior using canonical JSON output, and then review the flex table contents. The function returns the first duplicate key and its value ("aaa": "1") but omits remaining duplicate keys ("aaa": "2"):  

```
4. Next, call `maptoString()` with using parameters `canonical_json=false`). This time, the function returns the first duplicate keys and their values:

```sql
=> SELECT MAPTOSTRING (__raw__) FROM darkdata;
maptoString
---------------------------------------------
{  
    "AAA": "3",
    "aaa": "1",
    "bbb": "aaa\"bbb"
}
(1 row)
```

- `MAPCONTAINSVALUE`
- `MAPITEMS`
- `MAPKEYS`
- `MAPKEYSINFO`
- `MAPLOOKUP`
- `MAPSIZE`
MAPVALUES

Returns a string representation of the top-level values from a VMap. This transform function requires an over() clause.

Syntax

MAPVALUES(VMap_data)

Arguments

<table>
<thead>
<tr>
<th>VMap_data</th>
<th>The VMap from which values should be returned. The VMap can exist as:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The <em>raw</em> column of a flex table</td>
</tr>
<tr>
<td></td>
<td>Data returned from a map function such as maplookup()</td>
</tr>
<tr>
<td></td>
<td>Other database content</td>
</tr>
</tbody>
</table>

Examples

The following example shows how to query a darkmountain flex table, using an over() clause (in this case, the over(PARTITION BEST) clause) with mapvalues().

```sql
=> SELECT * FROM (SELECT MAPVALUES(darkmountain._raw__) OVER(PARTITION BEST) FROM darkmountain) AS a;
   values
  ---------------
  29029
  34.1
  Everest
  mountain
  29029
  15.4
  Mt St Helens
  volcano
  17000
  12.2
  Denali
  mountain
  14000
```

- MAPVERSION

MAPVERSION

Returns the version or invalidity of any map data. This scalar function returns the map version (such as 1) or -1, if the map data is invalid.

Syntax

MAPVERSION(VMap_data)
Arguments

| VMap_data | The VMap data either from a __raw__ column in a flex table or from the data returned from a map function such as maplookup(). |

Examples

The following example shows how to use mapversion() with the darkmountain flex table, returning mapversion 1 for the flex table map data:

=> SELECT MAPVERSION(__raw__) FROM darkmountain;

<table>
<thead>
<tr>
<th>mapversion</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
<tr>
<td>1</td>
</tr>
<tr>
<td>1</td>
</tr>
<tr>
<td>1</td>
</tr>
<tr>
<td>1</td>
</tr>
</tbody>
</table>

(5 rows)

MATERIALIZE_FLEXTABLE_COLUMNS

Materializes virtual columns listed as key_names in the flextable_keys table you compute using either COMPUTE_FLEXTABLE_KEYS or COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW.

Note: Each column that you materialize with this function counts against the data storage limit of your license. To check your Vertica license compliance, call the AUDIT() or AUDIT_FLEX() functions.

Syntax

MATERIALIZE_FLEXTABLE_COLUMNS('[[database.]schema.]flex-table' [, n-columns [, keys-table-name] ])

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject</td>
</tr>
</tbody>
</table>
| flex-table      | The name of the flex table with columns to materialize. Specifying only the flex table name attempts to materialize up to 50 columns of key names in the default flextable_keys table. When you use this argument, the function:  
  * Skips any columns already materialized  
  * Ignores any empty keys

To materialize a specific number of columns, use the optional parameter n_columns, described next.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n-columns</td>
<td>The number of columns to materialize. The function attempts to materialize the number of columns from the flextable_keys table, skipping any columns already materialized. Vertica tables support a total of 1600 columns, which is the largest value you can specify for n-columns. The function orders the</td>
</tr>
</tbody>
</table>
materialized results by frequency, descending, **key_name** when materializing the first \( n \) columns.

**keys-table-name**
The name of a flex_keys_table from which to materialize columns. The function:

- Materializes the number of columns (value of \( n-columns \)) from **keys-table-name**
- Skips any columns already materialized
- Orders the materialized results by frequency, descending, **key_name** when materializing the first \( n \) columns.

### Examples

The following example shows how to call `MATERIALIZE_FLEXTABLE_COLUMNS` to materialize columns. First, load a sample file of tweets (`tweets_10000.json`) into the flex table `twitter_r`.

After loading data and computing keys for the sample flex table, call `materialize_flextable_columns` to materialize the first four columns:

```sql
=> COPY twitter_r FROM '/home/release/KData/tweets_10000.json' parser fjsonparser();
Rows Loaded
------------------
10000 (1 row)
```

```sql
=> SELECT compute_flextable_keys ('twitter_r');
  compute_flextable_keys
-------------------------------
Please see public.twitter_r_keys for updated keys
(1 row)
```

```sql
=> select materialize_flextable_columns('twitter_r', 4);
  materialize_flextable_columns
------------------------------
The following columns were added to the table public.twitter_r:
  contributors
  entities.hashtags
  entities.urls
For more details, run the following query:
SELECT * FROM v_catalog.materialize_flextable_columns_results WHERE table_schema = 'public' and table_name = 'twitter_r';
(1 row)
```

The last message in the example recommends querying system table `MATERIALIZE_FLEXTABLE_COLUMNS_RESULTS` for the results of materializing the columns, as shown:
```sql
=> SELECT * FROM v_catalog.materialize_flextable_columns_results WHERE table_schema = 'public' and table_name = 'twitter_r';

<table>
<thead>
<tr>
<th>table_id</th>
<th>table_schema</th>
<th>table_name</th>
<th>creation_time</th>
<th>key_name</th>
<th>status</th>
<th>message</th>
</tr>
</thead>
<tbody>
<tr>
<td>4503596273733172</td>
<td>public</td>
<td>twitter_r</td>
<td>2013-11-20 17:00:27.945484-05</td>
<td>contributors</td>
<td>ADDED successfully</td>
<td></td>
</tr>
<tr>
<td>4503596273733172</td>
<td>public</td>
<td>twitter_r</td>
<td>2013-11-20 17:00:27.94551-05</td>
<td>entities.hashtags</td>
<td>ADDED successfully</td>
<td></td>
</tr>
<tr>
<td>4503596273733172</td>
<td>public</td>
<td>twitter_r</td>
<td>2013-11-20 17:00:27.945519-05</td>
<td>entities.urls</td>
<td>ADDED successfully</td>
<td></td>
</tr>
<tr>
<td>4503596273733172</td>
<td>public</td>
<td>twitter_r</td>
<td>2013-11-20 17:00:27.945532-05</td>
<td>created_at</td>
<td>ADDED successfully</td>
<td></td>
</tr>
</tbody>
</table>

EXISTS | Column of same name already (4 rows)
```

See Also

- [BUILD_FLEXTABLE_VIEW](#)
- [COMPUTE_FLEXTABLE KEYS](#)
- [COMPUTE_FLEXTABLE KEYS_AND_BUILD VIEW](#)
- [RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW](#)

### RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW

Restores the `_keys` table and the `_view`. The function also links the `_keys` table with its associated flex table, in cases where either table is dropped. The function also indicates whether it restored one or both objects.

#### Syntax

```
RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW('flex_table')
```

#### Arguments

- `flex_table` The name of a flex table.

#### Examples

This example shows how to invoke this function with an existing flex table, restoring both the `_keys` table and `_view`:
This example illustrates that the function restored `darkdata_view`, but that `darkdata_keys` did not need restoring:

```sql
=> SELECT RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW('darkdata');

<table>
<thead>
<tr>
<th>RESTORE_FLEXTABLE_DEFAULT_KEYS_TABLE_AND_VIEW</th>
</tr>
</thead>
<tbody>
<tr>
<td>The keys table public.darkdata_keys was restored successfully.</td>
</tr>
<tr>
<td>The view public.darkdata_view was restored successfully.</td>
</tr>
<tr>
<td>(1 row)</td>
</tr>
</tbody>
</table>
```

After restoring the `_keys` table, there is no content. To populate the flex keys, call the `COMPUTE_FLEXTABLE_KEYS` meta function.

```sql
=> SELECT * FROM darkdata_keys;

<table>
<thead>
<tr>
<th>key_name</th>
<th>frequency</th>
<th>data_type_guess</th>
</tr>
</thead>
</table>

(0 rows)
```

**Hadoop Functions**

This section contains functions to manage interactions with Hadoop.

**CLEAR_HDFS_CACHES**

Clears the configuration information copied from HDFS and any cached connections.

This function affects reads using the `hdfs` scheme in the following ways:
- This function flushes information loaded from configuration files copied from Hadoop (such as core-site.xml). These files are found on the path set by the HadoopConfDir configuration parameter.

- This function flushes information about which Name Node is active in a High Availability (HA) Hadoop cluster. Therefore, the first request to Hadoop after calling this function is slower than expected.

Vertica maintains a cache of open connections to name nodes to reduce latency. This function flushes that cache.

Syntax

```
CLEAR_HDFS_CACHES()
```

Privileges

Superuser

Example

The following example clears the Hadoop configuration information:

```
=> SELECT CLEAR_HDFS_CACHES();
CLEAR_HDFS_CACHES
-----------------
Cleared
(1 row)
```

See Also

* Apache Hadoop Parameters

**KERBEROS_HDFS_CONFIG_CHECK**

Tests the Kerberos configuration of a Vertica cluster that uses HDFS. The function succeeds if it can use both the Vertica keytab file and the session user to access HDFS, and reports errors otherwise. This function is a more specific version of **KERBEROS_CONFIG_CHECK**.

If the current session is not Kerberized, this function will not be able to use secured HDFS connections and will fail.
You can call this function with arguments to specify an HDFS configuration to test, or without arguments. If you call it with no arguments, this function reads the HDFS configuration files and fails if it does not find them. See Configuring the hdfs Scheme. If it finds configuration files, it tests all configured nameservices.

The function performs the following tests, in order:

- Are Kerberos services available?

- Does a keytab file exist and are the Kerberos and HDFS configuration parameters set in the database?

- Can Vertica read and invoke kinit with the keys to authenticate to HDFS and obtain the database Kerberos ticket?

- Can Vertica perform hdfs and webhdfs operations using both the database Kerberos ticket and user-forwardable tickets for the current session?

- Can Vertica connect to HiveServer2? (This function does not support WebHCat.)

If any test fails, the function returns a descriptive error message.

Syntax

```
KERBEROS_HDFS_CONFIG_CHECK( ['hdfsHost:hdfsPort', 'webhdfsHost:webhdfsPort'] )
```

Arguments

<table>
<thead>
<tr>
<th><strong>hdfsHost, hdfsPort</strong></th>
<th>The hostname or IP address and port of the HDFS name node. Vertica uses this server to access data that is specified with hdfs URLs. If the value is '', the function skips this part of the check.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>webhdfsHost, webhdfsPort</strong></td>
<td>The hostname or IP address and port of the WebHDFS server. Vertica uses this server to access data that is specified with webhdfs URLs. If the value is '', the function skips this part of the check.</td>
</tr>
</tbody>
</table>

Privileges

This function does not require privileges.
Examples

The following example shows the results when the function infers the configuration from the HDFS configuration files.

```
=> SELECT KERBEROS_HDFS_CONFIG_CHECK();
kerberos_hdfs_config_check
------------------------------------------------------------------------------------------------------------------------------------

-------- Checking Hadoop Kerberos configuration --------

HadoopFS parameters:
  Principal: [vertica/eng.example.com@EXAMPLE.COM]  
  Token Refresh Frequency: 0  
  Connection Timeout: 60  
  Authentication (default): [/scratch_b/qa/vertica.keytab]  
ok: krb5 exists at [/etc/krb5.conf]  
ok: Vertica can kinit using keytab file  
ok: User [release] has valid client authentication for kerberos principal [release@EXAMPLE.COM]

**Inferring HDFS configuration**

  Number of HDFS Clusters: 1
  Cluster 1: Nameservice [ns-eng] has [2] Namenodes [eng.example.com:8020][eng2.example.com:8020] and has [High Availability][No RPC Encryption][Kerberos Authitication][HTTP Enabled]

-------- Checking LibHdfs++ -------

  Attempting to check default nameservice [hdfs://] via Libhdfs++

-------- Checking HCatalgConnector ---------

ok: HCatalog connector library is properly installed.

Performing HCatalogConnector configuration checks.
INFO: Vertica is not configured to use its internal parsers for delimited files.
hint: This is off by default, but will be changed in a future release.

Searching for an impersonation configuration to use.
```
SYNC_WITH_HCATALOG_SCHEMA

Copies the structure of a Hive database schema available through the HCatalog Connector to a Vertica schema.

Syntax

```
SYNC_WITH_HCATALOG_SCHEMA( local_schema, hcatalog_schema, [drop_tables] )
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>local_schema</code></td>
<td>The existing Vertica schema to store the copied HCatalog schema's metadata. This can be the same schema as <code>hcatalog_schema</code>, or it can be a separate one created using CREATE SCHEMA.</td>
</tr>
<tr>
<td><code>hcatalog_schema</code></td>
<td>The HCatalog schema to copy. This is the schema created using CREATE HCATALOG SCHEMA.</td>
</tr>
<tr>
<td><code>[drop_tables]</code></td>
<td>If true, drop any tables in <code>local_schema</code> that do not correspond to a table in <code>hcatalog_schema</code>.</td>
</tr>
</tbody>
</table>

Notes

The SYNC_WITH_HCATALOG_SCHEMA function overwrites tables in the Vertica schema whose names match a table in the HCatalog schema. Do not use the Vertica schema to store other data.

Hive STRING and BINARY data types are matched, in Vertica, to VARCHAR(65000) and VARBINARY(65000) types. You can use ALTER TABLE to adjust these after creating the schema. The maximum size of a VARCHAR or VARBINARY in Vertica is 65000, but you can use LONG VARCHAR and LONG VARBINARY to specify larger values.

Hive and Vertica define string length in different ways. In Hive the length is the number of characters; in Vertica it is the number of bytes. Thus, a character encoding that uses more than one byte, such as Unicode, can result in mismatches between the two. Set values in Vertica based on bytes, not characters, to avoid data truncation.
If the data size exceeds the declared size for the column, Vertica logs an event at read time in the QUERY_EVENTS system table.

This function can synchronize the HCatalog schema directly, in which case you call it with the same schema name for both parameters. It can also synchronize a different schema to the HCatalog schema.

If you change the settings of any HCatalog Connector configuration parameters (Apache Hadoop Parameters), you must call this function again.

**Privileges**

The user must have CREATE privileges on *Local_schema*.

The user also requires access to Hive data in one of the following ways:

- Have USAGE permissions on *hcatalog_schema*, if Hive does not use an authorization service to manage access.
- Have permission through an authorization service (Sentry or Ranger), *and* have access to the underlying files in HDFS. (Sentry can provide that access through ACL synchronization.)
- Be the dbadmin user, with or without an authorization service.

**Examples**

The following example shows using SYNC_WITH_HCATALOG_SCHEMA to synchronize an HCatalog schema named hcat:

```
=> CREATE HCATALOG SCHEMA hcat WITH hostname='hcathost' HCATALOG_SCHEMA='default'
       HCATALOG_USER='hcatuser';
CREATE SCHEMA
=> SELECT sync_with_hcatalog_schema('hcat', 'hcat');
sync_with_hcatalog_schema
------------------------------------------
Schema hcat synchronized with hcat
  tables in hcat = 56
  tables altered in hcat = 0
  tables created in hcat = 56
  stale tables in hcat = 0
  table changes errored in hcat = 0
(1 row)
=> -- Use vsql's \d command to describe a table in the synced schema

=> \d hcat.messages
List of Fields by Tables
<table>
<thead>
<tr>
<th>Schema</th>
<th>Table</th>
<th>Column</th>
<th>Type</th>
<th>Size</th>
<th>Default</th>
<th>Not Null</th>
<th>Primary Key</th>
<th>Foreign Key</th>
</tr>
</thead>
</table>
```
The following example shows using `SYNC_WITH_HCATALOG_SCHEMA` followed by `ALTER TABLE` to adjust a column value:

```sql
=> CREATE HCATALOG SCHEMA hcat WITH hostname='hcathost' HCATALOG_SCHEMA='default'
=> HCATALOG_USER='hcatuser';
CREATE SCHEMA
=> SELECT sync_with_hcatalog_schema('hcat', 'hcat');
...
=> ALTER TABLE hcat.t ALTER COLUMN a1 SET DATA TYPE long varchar(1000000);
=> ALTER TABLE hcat.t ALTER COLUMN a2 SET DATA TYPE long varbinary(1000000);
```

The following example shows using `SYNC_WITH_HCATALOG_SCHEMA` with a local (non-HCatalog) schema:

```sql
=> CREATE HCATALOG SCHEMA hcat WITH hostname='hcathost' HCATALOG_SCHEMA='default'
=> HCATALOG_USER='hcatuser';
CREATE SCHEMA
=> CREATE SCHEMA hcat_local;
CREATE SCHEMA
=> SELECT sync_with_hcatalog_schema('hcat_local', 'hcat');
```

### `SYNC_WITH_HCATALOG_SCHEMA_TABLE`

Copies the structure of a single table in a Hive database schema available through the HCatalog Connector to a Vertica table.

**Syntax**

```sql
SYNC_WITH_HCATALOG_SCHEMA_TABLE( local_schema, hcatalog_schema, table_name )
```

**Parameters**

| **Local_schema** | The existing Vertica schema to store the copied HCatalog schema's metadata. This can be the same schema as `hcatalog_schema`, or it can be a separate one created using `CREATE SCHEMA`. |
| **hcatalog_schema** | The HCatalog schema to copy. This is the schema created using `CREATE HCATALOG SCHEMA`. |
**table_name** | The table in `hcatalog_schema` to copy.

**Notes**

If `table_name` does not exist in `hcatalog_schema`, this function returns an error.

If `table_name` already exists in `local_schema`, the `SYNC_WITH_HCATALOG_SCHEMA_TABLE` function overwrites it.

Hive STRING and BINARY data types are matched, in Vertica, to VARCHAR(65000) and VARBINARY(65000) types. You can use `ALTER TABLE` to adjust these after creating the schema. The maximum size of a VARCHAR or VARBINARY in Vertica is 65000, but you can use LONG VARCHAR and LONG VARBINARY to specify larger values.

Hive and Vertica define string length in different ways. In Hive the length is the number of characters; in Vertica it is the number of bytes. Thus, a character encoding that uses more than one byte, such as Unicode, can result in mismatches between the two. Set values in Vertica based on bytes, not characters, to avoid data truncation.

If the data size exceeds the declared size for the column, Vertica logs an event at read time in the `QUERY_EVENTS` system table.

This function can synchronize the HCatalog schema directly, in which case you call it with the same schema name for both of the `local_schema` and `hcatalog_schema` parameters. It can also synchronize a different schema to the HCatalog schema.

**Privileges**

The user must have CREATE privileges on `local_schema`.

The user also requires access to Hive data in one of the following ways:

- Have USAGE permissions on `hcatalog_schema`, if Hive does not use an authorization service to manage access.

- Have permission through an authorization service (Sentry or Ranger), and have access to the underlying files in HDFS. (Sentry can provide that access through ACL synchronization.)

- Be the dbadmin user, with or without an authorization service.

**Examples**

The following example shows using `SYNC_WITH_HCATALOG_SCHEMA_TABLE` to synchronize the "nation" table:
CREATE SCHEMA 'hcat_local';
CREATE SCHEMA
CREATE HCATALOG SCHEMA hcat WITH hostname='hcathost' HCATALOG_SCHEMA='hcat'
HCATALOG_USER='hcatuser';
CREATE SCHEMA
SELECT sync_with_hcatalog_schema_table('hcat_local', 'hcat', 'nation');
sync_with_hcatalog_schema_table
-----------------------------------------------
Schema hcat_local synchronized with hcat for table nation
  table nation is created in schema hcat_local
  (1 row)

The following example shows the behavior if the "nation" table already exists in the local schema:

SELECT sync_with_hcatalog_schema_table('hcat_local', 'hcat', 'nation');
sync_with_hcatalog_schema_table
-----------------------------------------------
Schema hcat_local synchronized with hcat for table nation
  table nation is altered in schema hcat_local
  (1 row)

### VERIFY_HADOOP_CONF_DIR

Verifies that the Hadoop configuration that is used to access HDFS is valid on all Vertica nodes. The configuration is valid if:

- all required configuration files are found on the path defined by the HadoopConfDir configuration parameter
- all properties needed by Vertica are set in those files

This function does not attempt to validate the settings of those properties; it only verifies that they have values.

It is possible for Hadoop configuration to be valid on some nodes and invalid on others. The function reports a validation failure if the value is invalid on any node; the rest of the output reports the details.

### Syntax

```sql
VERIFY_HADOOP_CONF_DIR( )
```
Parameters

This function has no parameters.

Privileges

This function does not require privileges.

Examples

The following example shows the results when the Hadoop configuration is valid.

```sql
=> SELECT VERIFY_HADOOP_CONF_DIR();
  verify_hadoop_conf_dir
```

```
Validation Success
v_vmart_node0001: HadoopConfDir [PG_TESTOUT/config] is valid
v_vmart_node0002: HadoopConfDir [PG_TESTOUT/config] is valid
v_vmart_node0003: HadoopConfDir [PG_TESTOUT/config] is valid
v_vmart_node0004: HadoopConfDir [PG_TESTOUT/config] is valid
(1 row)
```

In the following example, the Hadoop configuration is valid on one node, but on other nodes a needed value is missing.

```sql
=> SELECT VERIFY_HADOOP_CONF_DIR();
  verify_hadoop_conf_dir
```

```
Validation Failure
v_vmart_node0001: HadoopConfDir [PG_TESTOUT/test_configs/config] is valid
v_vmart_node0002: No fs.defaultFS parameter found in config files in [PG_TESTOUT/config]
v_vmart_node0003: No fs.defaultFS parameter found in config files in [PG_TESTOUT/config]
v_vmart_node0004: No fs.defaultFS parameter found in config files in [PG_TESTOUT/config]
(1 row)
```

LDAP Link Functions

This section contains the functions associated with the Vertica LDAP Link function.

In This Section
LDAP_LINK_SYNC_START

Begins the synchronization between the LDAP server and Vertica immediately rather than waiting for the interval set in LDAPLinkInterval.

Syntax

ldap_link_sync_start()

Privileges

You must be a dbadamin user.

Example

=> SELECT ldap_link_sync_start();

See Also

LDAP Link Parameters
License Management Functions

This section contains function that monitor Vertica license status and compliance.

AUDIT

Returns the raw data size (in bytes) of a database, schema, or table as it is counted in an audit of the database size. Unless you specify zero error tolerance and 100 percent confidence level, AUDIT returns only approximate results that can vary over multiple iterations.

AUDIT estimates the size for data in Vertica tables using the same data sampling method as Vertica uses, to determine if a database complies with the licensed database size allowance. Vertica does not use these results to determine whether the size of the database complies with the Vertica license's data allowance. For details, see Auditing Database Size in the Administrator's Guide.

For data stored in external tables based on ORC or Parquet format, AUDIT uses the total size of the data files. This value is never estimated—it is read from the file system storing the ORC or Parquet files (either the Vertica node's local filesystem, S3, or HDFS). See Reading ORC and Parquet Formats for more information about external tables based on these file formats.

Syntax

AUDIT('[[[database.]schema.]scope ]'[, 'granularity'[, error-tolerance[, confidence-level]]])

Parameters

<table>
<thead>
<tr>
<th>[database.]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>scope</td>
<td>Specifies the extent of the audit:</td>
</tr>
<tr>
<td></td>
<td>- Empty string (' ') audits the entire database.</td>
</tr>
<tr>
<td></td>
<td>- The name of the schema or table to audit.</td>
</tr>
</tbody>
</table>
The schema or table to audit. To audit the database, set this parameter to an empty string.

<table>
<thead>
<tr>
<th><strong>granularity</strong></th>
<th>The level at which the audit reports its results, one of the following strings:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• database</td>
</tr>
<tr>
<td></td>
<td>• schema</td>
</tr>
<tr>
<td></td>
<td>• table</td>
</tr>
<tr>
<td></td>
<td>The level of granularity must be equal to or less than the granularity of <strong>scope</strong>. If you omit this parameter, granularity is set to the same level as <strong>scope</strong>. Thus, if online_sales is a schema, the following statements are identical:</td>
</tr>
<tr>
<td></td>
<td>```sql</td>
</tr>
<tr>
<td></td>
<td>AUDIT('online_sales', 'schema');</td>
</tr>
<tr>
<td></td>
<td>AUDIT('online_sales');</td>
</tr>
<tr>
<td></td>
<td>```sql</td>
</tr>
<tr>
<td></td>
<td>If AUDIT sets granularity to a level lower than the target object, it returns with a message that refers you to system table <strong>USER_AUDITS</strong>. For details, see Querying <strong>V_CATALOG.USER_AUDITS</strong>, below.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>error-tolerance</strong></th>
<th>Specifies the percentage margin of error allowed in the audit estimate. Enter the tolerance value as a decimal number, between 0 and 100. The default value is 5, for a 5% margin of error.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>This argument has no effect on audits of external tables based on ORC or Parquet files. Audits of these tables always returns the actual size of the underlying data files.</td>
</tr>
<tr>
<td></td>
<td>Setting this value to 0 results in a full database audit, which is very resource intensive, as AUDIT analyzes the entire database. A full database audit significantly impacts performance, so Vertica does not recommend it for a production database.</td>
</tr>
<tr>
<td></td>
<td><strong>Caution:</strong> Due to the iterative sampling that the auditing process uses, setting the error tolerance to a small fraction of a percent (for example, 0.00001) can cause AUDIT to run for a longer period than a full database audit. The lower you specify this value, the more resources the audit uses, as it performs more data sampling.</td>
</tr>
</tbody>
</table>
**confidence-level**

Specifies the statistical confidence level percentage of the estimate. Enter the confidence value as a decimal number, between 0 and 100. The default value is 99, indicating a confidence level of 99%.

This argument has no effect on audits of external tables based on ORC or Parquet files. Audits of these tables always returns the actual size of the underlying data files.

The higher the confidence value, the more resources the function uses, as it performs more data sampling. Setting this value to 100 results in a full audit of the database, which is very resource intensive, as the function analyzes all of the database. A full database audit significantly impacts performance, so Vertica does not recommend it for a production database.

Privileges

Superuser, or the following privileges:

- SELECT privilege on the target tables
- USAGE privilege on the target schemas

Note: If you audit a schema or the database, Vertica only returns the size of all objects that you have privileges to access within the audited object, as described above.

Querying V_CATALOG.USER_AUDITS

If AUDIT sets granularity to a level lower than the target object, it returns with a message that refers you to system table **USER_AUDITS**. To obtain audit data on objects of the specified granularity, query this table. For example, the following query seeks to audit all tables in the store schema:

```
=> SELECT AUDIT('store', 'table');

AUDIT
-------------------------------------------------------------
See table sizes in v_catalog.user_audits for schema store
   (1 row)
```

The next query queries **USER_AUDITS** and obtains the latest audits on those tables:
=> SELECT object_name, AVG(size_bytes)::int size_bytes, MAX(audit_start_timestamp::date) audit_start 
FROM user_audits WHERE object_schema='store' 
GROUP BY rollup(object_name) HAVING GROUPING_ID(object_name) < 1 ORDER BY GROUPING_ID();

<table>
<thead>
<tr>
<th>object_name</th>
<th>size_bytes</th>
<th>audit_start</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_dimension</td>
<td>22067</td>
<td>2017-10-26</td>
</tr>
<tr>
<td>store_orders_fact</td>
<td>27201312</td>
<td>2017-10-26</td>
</tr>
<tr>
<td>store_sales_fact</td>
<td>301260170</td>
<td>2017-10-26</td>
</tr>
</tbody>
</table>

(3 rows)

Examples

See Auditing Database Size.

AUDIT_FLEX

Returns the estimated ROS size of __raw__ columns, equivalent to the export size of the flex data in the audited objects. You can audit all flex data in the database, or narrow the audit scope to a specific flex table, projection, or schema. Vertica stores the audit results in system table USER_AUDITS.

The audit excludes the following:

- Flex keys
- Other columns in the audited tables.
- Temporary flex tables

Syntax

AUDIT_FLEX ('[scope]')

Parameters

<table>
<thead>
<tr>
<th>scope</th>
<th>Specifies the extent of the audit:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Empty string (' ') audits all flexible tables in the database.</td>
</tr>
<tr>
<td></td>
<td>The name of a schema, projection, or flex table.</td>
</tr>
</tbody>
</table>

Privileges

Superuser, or the following privileges:
- SELECT privilege on the target tables
- USAGE privilege on the target schemas

**Note:** If you audit a schema or the database, Vertica only returns the size of all objects that you have privileges to access within the audited object, as described above.

**Examples**

**Audit all flex tables in the current database:**

```sql
dbs=> select audit_flex('');
audit_flex
----------
8567679  
(1 row)
```

**Audit the flex tables in schema public:**

```sql
dbs=> select audit_flex('public');
audit_flex
----------
8567679  
(1 row)
```

**Audit the flex data in projection bakery_b0:**

```sql
dbs=> select audit_flex('bakery_b0');
audit_flex
----------
8566723  
(1 row)
```

**Audit flex table bakery:**

```sql
dbs=> select audit_flex('bakery');
audit_flex
----------
8566723  
(1 row)
```

To report the results of all audits saved in the USER_AUDITS, the following shows part of an extended display from the system table showing an audit run on a schema called test, and the entire database, `dbs`:

```sql
dbs=> \x
Expanded display is on.

dbs=> select * from user_audits;
-[- RECORD 1 ]-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=
```
AUDIT_LICENSE_SIZE

Triggers an immediate audit of the database size to determine if it is in compliance with the raw data storage allowance included in your Vertica licenses.

If you use ORC or Parquet data stored in HDFS, results are only accurate if you run this function as a user who has access to all HDFS data. Either run the query with a principal that has read access to all such data, or use a Hadoop delegation token that grants this access. For more information about using delegation tokens, see Accessing Kerberized HDFS Data.

Syntax

AUDIT_LICENSE_SIZE()
Privileges

Superuser

Example

```sql
=> SELECT audit_license_size();
    audit_license_size
------------------------
Raw Data Size: 0.00TB +/- 0.00TB
License Size : 10.00TB
Utilization : 0%
Audit Time : 2015-09-24 12:19:15.425486-04
Compliance Status: The database is in compliance with respect to raw data size.

License End Date: 2015-11-23 00:00:00 Days Remaining: 60.53
(1 row)
```

AUDIT_LICENSE_TERM

Triggers an immediate audit to determine if the Vertica license has expired.

Syntax

`AUDIT_LICENSE_TERM()`

Privileges

Superuser

Example

```sql
=> SELECT audit_license_term();
    audit_license_term
------------------------
Raw Data Size: 0.00TB +/- 0.00TB
License Size : 10.00TB
Utilization : 0%
Audit Time : 2015-09-24 12:19:15.425486-04
Compliance Status: The database is in compliance with respect to raw data size.

License End Date: 2015-11-23 00:00:00 Days Remaining: 60.53
(1 row)
```
DISPLAY_LICENSE

Returns the terms of your Vertica license. The information this function displays is:

- The start and end dates for which the license is valid (or "Perpetual" if the license has no expiration).
- The number of days you are allowed to use Vertica after your license term expires (the grace period)
- The amount of data your database can store, if your license includes a data allowance.

Syntax

```sql
DISPLAY_LICENSE()
```

Privileges

None

Examples

```sql
=> SELECT DISPLAY_LICENSE();

+--------------------------+
<table>
<thead>
<tr>
<th>DISPLAY_LICENSE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertica Systems, Inc.</td>
</tr>
<tr>
<td>1/1/2011</td>
</tr>
<tr>
<td>12/31/2011</td>
</tr>
<tr>
<td>30</td>
</tr>
<tr>
<td>50TB</td>
</tr>
<tr>
<td>(1 row)</td>
</tr>
</tbody>
</table>
```

GET_AUDIT_TIME

Reports the time when the automatic audit of database size occurs. Vertica performs this audit if your Vertica license includes a data size allowance. For details of this audit, see Managing Licenses in the Administrator's Guide. To change the time the audit runs, use the SET_AUDIT_TIME function.

Syntax

```sql
GET_AUDIT_TIME()
```
Privileges
None

Example

```sql
=> SELECT get_audit_time();
get_audit_time
--------------------------------------------------
The audit is scheduled to run at 11:59 PM each day.
(1 row)
```

**GET_COMPLIANCE_STATUS**

Displays whether your database is in compliance with your Vertica license agreement. This information includes the results of Vertica's most recent audit of the database size (if your license has a data allowance as part of its terms), the license term (if your license has an end date), and the number of nodes (if your license has a node limit).

**GET_COMPLIANCE_STATUS** measures data allowance by TBs (where a TB equals 1024^4 bytes).

The information displayed by **GET_COMPLIANCE_STATUS** includes:

- The estimated size of the database (see Auditing Database Size in the Administrator's Guide for an explanation of the size estimate).
- The raw data size allowed by your Vertica license.
- The percentage of your allowance that your database is currently using.
- The number of nodes and license limit.
- The date and time of the last audit.
- Whether your database complies with the data allowance terms of your license agreement.
- The end date of your license.
- How many days remain until your license expires.

**Note:** If your license does not have a data allowance, end date, or node limit, some of the values might not appear in the output for **GET_COMPLIANCE_STATUS**.
If the audit shows your license is not in compliance with your data allowance, you should either delete data to bring the size of the database under the licensed amount, or upgrade your license. If your license term has expired, you should contact Vertica immediately to renew your license. See Managing Licenses in the Administrator's Guide for further details.

Syntax

GET_COMPLIANCE_STATUS()

Privileges

None

Examples

=> SELECT GET_COMPLIANCE_STATUS();
   get_compliance_status
   ------------------------
   Raw Data Size: 0.00TB +/- 0.00TB
   License Size : 10.00TB
   Utilization : 0%
   Audit Time : 2015-09-24 12:19:15.425486-04
   Compliance Status : The database is in compliance with respect to raw data size.
   License End Date: 2015-11-23 00:00:00 Days Remaining: 60.53
(1 row)

The following example shows output for a Vertica for SQL on Apache Hadoop cluster.

=> SELECT GET_COMPLIANCE_STATUS();
   get_compliance_status
   ------------------------
   Node count : 4
   License Node limit : 5
   No size-compliance concerns for an Unlimited license
   No expiration date for a Perpetual license
(1 row)

SET_AUDIT_TIME

Sets the time that Vertica performs automatic database size audit to determine if the size of the database is compliant with the raw data allowance in your Vertica license. Use this function if the audits are currently scheduled to occur during your database's peak activity time. This is normally not a concern, since the automatic audit has little impact on database performance.
Audits are scheduled by the preceding audit, so changing the audit time does not affect the next scheduled audit. For example, if your next audit is scheduled to take place at 11:59PM and you use SET_AUDIT_TIME to change the audit schedule 3AM, the previously scheduled 11:59PM audit still runs. As that audit finishes, it schedules the next audit to occur at 3AM.

Vertica always performs the next scheduled audit even where you have changed the audit time using SET_AUDIT_TIME and then triggered an automatic audit by issuing the statement, SELECT AUDIT_LICENSE_SIZE. Only after the next scheduled audit does Vertica begin auditing at the new time you set using SET_AUDIT_TIME. Thereafter, Vertica audits at the new time.

Syntax

SET_AUDIT_TIME(time)

time | A string containing the time in 'HH:MM AM/PM' format (for example, '1:00 AM') when the audit should run daily.

Privileges

Superuser

Example

```sql
=> SELECT SET_AUDIT_TIME('3:00 AM');

SET_AUDIT_TIME
-----------------------------------------
The scheduled audit time will be set to 3:00 AM after the next audit.
(1 row)
```

Multiple Active Result Sets Functions

This section contains the functions associated with the Vertica library for Multiple Active Result Sets (MARS).

CLOSE_ALL_RESULTSETS

Closes all result set sessions within Multiple Active Result Sets (MARS) and frees the MARS storage for other result sets.
Syntax

```
SELECT CLOSE_ALL_RESULTSETS ('session_id')
```

Parameters

| session_id | A string that specifies the Multiple Active Result Sets session. |

Privileges

None; however, without superuser privileges, you can only close your own session's results.

Examples

This example shows how you can view a MARS result set, then close the result set, and then confirm that the result set has been closed.

Query the MARS storage table. One session ID is open and three result sets appear in the output.

```
=> SELECT * FROM SESSION_MARS_STORE;
```

<table>
<thead>
<tr>
<th>node_name</th>
<th>session_id</th>
<th>user_name</th>
<th>resultset_id</th>
<th>row_count</th>
<th>remaining_row_count</th>
<th>bytes_used</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_vmart_node0001</td>
<td>server1.company.-83046:1y28gu9</td>
<td>dbadmin</td>
<td>7</td>
<td>777460</td>
<td>776460</td>
<td>89692848</td>
</tr>
<tr>
<td>v_vmart_node0001</td>
<td>server1.company.-83046:1y28gu9</td>
<td>dbadmin</td>
<td>8</td>
<td>324349</td>
<td>323349</td>
<td>81862010</td>
</tr>
<tr>
<td>v_vmart_node0001</td>
<td>server1.company.-83046:1y28gu9</td>
<td>dbadmin</td>
<td>9</td>
<td>277947</td>
<td>276947</td>
<td>32978280</td>
</tr>
</tbody>
</table>

(1 row)

Close all result sets for session server1.company.-83046:1y28gu9:

```
=> SELECT CLOSE_ALL_RESULTSETS('server1.company.-83046:1y28gu9');
```

```
close_all_resultsets
```

```
Closing all result sets from server1.company.-83046:1y28gu9
```

(1 row)

Query the MARS storage table again for the current status. You can see that the session and result sets have been closed:
CLOSE_RESULTSET

Closes a specific result set within Multiple Active Result Sets (MARS) and frees the MARS storage for other result sets.

Syntax

```
SELECT CLOSE_RESULTSET ('session_id', ResultSetID)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session_id</td>
<td>A string that specifies the Multiple Active Result Sets session containing the ResultSetID to close.</td>
</tr>
<tr>
<td>ResultSetID</td>
<td>An integer that specifies which result set to close.</td>
</tr>
</tbody>
</table>

Privileges

None; however, without superuser privileges, you can only close your own session's results.

Examples

This example shows a MARS storage table opened. One session_id is currently open, and one result set appears in the output.

```
=> SELECT * FROM SESSION_MARS_STORE;

<table>
<thead>
<tr>
<th>node_name</th>
<th>session_id</th>
<th>user_name</th>
<th>resultset_id</th>
<th>row_count</th>
<th>remaining_row_count</th>
<th>bytes_used</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_vmart_node0001</td>
<td>server1.company.-83046:1y28gu9</td>
<td>dbadmin</td>
<td>1</td>
<td>318718</td>
<td>312718</td>
<td>80441904</td>
</tr>
</tbody>
</table>

(1 row)
```

Close user session server1.company.-83046:1y28gu9 and result set 1:
-> SELECT CLOSE_RESULTSET('server1.company.-83046:1y28gu9', 1);
  close_resultset
  ---------------------------------------------------------------
  Closing result set 1 from server1.company.-83046:1y28gu9
  (1 row)

Query the MARS storage table again for current status. You can see that result set 1 is now closed:

```sql
SELECT * FROM SESSION_MARS_STORE;
```

<table>
<thead>
<tr>
<th>node_name</th>
<th>session_id</th>
<th>user_name</th>
<th>resultset_id</th>
<th>row_count</th>
<th>remaining_row_count</th>
<th>bytes_used</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>(0 rows)</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```
Partition Management Functions

This section contains partition management functions specific to Vertica.

**CALENDAR_HIERARCHY_DAY**

Specifies to group DATE partition keys into a hierarchy of years, months, and days. The Vertica Tuple Mover regularly evaluates partition keys against the current date, and merges partitions as needed into the appropriate year and month partition groups.

**Syntax**

```sql
CALENDAR_HIERARCHY_DAY( partition-expression[, active-months[, active-years] ] )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>partition-expression</code></td>
<td>The DATE expression on which to group partition keys, which must be identical to the table's PARTITION BY expression.</td>
</tr>
<tr>
<td><code>active-months</code></td>
<td>An integer ( \geq 0 ) that specifies how many months preceding ( \text{MONTH(CURRENT_DATE)} ) to store unique partition keys in separate partitions.</td>
</tr>
<tr>
<td></td>
<td>If you specify 1, only partition keys of the current month are stored in separate partitions.</td>
</tr>
<tr>
<td></td>
<td>If you specify 0, all partition keys of the current month are merged into a partition group for that month.</td>
</tr>
<tr>
<td></td>
<td>For details, see Hierarchical Partitioning.</td>
</tr>
<tr>
<td></td>
<td>Default value: 2</td>
</tr>
<tr>
<td><code>active-years</code></td>
<td>An integer ( \geq 0 ), specifies how many years preceding ( \text{YEAR(CURRENT_DATE)} ) to partition group keys by month in separate partitions.</td>
</tr>
<tr>
<td></td>
<td>If you specify 1, only partition keys of the current year are stored in month partition groups.</td>
</tr>
<tr>
<td></td>
<td>If you specify 0, all partition keys of the current and previous years are merged into year partition groups.</td>
</tr>
</tbody>
</table>
For details, see Hierarchical Partitioning.
Default value: 2

Important: The CALENDAR_HIERARCHY_DAY algorithm assumes that most table activity is focused on recent dates. Setting active-years and active-months to a low number ≥ 2 serves to isolate merge activity to date-specific containers, and incurs minimal overhead. Vertica recommends that you use the default setting of 2 for active-years and active-months. For most users, these settings achieve an optimal balance between ROS storage and performance.

Usage

Specify this function in a table partition clause, as its GROUP BY expression:

```
PARTITION BY partition-expression
group-expression
GROUP BY CALENDAR_HIERARCHY_DAY(
    group-expression
    [, active-months[, active-years] ]
)
```

For example:

```sql
=> CREATE TABLE public.store_orders
(    order_no int,
    order_date timestamp NOT NULL,
    shipper varchar(20),
    ship_date date
);...
=> ALTER TABLE public.store_orders
    PARTITION BY order_date::DATE
    GROUP BY CALENDAR_HIERARCHY_DAY(order_date::DATE, 3, 2) REORGANIZE;
```

For details on usage, see Hierarchical Partitioning in the Administrator's Guide.

Hierarchical Partitioning in the Administrator's Guide

COPY_PARTITIONS_TO_TABLE

Copies partitions from one table to another. This lightweight partition copy increases performance by initially sharing the same storage between two tables. After the copy operation is complete, the tables are independent of each other. Users can perform operations
on one table without impacting the other. These operations can increase the overall storage required for both tables.

Note: Although they share storage space, Vertica considers the partitions as discrete objects for license capacity purposes. For example, copying a one TB partition would only consume one TB of space. Your Vertica license, however, considers them as separate objects consuming two TB of space.

Syntax

COPY_PARTITIONS_TO_TABLE ( 
    '[[database.]schema.]source-table',
    'min-range-value',
    'max-range-value',
    '[[database.]schema.]target-table' 
)  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: mmyschema.thisDbObject</td>
</tr>
<tr>
<td>source-table</td>
<td>The source table of the partitions to copy.</td>
</tr>
<tr>
<td>min-range-value</td>
<td>The minimum and maximum value of partition keys to copy, where min-range-value must be ≤ max-range-value. To copy one partition, min-range-value and max-range-value must be equal.</td>
</tr>
<tr>
<td>max-range-value</td>
<td></td>
</tr>
<tr>
<td>target-table</td>
<td>The target table of the partitions to copy. If the table does not exist, Vertica creates a table from the source table's definition, by calling CREATE TABLE with LIKE and INCLUDING PROJECTIONS clause. The new table inherits ownership from the source table. For details, see Replicating a Table..</td>
</tr>
<tr>
<td>force-split</td>
<td>Optional Boolean argument, specifies whether to split ROS containers if the range of partition keys spans multiple containers or part of a single container:</td>
</tr>
</tbody>
</table>
- true: Split ROS containers as needed.
- false (default): Return with an error if ROS containers must be split to implement this operation.

Privileges

- Ownership or USAGE privileges on the source table.
- CREATE privileges on the target table, if COPY_PARTITIONS_TO_TABLE creates it.

Table Attribute Requirements

The following attributes of both tables must be identical:

- Column definitions, including NULL/NOT NULL constraints
- Segmentation
- Partition clause
- Number of projections
- Projection sort order
- Primary and unique key constraints. However, the key constraints do not have to be identically enabled. For more information on constraints, see Constraints in the Administrator's Guide.

Note: If the target table has primary or unique key constraints enabled and copying or moving the partitions will insert duplicate key values into the target table, Vertica rolls back the operation.

- Check constraints. For MOVE_PARTITIONS_TO_TABLE and COPY_PARTITIONS_TO_TABLE, Vertica enforces enabled check constraints on the target table only. For SWAP_PARTITIONS_BETWEEN_TABLES, Vertica enforces enabled check constraints on both tables. If there is a violation of an enabled check constraint, Vertica rolls back the operation.
- Number and definitions of text indices.

Table Restrictions

The following restrictions apply to the source and target tables:
If the source and target partitions are in different storage tiers, Vertica returns a warning but the operation proceeds. The partitions remain in their existing storage tier.

The following tables cannot be used as sources or targets:
- Temporary tables
- Virtual tables
- System tables
- External tables

Examples

If you call COPY_PARTITIONS_TO_TABLE and the target table does not exist, the function creates the table automatically. In the following example, the target table partn_backup.trades_200801 does not exist. COPY_PARTITIONS_TO_TABLE creates the table and replicates the partition. Vertica also copies all the constraints associated with the source table except foreign key constraints.

```sql
=> SELECT COPY_PARTITIONS_TO_TABLE ('prod_trades', '200801', '200801', 'partn_backup.trades_200801');
COPY_PARTITIONS_TO_TABLE
-----------------------------------------------
1 distinct partition values copied at epoch 15.
(1 row)
```

See Also

Archiving Partitions

DROP_PARTITIONS

This function supersedes meta-function DROP_PARTITION. Vertica will continue to support DROP_PARTITION. For information about this function, refer to the Vertica 9.1 documentation.

Drops the specified table partition keys. If the WOS contains table data, DROP_PARTITIONS forces a moveout before it executes the drop operation.
Syntax

```
DROP PARTITIONS (  
    '[[database.]schema.]table-name',  
    'min-range-value',  
    'max-range-value'  
    [, 'force-split']  
)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>database.schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>table-name</code></td>
<td>The target table. The table cannot be used as a dimension table in a pre-join projection and cannot have out-of-date (unrefreshed) projections.</td>
</tr>
<tr>
<td><code>min-range-value,max-range-value</code></td>
<td>The minimum and maximum value of partition keys to drop, where <code>min-range-value</code> must be \leq <code>max-range-value</code>. To drop one partition key, <code>min-range-value</code> and <code>max-range-value</code> must be equal.</td>
</tr>
</tbody>
</table>
| `force-split`              | Optional Boolean argument, specifies whether to split ROS containers if the range of partition keys spans multiple containers or part of a single container:  
  - `true`: Split ROS containers as needed.  
  - `false` (default): Return with an error if ROS containers must be split to implement this operation. |

Privileges

One of the following:
- DBADMIN
- Table owner
- USAGE privileges on the table schema and TRUNCATE privileges on the table

Examples

See Dropping Partitions in the Administrator's Guide.

See Also

PARTITION_TABLE

DUMP_PROJECTION_PARTITION_KEYS

Dumps the partition keys of the specified projection.

Syntax

DUMP_PROJECTION_PARTITION_KEYS( '[[[database.]schema.]projection-name'] )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject</td>
</tr>
<tr>
<td>projection-name</td>
<td>The projection name.</td>
</tr>
</tbody>
</table>

Privileges

- SELECT privilege on table
- USAGE privileges on schema
Example

The following statements create the table and projection `online_sales.online_sales_fact` and `online_sales.online_sales_fact_unseg_p`, respectively, and partitions table data by the column `call_center_key`:

```sql
=> CREATE TABLE online_sales.online_sales_fact
    (sale_date_key int NOT NULL,
     ship_date_key int NOT NULL,
     product_key int NOT NULL,
     product_version int NOT NULL,
     customer_key int NOT NULL,
     call_center_key int NOT NULL,
     online_page_key int NOT NULL,
     shipping_key int NOT NULL,
     warehouse_key int NOT NULL,
     promotion_key int NOT NULL,
     pos_transaction_number int NOT NULL,
     sales_quantity int,
     sales_dollar_amount float,
     ship_dollar_amount float,
     net_dollar_amount float,
     cost_dollar_amount float,
     gross_profit_dollar_amount float,
     transaction_type varchar(16)
    ) PARTITION BY (online_sales_fact.call_center_key);
```

```sql
=> CREATE PROJECTION online_sales.online_sales_fact_unseg_p AS SELECT * from online_sales.online_sales_fact unsegmented all nodes;
```

The following `DUMP_PROJECTION_PARTITION_KEYS` statement dumps the partition key from the projection `online_sales.online_sales_fact_unseg_p`:

```sql
=> SELECT DUMP_PROJECTION_PARTITION_KEYS('online_sales.online_sales_fact_unseg_p');
```

Partition keys on node v_vmart_node0001
Projection 'online_sales_fact_unseg_p'
   Storage [ROS container]
      No of partition keys: 1
      Partition keys: 200
   Storage [ROS container]
      No of partition keys: 1
      Partition keys: 199
   ... 
   Storage [ROS container]
      No of partition keys: 1
      Partition keys: 2
   Storage [ROS container]
      No of partition keys: 1
      Partition keys: 1

Partition keys on node v_vmart_node0002
Projection 'online_sales_fact_unseg_p'
See Also

- Partitioning Tables in the Administrator's Guide
- DUMP_PARTITION_KEYS
- DUMP_TABLE_PARTITION_KEYS
- PARTITION_PROJECTION
- PARTITION_TABLE

DUMP_TABLE_PARTITION_KEYS

Dumps the partition keys of all projections for the specified table.

Syntax

DUMP_TABLE_PARTITION_KEYS ( 'table-name' )

Parameters

<table>
<thead>
<tr>
<th>table-name</th>
<th>The name of the table.</th>
</tr>
</thead>
</table>

Privilege

- SELECT privilege on table
- USAGE privileges on schema

Examples

The following example creates a simple table called states and partitions the data by state:
CREATE TABLE states (year INTEGER NOT NULL, state VARCHAR NOT NULL) PARTITION BY state;
CREATE PROJECTION states_p (state, year) AS SELECT * FROM states ORDER BY state, year UNSEGMENTED ALL NODES;

Now dump the partition keys of all projections anchored on table states:

=> SELECT DUMP_TABLE_PARTITION_KEYS('states');

DUMP_TABLE_PARTITION_KEYS

---------------------------------------------------------------------
Partition keys on node v_vmart_node0001
  Projection 'states_p'
    Storage [ROS container]
      No of partition keys: 1
      Partition keys: VT
    Storage [ROS container]
      No of partition keys: 1
      Partition keys: PA
    Storage [ROS container]
      No of partition keys: 1
      Partition keys: NY
    Storage [ROS container]
      No of partition keys: 1
      Partition keys: MA

Partition keys on node v_vmart_node0002
...
(1 row)

- PARTITION_TABLE
- Partitioning Tables in the Administrator's Guide

MOVE_PARTITIONS_TO_TABLE

Moves partitions from one table to another.
Syntax

MOVE_PARTITIONS_TO_TABLE ( 
    '[[database.]schema.]source-table',
    'min-range-value',
    'max-range-value',
    '[[database.]schema.]target-table'
    [, force-split]
)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>source-table</td>
<td>The source table of the partitions to move.</td>
</tr>
<tr>
<td>min-range-value</td>
<td>The minimum and maximum value of partition keys to move, where min-range-value must be ≤ max-range-value. To move one partition, min-range-value and max-range-value must be equal.</td>
</tr>
<tr>
<td>max-range-value</td>
<td></td>
</tr>
<tr>
<td>target-table</td>
<td>The target table of the partitions to move. If the table does not exist, Vertica creates a table from the source table’s definition, by calling CREATE TABLE with LIKE and INCLUDING PROJECTIONS clause. The new table inherits ownership from the source table. For details, see Replicating a Table.</td>
</tr>
<tr>
<td>force-split</td>
<td>Optional Boolean argument, specifies whether to split ROS containers if the range of partition keys spans multiple containers or part of a single container:</td>
</tr>
<tr>
<td></td>
<td>- true: Split ROS containers as needed.</td>
</tr>
<tr>
<td></td>
<td>- false (default): Return with an error if ROS containers must be split to implement this operation.</td>
</tr>
</tbody>
</table>
Privileges

If the target table does not exist, you must have CREATE privileges on the target schema, to enable table creation. One of the following conditions is also required:

- DBADMIN role
- Owner of the source and target tables
- USAGE privileges on source and target schemas, TRUNCATE privileges on the source table, and INSERT privileges on the target table

Table Attribute Requirements

The following attributes of both tables must be identical:

- Column definitions, including NULL/NOT NULL constraints
- Segmentation
- Partition clause
- Number of projections
- Projection sort order
- Primary and unique key constraints. However, the key constraints do not have to be identically enabled. For more information on constraints, see Constraints in the Administrator's Guide.

  **Note:** If the target table has primary or unique key constraints enabled and copying or moving the partitions will insert duplicate key values into the target table, Vertica rolls back the operation.

- Check constraints. For MOVE_PARTITIONS_TO_TABLE and COPY_PARTITIONS_TO_TABLE, Vertica enforces enabled check constraints on the target table only. For SWAP_PARTITIONS_BETWEEN_TABLES, Vertica enforces enabled check constraints on both tables. If there is a violation of an enabled check constraint, Vertica rolls back the operation.
- Number and definitions of text indices.

Table Restrictions

The following restrictions apply to the source and target tables:
- If the source and target partitions are in different storage tiers, Vertica returns a warning but the operation proceeds. The partitions remain in their existing storage tier.

- The following tables cannot be used as sources or targets:
  - Temporary tables
  - Virtual tables
  - System tables
  - External tables

Examples

See Archiving Partitions.

See Also

- COPY_PARTITIONS_TO_TABLE
- SWAP_PARTITIONS_BETWEEN_TABLES

PARTITION_PROJECTION

Splits ROS containers for a specified projection. PARTITION_PROJECTION also purges data while partitioning ROS containers if deletes were applied before the AHM epoch.

Syntax

```
PARTITION_PROJECTION ( ‘[[database.]schema.]projection’)  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>
**projection** | The projection to partition.

Privileges

- Table owner
- USAGE privilege on schema

Examples

In this example, PARTITION_PROJECTION forces a split of ROS containers on the `states_p` projection:

```sql
=> SELECT PARTITION_PROJECTION ('states_p');
PARTITION_PROJECTION
-------------
Projection partitioned
(1 row)
```

See Also

- PARTITION_TABLE
- Partitioning Tables in the Administrator's Guide

**PARTITION_TABLE**

Invokes the Tuple Mover to reorganize ROS storage containers as needed to conform with the current partitioning policy.

Syntax

```
PARTITION_TABLE ( '[schema.]table-name')
```

Parameters

```
[database.]schema
```

Specifies a schema, by default public. If `schema` is any schema other than public, you must supply the schema name. For example:
If you specify a database, it must be the current database.

| table-name | The table to partition. |

Privileges

- Table owner
- USAGE privilege on schema

Restrictions

- You cannot run `PARTITION_TABLE` on a table that is an anchor table for a live aggregate projection or a Top-K projection.
- To reorganize storage to conform to a new policy, run `PARTITION_TABLE` after changing the partition GROUP BY expression.

See Also

- `PARTITION_PROJECTION`
- Partitioning Existing Table Data

**PURGE_PARTITION**

Purges a table partition of deleted rows. Similar to `PURGE` and `PURGE_PROJECTION`, this function removes deleted data from physical storage so you can reuse the disk space. `PURGE_PARTITION` removes data only from the AHM epoch and earlier.

Syntax

```
PURGE_PARTITION ( '[database.]schema.]table', partition-key )
```

Parameters

| [database.]schema | Specifies a schema, by default public. If schema is any schema |
other than public, you must supply the schema name. For example:

```sql
myschema.thisDbObject
```

If you specify a database, it must be the current database.

<table>
<thead>
<tr>
<th><strong>table</strong></th>
<th>The partitioned table to purge.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>partition-key</strong></td>
<td>The key of the partition to purge.</td>
</tr>
</tbody>
</table>

**Privileges**

- Table owner
- USAGE privilege on schema

**Example**

The following example lists the count of deleted rows for each partition in a table, then calls `PURGE_PARTITION()` to purge the deleted rows from the data.

```sql
=> SELECT partition_key, table_schema, projection_name, sum(deleted_row_count) AS deleted_row_count
    FROM partitions
    GROUP BY partition_key, table_schema, projection_name
    ORDER BY partition_key;
```

<table>
<thead>
<tr>
<th>partition_key</th>
<th>table_schema</th>
<th>projection_name</th>
<th>deleted_row_count</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>1</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>2</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>4</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>5</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>6</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>7</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>8</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>9</td>
<td>public</td>
<td>t_super</td>
<td>1</td>
</tr>
</tbody>
</table>

(10 rows)

```sql
=> SELECT PURGE_PARTITION('t',5); -- Purge partition with key 5.
```

---

Task: merge partitions
(Table: public.t) (Projection: public.t_super)

(1 row)

```sql
=> SELECT partition_key, table_schema, projection_name, sum(deleted_row_count) AS deleted_row_count
    FROM partitions
    GROUP BY partition_key, table_schema, projection_name
    ORDER BY partition_key;
```
See Also

- PURGE
- PURGE_PROJECTION
- PURGE_TABLE
- STORAGE_CONTAINERS

SWAP_PARTITIONS_BETWEEN_TABLES

Swaps partitions between two tables.

Syntax

SWAP_PARTITIONS_BETWEEN_TABLES (  
    '[[database.]schema.]staging-table',  
    'min-range-value',  
    'max-range-value',  
    '[[database.]schema.]target-table'  
)  

Parameters

<table>
<thead>
<tr>
<th>[database.]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
</table>
If you specify a database, it must be the current database.

<table>
<thead>
<tr>
<th><strong>staging-table</strong></th>
<th>The staging table from which to swap partitions.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>min-range-value</strong>&lt;br&gt;<strong>max-range-value</strong></td>
<td>The minimum and maximum value of partition keys to swap, where ( \text{min-range-value} ) must be ( \leq \text{max-range-value} ). To swap one partition, ( \text{min-range-value} ) and ( \text{max-range-value} ) must be equal.</td>
</tr>
<tr>
<td><strong>target-table</strong></td>
<td>The table to which the partitions are to be swapped. The target table cannot be the same as the staging table.</td>
</tr>
<tr>
<td><strong>force-split</strong></td>
<td>Optional Boolean argument, specifies whether to split ROS containers if the range of partition keys spans multiple containers or part of a single container:</td>
</tr>
<tr>
<td></td>
<td>- \text{true}: Split ROS containers as needed.</td>
</tr>
<tr>
<td></td>
<td>- \text{false} (default): Return with an error if ROS containers must be split to implement this operation.</td>
</tr>
</tbody>
</table>

### Privileges

One of the following:

- DBADMIN role
- Owner of both tables
- USAGE privileges on both schemas, and TRUNCATE and INSERT privileges on both tables.

### Requirements

The following attributes of both tables must be identical:

- Column definitions, including NULL/NOT NULL constraints
- Segmentation
- Partition clause
- Number of projections
- Projection sort order

- Primary and unique key constraints. However, the key constraints do not have to be identically enabled. For more information on constraints, see Constraints in the Administrator's Guide.

  Note: If the target table has primary or unique key constraints enabled and copying or moving the partitions will insert duplicate key values into the target table, Vertica rolls back the operation.

- Check constraints. For MOVE_PARTITIONS_TO_TABLE and COPY_PARTITIONS_TO_TABLE, Vertica enforces enabled check constraints on the target table only. For SWAP_PARTITIONS_BETWEEN_TABLES, Vertica enforces enabled check constraints on both tables. If there is a violation of an enabled check constraint, Vertica rolls back the operation.

- Number and definitions of text indices.

Restrictions

The following restrictions apply to the source and target tables:

- If the source and target partitions are in different storage tiers, Vertica returns a warning but the operation proceeds. The partitions remain in their existing storage tier.

- The following tables cannot be used as sources or targets:
  - Temporary tables
  - Virtual tables
  - System tables
  - External tables

Examples

See Swapping Partitions.

MOVE_PARTITIONS_TO_TABLE
Profiling Functions

This section contains profiling functions specific to Vertica.

CLEAR_PROFILING

Clears from memory data for the specified profiling type.

Note: Vertica stores profiled data in memory, so profiling can be memory intensive depending on how much data you collect.

Syntax

CLEAR_PROFILING( 'profiling-type' )

Parameters

<table>
<thead>
<tr>
<th>profiling-type</th>
<th>The type of profiling data to clear:</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>Clears profiling for basic session parameters and lock time out data.</td>
</tr>
<tr>
<td>query</td>
<td>Clears profiling for general information about queries that ran, such as the query strings used and the duration of queries.</td>
</tr>
<tr>
<td>ee</td>
<td>Clears profiling for information about the execution run of each query.</td>
</tr>
</tbody>
</table>

Example

The following statement clears profiled data for queries:

```sql
=> SELECT CLEAR_PROFILING('query');
```
See Also

- DISABLE_PROFILING
- ENABLE_PROFILING
- SHOW_PROFILING_CONFIG
- Profiling Database Performance

DISABLE_PROFILING

Disables for the current session collection of profiling data of the specified type. For detailed information, see Enabling Profiling in the Administrator's Guide

Syntax

DISABLE_PROFILING( 'profiling-type' )

Parameters

<table>
<thead>
<tr>
<th>profiling-type</th>
<th>The type of profiling data to disable:</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>Disables profiling for basic session parameters and lock timeout data.</td>
</tr>
<tr>
<td>query</td>
<td>Disables profiling for general information about queries that ran, such as the query strings used and the duration of queries.</td>
</tr>
<tr>
<td>ee</td>
<td>Disables profiling for information about the execution run of each query.</td>
</tr>
</tbody>
</table>

Example

The following statement disables profiling on query execution runs:

```sql
=> SELECT DISABLE_PROFILING('ee');
DISABLE_PROFILING
--------------------
EE Profiling Disabled
(1 row)
```
See Also

- CLEAR_PROFILING
- ENABLE_PROFILING
- SHOW_PROFILING_CONFIG

ENABLE_PROFILING

Enables for the current session collection of profiling data of the specified type. For detailed information, see Enabling Profiling in the Administrator's Guide.

Note: Vertica stores session and query profiling data in memory, so profiling can be memory intensive, depending on how much data you collect.

Syntax

ENABLE_PROFILING( 'profiling-type' )

Parameters

<table>
<thead>
<tr>
<th>profiling-type</th>
<th>The type of profiling data to enable:</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>Enables profiling for basic session parameters and lock timeout data.</td>
</tr>
<tr>
<td>query</td>
<td>Enables profiling for general information about queries that ran, such as the query strings used and the duration of queries.</td>
</tr>
<tr>
<td>ee</td>
<td>Enables profiling for information about the execution run of each query.</td>
</tr>
</tbody>
</table>

Example

The following statement enables profiling on query execution runs:

```
=> SELECT ENABLE_PROFILING('ee');
ENABLE_PROFILING
-----------------------------
```
SHOW_PROFILING_CONFIG

Shows whether profiling is enabled.

Syntax

SHOW_PROFILING_CONFIG()

Example

The following statement shows that profiling is enabled globally for all profiling types (session, execution engine, and query):

```
=> SELECT SHOW_PROFILING_CONFIG();
SHOW_PROFILING_CONFIG
-----------------------------------------------
  Session Profiling: Session off, Global on
  EE Profiling:     Session off, Global on
  Query Profiling: Session off, Global on
(1 row)
```

Projection Management Functions

This section contains projection management functions specific to Vertica.

See Also

- \texttt{V\_CATALOG\_PROJECTIONS}
- \texttt{V\_CATALOG\_PROJECTION\_COLUMNS}
- \texttt{V\_MONITOR\_PROJECTION\_REFRESHES}
- \texttt{V\_MONITOR\_PROJECTION\_STORAGE}

\textbf{CLEAR\_PROJECTION\_REFRESHES}

Clears information in system table \texttt{PROJECTION\_REFRESHES} of projection refresh history. System table \texttt{PROJECTION\_REFRESHES} records information about refresh operations, successful and unsuccessful. \texttt{PROJECTION\_REFRESHES} retains refresh data until one of the following events occurs:

- \texttt{CLEAR\_PROJECTION\_REFRESHES} is called.
- The table's storage quota is exceeded.

\texttt{PROJECTION\_REFRESHES} checks the Boolean column \texttt{IS\_EXECUTING} in \texttt{PROJECTION\_REFRESHES} to determine whether refresh operations are still running or are complete. The function only removes information for refresh operations that are complete.

Syntax

\begin{verbatim}
CLEAR\_PROJECTION\_REFRESHES()
\end{verbatim}

Privileges

Superuser
Example

```sql
=> SELECT CLEAR_PROJECTION_REFRESHES();
CLEAR_PROJECTION_REFRESHES
-----------------------------
CLEAR
(1 row)
```

See Also

- REFRESH
- START_REFRESH
- Clearing Projection Refresh History

**EVALUATE_DELETE_PERFORMANCE**

Evaluates projections for potential DELETE performance issues. If there are issues found, a warning message is displayed. For steps you can take to resolve delete and update performance issues, see DELETE and UPDATE Optimization in the Administrator's Guide. This function uses data sampling to determine whether there are any issues with a projection. Therefore, it does not generate false-positives warnings, but it can miss some cases where there are performance issues.

**Note:** Optimizing for delete performance is the same as optimizing for update performance. So, you can use this function to help optimize a projection for updates as well as deletes.

Syntax

```
EVALUATE_DELETE_PERFORMANCE ( 'target' )
```

Parameters

| **target** | The name of a projection or table. If you supply the name of a projection, only that projection is evaluated for DELETE performance issues. If you supply the name of a table, then all of the projections anchored to the table will be evaluated for issues. If you do not provide a projection or table name, EVALUATE_DELETE_ |
PERFORMANCE examines all of the projections that you can access for DELETE performance issues. Depending on the size you your database, this may take a long time.

Privileges
None

Notes
When evaluating multiple projections, EVALUATE_DELETE_PERFORMANCE reports up to ten projections that have issues, and refers you to a table that contains the full list of issues it has found.

Example
The following example demonstrates how you can use EVALUATE_DELETE_PERFORMANCE to evaluate your projections for slow DELETE performance.

```sql
=> create table example (A int, B int,C int);
CREATE TABLE
=> create projection one_sort (A,B,C) as (select A,B,C from example) order by A;
CREATE PROJECTION
=> create projection two_sort (A,B,C) as (select A,B,C from example) order by A,B;
CREATE PROJECTION
=> select evaluate_delete_performance('one_sort');
   evaluate_delete_performance
-------------------------------
No projection delete performance concerns found.
(1 row)
=> select evaluate_delete_performance('two_sort');
   evaluate_delete_performance
-------------------------------
No projection delete performance concerns found.
(1 row)
```

The previous example showed that there was no structural issue with the projection that would cause poor DELETE performance. However, the data contained within the projection can create potential delete issues if the sorted columns do not uniquely identify a row or small number of rows. In the following example, Perl is used to populate the table with data using a nested series of loops. The inner loop populates column C, the middle loop populates column B, and the outer loop populates column A. The result is column A contains only three distinct values (0, 1, and 2), while column B slowly varies between 20 and 0 and column C changes in
each row. EVALUATE_DELETE_PERFORMANCE is run against the projections again to see if the data within the projections causes any potential DELETE performance issues.

```perl
=\! perl -e 'for ($i=0; $i<3; $i++) { for ($j=0; $j<21; $j++) { for ($k=0; $k<19; $k++) { printf "%d,%d,%d\n", $i,$j,$k;}}}' | /opt/vertica/bin/vsql -c "copy example from stdin delimiter ',' direct;"
```

```
Password:

=> select * from example;

A | B | C
---|---|---

 0 | 20 |  5
 0 | 20 |  4
 0 | 20 |  3
 0 | 20 |  2
 0 | 20 |  1
 0 | 20 |  0
 0 | 19 | 18

1157 rows omitted

2 |  1 |  0
2 |  0 | 18
2 |  0 | 17
2 |  0 | 16
2 |  0 | 15
2 |  0 | 14
2 |  0 | 13
2 |  0 | 12
2 |  0 | 11
2 |  0 | 10
2 |  0 |  9
2 |  0 |  8
2 |  0 |  7
2 |  0 |  6
2 |  0 |  5
2 |  0 |  4
2 |  0 |  3
2 |  0 |  2
2 |  0 |  1
2 |  0 |  0

=> SELECT COUNT (*) FROM example;

COUNT
-------
 1197

(1 row)

=> SELECT COUNT (DISTINCT A) FROM example;

COUNT
-------
```
The one_sort projection has potential delete issues since it only sorts on column A which has few distinct values. This means that each value in the sort column corresponds to many rows in the projection, which negatively impacts DELETE performance. Since the two_sort projection is sorted on columns A and B, each combination of values in the two sort columns identifies just a few rows, allowing deletes to be performed faster.

Not supplying a projection name results in all of the projections you can access being evaluated for DELETE performance issues.

GET_PROJECTION_STATUS

Returns information relevant to the status of a projection:

- The current K-safety status of the database
- The number of nodes in the database
- Whether the projection is segmented
- The number and names of buddy projections
- Whether the projection is safe
- Whether the projection is up to date
- Whether statistics have been computed for the projection

Use GET_PROJECTION_STATUS to monitor the progress of a projection data refresh.
Syntax

`GET_PROJECTION_STATUS ( '[[database.]schema.]projection' );`

Parameters

<table>
<thead>
<tr>
<th><code>[database.]schema</code></th>
<th>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>

projection The projection for which to display status.

Examples

```sql
=> SELECT GET_PROJECTION_STATUS('public.customer_dimension_site01');

GET_PROJECTION_STATUS

Current system K is 1.
# of Nodes: 4.
public.customer_dimension_site01 [Segmented: No] [Seg Cols: ] [K: 3] [public.customer_dimension_site04, public.customer_dimension_site03, public.customer_dimension_site02] [Safe: Yes] [UptoDate: Yes][Stats: Yes]
```

**GET_PROJECTIONS**

Returns the following information about projections of the specified anchor table:

<table>
<thead>
<tr>
<th>Contextual information</th>
<th>Database K-safety</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Number of database nodes</td>
</tr>
<tr>
<td></td>
<td>Number of projections for this table</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Projection data</th>
<th>For each projection, specifies:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>All buddy projections</td>
</tr>
</tbody>
</table>
- Whether it is segmented
- Whether it is safe
- Whether it is up-to-date.

You can also use GET_PROJECTIONS to monitor the progress of a projection data refresh.

Syntax

```
GET_PROJECTIONS ( '[[database.]schema-name.]table' )
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>table</code></td>
<td>Anchor table of the projections to list.</td>
</tr>
</tbody>
</table>

Privileges

None

Examples

The following example gets information about projections for VMart table `store.store_dimension`:

```sql
=> SELECT GET_PROJECTIONS('store.store_dimension');
-[ RECORD 1 ]-+-
GET_PROJECTIONS | Current system K is 1.
# of Nodes: 3.
Table store.store_dimension has 2 projections.

Projection Name: [Segmented] [SegCols] [# of Buddies] [Buddy Projections] [Safe] [UptoDate] [Stats]

<table>
<thead>
<tr>
<th>Store</th>
<th>Segmented</th>
<th>SegCols</th>
<th># of Buddies</th>
<th>Buddy Projections</th>
<th>Safe</th>
<th>UptoDate</th>
<th>Stats</th>
</tr>
</thead>
<tbody>
<tr>
<td>store.store_dimension_b1</td>
<td>Yes</td>
<td>&quot;store.store_dimension.store_key&quot;</td>
<td>1</td>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>RowCounts</td>
</tr>
<tr>
<td>store.store_dimension_b0</td>
<td>Yes</td>
<td>&quot;store.store_dimension.store_key&quot;</td>
<td>1</td>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>RowCounts</td>
</tr>
<tr>
<td>store.store_dimension_b1</td>
<td>Yes</td>
<td>&quot;store.store_dimension.store_key&quot;</td>
<td>1</td>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>RowCounts</td>
</tr>
<tr>
<td>store.store_dimension_b0</td>
<td>Yes</td>
<td>&quot;store.store_dimension.store_key&quot;</td>
<td>1</td>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>RowCounts</td>
</tr>
</tbody>
</table>
```
REFRESH

Synchronously refreshes one or more table projections in the foreground, and updates system table `PROJECTION_REFRESHES`. If you run REFRESH with no arguments, it refreshes all projections that contain stale data.

To understand projection refresh in detail, go to Refreshing Projections.

Syntax

```sql
REFRESH ( [ '[[database.]schema.]table-name[,]' ])
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code>. If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>table-name</code></td>
<td>The anchor table of the projections to refresh. If you specify multiple tables, REFRESH attempts to refresh them in parallel. Such calls are part of the Database Designer deployment (and deployment script).</td>
</tr>
</tbody>
</table>

Returns

**Note:** If REFRESH does not refresh any projections, it returns a header string with no results.

<table>
<thead>
<tr>
<th>Column</th>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Projection Name</td>
<td>The projection targeted for refresh.</td>
</tr>
<tr>
<td>Anchor Table</td>
<td>The projection's associated anchor table.</td>
</tr>
</tbody>
</table>
Status | Projections' refresh status:
--- | ---
- queued: Queued for refresh.
- refreshing: Refresh is in process.
- refreshed: Refresh successfully completed.
- failed: Refresh did not successfully complete.

Refresh Method | Method used to refresh the projection.
Error Count | Number of times a refresh failed for the projection.
Duration (sec) | How long (in seconds) the projection refresh ran.

Privileges
- Superuser
- Owner of the specified tables

Refresh Methods
Vertica can refresh a projection from one of its buddies, if one is available. In this case, the target projection gets the source buddy's historical data. Otherwise, the projection is refreshed from scratch with data of the latest epoch at the time of the refresh operation. In this case, the projection cannot participate in historical queries on any epoch that precedes the refresh operation.

To determine the method used to refresh a given projection, query `REFRESH_METHOD` from system table `PROJECTION_REFRESSES`.

Examples
The following example refreshes the projections in tables t1 and t2:

```sql
=> SELECT REFRESH('t1, t2');

<table>
<thead>
<tr>
<th>REFRESH</th>
</tr>
</thead>
<tbody>
<tr>
<td>Refresh completed with the following outcomes:</td>
</tr>
<tr>
<td>Projection Name: [Anchor Table] [Status] [Refresh Method] [Error Count] [Duration (sec)]</td>
</tr>
</tbody>
</table>
```
This next example shows that only the projection on table `t` was refreshed:

```sql
=> SELECT REFRESH('allow, public.deny, t');

Refresh completed with the following outcomes:

<table>
<thead>
<tr>
<th>Projection Name</th>
<th>[Anchor Table]</th>
<th>[Status]</th>
<th>[Refresh Method]</th>
<th>[Error Count]</th>
<th>[Duration (sec)]</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;n/a&quot;.&quot;n/a&quot;</td>
<td>[n/a]</td>
<td>[failed: insufficient permissions on table &quot;allow&quot;]</td>
<td>[]</td>
<td>[1]</td>
<td>[0]</td>
</tr>
<tr>
<td>&quot;n/a&quot;.&quot;n/a&quot;</td>
<td>[n/a]</td>
<td>[failed: insufficient permissions on table &quot;public.deny&quot;]</td>
<td>[]</td>
<td>[1]</td>
<td>[]</td>
</tr>
<tr>
<td>&quot;public&quot;.&quot;t_p1&quot;</td>
<td>[t]</td>
<td>[refreshed]</td>
<td>[scratch]</td>
<td>[0]</td>
<td>[0]</td>
</tr>
</tbody>
</table>
```

See Also

- `CLEAR_PROJECTION_REFRESHES`
- `START_REFRESH`

### REFRESH_COLUMNS

Refreshes table columns that are defined with the constraint `SET USING`. All refresh operations associated with a `REFRESH_COLUMNS` operation belong to the same transaction. All tables and columns specified by `REFRESH_COLUMNS` must be refreshed; otherwise, the entire operation is rolled back.

**Syntax**

```sql
REFRESH_COLUMNS ( 'tables', ['columns'] [, 'refresh-mode'] )
```

**Parameters**

<table>
<thead>
<tr>
<th><code>tables</code></th>
<th>A comma-delimited list that specifies the tables to refresh: <code>[[database.]schema.]table[,...]</code></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>columns</code></td>
<td>Specifies one or more columns to refresh, as follows:</td>
</tr>
</tbody>
</table>
' ' (empty string)
Refresh all SET USING/DEFAULT USING columns in the specified tables.

[[database.]schema.]table.]column[,...]
Refresh all columns in the comma-delimited list. The following requirements apply:

- If REFRESH_COLUMNS specifies multiple tables, all column names must be qualified by their table names. If the target tables span multiple schemas, all column names must be fully qualified by their schema and table names.

- All specified columns must have a SET USING or DEFAULT USING constraint.

For example:

```
SELECT REFRESH_COLUMNS ('t1, t2', 't1.a, t2.b', 'REBUILD');
```

[[database.]schema.]table.*
Refresh all SET USING/DEFAULT USING columns in table. For example:

```
SELECT REFRESH_COLUMNS ('t1, t2', 't1.*, t2.b', 'REBUILD');
```

If you specify a database, it must be the current database.

**refresh-mode**
Specifies how to refresh SET USING columns:

- UPDATE: Marks original rows as deleted and replaces them with new rows. In order to save these updates, you must issue a COMMIT statement.

- REBUILD: Replaces all data in the specified columns. The rebuild operation is auto-committed.

If set to an empty string or omitted, REFRESH_COLUMNS executes in UPDATE mode. If you specify multiple tables, you must explicitly specify REBUILD mode.

In both cases, REFRESH_COLUMNS returns an error if any SET USING column is defined as a primary or unique key in a table that enforces those constraints.
Privileges

- MODIFY privilege on the target table, USAGE privilege on its schema
- For each SET USING column to refresh that queries another table or view: SELECT privilege on the queried table/view, USAGE privilege on its schema

REBUILD versus REFRESH Modes

In general, UPDATE is a better choice when changes to SET USING column data are confined to a relatively small number of rows. Use REBUILD when a significant amount of SET USING column data is stale and must be updated. It is generally good practice to call REFRESH_COLUMNS with REBUILD on any new SET USING column—for example, to populate a SET USING column after adding it with ALTER TABLE...ADD COLUMN.

REBUILD Mode Restrictions

If you call REFRESH_COLUMNS on a SET USING column and specify the refresh mode as REBUILD, Vertica returns an error if any of the following conditions is true for that column:

- Specified as a table partition key.
- Included in a live aggregate projection or projection with expressions.
- Included in a projection's sort order or segmentation.
- Included in a projection, and the projection omits an anchor table column that is referenced in the column's SET USING expression.
- Included in a projection's GROUPED clause.

Examples

See Flattened Table Example and SET USING versus DEFAULT in Analyzing Data.
See Also

- Column-Constraint
- Defining Column Values

START_REFRESH

Refreshes projections in the current schema with the latest data of their respective anchor tables. START_REFRESH runs asynchronously in the background, and updates system table PROJECTION_REFRESHES. This function has no effect if a refresh is already running.

To refresh only projections of a specific table, use REFRESH. When you deploy a design through Database Designer, it automatically refreshes its projections.

Syntax

START_REFRESH()

Privileges

None

Requirements

All nodes must be up.

Refresh Methods

Vertica can refresh a projection from one of its buddies, if one is available. In this case, the target projection gets the source buddy's historical data. Otherwise, the projection is refreshed from scratch with data of the latest epoch at the time of the refresh operation. In this case, the projection cannot participate in historical queries on any epoch that precedes the refresh operation.

To determine the method used to refresh a given projection, query REFRESH_METHOD from system table PROJECTION_REFRESHES.
Example

```sql
=> SELECT START_REFRESH();
START_REFRESH
-----------------------------------------------
Starting refresh background process.
(1 row)
```

See Also

- Refreshing Projections
- CLEAR_PROJECTION_REFRESHES
Purge Functions

This section contains purge functions specific to Vertica.

PURGE

Permanently removes delete vectors from ROS storage containers so disk space can be reused. PURGE removes all historical data up to and including the Ancient History Mark epoch.

PURGE does not delete temporary tables.

Caution: PURGE can temporarily take up significant disk space.

Syntax

```
SELECT PURGE()
```

Privileges

- Table owner
- USAGE privilege on schema

Example

After you delete data from a Vertica table, that data is marked for deletion. To see the data that is marked for deletion, query the DELETE_VECTORS system table.

Run PURGE to remove the delete vectors from ROS containers.

```
=> SELECT * FROM test1;
   number
  --------
     3
    12
    33
    87
   43
    99
(6 rows)
=> DELETE FROM test1 WHERE number > 50;
OUTPUT
```
After the ancient history mark (AHM) advances:

```sql
=> SELECT * FROM DELETE_VECTORS;

<table>
<thead>
<tr>
<th>node_name</th>
<th>projection_name</th>
<th>deleted_row_count</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_vmart_node0002</td>
<td>test1_b1</td>
<td>1</td>
</tr>
<tr>
<td>v_vmart_node0001</td>
<td>test1_b1</td>
<td>1</td>
</tr>
<tr>
<td>v_vmart_node0001</td>
<td>test1_b0</td>
<td>1</td>
</tr>
<tr>
<td>v_vmart_node0003</td>
<td>test1_b0</td>
<td>1</td>
</tr>
</tbody>
</table>
```

(4 rows)

```sql
=> SELECT PURGE();
...
```

(No rows)

See Also

- **PURGE_PARTITION**
- **PURGE_PROJECTION**
- **PURGE_TABLE**
- **Purging Deleted Data**

**PURGE_PARTITION**

Purges a table partition of deleted rows. Similar to `PURGE` and `PURGE_PROJECTION`, this function removes deleted data from physical storage so you can reuse the disk space. `PURGE_PARTITION` removes data only from the AHM epoch and earlier.
Syntax

PURGE_PARTITION ( '[database.]schema.]table', partition-key )

Parameters

<table>
<thead>
<tr>
<th>[database.]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td>If you specify a database, it must be the current database.</td>
<td></td>
</tr>
<tr>
<td>table</td>
<td>The partitioned table to purge.</td>
</tr>
<tr>
<td>partition-key</td>
<td>The key of the partition to purge.</td>
</tr>
</tbody>
</table>

Privileges

- Table owner
- USAGE privilege on schema

Example

The following example lists the count of deleted rows for each partition in a table, then calls PURGE_PARTITION() to purge the deleted rows from the data.

```sql
=> SELECT partition_key,table_schema,projection_name,sum(deleted_row_count)
     AS deleted_row_count FROM partitions
    GROUP BY partition_key,table_schema,projection_name
ORDER BY partition_key;
```

<table>
<thead>
<tr>
<th>partition_key</th>
<th>table_schema</th>
<th>projection_name</th>
<th>deleted_row_count</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>1</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>2</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>4</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>5</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>6</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>7</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>8</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>9</td>
<td>public</td>
<td>t_super</td>
<td>1</td>
</tr>
</tbody>
</table>
Task: merge partitions
(Table: public.t) (Projection: public.t_super)
(1 row)

=> SELECT partition_key,table_schema,projection_name,sum(deleted_row_count) AS deleted_row_count FROM partitions GROUP BY partition_key,table_schema,projection_name ORDER BY partition_key;

<table>
<thead>
<tr>
<th>partition_key</th>
<th>table_schema</th>
<th>projection_name</th>
<th>deleted_row_count</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>1</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>2</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>public</td>
<td>t_super</td>
<td>2</td>
</tr>
<tr>

<td>1</td>
</tr>
</tbody>
</table>

(10 rows)

See Also

- **PURGE**
- **PURGE_PROJECTION**
- **PURGE_TABLE**
- **STORAGE_CONTAINERS**

**PURGE_PROJECTION**

Permanently removes deleted data from physical storage so disk space can be reused. You can purge historical data up to and including the Ancient History Mark epoch.

Caution: PURGE_PROJECTION can use significant disk space while purging the data.

See **PURGE** for details about purge operations.

**Syntax**

PURGE_PROJECTION ( '[database.]schema.projection' )
Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td><code>projection</code></td>
<td>The projection to purge.</td>
</tr>
</tbody>
</table>

Privileges

- Table owner
- USAGE privilege on schema

Examples

The following example purges all historical data in projection `tbl_p` that precedes the Ancient History Mark epoch.

```sql
=> CREATE TABLE tbl (x int, y int);
CREATE TABLE
=> INSERT INTO tbl VALUES(1,2);
OUTPUT
-------
1
(1 row)
=> INSERT INTO tbl VALUES(3,4);
OUTPUT
-------
1
(1 row)
dbadmin=> COMMIT;
COMMIT
=> CREATE PROJECTION tbl_p AS SELECT x FROM tbl UNSEGMENTED ALL NODES;
WARNING 4468: Projection <public.tbl_p> is not available for query processing.
Execute the select start_refresh() function to copy data into this projection.
The projection must have a sufficient number of buddy projections and all nodes must be up before starting a refresh
CREATE PROJECTION
=> SELECT START_REFRESH();
START_REFRESH
```
Starting refresh background process.

```sql
=> DELETE FROM tbl WHERE x=1;
OUTPUT
--------
1
(1 row)

=> COMMIT;
COMMIT
=> SELECT MAKE_AHM_NOW();
MAKE_AHM_NOW

AHM set (New AHM Epoch: 9066)
(1 row)

=> SELECT PURGE_PROJECTION ('tbl_p');
PURGE_PROJECTION

-------------
Projection purged
(1 row)
```

- `PURGE_TABLE`
- `STORAGE_CONTAINERS`
- Purging Deleted Data in the Administrator's Guide.

**PURGE_TABLE**

Note: This function was formerly named `PURGE_TABLE_PROJECTIONS()`. Vertica still supports the former function name.

Permanently removes deleted data from physical storage so disk space can be reused. You can purge historical data up to and including the Ancient History Mark epoch.

Purges all projections of the specified table. You cannot use this function to purge temporary tables.

**Syntax**

```sql
PURGE_TABLE ( '[database.]schema.]table' )
```
Parameters

| [database.]schema | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:  

|                     | myschema.thisDbObject |
|                     | If you specify a database, it must be the current database. |
| table               | The table to purge. |

Privileges

- Table owner
- USAGE privilege on schema

**Caution:** PURGE_TABLE could temporarily take up significant disk space while the data is being purged.

Example

The following example purges all projections for the store sales fact table located in the Vmart schema:

```sql
=> SELECT PURGE_TABLE('store.store_sales_fact');
```

See Also

- PURGE
- PURGE_TABLE
- STORAGE_CONTAINERS
- Purging Deleted Data
Session Management Functions

This section contains session management functions specific to Vertica.
See also the SQL system table `V_MONITOR_SESSIONS`.

CANCEL_REFRESH

Cancels refresh-related internal operations initiated by `START_REFRESH` and `REFRESH`.

Syntax

```
CANCEL_REFRESH()
```

Privileges

None

Notes

- Refresh tasks run in a background thread in an internal session, so you cannot use `INTERRUPT_STATEMENT` to cancel those statements. Instead, use `CANCEL_REFRESH` to cancel statements that are run by refresh-related internal sessions.

- Run `CANCEL_REFRESH()` on the same node on which `START_REFRESH()` was initiated.

- `CANCEL_REFRESH()` cancels the refresh operation running on a node, waits for the cancelation to complete, and returns SUCCESS.

- Only one set of refresh operations runs on a node at any time.

Example

Cancel a refresh operation executing in the background.

```
=> SELECT START_REFRESH();
START_REFRESH
-----------------------------------
Starting refresh background process.
```
(1 row)

```sql
=> SELECT CANCEL REFRESH();

CANCEL_REFRESH
---------------------------------
Stopping background refresh process.
(1 row)
```

See Also

- `INTERRUPT_STATEMENT`
- `SESSIONS`
- `START_REFRESH`
- `PROJECTION_REFRESHES`

**CLOSE_ALL_SESSIONS**

Closes all external sessions except the one that issues this function. Use `CLOSE_ALL_SESSIONS` before shutting down the Vertica database.

Vertica closes sessions asynchronously, so it is possible for another session to open before all previous sessions close. In this case, you must reissue this function before the database can be shut down. To view the status of all open sessions, query the system table `SESSIONS`.

Query to view all database sessions.

For detailed information about session management options, see Managing Sessions in the Administrator's Guide.

**Syntax**

```sql
CLOSE_ALL_SESSIONS()
```

**Privileges**

- Superuser to close all database sessions
- None to close your own session

**Examples**

Two user sessions are open on separate nodes:
```
> SELECT * FROM sessions;
-[- RECORD 1 ]--------------------------------------------------------
| node_name     | v_vmartdb_node0001 |
| user_name     | dbadmin             |
| client_hostname | 127.0.0.1:52110    |
| client_pid    | 4554                |

- CLOSE_USER_SESSIONS
- SHUTDOWN

CLOSE_SESSION

Interrupts the specified external session, rolls back the current transaction if any, and closes the socket. You can only close your own session.

It might take some time before a session is closed. To view the status of all open sessions, query the system table SESSIONS.

For detailed information about session management options, see Managing Sessions in the Administrator's Guide.
Syntax

`CLOSE_SESSION ( 'sessionid')`

Parameters

| `sessionid` | A string that specifies the session to close. This identifier is unique within the cluster at any point in time but can be reused when the session closes. |

Privileges

None

Examples

User session opened. Record 2 shows the user session running a `COPY DIRECT` statement.

```sql
=> SELECT * FROM sessions;
- [ RECORD 1 ]------------------------------------------
node_name | v_vmartdb_node0001
user_name | dbadmin
client_hostname | 127.0.0.1:52110
client_pid | 4554
login_timestamp | 2011-01-03 14:05:40.252625-05
session_id | stress04-4325:0x14
client_label
transaction_start | 2011-01-03 14:05:44.325781
transaction_id | 45035996273728326
transaction_description | user dbadmin (SELECT * FROM sessions;)
statement_start | 2011-01-03 15:36:13.896288
statement_id | 10
last_statement_duration_us | 14978
current_statement | select * from sessions;
ssl_state | None
authentication_method | Trust
- [ RECORD 2 ]------------------------------------------
node_name | v_vmartdb_node0002
user_name | dbadmin
client_hostname | 127.0.0.1:57174
client_pid | 30117
login_timestamp | 2011-01-03 15:33:00.842021-05
session_id | stress05-27944:0xc1a
client_label
transaction_start | 2011-01-03 15:34:46.538102
transaction_id | -1
transaction_description | user dbadmin (COPY ClickStream_Fact FROM '/data/clickstream/1g/ClickStream_Fact.tbl' DELIMITER '|' NULL '\n' 'DIRECT';)
statement_start | 2011-01-03 15:34:46.538862
```
Close user session stress05-27944:0xc1a

=> \x
Expanded display is off.
=> SELECT CLOSE_SESSION('stress05-27944:0xc1a');
          CLOSE_SESSION
-----------------------------------------------
Session close command sent. Check v_monitor.sessions for progress.
(1 row)

Query the sessions table again for current status, and you can see that the second session has been closed:

=> SELECT * FROM SESSIONS;
-[
| node_name | v_vmartdb_node0001 |
| user_name | dbadmin |
| client_hostname | 127.0.0.1:52110 |
| client_pid | 4554 |
| login_timestamp | 2011-01-03 14:05:40.256250-05 |
| session_id | stress04-4325:0x14 |
| client_label | |
| transaction_start | 2011-01-03 14:05:44.325781 |
| transaction_id | 45035996273728326 |
| transaction_description | user dbadmin (select * from SESSIONS;)
| statement_start | 2011-01-03 16:12:07.841298 |
| statement_id | 20 |
| last_statement_duration_us | 2099 |
| current_statement | SELECT * FROM SESSIONS; |
| ssl_state | None |
| authentication_method | Trust |

See Also

- CLOSE_ALL_SESSIONS
- SHUTDOWN

CLOSE_USER_SESSIONS

Stops the session for a user, rolls back any transaction currently running, and closes the connection. To determine the status of the sessions to close, query the SESSIONS table.
Note: Running this function on your own sessions leaves one session running.

Syntax

CLOSE_USER_SESSIONS ( 'user-name' )

Parameters

| user-name | Specifies the user whose sessions are to be closed. If you specify your own user name, Vertica closes all sessions except the one in which you issue this function. |

Privileges

DBADMIN

Examples

This example closes all active session for user u1:

```sql
=> SELECT close_user_sessions('u1');
```

See Also

- CLOSE_ALL_SESSIONS
- CLOSE_SESSION
- SHUTDOWN

GET_NUM_ACCEPTED_ROWS

Returns the number of rows loaded into the database for the last completed load for the current session. GET_NUM_ACCEPTED_ROWS is a meta-function. Do not use it as a value in an INSERT query.

The number of accepted rows is not available for a load that is currently in process. Check the LOAD_STREAMS system table for its status.
This meta-function supports loads from STDIN, COPY LOCAL from a Vertica client, or a single file on the initiator. You cannot use GET_NUM_ACCEPTED_ROWS for multi-node loads.

**Syntax**

```sql
GET_NUM_ACCEPTED_ROWS();
```

**Privileges**

None

**Note:** The data regarding accepted rows from the last load during the current session does not persist, and is lost when you initiate a new load.

**Examples**

This examples shows the number of accepted rows from the vmart_load_data.sql meta-command.

```sql
=> \i vmart_load_data.sql;
=> SELECT GET_NUM_ACCEPTED_ROWS();
GET_NUM_ACCEPTED_ROWS
-------------------------
300000
(1 row)
```

**See Also**

- `GET_NUM_REJECTED_ROWS`

**GET_NUM_REJECTED_ROWS**

Returns the number of rows that were rejected during the last completed load for the current session. GET_NUM_REJECTED_ROWS is a meta-function. Do not use it as a value in an INSERT query.

Rejected row information is unavailable for a load that is currently running. The number of rejected rows is not available for a load that is currently in process. Check the LOAD_STREAMS system table for its status.

This meta-function supports loads from STDIN, COPY LOCAL from a Vertica client, or a single file on the initiator. You cannot use GET_NUM_REJECTED_ROWS for multi-node loads.
Syntax

GET_NUM_REJECTED_ROWS();

Privileges

None

Note: The data regarding rejected rows from the last load during the current session does not persist, and is dropped when you initiate a new load.

Examples

This example shows the number of rejected rows from the vmart_load_data.sql meta-command.

```
=> \i vmart_load_data.sql
=> SELECT GET_NUM_REJECTED_ROWS();
GET_NUM_REJECTED_ROWS
-----------------------
0
(1 row)
```

See Also

- GET_NUM_ACCEPTED_ROWS

**INTERRUPT_STATEMENT**

Interrupts the specified statement in a user session, rolls back the current transaction, and writes a success or failure message to the log file.

Sessions can be interrupted during statement execution. Only statements run by user sessions can be interrupted.

Syntax

INTERRUPT_STATEMENT( 'session-id', statement-id )
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session-id</td>
<td>Identifies the session to interrupt. This identifier is unique within the cluster at any point in time.</td>
</tr>
<tr>
<td>statement-id</td>
<td>Identifies the statement to interrupt. If the statement-id is valid, the statement can be interrupted and INTERRUPT_STATEMENT returns a success message. Otherwise the system returns an error.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

Messages

The following list describes messages you might encounter:

<table>
<thead>
<tr>
<th>Message</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Statement interrupt sent. Check SESSIONS for progress.</td>
<td>This message indicates success.</td>
</tr>
<tr>
<td>Session &lt;id&gt; could not be successfully interrupted: session not found.</td>
<td>The session ID argument to the interrupt command does not match a running session.</td>
</tr>
<tr>
<td>Session &lt;id&gt; could not be successfully interrupted: statement not found.</td>
<td>The statement ID does not match (or no longer matches) the ID of a running statement (if any).</td>
</tr>
<tr>
<td>No interruptible statement running</td>
<td>The statement is DDL or otherwise non-interruptible.</td>
</tr>
<tr>
<td>Internal (system) sessions cannot be interrupted.</td>
<td>The session is internal, and only statements run by external</td>
</tr>
</tbody>
</table>
Message | Meaning
--- | ---
 | sessions can be interrupted.

Examples

Two user sessions are open. RECORD 1 shows user session running SELECT FROM SESSION, and RECORD 2 shows user session running COPY DIRECT:

```sql
=> SELECT * FROM SESSIONS;
-| RECORD 1 |------------------------|
node_name | v_vmartdb_node0001
user_name | dbadmin
client_hostname | 127.0.0.1:52110
client_pid | 4554
login_timestamp | 2011-01-03 14:05:40.252625-05
session_id | stress04-4325:0x14
client_label | |
transaction_start | 2011-01-03 14:05:44.325781
transaction_id | 45035996273728326
transaction_description | user dbadmin (select * from sessions;)
statement_start | 2011-01-03 15:36:13.896288
statement_id | 10
last_statement_duration_us | 14978
current_statement | select * from sessions;
ssl_state | None
authentication_method | Trust
-| RECORD 2 |------------------------|
node_name | v_vmartdb_node0003
user_name | dbadmin
client_hostname | 127.0.0.1:56367
client_pid | 1191
login_timestamp | 2011-01-03 15:31:44.939302-05
session_id | stress06-25663:0xbec
client_label | |
transaction_start | 2011-01-03 15:34:51.05939
transaction_id | 54043195528458775
transaction_description | user dbadmin (COPY Mart_Fact FROM '/data/Mart_Fact.tbl' DELIMITER '|' NULL '\n' DIRECT;)
statement_start | 2011-01-03 15:35:46.436748
statement_id | 5
last_statement_duration_us | 1591403
current_statement | COPY Mart_Fact FROM '/data/Mart_Fact.tbl' DELIMITER '|' NULL '\n' DIRECT;
ssl_state | None
authentication_method | Trust
```

Interrupt the COPY DIRECT statement running in session stress06-25663:0xbec:

```sql
=> \x
Expanded display is off.
=> SELECT INTERRUPT_STATEMENT('stress06-25663:0x1537', 5);
interrupt_statement
```
Verify that the interrupted statement is no longer active by looking at the `current_statement` column in the `SESSIONS` system table. This column becomes blank when the statement is interrupted:

```sql
=> SELECT * FROM SESSIONS;
(1 row)

<table>
<thead>
<tr>
<th>node_name</th>
<th>v_vmartdb_node001</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_name</td>
<td>dbadmin</td>
</tr>
<tr>
<td>client_hostname</td>
<td>127.0.0.1:52110</td>
</tr>
<tr>
<td>client_pid</td>
<td>4554</td>
</tr>
<tr>
<td>login_timestamp</td>
<td>2011-01-03 14:05:40.252625-05</td>
</tr>
<tr>
<td>session_id</td>
<td>stress04-4325:8x14</td>
</tr>
<tr>
<td>client_label</td>
<td></td>
</tr>
<tr>
<td>transaction_start</td>
<td>2011-01-03 14:05:44.325781</td>
</tr>
<tr>
<td>transaction_id</td>
<td>45035996273728326</td>
</tr>
</tbody>
</table>
| transaction_description| user dbadmin (select * from sessions;)
| statement_start| 2011-01-03 15:36:13.896288 |
| statement_id   | 10                |
| last_statement_duration_us | 14978 |
| current_statement| select * from sessions; |
| ssl_state      | None              |
| authentication_method | Trust |
```

See Also

- `SESSIONS`
- Managing Sessions
- Configuration Parameters
**RELEASE_ALL_JVM_MEMORY**

Forces all sessions to release the memory consumed by their Java Virtual Machines (JVM).

**Syntax**

```
RELEASE_ALL_JVM_MEMORY();
```

**Privileges**

Must be a superuser.

**Example**

The following example demonstrates viewing the JVM memory use in all open sessions, then calling `RELEASE_ALL_JVM_MEMORY()` to release the memory:

```
=> select user_name,external_memory_kb FROM V_MONITORSESSIONS;
user_name |  external_memory_kb
-----------|----------------------
dbadmin   |      79705
(1 row)

=> SELECT RELEASE_ALL_JVM_MEMORY();
REL

Close all JVM sessions command sent. Check v_monitor.sessions for progress.
(1 row)

=> SELECT user_name,external_memory_kb FROM V_MONITORSESSIONS;
user_name |  external_memory_kb
-----------|----------------------
dbadmin   |              0
(1 row)
```

**See Also**

- `RELEASE_JVM_MEMORY`

**RELEASE_JVM_MEMORY**

Terminates a Java Virtual Machine (JVM), making available the memory the JVM was using.
Syntax

RELEASE_JVM_MEMORY();

Privileges

None.

Examples

User session opened. RECORD 2 shows the user session running COPY DIRECT statement.

```
=> SELECT RELEASE_JVM_MEMORY();
  release_jvm_memory
-----------------------------
Java process killed and memory released
(1 row)
```

See Also

- RELEASE_ALL_JVM_MEMORY

RESERVE_SESSION_RESOURCE

Reserves memory resources from the general resource pool for the exclusive use of the Vertica backup and restore process. No other Vertica process can access reserved resources. If insufficient resources are available, Vertica queues the reservation request.

This metafunction is a session level reservation. When a session ends Vertica automatically releases any resources reserved in that session. Because the metafunction operates at the session level, the resource name does not need to be unique across multiple sessions.

You can view reserved resources by querying the SESSIONS table.

Syntax

RESERVE_SESSION_RESOURCE ( 'name', memory)
Parameters

<table>
<thead>
<tr>
<th>name</th>
<th>The name of the resource to reserve.</th>
</tr>
</thead>
<tbody>
<tr>
<td>memory</td>
<td>The amount of memory in kilobytes to allocate to the resource.</td>
</tr>
</tbody>
</table>

Privileges

None

Example

Reserve 1024 kilobytes of memory for the backup and restore process:

```sql
=> SELECT reserve_session_resource('VBR_reserve',1024);
-[ RECORD 1 ]----------------------------------
  reserve_session_resource | Grant succeed
```

RESET_SESSION

Applies your default connection string configuration settings to your current session.

Syntax

```
RESET_SESSION()
```

Examples

The following example shows how you use RESET_SESSION.

Resets the current client connection string to the default connection string settings:

```sql
=> SELECT RESET_SESSION();
RESET_SESSION
------------------
Reset session: done.
(1 row)
```
Statistic Management Functions

This section contains statistic management functions specific to Vertica.

**ANALYZE_EXTERNAL_ROW_COUNT**

Calculates the exact number of rows in an external table. ANALYZE_EXTERNAL_ROW_COUNT runs in the background.

*Note: You cannot calculate row counts on external tables with DO_TM_TASK.*

**Syntax**

\[
\text{ANALYZE\_EXTERNAL\_ROW\_COUNT} \left( \left\{ \left[ \left[ \text{database} \right] . \text{schema} \right] . \text{table-name} \right\} \right) \]

**Parameters**

- \[ \text{database} . \text{schema} \]
  - Specifies a schema, by default public. If \text{schema} is any schema other than public, you must supply the schema name. For example:
    - \text{myschema}.thisDbObject
  - If you specify a database, it must be the current database.

- \text{table-name}
  - Specifies the name of the external table for which to calculate the exact row count. If you supply an empty string, Vertica calculate the exact number of rows for all external tables.

**Privileges**

Any INSERT/UPDATE/DELETE privilege on the external table

**Examples**

Calculate the exact row count for all external tables:

\[
=> \text{SELECT ANALYZE\_EXTERNAL\_ROW\_COUNT}('');
\]

Calculate the exact row count for table \text{loader\_rejects}:

\[
=> \text{SELECT ANALYZE\_EXTERNAL\_ROW\_COUNT}('loader\_rejects');
\]
=> SELECT ANALYZEEXTERNAL_ROW_COUNT('loader_rejects');

See Also

- Collecting Database Statistics
- DROP_EXTERNAL_ROW_COUNT

ANALYZE_STATISTICS

Note: ANALYZE_STATISTICS is an alias of the function ANALYZE_HISTOGRAM, which is no longer documented.

Collects and aggregates data samples and storage information from all nodes that store projections associated with the specified table. By default, Vertica analyzes multiple columns in a single-query execution plan, depending on resource limits. Such multi-column analysis facilitates the following objectives:

- Reduce plan execution latency.
- Speed up analysis of relatively small tables with many columns.

Vertica writes statistics to the database catalog. The query optimizer uses this collected data to create query plans. Without this data, the query optimizer assumes uniform distribution of data values and equal storage usage for all projections.

You can cancel statistics collection with CTRL+C or by calling INTERRUPT_STATEMENT.

Syntax

ANALYZE_STATISTICS ('[ scope ]' [, 'column[,...]'] [, percent ])

Returns

0—Success

If an error occurs, refer to vertica.log for details.
Parameters

| **scope** | Specifies the table on which to collect data, as follows:  
  \[[database \cdot schema \cdot table\]
If set to an empty string, Vertica collects statistics for all database tables and their projections.
If you specify a database, it must be the current database. |
|-----------|---------------------------------------------------------------|
| **column** | The name of a column in *table*, typically a predicate column. You can specify multiple comma-delimited columns. Vertica narrows the scope of the data collection to the specified columns.  
If you alter a table to add a column and populate its contents with either default or other values, call ANALYZE_STATISTICS on this column to get the most current statistics. |
| **percent** | A float value between 0 and 100 that specifies what percentage of data to read from disk (not the amount of data to analyze). If you omit this argument, Vertica sets the percentage to 10.  
Analyzing more than 10 percent disk space takes proportionally longer to process, but produces a higher level of sampling accuracy. |

Privileges

- Any INSERT/UPDATE/DELETE privilege on the specified table.
- USAGE privilege on schema that contains the table

Restrictions

- Vertica collects no statistics on live aggregate and Top-K projections that are anchored to the specified table.
- If you include a SQL function within an expression when you create a projection, Vertica collects no statistics for that projection.
- Vertica supports ANALYZE_STATISTICS on local temporary tables but not on global temporary tables. To obtain statistics on a temporary table, create the table with the option
ON COMMIT PRESERVE ROWS. Otherwise, Vertica deletes the table content when it commits the current transaction, so no table data is available for analysis.

See Also

- Getting Statistics
- DROP_STATISTICS
- EXPORT_STATISTICS
- IMPORT_STATISTICS
- VALIDATE_STATISTICS

DROPEXTERNALROWCOUNT

Removes external table row count statistics compiled by ANALYZEEXTERNALROWCOUNT. DROPEXTERNALROWCOUNT runs in the background.

Caution: Statistics can be time consuming to regenerate.

Syntax

DROPEXTERNALROWCOUNT ('[[database.]schema.]table-name ']);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>table-name</td>
<td>The external table for which to remove the exact row count. If you specify an empty string, Vertica drops the exact row count statistic for all external tables.</td>
</tr>
</tbody>
</table>
Privileges

- INSERT/UPDATE/DELETE privilege on table
- USAGE privilege on schema that contains the table

Examples

Drop row count statistics for external table `loader_rejects`:

```sql
=> SELECT DROP_EXTERNAL_ROW_COUNT('loader_rejects');
```

See Also

Collecting Database Statistics

**DROP_STATISTICS**

Removes statistical data on database projections previously generated by `ANALYZE_STATISTICS`. When you drop this data, the Vertica optimizer uses default statistics to create query plans.

**Caution:** Before you drop statistics, be aware that statistics can be time consuming to regenerate.

Syntax

```sql
DROP_STATISTICS ('[scope'][, 'category'][, 'column'][,..])
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `scope`  | Specifies the target table as follows:  
  ```sql
  [[database.]schema.]table
  ```  
  If set to an empty string, Vertica drops statistics for projections of all database tables.  
  If you specify a database, it must be the current database.  
| `category` | The category of statistics to drop for the named table, one of the |
following:

- BASE (default) drops histograms and row counts (min/max column values, histogram).
- HISTOGRAMS drops only histograms. Row counts statistics remain.
- ALL drops all statistics.

<table>
<thead>
<tr>
<th>column</th>
<th>The name of a column in table, typically a predicate column. You can specify multiple comma-delimited columns. Vertica narrows the scope of dropped statistics to the specified columns only.</th>
</tr>
</thead>
</table>

Privileges

- INSERT/UPDATE/DELETE privilege on table
- USAGE privilege on schema that contains the table

Examples

Drop all base statistics for the table store.store_sales_fact:

```sql
=> SELECT DROP_STATISTICS('store.store_sales_fact');
DROP_STATISTICS
----------
0
(1 row)
```

Drop statistics for all table projections:

```sql
=> SELECT DROP_STATISTICS ('');
DROP_STATISTICS
----------
0
(1 row)
```

See Also

- ANALYZE_STATISTICS
- EXPORT_STATISTICS
**IMPORT_STATISTICS**

**VALIDATE_STATISTICS**

**EXPORT_STATISTICS**

Generates database statistics in XML format from data previously collected by **ANALYZE_STATISTICS**. Before you export statistics, collect the latest data by calling **ANALYZE_STATISTICS**.

**Syntax**

`EXPORT_STATISTICS (['filename'][, 'scope'][, 'column[,...]'])`

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>filename</code></td>
<td>Specifies where to write the generated XML. If <code>filename</code> already exists, <code>EXPORT_STATISTICS</code> overwrites it. If you supply an empty string, <code>EXPORT_STATISTICS</code> writes the XML to standard output.</td>
</tr>
</tbody>
</table>
| `scope` | Specifies the target table as follows:  
[[`database`.]`schema.`]`table`  
If you specify a table, Vertica exports statistics for its projections. If you supply an empty string, Vertica exports all statistics for the database.  
If you specify a database, it must be the current database. |
| `column` | The name of a column in `table`, typically a predicate column. You can specify multiple comma-delimited columns. Vertica narrows the scope of exported statistics to the specified columns only. |

**Privileges**

Superuser

**Restrictions**

`EXPORT_STATISTICS` does not export statistics for LONG data type columns.
Examples

The following statement exports statistics on the VMart example database to a file:

```sql
=> SELECT EXPORT_STATISTICS('/opt/vertica/examples/VMart_Schema/vmart_stats.xml');

EXPORT_STATISTICS
----------------------
Statistics exported successfully
(1 row)
```

The next statement exports statistics on a single column (price) from a table named food:

```sql
=> SELECT EXPORT_STATISTICS('/opt/vertica/examples/VMart_Schema/price.xml', 'food.price');

EXPORT_STATISTICS
----------------------
Statistics exported successfully
(1 row)
```

See Also

- `ANALYZE_STATISTICS`
- `DROP_STATISTICS`
- `IMPORT_STATISTICS`
- `VALIDATE_STATISTICS`
- Collecting Database Statistics
- Best Practices For Statistics Collection

**IMPORT_STATISTICS**

Imports statistics from the XML file that was generated by `EXPORT_STATISTICS`. Imported statistics override existing statistics for all projections of the table referenced in the XML file.

**Syntax**

`IMPORT_STATISTICS ( 'filename' )`
Parameters

| filename | The path and name of an XML input file that was generated by `EXPORT_STATISTICS`. |

Privileges

Superuser

Restrictions

- `IMPORT_STATISTICS` imports only valid statistics. If the source XML file has invalid statistics for a specific column, those statistics are not imported and Vertica throws a warning. If the statistics file has an invalid structure, the import operation fails. To check a statistics file for validity, run `VALIDATE_STATISTICS`.

- `IMPORT_STATISTICS` returns warnings for LONG data type columns, as the source XML file generated by `EXPORT_STATISTICS` contains no statistics for columns of that type.

Example

Import the statistics for the VMart database that `EXPORT_STATISTICS` saved.

```sql
=> SELECT IMPORT_STATISTICS('/opt/vertica/examples/VMart_Schema/vmart_stats.xml');

IMPORT_STATISTICS

Importing statistics for projection date_dimension_super column date_key failure (stats did not contain row counts)

Importing statistics for projection date_dimension_super column date failure (stats did not contain row counts)

Importing statistics for projection date_dimension_super column full_date_description failure (stats did not contain row counts)

...

(1 row)
```

See Also

- `ANALYZE_STATISTICS`
- `DROP_STATISTICS`
- **EXPORT_STATISTICS**
- **Collecting Statistics** in the Administrator's Guide

## VALIDATE_STATISTICS

Validates statistics in the XML file generated by the EXPORT_STATISTICS command.

### Syntax

```sql
VALIDATE_STATISTICS ( 'XML_statistics_file' )
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>XML_statistics_file</code></td>
<td>Specifies the path and name of the XML file that contains the statistics you want to validate, type VARCHAR.</td>
</tr>
</tbody>
</table>

### Privileges

Superuser

### Usage Considerations

- **IMPORT_STATISTICS** imports only valid statistics. If the source file has invalid statistics for a specific column, those statistics are not imported and a warning occurs. To identify the invalid statistics, run VALIDATE_STATISTICS.

### Example: Valid Statistics

The following example shows the results when the statistics are valid:

```sql
=> SELECT EXPORT_STATISTICS('cust_dim_stats.xml','customer_dimension');
EXPORT_STATISTICS
---------------------------
Statistics exported successfully
(1 row)
=> SELECT VALIDATE_STATISTICS('cust_dim_stats.xml');
VALIDATE_STATISTICS
---------------------------
(1 row)
```
Example: Invalid Statistics File

The following example shows the results when some of the statistics are invalid. For example, the 'distinct', 'buckets', 'rows', 'count', and 'distinctCount' attributes cannot be negative numbers. Vertica recommends that you rerun **ANALYZE_STATISTICS** on this table to create valid statistics:

```
=> SELECT VALIDATE_STATISTICS('/stats.xml');
WARNING 0: Invalid value '-1' for attribute 'distinct' under column 'public.t.x'.
  Please use a positive value.
WARNING 0: Invalid value '-1' for attribute 'buckets' under column 'public.t.x'.
  Please use a positive value.
WARNING 0: Invalid value '-1' for attribute 'rows' under column 'public.t.x'.
  Please use a positive value.
WARNING 0: Invalid value '-1' for attribute 'count' under bound '1', column 'public.t.x'.
  Please use a positive value.
WARNING 0: Invalid value '-1' for attribute 'distinctCount' under bound '1', column 'public.t.x'.
  Please use a positive value.
VALIDATE_STATISTICS
```

(1 row)

Example: Invalid Statistics File

The following example shows the result when the statistics file is invalid:

```
=> SELECT VALIDATE_STATISTICS('/home/dbadmin/stats.xml');
VALIDATE_STATISTICS
```

Error validating statistics file: At line 1:1. Invalid document structure

(1 row)

Storage Management Functions

This section contains storage management functions specific to Vertica.

**ALTER_LOCATION_LABEL**

Adds a label to a storage location, or changes or removes an existing label. You can change a location label if it is not specified by any storage policy.

Caution: If you label an existing storage location that already contains data, and then include the labeled location in one or more storage policies, existing data could be moved. If the Tuple Mover determines data stored on a labeled location does not comply with a storage policy, it moves the data elsewhere.

Syntax

```
ALTER_LOCATION_LABEL ('path', '[node]', '[Location-Label]')
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>path</code></td>
<td>The storage location path.</td>
</tr>
<tr>
<td><code>node</code></td>
<td>The node where the label change is applied. If you supply an empty string,</td>
</tr>
<tr>
<td></td>
<td>Vertica applies the change across all cluster nodes.</td>
</tr>
<tr>
<td><code>Location-Label</code></td>
<td>The label to assign to the specified storage location. If you supply an</td>
</tr>
<tr>
<td></td>
<td>empty string, Vertica removes that storage location's label.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

Restrictions

You can remove a location label only if both of these conditions are true:
- The label is not specified in the storage policy of a database object.
- The labeled location is not the last available storage for the objects associated with it.

Example

The following ALTER_LOCATION_LABEL statement applies across all cluster nodes the label SSD to the storage location /home/dbadmin/SSD/tables:

```sql
=> SELECT ALTER_LOCATION_LABEL('/home/dbadmin/SSD/tables','','SSD');
ALTER_LOCATION_LABEL
--------------------------
/home/dbadmin/SSD/tables label changed.
(1 row)
```

See Also

- Altering Location Labels
- CLEAR_OBJECT_STORAGE_POLICY
- SET_OBJECT_STORAGE_POLICY

ALTER_LOCATION_USE

Alters the type of files that can be stored at the specified storage location.

Syntax

`ALTER_LOCATION_USE ( 'path' , 'node' , 'usage' )`

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Specifies where the storage location is mounted.</td>
</tr>
<tr>
<td>node</td>
<td>[Optional] The Vertica node with the storage location. Specifying the node parameter as an empty string (' ') alters the location across all cluster nodes in a single transaction.</td>
</tr>
<tr>
<td>usage</td>
<td>Is one of the following:</td>
</tr>
</tbody>
</table>
- **DATA**: The storage location stores only data files. This is the supported use for both a USER storage location, and a labeled storage location.
- **TEMP**: The location stores only temporary files that are created during loads or queries.
- **DATA,TEMP**: The location can store both types of files.

**Privileges**

Superuser

**USER Storage Location Restrictions**

You cannot change a storage location from a USER usage type if you created the location that way, or to a USER type if you did not. You can change a USER storage location to specify DATA (storing TEMP files is not supported). However, doing so does not affect the primary objective of a USER storage location, to be accessible by non-dbadmin users with assigned privileges.

**Monitoring Storage Locations**

To obtain disk storage information that the database uses on each node, query system table `DISK_STORAGE`.

**Example**

The following example alters the storage location across all cluster nodes to store only data:

```sql
=> SELECT ALTER_LOCATION_USE ('/thirdVerticaStorageLocation/', '', 'DATA');
```

**See Also**

- *Altering Location Use*
- *DROP_LOCATION*
- *RESTORE_LOCATION*
- *RETIRE_LOCATION*
- **GRANT (Storage Location)**
- **REVOKE (Storage Location)**

**CLEAR_CACHES**

Clears the Vertica internal cache files.

**Syntax**

```
CLEAR_CACHES ( )
```

**Privileges**

Superuser

**Notes**

If you want to run benchmark tests for your queries, in addition to clearing the internal Vertica cache files, clear the Linux file system cache. The kernel uses unallocated memory as a cache to hold clean disk blocks. If you are running version 2.6.16 or later of Linux and you have root access, you can clear the kernel filesystem cache as follows:

1. Make sure that all data in the cache is written to disk:

   ```
   # sync
   ```

2. Writing to the `drop_caches` file causes the kernel to drop clean caches, entries, and inodes from memory, causing that memory to become free, as follows:

   - **To clear the page cache:**
     ```
     # echo 1 > /proc/sys/vm/drop_caches
     ```
   - **To clear the entries and inodes:**
     ```
     # echo 2 > /proc/sys/vm/drop_caches
     ```
To clear the page cache, entries, and inodes:

```
# echo 3 > /proc/sys/vm/drop_caches
```

Example

The following example clears the Vertica internal cache files:

```
=> SELECT CLEAR_CACHES();
CLEAR_CACHES
--------------
Cleared
(1 row)
```

### CLEAR_OBJECT_STORAGE_POLICY

Removes a user-defined storage policy from the specified database, schema or table. Storage containers at the previous policy's labeled location are moved to the default location. By default, this move occurs after all pending mergeout tasks return.

**Syntax**

```
CLEAR_OBJECT_STORAGE_POLICY ( 'object-name' [, 'key-min', 'key-max'] [, 'enforce-storage-move' ] )
```

**Parameters**

<table>
<thead>
<tr>
<th><strong>object-name</strong></th>
<th>The object to clear, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <em>database</em>: Clears <em>database</em> of its storage policy.</td>
</tr>
<tr>
<td></td>
<td>• <em>[database.]schema</em>: Clears <em>schema</em> of its storage policy.</td>
</tr>
<tr>
<td></td>
<td>• <em>[database.]schema.]table</em>: Clears <em>table</em> of its storage policy. If <em>table</em> is in any schema other than public, you must supply the schema name.</td>
</tr>
</tbody>
</table>

In all cases, *database* must be the name of the current database.

<table>
<thead>
<tr>
<th><strong>key-min</strong></th>
<th>Valid only if <em>object-name</em> is a table, specifies the range of</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>key-max</strong></td>
<td>table partition key values stored at the labeled location.</td>
</tr>
<tr>
<td>-------------</td>
<td>----------------------------------------------------------</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>enforce-storage-move</strong></th>
<th>Specifies when the Tuple Mover moves all existing storage containers for the specified object to its default storage location:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- false (default): Move storage containers only after all pending mergeout tasks return.</td>
</tr>
<tr>
<td></td>
<td>- true: Immediately move all storage containers to the new location.</td>
</tr>
</tbody>
</table>

Tip: You can also enforce all storage policies immediately by calling Vertica meta-function `ENFORCE_OBJECT_STORAGE_POLICY`.  

### Privileges

Superuser

### Examples

This following statement clears the storage policy for table `store.store_orders_fact`. The `true` argument specifies to implement the move immediately:

```sql
=> SELECT CLEAR_OBJECT_STORAGE_POLICY ('store.store_orders_fact', 'true');
```

Object storage policy cleared.
Task: moving storages
(Table: store.store_orders_fact) (Projection: store.store_orders_fact_b0)
(Table: store.store_orders_fact) (Projection: store.store_orders_fact_b1)

(1 row)

### See Also

- Clearing Storage Policies
- `ALTER_LOCATION_LABEL`
SET_OBJECT_STORAGE_POLICY
ENFORCE_OBJECT_STORAGE_POLICY

COMPACT_STORAGE

Bundles existing data (.fdb) and index (.pidx) files into the .gt file format. The .gt format was introduced in Vertica 7.2 and is enabled by default for any data files created version 7.2 or later. If you have a database from an earlier version, you can use COMPACT_STORAGE to upgrade existing storage files to the new format. Your database can continue to operate with a mix of file storage formats.

If the settings you specify for COMPACT_STORAGE vary from the limit specified in configuration parameter MaxBundleableROSSizeKB, Vertica does not change the size of the automatically created bundles. You can use this function even if storage bundling is not enabled on your database.

Note: Run this function during periods of low demand.

Syntax

SELECT COMPACT_STORAGE (['[[database.]schema.]object-name', min-ros-filesize-kb, 'small-or-all-files', 'simulate']);

Parameters

<p>| [database.]schema | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: | myschema.thisDbObject |
| object-name | Specifies the table or projection to bundle. |
| min-ros-filesize-kb | Specifies the minimum size, in kilobytes, of an independent ROS file. Vertica bundles storage container ROS files below this size into a single file. If set to 0, Vertica bundles the data and index files of an individual column, but not with other columns in that storage |</p>
<table>
<thead>
<tr>
<th>small-or-all-files</th>
<th>One of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- small: Bundles only files smaller than the limit specified in \texttt{min-ros-filesize-\text{kb}}</td>
</tr>
<tr>
<td></td>
<td>- all: Bundles files smaller than the limit specified in \texttt{min-ros-filesize-\text{kb}} and bundles the \texttt{.fdb} and \texttt{.pidx} files for larger storage containers.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>simulate</th>
<th>Specifies whether to simulate the storage settings and produce a report describing the impact of those settings.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- true: Produces a report on the impact of the specified bundle settings without actually bundling storage files.</td>
</tr>
<tr>
<td></td>
<td>- false: Vertica performs the bundling according to the settings you specified.</td>
</tr>
</tbody>
</table>

Privileges
Superuser

Storage and Performance Impact
Bundling reduces the number of files in your file system by at least fifty percent and improves the performance of file-intensive operations. Improved operations include backups, restores, mergeouts and moveouts.

Vertica creates small files for the following reasons:

- Tables contain hundreds of columns.
- Partition ranges are small (partition by minute).
- Local segmentation is enabled and your factor is set to a high value.

Evaluating the Benefits of Bundled Storage
You can determine whether bundling existing storage can provide a significant benefit, as follows:

\textbf{View the median file size of a projection on a node}
Run the following query:

```sql
SELECT MEDIAN(size) OVER() AS median_fsize
FROM vs_ros AS ros, storage_containers AS cont
WHERE ros.delid=cont.storage_oid
AND cont.node_name='node-name'
AND cont.projection_name='proj-name' LIMIT 1;
```

If many files are smaller than 1mb, bundling storage is likely to provide significant performance benefits.

**Run COMPACT_STORAGE in simulation mode**

The simulate parameter produces a report that shows the number of affected files and the change in file storage.

**Example**

The following example describes the impact of bundling the table EMPLOYEES:

```sql
=> SELECT COMPACT_STORAGE('employees',1024,'small','true');
Task: compact_storage

On node v_vmart_node0001:
Projection Name:public.employees_b0 | selected_storage_containers :0 |
selected_files_to_compact :0 | files_after_compact : 0 | modified_storage_KB : 0

On node v_vmart_node0002:
Projection Name:public.employees_b0 | selected_storage_containers :1 |
selected_files_to_compact :6 | files_after_compact : 1 | modified_storage_KB : 0

On node v_vmart_node0003:
Projection Name:public.employees_b0 | selected_storage_containers :2 |
selected_files_to_compact :12 | files_after_compact : 2 | modified_storage_KB : 0

On node v_vmart_node0001:
Projection Name:public.employees_b1 | selected_storage_containers :2 |
selected_files_to_compact :12 | files_after_compact : 2 | modified_storage_KB : 0

On node v_vmart_node0002:
Projection Name:public.employees_b1 | selected_storage_containers :0 |
selected_files_to_compact :0 | files_after_compact : 0 | modified_storage_KB : 0

On node v_vmart_node0003:
Projection Name:public.employees_b1 | selected_storage_containers :1 |
selected_files_to_compact :6 | files_after_compact : 1 | modified_storage_KB : 0

Success

(1 row)
```
DROP_LOCATION

Removes the specified storage location. Dropping a storage location is a permanent operation and cannot be undone. Therefore, you must retire a storage location before dropping it.

Syntax

DROP_LOCATION ( 'path' , 'node' )

Parameters

<table>
<thead>
<tr>
<th>path</th>
<th>Specifies where the storage location to drop is mounted.</th>
</tr>
</thead>
<tbody>
<tr>
<td>node</td>
<td>The Vertica node where the location is available. A value of &quot;&quot; (an empty string) means to perform this operation on all nodes.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

Retiring a Storage Location

Retiring a storage location lets you verify that you do not need the storage before dropping it. You can also restore a retired storage location if you determine it is still in use.

Dropping a Shared Location

When a storage location is created in a shared location, such as HDFS, Vertica creates subdirectories for each node to prevent conflicts. For example, suppose you create a shared storage location in /data. The location for v_vmart_node0001 is /data/v_vmart_node0001, the location for v_vmart_node0002 is /data/v_vmart_node0002, and so on. To drop a location on only one node, use the node-specific path such as /data/v_vmart_node0002. To drop a location on all nodes, use the same path that you used to create it (/data in this example).

Storage Locations with Temp and Data Files

If you use a storage location to store data and then alter it to store only temp files, the location can still contain data files. Vertica does not let you drop a storage location containing data files.
You can use the function `MOVE_RETIRED_LOCATION_DATA` to manually merge out the data files from the storage location, or you can drop partitions. Deleting data files does not work.

Examples

The following example shows how to drop a previously retired storage location on `v_vmart_node0003`:

```
=> SELECT DROP_LOCATION('/data', 'v_vmart_node0003');
```

See Also

- Dropping Storage Locations
- Retiring Storage Locations
- `ALTER_LOCATION_USE`
- `RESTORE_LOCATION`
- `RETIRE_LOCATION`
- `GRANT (Storage Location)`
- `REVOKE (Storage Location)`

### ENFORCE_OBJECT_STORAGE_POLICY

Applies storage policies of the specified object immediately. By default, the Tuple Mover enforces object storage policies after all pending mergeout operations are complete. Calling this function is equivalent to setting the `enforce-storage-move` parameter on related meta-functions. You typically use this function as the last step before dropping a storage location.

**Syntax**

```
ENFORCE_OBJECT_STORAGE_POLICY ( 'object-name' [, 'key-min', 'key-max'] )
```

**Parameters**

| `object-name` | Identifies the database object whose storage policies are to be applied, |
one of the following:

- **database**: Applies *database* storage policies.
- **[database.]schema**: Applies *schema* storage policies.
- **[[database.]schema.]table**: Applies *table* storage policies. If *table* is in any schema other than public, you must supply the schema name.

In all cases, *database* must be the name of the current database.

<table>
<thead>
<tr>
<th>key-min</th>
<th>key-max</th>
</tr>
</thead>
<tbody>
<tr>
<td>Valid only if <em>object-name</em> is a table, specifies the range of table partition key values on which to perform the move.</td>
<td></td>
</tr>
</tbody>
</table>

Privileges

One of the following:

- Superuser
- Object owner and access to its storage location.

Examples

Apply storage policy updates to the test table:

```
=> SELECT ENFORCE_OBJECT_STORAGE_POLICY ('test');
```

See Also

- **CLEAR_OBJECT_STORAGE_POLICY**
- **RETIRE_LOCATION**
- **DROP_LOCATION**
- **Managing Storage Locations**

**MEASURE_LOCATION_PERFORMANCE**

Measures disk performance for the location specified.
Syntax

`MEASURE_LOCATION_PERFORMANCE ( 'path', 'node' )`

Parameters

<table>
<thead>
<tr>
<th>path</th>
<th>Specifies where the storage location to measure is mounted.</th>
</tr>
</thead>
<tbody>
<tr>
<td>node</td>
<td>Is the Vertica node where the location to be measured is available.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

Notes

- To get a list of all node names on your cluster, query the `V_MONITOR.DISK_STORAGE` system table:

  ```sql
  -> SELECT node_name FROM DISK_STORAGE;
  node_name
  -----------------------
  v_vmartdb_node0004
  v_vmartdb_node0004
  v_vmartdb_node0005
  v_vmartdb_node0005
  v_vmartdb_node0006
  v_vmartdb_node0006
  (6 rows)
  ```

- If you intend to create a tiered disk architecture in which projections, columns, and partitions are stored on different disks based on predicted or measured access patterns, you need to measure storage location performance for each location in which data is stored. You do not need to measure storage location performance for temp data storage locations because temporary files are stored based on available space.

- The method of measuring storage location performance applies only to configured clusters. If you want to measure a disk before configuring a cluster see Measuring Storage Performance.

- Storage location performance equates to the amount of time it takes to read and write 1MB of data from the disk. This time equates to:
IO time = Time to read/write 1MB + Time to seek = 1/Throughput + 1/Latency

Throughput is the average throughput of sequential reads/writes (units in MB per second)

Latency is for random reads only in seeks (units in seeks per second)

Note: The IO time of a faster storage location is less than a slower storage location.

Example

The following example measures the performance of a storage location on v_vmartdb_node0004:

```sql
=> SELECT MEASURE_LOCATION_PERFORMANCE('/secondVerticaStorageLocation/','v_vmartdb_node0004');
WARNING: measure_location_performance can take a long time. Please check logs for progress
measure_location_performance
--------------------------------------------------------
Throughput : 122 MB/sec. Latency : 140 seeks/sec
```

See Also

- CREATE LOCATION
- ALTER_LOCATION_USE
- RESTORE_LOCATION
- RETIRE_LOCATION
- Measuring Storage Performance

MOVE RETIRED LOCATION DATA

Moves all data from the specified retired storage location or from all retired storage locations in the database. MOVE RETIRED LOCATION DATA migrates the data to non-retired storage locations according to the storage policies of the objects whose data is stored in the location. This function returns only after it completes migration of all affected storage location data.

Note: The Tuple Mover migrates data of retired storage locations when it consolidates data into larger ROS containers.
Syntax

MOVE_RETIRED_LOCATION_DATA( ['location-path'] [, 'node'] )

Arguments

<table>
<thead>
<tr>
<th>location-path</th>
<th>The path of the storage location as specified in the LOCATION_PATH column of system table STORAGE_LOCATIONS. This storage location must be marked as retired. If you omit this argument, MOVE_RETIRED_LOCATION_DATA moves data from all retired storage locations.</th>
</tr>
</thead>
<tbody>
<tr>
<td>node</td>
<td>The node on which to move data of the retired storage location. If location-path is undefined on node, this function returns an error. If you omit this argument, MOVE_RETIRED_LOCATION_DATA moves data from location-path on all nodes.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

Examples

1. Query system table STORAGE_LOCATIONS to show which storage locations are retired:

```sql
=> SELECT node_name, location_path, location_label, is_retired FROM STORAGE_LOCATIONS
   WHERE is_retired = 't';
```
```
+-----------------+-----------------+-----------------+-----------------+
| node_name       | location_path   | location_label  | is_retired      |
|-----------------+-----------------+-----------------+-----------------|
| v_vmart_node0001| /home/dbadmin/SSDLoc | ssd             | t               |
| v_vmart_node0002| /home/dbadmin/SSDLoc | ssd             | t               |
| v_vmart_node0003| /home/dbadmin/SSDLoc | ssd             | t               |
| (3 rows)        |                 |                 |                 |
```

2. Query system table STORAGE_LOCATIONS for the location of the messages table, which is currently stored in retired storage location ssd:

```sql
=> SELECT node_name, total_row_count, storage_type, location_label FROM STORAGE_CONTAINERS
   WHERE projection_name ILIKE 'messages%';
```
```
+-----------------+-----------------+-----------------+-----------------+
| node_name       | total_row_count | storage_type    | location_label  |
|-----------------+-----------------+-----------------+-----------------|
| v_vmart_node0001| 333514          | ROS             | ssd             |
| (1 row)         |                 |                 |                 |
```
3. Call MOVE_RETIRED_LOCATION_DATA to move the data off the ssd storage location.

```sql
=> SELECT MOVE_RETIRED_LOCATION_DATA('/home/dbadmin/SSDLoc');
MOVE_RETIRED_LOCATION_DATA
---
Move data off retired storage locations done

(1 row)
```

4. Repeat the previous query to verify the storage location of the messages table:

```sql
=> SELECT node_name, total_row_count, storage_type, location_label FROM storage_containers
   WHERE projection_name ILIKE 'messages%';

+---------------------+----------+---------+-------------------+
| node_name            | total_row_count | storage_type | location_label    |
|---------------------+----------+---------+-------------------+
| v_vmart_node0001    | 333255   | ROS     | base              |
| v_vmart_node0002    | 333514   | ROS     | base              |
| v_vmart_node0003    | 333514   | ROS     | base              |
| v_vmart_node0001    | 333231   | ROS     | base              |
| v_vmart_node0002    | 333231   | ROS     | base              |
| v_vmart_node0003    | 333255   | ROS     | base              |

(6 rows)
```

See Also

- RETIRE_LOCATION
- RESTORE_LOCATION
- Managing Storage Locations in the Administrator's Guide.

## RESTORE_LOCATION

Restores a storage location that was previously retired with RETIRE_LOCATION.

**Syntax**

```sql
RESTORE_LOCATION ( 'location-path', 'node' )
```
Parameters

<table>
<thead>
<tr>
<th><strong>Location-path</strong></th>
<th>Specifies where to mount the retired storage location.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>node</strong></td>
<td>The Vertica node where the retired location is available. An empty string specifies to perform this operation on all nodes. The operation fails if you dropped any locations.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

Effects of Restoring a Previously Retired Location

After restoring a storage location, Vertica re-ranks all of the cluster storage locations. It uses the newly restored location to process queries as determined by its rank.

Monitoring Storage Locations

To obtain disk storage information that the database uses on each node, query system table `DISK_STORAGE`.

Examples

Restore the retired storage location on node4:

=> SELECT RESTORE_LOCATION ('/thirdVerticaStorageLocation/' , 'v_vmartdb_node0004');

See Also

- Altering Location Use
- CREATE LOCATION
- ALTER_LOCATION_USE
- DROP_LOCATION
RETIRE_LOCATION

Inactivates the specified storage location. To obtain a list of all existing storage locations, query system table `STORAGE_LOCATIONS`.

Syntax

```sql
RETIRE_LOCATION ('location-path', 'node' [, enforce-storage-move ] )
```

Parameters

<table>
<thead>
<tr>
<th><strong>Location-path</strong></th>
<th>Specifies where the storage location to retire resides.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>node</strong></td>
<td>The Vertica node where the location is available. An empty string specifies to perform this operation on all nodes.</td>
</tr>
<tr>
<td><strong>enforce-storage-move</strong></td>
<td>If set to true, the location label is set to an empty string, and the data is moved elsewhere. The location can then be dropped without errors or warnings. Use this argument to expedite dropping a location.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

Retiring a Shared Location

When you create a storage location in a shared HDFS location, Vertica creates subdirectories for each node to prevent conflicts. For example, suppose you create a shared storage location in `/data`. The location for `v_vmartdb_node0001` is `/data/v_vmartdb_node0001`, the location for `v_vmartdb_node0002` is `/data/v_vmartdb_node0002`, and so on. To retire a location on only one node, use the node-specific path such as `/data/v_vmartdb_node0002`. To retire a location on all nodes, use the same path that you used to create it (in this example, `/data`).

**Note:** Vertica does not identify NFS as a shared file system.
Effects of Retiring a Storage Location

RETIRE_LOCATION checks that the location is not the only storage for data and temp files. At least one location must exist on each node to store data and temp files. However, you can store both sorts of files in either the same location or separate locations.

Note: If a location is the last available storage for its associated objects, you can retire it only if you set enforce-storage-move to true

When you retire a storage location:

- No new data is stored at the retired location, unless you first restore it with RETIRE_LOCATION.
- By default, if the storage location being retired contains stored data, the data is not moved. Thus, you cannot drop the storage location. Instead, Vertica removes the stored data through one or more mergeouts. To drop the location immediately after retiring it, set parameter enforce-storage-move to true.
- If the storage location being retired is used only for temp files or you use enforce-storage-move, you can drop the location. See Dropping Storage Locations in the Administrator's Guide, and DROP_LOCATION.

Monitoring Storage Locations

To obtain disk storage information that the database uses on each node, query system table DISK_STORAGE.

Examples

The following examples show two approaches to retiring a storage location.

Specify that a storage location be dropped automatically at a future time:

```sql
=> SELECT RETIRE_LOCATION ('/data', 'v_vmartdb_node0004');
```

Specify that a storage location be dropped immediately:

```sql
=> SELECT RETIRE_LOCATION ('/data', 'v_vmartdb_node0004', true);
```
See Also

- Retiring Storage Locations
- CREATE_LOCATION
- DROP_LOCATION
- RESTORE_LOCATION

SET_LOCATION_PERFORMANCE

Sets disk performance for the location specified.

Syntax

```
SET_LOCATION_PERFORMANCE ( 'path' , 'node' , 'throughput' , 'average_Latency' )
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Specifies where the storage location to set is mounted.</td>
</tr>
<tr>
<td>node</td>
<td>Specifies the Vertica node where the location to be set is available.</td>
</tr>
<tr>
<td>throughput</td>
<td>Specifies the throughput for the location, which must be 1 or more.</td>
</tr>
<tr>
<td>average_Latency</td>
<td>Specifies the average latency for the location. The average_Latency must be 1 or more.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

Notes

To obtain the throughput and average latency for the location, run the MEASURE_LOCATION_PERFORMANCE() function before you attempt to set the location's performance.
Example

The following example sets the performance of a storage location on node2 to a throughput of 122 megabytes per second and a latency of 140 seeks per second.

```sql
=> SELECT SET_LOCATION_PERFORMANCE('secondVerticaStorageLocation/','node2','122','140');
```

See Also

- `CREATE LOCATION`
- `MEASURE_LOCATION_PERFORMANCE`
- Measuring Storage Performance
- Setting Storage Performance

**SET_OBJECT_STORAGE_POLICY**

Creates or changes the storage policy of a database object by assigning it a labeled storage location. The Tuple Mover uses this location to store new and existing data for this object. If the object already has an active storage policy, calling `SET_OBJECT_STORAGE_POLICY` sets this object's default storage to the new labeled location. Existing data for the object is moved to the new location.

**Note:** You cannot create a storage policy on a USER type storage location.

Syntax

```sql
SET_OBJECT_STORAGE_POLICY ( 
  '[[database.]schema.]object-name', 'Location-Label'
  [, 'key-min', 'key-max'] [, 'enforce-storage-move' ]
)
```

Parameters

<table>
<thead>
<tr>
<th><code>[database.]schema</code></th>
<th>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
</tbody>
</table>
If you specify a database, it must be the current database.

<table>
<thead>
<tr>
<th><strong>object-name</strong></th>
<th>Identifies the database object assigned to a labeled storage location. The <em>object-name</em> can resolve to a database, schema, or table.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>location-label</strong></td>
<td>The label of <em>object-name</em>’s storage location.</td>
</tr>
<tr>
<td><strong>key-min</strong></td>
<td>Valid only if <em>object-name</em> is a table, specifies the range of table partition key values to store at the labeled location.</td>
</tr>
<tr>
<td><strong>key-max</strong></td>
<td></td>
</tr>
<tr>
<td><strong>enforce-storage-move</strong></td>
<td>Specifies when the Tuple Mover moves all existing storage containers for <em>object-name</em> to the labeled storage location:</td>
</tr>
<tr>
<td></td>
<td>• false (default): Move storage containers only after all pending mergeout tasks return.</td>
</tr>
<tr>
<td></td>
<td>• true: Immediately move all storage containers to the new location.</td>
</tr>
</tbody>
</table>

Tip: You can also enforce all storage policies immediately by calling Vertica meta-function `ENFORCE_OBJECT_STORAGE_POLICY`

Privileges

One of the following:

- Superuser
- Object owner and access to its storage location.

Examples

See Clearing Storage Policies

See Also

- Creating Storage Policies
- Moving Data Storage Locations
System Table Restriction Functions

This section contains the functions associated with the System Table Restriction and Access functionality.

In This Section

RELEASE_SYSTEM_TABLES_ACCESS

Opens access to non-superuser-only tables that are not accessible during lockdown.

Syntax

RELEASE_SYSTEM_TABLES_ACCESS()

Privileges

Superuser

Determine if a Table is Restricted

Use the SYSTEM_TABLES to determine if a table is accessible. The table contains a column called is_accessible_during_lockdown. This flag indicates if a table is accessible. Valid values are:

- t — A table is accessible
- f — A table is not accessible

Examples

The following examples show how to open access to system tables:
SELECT RELEASE_SYSTEM_TABLES_ACCESS();

Granted SELECT privileges on system tables to public.
(1 row)

See Also

- RESTRICT_SYSTEM_TABLES_ACCESS
- System Table Restriction and Access

RESTRICT_SYSTEM_TABLES_ACCESS

Restricts access to non-superuser-only tables that are not accessible during lockdown.

Syntax

RESTRICT_SYSTEM_TABLES_ACCESS()

Privileges

Superuser

Determine if a Table is Restricted

Use the SYSTEM_TABLES to determine if a table is accessible. The table contains a column called is_accessible_during_lockdown. This flag indicates if a table is accessible. Valid values are:

- t — A table is accessible
- f — A table is not accessible

Examples

The following examples show how to restrict system table access:

=> SELECT RESTRICT_SYSTEM_TABLES_ACCESS();
RESTRICT_SYSTEM_TABLES_ACCESS

Dropped grants to public on non-accessible during lockdown system tables.
(1 row)
See Also

- `RELEASE_SYSTEM_TABLES_ACCESS`
- `System Table Restriction and Access`

Text Search Functions

This section contains text search functions specific to Vertica.

**DELETE_TOKENIZER_CONFIG_FILE**

Deletes a tokenizer configuration file.

**Syntax**

```sql
SELECT v_txtindex.DELETE_TOKENIZER_CONFIG_FILE (USING PARAMETERS proc_oid='proc_oid', confirm={true | false});
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| confirm = [true | false] | Boolean flag. Indicates that the configuration file should be removed even if the tokenizer is still in use.Reply True — Force deletion of the tokenizer when the used parameter value is True.  
False — Delete tokenizer if the used parameter value is False.  
**Default:** False |
| proc_oid    | A unique identifier assigned to a tokenizer when it is created. Users must query the system table vs_procedures to get the proc_oid for a given tokenizer name. See Configuring a Tokenizer for more information. |

**Examples**

The following example shows how you can use DELETE_TOKENIZER_CONFIG_FILE to delete the tokenizer configuration file:
GET_TOKENIZER_PARAMETER

Returns the configuration parameter for a given tokenizer.

Syntax

```
SELECT v_txtindex.GET_TOKENIZER_PARAMETER(parameter_name USING PARAMETERS proc_oid='proc_oid');
```

Parameters

<table>
<thead>
<tr>
<th>parameter_name</th>
<th>Name of the parameter to be returned. One of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• stopWordsCaseInsensitive</td>
</tr>
<tr>
<td></td>
<td>• minorSeparators</td>
</tr>
<tr>
<td></td>
<td>• majorSeparators</td>
</tr>
<tr>
<td></td>
<td>• minLength</td>
</tr>
<tr>
<td></td>
<td>• maxLength</td>
</tr>
<tr>
<td></td>
<td>• ngramsSize</td>
</tr>
<tr>
<td></td>
<td>• used</td>
</tr>
</tbody>
</table>

| proc_oid                | A unique identifier assigned to a tokenizer when it is created. Users must query the system table vs_procedures to get the proc_oid for a given tokenizer name. See Configuring a Tokenizer for more information. |

Examples

The following examples show how you can use GET_TOKENIZER_PARAMETER.

Return the stop words used in a tokenizer:
Read the major separators used in a tokenizer:

```
=> SELECT v_txtindex.GET_TOKENIZER_PARAMETER('stopwordscaseinsensitive' USING PARAMETERS proc_oid='45035996274126984');
getTokenizerParameter
------------------------
devil,TODAY,the,fox
(1 row)
```

**READ_CONFIG_FILE**

Reads and returns the key-value pairs of all the parameters of a given tokenizer. You must use the OVER() clause with this function.

**Syntax**

```
SELECT v_txtindex.READ_CONFIG_FILE(USING PARAMETERS proc_oid='proc_oid') OVER ()
```

**Parameters**

<table>
<thead>
<tr>
<th>proc_oid</th>
<th>A unique identifier assigned to a tokenizer when it is created. Users must query the system table vs_procedures to get the proc_oid for a given tokenizer name. See Configuring a Tokenizer for more information.</th>
</tr>
</thead>
</table>

**Examples**

The following example shows how you can use READ_CONFIG_FILE to return the parameters associated with a tokenizer:

```
=> SELECT v_txtindex.READ_CONFIG_FILE(USING PARAMETERS proc_oid='45035996274126984') OVER();

<table>
<thead>
<tr>
<th>config_key</th>
<th>config_value</th>
</tr>
</thead>
<tbody>
<tr>
<td>majorseparators</td>
<td>{}&amp;[]</td>
</tr>
<tr>
<td>stopwordscaseinsensitive</td>
<td>devil,TODAY, the, fox</td>
</tr>
</tbody>
</table>

(2 rows)
```
SET_TOKENIZER_PARAMETER

Configures the tokenizer parameters.

Important: \n, \t, \r must be entered as Unicode using Vertica notation, U&’\000D’, or using Vertica escaping notation, E’\r’. Otherwise, they are taken literally as two separate characters. For example, "\" & "\r".

Syntax

SELECT v_txtindex.SET_TOKENIZER_PARAMETER (parameter_name, parameter_value USING PARAMETERS proc_oid='proc_oid')

Parameters

<table>
<thead>
<tr>
<th>parameter_name</th>
<th>Name of the parameter to be configured.</th>
</tr>
</thead>
<tbody>
<tr>
<td>stopwordsCaseInsensitive</td>
<td>List of stop words. All the tokens that belong to the list are ignored. Vertica supports separators and stop words up to the first 256 Unicode characters.</td>
</tr>
</tbody>
</table>
|                 | If you want to define a stop word that contains a comma or a backslash, then it needs to be escaped. For example: "Dear Jack\", "Dear Jack\"
|                 | Default: '' (empty list) |
| majorSeparators | List of major separators. Enclose in quotes with no spaces between. |
|                 | Default: E' []<>(){}|!;,'"*?+\r\n\t' |
| minorSeparators | List of minor separators. Enclose in quotes with no spaces between. |
|                 | Default: E'/:=@.-$#\_%' |
| minLength       | Minimum length a token can have, type Integer. Must be greater than 0. |
Default: '2'

- maxLength — Maximum length a token can be. Type Integer. Cannot be greater than 1024 bytes. For information about increasing the token size, see Text Search Parameters.

  Default: '128'

- ngramsSize — Integer value greater than zero. Use only with ngram tokenizers.

  Default: '3'

- used — Indicates when a tokenizer configuration cannot be changed. Type Boolean. After you set used to True, any calls to setTokenizerParameter fail.

  You must set the parameter used to True before using the configured tokenizer. Doing so prevents the configuration from being modified after being used to create a text index.

  Default: False

<table>
<thead>
<tr>
<th>parameter_value</th>
<th>The value of a configuration parameter.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>If you want to disable minorSeperators or stopWordsCaseInsensitive, then set their values to ''.</td>
</tr>
</tbody>
</table>

| proc_oid | A unique identifier assigned to a tokenizer when it is created. Users must query the system table vs_procedures to get the proc_oid for a given tokenizer name. See Configuring a Tokenizer for more information. |

**Examples**

The following examples show how you can use SET_TOKENIZER_PARAMETER to configure stop words and separators.

**Configure the stop words of a tokenizer:**

```sql
=> SELECT v_txtindex.SET_TOKENIZER_PARAMETER('stopwordsCaseInsensitive', 'devil,TODAY,the,fox' USING PARAMETERS proc_oid='45035996274126984');
```

---

**Vertica Analytic Database (9.1.x)**

Page 3279 of 6174
Configure the major separators of a tokenizer:

```sql
=> SELECT v_txtindex.SET_TOKENIZER_PARAMETER('majorSeparators', E'()&[]' USING PARAMETERS proc_oid='45035996274126984');
```

Table Management Functions

This section contains the functions associated with the Vertica library table management.

**COPY_TABLE**

Copies one table to another. This lightweight, in-memory copy increases performance by initially sharing the same storage between two tables. The copied table includes copies of any explicitly created projections from the source table. Once copied, the source and copy tables are independent of each other. Users can perform operations on one table without impacting the other. These operations can increase the overall storage required for both tables.

Creating multiple, concurrent copies of the same table may cause some of the copies to fail. To ensure success, copy tables sequentially.

**Note:** Although they share storage space, Vertica considers the tables as discrete objects for license capacity purposes. For example, copying a one TB table would only consume one TB of space. Your Vertica license, however, considers them as separate objects consuming two TB of space.

**Syntax**

COPY_TABLE (  
    '[[database.]schema.]source-table',  
    '[[database.]schema.]target-table'  
)

**Parameters**

|   | Specifies a schema, by default public. If `schema` is any schema |
### database.schema

other than public, you must supply the schema name. For example:

```
myschema.thisDbObject
```

If you specify a database, it must be the current database.

### source-table

The source table to copy. Vertica copies all data from this table to the target table.

### target-table

The target table of the source table. If the target table already exists, Vertica appends the source to the existing table.

If the table does not exist, Vertica creates a table from the source table's definition, by calling `CREATE TABLE` with LIKE and INCLUDING PROJECTIONS clause. The new table inherits ownership from the source table. For details, see Replicating a Table.

### Privileges

- User must have INSERT, UPDATE, DELETE and SELECT privileges on the source table.

- User must have CREATE privileges on the target table and target table schema if COPY_TABLE is creating a new table.

- User must have INSERT privileges on the target table if COPY_TABLE is adding to an existing table.

### Table Attribute Requirements

The following attributes of both tables must be identical:

- Column definitions, including NULL/NOT NULL constraints

- Segmentation

- Partitioning expression

- Number of projections

- Projection sort order
Primary and unique key constraints. However, the key constraints do not have to be identically enabled.

Note: If the target table has primary or unique key constraints enabled and moving the partitions will insert duplicate key values into the target table, Vertica rolls back the operation. Enforcing constraints requires disk reads and can slow the copy process.

Number and definitions of text indices.

Table Restrictions

The following restrictions apply to the source and target tables:

- If the source and target partitions are in different storage tiers, Vertica returns a warning but the operation proceeds. The partitions remain in their existing storage tier.

- If the source table contains a sequence, Vertica converts the sequence to an integer before copying it to the target table. If the target table contains auto-increment, identity, or named sequence columns, Vertica cancels the copy and displays an error message.

- The following tables cannot be used as sources or targets:
  - Temporary tables
  - Virtual tables
  - System tables
  - External tables

Examples

If you call COPY_TABLE and the target table does not exist, the function creates the table automatically. In the following example, the target table public.newtable does not exist. COPY_TABLE creates the table and replicates the source table. Vertica also copies all the constraints associated with the source table except foreign key constraints.

```sql
=> SELECT COPY_TABLE (
   'public.product_dimension',
   'public.newtable');
- [RECORD 1 ]-----------------------------------------------------------
copy_table | Created table public.newtable.
Copied table public.product_dimension to public.newtable
```
REBALANCE_TABLE

Synchronously rebalances data in the specified table.

A rebalance operation performs the following tasks:

- Distributes data based on:
  - User-defined fault groups, if specified
  - Large cluster automatic fault groups
- Redistributes database projection data across all nodes.

Syntax

REBALANCE_TABLE('[[database.]schema.]table-name')

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
</table>
| schema        | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:  
  | myschema.thisDbObject                                                          |
|              | If you specify a database, it must be the current database.                  |
| table-name    | The table to rebalance.                                                     |

Privileges

Superuser

When to Rebalance

Rebalancing is useful or even necessary after you perform the following tasks:

- Mark one or more nodes as ephemeral in preparation of removing them from the cluster.
- Add one or more nodes to the cluster so that Vertica can populate the empty nodes with data.
• Change the scaling factor of an elastic cluster, which determines the number of storage containers used to store a projection across the database.

• Set the control node size or realign control nodes on a large cluster layout

• Add nodes to or remove nodes from a fault group.

Tip: By default, before performing a rebalance, Vertica queries system tables to compute the size of all projections involved in the rebalance task. This query can add significant overhead to the rebalance operation. To disable this query, set projection configuration parameter `RebalanceQueryStorageContainers` to 0.

Example

The following command shows how to rebalance data on the specified table.

```sql
=> SELECT REBALANCE_TABLE('online_sales.online_sales_fact');
REBALANCE_TABLE
--------------
REBALANCED
(1 row)
```

See Also

• `REBALANCE_CLUSTERS`

• Rebalancing Data Across Nodes

• `NODES`
Tuple Mover Functions

This section contains tuple mover functions specific to Vertica.

DO_TM_TASK

Runs a Tuple Mover operation on the specified table or projection and commits any current transaction.

Tip: Running this function does not require you to stop the tuple mover.

Syntax

```
DO_TM_TASK('task', '[database.]schema.[table | projection]')
```

Parameters

<table>
<thead>
<tr>
<th>task</th>
<th>Specifies one of the following tuple mover operations:</th>
</tr>
</thead>
<tbody>
<tr>
<td>moveout</td>
<td>Moves out data from WOS to ROS. For details, see Moveout in the Administrator's Guide.</td>
</tr>
<tr>
<td>mergeout</td>
<td>Consolidates ROS containers and purges deleted records. For details, see Mergeout in the Administrator's Guide.</td>
</tr>
<tr>
<td>analyze_row_count</td>
<td>Collects the number of rows in the specified projection. If you specify a table name, DO_TM_TASK returns the row counts for all projections of that table. Vertica automatically analyzes all projection row counts at the time intervals specified by configuration parameter AnalyzeRowCountInterval. DO_TM_TASK aggregates row counts calculated during loads. It commits this data to the catalog when the percentage of WOS to ROS equals the setting in configuration parameter ARCCommitPercentage.</td>
</tr>
</tbody>
</table>
analyze_row_count analyzes the row count of Vertica projections. To calculate row counts for external tables, use **ANALYZE_EXTERNAL_ROW_COUNT**.

<table>
<thead>
<tr>
<th>[database.]schema</th>
<th>Specifies a schema, by default public. If <em>schema</em> is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>table</td>
<td>projection</td>
</tr>
</tbody>
</table>

**Privileges**

- Any INSERT/UPDATE/DELETE privilege on table
- USAGE privileges on schema

**Examples**

The following example performs a moveout of all projections for the t1 table:

```
=> SELECT DO_TM_TASK('moveout', 't1');
```

The following example performs a moveout for the t1_proj projection:

```
=> SELECT DO_TM_TASK('moveout', 't1_proj');
```
Workload Management Functions

This section contains workload management functions specific to Vertica.

**ANALYZE_WORKLOAD**

Runs the Workload Analyzer (WLA), a utility that analyzes system information held in *system tables*.

WLA intelligently monitors the performance of SQL queries and workload history, resources, and configurations to identify the root causes for poor query performance. **ANALYZE_WORKLOAD** returns tuning recommendations for all events within the scope and time that you specify, from system table **TUNING_RECOMMENDATIONS**.

Tuning recommendations are based on a combination of *statistics*, system and data collector events, and database-table-projection design. WLA recommendations can help you quickly and easily tune query performance.

See *Understanding WLA Triggering Conditions* in the Administrator's Guide for the common triggering conditions and recommendations.

**Syntax**

```
ANALYZE_WORKLOAD ( [ 'scope'] [, 'since-time' | save-data ]);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| *scope*    | Specifies the catalog objects to analyze, as follows:  
  ```
  [[database.]schema.]table
  ```  
  If set to an empty string, Vertica returns recommendations for all database objects.  
  If you specify a database, it must be the current database. |
| *since-time* | Specifies the start time for the analysis time span, which continues up to the current system status, inclusive. If you omit this parameter, **ANALYZE_WORKLOAD** returns recommendations on events since the last time you called this function.  
  *Note: You must explicitly cast strings to **TIMESTAMP** or **TIMESTAMP TZ**.* |
For example:

```
SELECT ANALYZE_WORKLOAD('T1', '2010-10-04 11:18:15':TIMESTAMPTZ);
SELECT ANALYZE_WORKLOAD('T1', TIMESTAMPTZ '2010-10-04 11:18:15');
```

### save-data
Specifies whether to save returned values from ANALYZE_WORKLOAD:

- **false** (default): Results are discarded.
- **true**: Saves the results returned by ANALYZE_WORKLOAD. Subsequent calls to ANALYZE_WORKLOAD return results that start from the last invocation when results were saved. Object events preceding that invocation are ignored.

### Return Values

Returns aggregated tuning recommendations from **TUNING_RECOMMENDATIONS**.

### Privileges

**Superuser**

### Examples

See [Getting Tuning Recommendations](#) in the Administrator's Guide.

### See Also

- Analyzing Workloads
- Understanding WLA Triggering Conditions

### CHANGE_CURRENT_STATEMENT_RUNTIME_PRIORITY

Changes the run-time priority of an active query.

**Note:** This function replaces deprecated function **CHANGE_RUNTIME_PRIORITY**.

### Syntax

```
CHANGE_CURRENT_STATEMENT_RUNTIME_PRIORITY(transaction-id, 'value')
```
Parameters

<table>
<thead>
<tr>
<th><strong>transaction-id</strong></th>
<th>Identifies the transaction, obtained from the system table <strong>SESSIONS</strong>.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>value</strong></td>
<td>The RUNTIMEPRIORITY value: HIGH, MEDIUM, or LOW.</td>
</tr>
</tbody>
</table>

Privileges

- **Superuser**: None

- **Non-superusers** can only change the runtime priority of their own queries, and cannot raise the runtime priority of a query to a level higher than that of the resource pool.

Example

See [Changing Runtime Priority of a Running Query](#).

**CHANGE_RUNTIME_PRIORITY**

Changes the run-time priority of a query that is actively running. Note that, while this function is still valid, you should instead use CHANGE_CURRENT_STATEMENT_RUNTIME_PRIORITY to change run-time priority. **CHANGE_RUNTIME_PRIORITY** will be deprecated in a future release of Vertica.

Syntax

```
CHANGE_RUNTIME_PRIORITY(TRANSACTION_ID, STATEMENT_ID, 'value')
```

Parameters

<table>
<thead>
<tr>
<th><strong>TRANSACTION_ID</strong></th>
<th>An identifier for the transaction within the session.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>TRANSACTION_ID cannot be NULL.</td>
</tr>
<tr>
<td></td>
<td>You can find the transaction ID in the Sessions table.</td>
</tr>
<tr>
<td><strong>STATEMENT_ID</strong></td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the currently executing statement.</td>
</tr>
</tbody>
</table>
You can find the statement ID in the Sessions table. You can specify NULL to change the run-time priority of the currently running query within the transaction.

### 'value'

The RUNTIMEPRIORITY value. Can be HIGH, MEDIUM, or LOW.

**Privileges**

No special privileges required. However, non-superusers can change the run-time priority of their own queries only. In addition, non-superusers can never raise the run-time priority of a query to a level higher than that of the resource pool.

**Example**

```sql
=> SELECT CHANGE_RUNTIME_PRIORITY(45035996273705748, NULL, 'low');
```

### MOVE_STATEMENT_TO_RESOURCE_POOL

Attempts to move the specified query to the specified target pool.

**Syntax**

```sql
MOVE_STATEMENT_TO_RESOURCE_POOL (session_id, transaction_id, statement_id, target_resource_pool_name)
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session_id</td>
<td>Identifier for the session where the query you want to move is currently executing.</td>
</tr>
<tr>
<td>transaction_id</td>
<td>Identifier for the transaction within the session.</td>
</tr>
<tr>
<td>statement_id</td>
<td>Unique numeric ID for the statement you want to move.</td>
</tr>
<tr>
<td>target_resource_pool_name</td>
<td>Name of the existing resource pool to which you want to move the specified query.</td>
</tr>
</tbody>
</table>

**Outputs**

The function may return the following results:
MOV_REPLAN: Target pool does not have sufficient resources. See v_monitor.resource_pool_move for details. Vertica will attempt to replan the statement on target pool.

MOV_REPLAN: Target pool has priority HOLD. Vertica will attempt to replan the statement on target pool.

MOV_FAILED: Statement not found.

MOV_NO_OP: Statement already on target pool.

MOV_REPLAN: Statement is in queue. Vertica will attempt to replan the statement on target pool.

MOV_SUCCEED: Statement successfully moved to target pool.

Privileges
Superuser

Examples
The following example shows how you can move a specific statement to a resource pool called my_target_pool:

```sql
=> SELECT MOVE_STATEMENT_TO_RESOURCE_POOL ('v_vmart_node0001.example.-31427:0x82fbm', 45035996273711993, 1, 'my_target_pool');
```

See Also:
- Manually Moving Queries to Different Resource Pools
- RESOURCE_POOL_MOVE

SLEEP

Waits a specified number of seconds before executing another statement or command.

Syntax

```
SLEEP( seconds )
```
Parameters

| seconds | The wait time, specified in one or more seconds (0 or higher) expressed as a positive integer. Single quotes are optional; for example, SLEEP(3) is the same as SLEEP('3'). |

Notes

- This function returns value 0 when successful; otherwise it returns an error message due to syntax errors.
- You cannot cancel a sleep operation.
- Be cautious when using SLEEP() in an environment with shared resources, such as in combination with transactions that take exclusive locks.

Example

The following command suspends execution for 100 seconds:

```sql
=> SELECT SLEEP(100);
sleep
-----
0
(1 row)
```
**SQL Statements**

The primary structure of a SQL query is its statement. Multiple statements are separated by semicolons. The following example contains four common SQL statements—CREATE TABLE, INSERT, SELECT, and COMMIT:

```sql
=> CREATE TABLE comments (id INT, comment VARCHAR);
CREATE TABLE
=> INSERT INTO comments VALUES (1, 'Hello World');
OUTPUT
--------
1
(1 row)
=> SELECT * FROM comments;
 id | comment
--------
 1 | Hello World
(1 row)
=> COMMIT;
COMMIT
=>
```

**ALTER ACCESS POLICY**

The ALTER ACCESS POLICY statement:

- Enables and disables individual access policies in a table.
- Copies an access policy from one table to another.

**Important:** When you copy or rename a table, access policies associated with the original table are not included in the copied table. You must use ALTER ACCESS POLICY to copy the access policies to the new table.

**Syntax**

```
ALTER ACCESS POLICY ON [schema.]tablename
    | FOR COLUMN { columnname expression }
    | FOR ROWS WHERE expression
    [ENABLE | DISABLE | COPY TO TABLE tablename];
```
Parameters

<table>
<thead>
<tr>
<th><strong>tablename</strong></th>
<th>The name of the table that contains the access policy you want to enable, disable, or copy.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>columnname</strong></td>
<td>Either of the following values:</td>
</tr>
<tr>
<td></td>
<td>• The name of the column on which to enable or disable the access policy</td>
</tr>
<tr>
<td></td>
<td>• The name of the column you want to copy</td>
</tr>
<tr>
<td><strong>expression</strong></td>
<td>An expression that provides further information to limit column or row access.</td>
</tr>
<tr>
<td></td>
<td>• In a column access policy the expression is the transformation of the column.</td>
</tr>
<tr>
<td></td>
<td>• In a row access policy the expressions is the content of the WHERE clause.</td>
</tr>
<tr>
<td></td>
<td>For example, the expression:</td>
</tr>
<tr>
<td></td>
<td>=&gt; ALTER ACCESS POLICY ON customer_dimension FOR COLUMN customer_key length ('xxxxx') enable;</td>
</tr>
<tr>
<td></td>
<td>limits access to strings in the customer_key column to a specific length.</td>
</tr>
<tr>
<td>**ENABLE</td>
<td>DISABLE**</td>
</tr>
<tr>
<td><strong>COPY TO TABLE tablename</strong></td>
<td>Copies the existing access policy to the specified table. Do not use an expression when performing a COPY TO function.</td>
</tr>
</tbody>
</table>

Privileges

You must be a dbadmin user to alter an access policy.
Examples

Copy Access Policy from Table to Table

=> ALTER ACCESS POLICY ON customer FOR COLUMN customer_number COPY TO TABLE customer_old;

Enable Access Policy

=> ALTER ACCESS POLICY ON customer FOR ROWS WHERE cid1>1 ENABLE;

**ALTER AUTHENTICATION**

Modifies the settings for a specified authentication method.

Syntax

```
ALTER AUTHENTICATION auth_method_name {
  { ENABLE | DISABLE }
  { LOCAL | HOST [ { TLS | NO TLS } ] host_ip_address }
  RENAME TO new_auth_method_name
  METHOD value
  SET param=value[,-]
  PRIORITY value }
```

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auth_method_name</td>
<td>Name of the authentication method that you want to create.</td>
</tr>
<tr>
<td></td>
<td><strong>Type</strong>: VARCHAR</td>
</tr>
<tr>
<td>ENABLE</td>
<td>DISABLE</td>
</tr>
<tr>
<td></td>
<td><strong>Default</strong>: Enabled</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong>: When you perform an upgrade and use Kerberos authentication, you must manually set the authentication to ENABLE as it is disabled by default.</td>
</tr>
<tr>
<td>Parameter Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>LOCAL</td>
<td>HOST [ { TLS</td>
</tr>
<tr>
<td>RENAME TO new_auth_method_name</td>
<td>Rename the authentication record.&lt;br&gt;&lt;br&gt;Type: VARCHAR</td>
</tr>
<tr>
<td>METHOD value</td>
<td>The authentication method you are altering.</td>
</tr>
<tr>
<td>SET param=value</td>
<td>Set a parameter name and value for the authentication method that you are creating. Required only for LDAP and Ident authentication.&lt;br&gt;&lt;br&gt;ALTER AUTHENTICATION validates the parameters you enter.&lt;br&gt;&lt;br&gt;See parameters for specific authentication types in Client Authentication.</td>
</tr>
<tr>
<td>PRIORITY value</td>
<td>If the user is associated with multiple authentication methods, the priority value specifies which authentication method Vertica tries first.&lt;br&gt;&lt;br&gt;Default: 0&lt;br&gt;&lt;br&gt;Type: INTEGER</td>
</tr>
<tr>
<td></td>
<td>Higher values indicate higher priorities. For example, a priority of 10 is higher than a priority of 5; priority 0 is the lowest possible value.&lt;br&gt;&lt;br&gt;For details, see Priorities for Client Authentication Methods.</td>
</tr>
</tbody>
</table>

**Privileges**

Must have DBADMIN privileges.
Examples

Enabling and Disabling Authentication Methods
This example uses `ALTER AUTHENTICATION` to disable the `v_ldap` authentication method and then enable it again:

```sql
=> ALTER AUTHENTICATION v_ldap DISABLE;
=> ALTER AUTHENTICATION v_ldap ENABLE;
```

Renaming Authentication Methods
This example renames the `v_kerberos` authentication method to `K5` and enables it. All users who have been granted the `v_kerberos` authentication method now have the `K5` method granted instead.

```sql
=> ALTER AUTHENTICATION v_kerberos RENAME TO K5 ENABLE;
```

Modifying Authentication Parameters
This example sets the system user for `ident1` authentication to `user1`:

```sql
=> CREATE AUTHENTICATION ident1 METHOD 'ident' LOCAL;
=> ALTER AUTHENTICATION ident1 SET system_users='user1';
```

When you set or modify LDAP or Ident parameters using `ALTER AUTHENTICATION`, Vertica validates them.

This example changes the IP address and specifies the parameters for an LDAP authentication method named `Ldap1`. Specify the bind parameters for the LDAP server. Vertica connects to the LDAP server, which authenticates the database client. If authentication succeeds, Vertica authenticates any users who have been associated with (granted) the `Ldap1` authentication method on the designated LDAP server:

```sql
=> CREATE AUTHENTICATION Ldap1 METHOD 'ldap' HOST '172.16.65.196';
=> ALTER AUTHENTICATION Ldap1 SET host='ldap://172.16.65.177',
   binddn_prefix='cn=', binddn_suffix=',dc=qa_domain,dc=com';
```

The next example specifies the parameters for an LDAP authentication method named `Ldap2`. Specify the LDAP search and bind parameters. Sometimes, Vertica does not have enough information to create the distinguished name (DN) for a user attempting to authenticate. In such cases, you must specify to use LDAP search and bind:

```sql
=> CREATE AUTHENTICATION Ldap2 METHOD 'ldap' HOST '172.16.65.196';
```
=> ALTER AUTHENTICATION Ldap2 SET basedn='dc=qa_domain,dc=com',
    binddn='cn=Manager,dc=qa_domain,
    dc=com',search_attribute='cn',bind_password='secret';

Changing the Authentication Method

This example changes the localpwd authentication from hash to trust:

=> CREATE AUTHENTICATION localpwd METHOD 'hash' LOCAL;
=> ALTER AUTHENTICATION localpwd METHOD 'trust';

Set Multiple Realms

This example sets another realm for the authentication method krb_local:

=> ALTER AUTHENTICATION krb_local set realm = 'COMPANY.COM';

See Also

- CREATE AUTHENTICATION
- DROP AUTHENTICATION
- GRANT (Authentication)
- REVOKE (Authentication)

ALTER DATABASE

Use ALTER DATABASE to perform the following tasks:

- Drop all fault groups and their child fault groups from a database.
- Restore down nodes, and revert active standby nodes to standby status.
- Specify the subnet name of a public network to use for import/export.
- Set and clear database configuration parameters.
# Syntax

```sql
ALTER DATABASE `db-spec` {
    DROP ALL FAULT GROUP
    | EXPORT ON { `subnet-name` | DEFAULT }
    | RESET STANDBY
    | SET [PARAMETER] `parameter=value` [,…]
    | CLEAR [PARAMETER] `parameter` [,…]
}
```

## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>db-spec</code></td>
<td>Specifies the database to alter, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- The database name</td>
</tr>
<tr>
<td></td>
<td>- DEFAULT: The current database</td>
</tr>
<tr>
<td>DROP ALL FAULT GROUP</td>
<td>Drops all fault groups defined on the specified database.</td>
</tr>
<tr>
<td>EXPORT ON</td>
<td>Specifies the network to use for importing and exporting data, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- <code>subnet-name</code>: A subnet of the public network.</td>
</tr>
<tr>
<td></td>
<td>- DEFAULT: Specifies to use a private network.</td>
</tr>
<tr>
<td>RESET STANDBY</td>
<td>Restores any replaced nodes and reverts all active standby nodes to standby status. If any replaced nodes cannot resume activity, Vertica leaves the standby nodes in place.</td>
</tr>
<tr>
<td>SET [PARAMETER] <code>parameter=value</code></td>
<td>Sets <code>parameter</code> to the specified value.</td>
</tr>
<tr>
<td>CLEAR [PARAMETER] <code>parameter</code></td>
<td>Resets <code>parameter</code> to its default value.</td>
</tr>
</tbody>
</table>
Privileges
Superuser

**ALTER FAULT GROUP**
Modifies an existing fault group. For example, use the `ALTER FAULT GROUP` statement to:

- Add a node to or drop a node from an existing fault group
- Add a child fault group to or drop a child fault group from a parent fault group
- Rename a fault group

**Syntax**

```
ALTER FAULT GROUP fault-group-name {
  | ADD NODE node-name
  | DROP NODE node-name
  | ADD FAULT GROUP child-fault-group-name
  | DROP FAULT GROUP child-fault-group-name
  | RENAME TO new-fault-group-name }
```

**Parameters**

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fault-group-name</code></td>
<td>The existing fault group name you want to modify.  &lt;br&gt;<strong>Tip:</strong> For a list of all fault groups defined in the cluster, query the <code>FAULT_GROUPS</code> system table.</td>
</tr>
<tr>
<td><code>node-name</code></td>
<td>The node name you want to add to or drop from the existing (parent) fault group.</td>
</tr>
<tr>
<td><code>child-fault-group-name</code></td>
<td>The name of the child fault group you want to add to or remove from an existing parent fault group.</td>
</tr>
<tr>
<td><code>new-fault-group-name</code></td>
<td>The new name for the fault group you want to rename.</td>
</tr>
</tbody>
</table>
Privileges

Must be a superuser to alter a fault group.

Example

This example shows how to rename the parent0 fault group to parent100:

```sql
=> ALTER FAULT GROUP parent0 RENAME TO parent100;
ALTER FAULT GROUP
```

Verify the change by querying the `FAULT_GROUPS` system table:

```sql
=> SELECT member_name FROM fault_groups;
member_name
-----------------
 v_exampledb_node0003
parent100
mygroup
(3 rows)
```

See Also

- `CREATE FAULT GROUP`
- `V_CATALOG.FAULT_GROUPS`
- `V_CATALOG.CLUSTER_LAYOUT`
- Fault Groups
- High Availability With Fault Groups

**ALTER FUNCTION (SQL)**

Alters a user-defined SQL function.
Syntax

ALTER FUNCTION [[db-name.]schema.]function-name( [arg-list] ) { OWNER TO new-owner | RENAME TO new-name | SET SCHEMA new-schema }

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[db-name.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td>function-name</td>
<td>The name of the SQL function to alter.</td>
</tr>
<tr>
<td>arg-list</td>
<td>A comma-delimited list of function arguments. If none, specify an empty list.</td>
</tr>
<tr>
<td>OWNER TO</td>
<td>Transfers function ownership to another user.</td>
</tr>
<tr>
<td>RENAME TO</td>
<td>Assigns a new name to the function.</td>
</tr>
<tr>
<td>SET SCHEMA</td>
<td>Moves the function to another schema.</td>
</tr>
</tbody>
</table>

Privileges

Superuser or function owner. For non-superusers, the following requirements also apply:

- To rename a function: USAGE and CREATE privilege on the function's schema.
- To move a function to another schema: USAGE privilege on current schema and CREATE privilege on the destination schema.

Examples

Rename function SQL_one to SQL_two:
ALTER FUNCTION SQL_one (int, int) RENAME TO SQL_two;

Move function SQL_two to schema macros:
=> ALTER FUNCTION SQL_two (int, int) SET SCHEMA macros;

Reassign ownership of SQL_two:
=> ALTER FUNCTION SQL_two (int, int) OWNER TO user1;

See Also

- CREATE FUNCTION (SQL Functions)
- Using User-Defined SQL Functions

ALTER FUNCTION (UDF)

Alters a user-defined function (UDF).

Syntax

ALTER FUNCTION [[db-name.]schema.]function-name( [arg-list] ) {
  OWNER TO new-owner
  | RENAME TO new-name
  | SET FENCED boolean-expr
  | SET SCHEMA new-schema
}

Parameters

| [db-name.]schema | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>myschema.thisDbObject</td>
<td>If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>
function-name | The name of the UDF to alter.
--- | ---
arg-list | A comma-delimited list of function arguments. If none, specify an empty list.
OWNER TO | Transfers function ownership to another user.
RENAME TO | Assigns a new name to the function.
SET FENCED boolean-exp | Specifies whether fenced mode is enabled for this function, by default set to true.

**Note:** Fenced mode is not available for user-defined aggregates or user-defined load.

SET SCHEMA | Moves the function to another schema.

**Privileges**

Superuser or function owner. For non-superusers, the following requirements also apply:

- To rename a function: USAGE and CREATE privilege on the function's schema.
- To move a function to another schema: USAGE privilege on current schema and CREATE privilege on the destination schema.

**Examples**

Rename function UDF_one to UDF_two:

```sql
=> ALTER FUNCTION UDF_one (int, int) RENAME TO UDF_two;
```

Move function UDF_two to schema macros:

```sql
=> ALTER FUNCTION UDF_two (int, int) SET SCHEMA macros;
```

Disable fenced mode for function UDF_two:

```sql
=> ALTER FUNCTION UDF_two (int, int) SET FENCED false;
```
ALTER HCATALOG SCHEMA

Alters parameter values on a schema that was created with CREATE HCATALOG SCHEMA. HCatalog schemas are used by the HCatalog Connector to access data stored in a Hive data warehouse. For more information, see Using the HCatalog Connector in Integrating with Apache Hadoop.

Some parameters cannot be altered after creation. If you need to change one of those values, delete and recreate the schema instead. You can use ALTER HCATALOG SCHEMA to change the following parameters:

- HOSTNAME
- PORT
- HIVESERVER2_HOSTNAME
- WEBSERVICE_HOSTNAME
- WEBSERVICE_PORT
- WEBHDFS_ADDRESS
- HCATALOG_CONNECTION_TIMEOUT
- HCATALOG_SLOW_TRANSFER_LIMIT
- HCATALOG_SLOW_TRANSFER_TIME
- SSL_CONFIG
- CUSTOM_PARTITIONS

Syntax

ALTER HCATALOG SCHEMA schema-name SET [param=value]+;
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema-name</td>
<td>The name of the schema in the Vertica catalog to alter. The tables in the</td>
</tr>
<tr>
<td></td>
<td>Hive database are available through this schema.</td>
</tr>
<tr>
<td>param</td>
<td>The name of the parameter to alter.</td>
</tr>
<tr>
<td>value</td>
<td>The new value for the parameter. You must specify a value; this statement</td>
</tr>
<tr>
<td></td>
<td>does not read default values from configuration files like CREATE HCATALOG</td>
</tr>
<tr>
<td></td>
<td>SCHEMA.</td>
</tr>
</tbody>
</table>

Privileges

One of the following:

- Superuser
- Schema owner

Examples

The following example shows how to change the Hive metastore hostname and port for the "hcat" schema. In this example, Hive uses High Availability metastore.

```sql
=> ALTER HCATALOG SCHEMA hcat SET
    HOSTNAME='thrift://ms1.example.com:9083,thrift://ms2.example.com:9083';
```

The following example shows the error you receive if you try to set an unalterable parameter.

```sql
=> ALTER HCATALOG SCHEMA hcat SET HCATALOG_USER='admin';
   ERROR 4856: Syntax error at or near "HCATALOG_USER" at character 39
```
ALTER LIBRARY

Replaces the library file (for example, C++ .so file or Java .jar file) associated with a UDx library that is defined in the Vertica catalog. Vertica automatically distributes copies of the updated file throughout the cluster. UDxs defined in the catalog that reference the updated library automatically start using the updated library file. Nodes that are down or added to the cluster also receive a copy of the updated library file as soon as they join the cluster.

Syntax

```
ALTER LIBRARY [ [database.]schema.]library-name [DEPENDS 'support-path'] AS 'library-path';
```

Parameters

<table>
<thead>
<tr>
<th><strong>Parameter</strong></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>schema</strong></td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject</td>
</tr>
<tr>
<td><strong>library-name</strong></td>
<td>The library to alter. You can only alter an existing library.</td>
</tr>
<tr>
<td><strong>DEPENDS 'support-path'</strong></td>
<td>Indicates that the UDx library depends on one or more support libraries, where support-path specifies one or more absolute paths to the support libraries files, located in the initiator node's file system. You can specify multiple support paths as follows:</td>
</tr>
<tr>
<td></td>
<td>• Separate multiple paths with colons (:).</td>
</tr>
<tr>
<td></td>
<td>• Specify a directory that contains multiple libraries with an asterisk wildcard (<em>). For example: /home/mydir/mylibs/</em></td>
</tr>
<tr>
<td><strong>library-path</strong></td>
<td>The absolute path in the initiator node file system to the replacement library file.</td>
</tr>
</tbody>
</table>
Privileges

Superuser

Requirements

- The new library must be developed in the same programming language as the library file being replaced. For example, you cannot use this statement to replace a C++ library file with an R library file.

- Vertica does not compare the functions defined in the new library to ensure they match any currently-defined functions in the catalog. If you change the signature of a function in the library (for example, if you change the number and data types accepted by a UDSF defined in the library), calls to that function will likely generate errors. If your new library file changes the definition of a function, you must remove the function using `DROP FUNCTION` before using `ALTER LIBRARY` to load the new library. You can then recreate the function using its new signature.

Examples

This example shows how to update an already-defined library myFunctions with a new file.

```sql
=> ALTER LIBRARY myFunctions AS '/home/dbadmin/my_new_functions.so';
```

See Also

`Developing User-Defined Extensions (UDxs)`

**ALTER MODEL**

Allows users to rename an existing model, change ownership, or move it to a another schema.
Syntax

```
ALTER MODEL [[database.]schema.]model
  { OWNER TO owner
   | RENAME TO new-name
   | SET SCHEMA schema
  }
```

Parameters

| `[database.]schema` | Specifies a schema, by default public. If `schema` is any schema other than public, you must supply the schema name. For example:
|                   | `myschema.thisDbObject`
|                   | If you specify a database, it must be the current database.
| `model`           | Identifies the model to alter.
| `OWNER TO owner`  | Reassigns ownership of this model to `owner`. If a non-superuser, you must be the current owner.
| `RENAME TO new-name` | Renames the model. The following requirements apply:
|                   | - The new model name conforms to conventions described in `Identifiers`. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
|                   | - If a non-superuser, you must be the current owner.
| `SET SCHEMA schema` | Moves the model from one schema to another. If a non-superuser, you must have USAGE privileges on the current schema, and CREATE privileges on the destination schema.

Privileges

If a non-superuser, see requirements cited in Parameters.
Examples
See Altering Models.

ALTER NETWORK INTERFACE
Lets you rename a network interface.

Syntax
ALTER NETWORK INTERFACE network-interface-name RENAME TO new-network-interface-name

Parameters

<table>
<thead>
<tr>
<th>network-interface-name</th>
<th>The name of the existing network interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td>new-network-interface-name</td>
<td>The new name for the network interface.</td>
</tr>
</tbody>
</table>

Privileges
Must be a superuser to alter a network interface.

Examples
This example shows how to rename a network interface.

```sql
=> ALTER NETWORK INTERFACE myNetwork RENAME TO myNewNetwork;
```
**ALTER NODE**

Sets and clears node-level configuration parameters on the specified node. ALTER NODE also performs the following management tasks:

- Changes the node type.
- Specifies the network interface of the public network on individual nodes that are used for import and export.
- Replaces a down node.

For information about removing a node, see

- Removing Nodes From a Database
- Removing Hosts From a Cluster

### Syntax

```
ALTER NODE node-name {
    EXPORT ON { network-interface | DEFAULT }
    [IS] node-type
    | REPLACE [ WITH standby-node ]
    | RESET
    | SET [PARAMETER] parameter=value[,…]
    | CLEAR [PARAMETER] parameter[,…]
}
```

### Parameters

<table>
<thead>
<tr>
<th><strong>node-name</strong></th>
<th>The name of the node to alter.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>[IS] node-type</strong></td>
<td>Changes the node type, where <strong>node-type</strong> is one of the following:</td>
</tr>
<tr>
<td></td>
<td>- PERMANENT (default): A node that is used to store data.</td>
</tr>
<tr>
<td></td>
<td>- EPHEMERAL: A node that is in transition from one type to another—typically, from PERMANENT to either STANDBY or EXECUTE.</td>
</tr>
</tbody>
</table>
**STANDBY**: A node that is reserved to replace any node when it goes down. When used as a replacement node, Vertica changes its type to PERMANENT. A standby node stores no segments or data until it is called to replace a down node. At that time, Vertica changes its type to PERMANENT. For more information, see [Active Standby Nodes](#).

**EXECUTE**: A node that is reserved for computation purposes only. An execute node contains no segments or data.

<table>
<thead>
<tr>
<th><strong>EXPORT ON</strong></th>
<th>Specifies the network to use for importing and exporting data, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <em>network-interface</em>: The name of a network interface of the public network.</td>
</tr>
<tr>
<td></td>
<td>• DEFAULT: Use the default network interface of the public network, as specified by <code>ALTER DATABASE</code>.</td>
</tr>
</tbody>
</table>

| **REPLACE [WITH *standby-node*]** | Replaces the specified node with an available active standby node. If you omit the WITH clause, Vertica tries to find a replacement node from the same fault group as the down node. If you specify a node that is not down, Vertica ignores this statement. |

| **RESET** | Restores the specified down node and returns its replacement to standby status. If the down node is unable to resume activity, Vertica ignores this statement and leaves the standby node in place. |

| **SET [PARAMETER] parameter=value** | Sets one or more configuration parameters to the specified value at the node level. |

| **CLEAR [PARAMETER] parameter** | Clears one or more specified configuration parameters. |

**Privileges**

Superuser
Examples

Specify to use the default network interface of public network on v_vmart_node0001 for import/export operations:

```sql
=> ALTER NODE v_vmart_node0001 EXPORT ON DEFAULT;
```

Replace down node v_vmart_node0001 with an active standby node, then restore it:

```sql
=> ALTER NODE v_vmart_node0001 REPLACE WITH standby1;
...
=> ALTER NODE v_vmart_node0001 RESET;
```

Set and clear configuration parameter MaxClientSessions:

```sql
=> ALTER NODE v_vmart_node0001 SET MaxClientSessions = 0;
...
=> ALTER NODE v_vmart_node0001 CLEAR MaxClientSessions;
```

Set the node type as EPHEMERAL:

```sql
=> ALTER NODE v_vmart_node0001 IS EPHEMERAL;
```

**ALTER NOTIFIER**

Updates an existing notifier.

**Note:** To change the action URL associated with an existing identifier, **drop the notifier** and re-create it.

Syntax

```sql
ALTER NOTIFIER notifier-name parameter[...]
```

*parameter*

(NO) CHECK COMMITTED
ENABLE | DISABLE
IDENTIFIED BY uuid
MAXMEMORYSIZE max-memory-size
MAXPAYLOAD max-payload-size
PARAMETERS 'adapter-params'
Parameters

<table>
<thead>
<tr>
<th><strong>notifier-name</strong></th>
<th>Specifies the notifier to update.</th>
</tr>
</thead>
<tbody>
<tr>
<td>[NO] CHECK COMMITTED</td>
<td>Specifies to wait for delivery confirmation before sending the next message in the queue. Not all messaging systems support delivery confirmation.</td>
</tr>
<tr>
<td>ENABLE</td>
<td>DISABLE</td>
</tr>
<tr>
<td>IDENTIFIED BY <em>uuid</em></td>
<td>Specifies the notifier's unique identifier. If set, all the messages published by this notifier have this attribute.</td>
</tr>
</tbody>
</table>
| MAXMEMORYSIZE | The maximum size of the internal notifier, up to 2 TB, specified in kilobytes, megabytes, gigabytes, or terabytes as follows: 

\[
\text{MAXMEMORYSIZE} \text{ integer}\{K|M|G|T\}
\]

If the queue exceeds this size, the notifier drops excess messages. |
| MAXPAYLOAD | The maximum size of the message, up to 2 TB, specified in kilobytes, megabytes, gigabytes, or terabytes as follows: 

\[
\text{MAXPAYLOAD} \text{ integer}\{K|M|G|T\}
\]

The default setting is adapter-specific—for example, 1 M for Kafka. |
| PARAMETERS 'adapter-params' | Specifies one or more optional adapter parameters that are passed as a string to the adapter. Adapter parameters apply only to the adapter associated with the notifier. For Kafka notifiers, refer to Kafka and Vertica Configuration Settings. |

Privileges

Database Superuser
Examples

Update the settings on an existing notifier:

```sql
=> ALTER NOTIFIER my_dc_notifier
   ENABLE
   MAXMEMORYSIZE '2G'
   IDENTIFIED BY 'f8b0278a-3282-4e1a-9c86-e0f3f042a971'
   CHECK COMMITTED;
```

See Also

- CREATE NOTIFIER
- DROP NOTIFIER

**ALTER PROJECTION RENAME**

Initiates a rename operation on the specified projection.

**Syntax**

```sql
ALTER PROJECTION [database.]schema.projection RENAME TO new-name
```

**Parameters**

<table>
<thead>
<tr>
<th>schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td>myschema</td>
<td>thisDbObject</td>
</tr>
<tr>
<td>If you specify a database, it must be the current database.</td>
<td></td>
</tr>
</tbody>
</table>
### Projection Renaming

<table>
<thead>
<tr>
<th><strong>projection</strong></th>
<th>The projection to change. See Projection Naming for projection name conventions.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>new-name</strong></td>
<td>The new projection name.</td>
</tr>
</tbody>
</table>

#### Privileges

Superuser, or the following:

- Anchor table owner
- CREATE privilege on the schema

#### Examples

This example shows how to rename a projection.

```sql
=> CREATE TABLE tbl (x integer, y integer);
CREATE TABLE

=> CREATE PROJECTION tbl_p AS SELECT x from tbl;
CREATE PROJECTION

=> ALTER PROJECTION tbl_p RENAME to new_tbl_p;
ALTER PROJECTION
```

#### See Also

CREATE PROJECTION

---

## ALTER PROFILE

Changes a profile. All parameters that are not set in a profile inherit their setting from the default profile. You can use ALTER PROFILE to change the default profile.

### Syntax

```sql
CREATE PROFILE name LIMIT [ password-parameter setting ]...
```
### Parameters

**Note:** To reset a parameter to inherit from the default profile, set its value to `default`.  

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| **name**                | The name of the profile to create, where `name` conforms to conventions described in [Identifiers](#).  
To modify the default profile, set `name` to `default`. For example:  
  ```sql
  ALTER PROFILE DEFAULT LIMIT PASSWORD_MIN_SYMBOLS 1;
  ``` |
| **PASSWORD_LIFE_TIME**  | Set to an integer value, one of the following:  
  - $\geq 1$: The number of days a password remains valid.  
  - UNLIMITED: Password remains valid indefinitely.  
  After your password's lifetime and grace period expire, you must change your password on your next login, if you have not done so already. |
| **PASSWORD_GRACE_TIME** | Set to an integer value, one of the following:  
  - $\geq 1$: The number of days a password can be used after it expires.  
  - UNLIMITED: No grace period. |
<p>| <strong>FAILED_LOGIN_ATTEMPTS</strong> | Set to an integer value, one of the following: |</p>
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• ≥ 1: The number of consecutive failed login attempts Vertica allows before</td>
</tr>
<tr>
<td></td>
<td>locking your account.</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: Vertica allows an unlimited number of failed login attempts.</td>
</tr>
<tr>
<td>PASSWORD_LOCK_TIME</td>
<td>Set to an integer value, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• ≥ 1: The number of days your account is locked after too many failed login</td>
</tr>
<tr>
<td></td>
<td>attempts. The account is automatically unlocked when the lock time elapses.</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: Account remains indefinitely inaccessible until a superuser</td>
</tr>
<tr>
<td></td>
<td>manually unlocks it.</td>
</tr>
<tr>
<td>PASSWORD_REUSE_MAX</td>
<td>Set to an integer value, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• ≥ 1: The number of times you must change your password before you can</td>
</tr>
<tr>
<td></td>
<td>reuse an earlier password.</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: You can reuse an earlier password without any intervening</td>
</tr>
<tr>
<td></td>
<td>changes.</td>
</tr>
<tr>
<td>PASSWORD_REUSE_TIME</td>
<td>Set to an integer value, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• ≥ 1: The number of days that must pass after a password is set before you</td>
</tr>
<tr>
<td></td>
<td>can reuse it.</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: You can reuse an earlier password immediately.</td>
</tr>
<tr>
<td>PASSWORD_MAX_LENGTH</td>
<td>The maximum number of characters allowed in a password, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• Integer between 8 and 100, inclusive</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: Maximum of 100 characters</td>
</tr>
<tr>
<td>PASSWORD_MIN_LENGTH</td>
<td>The minimum number of characters required in a password, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• 0 to PASSWORD_MAX_LENGTH</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: Minimum of PASSWORD_MAX_LENGTH</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>PASSWORD_MIN_LETTERS</td>
<td>Minimum number of letters (a-z and A-Z) that must be in a password, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• Integer between 0 and PASSWORD_MAX_LENGTH, inclusive</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: 0 (no minimum)</td>
</tr>
<tr>
<td>PASSWORD_MIN_UPPERCASE_LETTERS</td>
<td>Minimum number of uppercase letters (A-Z) that must be in a password, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• Integer between 0 and PASSWORD_MAX_LENGTH, inclusive</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: 0 (no minimum)</td>
</tr>
<tr>
<td>PASSWORD_MIN_LOWERCASE_LETTERS</td>
<td>Minimum number of lowercase letters (a-z) that must be in a password, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• Integer between 0 and PASSWORD_MAX_LENGTH, inclusive</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: 0 (no minimum)</td>
</tr>
<tr>
<td>PASSWORD_MIN_DIGITS</td>
<td>Minimum number of digits (0-9) that must be in a password, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• Integer between 0 and PASSWORD_MAX_LENGTH, inclusive</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: 0 (no minimum)</td>
</tr>
<tr>
<td>PASSWORD_MIN_SYMBOLS</td>
<td>Minimum number of symbols—printable non-letter and non-digit characters such as $, #, @—that must be in a password, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• Integer between 0 and PASSWORD_MAX_LENGTH, inclusive</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: 0 (no minimum)</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser
Profile Settings and Client Authentication

The following profile settings affect client authentication methods, such as LDAP or GSS:

- FAILED_LOGIN_ATTEMPTS
- PASSWORD_LOCK_TIME

All other profile settings are used only by Vertica to manage its passwords.

Example

```
ALTER PROFILE sample_profile LIMIT FAILED_LOGIN_ATTEMPTS 3;
```

See Also

- CREATE PROFILE
- DROP PROFILE
- Creating a Database Name and Password

**ALTER PROFILE RENAME**

Rename an existing profile.

**Syntax**

```
ALTER PROFILE name RENAME TO newname;
```

**Parameters**

| name | The current name of the profile. |
Privileges

Must be a superuser to alter a profile.

Examples

This example shows how to rename an existing profile.

```
ALTER PROFILE sample_profile RENAME TO new_sample_profile;
```

See Also

- `ALTER PROFILE`
- `CREATE PROFILE`
- `DROP PROFILE`

**ALTER RESOURCE POOL**

Modifies an existing resource pool by setting one or more parameters.

Note: You can use `ALTER RESOURCE POOL` to modify some parameters in Vertica built-in resource pools. For details on default settings and restrictions, see [Built-In Resource Pools Configuration](#).

Syntax

```
ALTER RESOURCE POOL pool-name [ parameter-name setting ]...
```
## Parameters

<table>
<thead>
<tr>
<th><strong>pool-name</strong></th>
<th>The name of the resource pool. <em>Built-in pool</em> names cannot be used for user-defined pools.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>parameter-name</strong></td>
<td>The parameter to set, listed below.</td>
</tr>
<tr>
<td><strong>setting</strong></td>
<td>The value to set on <em>parameter-name</em>. To reset this parameter to its default value, specify DEFAULT.</td>
</tr>
</tbody>
</table>

**Note:** If you specify a resource pool name with uppercase letters, Vertica converts them to lowercase letters.

**Note:** Default values specified in this table pertain only to user-defined resource pools. For built-in pool default values, see *Built-In Resource Pools Configuration*, or query system table `RESOURCE_POOL_DEFAULTS`.

- **CASCADE TO**
  Specifies a secondary resource pool for executing queries that exceed the *RUNTIMECAP* setting of their assigned resource pool:
  ```
  CASCADE TO secondary-pool
  ```

- **CPUAFFINITYMODE**
  Specifies whether the resource pool has exclusive or shared use of the CPUs specified in `CPUAFFINITYSET`:
  ```
  CPUAFFINITYMODE { SHARED | EXCLUSIVE | ANY }
  ```
  - **SHARED:** Queries that run in this pool share its `CPUAFFINITYSET` CPUs with other Vertica resource pools.
  - **EXCLUSIVE:** Dedicates `CPUAFFINITYSET` CPUs to this resource pool only, and excludes other Vertica resource pools. If `CPUAFFINITYSET` is set as a percentage, then that percentage of CPU resources available to Vertica is assigned solely for this resource pool.
- ANY (default): Queries in this resource pool can run on any CPU, invalid if CPUAFFINITYSET designates CPU resources.

Important: CPUAFFINITYMODE and CPUAFFINITYSET must be set together in the same statement.

<table>
<thead>
<tr>
<th>CPUAFFINITYSET</th>
<th>Specifies which CPUs are available to this resource pool. All cluster nodes must have the same number of CPUs. The CPU resources assigned to this set are unavailable to general resource pools.</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPUAFFINITYSET</td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>'cpu-index[,..]'</td>
</tr>
<tr>
<td></td>
<td>'cpu-index_i-cpu-index_n'</td>
</tr>
<tr>
<td></td>
<td>'integer%'</td>
</tr>
<tr>
<td></td>
<td>NONE</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>

- \texttt{cpu-index[,..]}: Dedicates one or more comma-delimited CPUs to this pool.

- \texttt{cpu-index_i-cpu-index_n}: Dedicates a range of contiguous CPU indexes to this pool

- \texttt{integer} %: Percentage of all available CPUs to use for this pool. Vertica rounds this percentage down to include whole CPU units.

- NONE (default): No affinity set is assigned to this resource pool. The queries associated with this pool are executed on any CPU.

Important: CPUAFFINITYSET and CPUAFFINITYMODE must be set together in the same statement.

<table>
<thead>
<tr>
<th>EXECUTIONPARALLELISM</th>
<th>Limits the number of threads used to process any single query issued in this resource pool.</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXECUTIONPARALLELISM</td>
<td>{ integer</td>
</tr>
</tbody>
</table>

- \texttt{integer}: A value between 1 and the number of cores. Setting this parameter to a reduced value
increases throughput of short queries issued in the pool, especially if the queries are executed concurrently.

- AUTO (default): Vertica sets this value based on the number of cores, available memory, and amount of data in the system. Unless memory is limited, or the amount of data is very small, Vertica sets this value to the number of cores on the node.

**MAXCONCURRENCY**

Sets the maximum number of concurrent execution slots available to the resource pool, across the cluster:

```
MAXCONCURRENCY { integer | NONE }

NONE (default) specifies unlimited number of concurrent execution slots.
```

**MAXMEMORYSIZE**

The maximum size per node the resource pool can grow by borrowing memory from the **GENERAL** pool:

```
MAXMEMORYSIZE {
  'integer%'
  | 'integer{K|M|G|T}'
  | NONE
}

- integer%: Percentage of total memory
- integer{K|M|G|T}: Amount of memory in kilobytes, megabytes, gigabytes, or terabytes
- NONE (default): Unlimited, pool can borrow any amount of available memory from the **GENERAL** pool.

**MAXQUERYMEMORYSIZE**

The maximum amount of memory that this pool can allocate at runtime to process a query. If the query requires more memory than this setting, Vertica stops execution and returns an error.

Set this parameter as follows:

```
MAXQUERYMEMORYSIZE {
  'integer%'
  | 'integer{K|M|G|T}'
  | NONE
}

- integer%: Percentage of MAXMEMORYSIZE for this
### pool.

- **integer{K|M|G|T}**: Amount of memory in kilobytes, megabytes, gigabytes, or terabytes, up to the value of MAXMEMORYSIZE.

- **NONE** (default): Unlimited; pool can borrow any amount of available memory from the GENERAL pool, within the limits set by MAXMEMORYSIZE.

**Important**: Changes to MAXQUERYMEMORYSIZE are applied retroactively to queries that are currently executing. If you reduce this setting, queries that were budgeted with the previous memory size are liable to fail if they try to allocate more memory than the new setting allows.

### MEMORYSIZE

The amount of total memory available to the Vertica resource manager that is allocated to this pool per node:

```
MEMORYSIZE {
  `integer%`
  | `integer{K|M|G|T}'
}
```

- **integer%**: Percentage of total memory

- **integer{K|M|G|T}**: Amount of memory in kilobytes, megabytes, gigabytes, or terabytes

**Default**: 0%. No memory allocated, the resource pool borrows memory from the GENERAL pool.

### PLANNEDCONCURRENCY

Specifies the preferred number of queries to execute concurrently in the resource pool. This setting applies to the entire cluster:

```
PLANNEDCONCURRECY { integer | AUTO }
```

- **integer**: The preferred number of concurrently executing queries. When possible, query resource budgets are limited to allow this level of concurrent execution.

- **AUTO** (default): Value is calculated automatically at
query runtime. Vertica sets this parameter to the lower of these two calculations, but never less than 4:
- Number of logical cores
- Memory divided by 2GB

For clusters where the number of logical cores differs on different nodes, AUTO can apply differently on each node. Distributed queries run like the minimal effective planned concurrency. Single node queries run with the planned concurrency of the initiator.

Tip: Change this parameter only after evaluating performance over a period of time.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| **PRIORITY** | Specifies priority of queries in this pool when they compete for resources in the GENERAL pool:  

```
PRIORITY { integer | HOLD }
```

- **integer**: A negative or positive integer value, where higher numbers denote higher priority:
  - User-defined pools: -100 to 100
  - Built-in pools SYSQUERY, RECOVERY, and TM: -110 to 110
- **HOLD**: Sets priority to -999. Queries in this pool are queued until QUEUETIMEOUT is reached.

Default: 0 |
| **QUEUETIMEOUT** | Species how long a request can wait for pool resources before it is rejected:  

```
QUEUETIMEOUT { integer | NONE }
```

- **integer**: Maximum wait time in seconds
- **NONE**: No maximum wait time, request can be queued indefinitely.

Default: 300 seconds |
| **RUNTIMECAP** | Prevents runaway queries by setting the maximum time |
a query in the pool can execute. If a query exceeds this setting, it tries to cascade to a secondary pool:

RUNTIMECAP { 'interval' | NONE }

- interval: An interval of 1 minute or 100 seconds; should not exceed one year.
- NONE (default): No time limit on queries running in this pool.

To specify a value in days, provide an integer value. To provide a value less than one day, provide the interval in the format hours:minutes:seconds. For example a value of 1:30:00 would equal 90 minutes.

If the user or session also has a RUNTIMECAP, the shorter limit applies.

<table>
<thead>
<tr>
<th>RUNTIMEPRIORITY</th>
<th>Determines how the resource manager should prioritize dedication of run-time resources (CPU, I/O bandwidth) to queries already running in this resource pool:</th>
</tr>
</thead>
<tbody>
<tr>
<td>RUNTIMEPRIORITYTHRESHOLD</td>
<td>Specifies in seconds a time limit in which a query must finish before the resource manager assigns to it the resource pool's RUNTIMEPRIORITY. All queries begin running at a HIGH priority. When a query's duration exceeds this threshold, it is assigned the RUNTIMEPRIORITY of the resource pool.</td>
</tr>
<tr>
<td>SINGLEINITIATOR</td>
<td>By default, set to false for backward compatibility. Do not change this setting.</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser
Examples

This example shows how to alter resource pool ceo_pool by setting the priority to 5.

=> ALTER RESOURCE POOL ceo_pool PRIORITY 5;

This example shows how to designate a secondary resource pool for ceo_pool.

=> CREATE RESOURCE POOL second_pool;
=> ALTER RESOURCE POOL ceo_pool CASCADE TO second_pool;

See Also

- CREATE RESOURCE POOL
- CREATE USER
- DROP RESOURCE POOL
- RESOURCE_POOL_STATUS
- SET SESSION RESOURCE_POOL
- SET SESSION MEMORYCAP
- Managing Workloads

**ALTER ROLE RENAME**

Rename an existing role.

NOTE: You cannot use the ALTER ROLE RENAME command on a role added to the Vertica database with the LDAPLink service.

Syntax

```
ALTER ROLE name RENAME TO new_name;
```
Parameters

<table>
<thead>
<tr>
<th>name</th>
<th>The current name of the role that you want to rename.</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_name</td>
<td>The new name for the role.</td>
</tr>
</tbody>
</table>

Privileges

Must be a superuser to rename a role.

Example

```
=> ALTER ROLE applicationadministrator RENAME TO appadmin;
ALTER ROLE
```

See Also

- CREATE ROLE
- DROP ROLE

**ALTER SCHEMA**

Changes one or more schemas in one of the following ways:

- Enables or disables inheritance of schema privileges by tables created in the schemas.
- Reassigns schema ownership to another user.
- Renames schemas.
Syntax

Set inheritance of schema privileges

ALTER SCHEMA [database.]schema DEFAULT {INCLUDE | EXCLUDE} SCHEMA PRIVILEGES

Reassign schema ownership

ALTER SCHEMA [database.]schema OWNER TO user-name [CASCADE]

Rename schemas

ALTER SCHEMA [database.]schema[, …] RENAME TO new-schema-name[, …]

Parameters

<table>
<thead>
<tr>
<th>[database.]schema</th>
<th>The schema to modify. If you specify a database, it must be the current database.</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEFAULT {INCLUDE</td>
<td>Specifies whether to enable or disable default inheritance of privileges for new</td>
</tr>
<tr>
<td>EXCLUDE} SCHEMA PRIVILEGES</td>
<td>tables in the specified schema:</td>
</tr>
<tr>
<td></td>
<td>• EXCLUDE SCHEMA PRIVILEGES (default): Disables inheritance of schema privileges.</td>
</tr>
<tr>
<td></td>
<td>• INCLUDE SCHEMA PRIVILEGES: Specifies to grant tables in the specified schema the</td>
</tr>
<tr>
<td></td>
<td>same privileges granted to that schema. This option has no effect on existing tables</td>
</tr>
<tr>
<td></td>
<td>in the schema.</td>
</tr>
<tr>
<td></td>
<td>See also Enabling Schema Inheritance in the Administrator's Guide.</td>
</tr>
<tr>
<td>OWNER TO</td>
<td>Reassigns schema ownership to the specified user:</td>
</tr>
<tr>
<td></td>
<td>OWNER TO user-name [CASCADE]</td>
</tr>
<tr>
<td></td>
<td>By default, ownership of objects in the reassigned schema remain unchanged. To</td>
</tr>
<tr>
<td></td>
<td>reassign ownership of schema objects to the new schema owner, qualify the OWNER</td>
</tr>
<tr>
<td></td>
<td>TO clause with CASCADE. For details, see Cascading Schema Ownership below.</td>
</tr>
</tbody>
</table>
RENAME TO

Renames one or more schemas:

```
RENAME TO new-schema-name[, ...]
```

The following requirements apply:

- The new schema name conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, models, and schemas in the database.

- If you specify multiple schemas to rename, the source and target lists must have the same number of names.

**Caution:** Renaming a schema referenced by a view causes the view to fail unless another schema is created to replace it.

---

**Privileges**

Superuser, or the following privileges:

- To modify inheritance of privileges, schema owner or USAGE privilege on the schema

- To reassign schema ownership, owner of the schema.

- To rename a schema, owner of the schema and CREATE privilege on the database

---

**Cascading Schema Ownership**

By default, `ALTER SCHEMA...OWNER TO` does not affect ownership of objects in the target schema or the privileges granted on them. If you qualify the `OWNER TO` clause with `CASCADE`, Vertica acts as follows on objects in the target schema:

- Transfers ownership of objects owned by the previous schema owner to the new owner.

- Revokes all object privileges granted by the previous schema owner.

If issued by non-superusers, `ALTER SCHEMA...OWNER TO CASCADE` ignores all objects that belong to other users, and returns with notices on the objects that it cannot change.

For example:
1. Schema ms is owned by user mayday, and contains two tables: ms.t1 owned by mayday, and ms.t2 owned by user joe:

```
=> \dt
List of tables
<table>
<thead>
<tr>
<th>Schema</th>
<th>Name</th>
<th>Kind</th>
<th>Owner</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>ms</td>
<td>t1</td>
<td>table</td>
<td>mayday</td>
<td></td>
</tr>
<tr>
<td>ms</td>
<td>t2</td>
<td>table</td>
<td>joe</td>
<td></td>
</tr>
</tbody>
</table>
```

2. User mayday transfers ownership of schema ms to user dbadmin, using CASCADE. On return, ALTER SCHEMA notifies user mayday that it cannot transfer ownership of table ms.t2 and its projections, which are owned by user joe:

```
=> \c - mayday
You are now connected as user "mayday".
=> ALTER SCHEMA ms OWNER TO dbadmin CASCADE;
NOTICE 3583: Insufficient privileges on ms.t2
NOTICE 3583: Insufficient privileges on ms.t2_b0
NOTICE 3583: Insufficient privileges on ms.t2_b1
ALTER SCHEMA
=> \c
You are now connected as user "dbadmin".
=> \dt
List of tables
<table>
<thead>
<tr>
<th>Schema</th>
<th>Name</th>
<th>Kind</th>
<th>Owner</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>ms</td>
<td>t1</td>
<td>table</td>
<td>dbadmin</td>
<td></td>
</tr>
<tr>
<td>ms</td>
<td>t2</td>
<td>table</td>
<td>joe</td>
<td></td>
</tr>
</tbody>
</table>
```

3. User dbadmin transfers ownership of schema ms to user pat, again using CASCADE. This time, because dbadmin is a superuser, ALTER SCHEMA transfers ownership of all ms tables to user pat:

```
=> ALTER SCHEMA ms OWNER TO pat CASCADE;
ALTER SCHEMA
=> \dt
List of tables
<table>
<thead>
<tr>
<th>Schema</th>
<th>Name</th>
<th>Kind</th>
<th>Owner</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>ms</td>
<td>t1</td>
<td>table</td>
<td>pat</td>
<td></td>
</tr>
<tr>
<td>ms</td>
<td>t2</td>
<td>table</td>
<td>pat</td>
<td></td>
</tr>
</tbody>
</table>
```

Swapping Schemas

Renaming schemas is useful for swapping schemas without actually moving data. To facilitate the swap, enter a non-existent, temporary placeholder schema. For example, the following ALTER SCHEMA statement uses the temporary schema temps to facilitate swapping schema
S1 with schema S2. In this example, S1 is renamed to *temps*. Then S2 is renamed to *S1*. Finally, *temps* is renamed to S2.

```
=> ALTER SCHEMA S1, S2, temps RENAME TO temps, S1, S2;
```

**Examples**

The following example renames schemas S1 and S2 to S3 and S4, respectively:

```
=> ALTER SCHEMA S1, S2 RENAME TO S3, S4;
```

This example sets the default behavior for new table t2 to automatically inherit the schema's privileges:

```
=> ALTER SCHEMA s1 DEFAULT INCLUDE SCHEMA PRIVILEGES;
=> CREATE TABLE s1.t2 (i, int);
```

This example sets the default for new tables to not automatically inherit privileges from the schema:

```
=> ALTER SCHEMA s1 DEFAULT EXCLUDE SCHEMA PRIVILEGES;
```

**See Also**

- CREATE SCHEMA
- DROP SCHEMA

**ALTER SEQUENCE**

Changes a *named sequence* in two ways:

- Sets parameters that control sequence behavior—for example, its start value, and range of minimum and maximum values. These changes take effect only when you start a new database session.

- Sets sequence name, schema, or ownership. These changes take effect immediately.
**Note:** You can only modify a named sequence—that is, a sequence that was defined by `CREATE SEQUENCE`. AUTO_INCREMENT and IDENTITY sequences are owned by the table where they were created, and cannot be changed independently of that table.

### Syntax

**Change sequence behavior:**

```sql
ALTER SEQUENCE [\[database.]\]schema.]sequence ... [ INCREMENT [ BY ] integer ]
... [ MINVALUE integer | NO MINVALUE ]
... [ MAXVALUE integer | NO MAXVALUE ]
... [ RESTART [ WITH ] integer ]
... [ CACHE integer | NO CACHE ]
... [ CYCLE | NO CYCLE ]
```

**Change sequence name, schema, or ownership:**

```sql
ALTER SEQUENCE [schema.]sequence-name {
... RENAME TO seq-name
... | SET SCHEMA schema-name]
... | OWNER TO owner-name
}
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td></td>
<td>If you do not specify a schema, the table is created in the default schema.</td>
</tr>
<tr>
<td><code>sequence</code></td>
<td>The name of the sequence to alter.</td>
</tr>
<tr>
<td><code>INCREMENT [BY] integer</code></td>
<td>A positive or negative integer that specifies how much to increment or decrement the sequence on each call to <code>NEXTVAL</code>, by default set to 1.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Setting this parameter to <code>integer</code> guarantees that column values always increment by at least <code>integer</code>. However, column values can sometimes increment by more than <code>integer</code> unless</td>
</tr>
</tbody>
</table>
you also set the NO CACHE parameter.

<p>| MINVALUE integer NO MINVALUE (default) | Modifies the minimum value a sequence can generate. If you change this value and the current value exceeds the range, the current value is changed to the minimum value if increment is greater than zero, or to the maximum value if increment is less than zero. |
| MAXVALUE integer NO MAXVALUE (default) | Modifies the maximum value for the sequence. If you change this value and the current value exceeds the range, the current value is changed to the minimum value if increment is greater than zero, or to the maximum value if increment is less than zero. |
| RESTART [WITH] integer | Changes the current value of the sequence to integer. The next call to NEXTVAL returns integer. |
| CACHE integer NO CACHE (default) | Specifies how many sequence numbers are pre-allocated and stored in memory for faster access. Vertica sets up caching for each session, and distributes it across all nodes. By default, the sequence cache is set to 250,000. For details, see Distributing Named Sequences in the Administrator's Guide. |
| CYCLE NO CYCLE (default) | Specifies whether the sequence can wrap when its minimum or maximum values are reached: |
| | • CYCLE: The sequence wraps as follows: |
| | ▪ When an incrementing sequence reaches its upper limit, it is reset to its minimum value. |
| | ▪ When an decrementing sequence reaches its lower limit, it is reset to its maximum value. |
| | • NO CYCLE (default): Calls to NEXTVAL return an error after the sequence reaches its maximum or minimum value. |
| RENAME TO seq-name | Renames a sequence within the current schema, where seq-name conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema. |</p>
<table>
<thead>
<tr>
<th>SET SCHEMA \textit{schema-name}</th>
<th>Moves the sequence to schema \textit{schema-name}.</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWNER TO \textit{owner-name}</td>
<td>Reassigns the current sequence owner to the specified owner.</td>
</tr>
</tbody>
</table>

### Privileges

Superuser, or sequence owner with the following privileges:

- Rename sequence: USAGE and CREATE privileges on sequence.
- Move to another schema: USAGE privileges on current schema, and CREATE privilege on destination schema.
- Reassign ownership: Current sequence owner.

### Examples

See Altering Sequences in the Administrator's Guide.

### See Also

CREATE SEQUENCE

### ALTER SESSION

Use ALTER SESSION to set and clear session-level configuration parameter values for the current session.

#### Syntax

```
ALTER SESSION {
  SET [PARAMETER] \textit{parameter-name}=\textit{value} [,..]
  | CLEAR [PARAMETER] \textit{parameter-name}[..]
  | SET UDPARAMETER [ FOR \{ namespace | libname \} ] \textit{key}=\textit{value} [,..]
  | CLEAR UDPARAMETER [ FOR \{ namespace | libname \} ] \textit{key} [,..]
}
```
### Parameters

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SET [PARAMETER]</strong></td>
<td>Sets one or more configuration parameters to the specified value.</td>
</tr>
<tr>
<td><strong>CLEAR [PARAMETER]</strong></td>
<td>Clears one or more specified configuration parameters.</td>
</tr>
</tbody>
</table>
| **SET UDPARAMETER**   | Sets a user-defined session parameter, can be used in combination with a UDx. If omit a name space, Vertica uses the PUBLIC name space.  
  Key size values:  
  - Set from client side: 128 characters  
  - Set from UDx side: Unlimited |
| **CLEAR UDPARAMETER** | Clears one or more user-defined session parameters.                         |

### Privileges

None

### Examples

Set and clear a parameter

- Force all UDxes that support fenced mode to run in fenced mode, even if their definition specified is NOT FENCED:

  ```sql
  => ALTER SESSION SET ForceUDxFencedMode = 1;
  ```

- Clear `ForceUDxFencedMode` at the session level. The value now reflects the default value (0).

  ```sql
  => ALTER SESSION CLEAR ForceUDxFencedMode;
  ```
Set and clear a user-defined parameter

- Set the value of RowCount, in the MyLibrary library and PUBLIC namespace, to 25.
  
  => ALTER SESSION SET UDPARAMETER FOR MyLibrary RowCount = 25;

- Clear RowCount at the session level. The value now reflects the default value (0).
  
  => ALTER SESSION CLEAR UDPARAMETER FOR MyLibrary RowCount;

See Also

SESSION_PARAMETERS

**ALTER SUBNET**

Renames an existing subnet.

**Syntax**

```
ALTER SUBNET subnet-name RENAME TO new-subnet-name
```

**Parameters**

<table>
<thead>
<tr>
<th><strong>subnet-name</strong></th>
<th>The name of the existing subnet.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>new-subnet-name</strong></td>
<td>The new name for the subnet.</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser
Examples

=> ALTER SUBNET mysubnet RENAME TO myNewSubnet;

**ALTER TABLE**

Modifies the metadata of an existing table. The changes are auto-committed.

**General Usage**

```
ALTER TABLE [[database.]schema.]table {
  ...
  ADD COLUMN column data-type
    [ column-constraint ]
    [ ENCODING encoding-type ]
    [ RESTRICT | CASCADE ]
    [ PROJECTIONS (projection [,..]) ]
  ...
  | { ADD table-constraint }[,..]
  ...
  | { ALTER COLUMN column column-setting }[,..]
  ...
  | { ALTER CONSTRAINT constraint-name [ ENABLED | DISABLED ] }[,..]
  ...
  | { DROP CONSTRAINT constraint-name [ CASCADE | RESTRICT ] }[,..]
  ...
  | DROP [ COLUMN ] column [ CASCADE | RESTRICT ]
  ...
  | FORCE OUTER integer
  ...
  | { INCLUDE | EXCLUDE | MATERIALIZE } [ SCHEMA ] PRIVILEGES
  ...
  | OWNER TO owner
  ...
  | partition-clause [ REORGANIZE ]
  ...
  | REMOVE PARTITIONING
  ...
  | RENAME [ COLUMN ] name TO new-name
  ...
  | REORGANIZE
  ...
  | SET ACTIVEPARTITIONCOUNT expression
  ...
  | SET SCHEMA schema
  ...
  | SET STORAGE load-option
}
```

**Note:** Several **ALTER TABLE** clauses cannot be specified with other clauses in the same statement (see Exclusive **ALTER TABLE** Clauses below). Otherwise, **ALTER TABLE** supports multiple comma-delimited clauses. For example, the following **ALTER TABLE** statement changes table my-table in two ways: reassigns ownership to user Joe, and sets constraint UNIQUE on column b:

```
ALTER TABLE my-table OWNER TO Joe, ADD CONSTRAINT unique_b UNIQUE (b) ENABLED;
```

**Table Renaming**

```
ALTER TABLE [[database.]schema.]table[,] RENAME TO new-table-name[,..]
```
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>table</code></td>
<td>The table to alter.</td>
</tr>
<tr>
<td><code>ADD COLUMN</code></td>
<td>Adds a column to the table and to its superprojections: `ADD COLUMN column-name datatype [column-constraint] [ENCODING encoding-type] [RESTRICT</td>
</tr>
</tbody>
</table>

You can qualify the new column definition with one of these options:

- `column-constraint` specifies a column constraint as follows:
  ```sql
  [CONSTRAINT constraint-name] {
  { (NULL | NOT NULL) | DEFAULT expression }  
  ```

- ENCODING specifies the column's encoding type, by default set to AUTO.

- RESTRICT (default) adds the new column to pre-join projections only if they are anchored to the updated table. CASCADE updates all pre-join projections where the table is specified, regardless of whether they are anchored to it.

- PROJECTIONS specifies to add the new column to one or more projections, where `projection` is the projection base name and is not a superprojection. Vertica adds the column to all buddies of each projection.
<table>
<thead>
<tr>
<th>ADD <code>table-constraint</code></th>
<th>Adds a constraint to a table that does not have any associated projections. See Constraints in the Administrator's Guide.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER COLUMN</td>
<td>Alters a setting for <code>column</code>:</td>
</tr>
</tbody>
</table>
|                        | ```sql
ALTER COLUMN column column-setting
``` |
| `column-setting`       | can be one of the following:                                                                   |
|                        | • SET DEFAULT `expression` sets column values to the specified expression.                     |
|                        | ![Note](VerticaDocumentation_SQLReferenceManual.png) Altering an existing table column to specify a DEFAULT expression has no effect on existing values in that column. Vertica applies the DEFAULT expression only on new rows when they are added to the table, through load operations such as INSERT and COPY. To refresh the entire column with its DEFAULT expression, update the column as follows: |
|                        | ```sql
UPDATE table-name SET column-name=DEFAULT;
``` |
<p>|                        | • DROP DEFAULT drops the DEFAULT setting.                                                      |
|                        | • SET USING <code>expression</code> specifies to set this column's values from the result set returned by <code>expression</code>. When you make this change, Vertica automatically calls the function <code>REFRESH_COLUMNS</code>, which populates the column from the result set returned by <code>expression</code>. Thereafter, the column contents are refreshed only on explicit calls to <code>REFRESH_COLUMNS</code>. |
|                        | • DROP SET USING drops the SET USING setting.                                                   |
|                        | • SET DEFAULT USING <code>expression</code> combines SET DEFAULT and SET USING clauses, setting both to the same expression. The DDL for the column specifies both clauses. |
|                        | • DROP DEFAULT USING drops the column's                                                        |</p>
<table>
<thead>
<tr>
<th>SQL Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SET NOT NULL</td>
<td>Disallows inserting null values in the column.</td>
</tr>
<tr>
<td>DROP NOT NULL</td>
<td>Allows null values in the column.</td>
</tr>
<tr>
<td>SET DATA TYPE datatype</td>
<td>Resets the column data type, if Vertica supports the change. See Changing a Column Data Type in the Administrator's Guide. No restrictions apply to changing data types of external tables.</td>
</tr>
</tbody>
</table>

**ALTER CONSTRAINT**

Specifies whether to enforce primary key, unique key, and check constraints:

```sql
ALTER CONSTRAINT constraint-name {ENABLED | DISABLED}
```

See Constraint Enforcement in the Administrator's Guide.

**DROP CONSTRAINT**

Drops the specified table constraint from the table:

```sql
DROP CONSTRAINT constraint-name [CASCADE | RESTRICT]
```

You can qualify DROP CONSTRAINT with one of these options:

- **CASCADE**: Drops a constraint and all dependencies in other tables.
- **RESTRICT**: Does not drop a constraint if there are dependent objects. Same as the default behavior.

Dropping a table constraint has no effect on views that reference the table.

**DROP [COLUMN]**

Drops the specified column from the table and that column's ROS containers:

```sql
DROP [COLUMN] column [CASCADE | RESTRICT]
```

You can qualify DROP COLUMN with one of these options:

- **CASCADE** is required if the table column to drop has dependencies.
| RESTRICT drops the column only from the given table. See [Dropping Table Columns](#) in the Administrator's Guide.

| FORCE OUTER `integer` | Specifies whether a table is joined to another as an inner or outer input. For details, see [Controlling Join Inputs](#) in Analyzing Data.

| `{ INCLUDE | EXCLUDE | MATERIALIZE } [SCHEMA] PRIVILEGES` | Specifies default inheritance of schema privileges for this table:

- **EXCLUDE [SCHEMA] PRIVILEGES** (default) disables inheritance of privileges from the schema.
- **INCLUDE [SCHEMA] PRIVILEGES** grants the table the same privileges granted to its schema.
- **MATERIALIZE**: Copies grants to the table and creates a GRANT object on the table. This disables the inherited privileges flag on the table, so you can:
  - Grant more specific privileges at the table level
  - Use schema-level privileges as a template
  - Move the table to a different schema
  - Change schema privileges without affecting the table

  **Note:** If inherited privileges are disabled at the database level, schema privileges can still be materialized.

  See also [Setting Privileges Inheritance on Tables and Views](#) in the Administrator's Guide.

| OWNER TO `owner` | Changes the table owner. See [Changing Table Ownership](#) in the Administrator's Guide.

| `partition-clause [REORGANIZE]` | Invalid for external tables, logically divides table data storage through a `PARTITION BY` clause:

  `PARTITION BY partition-expression`
For details, see [Partition Clause](#).

If you qualify the partition clause with REORGANIZE and the table previously specified no partitioning, the Vertica Tuple Mover immediately implements the partition clause. If the table previously specified partitioning, the Tuple Mover evaluates ROS storage containers and reorganizes them as needed to conform with the new partition clause.

### REMOVE PARTITIONING

Specifies to remove partitioning from a table definition. The Tuple Mover subsequently removes existing partitions from ROS containers.

### RENAME [COLUMN]

Renames the specified column within the table. See [Renaming Columns](#) in the Administrator's Guide.

### REORGANIZE

Valid only for partitioned tables, invokes the Tuple Mover to reorganize ROS storage containers as needed to conform with the table's current partition clause. ALTER TABLE...REORGANIZE and Vertica meta-function `PARTITION_TABLE` operate identically.

REORGANIZE can also qualify a new partition clause.

### SET ACTIVEPARTITIONCOUNT `expression`

Valid only for partitioned tables, specifies how many partitions are active for this table, where `expression` is one of the following:

- **Unsigned integer**: Supersedes configuration parameter `ActivePartitionCount`.
- **DEFAULT**: Removes the table-level active partition count. The table obtains its active partition count from configuration parameter `ActivePartitionCount`.

For details on usage, see [Active and Inactive Partitions](#) in the Administrator's Guide.

### SET SCHEMA

Moves the table from one schema to another. Vertica automatically moves all projections that are anchored to
the source table to the destination schema. It also moves all IDENTIFY and AUTO_INCREMENT columns to the destination schema. For details, see Moving Tables to Another Schema in the Administrator's Guide.

<table>
<thead>
<tr>
<th>SET STORAGE Load-method</th>
<th>Specifies default load behavior for all DML operations on this table, such as INSERT and COPY, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• AUTO (default): Initially loads data into WOS, suitable for smaller bulk loads.</td>
</tr>
<tr>
<td></td>
<td>• DIRECT: Loads data directly into ROS containers, suitable for large (&gt;100 MB) bulk loads.</td>
</tr>
<tr>
<td></td>
<td>• TRICKLE: Loads data only into WOS, suitable for frequent incremental loads.</td>
</tr>
<tr>
<td></td>
<td>For details, see Choosing a Load Method in the Administrator's Guide.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>RENAME TO</th>
<th>Renames one or more tables:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RENAME TO new-table-name[,...]</td>
</tr>
</tbody>
</table>

The following requirements apply:

• The new table name conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.

• If you specify multiple tables to rename, the source and target lists must have the same number of names.

Privileges

Non-superusers must own the table they wish to change. They must also have USAGE privileges on the table schema for the following changes:

• Add, drop, rename, or alter columns.

• Add or drop constraints.
• Partition or repartition the table.

• Rename the table

To move a table to another schema, non-superusers must have USAGE privilege on the current schema and CREATE privilege on the destination schema.

Exclusive ALTER TABLE Clauses

The following ALTER TABLE clauses cannot be combined with another ALTER TABLE clause:

• ADD COLUMN

• DROP COLUMN

• RENAME COLUMN

• SET SCHEMA

• RENAME [TO]

Restrictions

You cannot modify the metadata of anchor table columns that are included in live aggregate or Top-K projections. You also cannot drop these columns. To make these changes, you must first drop all live aggregate and Top-K projections that are associated with it.

External Table Restrictions

Not all ALTER TABLE options pertain to external tables. For instance, you cannot add a column to an external table, but you can rename the table:

```sql
=> ALTER TABLE mytable RENAME TO mytable2;
ALTER TABLE
```

Locked Tables

If the operation cannot obtain an O lock on the target table, Vertica tries to close any internal Tuple Mover sessions that are running on that table. If successful, the operation can proceed.
Explicit Tuple Mover operations that are running in user sessions do not close. If an explicit Tuple Mover operation is running on the table, the operation proceeds only when the operation is complete.

See Also

- Working with Vertica-Managed Tables
- Altering Table Definitions
- Adding Table Columns

Table-Constraint

Adds a constraint to table metadata. You can specify table constraints with `CREATE TABLE`, or add a constraint to an existing table with `ALTER TABLE`. For details, see Setting Constraints in the Administrator's Guide.

Note: Adding a constraint to a table that is referenced in a view does not affect the view.

Syntax

```
[ CONSTRAINT constraint-name ]
{
  ... PRIMARY KEY (column[, ... ]) [ ENABLED | DISABLED ]
  ... | FOREIGN KEY (column[, ... ]) REFERENCES table [(column[, ...])] ]
  ... | UNIQUE (column[, ...]) [ ENABLED | DISABLED ]
  ... | CHECK (expression) [ ENABLED | DISABLED ]
}
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>constraint-name</code></td>
<td>Assigns a name to the constraint. Vertica recommends that you name all constraints.</td>
</tr>
<tr>
<td>PRIMARY KEY</td>
<td>Defines one or more NOT NULL columns as the primary key as follows:</td>
</tr>
<tr>
<td></td>
<td>PRIMARY KEY (column[, ...]) [ ENABLED</td>
</tr>
<tr>
<td></td>
<td>You can qualify this constraint with the keyword ENABLED or</td>
</tr>
</tbody>
</table>
DISABLED. See Enforcing Constraints below.

If you do not name a primary key constraint, Vertica assigns the name C_PRIMARY.

**FOREIGN KEY**

Adds a referential integrity constraint defining one or more columns as foreign keys as follows:

```
FOREIGN KEY (column[, ... ]) REFERENCES table [(column[, ... ])]
```

If you omit column references, if you omit column, Vertica references the primary key in table.

If you do not name a foreign key constraint, Vertica assigns the name C_FOREIGN.

**UNIQUE**

Specifies that the data in a column or group of columns is unique with respect to all table rows, as follows:

```
UNIQUE (column[, ...]) [ENABLED | DISABLED]
```

You can qualify this constraint with the keyword ENABLED or DISABLED. See Enforcing Constraints below.

If you do not name a unique constraint, Vertica assigns the name C_UNIQUE.

**CHECK**

Specifies a check condition as an expression that returns a Boolean value, as follows:

```
CHECK (expression) [ENABLED | DISABLED]
```

You can qualify this constraint with the keyword ENABLED or DISABLED. See Enforcing Constraints below.

If you do not name a check constraint, Vertica assigns the name C_CHECK.

### Privileges

Table owner or user WITH GRANT OPTION is grantor.
- REFERENCES privilege on table to create foreign key constraints that reference this table
- USAGE privilege on schema that contains the table

Enforcing Constraints

A table can specify whether Vertica automatically enforces a primary key, unique key or check constraint with the keyword ENABLED or DISABLED. If you omit ENABLED or DISABLED, Vertica determines whether to enable the constraint automatically by checking the appropriate configuration parameter:

- EnableNewPrimaryKeysByDefault
- EnableNewUniqueKeysByDefault
- EnableNewCheckConstraintsByDefault

For details, see Constraint Enforcement.

Examples

The following example creates a table (t01) with a primary key constraint.

```sql
CREATE TABLE t01 (id int CONSTRAINT sampleconstraint PRIMARY KEY);
```

This example creates the same table without the constraint, and then adds the constraint with ALTER TABLE ADD CONSTRAINT

```sql
CREATE TABLE t01 (id int);
ALTER TABLE t01 ADD CONSTRAINT sampleconstraint PRIMARY KEY(id);
WARNING 2623: Column "id" definition changed to NOT NULL
```

The following example creates a table (addapk) with two columns, adds a third column to the table, and then adds a primary key constraint on the third column.

```sql
=> CREATE TABLE addapk (col1 INT, col2 INT);
=> ALTER TABLE addapk ADD COLUMN col3 INT;
```
Using the sample table `addapk`, check that the primary key constraint is enabled (is_enabled is t).

```sql
=> SELECT constraint_name, column_name, constraint_type, is_enabled FROM PRIMARY_KEYS WHERE table_name IN ('addapk');

<table>
<thead>
<tr>
<th>constraint_name</th>
<th>column_name</th>
<th>constraint_type</th>
<th>is_enabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>col3constraint</td>
<td>col3</td>
<td>p</td>
<td>t</td>
</tr>
</tbody>
</table>

(1 row)
```

This example disables the constraint using `ALTER TABLE` `ALTER CONSTRAINT`.

```sql
=> ALTER TABLE addapk ALTER CONSTRAINT col3constraint DISABLED;
```

Check that the primary key is now disabled (is_enabled is f).

```sql
=> SELECT constraint_name, column_name, constraint_type, is_enabled FROM PRIMARY_KEYS WHERE table_name IN ('addapk');

<table>
<thead>
<tr>
<th>constraint_name</th>
<th>column_name</th>
<th>constraint_type</th>
<th>is_enabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>col3constraint</td>
<td>col3</td>
<td>p</td>
<td>f</td>
</tr>
</tbody>
</table>

(1 row)
```

For a general discussion of constraints, see `Constraints`. For additional examples of creating and naming constraints, see `Naming Constraints`.

---

**ALTER USER**

Changes a database user account. Changes that you make to a user account affect only future user sessions.

**Important:** The following `ALTER USER` parameters are invalid for a user who is added to the Vertica database with the LDAPLink service:

- IDENTIFIED BY
- PROFILE
- SECURITY ALGORITHM
Syntax

ALTER USER name user-parameter setting[, ...]

user-parameter

ACCOUNT
DEFAULT ROLE*
GRACEPERIOD
IDENTIFIED BY
IDLESESSIONTIMEOUT
MAXCONNECTIONS
MEMORYCAP
PASSWORD EXPIRE
PROFILE
RENAME TO*
RESOURCE POOL
RUNTIMECAP
SEARCH_PATH
SECURITY_ALGORITHM
TEMPSPACECAP

* Cannot be used in combination with other parameters

Parameters

| name | Specifies the name of the new user. Names that contain special characters must be double-quoted. To enforce case-sensitivity, use double-quotes. For details on name requirements, see Creating a Database Name and Password. |
| ACCOUNT | Locks or unlocks a user's access to the database: |
| { LOCK | UNLOCK } | - UNLOCK (default) |
| | - LOCK prevents a new user from logging in. This can be useful when creating an account for a user who does not need immediate access. |
| Tip: To automate account locking, set a maximum number of failed login attempts with CREATE PROFILE. |
| DEFAULT ROLE roles-expression | Specifies what roles are the default roles for this user, with one of the following expressions: |
- **NONE** (default): Removes all default roles.

- **role[,...]**: A comma-delimited list of roles.

- **ALL**: Sets as default all user roles.

- **ALL EXCEPT role[,...]**: A comma-delimited list of roles to exclude as default roles.

Default roles are automatically activated when a user logs in. The roles specified by this parameter supersede any roles assigned earlier.

**Note:** **DEFAULT ROLE** cannot be specified in combination with other **ALTER USER** parameters.

<table>
<thead>
<tr>
<th><strong>GRACEPERIOD limit</strong></th>
<th>Specifies how long a user query can block on any session socket, where <strong>limit</strong> is one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- <strong>NONE</strong> (default): Removes any grace period previously set on session queries.</td>
</tr>
<tr>
<td></td>
<td>- <code>'interval'</code>: Specifies as an <strong>interval</strong> the maximum grace period for current session queries, up to 20 days.</td>
</tr>
</tbody>
</table>

For details, see **Handling Session Socket Blocking**.

| **IDENTIFIED BY '[[new-password]'] [REPLACE 'current-password']** | Sets a new password for the user, where **new-password** must conform to the password complexity policy set by the user's profile. Superusers can change the password for any user, and are not required to specify the REPLACE clause. Non-superusers can only change their own password, and must supply their current password with the REPLACE clause. If you supply an empty string, the user's current password is removed, and the user is no longer prompted for a password when starting a new session. For details, see **Password Guidelines** and **Creating a Database Name and Password**. |

| **IDLESESSIONTIMEOUT limit** | The length of time the system waits before disconnecting an idle session, where **limit** is one of the following: |
### MAXCONNECTIONS

**limit**

Specifies the maximum number of connections the user can have to the server, where *limit* is one of the following:

- NONE (default): No limit. If you omit this parameter, the user can have an unlimited number of connections across the database cluster.

- *integer* ON DATABASE: Sets to *integer* the maximum number of connections across the database cluster.

- *integer* ON NODE: Sets to *integer* the maximum number of connections to each node.

For details, see [Managing Client Connections](#) .

---

### MEMORYCAP

**limit**

Specifies how much memory can be allocated to user requests, where *limit* is specified in this format:

- NONE (default): No limit

- *'max-expression'*: A string value that specifies the memory limit, one of the following:
  
  - *int%* — Expresses the maximum as a percentage of total memory available to the Resource Manager, where *int* is an integer value between 0 and 100. For example:

    ```
    MEMORYCAP '40%'
    ```

  - *int{K|M|G|T}* — Expresses memory allocation in kilobytes, megabytes, gigabytes, or terabytes. For example:

    ```
    MEMORYCAP '10G'
    ```

---

### PASSWORD EXPIRE

Forces immediate expiration of the user's password. The user must change the password on the next login.
**Note:** PASSWORD EXPIRE has no effect when using external password authentication methods such as LDAP or Kerberos.

### PROFILE profile
Assigns a profile that controls password requirements for this user, where *profile* is one of the following:

- **DEFAULT** (default): Assigns the default database profile to this user.
- **profile-name**: A profile that is defined by `CREATE PROFILE`.

### RENAME TO new-user-name
Assigns the user a new user name. All privileges assigned to the user remain unchanged.

**Note:** RENAME TO cannot be specified in combination with other `ALTER USER` parameters.

### RESOURCE POOL pool-name
Assigns a default resource pool to this user. The user must also be granted privileges to this pool, unless privileges to the pool are set to PUBLIC.

### RUNTIMECAP limit
Specifies how long this user's queries can execute, where *limit* is one of the following:

- **NONE** (default): No limit set for this user. If you omit this parameter, no limit is set for this user.
- **'interval'**: An interval value, up to one year.

A query's runtime limit can be set at three levels: the user's runtime limit, the user's resource pool, and the session setting. For more information, see Setting a Runtime Limit for Queries in the Administrator's Guide.

### SEARCH_PATH path
Specifies the user's default search path that tells Vertica which schemas to search for unqualified references to tables and UDFs, where *path* is one of the following:

- **DEFAULT** (default): Sets the search path as follows:
  
  "$user", public, v_catalog, v_monitor, v_internal

- A comma-delimited list of schemas.
For details, see Setting Search Paths in the Administrator's Guide.

| SECURITY_ALGORITHM 'algorithm' | Set the user-level security algorithm for hash authentication, where *algorithm* is one of the following:
|                               | - NONE (default): Uses the MD5 algorithm for hash authentication.
|                               | - MD5
|                               | - SHA512
|                               | The user's password expires when you change the SECURITY_ALGORITHM value, and must be reset.

| TEMPSPACECAP limit            | Limits how much temporary file storage is available for user requests, where *limit* is one of the following:
|                               | - NONE (default): No limit
|                               | - 'max-expression': A string value that specifies the storage limit, one of the following:
|                               |   - *int%* — Expresses storage as a percentage of total file space available, where *int* is an integer value between 0 and 100. For example:
|                               |     TEMPSPACECAP '40%'
|                               |   - *int{K|M|G|T}* — Expresses memory allocation in kilobytes, megabytes, gigabytes, or terabytes. For example:
|                               |     TEMPSPACECAP '10G'

### Privileges
- Superuser
- Non-superusers can change their own user accounts with these options:
- IDENTIFIED BY
- RESOURCE POOL
- SEARCH_PATH
- SECURITY_ALGORITHM

Examples

Change the user password

```sql
=> CREATE USER user1;
=> ALTER USER user1 IDENTIFIED BY 'newpassword';
```

Change the security algorithm and password

This example changes the user's hash authentication and password to SHA-512 and `newpassword`, respectively. When you execute the ALTER USER statement, Vertica hashes the password, using the SHA-512 algorithm, and saves the hashed version:

```sql
=> CREATE USER user1;
=> ALTER USER user1 SECURITY_ALGORITHM 'SHA512' IDENTIFIED BY 'newpassword'
```

Assign user default roles

This example makes a user's assigned roles the user's default roles. The first ALTER USER statement makes `role1` the default role. The second ALTER USER statement makes `role1`, `role2`, and `role3` the user's default roles.

```sql
=> CREATE USER user1;
CREATE USER
=> GRANT role1, role2, role3 to user1;
=> ALTER USER user1 default role role1;
=> ALTER USER user1 default role ALL;
```

Assign user default roles with EXCEPT

This example makes all the user's assigned roles default roles with the exception of `role1`.

```sql
=> GRANT role1, role2, role3 to user1;
=> ALTER USER user1 default role ALL EXCEPT r1;
```
See Also

- **CREATE USER**
- **DROP USER**

**ALTER VIEW**

Modifies the metadata of an existing view. The changes are auto-committed.

**Syntax**

**General Usage**

```
ALTER VIEW [[database.]schema.]view {
    ...
    | OWNER TO owner
    ...
    | SET SCHEMA schema
    ...
    | { INCLUDE | EXCLUDE | MATERIALIZE } [ SCHEMA ] PRIVILEGES
```

**View Renaming**

```
ALTER VIEW [[database.]schema.]view[,..] RENAME TO new-view-name[,..]
```

**Parameters**

<table>
<thead>
<tr>
<th><code>[database.]schema</code></th>
<th>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td>view</td>
<td>The view to alter.</td>
</tr>
<tr>
<td>SET SCHEMA <code>schema</code></td>
<td>Moves the view from one schema to another.</td>
</tr>
<tr>
<td>OWNER TO <code>owner</code></td>
<td>Changes the view owner.</td>
</tr>
<tr>
<td><code>{ INCLUDE</code></td>
<td>Specifies default inheritance of schema privileges for this view:</td>
</tr>
<tr>
<td></td>
<td>`EXCLUDE</td>
</tr>
</tbody>
</table>

If you specify a database, it must be the current database.
### EXCLUDE [SCHEMA] PRIVILEGES

- **EXCLUDE [SCHEMA] PRIVILEGES** (default) disables inheritance of privileges from the schema.
- **INCLUDE [SCHEMA] PRIVILEGES** grants the view the same privileges granted to its schema.
- **MATERIALIZE**: Copies grants to the view and creates a GRANT object on the view. This disables the inherited privileges flag on the view, so you can:
  - Grant more specific privileges at the view level
  - Use schema-level privileges as a template
  - Move the view to a different schema
  - Change schema privileges without affecting the view

**Note:** If inherited privileges are disabled at the database level, schema privileges can still be materialized.

See also Setting Privileges Inheritance on Tables and Views in the Administrator's Guide.

### RENAME TO

Renames one or more views:

```
RENAME TO new-view-name[,..]
```

The following requirements apply:

- The new view name conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
- If you specify multiple views to rename, the source and target lists must have the same number of names.
- Renaming a view requires USAGE and CREATE privileges on the schema that contains the view.
Privileges

Changing a view requires the following privileges:

- Superuser
- If renaming a view, CREATE privileges on the schema in which the view is renamed.

Example

The following command renames view1 to view2:

```
=> CREATE VIEW view1 AS SELECT * FROM t;
CREATE VIEW
=> ALTER VIEW view1 RENAME TO view2;
ALTER VIEW
```

BEGIN

Starts a transaction block. BEGIN is a synonym for `START TRANSACTION`.

Syntax

```
BEGIN [ WORK | TRANSACTION ] [ isolation-level ] [ transaction-mode]

and where transaction_mode is one of:

READ { ONLY | WRITE }
```

Parameters

<table>
<thead>
<tr>
<th>WORK</th>
<th>TRANSACTION</th>
<th>Optional keywords for readability purposes only.</th>
</tr>
</thead>
<tbody>
<tr>
<td>isolation-level</td>
<td>Specifies the transaction’s isolation level, which determines what data the transaction can access when other transactions are running concurrently. You can set <code>isolation-level</code> to one of the following:</td>
<td></td>
</tr>
</tbody>
</table>
• **READ COMMITTED** (default)

• **SERIALIZABLE**

• **REPEATABLE READ** (automatically converted to **SERIALIZABLE**)

• **READ UNCOMMITTED** (automatically converted to **READ COMMITTED**)

For detailed information, see *Transactions* in Vertica Concepts.

### transaction-mode

**READ { ONLY | WRITE }**

Transaction mode can be one of the following:

• **READ WRITE**—(default) The transaction is read/write.

• **READ ONLY**—The transaction is read-only.

Setting the transaction session mode to read-only disallows the following SQL commands, but does not prevent all disk write operations:

• INSERT, UPDATE, DELETE, and COPY if the table they would write to is not a temporary table

• All CREATE, ALTER, and DROP commands

• GRANT, REVOKE, and EXPLAIN if the command it would run is among those listed.

### Privileges

None

### Examples

This example shows how to begin a transaction and set the isolation level.
CREATE TABLE sample_table (a INT);
CREATE TABLE
=>
INSERT INTO sample_table (a) VALUES (1);
OUTPUT
--------
1
(1 row)

COMMENT ON Statements

The following functions allow you to create comments associated with Vertica database objects:

- COMMENT ON COLUMN
- COMMENT ON CONSTRAINT
- COMMENT ON FUNCTION
- COMMENT ON LIBRARY
- COMMENT ON NODE
- COMMENT ON PROJECTION
- COMMENT ON SCHEMA
- COMMENT ON SEQUENCE
- COMMENT ON TABLE
- COMMENT ON TRANSFORM FUNCTION
- COMMENT ON VIEW

COMMENT ON COLUMN

Adds, revises, or removes a projection column comment. You can only add comments to projection columns, not to table columns. Each object can have one comment. Comments are stored in the system table COMMENTS.

Syntax

```
COMMENT ON COLUMN ["database."]schema."]projection.column IS {'comment' | NULL}
```
Parameters

| [database.]schema | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:  
| myschema.thisDbObject |
| If you specify a database, it must be the current database. |
| projection.column | The name of the projection and column with which to associate the comment. |
| comment | Specifies the comment text to add. If a comment already exists for this column, this comment overwrites the previous comment.  
Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.  
You can enclose a blank value within single quotes to remove an existing comment. |
| NULL | Removes an existing comment. |

Privileges

- Superuser: View and add comments to all objects.
- Object owner: Add or edit comments for the object.
- User: VIEW privileges on an object to view its comments.

Example

The following example adds a comment to the customer_name column in the customer_dimension projection:

```sql
=> COMMENT ON COLUMN customer_dimension_vmart_node01.customer_name IS 'Last name only';
```
The following examples remove a comment from the `customer_name` column in the `customer_dimension` projection in two ways, using the NULL option, or specifying a blank string:

```sql
=> COMMENT ON COLUMN customer_dimension_vmart_node01.customer_name IS NULL;
=> COMMENT ON COLUMN customer_dimension_vmart_node01.customer_name IS '';
```

**COMMENT ON CONSTRAINT**

Adds, revises, or removes a comment on a constraint. Each object can have one comment. Comments are stored in the system table `COMMENTS`.

**Syntax**

```sql
COMMENT ON CONSTRAINT constraint ON [[database.]schema.]table IS ... {'comment' | NULL};
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>constraint</code></td>
<td>The name of the constraint associated with the comment.</td>
</tr>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td><code>table</code></td>
<td>The name of the table constraint with which to associate a comment.</td>
</tr>
<tr>
<td><code>comment</code></td>
<td>Specifies the comment text to add. If a comment already exists for this constraint, this comment overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message. You can enclose a blank value within single quotes to remove an existing comment.</td>
</tr>
<tr>
<td><code>NULL</code></td>
<td>Removes an existing comment.</td>
</tr>
</tbody>
</table>
Privileges

- Superuser: View and add comments to all objects.
- Object owner: Add or edit comments for the object.
- User: VIEW privileges on an object to view its comments.

Example

The following example adds a comment to the `constraint_x` constraint on the promotion_dimension table:

```sql
=> COMMENT ON CONSTRAINT constraint_x ON promotion_dimension IS 'Primary key';
```

The following examples remove a comment from the `constraint_x` constraint on the promotion_dimension table:

```sql
=> COMMENT ON CONSTRAINT constraint_x ON promotion_dimension IS NULL;
=> COMMENT ON CONSTRAINT constraint_x ON promotion_dimension IS '';
```

COMMENT ON FUNCTION

Adds, revises, or removes a comment on a function. Each object can have one comment. Comments are stored in the system table `COMMENTS`.

Syntax

```sql
COMMENT ON FUNCTION [[database.]schema.]function (function-args) IS { 'comment' | NULL };
```

Parameters

<table>
<thead>
<tr>
<th><code>[database.]schema</code></th>
<th>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
</table>
If you specify a database, it must be the current database.

<table>
<thead>
<tr>
<th>function</th>
<th>The name of the function with which to associate the comment.</th>
</tr>
</thead>
<tbody>
<tr>
<td>function-args</td>
<td>The function arguments.</td>
</tr>
<tr>
<td>comment</td>
<td>Specifies the comment text to add. If a comment already exists for this function, this overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message. Enclose a blank value within single quotes to remove an existing comment.</td>
</tr>
<tr>
<td>NULL</td>
<td>Removes an existing comment.</td>
</tr>
</tbody>
</table>

**Privileges**

- Superuser: View and add comments to all objects.
- Object owner: Add or edit comments for the object.
- User: VIEW privileges on an object to view its comments.

**Examples**

The following example adds a comment to the `macros.zerowhennull (x INT)` function:

```sql
=> COMMENT ON FUNCTION macros.zerowhennull(x INT) IS 'Returns a 0 if not NULL';
```

The following examples remove a comment from the `macros.zerowhennull (x INT)` function in two ways by using the NULL option, or specifying a blank string:

```sql
=> COMMENT ON FUNCTION macros.zerowhennull(x INT) IS NULL;
=> COMMENT ON FUNCTION macros.zerowhennull(x INT) IS '';
```

**COMMENT ON LIBRARY**

Adds, revises, or removes a comment on a library. Each object can have one comment. Comments are stored in the system table `COMMENTS`. 
**Syntax**

```
COMMENT ON LIBRARY [[database.]schema.]library IS {'comment' | NULL}
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>database.</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td><code>library</code></td>
<td>The name of the library associated with the comment.</td>
</tr>
<tr>
<td><code>comment</code></td>
<td>Specifies the comment text to add. If a comment already exists for this library, this comment overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message. Enclose a blank value within single quotes to remove an existing comment.</td>
</tr>
<tr>
<td><code>NULL</code></td>
<td>Removes an existing comment.</td>
</tr>
</tbody>
</table>

**Privileges**

- **Superuser**: View and add comments to all objects.
- **Object owner**: Add or edit comments for the object.
- **User**: VIEW privileges on an object to view its comments.

**Examples**

The following example adds a comment to the library `MyFunctions`:
COMMENT ON LIBRARY MyFunctions IS 'In development';

The following examples remove a comment from the library MyFunctions:

=> COMMENT ON LIBRARY MyFunctions IS NULL;
=> COMMENT ON LIBRARY MyFunctions IS '';

See Also

- COMMENTS

COMMENT ON NODE

Adds, revises, or removes a comment on a node. Each object can have one comment. Comments are stored in the system table COMMENTS.

Dropping an object drops all comments associated with the object.

Syntax

COMMENT ON NODE node-name IS { 'comment' | NULL }

Parameters

<table>
<thead>
<tr>
<th>node-name</th>
<th>The name of the node associated with the comment.</th>
</tr>
</thead>
<tbody>
<tr>
<td>comment</td>
<td>Specifies the comment text to add. If a comment already exists for this node, this comment overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message. Enclose a blank value within single quotes to remove an existing comment.</td>
</tr>
<tr>
<td>NULL</td>
<td>Removes an existing comment.</td>
</tr>
</tbody>
</table>
Privileges

- Superuser: View and add comments to all objects.
- Object owner: Add or edit comments for the object.
- User: VIEW privileges on an object to view its comments.

Examples

The following example adds a comment for the initiator node:

```sql
=> COMMENT ON NODE initiator IS 'Initiator node';
```

The following examples removes a comment from the initiator node.

```sql
=> COMMENT ON NODE initiator IS NULL;
=> COMMENT ON NODE initiator IS '';
```

See Also

- `COMMENTS`

COMMENT ON PROJECTION

Adds, revises, or removes a comment on a projection. Each object can have one comment. Comments are stored in the system table `COMMENTS`.

Dropping an object drops all comments associated with the object.

Syntax

```
COMMENT ON PROJECTION [[database.]schema.]projection IS { 'comment' | NULL }
```

Parameters

```
| [ ] | Specifies a schema, by default public. If schema is any schema |
```
### database.]schema

other than public, you must supply the schema name. For example:

```sql
myschema.thisDbObject
```

If you specify a database, it must be the current database.

<table>
<thead>
<tr>
<th><strong>projection</strong></th>
<th>The name of the projection associated with the comment.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>comment</strong></td>
<td>Specifies the text of the comment to add. If a comment already exists for this projection, the comment you enter here overwrites the previous comment. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message. Enclose a blank value within single quotes to remove an existing comment.</td>
</tr>
<tr>
<td><strong>NULL</strong></td>
<td>Removes an existing comment.</td>
</tr>
</tbody>
</table>

#### Privileges

- Superuser: View and add comments to all objects.
- Object owner: Add or edit comments for the object.
- User: VIEW privileges on an object to view its comments.

#### Examples

The following example adds a comment to the `customer_dimension_vmart_node01` projection:

```sql
=> COMMENT ON PROJECTION customer_dimension_vmart_node01 IS 'Test data';
```

The following examples remove a comment from the `customer_dimension_vmart_node01` projection:

```sql
=> COMMENT ON PROJECTION customer_dimension_vmart_node01 IS NULL;
=> COMMENT ON PROJECTION customer_dimension_vmart_node01 IS '';
```
See Also

COMMENTS

COMMENT ON SCHEMA

Adds, revises, or removes a comment on a schema. Each object can have one comment. Comments are stored in the system table COMMENTS.

Syntax

COMMENT ON SCHEMA schema-name IS {'comment' | NULL}

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema-name</td>
<td>The schema associated with the comment.</td>
</tr>
<tr>
<td>comment</td>
<td>Text of the comment to add. If a comment already exists for this schema, the comment you enter here overwrites the previous comment. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message. You can enclose a blank value within single quotes to remove an existing comment.</td>
</tr>
<tr>
<td>NULL</td>
<td>Removes an existing comment.</td>
</tr>
</tbody>
</table>

Privileges

- Superuser: View and add comments to all objects.
- Object owner: Add or edit comments for the object.
- User: VIEW privileges on an object to view its comments.
Examples

The following example adds a comment to the public schema:

```sql
=> COMMENT ON SCHEMA public IS 'All users can access this schema';
```

The following examples remove a comment from the public schema.

```sql
=> COMMENT ON SCHEMA public IS NULL;
=> COMMENT ON SCHEMA public IS '';
```

COMMENT ON SEQUENCE

Adds, revises, or removes a comment on a sequence. Each object can have one comment. Comments are stored in the system table `COMMENTS`.

Syntax

```
COMMENT ON SEQUENCE [[database.]schema.]sequence IS { 'comment' | NULL }
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>database</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td><code>sequence</code></td>
<td>The name of the sequence associated with the comment.</td>
</tr>
<tr>
<td><code>comment</code></td>
<td>Specifies the text of the comment to add. If a comment already exists for this sequence, this comment overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message. You can enclose a blank value within single quotes to remove an</td>
</tr>
<tr>
<td>existing comment.</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td></td>
</tr>
<tr>
<td>NULL</td>
<td>Removes an existing comment.</td>
</tr>
</tbody>
</table>

Privileges

- Superuser: View and add comments to all objects.
- Object owner: Add or edit comments for the object.
- User: VIEW privileges on an object to view its comments.

Examples

The following example adds a comment to the sequence called prom_seq.

```sql
=> COMMENT ON SEQUENCE prom_seq IS 'Promotion codes';
```

The following examples remove a comment from the prom_seq sequence.

```sql
=> COMMENT ON SEQUENCE prom_seq IS NULL;
=> COMMENT ON SEQUENCE prom_seq IS '';
```

COMMENT ON TABLE

Adds, revises, or removes a comment on a table. Each object can have one comment. Comments are stored in the system table COMMENTS.

Syntax

```sql
COMMENT ON TABLE [[database.]schema.]table IS { 'comment'| NULL }
```

Parameters

<table>
<thead>
<tr>
<th>database.schma</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
</table>
If you specify a database, it must be the current database.

<table>
<thead>
<tr>
<th>table</th>
<th>The name of the table with which to associate the comment.</th>
</tr>
</thead>
<tbody>
<tr>
<td>comment</td>
<td>Specifies the text of the comment to add. Enclose the text of the comment within single-quotes. If a comment already exists for this table, the comment you enter here overwrites the previous comment. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message. You can enclose a blank value within single quotes to remove an existing comment.</td>
</tr>
<tr>
<td>NULL</td>
<td>Removes a previously added comment.</td>
</tr>
</tbody>
</table>

**Privileges**

- Superuser: View and add comments to all objects.
- Object owner: Add or edit comments for the object.
- User: VIEW privileges on an object to view its comments

**Examples**

The following example adds a comment to the promotion_dimension table:

```sql
=> COMMENT ON TABLE promotion_dimension IS '2011 Promotions';
```

The following examples remove a comment from the promotion_dimension table:

```sql
=> COMMENT ON TABLE promotion_dimension IS NULL;
=> COMMENT ON TABLE promotion_dimension IS '';
```
COMMENT ON TRANSFORM FUNCTION

Adds, revises, or removes a comment on a user-defined transform function. Each object can have one comment. Comments are stored in the system table COMMENTS.

Syntax

```
COMMENT ON TRANSFORM FUNCTION [[database.]schema.]tfunction
...( [ tfunction-arg-name tfunction-arg-type ][,..] ) IS ('comment' | NULL)
``` 

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `[database.]schema` | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:  
`mySchema.myObject`  
If you specify a database, it must be the current database. |
| `tfunction`         | The name of the transform function with which to associate the comment.     |
| `tfunction-arg-name` | The names and data types of one or more transform function arguments. If you supply argument names and types, each type must match the type specified in the library used to create the original transform function. |
| `tfunction-arg-type`|                                                                           |
| `comment`           | Specifies the comment text to add. If a comment already exists for this transform function, this comment overwrites the previous one.  
Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message.  
Enclose a blank value within single quotes to remove an existing comment. |
| `NULL`              | Removes an existing comment.                                               |
Privileges

- Superuser: View and add comments to all objects.
- Object owner: Add or edit comments for the object.
- User: VIEW privileges on an object to view its comments.

Examples

The following example adds a comment to the `macros.zerowhennull` function:

```
=> COMMENT ON TRANSFORM FUNCTION macros.zerowhennull(x INT) IS 'Returns a 0 if not NULL';
```

The following example removes a comment from the `macros.zerowhennull` function by using the NULL option:

```
=> COMMENT ON TRANSFORM FUNCTION macros.zerowhennull(x INT) IS NULL;
```

COMMENT ON VIEW

Adds, revises, or removes a comment on a view. Each object can have one comment. Comments are stored in the system table `COMMENTS`.

Syntax

```
COMMENT ON VIEW [[database.]schema.]view IS { 'comment' | NULL }
```

Parameters

| `[database.]schema` | Specifies a schema, by default public. If `schema` is any schema other than public, you must supply the schema name. For example:
| | `myschema.thisDbObject`
<p>| | If you specify a database, it must be the current database. |</p>
<table>
<thead>
<tr>
<th><strong>view</strong></th>
<th>The name of the view with which to associate the comment.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>comment</strong></td>
<td>Specifies the text of the comment to add. If a comment already exists for this view, this comment overwrites the previous one. Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and alerts the user with a message. Enclose a blank value in single quotes to remove an existing comment.</td>
</tr>
<tr>
<td><strong>NULL</strong></td>
<td>Removes an existing comment.</td>
</tr>
</tbody>
</table>

**Privileges**

- **Superuser**: View and add comments to all objects.
- **Object owner**: Add or edit comments for the object.
- **User**: VIEW privileges on an object to view its comments.

**Examples**

The following example adds a comment to a view called `curr_month_ship`:

```sql
=> COMMENT ON VIEW curr_month_ship IS 'Shipping data for the current month';
```

The following example removes a comment from the `curr_month_ship` view:

```sql
=> COMMENT ON VIEW curr_month_ship IS NULL;
```

**COMMIT**

Ends the current transaction and makes all changes that occurred during the transaction permanent and visible to other users.

COMMIT is a synonym for **END**
Syntax

`COMMIT [ WORK | TRANSACTION ]`

Parameters

| WORK   | TRANSACTION | Optional keywords for readability only. |

Privileges

None

Examples

This example shows how to commit an insert.

```sql
=> CREATE TABLE sample_table (a INT);
=> INSERT INTO sample_table (a) VALUES (1);
OUTPUT
--------
1
=> COMMIT;
```

See Also

- Transactions
- Creating Transactions
- BEGIN
- ROLLBACK
- START TRANSACTION
**CONNECT**

Connects to another Vertica database to enable data import (using the COPY FROM VERTICA statement) or export (using the EXPORT statement). By default, invoking CONNECT occurs over the Vertica private network. Creating a connection over a public network requires some configuration. For information about using CONNECT to export data to or import data over a public network, see Using Public and Private IP Networks.

When importing from or exporting to a Vertica database, you can connect only to a database that uses trusted (username only) or password-based authentication, as described in Security and Authentication. SSL authentication is not supported.

**Syntax**

```
CONNECT TO VERTICA db-spec USER username PASSWORD 'password' ON 'host', port
```

**Parameters**

<table>
<thead>
<tr>
<th><strong>db-spec</strong></th>
<th>Specifies the target database, either the database name or DEFAULT.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>username</strong></td>
<td>The username to use when connecting to the other database.</td>
</tr>
<tr>
<td><strong>password</strong></td>
<td>A string containing the password to use to connect to the other database.</td>
</tr>
<tr>
<td><strong>host</strong></td>
<td>A string containing the host name of one of the nodes in the other database.</td>
</tr>
<tr>
<td><strong>port</strong></td>
<td>The port number of the other database as an integer.</td>
</tr>
</tbody>
</table>

**Privileges**

None

**Connection Details**

After you establish a connection to another database, the connection remains open for the current session. To disconnect a connection, use the DISCONNECT statement.
You can have only one connection to another database at a time. However, you can create connections to multiple different databases in the same session.

If the target database does not have a password, and you specify a password in the CONNECT statement, the connection succeeds, but does not give any indication that you supplied an incorrect password.

Example

```sql
=> CONNECT TO VERTICA ExampleDB USER dbadmin PASSWORD 'Password123' ON 'VerticaHost01',5433;
CONNECT
```

See Also

- COPY FROM VERTICA
- EXPORT TO VERTICA

COPY

COPY bulk-loads data into a Vertica database. By default, COPY automatically commits itself and any current transaction except when loading temporary tables. If COPY is terminated or interrupted Vertica rolls it back.

COPY reads data as UTF-8 encoding.

For information on loading one or more files or pipes on a cluster host or on a client system, see COPY LOCAL.

Syntax

```sql
COPY [[database.]schema-name.]target-table ...
... [ ( { column-as-expression | column } 
....... [ DELIMITER [ AS ] 'char' ]
....... [ ENCLOSED [ BY ] 'char' ]
....... [ ENFORCELNGTH ]
....... [ ESCAPE [ AS ] 'char' | NO ESCAPE ]
....... [ FILLER datatype]
....... [ FORMAT 'format' ]
....... [ NULL [ AS ] 'string' ]
....... [ TRIM 'byte' ]
... [,--] ]
```
... [ COLUMN OPTION ( column
       .. [ DELIMITER [ AS ] 'char' ]
       .. [ ENCLOSED [ BY ] 'char' ]
       .. [ ENFORCELENGTH ]
       .. [ ESCAPE [ AS ] 'char' | NO ESCAPE ]
       .. [ FORMAT 'format' ]
       .. [ NULL [ AS ] 'string' ]
       .. [ TRIM 'byte' ]
       .. [,,] ] ]
[ FROM {
...STDIN [ input-format ]
...[ 'path-to-data' [ ON { nodename | (nodeset) | ANY NODE } ] [ input-format ] ] [,,]
...[ LOCAL {STDIN | 'path-to-data'} [ input-format ] ] [,,]
...[ VERTICA source-database.[source-schema.]source-table[(source-column [,])]
  ] ]
...[ [ WITH ] PARSER parser ([ arg=value[,] ] ) ]
...[ [ WITH ] UDL-clause[,...] ]
...[ DELIMITER [ AS ] 'char' ]
...[ TRAILING NULLCOLS ]
...[ NULL [ AS ] 'string' ]
...[ ESCAPE [ AS ] 'char' | NO ESCAPE ]
...[ ENCLOSED [ BY ] 'char' ]
...[ RECORD TERMINATOR 'string' ]
...[ SKIP records ]
...[ SKIP BYTES integer ]
...[ TRIM 'byte' ]
...[ TRIM 'byte' ]
...[ REJECTBYTES integer ]
...[ [ REJECTED DATA ('path' [ ON nodename ] [,]) | AS TABLE reject-table] ]
...[ [ EXCEPTIONS 'path' [ ON nodename ] [,] ] ]
...[ ENFORCELENGTH ]
...[ ERROR TOLERANCE ]
...[ ABORT ON ERROR ]
...[ [ STORAGE ] load-method ]
...[ [ STREAM NAME 'streamName' ]
...[ NO COMMIT ]

Parameters

See COPY Parameters

Privileges

General

Superusers have full COPY privileges. The following requirements apply to non-superusers:

- USER-accessible storage location
- Applicable READ or WRITE privileges granted to the storage location where files are read or written
COPY LOCAL

- INSERT privileges to copy data from the STDIN pipe
- USAGE privileges on the schema

COPY FROM STDIN

- INSERT privilege on table
- USAGE privilege on schema

File Paths for Rejected Data and Exceptions

COPY can specify a path to store rejected data and exceptions. If the path resolves to a storage location, the following privileges apply to non-superusers:

- The storage location was created with the USER option (see CREATE LOCATION).
- The user must has READ access to the storage location, as described in GRANT (Storage Location)

COPY Parameters

Note: For details on which COPY parameters are valid for specific parsers, see COPY Option Parser Dependencies.

<table>
<thead>
<tr>
<th>[database.]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
</tbody>
</table>
If you specify a database, it must be the current database. 
COPY ignores `schema-name` when used in CREATE EXTERNAL TABLE or CREATE FLEX EXTERNAL TABLE statements.

<table>
<thead>
<tr>
<th><strong>target-table</strong></th>
<th>The target columnar or flexible table for loading new data. Vertica loads the data into all projections that include columns from the schema table.</th>
</tr>
</thead>
</table>
| **column-as-expression** | Specifies the expression used to compute values for the target column. For example: 

```sql
COPY t(year AS TO_CHAR(k, 'YYYY')) FROM 'myfile.dat'
```

Use this option to transform data when it is loaded into the target database.

For details about:

- Expressions with COPY: see [Transforming Data During Loads](#) in the Administrator's Guide.
- Fillers: see [Manipulating Source Data Columns](#) in the Administrator's Guide.

| **column** | Restricts the load to one or more specified columns in the table. If you omit specifying columns, COPY loads all columns by default. 

Table columns that you omit from the column list are assigned their DEFAULT or SET USING values, if any; otherwise, COPY inserts NULL.

If you leave the column parameter blank to load all columns in the table, you can use the optional parameter COLUMN OPTION to specify parsing options for specific columns.

The data file must contain the same number of columns as the COPY command's column list. For example, in a table T1 with nine columns (C1 through C9), the following statement loads the three columns of data in each record to columns C1, C6, and C9, respectively:

```sql
=> COPY T1 (C1, C6, C9);
```
| **FILLER `datatype`** | Specifies not to load the column and its fields into the destination table. Use this option to omit columns that you do not want to transfer into a table.

This parameter also transforms data from a source column and loads the transformed data to the destination table, rather than loading the original, untransformed source column (parsed column).

**Note:** If `datatype` is VARCHAR, set the VARCHAR length (VARCHAR(`n`)) so the combined length of all FILLER source fields does not exceed the target column's defined length. Otherwise, the COPY command can return with an error.

For more information, see [Manipulating Source Data Columns](#) in the Administrator's Guide |
| **FORMAT `'format'`** | Specifies the input formats to use when loading date/time and binary columns, where `format` can be one of the following:

These are the valid input formats when loading binary columns:

- octal
- hex
- bitstream

See [Loading Binary (Native) Data](#) to learn more about these formats.

When loading date/time columns, using FORMAT significantly improves load performance. COPY supports the same formats as the TO_DATE function.

See the following topics for additional information:

- [Template Patterns for Date/Time Formatting](#)
- [Template Pattern Modifiers for Date/Time Formatting](#)

If you specify invalid format strings, the COPY operation returns an error. |
**path-to-data**

Specifies the absolute path of the file (or files) containing the data, which can be from multiple input sources. If the file is stored in HDFS, *path-to-data* is a URL in the hdfs scheme, typically hdfs:///path/to/file. See [Using HDFS URLs](#).

For Parquet, ORC, text, and delimited files only, *path-to-data* can be the URL of an S3 bucket in the format 's3://bucket/path'.

*path-to-data* can optionally contain wildcards to match more than one file. The file or files must be accessible to the local client or the host on which the COPY statement runs. COPY skips empty files in the file list. A file list that includes directories causes the query to fail. See [Specifying COPY FROM Options](#). The supported patterns for wildcards are specified in the [Linux Manual Page for Glob](#), and for ADO.net platforms, through the .NET Directory.GetFiles Method.

You can use variables to construct the pathname as described in [Using Load Scripts](#).

If *path* resolves to a storage location on a local file system, and the user invoking COPY is not a superuser, the following privileges apply:

- The storage location must have been created with the USER option (see [CREATE LOCATION](#)).
- The user must already have been granted READ access to the file storage location, as described in [GRANT (Storage Location)](#).

Further, if a user has privileges but is not a superuser, and invokes COPY from that storage location, Vertica ensures that symbolic links do not result in unauthorized access.

**ON nodename**

Specifies the node on which the data to copy resides and the node that should parse the load file. If you omit *nodename*, the location of the input file defaults to the COPY initiator node. Use *nodename* to copy and parse a load file from a node other than the COPY initiator node.

**Note:** *nodename* is invalid with STDIN and LOCAL: STDIN is read on the initiator node only, and LOCAL indicates a
| **ON (nodeset)** | Specifies a set of nodes on which to perform the load. The same data must be available for load on all named nodes. **nodeset** is a comma-separated list of node names in parentheses. For example:

```sql
=> COPY t FROM 'file1.txt' ON (v_vmart_node0001, v_vmart_node0002);
```

Vertica apportions the load among all of the specified nodes. If you also specify **ERROR TOLERANCE** or **REJECTMAX**, Vertica instead chooses a single node on which to perform the load. If the data is available on all nodes, you usually use **ON ANY NODE**. However, you can use **ON nodeset** to do manual load-balancing among concurrent loads. |
| **ON ANY NODE** | Specifies that the source file to load is available on all nodes, so **COPY** opens the file and parses it from any node in the cluster.  

**Caution:** The file must be the same on all nodes. If the file differs on two nodes, an incorrect or incomplete result is returned, with no error or warning.  

Vertica attempts to apportion the load among several nodes if the file is large enough to benefit from apportioning. It chooses a single node if **ERROR TOLERANCE** or **REJECTMAX** is specified.  

You can use a wildcard or glob (such as *.dat) to load multiple input files, combined with the **ON ANY NODE** clause. If you use a glob, **COPY** distributes the list of files to all cluster nodes and spreads the workload.  

**ON ANY NODE** is invalid with **STDIN** and **LOCAL**: **STDIN** can only use the initiator node, and **LOCAL** indicates a client node.  

**ON ANY NODE** is the default for **HDFS** and **S3** paths and does not need to be specified. |
| **STDIN** | Reads from the client a standard input instead of a file. **STDIN** takes one input source only and is read on the initiator node. |
To load multiple input sources, use `path-to-data`.
User must have INSERT privileges on the table and USAGE privileges on its schema.
This parameter is not valid when creating external tables.

| LOCAL {STDIN | 'path-to-data'} | Specifies that all paths for the COPY statement are on the client system and that all COPY variants are initiated from a client. You can use LOCAL and `path-to-data` (see above), to specify a relative path.
For details, see COPY LOCAL.
This parameter is not valid when creating external tables. |

| input-format | Specifies the input format, one of the following:
- UNCOMPRESSED (default)
- BZIP
- GZIP
- LZO
Input files can be of any format. If you use wildcards, all qualifying input files must be in the same format. To load different file formats, specify the format types specifically.
The following requirements and restrictions apply:
- When using concatenated BZIP or GZIP files, verify that all source files terminate with a record terminator before concatenating them.
- Concatenated BZIP and GZIP files are not supported for NATIVE (binary) and NATIVE VARCHAR formats.
- LZO files are assumed to be compressed with `lzop`. Vertica supports the following `lzop` arguments:
  - --no-checksum / -F
  - --crc32
  - --adler32
  - --no-name / -n
  - --name / -N |
<table>
<thead>
<tr>
<th>Numbered compression levels</th>
</tr>
</thead>
<tbody>
<tr>
<td>- BZIP, GZIP, and LZO compression cannot be used with ORC format.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>parser</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the parser to use when bulk loading columnar tables, one of the following:</td>
</tr>
<tr>
<td>• NATIVE</td>
</tr>
<tr>
<td>• NATIVE VARCHAR</td>
</tr>
<tr>
<td>• FIXEDWIDTH</td>
</tr>
<tr>
<td>• ORC[(hive_partition_cols='partitions')]</td>
</tr>
<tr>
<td>• PARQUET[(hive_partition_cols='partitions')]</td>
</tr>
</tbody>
</table>

By default, COPY uses the DELIMITER parser for UTF-8 format, delimited text input data. To use a flex table parser for column tables, use the PARSER parameter followed by a flex table parser argument. For parser descriptions, see [Flex Parsers Reference](#).

**Note:** You do not specify the DELIMITER parser directly; absence of a specific parser indicates the default.

For more information, see [Specifying a COPY Parser](#) in the Administrator's Guide.

The following restrictions apply:

- These parsers are not applicable when loading flexible tables.

- The ORC and PARQUET parsers are for use with Hadoop files in those formats. The files do not need to be stored in HDFS. For details on using these formats, see [Reading ORC and Parquet Formats](#).
- COPY LOCAL does not support NATIVE and NATIVE VARCHAR parsers.

- To use a flex table parser for column tables, use the PARSER parameter followed by a flex table parser argument. For supported flex table parsers, see Bulk Loading Data into Flex Tables.

[WITH] **UDL-clause[...]**

Specifies one or more user-defined load functions—one source, one or more filters, and one parser, as follows:

- **SOURCE** `source([arg=value[,..]] )`
- **FILTER** `filter([arg=value[,..]] )`
- **PARSER** `parser([arg=value[,..]] )`

To use a flex table parser for column tables, use the PARSER parameter followed by a flex table parser argument. For supported flex table parsers, see Bulk Loading Data into Flex Tables.

**COLUMN OPTION**

Specifies load metadata for one or more columns declared in the table column list. For example, you can specify that a column has its own DELIMITER, ENCLOSED BY, NULL as 'NULL' expression, and so on. You do not have to specify every column name explicitly in the COLUMN OPTION list, but each column you specify must correspond to a column in the table column list.

**COLSIZES (integer [,..])**

Specifies column widths when loading fixed-width data. COPY requires that you specify the COLSIZES when using the FIXEDWIDTH parser. COLSIZES and the list of integers must correspond to the columns listed in the table column list. For more information, see Loading Fixed-Width Format Data in the Administrator's Guide.

**DELIMITER**

Indicates the single ASCII character used to separate columns within each record of a file. You can use any ASCII value in the range E'\000' to E'\177', inclusive. You cannot use the same character for both the DELIMITER and NULL parameters. For more information, see Loading Delimited Data in the Administrator's Guide.
### TRAILING NULLCOLS
Specifies that if Vertica encounters a record with insufficient data to match the columns in the table column list, COPY inserts the missing columns with NULLs. For other information and examples, see Loading Fixed-Width Format Data in the Administrator's Guide. This option is not available for ORC or Parquet data.

### ESCAPE [AS]
Sets the escape character. Once set, the character following the escape character is interpreted literally, rather than as a special character. You can define an escape character using any ASCII value in the range E'\001' to E'\177', inclusive (any ASCII character except NULL: E'\000'). Note that the backslash character (\) is the default escape character.

The COPY statement does not interpret the data it reads in as String Literals. It also does not follow the same escape rules as other SQL statements (including the COPY parameters). When reading in data, COPY interprets only the characters defined by these options as special values:

- ESCAPE [AS]
- DELIMITER
- ENCLOSED [BY]
- RECORD TERMINATOR

### NO ESCAPE
Eliminates escape character handling. Use this option if you do not need any escape character and you want to prevent characters in your data from being interpreted as escape sequences.

### ENCLOSED [BY]
Sets the quote character within which to enclose data, allowing delimiter characters to be embedded in string values. You can choose any ASCII value in the range E'\001' to E'\177' inclusive (any ASCII character except NULL: E'\000'). By default, ENCLOSED [BY] has no value, meaning data is not enclosed by any sort of quote character.

### NULL
The string representing a null value. The default is an empty
string (' '). You can specify a null value as any ASCII value in the range E'\001' to E'\177' inclusive (any ASCII character except NULL: E'\000'). You cannot use the same character for both the DELIMITER and NULL options. For more information, see [Loading Delimited Data](#).

**RECORD TERMINATOR** Specifies the literal character string indicating the end of a data file record. For more information about using this parameter, see [Loading Delimited Data](#).

This option is not available for ORC or Parquet data.

**SKIP records** Indicates the number (integer) of records to skip in a load file. For example, you can use the SKIP option to omit table header information.

This option is not available for ORC or Parquet data.

**SKIP BYTES total** Indicates the total number (integer) of bytes in a record to skip. This option is only available when loading fixed-width data.

This option is not available for ORC or Parquet data.

**TRIM** Trims the number of bytes you specify from a column. This option is only available when loading fixed-width data. You can set TRIM at the table level for a column, or as part of the COLUMN OPTION parameter.

This option is not available for ORC or Parquet data.

**REJECTMAX** Specifies a maximum number of logical records that can be rejected before a load fails. For details, see [Capturing Load Rejections and Exceptions](#).

REJECTMAX disables apportioned load.

**REJECTED DATA** Specifies where to write each row that failed to load. If this parameter is specified, records that failed due to parsing errors are always written. Records that failed due to an error during a transformation are written only if the CopyFaultTolerantExpressions configuration parameter is set. (See [General Parameters](#).) The syntax for this parameter is:

```sql
REJECTED DATA
{ 'path' [ ON nodename ] [,..] | AS TABLE reject-table }
```
Vertica can write rejected data to the specified path or to a table:

- `path' [ ON nodename ]: Copies the rejected row data to the specified path on the node executing the load. If qualified by ON nodename, Vertica moves existing rejected data files on nodename to path on the same node.

  The value of path can be a directory or a file prefix. If there are multiple load sources, path is always treated as a directory. If there are not multiple load sources but path ends with '/', or if a directory of that name already exists, it is also treated as a directory. Otherwise, path is treated as a file prefix.

  When this parameter is used with LOCAL, the output is written to the client.

- **REJECTED DATA AS TABLE reject-table**: Saves rejected rows to columnar table reject-table.

  When this parameter is used with COPY...ON ANY NODE, rejected data processed by each node is written to path on that node. To collect all rejected data in one place regardless of how the load is distributed, use a table.

  For details about both options, see **Capturing Load Rejections and Exceptions** in the Administrator's Guide.

**EXCEPTIONS** specifies the file name or absolute path of the file in which to write exceptions, as follows:

```
EXCEPTIONS 'path' [ ON nodename[,..]]
```

Files are written on the node or nodes executing the load.

Exceptions describe why each rejected row was rejected. Each exception describes the corresponding record in the file specified by the REJECTED DATA option.

If path resolves to a storage location, the following privileges apply to non-superusers:

- The storage location must be created with the USER option (see `CREATE LOCATION`).
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENFORCELENGTH</td>
<td>Determines whether COPY truncates or rejects data rows of type char, varchar, binary, and varbinary if they do not fit the target table. Specifying the optional ENFORCELENGTH parameter rejects rows.</td>
</tr>
<tr>
<td></td>
<td>You can set ENFORCELENGTH at the table level for a column, or as part of the COLUMN OPTION parameter.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> COPY truncates offending rows of these data types, but does not reject them. For more details, see Tracking Load Exceptions and Rejections Status in the Administrator's Guide.</td>
</tr>
<tr>
<td>ERROR TOLERANCE</td>
<td>Specifies that COPY treats each source during execution independently when loading data. The statement is not rolled back if a single source is invalid. The invalid source is skipped and the load continues.</td>
</tr>
<tr>
<td></td>
<td>This option is not available for ORC or Parquet data.</td>
</tr>
<tr>
<td></td>
<td>Using this parameter disables apportioned load.</td>
</tr>
<tr>
<td>ABORT ON ERROR</td>
<td>Specifies that COPY stops if any row is rejected. The statement is rolled back and no data is loaded.</td>
</tr>
<tr>
<td>[STORAGE] Load-method</td>
<td>Specifies how to load data into the database, one of the following:</td>
</tr>
</tbody>
</table>
|                         | **Note:** The STORAGE option is provided only to facilitate...

- The user must have READ access to the storage location where the files exist, as described in **GRANT (Storage Location)**.

The ON `nodename` clause moves existing exceptions files on `nodename` to the indicated `path` on the same node. For details, see Saving Load Exceptions (EXCEPTIONS) in the Administrator's Guide.

When this parameter is used with COPY...ON ANY NODE, exceptions processed by each node are written to `path` on that node.

Specifying an exceptions file name is incompatible with the REJECTED DATA AS TABLE clause. Exceptions are listed in the table's `rejected_reason` column.
readability.

- **AUTO** (default): Initially loads data into WOS, suitable for smaller bulk loads.

- **DIRECT**: Loads data directly into ROS containers, suitable for large (>100 MB) bulk loads.

- **TRICKLE**: Loads data only into WOS, suitable for frequent incremental loads.

This option is invalid for external tables.

For details, see Choosing a Load Method in the Administrator’s Guide.

### STREAM NAME

Supplies a COPY load stream identifier. Using a stream name helps to quickly identify a particular load. The **STREAM NAME** value that you supply in the load statement appears in the stream column of system table **LOAD_STREAMS**.

A valid stream name can contain any combination of alphanumeric or special characters up to 128 bytes in length.

By default, Vertica names streams by table and file name. For example, if you are loading two files (f1, f2) into TableA, their default stream names are TableA-f1, TableA-f2, respectively.

To name a stream:

```sql
=> COPY mytable FROM myfile DELIMITER '|' DIRECT STREAM NAME 'My stream name';
```

### NO COMMIT

Prevents the COPY statement from committing its transaction automatically when it finishes copying data.

The following requirements and restrictions apply:

- This option must be the last COPY statement parameter.

- **CREATE EXTERNAL TABLE AS COPY** ignores this option.

For more information, see Overriding COPY Auto Commit.

This option is not available for ORC or Parquet data.
COPY Option Parser Dependencies

The following table summarizes which COPY parameters are available when loading data using the default (DELIMITER), NATIVE (binary), NATIVE VARCHAR, and FIXEDWIDTH parsers:

<table>

</tr>
</tbody>
</table>
COPY Restrictions

Invalid Data

COPY considers the following data invalid:

- Missing columns (an input line has fewer columns than the recipient table).
- Extra columns (an input line has more columns than the recipient table).
- Empty columns for an INTEGER or DATE/TIME data type. If a column is empty for either of these types, COPY does not use the default value that was defined by CREATE TABLE. However, if you do not supply a column option as part of the COPY statement, the default value is used.
- Incorrect representation of a data type. For example, trying to load a non-numeric value into an INTEGER column is invalid.

Constraint Violations

If any primary key, unique key, or check constraints are enabled for automatic enforcement, Vertica enforces those constraints when you insert values into a table. If a violation occurs,
Vertica rolls back the SQL statement and returns an error. This behavior occurs for INSERT, UPDATE, COPY, and MERGE SQL statements.

Note: Automatic constraint enforcement requires that you have SELECT privileges on the table containing the constraint.

Empty Line Handling

When COPY encounters an empty line while loading data, the line is neither inserted nor rejected, but COPY increments the line record number. Consider this behavior when evaluating rejected records. If you return a list of rejected records and COPY encountered an empty row while loading data, the position of rejected records is incremented by one.

Compressed File Errors

When loading compressed files, COPY might abort and report an error, if the file seems to be corrupted. For example, this behavior can occur if reading the header block fails.

COPY Examples

The following examples show how to load data with the COPY statement using various string options.

The FORMAT, DELIMITER, NULL, and ENCLOSED BY options:

```sql
=> COPY public.customer_dimension (customer_since FORMAT 'YYYY')
    FROM STDIN
    DELIMITER ','
    NULL AS 'null'
    ENCLOSED BY '';
```

The DELIMITER, NULL, and DIRECT options:

```sql
=> COPY a
    FROM STDIN
    DELIMITER ','
    NULL E'\n'
    DIRECT;
```

The DELIMITER and NULL options:

```sql
=> COPY store.store_dimension
    FROM :input_file
    DELIMITER '|';
```
Setting vsql Variables

The first two examples load data from STDIN. The last example uses a vsql variable (input_file). You can set a vsql variable as follows:

```sql
\set input_file ../myCopyFromLocal/large_table.gzip
```

Including Multiple Source Files

COPY supports the inclusion of multiple source files in a single COPY statement.

The following example creates a table named 'sampletab.' It then copies multiple source files to the table using a single COPY statement.

```sql
CREATE TABLE sampletab (a int);
CREATE TABLE
COPY sampletab FROM '/home/dbadmin/one.dat', 'home/dbadmin/two.dat';
Rows Loaded
----------
2
(1 row)
```

You can use wildcards to indicate a group of files:

```sql
COPY myTable FROM 'hdfs:///mydirectory/ofmanyfiles/*.dat';
```

Wildcards can include regular expressions:

```sql
COPY myTable FROM 'hdfs:///mydirectory/*_[0-9]';
```

You can use multiple paths in a single COPY statement:

```sql
COPY myTable FROM 'hdfs:///data/sales/01/*.dat', 'hdfs:///data/sales/02/*.dat',
    'hdfs:///data/sales/historical.dat';
```

Distributing a Load

The following example shows how you can load data that is shared across all nodes. Vertica distributes the load across all nodes, if possible.

```sql
COPY sampletab FROM '/data/file.dat' ON ANY NODE;
```
This example shows how to load data from two files. Because the first load file does not specify
nodes (or ON ANY NODE), the initiator performs the load. Loading the second file is distributed
across all nodes.

```sql
=> COPY sampletab FROM '/data/file1.dat', '/data/file2.dat' ON ANY NODE;
```

This example shows how to specify different nodes for each load file. Vertica distributes the
load of file1.dat across v_vmart_node0001 and v_vmart_node0002 and distributes the load of
file2.dat across v_vmart_node0003 and v_vmart_node0004.

```sql
=> COPY sampletab FROM '/data/file1.dat' ON (v_vmart_node0001, v_vmart_node0002),
'/data/file2.dat' ON (v_vmart_node0003, v_vmart_node0004);
```

ON ANY NODE is the default for loads from HDFS. You do not need to specify it.

### Loading Data from Shared Storage

To load data from HDFS or S3, use URLs in the corresponding schemes—hdfs://path or
s3://bucket/path. Loads from HDFS and S3 default to ON ANY NODE; you do not need to
specify it.

This example shows how you can load a file stored in HDFS using the default name node or
name service. See [Using HDFS URLs](#) for more information about HDFS URLs.

```sql
=> COPY t FROM 'hdfs:///opt/data/file1.dat';
```

This example shows how you can load data from a particular HDFS name service (testNS). You
specify a name service if your database is configured to read from more than one HDFS cluster.

```sql
=> COPY t FROM 'hdfs://testNS/opt/data/file2.csv';
```

This example shows how you can load data from an S3 bucket. See [Loading from an S3 Bucket](#)
for more information.

```sql
=> COPY t FROM 's3://AWS_DataLake/*/ ORC;
```

### Loading Hadoop Native Formats

This example shows how you can load data in the ORC format from HDFS.

```sql
=> COPY t FROM 'hdfs:///opt/data/sales.orc' ORC;
```

This example shows how you can load Parquet data from an S3 bucket.
=> COPY t FROM 's3://AWS_DataLake/sales.parquet' PARQUET;

Loading Data into a Flex Table

This statement creates a Flex table, and copies JSON data into the table, using the flex table parser, fjsonparser:

```
=> CREATE FLEX TABLE darkdata();
CREATE TABLE
=> COPY tweets FROM '/myTest/Flexible/DATA/tweets_12.json' parser fjsonparser();
Rows Loaded
----------
  12
(1 row)
```

Using Named Pipes

COPY supports named pipes that follow the same naming conventions as file names on the given file system. Permissions are open, write, and close.

This statement creates the named pipe, pipe1, and sets two vsql variables, dir and file:

```
=> \! mkfifo pipe1
=> \! set dir `pwd`/
=> \! set file `''`dir`pipe1''`
```

This statement copies an uncompressed file from the named pipe:

```
=> \! cat pf1.dat > pipe1 &
=> COPY large_tbl FROM :file delimiter '|';
=> SELECT * FROM large_tbl;
=> COMMIT;
```

Loading Compressed Data

This statement copies a GZIP file from a named pipe and uncompresses it:

```
=> \! gzip pf1.dat
=> \! cat pf1.dat.gz > pipe1 &
=> COPY large_tbl FROM :file ON site01 GZIP delimiter '|';
=> SELECT * FROM large_tbl;
=> COMMIT;
=> \!gunzip pf1.dat.gz
```

This statement copies a BZIP file from a named pipe and then uncompresses it:
This statement copies an LZO file from a named pipe and then uncompresses it:

```bash
=> \! bzip2 pf1.dat
=> \! cat pf1.dat.bz2 > pipe1 &
=> COPY large_tbl FROM :file ON site01 BZIP delimiter '|';
=> SELECT * FROM large_tbl;
=> COMMIT;
=> \! bunzip2 pf1.dat.bz2
```

COPY LOCAL

Using the COPY statement with its LOCAL option lets you load a data file on a client system, rather than on a cluster host. COPY LOCAL supports the STDIN and 'pathToData' parameters, but not the [ON nodename] clause. COPY LOCAL does not support multiple file batches in NATIVE or NATIVE VARCHAR formats. COPY LOCAL does not support reading ORC or Parquet files; use ON NODE instead. COPY LOCAL does not support CURRENT_LOAD_SOURCE().

The COPY LOCAL option is platform-independent. The statement works in the same way across all supported Vertica platforms and drivers. For more details about using COPY LOCAL with supported drivers, see the Connecting to Vertica section for your platform.

COPY LOCAL must be the first statement in any multi-statement query you make with the ODBC client library. Using it as the second or later statement results in an error. When using other client libraries, such as JDBC, COPY LOCAL should always be the first statement in a multi-statement query. Also, do not use it multiple times in the same query.

Note: On Windows clients, the path you supply for the COPY LOCAL file is limited to 216 characters due to limitations in the Windows API.

COPY LOCAL does not automatically create exceptions and rejections files, even if exceptions occur.

Privileges

User must have INSERT privilege on the table and USAGE privilege on the schema.

How Copy Local Works

COPY LOCAL loads data in a platform-neutral way. The COPY LOCAL statement loads all files from a local client system to the Vertica host, where the server processes the files. You can copy files in various formats: uncompressed, compressed, fixed-width format, in bzip or gzip format, or specified as a bash glob. Files of a single format (such as all bzip, or gzip) can be comma-separated in the list of input files. You can also use any of the applicable COPY statement options (as long as the data format supports the option). For instance, you can define a specific delimiter character, or how to handle NULLs, and so forth.
Note: The Linux `glob` command returns files that match the pattern you enter, as specified in the Linux Manual Page for `Glob (7)`. For ADO.net platforms, specify patterns and wildcards as described in the .NET `Directory.GetFiles` Method.

For more information about using the `COPY LOCAL` option to load data, see `COPY` for syntactical descriptions, and `Using COPY and COPY LOCAL` for detailed examples.

The Vertica host uncompresses and processes the files as necessary, regardless of file format or the client platform from which you load the files. Once the server has the copied files, Vertica maintains performance by distributing file parsing tasks, such as encoding, compressing, uncompressing, across nodes.

Viewing Copy Local Operations in a Query Plan

When you use the `COPY LOCAL` option, the GraphViz query plan includes a label for `Load-Client-File`, rather than `Load-File`. Following is a section from a sample query plan:

```
PLAN: BASE BULKLOAD PLAN (GraphViz Format)

digraph G {
  graph [rankdir=BT, label = " BASE BULKLOAD PLAN \nAll Nodes Vector: \n\n  node[0]=initiator (initiator) Up\n", labelloc=t, labeljust=1 ordering=out]
  .
  .
  i0[label = "Load-Client-File(/tmp/diff) \nOutBlk=[UncTuple]",
    color = "green", shape = "ellipse"];
```

Examples

The following example shows a load from a local file.

```
$ cat > t.dat
12
17
9
^C

=> CREATE TABLE numbers (value INT);
CREATE TABLE

=> COPY numbers FROM LOCAL 't.dat';
Rows Loaded
-----------
  3
(1 row)
```
COPY FROM VERTICA

Imports data from another Vertica database. COPY  FROM  VERTICA is similar to COPY, but accepts only a subset of its parameters.

Important: The source database can be one major release behind the target database.

Syntax

COPY [[database.]schema.]target-table ...
... [[ target-column[,]...]]
... FROM VERTICA database.[schema.]source-table ...
... [[(source-column[,]...)]
... [load-method]
... [STREAM NAME 'stream name']
... [NO COMMIT]

Parameters

<table>
<thead>
<tr>
<th>[database.]schema</th>
<th>The table in the local database to store the copied data.</th>
</tr>
</thead>
<tbody>
<tr>
<td>target-column</td>
<td>A target table column to store the copied data. If you specify target columns, COPY FROM VERTICA writes only to those columns. If you omit specifying target columns, Vertica writes to target table columns as described below, in Source and Target Column Mapping.</td>
</tr>
<tr>
<td></td>
<td>Note: You cannot use column fillers as part of the column definition.</td>
</tr>
<tr>
<td>database</td>
<td>The source database of the data to copy. A connection to this database must already exist in the current session.</td>
</tr>
</tbody>
</table>
The table that is the source of the copied data.

A source table column to copy. If you specify source columns, only these columns are copied from the source table. If you omit specifying source columns, Vertica copies columns from the source table, as described below in Source and Target Column Mapping.

Specifies how to load data into the database, one of the following:

- AUTO (default): Initially loads data into WOS, suitable for smaller bulk loads.
- DIRECT: Loads data directly into ROS containers, suitable for large (>100 MB) bulk loads.
- TRICKLE: Loads data only into WOS, suitable for frequent incremental loads.

This option is invalid for external tables.

For details, see Choosing a Load Method in the Administrator's Guide.

Specifies a COPY load stream identifier. Using a stream name helps to quickly identify a particular load. The STREAM NAME value that you specify in the load statement appears in the stream column of the LOAD_STREAMS system table.

Prevents COPY from committing its transaction automatically when it finishes copying data. For details, see Overriding COPY Auto Commit in the Administrator's Guide.

Privileges

- SELECT privileges on the source table
- USAGE privilege on source table schema
- INSERT privileges for the destination table in target database
- USAGE privilege on destination table schema

Connecting to the Source Database

Before you can import data from another database, you must establish a connection to the source database with CONNECT. See Copying Data from Another Vertica Database for details.

By default, COPY FROM VERTICA copies or imports data over the Vertica private network. Connecting to a public network requires some configuration. For information about using this statement to copy data across a public network, see Using Public and Private IP Networks.

The copy operation fails if either side of the connection is a single-node cluster installed to localhost, or you do not specify a host name or IP address.

Source and Target Column Mapping

You can optionally name a subset of source and target columns to participate in the copy operation. COPY FROM VERTICA attempts to match columns in the source table with corresponding columns in the destination table.

The following table compares the different combinations of naming source and target columns, and the requirements that pertain to each option.

<table>
<thead>
<tr>
<th></th>
<th>Omit source columns</th>
<th>Specify source columns</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Omit target columns</strong></td>
<td>Match all columns in source table to columns in target table.</td>
<td>Match named source table columns to target table columns.</td>
</tr>
<tr>
<td></td>
<td>The number of columns in the two tables can differ, but the target table must have at least as many columns as the source table.</td>
<td>The number of columns in the two tables can differ, but the target table must have at least as many columns as the number of specified source columns.</td>
</tr>
<tr>
<td><strong>Specify target columns</strong></td>
<td>Match source columns to the named target columns.</td>
<td>Match named source columns to named target columns.</td>
</tr>
<tr>
<td></td>
<td>The number of named target columns must equal the number of columns in the</td>
<td>The number of source and target columns must be equal.</td>
</tr>
<tr>
<td>Omit source columns</td>
<td>Specify source columns</td>
<td></td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------</td>
<td></td>
</tr>
<tr>
<td>source table.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Node Failure During COPY

See [Handling Node Failure During Copy/Export](#) in the Administrator's Guide.

### Examples

This example demonstrates connecting to another database, copying the contents of an entire table from the source database to an identically-defined table in the current database directly into ROS, and then closing the connection:

```sql
=> CONNECT TO VERTICA vmart USER dbadmin PASSWORD 'myPassword' ON 'VertTest01',5433;
CONNECT
=> COPY customer_dimension FROM VERTICA vmart.customer_dimension DIRECT;
Rows Loaded
----------
500000
(1 row)
=> DISCONNECT vmart;
DISCONNECT
```

For more examples, see [Copying Data from Another Vertica Database](#) in the Administrator's Guide.

### See Also

[EXPORT TO VERTICA](#)

## CREATE ACCESS POLICY

Creates a secure access policy to prevent unauthorized users from accessing potentially sensitive information. You can create access policies for table rows and columns. Access policies are a technique of on-the-fly query modification in which the query excludes rows or modifies data from a column in the results returned to the user running the query. Access policies allow different users to run the same query and receive different results.
Column access policies limit access to specific column in a table. Creating a column access policy depends on the expressions specified when creating the policy. The expression is substituted for the column's actual value in any data fetched from the table.

Row access policies limit access to a specific row in a table. You must use a WHERE clause to set the access policy's condition. Only rows that satisfy the WHERE clause are fetched from the table.

For information on how implementing access policies affects how you manage data, see Working With Access Policies in the Administrator's Guide.

Syntax

CREATE ACCESS POLICY ON [[database.]schema.]table... { FOR COLUMN column | FOR ROWS WHERE } expression

ENABLE

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[database .]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>table</td>
<td>The table that contains the target column.</td>
</tr>
<tr>
<td>column</td>
<td>The column on which to apply an access policy.</td>
</tr>
<tr>
<td>expression</td>
<td>An SQL expression that specifies conditions for column or row access:</td>
</tr>
<tr>
<td></td>
<td>• In a column access policy, the expression defines what value is returned when this column is fetched. The expression can contain conditions such as a role to determine what value to return. The expression might return null if no data is returned for this column.</td>
</tr>
<tr>
<td></td>
<td>• In a row access policy, only rows for which the expression is true are returned.</td>
</tr>
</tbody>
</table>

The expression in the example below shows the first 5 characters of the key in the customer_key column:

```sql
=> CREATE ACCESS POLICY ON customer_dimension
```
<table>
<thead>
<tr>
<th>Privileges</th>
<th>Enables the access policy. Always add this to the end of the statement when creating an access policy.</th>
</tr>
</thead>
</table>

### Privileges

One of the following:

- dbadmin
- Superuser

### Examples

#### Create access policy per role on column

Add an expression to the policy to specify the access each role receives. A manager can access the complete customer number, while an operator can only see a portion of the number:

```sql
=> CREATE ACCESS POLICY on customer FOR column customer_number CASE WHEN enabled_role ('manager') then customer_number WHEN enabled_role ('operator') then substr (customer_number, 8,2) ELSE NULL END ENABLE;
```

#### Create access policy for rows

```sql
=> CREATE ACCESS POLICY ON customer FOR ROWS WHERE cid1>1 ENABLE;
```

### See Also

In the Administrator's Guide:

- Access Policies
- Column Access Policy
- Row Access Policy
CREATE AUTHENTICATION

Creates and enables an authentication method associated with users or roles. Vertica enables
the authentication method automatically.

Syntax

CREATE AUTHENTICATION auth-method-name METHOD 'auth-type' acess-method

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auth-method-name</td>
<td>Name of the authentication method to create, where auth-method-name conforms to conventions described in Identifiers.</td>
</tr>
<tr>
<td>auth-type</td>
<td>Name of the authentication method to use, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• gss</td>
</tr>
<tr>
<td></td>
<td>• ident</td>
</tr>
<tr>
<td></td>
<td>• ldap</td>
</tr>
<tr>
<td></td>
<td>• hash</td>
</tr>
<tr>
<td></td>
<td>• reject</td>
</tr>
<tr>
<td></td>
<td>• trust</td>
</tr>
<tr>
<td></td>
<td>• tls</td>
</tr>
<tr>
<td>acess-method</td>
<td>The access method the client uses to connect, specified in one of the following ways:</td>
</tr>
<tr>
<td></td>
<td>• LOCAL</td>
</tr>
<tr>
<td></td>
<td>Matches connection attempts made using local domain</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>sockets.</td>
</tr>
</tbody>
</table>
|      | - HOST [ TLS | NO TLS ] 'host-ip-address'
|      | Matches connection attempts made using TCP/IP, where host-ip-address can be an IPv4 or IPv6 address. You can qualify HOST with one of the following options |
|      |   - NO TLS: Match a plain (non-SSL/TLS) socket only. |

Privileges

DBADMIN

Examples

See Creating Authentication Records.

See Also

- ALTER AUTHENTICATION
- DROP AUTHENTICATION
- GRANT (Authentication)
- REVOKE (Authentication)

**CREATE EXTERNAL TABLE AS COPY**

CREATE EXTERNAL TABLE AS COPY creates a table definition for data external to your Vertica database. This statement is a combination of the CREATE TABLE and COPY statements, supporting a subset of each statement's parameters.
Canceling a CREATE EXTERNAL TABLE AS COPY statement can cause unpredictable results. If you need to make a change, allow the statement to complete, drop the table, and then retry.

You can use ALTER TABLE to change the data types of columns instead of dropping and recreating the table.

You can use CREATE EXTERNAL TABLE AS COPY with any types except types from the Place package.

Note: Vertica does not create superprojections for external tables, since external tables are not stored in the database.

Syntax

CREATE EXTERNAL TABLE [ IF NOT EXISTS ] [[database.]schema.]table-name
  ... ( column-definition[,...] )
  {[INCLUDE | EXCLUDE] [SCHEMA] PRIVILEGES}
  AS COPY
  ... [ ( { column-as-expression | column }]
  ........ [ DELIMITER [ AS ] 'char' ]
  ........ [ ENCLOSED [ BY ] 'char' ]
  ........ [ ENFORCENOSIZE ]
  ........ [ ESCAPE [ AS ] 'char' | NO ESCAPE ]
  ........ [ FILLER datatype ]
  ........ [ FORMAT 'format' ]
  ........ [ NULL [ AS ] 'string' ]
  ........ [ TRIM 'byte' ]
  ... [, ... ) ]
  ... [ COLUMN OPTION ( column
  ........ [ DELIMITER [ AS ] 'char' ]
  ........ [ ENCLOSED [ BY ] 'char' ]
  ........ [ ENFORCENOSIZE ]
  ........ [ ESCAPE [ AS ] 'char' | NO ESCAPE ]
  ........ [ FORMAT 'format' ]
  ........ [ NULL [ AS ] 'string' ]
  ........ [ TRIM 'byte' ]
  ... [, ... ) ]
  [ FROM
  ... 'pathToData'[,,...] [ ON nodename | ON ANY NODE | ON (nodeset) ]
  ... [ WITH ] SOURCE source([arg=value [,,...]] ) ]
  ........ [ BZIP | GZIP | LZO | UNCOMPRESSED ] [, ...]
  ........ [ NATIVE ]
  ........ [ FIXEDWIDTH COLSIZES ( [ integer ] [, ...])
  ........ [ NATIVE VARCHAR ]
  ........ [ ORC ]
  ........ [ PARQUET ]
  ...]
  ... [ ABORT ON ERROR ]
  ... [ DELIMITER [ AS ] 'char' ]
  ... [ ENCLOSED BY 'char' [ AND 'char' ] ]
  ... [ ENFORCENOSIZE ]
  ... [ ERROR TOLERANCE ]
  ... [ ESCAPE AS 'char' | NO ESCAPE ]
  ... [ EXCEPTIONS 'path' [ ON nodename ] [, ... ]]
  ... [ WITH ] [... [ FILTER filter([arg=value [,,...]] ) ] ] [...]

Parameters

For all supported parameters, see the `CREATE TABLE` and `COPY` statements. For information on using this statement with UDLs see `Load (UDLs)`.

For additional guidance on using COPY parameters, see `Specifying COPY FROM Options`.

Privileges

Superuser, or non-superuser with the following privileges:

- READ privileges on the USER-accessible storage location, see `GRANT (Storage Location)`
- Full access (including SELECT) to an external table that the user has privileges to create

Examples

The following example defines an external table for data stored in HDFS:

```sql
=> CREATE EXTERNAL TABLE sales (itemID INT, date DATE, price FLOAT) AS COPY FROM 'hdfs:///dat/ext1.csv' DELIMITER ',';
```

The following example uses data in the Parquet format that is stored in S3:

```sql
=> CREATE EXTERNAL TABLE sales (itemID INT, date DATE, price FLOAT) AS COPY FROM 's3://datalake/sales/*.parquet' PARQUET;
```

When using the ORC and Parquet formats, Vertica supports some additional options in the COPY statement. See `Reading ORC and Parquet Formats`.

If ORC or Parquet data is partitioned, Vertica expects Hive-style partitioning. If you see unexpected results when reading data, verify that globs in your file paths correctly align with the partition structure. See `Troubleshooting Reads from ORC and Parquet Files`.
The following example creates an external table using partitioned data in the ORC format. The table includes four columns. Two columns, "id" and "name", are in the data files. The other two, "created" and "region", are partition columns. For more about partition columns, see Using Partition Columns.

```sql
=> CREATE EXTERNAL TABLE t (id int, name varchar(50), created date, region varchar(50))
    AS COPY 'hdfs:///path/*//*'
    ORC(hive_partition_cols='created,region');
```

The following examples create external tables from data in the local file system:

```sql
=> CREATE EXTERNAL TABLE ext1 (x integer) AS COPY FROM '/tmp/ext1.dat' DELIMITER ',';
=> CREATE EXTERNAL TABLE ext2 (x integer) AS COPY FROM '/tmp/ext2.dat.bz2' BZIP DELIMITER ',';
=> CREATE EXTERNAL TABLE ext3 (x integer, y integer) AS COPY (x as '5', y) FROM '/tmp/ext3.dat.bz2'
    BZIP DELIMITER ',';
```

To allow users without superuser access to use external tables with data on the local file system or S3, create a location for 'user' usage and grant access to it. This example shows granting access to a user named Bob to any external table whose data is located under /tmp (including in subdirectories to any depth):

```sql
=> CREATE LOCATION '/tmp' ALL NODES USAGE 'user';
=> GRANT ALL ON LOCATION '/tmp' to Bob;
```

The following example shows CREATE EXTERNAL TABLE using a user-defined source:

```sql
=> CREATE SOURCE curl AS LANGUAGE 'C++' NAME 'CurlSourceFactory' LIBRARY curllib;
=> CREATE EXTERNAL TABLE curl_table1 as COPY SOURCE CurlSourceFactory;
```

See Also

Creating External Tables in the Administrator's Guide

**CREATE FAULT GROUP**

Creates a fault group, which can contain the following:

- One or more nodes
- One or more child fault groups
- One or more nodes and one or more child fault groups
The `CREATE FAULT GROUP` statement creates an empty fault group. You must run the `ALTER FAULT GROUP` statement to add nodes or other fault groups to an existing fault group.

**Syntax**

```
CREATE FAULT GROUP  name
```

**Parameters**

| name | The name of the fault group to create, unique among all fault groups, where name conforms to conventions described in Identifiers. |

**Privileges**

Superuser

**Example**

The following command creates a fault group called `parent0`:

```
=> CREATE FAULT GROUP parent0;
```

To add nodes or other fault groups to the `parent0` fault group, run the `ALTER FAULT GROUP` statement.

**See Also**

- `V_CATALOG.FAULT_GROUPS`
- `V_CATALOG.CLUSTER_LAYOUT`
- Fault Groups
- High Availability With Fault Groups
CREATE FLEX TABLE

Creates a flex table in the logical schema. Declaring columns (or other supported parameters) is optional. If you do not declare any column definitions, the statement creates two columns automatically:

- __raw__ : A LONG VARBINARY type column to store any unstructured data you load. This column has a NOT NULL constraint by default.
- __identity__ : An IDENTITY column. Flex tables use this value for segmentation and sorting, when no other column definition exists.

Additionally, creating any flex table results in three associated objects:

- A flex table (flex_table) named in this statement
- A related keys table, called flex_table_keys
- A related view, called flex_table_view

Both the flex table and its associated _keys table are required to use flex tables successfully. The _keys table and _view are subservient objects of the flex table. Neither can exist without the flex table.

For more details about creating and using flex tables, see Creating Flex Tables and other sections in Using Flex Tables.

CREATE FLEX TABLE supports many of the parameters available when creating columnar tables, but not all. This section presents the optional use of column definitions, and the subset of supported parameters.

You can also create flex external tables, with some syntactical variations, as described in CREATE FLEX EXTERNAL TABLE AS COPY.

You cannot partition a flex table on any virtual column (key).

Note: Vertica does not support flexible global temporary tables.

Syntax

```
CREATE {FLEX | FLEXIBLE} TABLE [ IF NOT EXISTS ] [ [database.]schema.]table-name { ... ( [ column-definition[,..] ] ) ... | [ table-constraint ( column_name[,..] ) ]
```
... | [ column-name-list (create table) ]

... [ {INCLUDE | EXCLUDE) [SCHEMA] PRIVILEGES ]
... [ ORDER BY table-column[,..] ]
... [ ENCODED BY column-definition[,...]
... [ hash-segmentation-clause
..... | UNSEGMENTED { NODE node | ALL NODES } ]
... [ KSAFE [k_num] ]
... [ PARTITION BY partition-expression]
... [ AS SELECT (column-name-list) FROM (table-name) ]

Parameters

See the CREATE TABLE statement for all parameter descriptions.

Unsupported CREATE Flex Table Option

You cannot use the following options when creating a flex table:

... AS [COPY] [ [ AT EPOCH LATEST ] ... [ AT TIME 'timestamp' ] ]
......[/*+ direct */ ] query
... | [ LIKE [schema.]existing-table [ INCLUDING PROJECTIONS | EXCLUDING PROJECTIONS ] ]

Default Flex Table and Keys Table Projections

Vertica automatically creates superprojections for both the flex table and keys tables when you create them.

If you create a flex table with one or more of the ORDER BY, ENCODED BY, SEGMENTED BY, or KSAFE clauses, the clause information is used to create projections. If no clauses are in use, Vertica uses the following defaults for unspecified aspects:

<table>
<thead>
<tr>
<th>Table</th>
<th>order_by</th>
<th>encoded_by</th>
<th>Segmentation</th>
<th>Ksafe</th>
</tr>
</thead>
<tbody>
<tr>
<td>flexible table</td>
<td><em>identity</em></td>
<td>none</td>
<td>by hash <em>identity</em></td>
<td>1</td>
</tr>
<tr>
<td>keys_table</td>
<td>frequency</td>
<td>none</td>
<td>replicated/unsegmented all nodes</td>
<td>1</td>
</tr>
</tbody>
</table>

Note: When you build a view for a flex table (see BUILD_FLEXTABLE_VIEW), the view is ordered by frequency, desc, and key_name.
Privileges

CREATE privileges on the table schema.

Examples

The following example creates a flex table named `darkdata` without specifying any column information. Vertica creates a default superprojection and buddy projection as part of creating the table:

```
=> CREATE FLEXIBLE TABLE darkdata();
CREATE TABLE
```

The following example creates a table called `darkdata1` with one column definition (`date_col`). The statement specifies the `partition by` clause to partition the data by year. Vertica creates a default superprojection and buddy projections as part of creating the table:

```
=> CREATE FLEX TABLE darkdata1 (date_col date NOT NULL) partition by extract('year' from date_col);
CREATE TABLE
```

See Also

- `CREATE FLEX EXTERNAL TABLE AS COPY`
- Creating Flex Tables in the Administrator's Guide

**CREATE FLEX EXTERNAL TABLE AS COPY**

The `CREATE FLEX EXTERNAL TABLE AS COPY` statement creates a flexible external table. This statement is a combination of the `CREATE FLEX TABLE` and `COPY` statements, supporting a subset of each statement's parameters. You can also use user-defined load extension functions (UDLs) to create external flex tables. For more information about UDL syntax, see User Defined Load (UDL) and `COPY`. For more details about creating and using flex tables, see Using Flex Tables.

**Note:** Vertica does not create a superprojection for an external table when you create it.
For details about creating and using flex tables, see Creating Flex Tables in Using Flex Tables.

Caution: Canceling a CREATE FLEX EXTERNAL TABLE AS COPY statement can cause unpredictable results. Vertica recommends that you allow the statement to finish, then use DROP TABLE after the table exists.

Syntax

CREATE {FLEX | FLEXIBLE} EXTERNAL TABLE [ IF NOT EXISTS ] [[database.]schema.]table-name {
... ( [ column-definition[,..] ] )
} [INCLUDE | EXCLUDE [SCHEMA] PRIVILEGES]
... AS COPY .... [ ( { column-as-expression | column } [ FILLER datatype ] ]
[ FROM
... 'pathToData' [ ON nodename | ON ANY NODE | ON (nodeset) ]
...... [ BZIP | GZIP | LZO | UNCOMPRESSED ] [,..]
...[ WITH ]
...[ SOURCE source(arg='value'))]
...[ FILTER filter(arg='value') ]
...[ PARSER flexparser(arg='value') ]
...[ DELIMITER [ AS ] 'char' ]
...[ TRAILING NULLCOLS ]
...[ NULL [ AS ] 'char' ]
...[ ESCAPE [ AS ] 'char' ]
...[ ENCLOSED [ BY ] 'char' ]
...[ RECORD TERMINATOR 'string']
...[ SKIP integer ]
...[ SKIP BYTES integer ]
...[ TRIM 'byte' ]
...[ REJECTMAX integer ]
...[ EXCEPTIONS 'path' [ ON nodename ] [,..] ]
...[ REJECTED DATA 'path' [ ON nodename ] [,..] ]
...[ ENFORCELENGTH ]
...[ ABORT ON ERROR ]

Parameters

See CREATE TABLE and COPY parameters for all parameter descriptions.

Excluded Parameters

CREATE FLEXIBLE EXTERNAL TABLE AS COPY does not support the following parameters:

<table>
<thead>
<tr>
<th>CREATE TABLE</th>
</tr>
</thead>
<tbody>
<tr>
<td>AS AT EPOCH</td>
</tr>
<tr>
<td>AT TIME 'timestamp'</td>
</tr>
</tbody>
</table>
CREATE TABLE

ORDER BY
ENCODED BY
hash-segmentation-clause
unsegmented-clause
KSAFE k-num
PARTITION BY

COPY

FROM STDIN
FROM LOCAL
DIRECT
TRICKLE
NO COMMIT

Privileges

Superuser, or non-superuser with the following privileges:

- READ privileges on the USER-accessible storage location, see GRANT (Storage Location)
- Full access (including SELECT) to an external table that the user has privileges to create

Examples

To create an external flex table:

```sql
=> CREATE flex external table mountains() AS COPY FROM 'home/release/KData/kmm_ountains.json' PARSER fjsonparser();
CREATE TABLE
```

As with other flex tables, creating an external flex table produces two regular tables: the named table and its associated _keys table. The keys table is not an external table:

```sql
=> \dt mountains
List of tables
<table>
<thead>
<tr>
<th>Schema</th>
<th>Name</th>
<th>Kind</th>
<th>Owner</th>
<th>Comment</th>
</tr>
</thead>
</table>
```
You can use the helper function, `COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW`, to compute keys and create a view for the external table:

```sql
=> SELECT compute_flextable_keys_and_build_view ('appLog');
```

Please see `public.appLog_keys` for updated keys
The view `public.appLog_view` is ready for querying

(1 row)

1. Check the keys from the `_keys` table for the results of running the helper application:

```sql
=> SELECT * FROM appLog_keys;
```

<table>
<thead>
<tr>
<th>key_name</th>
<th>frequency</th>
<th>data_type_guess</th>
</tr>
</thead>
<tbody>
<tr>
<td>contributors</td>
<td>8</td>
<td>varchar(20)</td>
</tr>
<tr>
<td>coordinates</td>
<td>8</td>
<td>varchar(20)</td>
</tr>
<tr>
<td>created_at</td>
<td>8</td>
<td>varchar(60)</td>
</tr>
<tr>
<td>entities.hashtags</td>
<td>8</td>
<td>long varbinary(186)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>retweeted_status.user.time_zone</td>
<td>1</td>
<td>varchar(20)</td>
</tr>
<tr>
<td>retweeted_status.user.url</td>
<td>1</td>
<td>varchar(68)</td>
</tr>
<tr>
<td>retweeted_status.user.utc_offset</td>
<td>1</td>
<td>varchar(20)</td>
</tr>
<tr>
<td>retweeted_status.user.verified</td>
<td>1</td>
<td>varchar(20)</td>
</tr>
</tbody>
</table>

(125 rows)

2. Query from the external flex table view:

```sql
=> SELECT "user.lang" FROM appLog_view;
```

```
<table>
<thead>
<tr>
<th>user.lang</th>
</tr>
</thead>
<tbody>
<tr>
<td>it</td>
</tr>
<tr>
<td>en</td>
</tr>
<tr>
<td>es</td>
</tr>
<tr>
<td>en</td>
</tr>
<tr>
<td>es</td>
</tr>
<tr>
<td>tr</td>
</tr>
<tr>
<td>en</td>
</tr>
</tbody>
</table>
```

CREATE FUNCTION Statements

CREATE FUNCTION statements can create two different kinds of functions:

- User defined SQL functions let you define and store commonly-used SQL expressions as a function. User defined SQL functions are useful for executing complex queries and combining Vertica built-in functions. You simply call the function name you assigned in your query.

- User defined scalar functions (UDSFs) take in a single row of data and return a single value. These functions can be used anywhere a native Vertica function or statement can be used, except CREATE TABLE with its PARTITION BY or any segmentation clause.

While you use CREATE FUNCTION to create both SQL and scalar functions, you use a different syntax for each function type. For more information, see:

- CREATE FUNCTION (SQL Functions)
- CREATE FUNCTION (UDF)

About Creating User Defined Transform Functions (UDTFs)

You can use a similar SQL statement to create user-defined transform functions. User defined transform functions (UDTFs) operate on table segments and return zero or more rows of data. The data they return can be an entirely new table, unrelated to the schema of the input table, including having its own ordering and segmentation expressions. They can only be used in a query's SELECT list. For details about creating a UDTF, see CREATE TRANSFORM FUNCTION.
CREATE AGGREGATE FUNCTION

Adds a user-defined aggregate function (UDAF) stored in a shared Linux library to the catalog. You must have already loaded this library using the CREATE LIBRARY statement. When you call the SQL function, Vertica passes data values to the code in the library to process it.

Syntax

```sql
CREATE [ OR REPLACE ] AGGREGATE FUNCTION [[database.]schema.]function
... AS [LANGUAGE 'language'] NAME 'factory' LIBRARY library;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OR REPLACE</td>
<td>If you do not supply this parameter, CREATE AGGREGATE FUNCTION fails if an existing function matches the name and parameters of the function you are trying to define. If you do supply this parameter, the new function definition overwrites the old.</td>
</tr>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject</td>
</tr>
<tr>
<td><code>function</code></td>
<td>Identifies the function to create, where <code>function</code> conforms to conventions described in Identifiers. Tip: This name does not need to match the name of the factory, but it is less confusing if they are the same or similar.</td>
</tr>
<tr>
<td><code>LANGUAGE 'Language'</code></td>
<td>The language used to develop this function, currently C++ only. Default value: C++</td>
</tr>
<tr>
<td><code>NAME 'factory'</code></td>
<td>The name of the factory class in the shared library that generates the object to handle the function's processing.</td>
</tr>
</tbody>
</table>
LIBRARY  *Library*  The name of the shared library that contains the C++ object to perform the processing for this function. This library must have been previously loaded using the `CREATE LIBRARY` statement.

**Notes**

- The parameters and return value for the function are automatically determined by the `CREATE AGGREGATE FUNCTION` statement, based on data supplied by the factory class.

- When a User Defined Aggregate function that is defined multiple times with arguments of different data types is called, Vertica selects the function whose input parameters match the parameters in the function call to perform the processing.

- You can return a list of all SQL functions and User Defined Functions (including aggregates) by querying the system table `V_CATALOG.USER_FUNCTIONS` or executing the `vsql` meta-command `\df`. Users see only the functions on which they have `EXECUTE` privileges.

**Privileges**

- Only a superuser can create or drop a User Defined Aggregate library.

- To create a User Defined Aggregate function, the user must have `CREATE` and `USAGE` privileges on the schema and `USAGE` privileges on the library.

- To use a User Defined Aggregate, the user must have `USAGE` privileges on the schema and `EXECUTE` privileges on the defined function. See `GRANT (User Defined Extension)` and `REVOKE (User Defined Extension)`.

**Examples**

The following example demonstrates loading a library named `AggregateFunctions` then defining a function named `ag_avg` and `ag_cat` that are mapped to the `ag_cat` `AverageFactory` and `ConcatenateFactory` classes in the library:

```sql
=> CREATE LIBRARY AggregateFunctions AS '/opt/vertica/sdk/examples/build/AggregateFunctions.so';
CREATE LIBRARY
=> CREATE AGGREGATE FUNCTION ag_avg AS LANGUAGE 'C++' NAME 'AverageFactory'
   library AggregateFunctions;
CREATE AGGREGATE FUNCTION
=> CREATE AGGREGATE FUNCTION ag_cat AS LANGUAGE 'C++' NAME 'ConcatenateFactory'
   library AggregateFunctions;
```
CREATE AGGREGATE FUNCTION
=> \x
Expanded display is on.
select * from user_functions;

CREATE ANALYTIC FUNCTION

Associates a User Defined Analytic Function (UDAnF) stored in a shared Linux library with a SQL function name. You must have already loaded the library containing the UDAnF using the
CREATE LIBRARY statement. When you call the SQL function, Vertica passes the arguments to the analytic function in the library to process.

Syntax

```
CREATE [ OR REPLACE ] ANALYTIC FUNCTION function-name
    ... AS [ LANGUAGE 'language' ] NAME 'factory'
    ... LIBRARY library_name
    ... [ FENCED | NOT FENCED ];
```

Parameters

<table>
<thead>
<tr>
<th><strong>function-name</strong></th>
<th>The name to assign to the UDAnF. This is the name you use in your SQL statements to call the function.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>LANGUAGE 'language'</strong></td>
<td>The language used to develop this function, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• C++ (default)</td>
</tr>
<tr>
<td></td>
<td>• Java</td>
</tr>
<tr>
<td><strong>NAME 'factory'</strong></td>
<td>The name of the C++ factory class in the shared library that generates the object to handle the function's processing.</td>
</tr>
<tr>
<td><strong>LIBRARY library-name</strong></td>
<td>The name of the shared library that contains the C++ object to perform the processing for this function. This library must have been previously loaded using the CREATE LIBRARY statement.</td>
</tr>
<tr>
<td>**FENCED</td>
<td>NOT FENCED**</td>
</tr>
<tr>
<td></td>
<td><strong>Default Value:</strong> FENCED</td>
</tr>
</tbody>
</table>

Privileges

- To create a function, the user must have CREATE privilege on the schema to contain the function and USAGE privilege on the library containing the function.

- To use a function, the user must have USAGE privilege on the schema that contains the function and EXECUTE privileges on the function.
To drop a function, the user must either be a superuser, the owner of the function, or the owner of the schema which contains the function.

Usage Considerations

- The parameters and return value for the function are automatically determined by the `CREATE ANALYTIC FUNCTION` statement, based on data supplied by the factory class.
- You can assign multiple functions the same name if they accept different sets of arguments. See Overloading Your UDx in Extending Vertica for more information.
- You can return a list of all UDFs by querying the system table `V_CATALOG.USER_FUNCTIONS`. Users see only the functions on which they have EXECUTE privileges.

Examples

This example shows how to create an analytic function named an_rank based on the factory class named RankFactory in the AnalyticFunctions library..

```sql
=> CREATE ANALYTIC FUNCTION an_rank AS LANGUAGE 'C++'
    NAME 'RankFactory' LIBRARY AnalyticFunctions;
```

See Also

Analytic Functions (UDAnFs)

CREATE FILTER

Adds a user-defined load filter function. You must have already loaded this library using the `CREATE LIBRARY` statement. When you call the SQL function, Vertica passes the parameters to the function in the library to process it.

Syntax

```sql
CREATE [ OR REPLACE ] FILTER [[database.]schema.]function
... AS [LANGUAGE 'Language'] NAME 'factory' LIBRARY library
... [ FENCED | NOT FENCED ];
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OR REPLACE</td>
<td>If you do not supply this parameter, the CREATE FILTER statement fails if an existing function matches the name and parameters of the filter function you are trying to define. If you do supply this parameter, the new filter function definition overwrites the old.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject \nmyschema.thisDbObject</td>
</tr>
<tr>
<td>function</td>
<td>The name of the filter function to create. If the filter function name is schema-qualified (as above), the function is created in the specified schema. This name does not need to match the name of the factory, but it is less confusing if they are the same or similar.</td>
</tr>
</tbody>
</table>
| LANGUAGE 'language' | The language used to develop this function, one of the following:  
  • C++ (default)  
  • Java                                                                                                                                                                                                                                                                         |
| NAME 'factory'  | The name of the factory class in the shared library that generates the object to handle the filter function's processing. This is the same name used by the RegisterFactory class.                                                                                                                                               |
| LIBRARY Library | The name of the shared library that contains the C++ object to perform the processing for this filter function. This library must have been previously loaded using the CREATE LIBRARY statement.                                                                                                                                     |
| FENCED | NOT FENCED | Enables or disables Fenced Mode for this function. Fenced mode is enabled by default.                                                                                                                                                                                                                                                      |
Privileges

- Only a superuser can create or drop a function that uses a UDx library.
- To use a User Defined Filter, the user must have USAGE privileges on the schema and EXECUTE privileges on the defined filter function. See Grant (User Defined Extension) and Revoke (User Defined Extension).

Important: Installing an untrusted UDL function can compromise the security of the server. UDx's can contain arbitrary code. In particular, UD Source functions can read data from any arbitrary location. It is up to the developer of the function to enforce proper security limitations. Superusers must not grant access to UDx’s to untrusted users.

Notes

- The parameters and return value for the filter function are automatically determined by the CREATE FILTER statement, based on data supplied by the factory class.
- You can return a list of all SQL functions and User Defined Functions by querying the system table V_CATALOG.USER_FUNCTIONS or executing the vsqi meta-command \d f. Users see only the functions on which they have EXECUTE privileges.

Example

The following example demonstrates loading a library named iConverterLib, then defining a function named Iconverter that is mapped to the iConverterFactory factory class in the library:

```sql
=> CREATE LIBRARY iConverterLib as '/opt/vertica/sdk/examples/build/iConverterLib.so';
CREATE LIBRARY
=> CREATE FILTER Iconverter AS LANGUAGE 'C++' NAME 'IconverterFactory' LIBRARY iConverterLib;
CREATE FILTER FUNCTION
=> \x
Expanded display is on.
=> SELECT * FROM user_functions;
- [ RECORD 1 ]-----------------------------
schema_name | public
function_name | Iconverter
procedure_type | User Defined Filter
function_return_type |
function_argument_type |
function_definition |
volatility |
is_strict | f
```

CREATE FUNCTION (SQL Functions)

Lets you store SQL expressions as functions in Vertica for use in queries. These functions are useful for executing complex queries or combining Vertica built-in functions. You simply call the function name you assigned.

Note: This topic describes how to use CREATE FUNCTION to create a SQL function. If you want to create a user-defined scalar function (UDSF), see CREATE FUNCTION (UDF).

In addition, if you want to see how to create a user-defined transform function (UDTF), see CREATE TRANSFORM FUNCTION.

Syntax

CREATE [ OR REPLACE ] FUNCTION
... [[database.]schema.]function( [ argname argtype[,..] ] )
... RETURN rettype
... AS
... BEGIN
...... RETURN expression;
... END;
Parameters

[ database.]schema

Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:

myschema.thisDbObject

If you specify a database, it must be the current database.

function

Specifies a name for the SQL function to create, where function conforms to conventions described in Identifiers. When using more than one schema, specify the schema that contains the function, as noted above.

argname

Specifies the name of the argument.

argtype

Specifies the data type for argument that is passed to the function. Argument types must match Vertica type names. See SQL Data Types.

rettype

Specifies the data type to be returned by the function.

RETURN expression;

Specifies the SQL function (function body), which must be in the form of ‘RETURN expression.’ expression can contain built-in functions, operators, and argument names specified in the CREATE FUNCTION statement.

A semicolon at the end of the expression is required.

Note: Only one RETURN expression is allowed in the CREATE FUNCTION definition. FROM, WHERE, GROUP BY, ORDER BY, LIMIT, aggregation, analytics, and meta function are not allowed.

Privileges

- To create a function, the user must have CREATE privilege on the schema to contain the function and USAGE privilege on the library containing the function.
To use a function, the user must have USAGE privilege on the schema that contains the function and EXECUTE privileges on the function.

To drop a function, the user must either be a superuser, the owner of the function, or the owner of the schema which contains the function.

See GRANT (User Defined Extension) and REVOKE (User Defined Extension).

Notes

- A SQL function can be used anywhere in a query where an ordinary SQL expression can be used, except in the table partition clause or the projection segmentation clause.

- SQL Macros are flattened in all cases, including DDL.

- You can create views on the queries that use SQL functions and then query the views. When you create a view, a SQL function replaces a call to the user-defined function with the function body in a view definition. Therefore, when the body of the user-defined function is replaced, the view should also be replaced.

- If you want to change the body of a SQL function, use the CREATE OR REPLACE syntax. The command replaces the function with the new definition. If you change only the argument name or argument type, the system maintains both versions under the same function name. See Examples section below.

- If multiple SQL functions with same name and argument type are in the search path, the first match is used when the function is called.

- The strictness and volatility (stable, immutable, or volatile) of a SQL Macro are automatically inferred from the function's definition. Vertica then determines the correctness of usage, such as where an immutable function is expected but a volatile function is provided.

- You can return a list of all SQL functions by querying the system table V_CATALOG.USER_FUNCTIONS and executing the vsql meta-command \df. Users see only the functions on which they have EXECUTE privileges.

Example

This following statement creates a SQL function called myzeroifnull that accepts an INTEGER argument and returns an INTEGER result.
CREATE FUNCTION myzeroifnull(x INT) RETURN INT
AS BEGIN
    RETURN (CASE WHEN (x IS NOT NULL) THEN x ELSE 0 END);
END;

You can use the new SQL function (myzeroifnull) anywhere you use an ordinary SQL expression. For example, create a simple table:

CREATE TABLE tabwnulls(col1 INT);
INSERT INTO tabwnulls VALUES(1);
INSERT INTO tabwnulls VALUES(NULL);
INSERT INTO tabwnulls VALUES(0);
SELECT * FROM tabwnulls;

You can use the myzeroifnull function in a SELECT statement, where the function calls col1 from table tabwnulls:

SELECT myzeroifnull(col1) FROM tabwnulls;

Use the myzeroifnull function in the GROUP BY clause:

SELECT COUNT(*) FROM tabwnulls GROUP BY myzeroifnull(col1);

If you want to change a SQL function's body, use the CREATE OR REPLACE syntax. The following command modifies the CASE expression:

CREATE OR REPLACE FUNCTION zerowhennull(x INT) RETURN INT
AS BEGIN
    RETURN (CASE WHEN (x IS NULL) THEN 0 ELSE x END);
END;

To see how this information is stored in the Vertica catalog, see Viewing Information About SQL Functions in Extending Vertica.
See Also

- ALTER FUNCTION (UDF)
- DROP FUNCTION
- GRANT (User Defined Extension)
- REVOKE (User Defined Extension)
- USER_FUNCTIONS
- Using User-Defined SQL Functions

CREATE FUNCTION (UDF)

Adds a user-defined function (UDF) to the catalog. You must have already loaded this library using the CREATE LIBRARY statement. When you call the SQL function, Vertica passes the parameters to the function in the library to process it.

Note: This topic describes how to use CREATE FUNCTION to create a User Defined Function. If you want to create a SQL function, see CREATE FUNCTION (SQL Function).

In addition, if you want to create a user-defined transform function (UDTF), see CREATE TRANSFORM FUNCTION.

Syntax

```
CREATE [ OR REPLACE ] FUNCTION [
[database.]schema.]function ...
AS [ LANGUAGE 'language' ] NAME 'factory' LIBRARY library [ FENCED | NOT FENCED ];
```

Parameters

| OR REPLACE  | If you do not supply this parameter, the CREATE FUNCTION statement fails if an existing function matches the name and parameters of the function you are trying to define. If you do supply this parameter, the new function definition overwrites the old. |
[database.]schema

Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:

myschema.thisDbObject

If you specify a database, it must be the current database.

function

The name of the function to create, where function conforms to conventions described in Identifiers. If the function name is schema-qualified (as above), the function is created in the specified schema. This name does not need to match the name of the factory, but it is less confusing if they are the same or similar.

LANGUAGE 'Language'

The language used to develop this function, one of the following:

- C++
- Python
- Java
- R

NAME 'factory'

The name of the factory class in the shared library that generates the object to handle the function's processing.

LIBRARY library

The name of the file that contains the C++ library, Python file, Java Jar file, or R functions file to perform the processing for this function. This library must have been previously loaded using the CREATE LIBRARY statement.

FENCED | NOT FENCED

Enables or disables Fenced Mode for this function. Fenced mode is enabled by default. Functions written in Java and R always run in fenced mode.

Privileges

- To create a function, the user must have CREATE privilege on the schema to contain the function and USAGE privilege on the library containing the function.
- To use a function, the user must have USAGE privilege on the schema that contains the function and EXECUTE privileges on the function.

- To drop a function, the user must either be a superuser, the owner of the function, or the owner of the schema which contains the function.

Notes

- The parameters and return value for the function are automatically determined by the CREATE FUNCTION statement, based on data supplied by the factory class.

- Multiple functions can share the same name if they have different parameters. When you call a multiply-defined function, Vertica selects the UDF function whose input parameters match the parameters in the function call to perform the processing. This behavior is similar to having multiple signatures for a method or function in other programming languages.

- You can return a list of all SQL functions and UDFs by querying the system table V_CATALOG.USER_Functions or executing the vsql meta-command \df. Users see only the functions on which they have EXECUTE privileges.

Examples

The following example demonstrates loading a library named scalarfunctions, then defining a function named Add2Ints that is mapped to the Add2IntsInfo factory class in the library:

```
=> CREATE LIBRARY ScalarFunctions AS '/opt/vertica/sdk/examples/build/ScalarFunctions.so';
CREATE LIBRARY

=> CREATE FUNCTION Add2Ints AS LANGUAGE 'C++' NAME 'Add2IntsFactory' LIBRARY ScalarFunctions;
CREATE FUNCTION

=> \x
Expanded display is on.
=> SELECT * FROM USER_FUNCTIONS;

- [ RECORD 1 ]---------------------------------------------------------------
schema_name | public
function_name | Add2Ints
procedure_type | User Defined Function
function_return_type | Integer
function_argument_type | Integer, Integer
function_definition | Class 'Add2IntsFactory' in Library 'public.ScalarFunctions'
volatility | volatile
is_strict | f
is_fenced | t
```
comment | => \x
Expanded display is off.
=> -- Try a simple call to the function
=> SELECT Add2Ints(23,19);
Add2Ints
----------
   42
(1 row)

Developing User-Defined Extensions (UDxs)

CREATE PARSER

Adds a user-defined load parser function. You must have already loaded this library using the CREATE LIBRARY statement. When you call the SQL function, Vertica passes the parameters to the function in the library to process it.

Syntax

CREATE [ OR REPLACE ] PARSER [[database.]schema.]function
... AS [ LANGUAGE 'language' ] NAME 'factory' LIBRARY library
... [ FENCED | NOT FENCED ];

Parameters

<table>
<thead>
<tr>
<th>OR REPLACE</th>
<th>If you do not supply this parameter, the CREATE PARSER statement fails if an existing function matches the name and parameters of the parser function you are trying to define. If you do supply this parameter, the new parser function definition overwrites the old.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>[database.]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
</table>

myschema.thisDbObject
<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>function</code></td>
<td>The name of the parser function to create. If the parser function name is schema-qualified (as above), the function is created in the specified schema. This name does not need to match the name of the factory, but it is less confusing if they are the same or similar.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><code>LANGUAGE 'Language'</code></th>
<th>The language used to develop this function, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>- C++ (default)</td>
<td></td>
</tr>
<tr>
<td>- Java</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><code>NAME 'factory'</code></th>
<th>The name of the factory class in the shared library that generates the object to handle the parser function's processing.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>This is the same name used by the RegisterFactory class.</td>
</tr>
</tbody>
</table>

| `LIBRARY Library`    | The name of the shared library that contains the C++ object to perform the processing for this parser function. This library must have been previously loaded using the CREATE LIBRARY statement. |

<table>
<thead>
<tr>
<th>`FENCED</th>
<th>NOT FENCED`</th>
<th>Enables or disables Fenced Mode for this function.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default Value:</strong></td>
<td>FENCED</td>
<td></td>
</tr>
</tbody>
</table>

**Privileges**

- Only a superuser can create or drop a function that uses a U Dx library.

- To use a User Defined Parser, the user must have USAGE privileges on the schema and EXECUTE privileges on the defined parser function. See **GRANT (User Defined Extension)** and **REVOKE (User Defined Extension)**.

**Important:** Installing an untrusted UDL function can compromise the security of the server. U Dx's can contain arbitrary code. In particular, UD Source functions can read data from any arbitrary location. It is up to the developer of the function to enforce proper security limitations. Superusers must not grant access to U Dx's to untrusted users.
Notes

- The parameters and return value for the parser function are automatically determined by the CREATE PARSER statement, based on data supplied by the factory class.

- You can return a list of all SQL functions and User Defined Functions by querying the system table V_CATALOG.USER_FUNCTIONS or executing the vsql meta-command \df. Users see only the functions on which they have EXECUTE privileges.

Example

The following example demonstrates loading a library named BasicIntegerParserLib, then defining a function named BasicIntegerParser that is mapped to the BasicIntegerParserFactory library class in the library:

```
=> CREATE LIBRARY BasicIntegerParserLib as '/opt/vertica/sdk/examples/build/BasicIntegerParser.so';
CREATE LIBRARY
=> CREATE PARSER BasicIntegerParser AS LANGUAGE 'C++' NAME 'BasicIntegerParserFactory' LIBRARY
BasicIntegerParserLib;
CREATE PARSER FUNCTION
=> \x
Expanded display is on.
=> SELECT * FROM user_functions;

- CREATE LIBRARY
- DROP PARSER
- GRANT (User Defined Extension)
- REVOKE (User Defined Extension)
CREATE SOURCE

Adds a user-defined load source function. You must have already loaded this library using the CREATE LIBRARY statement. When you call the SQL function, Vertica passes the parameters to the function in the library to process it.

Syntax

```
CREATE [ OR REPLACE ] SOURCE [[database.]schema.]function
... AS LANGUAGE 'language' NAME 'factory' LIBRARY Library
... [ FENCED | NOT FENCED ];
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OR REPLACE</td>
<td>If you do not supply this parameter, the CREATE SOURCE statement fails if an existing function matches the name and parameters of the source function you are trying to define. If you do supply this parameter, the new source function definition overwrites the old.</td>
</tr>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than <code>public</code>, you must supply the schema name. For example: <code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td><code>function</code></td>
<td>The name of the source function to create. If the source function name is schema-qualified (as above), the function is created in the specified schema. This name does not need to match the name of the factory, but it is less confusing if they are the same or similar.</td>
</tr>
<tr>
<td><code>LANGUAGE 'language'</code></td>
<td>The language used to develop this function, one of the following:</td>
</tr>
<tr>
<td>NAME</td>
<td>'factory'</td>
</tr>
<tr>
<td>------</td>
<td>----------</td>
</tr>
<tr>
<td>LIBRARY</td>
<td>Library</td>
</tr>
<tr>
<td>FENCED</td>
<td>NOT FENCED</td>
</tr>
</tbody>
</table>

### Privileges

- Only a superuser can create or drop a function that uses a UDx library.

- To use a User Defined Source, the user must have USAGE privileges on the schema and EXECUTE privileges on the defined source function. See [GRANT (User Defined Extension)](https://docs.vertica.com/9.1.x/vertica_analytic_database_manual/03_sql_reference_manual/03_4_40_authorizing_udx.html) and [REVOKE (User Defined Extension)](https://docs.vertica.com/9.1.x/vertica_analytic_database_manual/03_sql_reference_manual/03_4_40_authorizing_udx.html).

**Important:** Installing an untrusted UDL function can compromise the security of the server. UDx's can contain arbitrary code. In particular, UD Source functions can read data from any arbitrary location. It is up to the developer of the function to enforce proper security limitations. Superusers must not grant access to UDx’s to untrusted users.

### Notes

- The parameters and return value for the source function are automatically determined by the CREATE SOURCE statement, based on data supplied by the factory class.

- You can return a list of all SQL functions and User Defined Functions by querying the system table `V_CATALOG.USER_FUNCTIONS` or executing the vsql meta-command `\df`. Users see only the functions on which they have EXECUTE privileges.
Example

The following example demonstrates loading a library named curllib, then defining a function named curl that is mapped to the CurlSourceFactory factory class in the library:

```
=> CREATE LIBRARY curllib as '/opt/vertica/sdk/examples/build/cURLLib.so';
CREATE LIBRARY
=> CREATE SOURCE curl AS LANGUAGE 'C++' NAME 'CurlSourceFactory' LIBRARY curllib;
CREATE SOURCE
=> \x
Expanded display is on.
=> SELECT * FROM user_functions;
- [ RECORD 1 ]------------------------
schema_name | public
function_name | curl
procedure_type | User Defined Source
function_return_type |
function_argument_type |
function_definition |
volatility |
is_strict | f
is_fenced | f
comment |
```

- GRANT (User Defined Extension)
- REVOKE (User Defined Extension)
- USER_FUNCTIONS
- Load (UDLs)

CREATE TRANSFORM FUNCTION

Adds a user-defined transform function (UDTF) stored in a shared Linux library to the catalog. You must have already loaded this library using the CREATE LIBRARY statement. When you call the SQL function, Vertica passes the input table to the transform function in the library to process.
Note: This topic describes how to create a UDTF. To create a user-defined function (UDF), see CREATE FUNCTION (UDF). To create a SQL function, see CREATE FUNCTION (SQL).

## Syntax

```sql
CREATE [OR REPLACE] TRANSFORM FUNCTION function-name
AS [LANGUAGE 'language'] NAME 'factory'
LIBRARY library-name
[ FENCED | NOT FENCED ]
```

## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OR REPLACE</td>
<td>If you omit this parameter, the CREATE TRANSFORM FUNCTION statement fails if an existing function matches the name and parameters of the function you are trying to define. If you supply this parameter, the new function definition overwrites the old one.</td>
</tr>
<tr>
<td>function-name</td>
<td>The name to assign to the UDTF. This is the name you use in your SQL statements to call the function.</td>
</tr>
<tr>
<td>LANGUAGE 'language'</td>
<td>The language used to develop this function, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• C++ (default)</td>
</tr>
<tr>
<td></td>
<td>• Java</td>
</tr>
<tr>
<td></td>
<td>• R</td>
</tr>
<tr>
<td></td>
<td>• PYTHON</td>
</tr>
<tr>
<td>NAME 'factory'</td>
<td>The name of the factory class or R factory function in the shared library that generates the object to handle the function's processing.</td>
</tr>
<tr>
<td>LIBRARY library-name</td>
<td>The name of the shared library that contains the object to perform the processing for this function. This library must have been previously loaded using the CREATE LIBRARY statement.</td>
</tr>
<tr>
<td>FENCED</td>
<td>NOT FENCED</td>
</tr>
</tbody>
</table>
Privileges

- To create a function, the user must have CREATE privilege on the schema to contain the function and USAGE privilege on the library containing the function.

- To use a function, the user must have USAGE privilege on the schema that contains the function and EXECUTE privileges on the function.

- To drop a function, the user must either be a superuser, the owner of the function, or the owner of the schema which contains the function.

UDTF Query Restrictions

A query that includes a UDTF cannot contain:

- Any statements other than the SELECT statement containing the call to the UDTF and a PARTITION BY expression

- Any other analytic function

- A call to another UDTF

- A TIMESERIES clause

- A pattern matching clause

- A gap filling and interpolation clause

Notes

- The parameters and return values for the function are automatically determined by the CREATE TRANSFORM FUNCTION statement, based on data supplied by the factory class.

- You can assign multiple functions the same name if they have different parameters. When you call a multiply-defined function, Vertica selects the UDTF function whose input parameters match the parameters in the function call to perform the processing. This
behavior is similar to having multiple signatures for a method or function in other programming languages.

- You can return a list of all UDTFs by querying the system table `V_CATALOG USER_FUNCTIONS`. You can only see functions for which you have EXECUTE privileges.

**Examples**

This example shows how to add a UDTF to the catalog.

```
=> CREATE TRANSFORM FUNCTION transFunct AS LANGUAGE 'C++' NAME 'myFactory' LIBRARY myFunction;
```

**CREATE HCATALOG SCHEMA**

Define a schema for data stored in a Hive data warehouse using the HCatalog Connector. For more information, see Using the HCatalog Connector in Integrating with Apache Hadoop.

Most of the optional parameters are read out of Hadoop configuration files if available. If you copied the Hadoop configuration files as described in Configuring Vertica for HCatalog, you can omit most parameters. By default this statement uses the values specified in those configuration files. If the configuration files are complete, the following is a valid statement:

```
=> CREATE HCATALOG SCHEMA hcat;
```

If a value is not specified in the configuration files and a default is shown in the parameter list, then that default value is used.
Some parameters apply only if you are using HiveServer2 (the default). Others apply only if you are using WebHCat, a legacy Hadoop service. When using HiveServer2, use HIVESERVER2_HOSTNAME to specify the server host. When using WebHCat, use WEBSERVICE_HOSTNAME to specify the server host.

If you need to use WebHCat you must also set the HCatalogConnectorUseHiveServer2 configuration parameter to 0. See Apache Hadoop Parameters.

After creating the schema, you can change many (but not all) parameters using ALTER HCATALOG SCHEMA.

**Syntax**

```
CREATE HCATALOG SCHEMA [IF NOT EXISTS] schemaName
    [AUTHORIZATION user-id]
    [WITH [param=value [,..] ] ]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[IF NOT EXISTS]</td>
<td>If given, the statement exits without an error when the schema named in <code>schemaName</code> already exists.</td>
</tr>
<tr>
<td><code>schemaName</code></td>
<td>The name of the schema to create in the Vertica catalog. The tables in the Hive database will be available through this schema.</td>
</tr>
<tr>
<td>AUTHORIZATION <code>user-id</code></td>
<td>The name of a Vertica account to own the schema being created. This parameter is ignored if Kerberos authentication is being used; in that case the current vsql user is used.</td>
</tr>
</tbody>
</table>

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOSTNAME</td>
<td>The hostname, IP address, or URI of the database server that stores the Hive data warehouse's metastore information. If you specify this parameter and do not also specify PORT, then this value must be in the URI format used for hive.metastore.uris in hive-</td>
</tr>
<tr>
<td><strong>site.xml.</strong></td>
<td>If the Hive metastore supports High Availability, you can specify a comma-separated list of URIs for this value. If this value is not specified, hive-site.xml must be available.</td>
</tr>
<tr>
<td><strong>PORT</strong></td>
<td>The port number on which the metastore database is running. If you specify this parameter, you must also specify HOSTNAME and it must be a name or IP address (not a URI).</td>
</tr>
</tbody>
</table>
| **HIVESERVER2_HOSTNAME** | The hostname or IP address of the HiveServer2 service. This parameter is optional if in hive-site.xml you set one of the following properties:  
  - hive.server2.thrift.bind.host to a valid host  
  - hive.server2.support.dynamic.service.discovery to true  
  This parameter is ignored if you are using WebHCat. |
| **WEBSERVICE_HOSTNAME** | The hostname or IP address of the WebHCat service, if using WebHCat instead of HiveServer2. If this value is not specified, webhcat-site.xml must be available. |
| **WEBSERVICE_PORT** | The port number on which the WebHCat service is running, if using WebHCat instead of HiveServer2. If this value is not specified, webhcat-site.xml must be available. |
| **WEBHDFS_ADDRESS** | The host and port ("host:port") for the WebHDFS service. This parameter is used only for reading ORC and Parquet files. If this value is not set, hdfs-site.xml must be available to read these file types through the HCatalog Connector. |
| **HCATALOG_SCHEMA** | The name of the Hive schema or database that the Vertica schema is being mapped to. The default is `schemaName`. |
| **CUSTOM_PARTITIONS** | Whether the Hive schema uses custom partition locations ('YES' or 'NO'). If the schema uses custom partition locations, then Vertica queries Hive to get those locations when executing queries. These additional Hive queries can be expensive, so use this parameter only if you need to. The default is 'NO' (disabled). For more information, see Using Partitioned Data in Integrating with Apache Hadoop. |
| **HCATALOG_USER** | The username of the HCatalog user to use when making calls to the HiveServer2 or WebHCat server. The default is the current database |
The number of seconds the HCatalog Connector waits for a successful connection to the HiveServer or WebHCat server. A value of 0 means wait indefinitely.

The lowest data transfer rate (in bytes per second) from the HiveServer2 or WebHCat server that the HCatalog Connector accepts. See HCATALOG_SLOW_TRANSFER_TIME for details.

The number of seconds the HCatalog Connector waits before enforcing the data transfer rate lower limit. After this time has passed, the HCatalog Connector tests whether the data transfer rate is at least as fast as the value set in HCATALOG_SLOW_TRANSFER_LIMIT. If it is not, then the HCatalog Connector breaks the connection and terminates the query.

The path of the Hadoop ssl-client.xml configuration file. This parameter is required if you are using HiveServer2 and it uses SSL wire encryption. This parameter is ignored if you are using WebHCat.

The default values for HCATALOG_CONNECTOR_TIMEOUT, HCATALOG_SLOW_TRANSFER_LIMIT, and HCATALOG_SLOW_TRANSFER_TIME are set by the database configuration parameters HCatConnectionTimeout, HCatSlowTransferLimit, and HCatSlowTransferTime. See Apache Hadoop Parameters in the Administrator's Guide for more information.

**Configuration Files**

The HCatalog Connector uses the following values from the Hadoop configuration files if you do not override them when creating the schema.

<table>
<thead>
<tr>
<th>File</th>
<th>Properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>hive-site.xml</td>
<td>hive.server2.thrift.bind.host (used for HIVESERVER2_HOSTNAME)</td>
</tr>
<tr>
<td></td>
<td>hive.server2.thrift.port</td>
</tr>
<tr>
<td></td>
<td>hive.server2.transport.mode</td>
</tr>
<tr>
<td></td>
<td>hive.server2.authentication</td>
</tr>
</tbody>
</table>
Privileges

The user must be a superuser or be granted all permissions on the database to use this statement.

The user also requires access to Hive data in one of the following ways:

- Have USAGE permissions on `hcatalog_schema`, if Hive does not use an authorization service (Sentry or Ranger) to manage access.

- Have permission through an authorization service, if Hive uses it to manage access. In this case you must either set `EnableHCatImpersonation` to 0, to access data as the Vertica principal, or grant users access to the HDFS data. For Sentry, you can use ACL synchronization to manage HDFS access.

- Be the dbadmin user, with or without an authorization service.

Examples

The following example shows how to use CREATE HCATALOG SCHEMA to define a new schema for tables stored in a Hive database and then query the system tables that contain information about those tables:
The following example shows how to specify more than one metastore host.

```
=> CREATE HCATALOG SCHEMA hcat WITH HOSTNAME='hcathost' PORT=9083
    HCATALOG_SCHEMA='default' HIVESERVER2_HOSTNAME='hs.example.com'
    SSL_CONFIG='/etc/hadoop/conf/ssl-client.xml' HCATALOG_USER='admin';
CREATE SCHEMA
=> \x
Expanded display is on.
```

```
=> SELECT * FROM v_catalog.hcatalog_schemata;
-[ RECORD 1 ]-----------------------------------------------
schema_id | 45035996273748224
schema_name | hcat
schema_owner_id | 45035996273704962
schema_owner | admin
create_time | 2017-12-05 14:43:03.353404-05
hostname | hcathost
port | -1
hiveserver2_hostname | hs.example.com
webservice_hostname |
webservice_port | 50111
webhdfs_address | hs.example.com:50070
hcatalog_schema_name | default
ssl_config | /etc/hadoop/conf/ssl-client.xml
hcatalog_user_name | admin
hcatalog_connection_timeout | -1
hcatalog_slow转让_limit | -1
hcatalog_slow转让_time | -1
custom_partitions | F
```

```
=> SELECT * FROM v_catalog.hcatalog_table_list;
-[ RECORD 1 ]-----------------------------
table_schema_id | 45035996273748224
table_schema | hcat
hcatalog_schema | default
table_name | nation
hcatalog_user_name | admin
-[ RECORD 2 ]-----------------------------
table_schema_id | 45035996273748224
table_schema | hcat
hcatalog_schema | default
table_name | raw
hcatalog_user_name | admin
-[ RECORD 3 ]-----------------------------
table_schema_id | 45035996273748224
table_schema | hcat
hcatalog_schema | default
table_name | raw_rcfile
hcatalog_user_name | admin
-[ RECORD 4 ]-----------------------------
table_schema_id | 45035996273748224
table_schema | hcat
hcatalog_schema | default
table_name | raw_sequence
hcatalog_user_name | admin
```

The following example shows how to include custom partition locations:

```
=> CREATE HCATALOG SCHEMA hcat
    WITH HOSTNAME='thrift://node1.example.com:9083,thrift://node2.example.com:9083';
```

The following example shows how to include custom partition locations:
CREATE HCATALOG SCHEMA hcat WITH HCATALOG_SCHEMA='default'
    HIVESERVER2_HOSTNAME='hs.example.com'
    CUSTOM_PARTITIONS='yes';

CREATE LIBRARY

Loads a library containing user defined extensions (UDxs) into the Vertica catalog. Vertica automatically distributes copies of the library file and any supporting libraries to all cluster nodes. UDxs defined in the catalog that reference the updated library automatically start using the new library file. Nodes that are down or added to the cluster also receive a copy of the updated library file as soon as they join the cluster.

Because libraries are added to the database catalog, they persist across database restarts.

After loading a library in the catalog, you can use statements such as CREATE FUNCTION to define the extensions contained in the library. See Developing User-Defined Extensions (UDxs) in Extending Vertica for details.

Syntax

CREATE [OR REPLACE] LIBRARY
  [[database.]schema.]library
  AS 'library-path'
  [ DEPENDS 'support-path' ]
  [ LANGUAGE 'language' ]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OR REPLACE</td>
<td>Replaces the old library with the new one. If you do not supply this parameter, the CREATE LIBRARY statement fails when an existing library matches the name the library you are trying to define.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>
| **Library** | A name to assign to this library, where *library* conforms to conventions described in Identifiers. Use this name in a CREATE FUNCTION statement to enable user defined functions stored in the library.

**Tip:** While not required, it is good practice to match *library* to the library file name. |
| **Library-path** | The absolute path and file name of the library to load. This file must be located in the initiator node file system. |
| **DEPENDS 'support-path'** | Indicates that the UDx library depends on one or more support libraries, where *support-path* specifies one or more absolute paths to the support libraries files, located in the initiator node's file system.

You can specify multiple support paths as follows:

- Separate multiple paths with colons (:).
- Specify a directory that contains multiple libraries with an asterisk wildcard (*). For example: /home/mydir/mylibs/*

If your Java library depends on native libraries (SO files), use DEPENDS to specify the path and call System.loadLibrary() in your UDx to load the native libraries from that path. |
| **LANGUAGE 'Language'** | The programming language used to develop the function, where *Language* is one of the following:

- C++
- Python
- Java
- R |

**Privileges**

Superuser
Requirements

- Vertica makes its own copies of the library files. Later modification or deletion of the original files specified in the statement does not affect the library defined in the catalog. To update the library, use ALTER LIBRARY.

- Loading a library is no guarantee that it functions correctly. CREATE LIBRARY performs some basic checks on the library file to verify it is compatible with Vertica. The statement fails if it detects that the library was not correctly compiled or it finds other basic incompatibilities. However, CREATE LIBRARY cannot detect many other issues in shared libraries.

- You can choose to run UDxs developed in C++ in unfenced mode. Unfenced UDxs run directly in the Vertica process. If the UDx you run in unfenced mode has bugs, it can negatively impact the database, causing instability or even crashes. To avoid these issues, run your UDx only in fenced mode. A few UDx types can only be run in unfenced mode.

Examples

To load a library in the home directory of the dbadmin account with the name MyFunctions:

```sql
=> CREATE LIBRARY MyFunctions AS 'home/dbadmin/my_functions.so';
```

To load a library located in the directory where you started vsql:

```sql
=> \set libfile '"pwd"/MyOtherFunctions.so';
=> CREATE LIBRARY MyOtherFunctions AS :libfile;
```

To load a Java library named JavaLib.jar that depends on multiple support JAR files in the /home/dbadmin/mylibs subdirectory:

```sql
=> CREATE LIBRARY DeleteVowelsLib AS '/home/dbadmin/JavaLib.jar'
   DEPENDS '/home/dbadmin/mylibs/*' LANGUAGE 'JAVA';
```

See Also

DROP LIBRARY
**CREATE LOCAL TEMPORARY VIEW**

Creates or replaces a local temporary view. Views are read only, so they do not support insert, update, delete, or copy operations. Local temporary views are session-scoped, so they are visible only to their creator in the current session. Vertica drops the view when the session ends.

*Note: Vertica does not support global temporary views.*

**Syntax**

```
CREATE [OR REPLACE] LOCAL TEMPORARY VIEW view [ (column[,..] ) ] AS query
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>OR REPLACE</strong></td>
<td>Specifies to overwrite the existing view <code>view-name</code>. If you omit this option and <code>view-name</code> already exists, CREATE VIEW returns an error.</td>
</tr>
<tr>
<td><strong>view</strong></td>
<td>Identifies the view to create, where <code>view</code> conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.</td>
</tr>
<tr>
<td><strong>column[,..]</strong></td>
<td>A list of names to use as view column names. Vertica maps view column names to query columns according to the order of their respective lists. By default, the view uses column names as they are specified in the query. Each view can contain up to 1600 columns.</td>
</tr>
<tr>
<td><strong>AS query</strong></td>
<td>A SELECT statement that the temporary view executes. The SELECT statement can reference tables, temporary tables, and other views.</td>
</tr>
</tbody>
</table>

**Privileges**

See Creating Views
Example

The following CREATE LOCAL TEMPORARY VIEW statement creates the temporary view myview. This view sums all individual incomes of customers listed in the store.store_sales_fact table, and groups results by state:

```sql
=> CREATE LOCAL TEMP VIEW myview AS
    SELECT SUM(annual_income), customer_state FROM public.customer_dimension
    WHERE customer_key IN (SELECT customer_key FROM store.store_sales_fact)
    GROUP BY customer_state
    ORDER BY customer_state ASC;
```

The following example uses the temporary view myview with a WHERE clause that limits the results to combined salaries greater than $2 billion:

```sql
=> SELECT * FROM myview WHERE SUM > 200000000;
```

<table>
<thead>
<tr>
<th>SUM</th>
<th>customer_state</th>
</tr>
</thead>
<tbody>
<tr>
<td>2723441590</td>
<td>AZ</td>
</tr>
<tr>
<td>29253817091</td>
<td>CA</td>
</tr>
<tr>
<td>4907216137</td>
<td>CO</td>
</tr>
<tr>
<td>3769455689</td>
<td>CT</td>
</tr>
<tr>
<td>3330524215</td>
<td>FL</td>
</tr>
<tr>
<td>4581840709</td>
<td>IL</td>
</tr>
<tr>
<td>3310667307</td>
<td>IN</td>
</tr>
<tr>
<td>2793284639</td>
<td>MA</td>
</tr>
<tr>
<td>5225333668</td>
<td>MI</td>
</tr>
<tr>
<td>2128169759</td>
<td>NV</td>
</tr>
<tr>
<td>2886158503</td>
<td>PA</td>
</tr>
<tr>
<td>2832710696</td>
<td>TN</td>
</tr>
<tr>
<td>14215397659</td>
<td>TX</td>
</tr>
<tr>
<td>2642551509</td>
<td>UT</td>
</tr>
</tbody>
</table>

- Creating Views
CREATE LOCATION

Creates a storage location where Vertica can store data. After you create the location, you create storage policies that assign the storage location to the database objects that will store data in the location.

Caution: While no technical issue prevents you from using CREATE LOCATION to add one or more Network File System (NFS) storage locations, Vertica does not support NFS data or catalog storage except for MapR mount points. You will be unable to run queries against any other NFS data. When creating locations on MapR file systems, you must specify ALL NODES SHARED.

If you use any HDFS storage locations, the HDFS data must be available at the time you start Vertica. Your HDFS cluster must be operational, and the ROS files must be present. If you have moved data files, or if they have become corrupted, or if your HDFS cluster is not responsive, Vertica cannot start.

Syntax

CREATE LOCATION 'path'
    [NODE 'nodename' | ALL NODES]
    [SHARED]
    [USAGE 'usertype']
    [LABEL 'labelname']
    [LIMIT 'MaxSize']

Arguments

<table>
<thead>
<tr>
<th>path</th>
<th>Where Vertica will store this location's data. The type of filesystem on which the location is based determines the format of this argument:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- For storage locations on the Linux file system, path must be an absolute path to the directory where Vertica can write the storage location's data.</td>
</tr>
<tr>
<td></td>
<td>- For storage locations on HDFS, path must be an HDFS URL where Vertica can write the storage location's data.</td>
</tr>
</tbody>
</table>
See more information below.

- For USER storage locations on S3 in Eon Mode only, `path` must be a URL of the form 's3:bucket/path'.

<table>
<thead>
<tr>
<th>NODE <code>'nodename'</code></th>
<th>The node or nodes on which the storage location is defined.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL NODES</td>
<td>NODE: Use this keyword to create the storage location on a single node. Specify the node using its name as it appears in the NODES system table.</td>
</tr>
<tr>
<td></td>
<td>ALL NODES (default): Use this keyword to create the storage location on all nodes</td>
</tr>
</tbody>
</table>

| SHARED | Indicates the location set by the `path` is shared (used by all of the nodes) rather than local to each node. See below for details. |

<table>
<thead>
<tr>
<th>USAGE <code>'use-type'</code></th>
<th>The type of data the storage location can hold, where <code>use-type</code> is one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>TEMP</td>
<td>Vertica uses the location to store temporary files it creates while processing queries.</td>
</tr>
<tr>
<td>DATA</td>
<td>The storage location can only store data.</td>
</tr>
<tr>
<td>TEMP, DATA (default)</td>
<td>The storage location can store both temporary files and data.</td>
</tr>
<tr>
<td>USER</td>
<td>Users who have been granted access to the storage location can read and store data there (see GRANT (Storage Location)). This usage type can be used with external tables (see CREATE EXTERNAL TABLE AS COPY), which by default are readable only by administrators.</td>
</tr>
</tbody>
</table>

| LABEL `'labelname'` | A label for the storage location. You use this name later when assigning the storage location to data objects. |
| LIMIT `'MaxSize'`   | Maximum size for the storage location. You use this name later when assigning the storage location to data objects. If set to 1, there is no limit on the storage location size. |
Privileges

Superuser

The Vertica process must also have read and write permissions to the location where data will be stored. Each type of filesystem has its own requirements:

- **Linux**: The database superuser account (usually named dbadmin) must have full read and write access to the directory in the *path* argument.

- **HDFS without Kerberos**: Requires a Hadoop user whose username matches the Vertica database administrator username (usually dbadmin). This Hadoop user must have read and write access to the HDFS directory specified in the *path* argument.

- **HDFS with Kerberos**: Requires a Hadoop user whose username matches the principal in the keytab file on each Vertica node. This is not the same as the database administrator username. This Hadoop user must have read and write access to the HDFS directory stored in the path argument.

Shared Versus Local Storage

The **SHARED** keyword indicates that the location set by the *path* argument is shared by all nodes. Most remote filesystems (such as HDFS) are shared. For these filesystems, the *path* argument represents a single location where all of the nodes store data. Each node creates its own subdirectory to hold its own files in a shared storage location. These subdirectories prevent the nodes from overwriting each other's files. Even if your cluster has only one node, you must include the SHARED keyword if you are using a remote filesystem. If the location is declared as USER Vertica does not create sub directories for each node. The setting of USER takes precedence over SHARED.

If you do not supply this keyword, the new storage location is local. The *path* argument specifies a location that is unique for each node in the cluster. This location is usually a path in the node's own filesystem. Storage locations contained in filesystems that are local to each node (such as the Linux filesystem) are always local.

HDFS URLs

To specify a path for a location on HDFS, use URLs in the hdfs scheme. In most cases you can use hdfs:// (three slashes) followed by the HDFS path. To use HDFS URLs you must give
Vertica access to some HDFS configuration files. For more information, see Using HDFS URLs and Configuring the hdfs Scheme.

- Vertica node. This is *not* the same as the database administrator username. This Hadoop user must have read and write access to the HDFS directory stored in the *path* argument.

**Examples**

The following example shows how to create a storage location in the local Linux filesystem for temporary data storage.

```sql
=> CREATE LOCATION '/home/dbadmin/testloc' USAGE 'TEMP' LABEL 'tempfiles';
```

The following example shows how to create a storage location on HDFS in the `/user/dbadmin` directory. The HDFS cluster does not use Kerberos.

```sql
=> CREATE LOCATION 'hdfs:///user/dbadmin' ALL NODES SHARED
    USAGE 'data' LABEL 'coldstorage';
```

The following example shows how to create the same storage location, but on a Hadoop cluster that uses Kerberos. Note the output that reports the principal being used.

```sql
=> CREATE LOCATION 'hdfs:///user/dbadmin' ALL NODES SHARED
    USAGE 'data' LABEL 'coldstorage';
NOTICE 0: Performing HDFS operations using kerberos principal [vertica/hadoop.example.com]
CREATE LOCATION
```

The following example shows how to create a location for user data, grant access to it, and use it to create an external table.

```sql
=> CREATE LOCATION '/tmp' ALL NODES USAGE 'user';
CREATE LOCATION
=> GRANT ALL ON LOCATION '/tmp' to Bob;
GRANT PRIVILEGE
=> CREATE EXTERNAL TABLE ext1 (x integer) AS COPY FROM '/tmp/data/ext1.dat' DELIMITER ',';
CREATE TABLE
```

For an example of a USER storage location using S3, see Browsing S3 Data Using External Tables in Using Eon Mode.

**See Also**

- Managing Storage Locations in the Administrator's Guide
- Vertica Storage Location for HDFS in Integrating with Apache Hadoop.
CREATE NETWORK INTERFACE

Identifies a network interface to which a node belongs.

Use this statement when you want to configure import/export operations from individual nodes to other Vertica clusters. By default, when you install Vertica, it creates interfaces for all connected networks. You would only need CREATE NETWORK INTERFACE in situations where the network topology has changed since you installed Vertica.

Syntax

```
CREATE NETWORK INTERFACE network-interface-name ON node-name WITH 'node-IP-address'
```

<table>
<thead>
<tr>
<th>network-interface-name</th>
<th>The name you assign to the network interface, where network-interface-name conforms to conventions described in Identifiers.</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-name</td>
<td>The name of the node.</td>
</tr>
<tr>
<td>node-IP-address</td>
<td>The node's IP address, either a public or private IP address. For more information, see Using Public and Private IP Networks.</td>
</tr>
</tbody>
</table>

Privileges

Superuser
Examples

Create a network interface:

```
=> CREATE NETWORK INTERFACE mynetwork ON v_vmart_node0001 WITH '123.4.5.6';
```

**CREATE NOTIFIER**

Creates a push-based notifier to send event notifications and messages out of Vertica.

**Syntax**

```
CREATE NOTIFIER notifier-name ACTION action-url
[ ENABLE | DISABLE ]
[ MAXPAYLOAD max-payload-size ]
MAXMEMORYSIZE max-memory-size
[ IDENTIFIED BY uuid ]
[ [NO] CHECK COMMITTED ]
[ PARAMETERS 'adapter-params' ]
```

**Parameters**

<table>
<thead>
<tr>
<th><strong>notifier-name</strong></th>
<th>This notifier's unique identifier.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ACTION action-url</strong></td>
<td>Identifies the target Kafka server, where <em>action-url</em> has the following format: kafka://kafka-server-ip-address:port-number For example: kafka://127.0.0.1:9092</td>
</tr>
<tr>
<td>**ENABLE</td>
<td>DISABLE**</td>
</tr>
<tr>
<td><strong>MAXPAYLOAD</strong></td>
<td>The maximum size of the message, up to 2 TB, specified in kilobytes, megabytes, gigabytes, or terabytes as follows: MAXPAYLOAD integer{K</td>
</tr>
</tbody>
</table>
The default setting is adapter-specific—for example, 1 M for Kafka.

**MAXMEMORYSIZE**
The maximum size of the internal notifier, up to 2 TB, specified in kilobytes, megabytes, gigabytes, or terabytes as follows:

```
MAXMEMORYSIZE integer{K|M|G|T}
```

If the queue exceeds this size, the notifier drops excess messages.

**IDENTIFIED BY uuid**
Specifies the notifier's unique identifier. If set, all the messages published by this notifier have this attribute.

**[NO] CHECK COMMITTED**
Specifies to wait for delivery confirmation before sending the next message in the queue. Not all messaging systems support delivery confirmation.

**PARAMETERS 'adapter-params'**
Specifies one or more optional adapter parameters that are passed as a string to the adapter. Adapter parameters apply only to the adapter associated with the notifier.

For Kafka notifiers, refer to [Kafka and Vertica Configuration Settings](#).

### Privileges

Database Superuser

### Examples

Create a Kafka notifier:

```sql
=> CREATE NOTIFIER my_dc_notifier
    ACTION 'kafka://172.16.20.10:9092'
    MAXMEMORYSIZE '1G'
    IDENTIFIED BY 'f8b0278a-3282-4e1a-9c86-e0f3f042a971'
    NO CHECK COMMITTED;
```

Create a notifier with an adapter-specific parameter:

```sql
=> CREATE NOTIFIER my_notifier
    ACTION 'kafka://127.0.0.1:9092'
```
See Also

- ALTER NOTIFIER
- DROP NOTIFIER

**CREATE PROCEDURE**

Adds an external procedure to Vertica. See Implementing External Procedures in Extending Vertica for more information about external procedures.

**Syntax**

CREATE PROCEDURE [[database.]schema.]procedure( [ argument-list ] )
... AS 'executable'
... LANGUAGE 'Language'
... USER 'OS-user'

**Parameters**

<table>
<thead>
<tr>
<th>[database.]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>

| procedure | Specifies a name for the external procedure, where procedure-name conforms to conventions described in Identifiers. |

| argument-list | A comma-delimited list of procedure arguments, where each argument is specified as follows: |
[ argname ] argtype

- **argname** optionally provides a descriptive name for this argument.
- **argtype** must be one of the following data types supported by Vertica: BIGINT, BOOLEAN, DECIMAL, DOUBLE PRECISION, FLOAT, FLOAT8, INT, INT8, INTEGER, MONEY, NUMBER, NUMERIC, REAL, SMALLINT, TINYINT, VARCHAR.

If the procedure is defined with no arguments, supply an empty argument list.

<table>
<thead>
<tr>
<th>executable</th>
<th>The name of the executable program in the procedures directory.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Language</td>
<td>Specifies the procedure language, set to EXTERNAL.</td>
</tr>
<tr>
<td>USER</td>
<td>The owner of the file. The external program must allow execute privileges for this user. The user cannot be root.</td>
</tr>
</tbody>
</table>

**Privileges**

CREATE privilege on the schema to contain the procedure.

**System Security**

- A procedure file must be owned by the database administrator (OS account) or by a user in the same group as the administrator. (The procedure file owner cannot be root.) The procedure file must also have the set UID attribute enabled, and allow read and execute permission for the group.

- External procedures that you create with CREATE PROCEDURE are always run with Linux dbadmin privileges. If a dbadmin or pseudosuperuser grants a non-dbadmin permission to run a procedure using GRANT (Procedure), be aware that the non-dbadmin user runs the procedure with full Linux dbadmin privileges.

**Examples**

The following example shows how to create procedure helloplanet for external procedure file helloplanet.sh. This file accepts one varchar argument.
Create the file:

```bash
#!/bin/bash
echo "hello planet argument: $1" >> /tmp/myprocedure.log
```

Create the procedure with the following SQL:

```sql
=> CREATE PROCEDURE helloplanet(arg1 varchar) AS 'helloplanet.sh' LANGUAGE 'external' USER 'dbadmin';
```

See Also

- DROP PROCEDURE
- Installing External Procedure Executable Files

**CREATE PROFILE**

Creates a profile that controls password requirements for users.

**Syntax**

```
CREATE PROFILE name LIMIT [ password-parameter setting ]...
```

**password-parameter**

- PASSWORD_LIFE_TIME
- PASSWORD_GRACE_TIME
- FAILED_LOGIN_ATTEMPTS
- PASSWORD_LOCK_TIME
- PASSWORD_REUSE_MAX
- PASSWORD_REUSE_TIME
- PASSWORD_MAX_LENGTH
- PASSWORD_MIN_LENGTH
- PASSWORD_MIN_NUMBERS
- PASSWORD_MIN_UPPERCASE_LETTERS
- PASSWORD_MIN_LOWERCASE_LETTERS
- PASSWORD_MIN_DIGITS
- PASSWORD_MIN_SYMBOLS

**Parameters**

*Note: All parameters that are not explicitly set in a new profile are set to default, and inherit their settings from the default profile.*
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the profile to create, where name conforms to conventions described in Identifiers.</td>
</tr>
<tr>
<td>PASSWORD_LIFE_TIME</td>
<td>Set to an integer value, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• ( \geq 1 ): The number of days a password remains valid.</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: Password remains valid indefinitely.</td>
</tr>
<tr>
<td></td>
<td>After your password's lifetime and grace period expire, you must change your password on your next login, if you have not done so already.</td>
</tr>
<tr>
<td>PASSWORD_GRACE_TIME</td>
<td>Set to an integer value, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• ( \geq 1 ): The number of days a password can be used after it expires.</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: No grace period.</td>
</tr>
<tr>
<td>FAILED_LOGIN_ATTEMPTS</td>
<td>Set to an integer value, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• ( \geq 1 ): The number of consecutive failed login attempts Vertica allows before locking your account.</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: Vertica allows an unlimited number of failed login attempts.</td>
</tr>
<tr>
<td>PASSWORD_LOCK_TIME</td>
<td>Set to an integer value, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• ( \geq 1 ): The number of days your account is locked after too many failed login attempts. The account is automatically unlocked when the lock time elapses.</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: Account remains indefinitely inaccessible until a superuser manually unlocks it.</td>
</tr>
<tr>
<td>PASSWORD_REUSE_MAX</td>
<td>Set to an integer value, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• ( \geq 1 ): The number of times you must change your password before you can reuse an earlier password.</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: You can reuse an earlier password without any intervening changes.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| PASSWORD_REUSE_TIME          | Set to an integer value, one of the following:  
  - $\geq 1$: The number of days that must pass after a password is set before you can reuse it.  
  - UNLIMITED: You can reuse an earlier password immediately. |
| PASSWORD_MAX_LENGTH          | The maximum number of characters allowed in a password, one of the following:  
  - Integer between 8 and 100, inclusive  
  - UNLIMITED: Maximum of 100 characters |
| PASSWORD_MIN_LENGTH          | The minimum number of characters required in a password, one of the following:  
  - 0 to PASSWORD_MAX_LENGTH  
  - UNLIMITED: Minimum of PASSWORD_MAX_LENGTH |
| PASSWORD_MIN_LETTERS         | Minimum number of letters (a-z and A-Z) that must be in a password, one of the following:  
  - Integer between 0 and PASSWORD_MAX_LENGTH, inclusive  
  - UNLIMITED: 0 (no minimum) |
| PASSWORD_MIN_UPPERCASE_LETTERS| Minimum number of uppercase letters (A-Z) that must be in a password, one of the following:  
  - Integer between 0 and PASSWORD_MAX_LENGTH, inclusive  
  - UNLIMITED: 0 (no minimum) |
| PASSWORD_MIN_LOWERCASE_LETTERS| Minimum number of lowercase letters (a-z) that must be in a password, one of the following:  
  - Integer between 0 and PASSWORD_MAX_LENGTH, inclusive  
  - UNLIMITED: 0 (no minimum) |
<p>| PASSWORD_MIN_DIGITS          | Minimum number of digits (0-9) that must be in a password, one of the following: |</p>
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Integer between 0 and PASSWORD_MAX_LENGTH, inclusive</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: 0 (no minimum)</td>
</tr>
<tr>
<td>PASSWORD_MIN_SYMBOLS</td>
<td>Minimum number of symbols—printable non-letter and non-digit characters such as $, #, @—that must be in a password, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• Integer between 0 and PASSWORD_MAX_LENGTH, inclusive</td>
</tr>
<tr>
<td></td>
<td>• UNLIMITED: 0 (no minimum)</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser

**Profile Settings and Client Authentication**

The following profile settings affect client authentication methods, such as LDAP or GSS:

- FAILED_LOGIN_ATTEMPTS
- PASSWORD_LOCK_TIME

All other profile settings are used only by Vertica to manage its passwords.

**Example**

```sql
=> CREATE PROFILE sample_profile LIMIT PASSWORD_MAX_LENGTH 20;
```
CREATE PROJECTION

Creates metadata for a projection in the Vertica catalog.

Note: For detailed information about using CREATE PROJECTION to create live aggregate projections and Top-K projections, see CREATE PROJECTION (Live Aggregate Projections). To create live aggregate projections that support user-defined transform functions, see CREATE PROJECTION (UDTFs).

Syntax

CREATE PROJECTION [ IF NOT EXISTS ] [[database.]schema.]projection
...............{projection-col | grouped-clause
...............[ ENCODING encoding-type ]
...............[ ACCESSRANK integer ]
...............}[,-]
...
AS SELECT
...select-list FROM [[database.]schema.]table [ [AS] alias]
...
[ ORDER BY column-expr[,,-] ]
...
[ segmentation-spec ]
...
[ KSAFE [ k-num ] ]

Parameters

| IF NOT EXISTS | Specifies to generate an informational message if an object already exists under the specified name. If you omit this option and the object exists, Vertica generates a ROLLBACK error message. In both cases, the object is not created. |
The IF NOT EXISTS clause is useful for SQL scripts where you want to create an object if it does not already exist, and reuse the existing object if it does. For related information, see ON_ERROR_STOP.

<table>
<thead>
<tr>
<th><strong>[database.]schema</strong></th>
<th>Specifies the schema for this projection and its anchor table, where schema must be the same for both. If you specify a database, it must be the current database.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>projection</strong></td>
<td>Identifies the projection to create, where projection conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema. If the projection is segmented, Vertica uses this string as the projection base name when it creates unique identifiers for buddy projections. For more information, see Projection Naming in the Administrator's Guide.</td>
</tr>
<tr>
<td><strong>projection-col</strong></td>
<td>The name of a projection column. The list of projection columns must match the select-list columns and expressions in number, type, and sequence. If projection column names are omitted, Vertica uses the anchor table column names specified in select-list.</td>
</tr>
<tr>
<td><strong>grouped-clause</strong></td>
<td>See GROUPED Clause.</td>
</tr>
<tr>
<td><strong>ENCODING encoding-type</strong></td>
<td>Specifies the column encoding type, by default set to AUTO.</td>
</tr>
<tr>
<td><strong>ACCESSRANK integer</strong></td>
<td>Overrides the default access rank for a column. Use this parameter to increase or decrease the speed at which Vertica accesses a column. For more information, see Overriding Default Column Ranking.</td>
</tr>
<tr>
<td><strong>select-list</strong></td>
<td>Specifies the columns or column expressions to select from the specified table, one of the following:</td>
</tr>
<tr>
<td></td>
<td>* {asterisk}</td>
</tr>
<tr>
<td></td>
<td>Lists all columns in the queried tables.</td>
</tr>
<tr>
<td></td>
<td>expression [ [AS] output-name ] ][,...]</td>
</tr>
</tbody>
</table>
|                        | A table column or column expression to select from the
queried tables. You can optionally qualify *expression* with an output name, which can be used in two ways:

- Label the column for display.
- Refer to the column in the projection's ORDER BY clause.

**FROM** *table* [ [AS] ALIAS]

Specifies the projection's anchor table, optionally qualified by an alias.

**ORDER BY**

Specifies columns from the SELECT list on which to sort the projection. The ORDER BY clause cannot include qualifiers ASC or DESC. Vertica always stores projection data in ascending sort order.

If you omit the ORDER BY clause, Vertica uses `select-list` to sort the projection.

**segmentation-spec**

Specifies how to distribute projection data with one of the following clauses:

- *hash-segmentation-clause*: Specifies to segment projection data evenly and distribute across cluster nodes. Vertica recommends segmenting large tables.

- *unsegmented-clause*: Specifies to create an unsegmented projection.

If the anchor table and projection both omit specifying segmentation, the projection is defined with a hash segmentation clause that includes all columns in the SELECT list, as follows:

```
SEGMENTED BY HASH(column-expr[,...]) ALL NODES OFFSET 0;
```

**KSAFE [k-num]**

Specifies K-safety for the projection, where *k-num* must be equal to or greater than system K-safety. Vertica ignores this parameter if set for unsegmented projections. If you omit *k-num*, Vertica uses system K-safety.

For general information, see *K-Safety* in Vertica Concepts.

### Privileges

Superuser, or the following:
- Anchor table owner
- CREATE privilege on the schema

Requirements
- To prevent data loss and inconsistencies, tables must have at least one superprojection. You cannot drop a projection if that projection is the table’s only superprojection.
- You cannot drop a buddy projection if dropping that projection violates system K-safety.

See Also
Working with Projections

Encoding Types
Vertica supports various encoding and compression types, specified by the following ENCODING parameter arguments:
- AUTO (default)
- BLOCK_DICT
- BLOCKDICT_COMP
- BZIP_COMP
- COMMONDELTA_COMP
- DELTARANGE_COMP
- DELTAVAL
- GCDDELTA
- GZIP_COMP
- RLE
AUTO (default)

AUTO encoding is ideal for sorted, many-valued columns such as primary keys. It is also suitable for general purpose applications for which no other encoding or compression scheme is applicable. Therefore, it serves as the default if no encoding/compression is specified.

<table>
<thead>
<tr>
<th>Column data type</th>
<th>Default encoding type</th>
</tr>
</thead>
<tbody>
<tr>
<td>BINARY/VARBINARY BOOLEAN</td>
<td>Lempel-Ziv-Oberhumer-based (LZO) compression</td>
</tr>
<tr>
<td>CHAR/VARCHAR</td>
<td>Compression scheme based on the delta between consecutive column values.</td>
</tr>
</tbody>
</table>

The CPU requirements for this type are relatively small. In the worst case, data might expand by eight percent (8%) for LZO and twenty percent (20%) for integer data.

BLOCK_DICT

For each block of storage, Vertica compiles distinct column values into a dictionary and then stores the dictionary and a list of indexes to represent the data block.

BLOCK_DICT is ideal for few-valued, unsorted columns where saving space is more important than encoding speed. Certain kinds of data, such as stock prices, are typically few-valued within a localized area after the data is sorted, such as by stock symbol and timestamp, and are good candidates for BLOCK_DICT. By contrast, long CHAR/VARCHAR columns are not good candidates for BLOCK_DICT encoding.

CHAR and VARCHAR columns that contain 0x00 or 0xFF characters should not be encoded with BLOCK_DICT. Also, BINARY/VARBINARY columns do not support BLOCK_DICT encoding.

BLOCK_DICT encoding requires significantly higher CPU usage than default encoding schemes. The maximum data expansion is eight percent (8%).

BLOCK_DICT_COMP

This encoding type is similar to BLOCK_DICT except dictionary indexes are entropy coded. This encoding type requires significantly more CPU time to encode and decode and has a poorer
worst-case performance. However, if the distribution of values is extremely skewed, using BLOCK_DICT_COMP encoding can lead to space savings.

**BZIP_COMP**

BZIP_COMP encoding uses the bzip2 compression algorithm on the block contents. See bzip web site for more information. This algorithm results in higher compression than the automatic LZO and gzip encoding; however, it requires more CPU time to compress. This algorithm is best used on large string columns such as VARCHAR, VARBINARY, CHAR, and BINARY. Choose this encoding type when you are willing to trade slower load speeds for higher data compression.

**COMMONDELTA_COMP**

This compression scheme builds a dictionary of all deltas in the block and then stores indexes into the delta dictionary using entropy coding.

This scheme is ideal for sorted FLOAT and INTEGER-based (DATE/TIME/TIMESTAMP/INTERVAL) data columns with predictable sequences and only occasional sequence breaks, such as timestamps recorded at periodic intervals or primary keys. For example, the following sequence compresses well: 300, 600, 900, 1200, 1500, 600, 1200, 1800, 2400. The following sequence does not compress well: 1, 3, 6, 10, 15, 21, 28, 36, 45, 55.

If delta distribution is excellent, columns can be stored in less than one bit per row. However, this scheme is very CPU intensive. If you use this scheme on data with arbitrary deltas, it can cause significant data expansion.

**DELTARANGE_COMP**

This compression scheme is primarily used for floating-point data; it stores each value as a delta from the previous one.

This scheme is ideal for many-valued FLOAT columns that are sorted or confined to a range. Do not use this scheme for unsorted columns that contain NULL values, as the storage cost for representing a NULL value is high. This scheme has a high cost for both compression and decompression.

To determine if DELTARANGE_COMP is suitable for a particular set of data, compare it to other schemes. Be sure to use the same sort order as the projection, and select sample data that will be stored consecutively in the database.
DELTAVAL

For INTEGER and DATE/TIME/TIMESTAMP/INTERVAL columns, data is recorded as a difference from the smallest value in the data block. This encoding has no effect on other data types.

DELTAVAL is best used for many-valued, unsorted integer or integer-based columns. CPU requirements for this encoding type are minimal, and data never expands.

GCDDELTA

For INTEGER and DATE/TIME/TIMESTAMP/INTERVAL columns, and NUMERIC columns with 18 or fewer digits, data is recorded as the difference from the smallest value in the data block divided by the greatest common divisor (GCD) of all entries in the block. This encoding has no effect on other data types.

ENCODING GCDDELTA is best used for many-valued, unsorted, integer columns or integer-based columns, when the values are a multiple of a common factor. For example, timestamps are stored internally in microseconds, so data that is only precise to the millisecond are all multiples of 1000. The CPU requirements for decoding GCDDELTA encoding are minimal, and the data never expands, but GCDDELTA may take more encoding time than DELTAVAL.

GZIP_COMP

This encoding type uses the gzip compression algorithm. See gzip web site for more information. This algorithm results in better compression than the automatic LZO compression, but lower compression than BZIP_COMP. It requires more CPU time to compress than LZO but less CPU time than BZIP_COMP. This algorithm is best used on large string columns such as VARCHAR, VARBINARY, CHAR, and BINARY. Use this encoding when you want a better compression than LZO, but at less CPU time than bzip2.

RLE

RLE (run length encoding) replaces sequences (runs) of identical values with a single pair that contains the value and number of occurrences. Therefore, it is best used for low cardinality columns that are present in the ORDER BY clause of a projection.

The Vertica execution engine processes RLE encoding run-by-run and the Vertica optimizer gives it preference. Use it only when run length is large, such as when low-cardinality columns are sorted.
The storage for RLE and AUTO encoding of CHAR/VARCHAR and BINARY/VARBINARY is always the same.

**Valid Encoding for Numeric Data Types**

- Valid encoding types for numeric data type columns with precision \( \leq 18 \) include AUTO, BLOCK_DICT, BLOCKDICT_COMP, COMMONDELTA_COMP, DELTAVAL, GCDDELTA, and RLE.

- Valid encoding types for numeric data type columns with precision \( > 18 \) include AUTO, BLOCK_DICT, BLOCKDICT_COMP, RLE.

- For information on numeric data types, see the section, [Numeric Data Types](#).

**GROUPED Clause**

Groups two or more columns into a single disk file. This minimizes file I/O for work loads that:

- Read a large percentage of the columns in a table.

- Perform single row look-ups.

- Query against many small columns.

- Frequently update data in these columns.

If you have data that is always accessed together and it is not used in predicates, you can increase query performance by grouping these columns. Once grouped, queries can no longer independently retrieve from disk all records for an individual column independent of the other columns within the group.

Note: RLE encoding is reduced when an RLE column is grouped with one or more non-RLE columns.

When grouping columns you can:

- Group some of the columns:
  
  \((a, \text{GROUPED}(b, c), d)\)

- Group all of the columns:
  
  \((\text{GROUPED}(a, b, c, d))\)
Create multiple groupings in the same projection:

\[(\text{GROUPED}(a, b), \text{GROUPED}(c, d))\]

**Note:** Vertica performs dynamic column grouping. For example, to provide better read and write efficiency for small loads, Vertica ignores any projection-defined column grouping (or lack thereof) and groups all columns together by default.

### Grouping Correlated Columns

The following example shows how to group highly correlated columns \(b\text{id}\) and \(a\text{sk}\). The stock column is stored separately.

```sql
=> CREATE TABLE trades (stock CHAR(5), bid INT, ask INT);
=> CREATE PROJECTION tradeproj (stock ENCODING RLE,
  GROUPED(bid ENCODING DELTAVAL, ask))
  AS (SELECT * FROM trades) KSAFE 1;
```

The following example show how to create a projection that uses expressions in the column definition. The projection contains two integer columns \(a\) and \(b\), and a third column \(\text{product\_value}\) that stores the product of \(a\) and \(b\):

```sql
=> CREATE TABLE values (a INT, b INT)
=> CREATE PROJECTION product (a, b, product_value)
  AS SELECT a, b, a*b FROM values ORDER BY a KSAFE;
```

### Hash Segmentation Clause

Specifies how to segment projection data for distribution across some or all cluster nodes. You can specify segmentation for a table and a projection. If a table definition specifies segmentation, Vertica uses it for that table's auto-projections.

It is strongly recommended that you use Vertica's built-in **HASH** function, which distributes data evenly across the cluster, and facilitates optimal query execution.

**Syntax**

```
SEGMENTED BY expression { ALL NODES [ OFFSET offset ] | NODES node[,...] }
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SEGMENTED BY expression</td>
<td>A general SQL expression. Hash segmentation is the preferred method of segmentation. Vertica recommends using its built-in HASH function, whose arguments resolve to table columns. If you use an expression other than HASH, Vertica issues a warning. The segmentation expression should specify columns with a large number of unique data values and acceptable skew in their data distribution. In general, primary key columns that meet these criteria are good candidates for hash segmentation. For details, see Expression Requirements below.</td>
</tr>
<tr>
<td>ALL NODES</td>
<td>Automatically distributes data evenly across all nodes when the projection is created. Node ordering is fixed.</td>
</tr>
<tr>
<td>OFFSET offset</td>
<td>A zero-based offset that indicates on which node to start segmentation distribution. This option is not valid for CREATE TABLE and CREATE TEMPORARY TABLE.</td>
</tr>
<tr>
<td>Important: If you create a projection for a table with the OFFSET option, be sure to create enough copies of each projection segment to satisfy system K-safety; otherwise, Vertica regards the projection as unsafe and cannot use it to query the table. You can ensure K-safety compliance when you create projections by combining OFFSET and KSAFE options in the CREATE PROJECTION statement. On executing this statement, Vertica automatically creates the necessary number of projection copies.</td>
<td></td>
</tr>
<tr>
<td>NODES node[,...]</td>
<td>Specifies a subset of the nodes in the cluster over which to distribute projection data. You can specify a node only once. To obtain a list of all cluster nodes, query the system table V_CATALOG.NODES.</td>
</tr>
</tbody>
</table>
Expression Requirements

A segmentation expression must specify table columns as they are defined in the source table. Projection column names are not supported.

The following restrictions apply to segmentation expressions:

- All leaf expressions must be constants or column references to a column in the CREATE PROJECTION's SELECT list.
- The expression must return the same value over the life of the database.
- Aggregate functions are not allowed.
- The expression must return non-negative INTEGER values in the range $0 \leq x < 2^{63}$, and values are generally distributed uniformly over that range.

Note: If the expression produces a value outside the expected range—for example, a negative value—no error occurs, and the row is added to the projection's first segment.

Examples

The following CREATE PROJECTION statement creates projection public.employee_dimension_super. It specifies to include all columns in table public.employee_dimension. The hash segmentation clause invokes the Vertica HASH function to segment projection data on the column employee_key; it also includes the ALL NODES clause, which specifies to distribute projection data evenly across all nodes in the cluster:

```sql
=> CREATE PROJECTION public.employee_dimension_super
    AS SELECT * FROM public.employee_dimension
    ORDER BY employee_key
    SEGMENTED BY hash(employee_key) ALL NODES;
```

Unsegmented Clause

Specifies to distribute identical copies of table or projection data across the cluster. Use this clause to facilitate distributed query execution on tables and projections that are too small to benefit from segmentation.

Vertica uses the same name to identify all instances of an unsegmented projection. For more information about projection name conventions, see Projection Naming.
Syntax

UNSEGMENTED {NODE node | ALL NODES}

Parameters

<table>
<thead>
<tr>
<th>NODE node</th>
<th>Creates an unsegmented projection only on the specified node node. To obtain a list of all cluster nodes, query the system table V_CATALOG.NODES.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL NODES</td>
<td>Creates instances of the unsegmented projection on all cluster nodes. You must set this option if projection or system K-safety is greater than 0, otherwise Vertica regards the projection as unsafe and does not use it.</td>
</tr>
</tbody>
</table>

Example

This example creates an unsegmented projection for table store.store_dimension:

```
=> CREATE PROJECTION store.store_dimension_proj (storekey, name, city, state)
   AS SELECT store_key, store_name, store_city, store_state
   FROM store.store_dimension
   UNSEGMENTED ALL NODES;

CREATE PROJECTION
```

```
=> SELECT anchor_table_name anchor_table, projection_name, node_name
   FROM PROJECTIONS WHERE projection_basename='store_dimension_proj';

<table>
<thead>
<tr>
<th>anchor_table</th>
<th>projection_name</th>
<th>node_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_dimension</td>
<td>store_dimension_proj</td>
<td>v_vmart_node0001</td>
</tr>
<tr>
<td>store_dimension</td>
<td>store_dimension_proj</td>
<td>v_vmart_node0002</td>
</tr>
<tr>
<td>store_dimension</td>
<td>store_dimension_proj</td>
<td>v_vmart_node0003</td>
</tr>
</tbody>
</table>

(3 rows)
```

CREATE PROJECTION (Live Aggregate Projections)

Creates metadata for live aggregate projections in the Vertica catalog. Top-K projections are a type of live aggregate projection.
Information here focuses on creating live aggregate projections. For details about creating other types of projections, including projections with expressions, see CREATE PROJECTION.

Syntax

**Grouping aggregate function results**

```
CREATE PROJECTION [ IF NOT EXISTS ] [[database.]schema.]projection
... ( projection-col | grouped-clause
...... [ ENCODING encoding-type ]
...... [ ACCESSRANK integer ]
...... ) [ ,... ]
... GROUP BY column-expr
... [ KSAFE [ k-num ] ]
```

**Top-K aggregation**

```
CREATE PROJECTION [ IF NOT EXISTS ] projection-name
... ( projection-col | grouped-clause
...... [ ENCODING encoding-type ]
...... [ ACCESSRANK integer ]
...... ) [ ,... ]
)
... LIMIT num-rows OVER (PARTITION BY column-expr ORDER BY column-expr)
... [ KSAFE [ k-num ] ]
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>IF NOT EXISTS</strong></td>
<td>Specifies to generate an informational message if an object already exists under the specified name. If you omit this option and the object exists, Vertica generates a ROLLBACK error message. In both cases, the object is not created. The IF NOT EXISTS clause is useful for SQL scripts where you want to create an object if it does not already exist, and reuse the existing object if it does. For related information, see <a href="#">ON_ERROR_STOP</a>.</td>
</tr>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies the schema for this projection and its anchor table, where <code>schema</code> must be the same for</td>
</tr>
</tbody>
</table>
both. If you specify a database, it must be the current database.

**projection**
Identifies the projection to create, where *projection* conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.

**projection-col**
The name of a projection column.
If you do not specify projection column names, Vertica uses the anchor table column names in the SELECT statement.

**grouped-clause**
See GROUPED Clause.

**ENCODING encoding-type**
Specifies the column *encoding type*, by default set to AUTO.

**ACCESSRANK integer**
 Overrides the default access rank for a column. Use this parameter to increase or decrease the speed at which Vertica accesses a column. For more information, see Overriding Default Column Ranking.

**table-col expr-with-table-cols**
A table column or expression of table columns to be included in the projection. If you specify projection column names, the two lists of projection columns and table columns/expressions must exactly match in number and order.

**FROM table [ [AS] ALIAS]**
Specifies the projection's anchor table, optionally qualified by an alias.

**GROUP BY column-expr [ , ...]**
One or more column expressions from the SELECT list. The first *column-expr* must be the first column expression in the SELECT list, the second *column-expr* must be the second column expression in the SELECT list, and so on.

**LIMIT num-rows**
The number of rows to return from the specified partition.

**OVER**
Specifies window partitioning by one or more column
(PARTITION BY column-expr [, ...])

expressions from the SELECT list. The first column-expr is the first column expression in the SELECT list, the second column-expr is the second column expression in the SELECT list, and so on.

ORDER BY column-expr [, ...] [ASC | DESC]

The order in which the top $k$ rows are returned, by default in ascending (ASC) order. All column expressions must be from the SELECT list, where the first column-expr must be the first column expression in the SELECT list to follow the last PARTITION BY column expression.

Top-K projections support ORDER BY NULLS FIRST/LAST.

KSAFE [ k-num ]

Specifies K-safety for the projection, where $k$-num must be equal to or greater than system K-safety. Vertica ignores this parameter if set for unsegmented projections. If you omit $k$-num, Vertica uses system K-safety.

For general information, see K-Safety in Vertica Concepts.

Privileges

Superuser, or the following:

- Anchor table owner
- CREATE privilege on the schema

Requirements and Restrictions

See:

- Creating Live Aggregate Projections
- Creating Top-K Projections
Examples

See:

- Live Aggregate Projection Example
- Top-K Projection Examples

CREATE PROJECTION (UDTFs)

Creates metadata in the Vertica catalog for projections that invoke user-defined transform functions (UDTFs).

Important: Currently, live aggregate projections can only reference UDTFs that are developed in C++.

Syntax

CREATE PROJECTION [ IF NOT EXISTS ] [[database.]schema.]projection

...[

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF NOT EXISTS</td>
<td>Specifies to generate an informational message if an object already exists under the specified name. If you omit this option and the object exists, Vertica generates a ROLLBACK error message. In both cases, the object is not created. The IF NOT EXISTS clause is useful for SQL scripts where you want to create an object if it does not already exist, and reuse the existing object if it does. For related information, see ON_ERROR_STOP.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Specifies the schema for this projection and its anchor table, where schema must be the same for both. If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>projection</td>
<td>Identifies the projection to create, where projection conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema. The projection is created in the same schema as the anchor table.</td>
</tr>
<tr>
<td>projection-column</td>
<td>The name of a projection column. If you do not specify projection column names, Vertica uses the anchor table column names that are specified in the SELECT statement.</td>
</tr>
<tr>
<td>grouped-clause</td>
<td>See GROUPED Clause.</td>
</tr>
<tr>
<td>ENCODING encoding-type</td>
<td>Specifies the column encoding type, by default set to AUTO.</td>
</tr>
<tr>
<td>ACCESSRANK integer</td>
<td>Overrides the default access rank for a column. Use this parameter to increase or decrease the speed at which Vertica accesses a column. For more information, see Overriding Default Column Ranking.</td>
</tr>
<tr>
<td>table-col expr-with-table-cols</td>
<td>A table column or expression of table columns to include in the projection.</td>
</tr>
</tbody>
</table>
**batch-udtf(batch-args)**

The **batch UDTF** to invoke each time the following events occur:

- Tuple mover mergeout
- Queries on the projection
- If invoked singly, on data load operations

**Important:** If the projection definition includes a pre-pass subquery, **batch-args** must exactly match the pre-pass UDTF output columns, in name and order.

**prepass-udtf(prepass-args)**

The **pre-pass UDTF** to invoke on each load operation such as COPY or INSERT.

If specified in a subquery, the pre-pass UDTF returns transformed data to the batch query for further processing. Otherwise, the pre-pass query results are added to projection data storage.

**OVER (PARTITION BATCH BY partition-col-exp[, ...])**

Specifies the UDTF type and how to partition the data it returns:

- BATCH identifies the UDTF as a **batch UDTF**.
- PREPASS identifies the UDTF as a **pre-pass UDTF**.

In both cases, the OVER clause specifies partitioning with one or more column expressions from the SELECT list. The first **partition-col-exp** is the first column expression in the SELECT list, the second **partition-col-exp** is the second column expression in the SELECT list, and so on.

**Note:** The projection is implicitly segmented and ordered on PARTITION BY columns.

**AS (batch-output-cols) AS (prepass-output-cols)**

Optionally names columns that are returned by the UDTF.

If a pre-pass subquery omits this clause, the outer batch query UDTF arguments (**batch-args**) must reference the column names as they are defined in the pre-pass UDTF.
**table** [ [AS] ALIAS]
Specifies the projection's anchor table, optionally qualified by an alias.

**sq-results**
Subquery result set that is returned to the outer batch UDTF.

### Privileges
Superuser, or the following:

- Anchor table owner
- CREATE privilege on the schema
- EXECUTE privileges on all UDTFs that are referenced by the projection

### Restrictions
Vertica does not regard live aggregate projections as superprojections, even one that includes all table columns.

### UDTF Types
CREATE PROJECTION can define live aggregate projections that invoke user-defined transform functions (UDTFs). Vertica invokes UDTFs at multiple points of projection processing:

- **Pre-pass UDTFs**: Invoked when data is loaded into the projection's anchor table—for example through COPY or INSERT statements. A pre-pass UDTF transforms the new data before it is stored in the projection's ROS containers. You identify a pre-pass UDTF in the projection's PARTITION BY clause, through the keyword PREPASS.

- **Batch UDTFs**: Invoked on three events: the Vertica tuple mover consolidates stored projection data (mergeout); the projection is queried; and if invoked singly, data load operations. In all cases, the UDTF aggregates projection data and stores the aggregated results. Aggregation is cumulative across mergeout and load operations, and is completed (if necessary) on query execution. You identify a batch UDTF in the projection's PARTITION BY clause, through the keyword BATCH.
Vertica stores all UDTF results in projection ROS containers, thereby enabling faster response time when you query the projection.

**UDTF Specification Options**

A projection definition can specify up to two UDTFs, in any of the following ways:

- **Single pre-pass UDTF**: The pre-pass UDTF transforms newly loaded data and stores it in the projection. Use the following syntax:

  ```sql
  => CREATE PROJECTION projection-name AS SELECT ..., udtf(args)
      OVER(PARTITION PREPASS BY partition-cols) AS (prepass-output-columns) FROM table-ref;
  ```

- **Single batch UDTF**: The batch UDTF transforms and aggregates projection data on mergeout, insert, and query operations. Use the following syntax:

  ```sql
  => CREATE PROJECTION projection-name AS SELECT ..., udtf(args)
      OVER(PARTITION BATCH BY partition-cols) AS (batch-output-columns) FROM table-ref;
  ```

- **Pre-pass and batch UDTFs**: You can define a projection with a subquery that invokes a pre-pass UDTF. The pre-pass UDTF returns transformed data to the top-level batch query. The batch UDTF then iteratively aggregates all projection data.

  Use the following syntax:

  ```sql
  => CREATE PROJECTION projection-name AS SELECT ..., batch-udtf(batch-args)
      OVER ( PARTITION BATCH BY partition-cols ) AS (batch-output-columns)
      FROM ( SELECT ..., prepass-udtf(prepass-args)
      OVER ( PARTITION PREPASS BY partition-cols ) AS (prepass-output-columns)
      FROM table-ref ) sq-ref;
  ```

**Examples**

See Examples in Pre-Aggregating UDTF Results.

**See Also**

Pre-Aggregating UDTF Results
CREATE RESOURCE POOL

Creates a custom resource pool and sets one or more resource pool parameters.

Syntax

CREATE RESOURCE POOL  pool-name  [ parameter-name setting ]...

Parameters

<table>
<thead>
<tr>
<th>pool-name</th>
<th>The name of the resource pool. Built-in pool names cannot be used for user-defined pools.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note: If you specify a resource pool name with uppercase letters, Vertica converts them to lowercase letters.</td>
<td></td>
</tr>
<tr>
<td>parameter-name</td>
<td>The parameter to set, listed below.</td>
</tr>
<tr>
<td>setting</td>
<td>The value to set on parameter-name. To reset this parameter to its default value, specify DEFAULT.</td>
</tr>
<tr>
<td>Note: Default values specified in this table pertain only to user-defined resource pools. For built-in pool default values, see Built-In Resource Pools Configuration, or query system table RESOURCEPOOL_DEFAULTS.</td>
<td></td>
</tr>
<tr>
<td>CASCADE TO</td>
<td>Specifies a secondary resource pool for executing queries that exceed the RUNTIMECAP setting of their assigned resource pool: CASCADE TO secondary-pool</td>
</tr>
<tr>
<td>CPUAFFINITYMODE</td>
<td>Specifies whether the resource pool has exclusive or shared use of the CPUs specified in CPUAFFINITYSET: CPUAFFINITYMODE { SHARED</td>
</tr>
</tbody>
</table>
- **SHARED**: Queries that run in this pool share its CPUAFFINITYSET CPUs with other Vertica resource pools.

- **EXCLUSIVE**: Dedicates CPUAFFINITYSET CPUs to this resource pool only, and excludes other Vertica resource pools. If CPUAFFINITYSET is set as a percentage, then that percentage of CPU resources available to Vertica is assigned solely for this resource pool.

- **ANY** (default): Queries in this resource pool can run on any CPU, invalid if CPUAFFINITYSET designates CPU resources.

**Important**: CPUAFFINITYMODE and CPUAFFINITYSET must be set together in the same statement.

### CPUAFFINITYSET

Specifies which CPUs are available to this resource pool. All cluster nodes must have the same number of CPUs. The CPU resources assigned to this set are unavailable to general resource pools.

```sql
CPUAFFINITYSET {
  'cpu-index[,..]' | 'cpu-index_{i}-cpu-index_{n}' |
  'integer%' |
  NONE
}
```

- **cpu-index[,..]**: Dedicates one or more comma-delimited CPUs to this pool.

- **cpu-index_{i}-cpu-index_{n}**: Dedicates a range of contiguous CPU indexes to this pool

- **integer%**: Percentage of all available CPUs to use for this pool. Vertica rounds this percentage down to include whole CPU units.

- **NONE** (default): No affinity set is assigned to this resource pool. The queries associated with this pool are executed on any CPU.
**Important:** CPUAFFINITYSET and CPUAFFINITYMODE must be set together in the same statement.

<table>
<thead>
<tr>
<th><strong>EXECUTIONPARALLELISM</strong></th>
<th>Limits the number of threads used to process any single query issued in this resource pool.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>EXECUTIONPARALLELISM { integer</td>
</tr>
<tr>
<td></td>
<td>• integer: A value between 1 and the number of cores. Setting this parameter to a reduced value increases throughput of short queries issued in the pool, especially if the queries are executed concurrently.</td>
</tr>
<tr>
<td></td>
<td>• AUTO (default): Vertica sets this value based on the number of cores, available memory, and amount of data in the system. Unless memory is limited, or the amount of data is very small, Vertica sets this value to the number of cores on the node.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>MAXCONCURRENCY</strong></th>
<th>Sets the maximum number of concurrent execution slots available to the resource pool, across the cluster:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>MAXCONCURRENCY { integer</td>
</tr>
<tr>
<td></td>
<td>NONE (default) specifies unlimited number of concurrent execution slots.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>MAXMEMORYSIZE</strong></th>
<th>The maximum size per node the resource pool can grow by borrowing memory from the GENERAL pool:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>MAXMEMORYSIZE {</td>
</tr>
<tr>
<td></td>
<td>'integer%'</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td></td>
<td>• integer%: Percentage of total memory</td>
</tr>
<tr>
<td></td>
<td>• integer{K</td>
</tr>
<tr>
<td></td>
<td>• NONE (default): Unlimited, pool can borrow any amount of available memory from the GENERAL pool.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MAXQUERYMEMORYSIZE</td>
<td>The maximum amount of memory that this pool can allocate at runtime to process a query. If the query requires more memory than this setting, Vertica stops execution and returns an error. Set this parameter as follows:</td>
</tr>
</tbody>
</table>
|                       | $\text{MAXQUERYMEMORYSIZE} \{  \\
|                       | \quad '\text{integer}\%' \\
|                       | \quad | '\text{integer}\{K|M|G|T\}' \\
|                       | \quad | NONE \\
|                       | \}                                                                                                                                           |
|                       | - $\text{integer}\%$: Percentage of MAXMEMORYSIZE for this pool.                                                                          |
|                       | - $\text{integer}\{K|M|G|T\}$: Amount of memory in kilobytes, megabytes, gigabytes, or terabytes, up to the value of MAXMEMORYSIZE.             |
|                       | - NONE (default): Unlimited; pool can borrow any amount of available memory from the GENERAL pool, within the limits set by MAXMEMORYSIZE. |
| MEMORYSIZE            | The amount of total memory available to the Vertica resource manager that is allocated to this pool per node:                             |
|                       | $\text{MEMORYSIZE} \{  \\
|                       | \quad '\text{integer}\%' \\
|                       | \quad | '\text{integer}\{K|M|G|T\}' \\
|                       | \}                                                                                                                                           |
|                       | - $\text{integer}\%$: Percentage of total memory                                                                                        |
|                       | - $\text{integer}\{K|M|G|T\}$: Amount of memory in kilobytes, megabytes, gigabytes, or terabytes                                             |
|                       | **Default**: 0%. No memory allocated, the resource pool borrows memory from the **GENERAL** pool.                                         |
| PLANNEDCONCURRENCY    | Specifies the preferred number queries to execute concurrently in the resource pool. This setting applies to the entire cluster:        |
|                       | $\text{PLANNEDCONCURRENCY} \{ \text{integer} \mid \text{AUTO} \}$                                                                     |
|                       | - $\text{integer}$: The preferred number of concurrently executing queries. When possible, query resource                                |
Budgets are limited to allow this level of concurrent execution.

- **AUTO (default):** Value is calculated automatically at query runtime. Vertica sets this parameter to the lower of these two calculations, but never less than 4:
  - Number of logical cores
  - Memory divided by 2GB

For clusters where the number of logical cores differs on different nodes, AUTO can apply differently on each node. Distributed queries run like the minimal effective planned concurrency. Single node queries run with the planned concurrency of the initiator.

**Tip:** Change this parameter only after evaluating performance over a period of time.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRIORITY</td>
<td>Specifies priority of queries in this pool when they compete for resources in the <strong>GENERAL</strong> pool:</td>
</tr>
<tr>
<td></td>
<td>PRIORITY { integer</td>
</tr>
<tr>
<td></td>
<td>- <strong>integer</strong>: A negative or positive integer value, where higher numbers denote higher priority:</td>
</tr>
<tr>
<td></td>
<td>- User-defined pools: -100 to 100</td>
</tr>
<tr>
<td></td>
<td>- Built-in pools <strong>SYSQUERY</strong>, <strong>RECOVERY</strong>, and <strong>TM</strong>: -110 to 110</td>
</tr>
<tr>
<td></td>
<td>- <strong>HOLD</strong>: Sets priority to -999. Queries in this pool are queued until <strong>QUEUETIMEOUT</strong> is reached.</td>
</tr>
<tr>
<td></td>
<td>Default: 0</td>
</tr>
<tr>
<td>QUEUETIMEOUT</td>
<td>Species how long a request can wait for pool resources before it is rejected:</td>
</tr>
<tr>
<td></td>
<td>QUEUETIMEOUT { integer</td>
</tr>
<tr>
<td></td>
<td>- <strong>integer</strong>: Maximum wait time in seconds</td>
</tr>
<tr>
<td></td>
<td>- <strong>NONE</strong>: No maximum wait time, request can be queued indefinitely.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Default: 300 seconds</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>RUNTIMECAP</td>
<td>Prevents runaway queries by setting the maximum time a query in the pool can execute. If a query exceeds this setting, it tries to cascade to a secondary pool:</td>
</tr>
<tr>
<td></td>
<td>RUNTIMECAP { 'interval'</td>
</tr>
<tr>
<td></td>
<td>• interval: An interval of 1 minute or 100 seconds; should not exceed one year.</td>
</tr>
<tr>
<td></td>
<td>• NONE (default): No time limit on queries running in this pool.</td>
</tr>
<tr>
<td></td>
<td>To specify a value in days, provide an integer value. To provide a value less than one day, provide the interval in the format hours:minutes:seconds. For example a value of 1:30:00 would equal 90 minutes.</td>
</tr>
<tr>
<td></td>
<td>If the user or session also has a RUNTIMECAP, the shorter limit applies.</td>
</tr>
<tr>
<td>RUNTIMEPRIORITY</td>
<td>Determines how the resource manager should prioritize dedication of run-time resources (CPU, I/O bandwidth) to queries already running in this resource pool:</td>
</tr>
<tr>
<td></td>
<td>RUNTIMEPRIORITY { HIGH</td>
</tr>
<tr>
<td></td>
<td>Default: MEDIUM</td>
</tr>
<tr>
<td>RUNTIMEPRIORITYTHRESHOLD</td>
<td>Specifies in seconds a time limit in which a query must finish before the resource manager assigns it the resource pool's RUNTIMEPRIORITY. All queries begin running at a HIGH priority. When a query's duration exceeds this threshold, it is assigned the RUNTIMEPRIORITY of the resource pool.</td>
</tr>
<tr>
<td></td>
<td>RUNTIMEPRIORITYTHRESHOLD seconds</td>
</tr>
<tr>
<td></td>
<td>Default: 2</td>
</tr>
<tr>
<td>SINGLEINITIATOR</td>
<td>By default, set to false for backward compatibility. Do not change this setting.</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser
Examples

This example shows how to create a resource pool with MEMORYSIZE of 1800 MB.

=> CREATE RESOURCE POOL ceo_pool MEMORYSIZE '1800M' PRIORITY 10;
CREATE RESOURCE POOL

Assuming the CEO report user already exists, associate this user with the preceding resource pool using ALTER USER statement.

=> GRANT USAGE ON RESOURCE POOL ceo_pool to ceo_user;
GRANT PRIVILEGE
=> ALTER USER ceo_user RESOURCE POOL ceo_pool;
ALTER USER

Issue the following command to confirm that the ceo_user is associated with the ceo_pool:

=> SELECT * FROM users WHERE user_name='ceo_user';
- [ RECORD 1 ]------------------------------------------
user_id         | 45035996273733402
user_name       | ceo_user
is_super_user   | f
profile_name    | default
is_locked       | f
lock_time       |
resource_pool   | ceo_pool
memory_cap_kb   | unlimited
temp_space_cap_kb| unlimited
run_time_cap    | unlimited
all_roles       |
default_roles   |
search_path     | "$user", public, v_catalog, v_monitor, v_internal

This example shows how to create and designate secondary resource pools.

=> CREATE RESOURCE POOL rp3 RUNTIMECAP '5 minutes';
=> CREATE RESOURCE POOL rp2 RUNTIMECAP '3 minutes' CASCADE TO rp3;
=> CREATE RESOURCE POOL rp1 RUNTIMECAP '1 minute' CASCADE TO rp2;
=> SET SESSION RESOURCE_POOL = rp1;

**Built-In Pools**

Vertica is preconfigured with built-in pools for various system tasks:

- GENERAL
- BLOBDATA
- DBD
- JVM
- METADATA
- RECOVERY
- REFRESH
- SYSDATA
- SYSQUERY
- TM
- WOSDATA

Built-in pools can be customized to suit your usage requirements. See ALTE... RESOURCE POOL for details on resource pool settings.

**GENERAL**

A special, catch-all pool used to answer requests that have no specific resource pool associated with them. Any memory left over after memory has been allocated to all other pools is automatically allocated to the GENERAL pool. The MEMORYSIZE parameter of the GENERAL pool is undefined (variable), however, the GENERAL pool must be at least 1GB in size and cannot be smaller than 25% of the memory in the system.
The `MAXMEMORYSIZE` parameter of the GENERAL pool has special meaning; when set as a % value it represents the percent of total physical RAM on the machine that the Resource Manager can use for queries. By default, it is set to 95%. `MAXMEMORYSIZE` governs the total amount of RAM that the Resource Manager can use for queries, regardless of whether it is set to a percent or to a specific value (for example, '10GB').

User-defined pools can borrow memory from the GENERAL pool to satisfy requests that need extra memory until the `MAXMEMORYSIZE` parameter of that pool is reached. If the pool is configured to have `MEMORYSIZE` equal to `MAXMEMORYSIZE`, it cannot borrow any memory from the GENERAL pool. When multiple pools request memory from the GENERAL pool, they are granted access to general pool memory according to their priority setting. In this manner, the GENERAL pool provides some elasticity to account for point-in-time deviations from normal usage of individual resource pools.

Vertica recommends reducing the GENERAL pool `MAXMEMORYSIZE` if your catalog uses over 5% of overall memory.

**BLOBDATA**

The BLOBDATA pool controls resource usage for in-memory blobs. *In-memory blobs* are objects used by a number of the machine learning SQL functions. You should adjust this pool if you plan on processing large machine learning workloads. For information about tuning the pool, see Tuning for Machine Learning.

If a query using the BLOBDATA pool exceeds its query planning budget, then it spills to disk. For more information about tuning your query budget, see Query Budgeting.

**DBD**

The DBD pool controls resource usage for Database Designer processing. Use of this pool is enabled by configuration parameter `DBDUseOnlyDesignerResourcePool`, by default set to false.

By default, `QUEUETIMEOUT` is set to 0 for this pool. When resources are under pressure, this setting causes the DBD to time out immediately, and not be queued to run later. Database Designer then requests the user to run the designer later, when resources are more available.

**Important:** Do not change `QUEUETIMEOUT` or other DBD pool settings.
JVM

The JVM pool controls Java Virtual Machine resources used by Java User Defined Extensions. When a Java UDx starts the JVM, it draws resources from the those specified in the JVM resource pool. Vertica does not reserve memory in advance for the JVM pool. When needed, the pool can expand to 10% of physical memory or 2 GB of memory, whichever is smaller. If you are buffering large amounts of data, you may need to increase the size of the JVM resource pool.

You can adjust the size of your JVM resource pool by changing its configuration settings. Unlike other resource pools, the JVM resource pool does not release resources until a session is closed.

METADATA

The pool that tracks memory allocated for catalog data and storage data structures. This pool increases in size as Vertica metadata consumes additional resources. Memory assigned to the METADATA pool is subtracted from the GENERAL pool, enabling the Vertica resource manager to make more effective use of available resources. If the METADATA resource pool reaches 75% of the GENERAL pool, Vertica stops updating METADATA memory size and displays a warning message in the the vertica.log file. You can enable or disable the METADATA pool with the EnableMetadataMemoryTracking general parameter.

If you have created a "dummy" or "swap" resource pool to protect resources for use by your operating system, you can replace that pool with the METADATA pool.

Users cannot change the parameters of the METADATA resource pool.

RECOVERY

The pool used by queries issued when recovering another node of the database. The MAXCONCURRENCY parameter is used to determine how many concurrent recovery threads to use. You can use the PLANNEDCONCURRENCY parameter (by default, set to twice the MAXCONCURRENCY) to tune how to apportion memory to recovery queries.

See Tuning for Recovery in the Administrator's Guide.
REFRESH

The pool used by queries issued by `PROJECTION_REFRESHES` operations. Refresh does not currently use multiple concurrent threads; thus, changes to the `MAXCONCURRENCY` values have no effect.

See `Scenario: Tuning for Refresh` in the Administrator's Guide.

SYSDATA

The pool reserved for temporary storage of intermediate results of queries against system monitoring and catalog tables. If the SYSDATA pool size is too low, Vertica cannot execute queries for large system tables or during high concurrent access to system tables.

Note: `MAXMEMORYSIZE` of the SYSDATA pool cannot be changed if any of its memory is in use.

SYSQUERY

The pool that runs queries against system monitoring and catalog tables. The SYSQUERY pool reserves resources for system table queries so that they are never blocked by contention for available resources.

TM

The Tuple Mover (TM) pool. You can set the `MAXCONCURRENCY` parameter for the TM pool to allow more than one concurrent TM operation to occur.

See `Tuning Tuple Mover Pool Settings` in the Administrator's Guide.

WOSDATA

The Write Optimized Store (WOS) resource pool. Data loads to the WOS automatically spill to the ROS once it exceeds a certain amount of WOS usage; the `PLANNEDCONCURRENCY` parameter of the WOS is used to determine this spill threshold. For instance, if `PLANNEDCONCURRENCY` of the WOSDATA pool is set to 4, once a load has occupied one quarter of the WOS, it spills to the ROS.
The WOSDATA pool is limited to a size of 2GB or 25% of the GENERAL pool's limits, whichever is less. However, when the GENERAL pool has a limit of 20GB or higher, the WOSDATA pool will instead have 2GB of dedicated memory.

Note: MAXMEMORYSIZE of the WOSDATA pool cannot be changed if any of its memory is in use. For example, you cannot change MAXMEMORYSIZE unless you first disable trickle loading jobs and wait until the WOS is empty.

See Scenario: Tuning for Continuous Load and Query in the Administrator's Guide.

**Built-In Resource Pools Configuration**

You can view the current and default configuration for built-in resource pools by querying system tables RESOURCE_POOLS and RESOURCE_POOL_DEFAULTS, respectively. The sections below provide this information, and also indicate which built-in pool parameters can be modified with ALTER RESOURCE_POOL:

- GENERAL
- BLOBDATA
- DBD
- JVM
- METADATA
- RECOVERY
- REFRESH
- SYSDATA
- SYSQUERY
- TM
- WOSDATA

</table>
CREATE ROLE

Creates a role. After creating a role, use GRANT statements to specify role permissions.

Syntax

CREATE ROLE role

Parameters

| role | The name for the new role, where role conforms to conventions described in Identifiers. |

Privileges

Superuser

Examples

This example shows to create an empty role called roleA.

```
=> CREATE ROLE roleA;
CREATE ROLE
```

See Also

- ALTER ROLE RENAME
- DROP ROLE
CREATE SCHEMA

Defines a schema.

Syntax

CREATE SCHEMA [ IF NOT EXISTS ] [database.]schema
... [ AUTHORIZATION username]
... [ DEFAULT { INCLUDE | EXCLUDE } [ SCHEMA ] PRIVILEGES ]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF NOT EXISTS</td>
<td>Specifies to generate an informational message if an object already exists under the specified name. If you omit this option and the object exists, Vertica generates a ROLLBACK error message. In both cases, the object is not created.</td>
</tr>
<tr>
<td></td>
<td>The IF NOT EXISTS clause is useful for SQL scripts where you want to create an object if it does not already exist, and reuse the existing object if it does.</td>
</tr>
<tr>
<td></td>
<td>For related information, see ON_ERROR_STOP.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Identifies the schema to create, where schema conforms to conventions described in Identifiers. This name must be unique among all other schema names in the database.</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>AUTHORIZATION username</td>
<td>Assigns ownership of the schema to a user. If a user name is not provided, the user who creates the schema is assigned ownership. Only superusers can create a schema that is owned by another user.</td>
</tr>
<tr>
<td>DEFAULT { INCLUDE</td>
<td>EXCLUDE} [SCHEMA] PRIVILEGES</td>
</tr>
<tr>
<td></td>
<td>- EXCLUDE SCHEMA PRIVILEGES (default): Disables inheritance of schema privileges.</td>
</tr>
</tbody>
</table>
INCLUDE SCHEMA PRIVILEGES: Specifies to grant tables in the specified schema the same privileges granted to that schema. This option has no effect on existing tables in the schema.

If you omit INCLUDE PRIVILEGES, you must explicitly grant schema privileges on the desired tables.

For more information see Enabling Schema Inheritance.

Privileges

- Superuser
- CREATE privilege for the database

Optionaly, CREATE SCHEMA can include the following sub-statements to create tables within the schema:

- CREATE TABLE
- GRANT Statements

These sub-statements are treated as if they were entered as individual commands after CREATE SCHEMA executes. The following exceptions apply:

- The AUTHORIZATION statement indicates all tables are owned by the specified user.
- CREATE SCHEMA statement and all associated sub-statements are treated as a single transaction. If any statement fails, Vertica rolls back the entire CREATE SCHEMA statement.

Examples

Create schema s1:

```sql
=> CREATE SCHEMA s1;
```

Create schema s2 if it does not already exist:

```sql
=> CREATE SCHEMA IF NOT EXISTS s2;
```

If the schema already exists, Vertica returns a rollback message:
CREATE SCHEMA IF NOT EXISTS s2;

NOTICE 4214: Object "s2" already exists; nothing was done

Create table t1 in schema s1, then grant users Fred and Aniket access to all existing tables and all privileges on table t1:

```sql
=> CREATE TABLE s1.t1 (c INT);
=> CREATE TABLE
=> GRANT USAGE ON SCHEMA s1 TO Fred, Aniket;
=> GRANT PRIVILEGE
=> GRANT ALL PRIVILEGES ON TABLE s1.t1 TO Fred, Aniket;
=> GRANT PRIVILEGE
```

Enable inheritance on new schema s3 so all tables created in it automatically inherit its privileges. In this case, new table s3.t2 inherits USAGE, CREATE, and SELECT privileges, which are automatically granted to all database users:

```sql
=> CREATE SCHEMA s3 DEFAULT INCLUDE SCHEMA PRIVILEGES;
CREATE SCHEMA
=> GRANT USAGE, CREATE, SELECT, INSERT ON SCHEMA s3 TO PUBLIC;
GRANT PRIVILEGE
=> CREATE TABLE s3.t2(i int);
WARNING 6978: Table "t2" will include privileges from schema "s3"
CREATE TABLE
```

See Also

- ALTER SCHEMA
- DROP SCHEMA

**CREATE SEQUENCE**

Defines a new named sequence number generator object. Along with AUTO_INCREMENT and IDENTITY sequences, you can use named sequences to set the default values of primary key columns. Sequences guarantee uniqueness, and avoid constraint enforcement problems and overhead. For more information about sequence types and their usage, see Sequences in the Administrator's Guide.
Syntax

CREATE SEQUENCE [database.schema.sequence]
... [ INCREMENT [ BY ] integer ]
... [ MINVALUE integer | NO MINVALUE ]
... [ MAXVALUE maxvalue | NO MAXVALUE ]
... [ START [ WITH ] integer ]
... [ CACHE [ WITH ] integer ]
... [ CYCLE | NO CYCLE ]

Parameters

**[database.schema]**  
Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:

```
myschema.thisDbObject
```

If you specify a database, it must be the current database.

**sequence**  
Identifies the sequence to create, where sequence conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.

**INCREMENT [BY] integer**  
A positive or negative integer that specifies how much to increment or decrement the sequence on each call to NEXTVAL, by default set to 1.

Note: Setting this parameter to integer guarantees that column values always increment by at least integer. However, column values can sometimes increment by more than integer unless you also set the NO CACHE parameter.

**MINVALUE integer**  
Determines the minimum value a sequence can generate. If you omit this clause or specify NO MINVALUE, default values are used: 1 and -2^63-1 for ascending and descending sequences, respectively.

**MAXVALUE integer**  
Determines the maximum value for the sequence. If you omit this clause or specify NO MAXVALUE, default values are used: 2^63-1 and -1 for ascending and descending sequences, respectively.
### START [WITH] `integer`

Sets the sequence start value to `integer`. The next call to `NEXTVAL` returns `integer`. If you omit this clause, the sequence start value is set to `MINVALUE` for ascending sequences, and `MAXVALUE` for descending sequences.

### CACHE `integer`

<table>
<thead>
<tr>
<th>NO CACHE</th>
</tr>
</thead>
</table>

Specifies whether to cache unique sequence numbers on each node for faster access. `CACHE` takes an integer argument as follows:

- >1 specifies how many unique numbers each node caches per session.
- 0 or 1 specifies to disable caching (equivalent to `NO CACHE`).

If you omit this clause, the sequence cache is set to 250,000. For details, see `Sequence Caching` in the Administrator's Guide.

### CYCLE

| NO CYCLE (default) |

Specifies whether the sequence can wrap when its minimum or maximum values are reached:

- CYCLE: The sequence wraps as follows:
  - When an incrementing sequence reaches its upper limit, it is reset to its minimum value.
  - When a decrementing sequence reaches its lower limit, it is reset to its maximum value.
- NO CYCLE (default): Calls to `NEXTVAL` return an error after the sequence reaches its maximum or minimum value.

### Privileges

Superuser, or user with CREATE privilege on the sequence schema.

For details on privileges required to use and manage sequence, see `Named Sequence Privileges` in the Administrator's Guide.

### Examples

See Also

- `AUTO_INCREMENT` and `IDENTITY Sequences` in the Administrator's Guide
- `ALTER SEQUENCE`
- `DROP SEQUENCE`

**CREATE SUBNET**

Identifies the subnet to which the nodes of a Vertica database belong. Use this statement to configure import/export from a database to other Vertica clusters.

**Syntax**

```sql
CREATE SUBNET subnet-name WITH 'subnet-prefix'
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>subnet-name</code></td>
<td>A name you assign to the subnet, where <code>subnet-name</code> conforms to conventions described in Identifiers.</td>
</tr>
<tr>
<td><code>subnet-prefix</code></td>
<td>The routing prefix expressed in quad-dotted decimal representation. Refer to system table <code>NETWORK_INTERFACES</code> to get the prefix of all available IP networks.</td>
</tr>
</tbody>
</table>

You can then configure the database to use the subnet for import/export. For details, see Identify the Database or Nodes Used for Import/Export in the Administrator's Guide.

**Privileges**

Superuser
Examples

```sql
=> CREATE SUBNET mySubnet WITH '123.4.5.6';
```

**CREATE TABLE**

Creates a table in the logical schema.

**Syntax**

Create with column definitions:

```sql
CREATE TABLE [ IF NOT EXISTS ] [[database.]schema.]table
... ( column-definition[,...] [, table-constraint ][,...] )
... [ load-method ]
... [ ORDER BY column[,...] ]
... [ segmentation-spec ]
... [ KSAFE [k-num] ]
... [ partition-clause ]
... [ {INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES ]
```

Create from another table:

```sql
CREATE TABLE [ IF NOT EXISTS ] [[database.]schema.]table { AS-clause | LIKE-clause }

AS-clause

```sql
... [ ( column-name-list ) ]
... [ load-method ]
... [ {INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES ]
AS [ /*+ hint[, hint] */ ] [ AT epoch ] query [ ENCODED BY column-ref-list ]
```

**LIKE-clause**

```sql
LIKE [[database.]schema.]existing-table
... [ {INCLUDING | EXCLUDING} PROJECTIONS ]
... [ load-method ]
... [ {INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES ]
```

**Parameters**

<table>
<thead>
<tr>
<th>IF NOT EXISTS</th>
<th>Specifies to generate an informational message if an object already exists under the specified name. If you omit this option</th>
</tr>
</thead>
</table>
and the object exists, Vertica generates a ROLLBACK error message. In both cases, the object is not created.

The IF NOT EXISTS clause is useful for SQL scripts where you want to create an object if it does not already exist, and reuse the existing object if it does.

For related information, see ON_ERROR_STOP.

<table>
<thead>
<tr>
<th>database.</th>
<th>schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>table</td>
<td></td>
<td>Identifies the table to create, where table conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.</td>
</tr>
<tr>
<td>column-definition</td>
<td></td>
<td>Defines a table column. A table can have up to 1600 columns.</td>
</tr>
<tr>
<td>table-constraint</td>
<td></td>
<td>Adds a constraint to table metadata.</td>
</tr>
<tr>
<td>load-method</td>
<td></td>
<td>Specifies default load behavior for all DML operations on this table, such as INSERT and COPY, one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- AUTO (default): Initially loads data into WOS, suitable for smaller bulk loads.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- DIRECT: Loads data directly into ROS containers, suitable for large (&gt;100 MB) bulk loads.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- TRICKLE: Loads data only into WOS, suitable for frequent incremental loads.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For details, see Choosing a Load Method in the Administrator's Guide.</td>
</tr>
<tr>
<td>ORDER BY column [, …]</td>
<td></td>
<td>Invalid for external tables, specifies columns from the SELECT list on which to sort the superprojection that is automatically created for this table. The ORDER BY clause cannot include qualifiers ASC or DESC. Vertica always stores projection data in ascending sort order.</td>
</tr>
</tbody>
</table>
If you omit the ORDER BY clause, Vertica uses the SELECT list order as the projection sort order.

<table>
<thead>
<tr>
<th>segmentation-spec</th>
<th>Invalid for external tables, specifies how to distribute data for auto-projections of this table. Supply one of the following clauses:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• hash-segmentation-clause: Specifies to segment data evenly and distribute across cluster nodes. Vertica recommends segmenting large tables. For details, see Hash Segmentation Clause.</td>
</tr>
<tr>
<td></td>
<td>• unsegmented-clause: Specifies to create an unsegmented projection. For details, see Unsegmented Clause.</td>
</tr>
</tbody>
</table>

If this clause is omitted, Vertica generates auto-projections with default hash segmentation.

| KSAFE [k-num] | Invalid for external tables, specifies K-safety of auto-projections created for this table, where k-num must be equal to or greater than system K-safety. If you omit this option, the projection uses the system K-safety level. For general information, see K-Safety in Vertica Concepts. |

<table>
<thead>
<tr>
<th>partition-clause</th>
<th>Invalid for external tables, logically divides table data storage through a PARTITION BY clause:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>PARTITION BY partition-expression [ GROUP BY group-expression ] [ ACTIVEPARTITIONCOUNT integer ]</td>
</tr>
<tr>
<td></td>
<td>For details, see Partition Clause.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>column-name-list</th>
<th>Valid only when creating a table from a query (AS query), defines column names that map to the query output. If you omit this list, Vertica uses the query output column names. The names in column-name-list and queried columns must be the same in number.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td>CREATE TABLE customeroccupations (name, profession) AS SELECT customer_name, occupation FROM customer_dimension;</td>
</tr>
</tbody>
</table>

This clause and the ENCODED BY clause are mutually exclusive. Column name lists are invalid for external tables.
<table>
<thead>
<tr>
<th>INCLUDE</th>
<th>EXCLUDE</th>
<th>[SCHEMA] PRIVILEGES</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Specifies default inheritance of schema privileges for this table:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- INCLUDE [SCHEMA] PRIVILEGES specifies that the table inherits privileges that are set on its schema. This is the default behavior if privileges inheritance is enabled for the schema.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- EXCLUDE [SCHEMA] PRIVILEGES disables inheritance of privileges from the schema.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For details, see Inherited Privileges in the Administrator’s Guide.</td>
</tr>
</tbody>
</table>

**AS query**

Creates and loads a table from the results of a query, specified as follows:

```
AS [ /*+hint[, hint]*/ ] [ AT epoch ] query
```

You can qualify the AS clause with one or both of the following hints:

- A load method hint: AUTO, DIRECT, or TRICKLE

  **Note:** The CREATE TABLE statement can also specify a load method. However, this load method applies to load operations only after the table is created.

- LABEL

For details, see Creating a Table from a Query in the Administrator’s Guide.

**ENCODED BY column-ref-list**

A list of columns from the source table, where each column is qualified by one or both of the following encoding options:

- ACCESSRANK integer: Overrides the default access rank for a column, useful for prioritizing access to a column. See Prioritizing Column Access Speed in the Administrator’s Guide.

- ENCODING encoding-type: Specifies the type of encoding to use on the column. The default encoding type is AUTO.

This option and column-name-list are mutually exclusive. This option is invalid for external tables.
LIKE `existing-table` | Creates the table by replicating an existing table. You can qualify the LIKE clause with one of the following options:

- **EXCLUDING PROJECTIONS** (default): Do not copy projections from the source table.
- **INCLUDING PROJECTIONS**: Copy current projections from the source table for the new table.
- **Load-method**: See description above.
- `{INCLUDE|EXCLUDE} [SCHEMA] PRIVILEGES`: See description above.

For details, see Replicating a Table in the Administrator's Guide.

---

### Privileges

The following privileges are required:

- **CREATE** privileges on the table schema

If creating a table that includes a named sequence:

- **SELECT** privilege on sequence object
- **USAGE** privilege on sequence schema

If creating a table with the LIKE clause, owner privileges on the source table

---

### Examples

In the Administrator's Guide, see:

- Creating Tables
- Replicating a Table
- Creating a Table from a Query
See Also

- CREATE TEMPORARY TABLE
- CREATE EXTERNAL TABLE AS COPY
- CREATE FLEX TABLE

Column-Definition

Specifies the name, data type, and constraints to be applied to a column.

Syntax

```
column-name data-type
... [ column-constraint ][-]
... [ ENCODING encoding-type ]
... [ ACCESSRANK integer ]
```

Parameters

<table>
<thead>
<tr>
<th>column-name</th>
<th>The name of a column to be created or added.</th>
</tr>
</thead>
<tbody>
<tr>
<td>data-type</td>
<td>One of the following data types:</td>
</tr>
<tr>
<td></td>
<td>• BINARY</td>
</tr>
<tr>
<td></td>
<td>• BOOLEAN</td>
</tr>
<tr>
<td></td>
<td>• CHARACTER</td>
</tr>
<tr>
<td></td>
<td>• DATE/TIME</td>
</tr>
<tr>
<td></td>
<td>• NUMERIC</td>
</tr>
</tbody>
</table>

Tip: When specifying the maximum column width in a CREATE TABLE statement, use the width in bytes (octets) for any of the string types. Each UTF-8 character might require four bytes, but European languages generally require...
a little over one byte per character, while Oriental languages generally require a little under three bytes per character.

<table>
<thead>
<tr>
<th>column-constraint</th>
<th>Specifies a column constraint for this column.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENCODING encoding-type</td>
<td>Specifies the column encoding type, by default set to AUTO.</td>
</tr>
<tr>
<td>ACCESSRANK integer</td>
<td>Overrides the default access rank for a column. Use this parameter to increase or decrease the speed at which Vertica accesses a column. For more information, see Overriding Default Column Ranking.</td>
</tr>
</tbody>
</table>

Example

The following example creates a table named Employee Dimension and its associated superprojection in the Public schema. The Employee_key column is designated as a primary key, and RLE encoding is specified for the Employee_gender column definition:

```sql
=> CREATE TABLE Public.Employee_Dimension (  
    Employee_key integer PRIMARY KEY NOT NULL,  
    Employee_gender varchar(8) ENCODING RLE,  
    Courtesy_title varchar(8),  
    Employee_first_name varchar(64),  
    Employee_middle_initial varchar(8),  
    Employee_last_name varchar(64)  
);```

Column-Name-List

Used to rename columns when creating a table or temporary table from a query (CREATE TABLE AS SELECT); also used to specify the column's encoding type and access rank.

Syntax

```
column-name-list
... [ ENCODING encoding-type ]
... [ ACCESSRANK integer ]
... [ GROUPED ( column-reference[,..] ) ]
```
Parameters

<table>
<thead>
<tr>
<th>column-name</th>
<th>Specifies the new name for the column.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENCODING</td>
<td>Specifies the type of encoding to use on the column. The default encoding type is AUTO.</td>
</tr>
<tr>
<td>ACCESSRANK</td>
<td>Overrides the default access rank for a column, useful for prioritizing access to a column. See Prioritizing Column Access Speed in the Administrator's Guide.</td>
</tr>
<tr>
<td>GROUPED</td>
<td>Groups two or more columns. For detailed information, see GROUPED Clause.</td>
</tr>
</tbody>
</table>

Requirements

- A column in the list can not specify the column's data type or any constraint. These are derived from the queried table.

- If the query output has expressions other than simple columns (for example, constants or functions) then an alias must be specified for that expression, or the column name list must include all queried columns.

- CREATE TABLE can specify encoding types and access ranks in the column name list or the query's ENCODED BY clause, but not in both. For example, the following CREATE TABLE statement sets encoding and access rank on two columns in the column name list:

```
=> CREATE TABLE promo1 (state ENCODING RLE ACCESSRANK 1, zip ENCODING RLE,...)
    AS SELECT * FROM customer_dimension ORDER BY customer_state;
```

The next statement specifies the same encoding and access rank in the query's ENCODED BY clause.

```
=> CREATE TABLE promo2
    AS SELECT * FROM customer_dimension ORDER BY customer_state
    ENCODED BY customer_state ENCODING RLE ACCESSRANK 1, customer_zip ENCODING RLE;
```
Column-Constraint

Adds a constraint to a column's metadata. For details, see Constraints in the Administrator's Guide.

Syntax

```
[ { AUTO_INCREMENT | IDENTITY } [ (args) ] ]
[ CONSTRAINT constraint-name ]
...[ CHECK (expression) [ ENABLED | DISABLED ] ]
...[ [ DEFAULT default-expr ] [ SET USING using-expr ] | DEFAULT USING expr ]
...[ NULL | NOT NULL ]
...[ { PRIMARY KEY [ ENABLED | DISABLED ] | REFERENCES table [(column)] } ]
...[ UNIQUE [ ENABLED | DISABLED ] ]
```

Parameters

**Note:** You can specify enforcement of several constraints by qualifying them with the keywords ENABLED or DISABLED. See Enforcing Constraints below.

<table>
<thead>
<tr>
<th>Constraint</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTO_INCREMENT</td>
<td>Creates a table column whose values are automatically generated by the database, and cannot be changed. You can set this constraint on only one table column. AUTO_INCREMENT and IDENTITY are synonyms. For details on this constraint and optional arguments, see AUTO_INCREMENT and IDENTITY Sequences in the Administrator's Guide. These options are invalid for temporary tables.</td>
</tr>
</tbody>
</table>
| CONSTRAINT constraint-name | Assigns a name to the constraint, valid for the following constraints:  
  - PRIMARY KEY  
  - REFERENCES (foreign key)  
  - CHECK  
  - UNIQUE  

If you omit assigning a name to these constraints, Vertica assigns its
own name. For details, see Naming Constraints in the Administrator's Guide.

Vertica recommends that you name all constraints.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHECK (expression)</td>
<td>Adds check condition <em>expression</em>, which returns a Boolean value.</td>
</tr>
<tr>
<td>DEFAULT</td>
<td>Specifies this column's default value:</td>
</tr>
<tr>
<td></td>
<td><code>DEFAULT default-expr</code></td>
</tr>
<tr>
<td></td>
<td>Vertica evaluates the DEFAULT expression and sets the column on load operations, if the operation omits a value for the column. For details about valid expressions, see Defining Column Values.</td>
</tr>
<tr>
<td>SET USING</td>
<td>Specifies to set values in this column from the specified expression:</td>
</tr>
<tr>
<td></td>
<td><code>SET USING using-expr</code></td>
</tr>
<tr>
<td></td>
<td>Vertica evaluates the SET USING expression and refreshes column values only when the function ( \text{REFRESH_COLUMNS} ) is invoked. For details about valid expressions, see Defining Column Values.</td>
</tr>
<tr>
<td>DEFAULT USING</td>
<td>Defines the column with DEFAULT and SET USING constraints, specifying the same expression for both. DEFAULT USING columns support the same expressions as SET USING columns, and are subject to the same restrictions.</td>
</tr>
<tr>
<td>NULL NOT NULL</td>
<td>Specifies whether the column can contain null values:</td>
</tr>
<tr>
<td></td>
<td>- <code>NULL</code>: Allows null values in the column. If you set this constraint on a primary key column, Vertica ignores it and sets it to NOT NULL.</td>
</tr>
<tr>
<td></td>
<td>- <code>NOT NULL</code>: Specifies that the column must be set to a value during insert and update operations. If the column has no default value and no value is provided, INSERT or UPDATE returns an error.</td>
</tr>
</tbody>
</table>

If you omit this constraint, the default is NULL for all columns except primary key columns, which Vertica always sets to NOT NULL.

**External tables:** If you specify NOT NULL and the column
contains null values, queries are liable to return errors or generate unexpected behavior. Specify NOT NULL for an external table column only if you are sure that the column does not contain nulls.

<table>
<thead>
<tr>
<th>PRIMARY KEY</th>
<th>Identifies this column as the table's primary key.</th>
</tr>
</thead>
<tbody>
<tr>
<td>REFERENCES</td>
<td>Identifies this column as a foreign key:</td>
</tr>
<tr>
<td>REFERENCES table [column]</td>
<td>where column is the primary key in table. If you omit column, Vertica references the primary key in table.</td>
</tr>
<tr>
<td>UNIQUE</td>
<td>Requires column data to be unique with respect to all table rows.</td>
</tr>
</tbody>
</table>

Privileges

Table owner or user WITH GRANT OPTION is grantor.

- REFERENCES privilege on table to create foreign key constraints that reference this table
- USAGE privilege on schema that contains the table

Enforcing Constraints

The following constraints can be qualified with the keyword ENABLED or DISABLED:

- PRIMARY KEY
- UNIQUE
- CHECK

If you omit ENABLED or DISABLED, Vertica determines whether to enable the constraint automatically by checking the appropriate configuration parameter:

- EnableNewPrimaryKeysByDefault
- EnableNewUniqueKeysByDefault
- EnableNewCheckConstraintsByDefault
For details, see Constraint Enforcement.

## Partition Clause

Specifies partitioning of table data, through a `PARTITION BY` clause in the table definition:

\[
\text{PARTITION BY } \text{partition-expression} [ \text{ GROUP BY } \text{group-expression} ] [ \text{ACTIVEPARTITIONCOUNT integer } ]
\]

<table>
<thead>
<tr>
<th><strong>PARTITION BY</strong> ( \text{partition-expression} )</th>
<th>For each table row, resolves to a partition key that is derived from one or more table columns.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>GROUP BY</strong> ( \text{group-expression} )</td>
<td>For each table row, resolves to a partition group key that is derived from the partition key. Vertica uses group keys to merge partitions into separate partition groups. GROUP BY must use the same expression as PARTITION BY. For example:</td>
</tr>
</tbody>
</table>
|                                                     | \[
\ldots \text{PARTITION BY } (i+j) \text{ GROUP BY (}
\begin{align*}
\text{CASE WHEN } (i+j) &< 5 \text{ THEN } 1 \\
\text{WHEN } (i+j) &< 10 \text{ THEN } 2 \\
\text{ELSE } 3; 
\end{align*}
\) |
|                                                     | For details on partitioning table data by groups, see Partition Grouping and Hierarchical Partitioning in the Administrator's Guide. |
| **ACTIVEPARTITIONCOUNT integer**                    | Specifies how many partitions are active for this table. This setting supersedes configuration parameter ActivePartitionCount. For details on usage, see Active and Inactive Partitions in the Administrator's Guide. |

### Partitioning Requirements and Restrictions

PARTITION BY expressions can specify leaf expressions, functions, and operators. The following requirements and restrictions apply:

- All table projections must include all columns referenced in the expression; otherwise, Vertica cannot resolve the expression.

---

Vertica Documentation
SQL Reference Manual

Vertica Analytic Database (9.1.x)
The expression can reference multiple columns, but it must resolve to a single non-null value for each row.

All leaf expressions must be constants or table columns.

All other expressions must be functions and operators. The following restrictions apply to functions:

- They must be immutable—that is, they return the same value regardless of time and locale and other session- or environment-specific conditions.
- They cannot be aggregate functions.
- They cannot be Vertica meta-functions.

The expression cannot include queries.

GROUP BY expressions do not support modulo (%) operations.

Examples

See Defining Partitions and Hierarchical Partitioning in the Administrator's Guide

See Also

Partitioning Tables in the Administrator's Guide

Table-Constraint

Adds a constraint to table metadata. You can specify table constraints with CREATE TABLE, or add a constraint to an existing table with ALTER TABLE. For details, see Setting Constraints in the Administrator's Guide.

Note: Adding a constraint to a table that is referenced in a view does not affect the view.

Syntax

```sql
[ CONSTRAINT constraint-name ]
{
  ... PRIMARY KEY (column[, ... ]) [ ENABLED | DISABLED ]
  ... | FOREIGN KEY (column[, ... ]) REFERENCES table (column[, ...]) ]
  ... | UNIQUE (column[, ...]) [ ENABLED | DISABLED ]
}
```
... | CHECK (expression) [ ENABLED | DISABLED ]
}

## Parameters

<table>
<thead>
<tr>
<th>Constraint</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONSTRAINT</td>
<td>Assigns a name to the constraint. Vertica recommends that you name all constraints.</td>
</tr>
<tr>
<td>PRIMARY KEY</td>
<td>Defines one or more NOT NULL columns as the primary key as follows:</td>
</tr>
<tr>
<td>FOREIGN KEY</td>
<td>Adds a referential integrity constraint defining one or more columns as foreign keys as follows:</td>
</tr>
<tr>
<td>UNIQUE</td>
<td>Specifies that the data in a column or group of columns is unique with respect to all table rows, as follows:</td>
</tr>
<tr>
<td>CHECK</td>
<td>Specifies a check condition as an expression that returns a Boolean value, as follows:</td>
</tr>
</tbody>
</table>

PUBLIC

If you do not name a primary key constraint, Vertica assigns the name C_PRIMARY.

If you do not name a foreign key constraint, Vertica assigns the name C_FOREIGN.

If you do not name a unique constraint, Vertica assigns the name C_UNIQUE.
You can qualify this constraint with the keyword ENABLED or DISABLED. See Enforcing Constraints below.

If you do not name a check constraint, Vertica assigns the name C_CHECK.

Privileges

Table owner or user WITH GRANT OPTION is grantor.

- REFERENCES privilege on table to create foreign key constraints that reference this table
- USAGE privilege on schema that contains the table

Enforcing Constraints

A table can specify whether Vertica automatically enforces a primary key, unique key or check constraint with the keyword ENABLED or DISABLED. If you omit ENABLED or DISABLED, Vertica determines whether to enable the constraint automatically by checking the appropriate configuration parameter:

- EnableNewPrimaryKeysByDefault
- EnableNewUniqueKeysByDefault
- EnableNewCheckConstraintsByDefault

For details, see Constraint Enforcement.

Examples

The following example creates a table (t01) with a primary key constraint.

```
CREATE TABLE t01 (id int CONSTRAINT sampleconstraint PRIMARY KEY);
```

This example creates the same table without the constraint, and then adds the constraint with ALTER TABLE ADD CONSTRAINT
CREATE TABLE t01 (id int);

ALTER TABLE t01 ADD CONSTRAINT sampleconstraint PRIMARY KEY (id);
WARNING 2623: Column "id" definition changed to NOT NULL

The following example creates a table (addapk) with two columns, adds a third column to the table, and then adds a primary key constraint on the third column.

=> CREATE TABLE addapk (col1 INT, col2 INT);
CREATE TABLE
=> ALTER TABLE addapk ADD COLUMN col3 INT;
ALTER TABLE
=> ALTER TABLE addapk ADD CONSTRAINT col3constraint PRIMARY KEY (col3) ENABLED;
WARNING 2623: Column "col3" definition changed to NOT NULL

Using the sample table addapk, check that the primary key constraint is enabled (is_enabled is t).

=> SELECT constraint_name, column_name, constraint_type, is_enabled FROM PRIMARY_KEYS WHERE table_name IN ('addapk');

<table>
<thead>
<tr>
<th>constraint_name</th>
<th>column_name</th>
<th>constraint_type</th>
<th>is_enabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>col3constraint</td>
<td>col3</td>
<td>p</td>
<td>t</td>
</tr>
</tbody>
</table>
(1 row)

This example disables the constraint using ALTER TABLE ALTER CONSTRAINT.

=> ALTER TABLE addapk ALTER CONSTRAINT col3constraint DISABLED;

Check that the primary key is now disabled (is_enabled is f).

=> SELECT constraint_name, column_name, constraint_type, is_enabled FROM PRIMARY_KEYS WHERE table_name IN ('addapk');

<table>
<thead>
<tr>
<th>constraint_name</th>
<th>column_name</th>
<th>constraint_type</th>
<th>is_enabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>col3constraint</td>
<td>col3</td>
<td>p</td>
<td>f</td>
</tr>
</tbody>
</table>
(1 row)

For a general discussion of constraints, see Constraints. For additional examples of creating and naming constraints, see Naming Constraints.
CREATE TEMPORARY TABLE

Creates a table whose data persists only during the current session. Temporary table data is not visible to other sessions.

Syntax

Create with column definitions

```
  ... ( column-definition[,] )
  ... [ table-constraint ]
  ... [ ON COMMIT { DELETE | PRESERVE } ROWS ]
  ... [ load-method ]
  ... [ NO PROJECTION ]
  ... [ ORDER BY table-column[,...] ]
  ... [ segmentation-spec ]
  ... [ KSAFE [k-num] ]
  ... [ INCLUDE | EXCLUDE ] [SCHEMA] PRIVILEGES ]
```

Create from another table

```
CREATE TEMP[ORARY] TABLE [ IF NOT EXISTS ] [[database.]schema.]table-name
  ... ( column-name-list )
  ... [ ON COMMIT { DELETE | PRESERVE } ROWS ]
  ... [ load-method ]
  AS [ /*+ hint[, hint] */ ] [ AT epoch ] query [ ENCODED BY column-ref-list ]
```

Parameters

<table>
<thead>
<tr>
<th>scope</th>
<th>Specifies visibility of the table definition:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• GLOBAL (default): The table definition is visible to all sessions, and persists until you explicitly drop the table.</td>
</tr>
<tr>
<td></td>
<td>• LOCAL: the table definition is visible only to the session in which it is created, and is dropped when the session ends.</td>
</tr>
</tbody>
</table>

Regardless of this setting, retention of temporary table data is set by the keywords ON COMMIT DELETE and ON COMMIT PRESERVE (see below).

For more information, see Creating Temporary Tables in the Administrator's Guide.
| **IF NOT EXISTS** | Specifies to generate an informational message if an object already exists under the specified name. If you omit this option and the object exists, Vertica generates a ROLLBACK error message. In both cases, the object is not created.

The IF NOT EXISTS clause is useful for SQL scripts where you want to create an object if it does not already exist, and reuse the existing object if it does.

For related information, see **ON_ERROR_STOP**. |
| **[database.]schema** | Specifies a schema, by default public. If *schema* is any schema other than public, you must supply the schema name. For example:

```
myschema.thisDbObject
``` |
| **table-name** | Identifies the table to create, where *table-name* conforms to conventions described in **Identifiers**. It must also be unique among all names of sequences, tables, projections, views, and models within the same schema. |
| **column-definition** | Defines a table column. A table can have up to 1600 columns. |
| **table-constraint** | Adds a constraint to table metadata. |
| **ON COMMIT** | Specifies whether data is transaction- or session-scoped:

```
ON COMMIT {PRESERVE | DELETE} ROWS
``` |
| | - DELETE (default) marks the temporary table for transaction-scoped data. Vertica removes all table data after each commit.

- PRESERVE marks the temporary table for session-scoped data, which is preserved beyond the lifetime of a single transaction. Vertica removes all table data when the session ends. |
<p>| <strong>load-method</strong> | Specifies default load behavior for all DML operations on this table, such as INSERT and COPY, one of the following: |</p>
<table>
<thead>
<tr>
<th>Load Method</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTO (default)</td>
<td>Initially loads data into WOS, suitable for smaller bulk loads.</td>
</tr>
<tr>
<td>DIRECT</td>
<td>Loads data directly into ROS containers, suitable for large (&gt;100 MB) bulk loads.</td>
</tr>
<tr>
<td>TRICKLE</td>
<td>Loads data only into WOS, suitable for frequent incremental loads.</td>
</tr>
</tbody>
</table>

For details, see Choosing a Load Method in the Administrator’s Guide.

<table>
<thead>
<tr>
<th>Clause</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO PROJECTION</td>
<td>Prevents Vertica from creating auto-projections for this table. A superprojection is created only when data is explicitly loaded into this table. NO PROJECTION is invalid with the following clauses:</td>
</tr>
<tr>
<td>ORDER BY</td>
<td></td>
</tr>
<tr>
<td>KSAFE</td>
<td></td>
</tr>
<tr>
<td>Any segmentation clause</td>
<td>(hash-segmentation-clause or unsegmented-clause).</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Clause</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>{INCLUDE</td>
<td>EXCLUDE} [SCHEMA] PRIVILEGES</td>
</tr>
<tr>
<td>INCLUDE [SCHEMA] PRIVILEGES</td>
<td>specifies that the table inherits privileges that are set on its schema. This is the default behavior if privileges inheritance is enabled for the schema.</td>
</tr>
<tr>
<td>EXCLUDE [SCHEMA] PRIVILEGES</td>
<td>disables inheritance of privileges from the schema.</td>
</tr>
</tbody>
</table>

For details, see Inherited Privileges in the Administrator's Guide.

<table>
<thead>
<tr>
<th>Clause</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORDER BY table-column[, …]</td>
<td>Invalid for external tables, specifies columns from the SELECT list on which to sort the superprojection that is automatically created for this table. The ORDER BY clause cannot include qualifiers ASC or DESC. Vertica always stores projection data in ascending sort order. If you omit the ORDER BY clause, Vertica uses the SELECT list order as the projection sort order.</td>
</tr>
</tbody>
</table>
**segmentation-spec**

Invalid for external tables, specifies how to distribute data for auto-projections of this table. Supply one of the following clauses:

- **hash-segmentation-clause**: Specifies to segment data evenly and distribute across cluster nodes. Vertica recommends segmenting large tables. For details, see Hash Segmentation Clause.

- **unsegmented-clause**: Specifies to create an unsegmented projection. For details, see Unsegmented Clause.

If this clause is omitted, Vertica generates auto-projections with default hash segmentation.

**KSAFE [k-num]**

Invalid for external tables, specifies K-safety of auto-projections created for this table, where *k-num* must be equal to or greater than system K-safety. If you omit this option, the projection uses the system K-safety level. For general information, see K-Safety in Vertica Concepts.

**Eon Mode**: K-safety of temporary tables is always set to 0, regardless of system K-safety. If a CREATE TEMPOARY TABLE statement sets *k-num* greater than 0, Vertica returns an warning.

**column-name-list**

Valid only when creating a table from a query (AS query), defines column names that map to the query output. If you omit this list, Vertica uses the query output column names. The names in **column-name-list** and queried columns must be the same in number.

For example:

```
CREATE TABLE customer_occupations (name, profession) 
AS SELECT customer_name, occupation FROM customer_dimension;
```

This clause and the ENCODED BY clause are mutually exclusive. Column name lists are invalid for external tables

**AS query**

Creates and loads a table from the results of a query, specified as follows:

```
AS [ /+hint[, hint]* ] [ AT epoch ] query
```
You can qualify the AS clause with one or both of the following hints:

- A load method hint: AUTO, DIRECT, or TRICKLE

**Note:** The CREATE TABLE statement can also specify a load method. However, this load method applies to load operations only after the table is created.

- LABEL

For details, see Creating a Table from a Query in the Administrator's Guide.

<table>
<thead>
<tr>
<th>ENCODED BY column-ref-list</th>
<th>A list of columns from the source table, where each column is qualified by one or both of the following encoding options:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• ACCESSRANK  <em>integer</em>: Overrides the default access rank for a column, useful for prioritizing access to a column. See Prioritizing Column Access Speed in the Administrator's Guide.</td>
</tr>
<tr>
<td></td>
<td>• ENCODING  <em>encoding-type</em>: Specifies the type of encoding to use on the column. The default encoding type is AUTO.</td>
</tr>
</tbody>
</table>

This option and `column-name-list` are mutually exclusive. This option is invalid for external tables.

### Privileges

The following privileges are required:

- CREATE privileges on the table schema

- If creating a temporary table that includes a named sequence:
  - SELECT privilege on sequence object
  - USAGE privilege on sequence schema
Restrictions

- Queries on temporary tables are subject to the same restrictions on SQL support as persistent tables.

- You cannot add projections to non-empty, global temporary tables (ON COMMIT PRESERVE ROWS). Make sure that projections exist before you load data. See Auto-Projections in the Administrator's Guide.

- While you can add projections for temporary tables that are defined with ON COMMIT DELETE ROWS specified, be aware that you might lose all data.

- Moveout and mergeout operations cannot be used on session-scoped temporary data.

- In general, session-scoped temporary table data is not visible using system (virtual) tables.

- Temporary tables do not recover. If a node fails, queries that use the temporary table also fail. Restart the session and populate the temporary table.

- Creating Temporary Tables
- ALTER TABLE
- CREATE TABLE

CREATE TEXT INDEX

Creates a text index used to perform text searches.

Syntax

CREATE TEXT INDEX [[database.]schema.]txtindex-name
.. ON [schema.]source-table (unique-id, text-field [, column-name,..])
.. [STEMMER {stemmer-name(stemmer-input-data-type)} NONE]
.. [TOKENIZER tokenizer-name(tokenizer-input-data-type)];
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code>  If you specify a database, it must be the current database. If you do not specify a schema, the table is created in the default schema.</td>
</tr>
<tr>
<td><code>txtindex-name</code></td>
<td>The text index name.</td>
</tr>
<tr>
<td><code>source-table</code></td>
<td>The source table to index.</td>
</tr>
<tr>
<td><code>unique-id</code></td>
<td>The name of the column in the source table that contains a unique identifier. Any data type is permissible. The column must be the primary key in the source table.</td>
</tr>
<tr>
<td><code>text-field</code></td>
<td>The name of the column in the source table that contains the text field. Valid data types are: CHAR, VARCHAR, LONG VARCHAR, VARBINARY, LONG VARBINARY. Nulls are allowed.</td>
</tr>
<tr>
<td><code>column-name</code></td>
<td>The name of a column or columns to be included as additional columns.</td>
</tr>
<tr>
<td><code>stemmer-name</code></td>
<td>The name of the stemmer.</td>
</tr>
<tr>
<td><code>stemmer-input-data-type</code></td>
<td>The input data type of the <code>stemmer-name</code> function.</td>
</tr>
</tbody>
</table>
### tokenizer-name

Specifies the name of the tokenizer.

### tokenizer-input-data-type

This value is the input data type of the `tokenizer-name` function. It can accept any number of arguments.

If a Vertica Tokenizers is used, then this parameter can be omitted.

### Privileges

The index automatically inherits the query permissions of its parent table. The table owner and dbadmin will be allowed to create and/or modify the indices.

Important: Do not alter the contents or definitions of the text index. If the contents or definitions of the text index are altered, then the results will not appropriately match the source table.

### Requirements

- Requires there be a column with a unique identifier set as the primary key.
- The source table must have an associated projection, and must be both sorted and segmented by the primary key.

### Behavior

If data within a table is partitioned, then an extra column appears in the text index, showing the partition.

### Examples

The following example shows how to create a text index with an additional unindexed column on the table `t_log` using the `CREATE TEXT INDEX` statement:

```sql
=> CREATE TEXT INDEX t_log_index ON t_log (id, text, day_of_week);
CREATE INDEX
```
The following example shows a text index, tpart_index, created from a partitioned source table:

```sql
=> SELECT * FROM tpart_index;

<table>
<thead>
<tr>
<th>token</th>
<th>doc_id</th>
<th>partition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>4</td>
<td>2014</td>

</tbody>
</table>
```

... (97 rows)
CREATE USER

Adds a name to the list of authorized database users.

**Note:** New users lack default access to schema PUBLIC. Be sure to assign new users USAGE privileges to the PUBLIC schema (`GRANT USAGE ON SCHEMA PUBLIC`)

**Syntax**

```
CREATE USER name [ user-parameter setting[,] ]
```

**Parameters**

| name | Specifies the name of the new user. Names that contain special |
characters must be double-quoted. To enforce case-sensitivity, use double-quotes.

For details on name requirements, see Creating a Database Name and Password.

| ACCOUNT { LOCK | UNLOCK } | Locks or unlocks a user's access to the database, set to one of the following:
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• UNLOCK (default)</td>
</tr>
<tr>
<td></td>
<td>• LOCK prevents a new user from logging in. This can be useful when creating an account for a user who does not need immediate access.</td>
</tr>
</tbody>
</table>

**Tip:** To automate account locking, set a maximum number of failed login attempts with `CREATE PROFILE`.

| GRACEPERIOD limit | Specifies how long a user query can block on any session socket, where `limit` is one of the following:
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• NONE (default): Removes any grace period previously set on session queries.</td>
</tr>
<tr>
<td></td>
<td>• <code>'interval'</code>: Specifies as an <code>interval</code> the maximum grace period for current session queries, up to 20 days.</td>
</tr>
</tbody>
</table>

For details, see Handling Session Socket Blocking.

| IDENTIFIED BY 'password' | Sets the new user's password, where `password` must conform to the password complexity policy set by the user's profile. If you supply an empty string or omit this parameter, the user is assigned no password and is not prompted for one when connecting. For details, see Password Guidelines and Creating a Database Name and Password. |

| IDLESESSIONTIMEOUT limit | The length of time the system waits before disconnecting an idle session, where `limit` is one of the following:  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• NONE (default): No limit set for this user. If you omit this parameter, no limit is set for this user.</td>
</tr>
</tbody>
</table>
- `'interval'` An interval value, up to one year.

For details, see Managing Client Connections.

**MAXCONNECTIONS limit**

Specifies the maximum number of connections the user can have to the server, where `limit` is one of the following:

- NONE (default): No limit set. If you omit this parameter, the user can have an unlimited number of connections across the database cluster.

- `integer [connection-mode]`: Specifies the maximum number of connections allowed to the user, where `connection-mode` is one of the following:
  - ON DATABASE (default): Allows up to `integer` connections across the database cluster.
  - ON NODE: Allows up to `integer` connections to each node.

For details, see Managing Client Connections.

**MEMORYCAP limit**

Specifies how much memory can be allocated to user requests, where `limit` is specified in this format:

- NONE (default): No limit

- `'max-expression'`: A string value that specifies the memory limit, one of the following:
  - `int%` — Expresses the maximum as a percentage of total memory available to the Resource Manager, where `int` is an integer value between 0 and 100. For example:

    `MEMORYCAP '40%'`

  - `int{K|M|G|T}` — Expresses memory allocation in kilobytes, megabytes, gigabytes, or terabytes. For example:

    `MEMORYCAP '10G'`

**PASSWORD EXPIRE**

Forces immediate expiration of the user's password. The user must change the password on the next login.
<table>
<thead>
<tr>
<th><strong>Note:</strong> PASSWORD EXPIRE has no effect when using external password authentication methods such as LDAP or Kerberos.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>PROFILE profile</strong> Assigns a profile that controls password requirements for this user, where <em>profile</em> is one of the following:</td>
</tr>
<tr>
<td>- DEFAULT (default): Assigns the default database profile to this user.</td>
</tr>
<tr>
<td>- <em>profile-name</em>: A profile that is defined by CREATE PROFILE. If you omit this parameter, the user is assigned the default profile.</td>
</tr>
<tr>
<td><strong>RESOURCE POOL pool-name</strong> Assigns a default resource pool to this user. The user must also be granted privileges to this pool, unless privileges to the pool are set to PUBLIC.</td>
</tr>
<tr>
<td><strong>RUNTIMECAP limit</strong> Specifies how long this user's queries can execute, where <em>limit</em> is one of the following:</td>
</tr>
<tr>
<td>- NONE (default): No limit set for this user. If you omit this parameter, no limit is set for this user.</td>
</tr>
<tr>
<td>- <em>interval</em>: An interval value, up to one year.</td>
</tr>
<tr>
<td>A query's runtime limit can be set at three levels: the user's runtime limit, the user's resource pool, and the session setting. For more information, see Setting a Runtime Limit for Queries in the Administrator's Guide.</td>
</tr>
<tr>
<td><strong>SEARCH_PATH path</strong> Specifies the user's default search path that tells Vertica which schemas to search for unqualified references to tables and UDFs, where <em>path</em> is one of the following:</td>
</tr>
<tr>
<td>- DEFAULT (default): Sets the search path as follows:</td>
</tr>
<tr>
<td>- &quot;$user&quot;, public, v_catalog, v_monitor, v_internal</td>
</tr>
<tr>
<td>- A comma-delimited list of schemas.</td>
</tr>
<tr>
<td>For details, see Setting Search Paths in the Administrator's Guide.</td>
</tr>
<tr>
<td><strong>TEMPSPACECAP limit</strong> Limits how much temporary file storage is available for user</td>
</tr>
</tbody>
</table>
requests, where \textit{limit} is one of the following:

- NONE (default): No limit
- 'max-expression': A string value that specifies the storage limit, one of the following:
  - \textit{int\%} — Expresses storage as a percentage of total file space is available, where \textit{int} is an integer value between 0 and 100. For example:
    \begin{verbatim}
    TEMPSPACECAP '40\%
    \end{verbatim}
  - \textit{int\{K|M|G|T\}} — Expresses memory allocation in kilobytes, megabytes, gigabytes, or terabytes. For example:
    \begin{verbatim}
    TEMPSPACECAP '10G'
    \end{verbatim}

**Privileges**

Superuser

**User Name Best Practices**

Vertica database user names are logically separate from user names of the operating system in which the server runs. If all the users of a particular server also have accounts on the server's machine, it makes sense to assign database user names that match their operating system user names. However, a server that accepts remote connections might many database users with no local operating system account. In this case, there is no need to connect database and system user names.

**Examples**

\begin{verbatim}
=> CREATE USER Fred IDENTIFIED BY 'Mxyzptlk';
=> GRANT USAGE ON SCHEMA PUBLIC to Fred;
\end{verbatim}
CREATE VIEW

Defines a view. Views are read only, so they do not support insert, update, delete, or copy operations.

Syntax

CREATE [ OR REPLACE ] VIEW [[database.]schema.]view [ (column[,...]) ]
  [ {INCLUDE|EXCLUDE} [SCHEMA] PRIVILEGES ] AS query

Parameters

<table>
<thead>
<tr>
<th>OR REPLACE</th>
<th>Specifies to overwrite the existing view view-name. If you omit this option and view-name already exists, CREATE VIEW returns an error. Any grants assigned to the view before you execute a CREATE OR REPLACE remain on the updated view. See GRANT (View).</th>
</tr>
</thead>
<tbody>
<tr>
<td>[database]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td>view</td>
<td>Identifies the view to create, where view conforms to conventions described in Identifiers. It must also be unique among all names of sequences, tables, projections, views, and</td>
</tr>
</tbody>
</table>
models within the same schema.

column[,...]  A list of names to use as view column names. Vertica maps view column names to query columns according to the order of their respective lists. By default, the view uses column names as they are specified in the query. Each view can contain up to 1600 columns.

query  A SELECT statement that the temporary view executes. The SELECT statement can reference tables, temporary tables, and other views.

{INCLUDE|EXCLUDE} [SCHEMA] PRIVILEGES  Specifies whether this view inherits schema privileges:

- INCLUDE PRIVILEGES specifies that the view inherits privileges that are set on its schema. This is the default behavior if privileges inheritance is enabled for the schema.

- EXCLUDE PRIVILEGES disables inheritance of privileges from the schema.

For details, see Inherited Privileges in the Administrator’s Guide.

Privileges

See Creating Views

Examples

The following example shows how to create a view that contains data from multiple tables.

```sql
=> CREATE VIEW temp_t0 AS
    SELECT * from t0_p1 UNION ALL
    SELECT * from t0_p2 UNION ALL
    SELECT * from t0_p3 UNION ALL
    SELECT * from t0_p4 UNION ALL
    SELECT * from t0_p5;
```
See Also

- ALTER VIEW
- CREATE LOCAL TEMPORARY VIEW
- Creating Views
- DROP VIEW
- GRANT (View)
- REVOKE (View)

DELETE

Removes the specified rows from a table and returns a count of the deleted rows. A count of 0 is not an error, but indicates that no rows matched the condition. An unqualified DELETE statement (omits a WHERE clause) removes all rows but leaves intact table columns, projections, and constraints.

DELETE supports subqueries and joins, so you can delete values in a table based on values in other tables.

Syntax

```
```

Parameters

<table>
<thead>
<tr>
<th>/*+ hint [ , hint ] */</th>
<th>One or both of the following hints:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• DIRECT</td>
</tr>
<tr>
<td></td>
<td>• LABEL</td>
</tr>
</tbody>
</table>

| [database. ]schema     | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For |
example:

```sql
myschema.thisDbObject
```

If you specify a database, it must be the current database.

<table>
<thead>
<tr>
<th>table</th>
<th>Any table, including temporary tables.</th>
</tr>
</thead>
<tbody>
<tr>
<td>where-clause</td>
<td>Specifies which rows to mark for deletion. If you omit this clause, \nDELECTE behavior varies depending on whether the table is \npersistent or temporary. See below for details.</td>
</tr>
</tbody>
</table>

### Privileges

Table owner or user with GRANT OPTION is grantor.

- DELETE privilege on table
- USAGE privilege on the schema of the target table
- SELECT privilege on a table when the DELETE statement includes a `WHERE` or `SET` clause \nthat specifies columns from that table.

### Restrictions

You cannot execute DELETE on a projection.

### Deleting from Persistent Tables

Unlike `TRUNCATE TABLE`, DELETE does not delete data from disk storage. Rather, it marks \nrows for deletion in the WOS. These rows are no longer valid in the current epoch. By default, \nDELETE uses WOS. If WOS fills up, the operation overflows to the ROS.

### Deleting from a Temporary Table

DELETE execution on temporary tables varies, depending on whether the table was created \nwith `ON COMMIT DELETE ROWS` (default) or `ON COMMIT PRESERVE ROWS:`
If DELETE contains a WHERE clause that specifies which rows to remove, behavior is identical: DELETE marks the rows for deletion. In both cases, you cannot roll back to an earlier savepoint.

If DELETE omits a WHERE clause and the table was created with ON COMMIT PRESERVE ROWS, Vertica marks all table rows for deletion. If the table was created with ON COMMIT DELETE ROWS, DELETE behaves like TRUNCATE TABLE and removes all rows from storage.

**Note:** If you issue an unqualified DELETE statement on a temporary table created with ON COMMIT DELETE ROWS, Vertica removes all rows from storage but does not end the transaction.

### Examples

The following command removes all rows from temporary table temp1:

```sql
=> DELETE FROM temp1;
```

The following command deletes all records from anchor table T where \( C_1 = C_2 - C_1 \).

```sql
=> DELETE FROM T WHERE C1=C2-C1;
```

The following command deletes all records from the customer table in the retail schema where the state attribute is in MA or NH:

```sql
=> DELETE FROM retail.customer WHERE state IN ('MA', 'NH');
```

For examples that show how to nest a subquery within a DELETE statement, see [Subqueries in \( UPDATE \) and DELETE](Analyzing Data) in Analyzing Data.

Directed Query Statements

The following statements let you create and manage directed queries:

<table>
<thead>
<tr>
<th>Statement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVATE DIRECTED QUERY</td>
<td>Activates a directed query.</td>
</tr>
<tr>
<td>CREATE DIRECTED QUERY</td>
<td>Saves an association between an input query and a query that is annotated with optimizer hints.</td>
</tr>
<tr>
<td>DEACTIVATE DIRECTED QUERY</td>
<td>Deactivates one or more directed queries.</td>
</tr>
<tr>
<td>DROP DIRECTED QUERY</td>
<td>Removes a directed query from the database.</td>
</tr>
<tr>
<td>GET DIRECTED QUERY</td>
<td>Returns a list of directed queries stored in the database for a given input query.</td>
</tr>
<tr>
<td>SAVE QUERY</td>
<td>Saves an input query to associate with a custom directed query.</td>
</tr>
</tbody>
</table>

ACTIVATE DIRECTED QUERY

Activates a directed query and makes it available to the query optimizer across all sessions.

Syntax

```
ACTIVATE DIRECTED QUERY query-name
```

Parameters

<table>
<thead>
<tr>
<th>query-name</th>
<th>Identifies the directed query to activate.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>To obtain identifiers for directed queries, use GET DIRECTED QUERY, or query the system table V_CATALOG.DIRECTED_QUERIES.</td>
</tr>
</tbody>
</table>
Privileges

Superuser

Activation Life Cycle

After you activate a directed query, it remains active until it is explicitly deactivated by `DEACTIVATE DIRECTED QUERY` or removed from storage by `DROP DIRECTED QUERY`. If a directed query is active at the time of database shutdown, Vertica automaticallyreactivates it when you restart the database.

Examples

See Activating and Deactivating Directed Queries.

CREATE DIRECTED QUERY

Saves an association between an input query and a query that is annotated with optimizer hints.

Syntax

Optimizer-generated

```
CREATE DIRECTED QUERY OPTIMIZER directedqueryID [COMMENT 'comments'] input-query
```

User-generated (custom)

```
CREATE DIRECTED QUERY CUSTOM directedqueryID [COMMENT 'comments'] annotated-query
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPTIMIZER</td>
<td>Directs the query optimizer to generate an annotated query from <code>input-query</code>, and associate both in the new directed query.</td>
</tr>
<tr>
<td>CUSTOM</td>
<td>Specifies to associate <em>annotated-query</em> with the query previously specified by <code>SAVE QUERY</code>.</td>
</tr>
<tr>
<td>------------------------</td>
<td>------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><em>directedqueryID</em></td>
<td>A unique identifier for the directed query, a string that conforms to conventions described in Identifiers.</td>
</tr>
</tbody>
</table>
| *COMMENT 'comments'*  | Comments about the directed query, up to 128 characters. Comments can be useful for future reference—for example, explain why a given directed query was created. If you omit this argument, Vertica inserts one of the following comments:  
  * Optimizer-generated directed query  
  * Custom directed query |
| *input-query*          | The input query to associate with an optimizer-generated directed query. The input query supports only one optimizer hint, `IGNORECONST`. |
| *annotated-query*      | A query with embedded optimizer hints to associate with the input query most recently saved with `SAVE QUERY`. |

**Privileges**

Superuser

**Description**

`CREATE DIRECTED QUERY` associates an input query with a query annotated with optimizer hints. It stores the association under a unique identifier. `CREATE DIRECTED QUERY` has two variants:

- `CREATE DIRECTED QUERY OPTIMIZER` directs the query optimizer to generate annotated SQL from the specified input query. The annotated query contains hints that the optimizer can use to recreate its current query plan for that input query.

- `CREATE DIRECTED QUERY CUSTOM` specifies an annotated query supplied by the user. Vertica associates the annotated query with the input query specified by the last `SAVE QUERY` statement.
In both cases, Vertica associates the annotated query and input query, and registers their association in the system table `V_CATALOG.DIRECTED_QUERIES` under `query_name`.

**Caution:** Vertica associates a saved query and directed query without checking whether the two are compatible. Be careful to sequence `SAVE QUERY` and `CREATE DIRECTED QUERY` `CUSTOM` so the saved and directed queries are correctly matched.

### See Also

*Creating Directed Queries*

### DEACTIVATE DIRECTED QUERY

Deactivates one or more directed queries previously activated by `ACTIVATE DIRECTED QUERY`.

### Syntax

```
DEACTIVATE DIRECTED QUERY {query-name|input-query}
```

### Arguments

<table>
<thead>
<tr>
<th><code>query-name</code></th>
<th>Identifies the directed query to deactivate. To obtain identifiers for directed queries, use <code>GET DIRECTED QUERY</code>, or query the system table <code>V_CATALOG.DIRECTED_QUERIES</code>.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>input-query</code></td>
<td>The input query of the directed queries to deactivate. Use this argument to deactivate multiple direct queries that map to the same input query.</td>
</tr>
</tbody>
</table>
DROP DIRECTED QUERY

Removes a directed query from the database. If the directed query is active, Vertica deactivates it before removal.

Syntax

DROP DIRECTED QUERY directedqueryID

Arguments

| directedqueryID | Identifies the directed query to remove from the database. To obtain identifiers for directed queries, use GET DIRECTED QUERY, or query the system table V_CATALOG.DIRECTED QUERIES. |

Privileges

Superuser

GET DIRECTED QUERY

Returns a list of directed queries that map to the specified input query

Syntax

GET DIRECTED QUERY input-query

Parameters

| input-query | An input query that is associated with one or more directed queries. |
Returns

A list of one or more directed queries that map to the specified input query. Each list item includes six fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query-name</td>
<td>A unique identifier that is associated with this directed query and used by statements such as <code>ACTIVATE DIRECTED QUERY</code>.</td>
</tr>
<tr>
<td>is_active</td>
<td>A Boolean field that specifies whether the directed query is active.</td>
</tr>
<tr>
<td>vertica_version</td>
<td>The Vertica version that was current when this directed query was created.</td>
</tr>
<tr>
<td>comment</td>
<td>A user-supplied comment specified on creation of the directed query.</td>
</tr>
<tr>
<td>creation_date</td>
<td>The creation timestamp of this directed query.</td>
</tr>
<tr>
<td>annotated_query</td>
<td>The annotated query that was saved with <code>CREATE DIRECTED QUERY</code>.</td>
</tr>
</tbody>
</table>

Privileges

None required

Examples

See Getting Directed Queries in the Administrator's Guide.

See Also

`V_CATALOG.DIRECTED_QUERIES`

SAVE QUERY

Saves an input query to associate with a custom directed query.
Syntax
SAVE QUERY input-query

Parameters

| input-query | The input query to associate with a custom directed query. The input query supports only one optimizer hint, IGNORECONST. |

Privileges
Superuser

Description
SAVE QUERY saves the specified input query for use by the next invocation of CREATE DIRECTED QUERY CUSTOM. CREATE DIRECTED QUERY CUSTOM pairs the saved query with its annotated query argument to create a directed query. Both statements must be issued in the same user session.

The saved query remains available until the one of the following events occurs:

- The next invocation of CREATE DIRECTED QUERY, whether invoked with CUSTOM or OPTIMIZER.
- Another invocation of SAVE QUERY.
- The session ends.

Caution: Vertica associates a saved query with a directed query without checking whether the input and annotated queries are compatible. Be careful to sequence SAVE QUERY and CREATE DIRECTED QUERY CUSTOM so the saved and directed queries are correctly matched.

Examples
See Custom Directed Queries.
DISCONNECT

Closes a previously established connection to another Vertica database. You must have previously used the CONNECT statement to perform a COPY FROM VERTICA or EXPORT TO VERTICA statement.

Syntax

DISCONNECT db-spec

Parameters

| db-spec       | Specifies the target database, either the database name or DEFAULT. |

Privileges

None

Example

=> DISCONNECT ExampleDB;
DISCONNECT

DROP ACCESS POLICY

Removes an access policy from a column or row. If you attempt to run a DROP TABLE statement on a table that contains an access policy, the following message appears:

NOTICE 4927: The AccessPolicy depends on Table tablename
ROLLBACK 3128: DROP failed due to dependencies
DETAIL: Cannot drop Table tablename because other objects depend on it
Projection projection has column column_name as part of its sort order
Projection public.p_1 has column column_name as part of its sort order
HINT: Use DROP .. CASCADE to drop or modify the dependent objects

Syntax

DROP ACCESS POLICY ON tablename
FOR { COLUMN columnname | ROWS};

Parameters

<table>
<thead>
<tr>
<th>tablename</th>
<th>The name of the table that contains the column access policy you want to remove.</th>
</tr>
</thead>
<tbody>
<tr>
<td>columnname</td>
<td>The name of the column that contains the access policy you want to remove.</td>
</tr>
</tbody>
</table>

Privileges

You must be a dbadmin user to drop an access policy.

Examples

These examples show various cases where you can drop an access policy.

Drop Column Access Policy from Customer Table for a Specified Column

=> DROP ACCESS POLICY ON customer FOR COLUMN Customer_Number;

Drop Access Policy and Table Using the CASCADE Keyword with DROP TABLE

=> DROP TABLE <tablename> CASCADE;

Drop Row Access Policy on customer_info table

=> DROP ACCESS POLICY ON customer_info FOR ROWS;
DROP AGGREGATE FUNCTION

Drops a User Defined Aggregate Function (UDAF) from the Vertica catalog.

Syntax

```
DROP AGGREGATE FUNCTION [[database.]schema.]function[,]
... ( [ [argname] argtype[,,...] ] )
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject</td>
</tr>
<tr>
<td><code>function</code></td>
<td>Specifies a name of the SQL function to drop. If the function name is schema-qualified, the function is dropped from the specified schema (as noted above).</td>
</tr>
<tr>
<td><code>argname</code></td>
<td>Specifies the name of the argument, typically a column name.</td>
</tr>
<tr>
<td><code>argtype</code></td>
<td>Specifies the data type for argument(s) that are passed to the function. Argument types must match Vertica type names. See SQL Data Types.</td>
</tr>
</tbody>
</table>

Privileges

One of the following:

- Superuser
- Owner
Notes

- To drop a function, you must specify the argument types because several functions might share the same name with different parameters.

- Vertica does not check for dependencies, so if you drop a SQL function where other objects reference it (such as views or other SQL functions), Vertica returns an error when those objects are used and not when the function is dropped.

Example

The following command drops the ag_avg function:

```sql
=> DROP AGGREGATE FUNCTION ag_avg(numeric);
```

See Also

- ALTER FUNCTION (UDF)
- CREATE AGGREGATE FUNCTION
- GRANT (User Defined Extension)
- REVOKE (User Defined Extension)
- USER_FUNCTIONS
- Using User-Defined SQL Functions
- Developing User-Defined Extensions (UDxs)
- Aggregate Functions (UDAFs)

**DROP ANALYTIC FUNCTION**

Drops a user-defined analytic function from the Vertica catalog.
Syntax

DROP ANALYTIC FUNCTION [ IF EXISTS ] [[database.]schema.]function( [ arglist ] )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF EXISTS</td>
<td>Specifies not to report an error if the function to drop does not exist. (missing or bad snippet)</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>function</td>
<td>Specifies a name of the SQL function to drop. If the function name is schema-qualified, the function is dropped from the specified schema (as noted above).</td>
</tr>
<tr>
<td>arglist</td>
<td>A comma delimited list of argument names and data types that are passed to the function, formatted as follows:</td>
</tr>
<tr>
<td></td>
<td>{ [argname] argtype }[,..]</td>
</tr>
<tr>
<td></td>
<td>• argname optionally specifies the argument name, typically a column name.</td>
</tr>
<tr>
<td></td>
<td>• argtype specifies the argument's data type, where argtype matches a Vertica data type.</td>
</tr>
</tbody>
</table>

Privileges

Non-superuser: Owner
Requirements

- To drop a function, you must specify the argument types because several functions might share the same name with different parameters.

- Vertica does not check for dependencies, so if you drop a SQL function where other objects reference it (such as views or other SQL functions), Vertica returns an error when those objects are used and not when the function is dropped.

Example

The following command drops the analytic_avg function:

```sql
=> DROP ANALYTIC FUNCTION analytic_avg(numeric);
DROP FUNCTION analytic_avg(numeric)
```

See Also

Analytic Functions (UDAnFs)

**DROP AUTHENTICATION**

Drops an authentication method that has been created but not granted to any users. If you try to drop an authentication method that has been granted to one or more users, the DROP operation fails. To successfully drop an authentication method that is currently granted to a user, use the CASCADE keyword.

Syntax

```
DROP AUTHENTICATION auth_method_name [ CASCADE ]
```
Parameters

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auth_method_name</td>
<td>Name of the authentication method to drop.</td>
</tr>
<tr>
<td>Type:</td>
<td>VARCHAR (not case sensitive)</td>
</tr>
</tbody>
</table>

Privileges

Must have DBADMIN privileges.

Examples

To delete an authentication record for md5_auth, use the following command:

```
=> DROP AUTHENTICATION md5_auth;
```

To delete an authentication record for a method that has been granted to a user, use the CASCADE keyword:

```
=> CREATE AUTHENTICATION localpwd METHOD 'password' LOCAL;
=> GRANT AUTHENTICATION localpwd TO jsmith;
=> DROP AUTHENTICATION localpwd CASCADE;
```

See Also

- ALTER AUTHENTICATION
- CREATE AUTHENTICATION
- GRANT (Authentication)
- REVOKE (Authentication)
DROP FAULT GROUP

A drop operation removes the specified fault group and its child fault groups, placing all nodes under the parent of the dropped fault group.

To drop all fault groups, use `ALTER DATABASE..DROP ALL FAULT GROUP` syntax.

To add an orphaned node back to a fault group, you must manually re-assign it to a new or existing fault group using a combination of `CREATE FAULT GROUP` and `ALTER FAULT GROUP..ADD NODE` statements.

Tip: For a list of all fault groups defined in the cluster, query the `V_CATALOG.FAULT_GROUPS` system table.

Syntax

```
DROP FAULT GROUP name
```

Parameters

| name | Specifies the name of the fault group to drop. |

Privileges

Must be a superuser to drop a fault group.

Example

The following example drops the `group2` fault group from the cluster:

```
exampledb=> DROP FAULT GROUP group2;
DROP FAULT GROUP
```
See Also

- `V_CATALOG.FAULT_GROUPS` and `V_CATALOG.CLUSTER_LAYOUT`
- Fault Groups in the Administrator's Guide
- High Availability With Fault Groups in Vertica Concepts
**DROP FUNCTION**

Drops a SQL function or User Defined Function (UDF) from the Vertica catalog.

**Syntax**

```
DROP FUNCTION [([database.]schema.]function[,..] ( [ arg-list ]
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>database</code> or <code>schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td><code>function</code></td>
<td>The SQL function to drop.</td>
</tr>
<tr>
<td><code>arg-list</code></td>
<td>A comma-delimited list of arguments as defined for this function when it was created, specified as follows: <code>[arg-name] arg-type[,]</code></td>
</tr>
<tr>
<td></td>
<td>where <code>arg-name</code> optionally qualifies <code>arg-type</code>:</td>
</tr>
<tr>
<td></td>
<td>- <code>arg-name</code> is typically a column name.</td>
</tr>
<tr>
<td></td>
<td>- <code>arg-type</code> is the name of an SQL data type supported by Vertica.</td>
</tr>
</tbody>
</table>

**Privileges**

One of the following:

- Superuser
- Schema or function owner
Requirements

- To drop a function, you must specify the argument types because several functions might share the same name with different parameters.

- Vertica does not check for dependencies, so if you drop a SQL function where other objects reference it (such as views or other SQL functions), Vertica returns an error when those objects are used and not when the function is dropped.

Example

The following command drops the zerowhennull function in the macros schema:

```sql
=> DROP FUNCTION macros.zerowhennull(x INT);
DROP FUNCTION
```

See Also

- ALTER FUNCTION (UDF)
- CREATE FUNCTION (SQL Functions)
- GRANT (User Defined Extension)
- REVOKE (User Defined Extension)
- USER_FUNCTIONS
- Using User-Defined SQL Functions

DROP SOURCE

Drops a User Defined Load Source function from the Vertica catalog.

Syntax

```
DROP SOURCE [[database.]schema.]source()
```
Parameters

| [database.]schema | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:
|                  | myschema.thisDbObject
|                  | If you specify a database, it must be the current database.

| source()         | Specifies the source function to drop. You must append empty parentheses to the function name.

Privileges

One of the following:

- Superuser
- Source function owner

Example

The following command drops the curl source function:

```sql
=> DROP SOURCE curl();
DROP SOURCE
```

See Also

- ALTER FUNCTION (UDF)
- CREATE SOURCE
- GRANT (User Defined Extension)
- REVOKE (User Defined Extension)
DROP FILTER

Drops a User Defined Load Filter function from the Vertica catalog.

Syntax

```
DROP FILTER [database.]schema.]filter()
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: &lt;br&gt;<code>myschema.thisDbObject</code>&lt;br&gt;If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>filter()</code></td>
<td>Specifies the filter function to drop. You must append empty parentheses to the function name.</td>
</tr>
</tbody>
</table>

Privileges

Only the superuser or owner can drop the filter function.

Example

The following command drops the `Iconverter` filter function:

```
=> drop filter Iconverter();
DROP FILTER
```
See Also

- ALTER FUNCTION (UDF)
- CREATE FILTER
- GRANT (User Defined Extension)
- REVOKE (User Defined Extension)
- USER_FUNCTIONS
- Load (UDLs)

DROP PARSER

Drops a User Defined Load Parser function from the Vertica catalog.

Syntax

DROP PARSER([database.]schema.]parser())

Parameters

| [database.]schema | Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:
| | myschema.thisDbObject |
| | If you specify a database, it must be the current database. |
| parser() | The name of the parser function to drop. You must append empty parentheses to the function name. |

Privileges

Only the superuser or owner can drop the parser function.
Example

The following command drops the BasicIntegerParser parser function:

```
=> DROP PARSER BasicIntegerParser();
```

See Also

- ALTER FUNCTION (UDF)
- CREATE PARSER
- GRANT (User Defined Extension)
- REVOKE (User Defined Extension)
- USER_FUNCTIONS
- Load (UDLs)

**DROP MODEL**

Removes one or more models from the Vertica database.

Syntax

```
DROP MODEL [ IF EXISTS ] [[database.]schema.]model[, ...]
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF EXISTS</td>
<td>Specifies not to report an error if one or more of the models to drop does not exist. This clause is useful in SQL scripts where you want to drop a model if it exists before recreating it.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema</td>
</tr>
</tbody>
</table>
other than public, you must supply the schema name. For example:

`myschema.thisDbObject`

If you specify a database, it must be the current database.

**model**  The model to drop.

### Privileges

One of the following:

- **Superuser**
- **Non-superuser: model owner**

### Examples

See [Dropping Models](#) in Analyzing Data.

## DROP LIBRARY

Removes a shared library from the database. The library file is deleted from managed directories on the Vertica nodes. The user defined functions (UDFs) in the library are no longer available. See [Developing User-Defined Extensions (UDxs)](#) in Extending Vertica for details.

### Syntax

```
DROP LIBRARY [[database.]schema.]library [CASCADE]
```

### Parameters

```
[ database.]schema
```

Specifies a schema, by default public. If `schema` is any schema other than public, you must supply the schema name. For example:
### Library

The name of the library to drop, the same name used in `CREATE LIBRARY` to load the library.

### CASCADE

Drops any functions that were defined using the library. DROP LIBRARY fails if CASCADE is omitted and one or more UDFs use the target library.

### Privileges

Superuser

### Example

To drop the library `MyFunctions`:

```sql
=> DROP LIBRARY MyFunctions CASCADE;
```

## DROP NETWORK INTERFACE

Removes a network interface from Vertica. You can use the CASCADE option to also remove the network interface from any node definition. (See [Identify the Database or Nodes Used for Import/Export](https://docs.vertica.com) for more information.)

### Syntax

`DROP NETWORK INTERFACE network-interface-name [CASCADE]`

### Parameters

The parameters are defined as follows:

<table>
<thead>
<tr>
<th>network-interface-name</th>
<th>The network interface you want to remove.</th>
</tr>
</thead>
</table>

Vertica Analytic Database (9.1.x)
Privileges

Must be a superuser to drop a network interface.

Examples

This example shows how to drop a network interface.

=> DROP NETWORK INTERFACE myNetwork;

**DROP NOTIFIER**

Drops a push-based notifier created by `CREATE NOTIFIER`.

Syntax

`DROP NOTIFIER notifier-name`

Parameters

| notifier-name | This notifier's unique identifier. |

**DROP PROCEDURE**

Removes an external procedure from Vertica. Only the reference to the procedure is removed. The external file remains in the `database/procedures` directory of each database node.

Syntax

`DROP PROCEDURE [[database.]schema.]procedure( [ arg-list ] )`
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>database</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td>myschema.thisDbObject</td>
<td></td>
</tr>
<tr>
<td>If you specify a database, it must be the current database.</td>
<td></td>
</tr>
<tr>
<td>procedure</td>
<td>Specifies the procedure to drop.</td>
</tr>
<tr>
<td>arg-List</td>
<td>A comma-delimited list of arguments defined for this procedure when it was created, specified as follows:</td>
</tr>
<tr>
<td>[arg-name] arg-type[,…]</td>
<td></td>
</tr>
<tr>
<td>where arg-name optionally qualifies arg-type. If no arguments are defined for this procedure, specify empty parentheses.</td>
<td></td>
</tr>
</tbody>
</table>

Privileges

- Superuser or procedure owner
- USAGE privilege on schema, or schema owner

Example

```sql
=> DROP PROCEDURE helloplanet(arg1 varchar);
```

See Also

CREATE PROCEDURE
DROP PROFILE

Removes a profile from the database. Only the superuser can drop a profile.

Syntax

DROP PROFILE name [,...] [ CASCADE ]

Parameters

<table>
<thead>
<tr>
<th>name</th>
<th>The name of one or more profiles (separated by commas) to be removed.</th>
</tr>
</thead>
<tbody>
<tr>
<td>CASCADE</td>
<td>Moves all users assigned to the profile or profiles being dropped to the DEFAULT profile. If you do not include CASCADE in the DROP PROFILE command and a targeted profile has users assigned to it, the command returns an error.</td>
</tr>
</tbody>
</table>

Privileges

Must be a superuser to drop a profile.

Notes

You cannot drop the DEFAULT profile.

Example

```sql
=> DROP PROFILE sample_profile;
```
See Also

- ALTER PROFILE
- CREATE PROFILE

**DROP PROJECTION**

Marks a projection to drop from the catalog so it is unavailable to user queries.

**Syntax**

```sql
DROP PROJECTION { [[database.]schema.]projection[,] } ... [ RESTRICT | CASCADE ]
```

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>
| `projection` | Specifies a projection to drop:  
  - If the projection is unsegmented, all projection replicas in the database cluster are dropped.  
  - If the projection is segmented, drop all buddy projections by specifying the projection base name. You can also specify the name of a specific buddy projection as long as dropping it so does not violate system K-safety.  
See [Projection Naming](#) for projection name conventions. |
| RESTRICT | CASCADE | Specifies whether to drop the projection when it contains... |
objects:

- RESTRICT (default): Drop the projection only if it contains no objects.
- CASCADE: Drop the projection even if it contains objects.

Privileges

Superuser, or owner of the anchor table

Restrictions

The following restrictions apply to dropping a projection:

- The projection cannot be the anchor table's superprojection.
- You cannot drop a buddy projection if doing so violates system K-safety.
- Another projection must be available to enforce the same primary or unique key constraint.

See Also

- CREATE PROJECTION
- DROP TABLE
- GET_PROJECTIONS
- GET_PROJECTION_STATUS
- MARK_DESIGN_KSAFE
- Adding Nodes
**DROP RESOURCE POOL**

Drops a user-created resource pool. All memory allocated to the pool is returned back to the GENERAL pool.

**Syntax**

```
DROP RESOURCE POOL pool-name
```

**Parameters**

| pool-name | Specifies the name of the resource pool to be dropped. |

**Privileges**

Must be a superuser to drop a resource pool.

**Dropping a Secondary Pool**

If you try to drop a resource pool that is a secondary pool for another resource pool, Vertica returns an error. The error lists the resource pools that depend on the secondary pool you tried to drop. To drop a secondary resource pool, first set the CASCADE TO parameter to DEFAULT on the primary resource pool, and then drop the secondary pool.

For example, you can drop resource pool rp2, which is a secondary pool for rp1, as follows:

```
=> ALTER RESOURCE POOL rp1 CASCADE TO DEFAULT;
=> DROP RESOURCE POOL rp2;
```

**Transferring Resource Requests**

Any requests queued against the pool are transferred to the GENERAL pool according to the priority of the pool compared to the GENERAL pool. If the pool’s priority is higher than the
GENERAL pool, the requests are placed at the head of the queue; otherwise the requests are placed at the end of the queue.

Any users who are using the pool are switched to use the GENERAL pool with a NOTICE:

```
NOTICE: Switched the following users to the General pool: username
```

DROP RESOURCE POOL returns an error if the user does not have permission to use the GENERAL pool. Existing sessions are transferred to the GENERAL pool regardless of whether the session's user has permission to use the GENERAL pool. This can result in additional user privileges if the pool being dropped is more restrictive than the GENERAL pool. To prevent giving users additional privileges, follow this procedure to drop restrictive pools:

1. **Revoke the permissions on the pool** for all users.
2. Close any sessions that had permissions on the pool.
3. Drop the resource pool.

**Examples**

The following command drops the resource pool that was created for the CEO:

```
=> DROP RESOURCE POOL ceo_pool;
```

**See Also**

- ALTER RESOURCE POOL
- CREATE RESOURCE POOL
- Managing Workloads

**DROP ROLE**

Removes a role from the database. Only the database superuser can drop a role.

Use the CASCADE option to drop a role that is assigned to one or more users or roles.
NOTE: You cannot use the DROP ROLE command on a role added to the Vertica database with the LDAPLink service.

Syntax

```sql
DROP ROLE role [CASCADE];
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>role</td>
<td>The name of the role to drop</td>
</tr>
<tr>
<td>CASCADE</td>
<td>Revoke the role from users and other roles before dropping the role</td>
</tr>
</tbody>
</table>

Privileges

Must be a superuser to drop a role.

Examples

```sql
=> DROP ROLE appadmin;
NOTICE: User bob depends on Role appadmin
ROLLBACK: DROP ROLE failed due to dependencies
DETAIL: Cannot drop Role appadmin because other objects depend on it
HINT: Use DROP ROLE ... CASCADE to remove granted roles from the dependent users/roles
=> DROP ROLE appadmin CASCADE;
DROP ROLE
```

See Also

- ALTER ROLE RENAME
- CREATE ROLE
**DROP SCHEMA**

Permanently removes a schema from the database. Be sure that you want to remove the schema before you drop it, because DROP SCHEMA is an irreversible process. Use the CASCADE parameter to drop a schema containing one or more objects.

**Syntax**

```sql
DROP SCHEMA [database.]schema[,..] [ CASCADE | RESTRICT ]
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Name of the schema to drop. If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>CASCADE</td>
<td>Specifies to drop the schema and all objects in it, regardless of who owns those objects.</td>
</tr>
<tr>
<td></td>
<td><strong>Caution:</strong> Objects in other schemas that depend on objects in the dropped schema—for example, user-defined functions—are also silently dropped.</td>
</tr>
<tr>
<td>RESTRICT</td>
<td>Drops the schema only if it is empty (default).</td>
</tr>
</tbody>
</table>

**Privileges**

Schema owner
Restrictions

- You cannot drop the PUBLIC schema.
- If a user is accessing an object within a schema that is in the process of being dropped, the schema is not deleted until the transaction completes.
- Canceling a DROP SCHEMA statement can cause unpredictable results.

Examples

The following example drops schema S1 only if it doesn't contain any objects:

```sql
=> DROP SCHEMA S1;
```

The following example drops schema S1 whether or not it contains objects:

```sql
=> DROP SCHEMA S1 CASCADE;
```

DROP SEQUENCE

Removes the specified named sequence number generator.

Syntax

```sql
DROP SEQUENCE [[database.]schema.]sequence[,..]
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current</td>
</tr>
<tr>
<td>sequence</td>
<td>Specifies the sequence to drop.</td>
</tr>
<tr>
<td>----------</td>
<td>----------------------------------</td>
</tr>
</tbody>
</table>

**Privileges**

One of the following:

- Superuser
- Sequence or schema owner

**Restrictions**

- For sequences specified in a table's default expression, the default expression fails the next time you try to load data. Vertica does not check for these instances.
- `DROP SEQUENCE` does not support the `CASCADE` keyword. Sequences used in a default expression of a column cannot be dropped until all references to the sequence are removed from the default expression.

**Example**

The following command drops the sequence named `sequential`.

```sql
=> DROP SEQUENCE sequential;
```

**See Also**

- `ALTER SEQUENCE`
- `CREATE SEQUENCE`
- `CURRVAL`
- `GRANT (Sequence)`
• NEXTVAL
• Sequences
• Named Sequence Privileges

**DROP SUBNET**

Removes a subnet from Vertica.

Caution: Before removing a subnet, be sure your database is not configured to allow export on the public subnet.

**Syntax**

```
DROP SUBNET subnet-name [CASCADE]
```

**Parameters**

The parameters are defined as follows:

<table>
<thead>
<tr>
<th><code>subnet-name</code></th>
<th>The subnet to remove.</th>
</tr>
</thead>
<tbody>
<tr>
<td>CASCADE</td>
<td>Removes the subnet from any database definition.</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser

**Examples**

```
=> DROP SUBNET mySubnet;
```
See Also

Identify the Database or Nodes Used for Import/Export

**DROP TABLE**

Removes a table and its projections. When you run DROP TABLE, the change is auto-committed.

**Syntax**

```sql
DROP TABLE [ IF EXISTS ] [ [database.]schema.]table[,..] [ CASCADE ]
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF EXISTS</td>
<td>Specifies not to report an error if one or more of the tables to drop does not exist. This clause is useful in SQL scripts where you want to drop a table if it exists before recreating it.</td>
</tr>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>&lt;myschema.thisDbObject&gt;</code> If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>table</code></td>
<td>The table to drop.</td>
</tr>
<tr>
<td>CASCADE</td>
<td>Specifies to drop all projections for this table before the table is dropped. CASCADE is optional if only auto-projections are associated with this table; otherwise it is required. This option is not valid for external tables.</td>
</tr>
</tbody>
</table>
Privileges

- Table owner with USAGE privilege on table's schema
- Schema owner

Requirements

- Do not cancel an executing DROP TABLE. Doing so can leave the database in an inconsistent state.
- Check that the target table is not in use, either directly or indirectly—for example, in a view.
- If you drop and restore a table that is referenced by a view, the new table must have the same name and column definitions.

Examples

See Dropping Tables in the Administrator's Guide.

See Also

- DROP PROJECTION
- TRUNCATE TABLE

**DROP TEXT INDEX**

Drops a text index used to perform text searches.

**Syntax**

```
DROP TEXT INDEX [ IF EXISTS ] [[database.]schema.]idx-table
```
Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IF EXISTS</td>
<td>If specified, DROP TEXT INDEX does not report an error if one or more of the tables to be dropped does not exist. You can use this clause in SQL scripts where you want to drop a table, if it exists, before recreating it.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code>&lt;br&gt;If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>idx-table</td>
<td>Specifies the text index name. When using more than one schema, specify the schema that contains the index in the DROP TEXT INDEX statement.</td>
</tr>
</tbody>
</table>

Privileges

Table owner and dbadmin with USAGE privilege on schema that contains the table or schema owner.

Behavior

When a source table is dropped that has a text index associated with it, the text index is also dropped.

Examples

The following example drops the text index t_text_index:

```
=> DROP TEXT INDEX t_text_index;
DROP INDEX
```
See Also

- Using Text Search
- CREATE TEXT INDEX

**DROP TRANSFORM FUNCTION**

Drops a user-defined transform function (UDTF) from the Vertica catalog.

**Syntax**

```sql
DROP TRANSFORM FUNCTION [[database.]schema.]function([ arg-list ])
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `[database.]schema` | Specifies a schema, by default public. If `schema` is any schema other than public, you must supply the schema name. For example:  

  ```sql
  myschema.thisDbObject
  ```  

  If you specify a database, it must be the current database. |
| `function`      | Specifies the transform function to drop. |
| `arg-list`      | A comma-delimited list of arguments as defined for this function when it was created, specified as follows:  

  ```sql
  [arg-name] arg-type[,...]
  ```  

  If multiple functions share the same name, specify the argument types of the function you wish to drop.  

  - `arg-name` is typically a column name. You (optionally) use an `arg-name` to qualify an `arg-type`.  
  - `arg-type` is the name of an SQL data type supported by Vertica. |
Privileges

One of the following:

- Superuser
- Schema or function owner

Example

The following command drops the `tokenize` UDTF in the `macros` schema:

```sql
=> DROP TRANSFORM FUNCTION macros.tokenize(varchar);
DROP TRANSFORM FUNCTION
```

The following command drops the `Pagerank` polymorphic function in the `online` schema:

```sql
=> DROP TRANSFORM FUNCTION online.Pagerank();
DROP TRANSFORM FUNCTION
```

See Also

- [CREATE TRANSFORM FUNCTION](#)

**DROP USER**

Removes a name from the list of authorized database users.

**NOTE:** You cannot use the DROP USER command on a user added to the Vertica database with the LDAPLink service.

Syntax

```sql
DROP USER name[,...] [ CASCADE ]
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the name or names of the user to drop.</td>
</tr>
<tr>
<td>CASCADE</td>
<td>[Optional] Drops all user-defined objects created by the user dropped, including schema, table and all views that reference the table, and the table's associated projections.</td>
</tr>
</tbody>
</table>

Privileges

Must be a superuser to drop a user.

Examples

DROP USER <username> fails if objects exist that were created by the user, such as schemas, and tables and their associated projections:

```sql
=> DROP USER user1;
NOTICE: Table T_tbd1 depends on User user1
ROLLBACK:  DROP failed due to dependencies
DETAIL:  Cannot drop user user1 because other objects depend on it
HINT:  Use DROP ... CASCADE to drop the dependent objects too
```

DROP USER <name> CASCADE succeeds regardless of any pre-existing user-defined objects. The statement forcibly drops all user-defined objects, such as schemas, tables and their associated projections:

```sql
=> DROP USER user1 CASCADE;
```

Caution: Tables owned by the user being dropped cannot be recovered after you issue DROP USER CASCADE.

DROP USER <username> succeeds if no user-defined objects exist (no schemas, tables or projections defined by the user):

```sql
=> CREATE USER user2;
CREATE USER
=> DROP USER user2;
DROP USER
```
See Also

- ALTER USER
- CREATE USER

**DROP VIEW**

Removes the specified view. Vertica does not check for dependencies on the dropped view. After dropping a view, other views that reference it fail.

If you drop a view and replace it with another view or table with the same name and column names, other views that reference that name use the new view. If you change the column data type in the new view, the server coerces the old data type to the new one if possible; otherwise, it returns an error.

**Syntax**

```
DROP VIEW [[database.]schema.]view [, ...]
```

**Parameters**

<table>
<thead>
<tr>
<th>[database.]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td>view</td>
<td>Specifies the view to drop.</td>
</tr>
</tbody>
</table>

**Privileges**

One of the following
- View owner and USAGE privileges
- Schema owner

Examples

```sql
=> DROP VIEW myview;
```

END

Ends the current transaction and makes all changes that occurred during the transaction permanent and visible to other users.

Syntax

```
COMMIT [ WORK | TRANSACTION ]
```

Parameters

| WORK | TRANSACTION | Have no effect; they are optional keywords for readability. |

Privileges

No special permissions required.

Notes

`COMMIT` is a synonym for `END`.

Examples

This example shows how to end a transaction.
CREATE TABLE sample_table (a INT);
INSERT INTO sample_table (a) VALUES (1);
OUTPUT
-------
1
=> END;
COMMIT

See Also

- Transactions
- Creating Transactions
- BEGIN
- ROLLBACK
- START TRANSACTION

EXPLAIN

Returns a formatted description of the Vertica optimizer's plan for executing the specified statement.

Syntax

EXPLAIN [/*+ ALLNODES */] [explain-options] sql-statement

Parameters

<table>
<thead>
<tr>
<th>/<em>+ALLNODES</em>/</th>
<th>Specifies to create a query plan that assumes all nodes are active, not valid with LOCAL option.</th>
</tr>
</thead>
<tbody>
<tr>
<td>explain-options</td>
<td>One or more EXPLAIN options, specified in the order shown:</td>
</tr>
<tr>
<td></td>
<td>• LOCAL: On a multi-node database, shows the local query plans</td>
</tr>
</tbody>
</table>
assigned to each node, which together comprise the total (global) query plan. If you omit this option, Vertica shows only the global query plan. Local query plans are shown only in DOT language source, which can be rendered in Graphviz.

This option is incompatible with the hint /*+ALL NODES*/. If you specify both, EXPLAIN returns with an error.

- **VERBOSE**: Increases the level of detail in the rendered query plan.
- **JSON**: Renders the query plan in JSON format. This option is compatible only with VERBOSE.
- **ANNOTATED**: Embeds optimizer hints that encapsulate the query plan for this query. Vertica uses these hints to create directed queries. For more information, see Directed Queries in the Administrator's Guide. This option is compatible with LOCAL and VERBOSE.

| sql-statement | A query or DML statement—for example, SELECT, INSERT, UPDATE, COPY, and MERGE. |

**Privileges**

The same privileges required by the specified statement.

**Requirements**

The following requirements apply to EXPLAIN's ability to produce useful information:

- EXPLAIN produces useful output only if projections are available for the queried tables.

- Qualifier options must be specified in the order shown earlier, otherwise EXPLAIN returns with an error. If an option is incompatible with any preceding options, EXPLAIN ignores them.
See Also

Viewing Query Plans in the Administrator's Guide

**EXPORT TO PARQUET**

Exports a table, columns from a table, or query results to files in the Parquet format. You can use an OVER() clause to partition the data before export. Partitioning data can improve query performance by enabling partition pruning; see Improving Query Performance.

You can export data stored in Vertica in ROS format and data from external tables.

EXPORT TO PARQUET returns the number of rows written.

During an export to HDFS or an NFS mount point, Vertica writes files to a temporary directory in the same location as the destination and renames the directory when the export is complete. Do not attempt to use the files in the temporary directory. During an export to S3, Vertica writes files directly to the destination path, so you must wait for the export to finish before reading the files. (For more about special S3 considerations, see Exporting to S3.)

**Syntax**

```sql
EXPORT TO PARQUET ( directory = 'path'
    [, compression = 'compression-type' ]
    [, rowGroupSizeMB = size ]
    [, fileSizeMB = file-size-hint ]
    [ OVER (over-clause ) ]
AS SELECT query-expression;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>path</code></td>
<td>The destination directory for the Parquet files. The directory must not exist, and the current user must have permission to write it. The destination can be in HDFS, S3, or an NFS mount point on the local file system.</td>
</tr>
<tr>
<td><code>compression-type</code></td>
<td>Column compression type, one of Snappy or Uncompressed. The default is Snappy.</td>
</tr>
</tbody>
</table>
**size**

The uncompressed size of exported row groups, in MB (integer). The maximum value is 512 and the default is 64. The row groups in the exported files are smaller because Parquet files are compressed on write. For best performance when exporting to HDFS, set `size` to be smaller than the HDFS block size.

**file-size**

The maximum file size of a single output Parquet file. By default, Vertica limits exports to a file size of 10GB. This value is a hint, not a hard limit. A value of 0 means there is no limit.

### Arguments

| **over-clause** | Specifies how to partition table data using PARTITION BY. Within partitions you can sort by using ORDER BY. See [SQL Analytics](https://www.vertica.com/docs/9.1.x/Manuals/Vertica_PDW_Sql_Reference_Manual.pdf). This clause may contain column references but not expressions.
|
| **query-expression** | Specifies the data to be exported. See [SELECT](https://www.vertica.com/docs/9.1.x/Manuals/Vertica_PDW_Sql_Reference_Manual.pdf) for the syntax. You must provide an alias column label for selected column targets that are expressions.|

### Privileges

- SELECT privileges on the source table
- USAGE privileges on source table schema
- Write privileges for the destination directory
Data Types

EXPORT TO PARQUET does not support the following data types:

- INTERVAL
- TIME/TIMETZ
- UUID Data Type

Decimal precision must be <= 38.

Vertica does not convert TIMESTAMP values to UTC. To avoid problems arising from time zones, use TIMESTAMPTZ instead of TIMESTAMP.

The exported Hive types might not be identical to the Vertica types. For example, a Vertica INT is exported as a Hive BIGINT. When defining Hive external tables to read exported data, you might have to adjust column definitions.

This operation exports raw Flex columns as binary data.

Output Files

You must use a shared file location for output. If you use a directory in the local file system, it must be an NFS-mounted directory.

For output to the local file system, you must have a USER storage location.

Output file names follow the pattern: [8-character hash]-[node name]-[thread_id].parquet.

When exporting to S3 the maximum size of all output is 5TB. You might have to divide large exports into more than one piece.

Vertica does not support simultaneous exports to the same directory in HDFS or S3. The results are undefined.

When exporting to the local file system, the permission mode is 700 for directories and 600 for files. You cannot override these values.

Parquet files exported to a local file system by any Vertica user are owned by the Vertica superuser. Parquet files exported to HDFS or S3 are owned by the Vertica user who exported the data.
Examples

The following example demonstrates exporting all columns from the T1 table in the public schema, using Snappy compression (the default).

```
=> EXPORT TO PARQUET(directory = 'hdfs:///user1/data')
    AS SELECT * FROM public.T1;

  Rows Exported
  ---------------
       87436
  (1 row)
```

The following example demonstrates exporting the results of a query using more than one table.

```
=> EXPORT TO PARQUET(directory='s3://DataLake/sales_by_region')
    AS SELECT sale.price, sale.date, store.region
         FROM public.sales sale
         JOIN public.vendor store ON sale.distribID = store.ID;

  Rows Exported
  ---------------
        23301
  (1 row)
```

The following example demonstrates partitioning and exporting data. EXPORT TO PARQUET first partitions the data on 'b' and then, within each partition, sorts by 'd'.

```
=> EXPORT TO PARQUET(directory = 's3://DataLake/user2/data')
    OVER(PARTITION BY b ORDER BY d) AS SELECT b, d FROM public.T2;

  Rows Exported
  ---------------
       120931
  (1 row)
```

The following example uses an alias column label for a selected column target that is an expression.

```
=> EXPORT TO PARQUET(directory = 'hdfs:///user3/data')
    OVER(ORDER BY col1) AS SELECT col1 + col1 AS A, col2
         FROM public.T3;

  Rows Exported
  ---------------
        14336
  (1 row)
```
EXPORT TO VERTICA

Exports an entire table, columns from a table, or query results to another Vertica database. Exported data is always written in **AUTO mode**.

**Important:** The source database can be one major release behind the target database.

**Syntax**

```
EXPORT TO VERTICA database.[schema.]target-table
  ... [ ( target-column[,...] ) ]
  ... { AS SELECT query-expression | FROM [schema.]source-table[ ( source-column[,...] ) ] }
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>database</code></td>
<td>A string containing the name of the database to receive the exported data. There must be an active connection to this database for the export to succeed.</td>
</tr>
<tr>
<td><code>[schema.]target-table</code></td>
<td>The table to store the exported data (schema specification is optional). This table must already exist.</td>
</tr>
<tr>
<td><code>target-column</code></td>
<td>A list of columns in the target table to store the exported data.</td>
</tr>
<tr>
<td><code>query-expression</code></td>
<td>Specifies the data to be exported. See <code>SELECT</code> for the syntax.</td>
</tr>
<tr>
<td><code>[schema.]source-table</code></td>
<td>The table that contains the data to export.</td>
</tr>
<tr>
<td><code>source-column</code></td>
<td>A list of the columns in the source table to export. If present, only these columns are exported.</td>
</tr>
</tbody>
</table>
Privileges

- SELECT privileges on the source table
- USAGE privilege on source table schema
- INSERT privileges for the destination table in target database
- USAGE privilege on destination table schema

Connecting to the Target Database

Before you can export data to another database, you must establish a connection to the target database with CONNECT. See Exporting Data to Another Vertica Database for details.

By default, EXPORT TO VERTICA exports data to another database over the Vertica private network. Connecting to a public network requires some configuration. For details about exporting data across a public network, see Using Public and Private IP Networks.

The export operation fails if either side of the connection is a single-node cluster installed to localhost, or you do not specify a host name or IP address.

Source and Target Column Mapping

You can optionally name a subset of source and target columns to participate in the export operation. EXPORT TO VERTICA tries to match columns in the source table with corresponding columns in the destination table. If you do not supply a list of source and destination columns, EXPORT TO VERTICA tries to match columns in the source table with corresponding columns in the destination table. Auto-projections for the target table are similar to the projections for the source table.

The following table compares the different combinations of naming source and target columns, and the requirements that pertain to each option.

<table>
<thead>
<tr>
<th>Omit target columns</th>
<th>Specify source columns</th>
</tr>
</thead>
</table>
| Omit source columns | Match all columns in source table to columns in target table.  
The number of columns in the | Match named source table columns to target table columns.  
The number of columns in the two |
<table>
<thead>
<tr>
<th>Omit source columns</th>
<th>Specify source columns</th>
</tr>
</thead>
<tbody>
<tr>
<td>two tables can differ, but the target table must have at least as many columns as the source table.</td>
<td>tables can differ, but the target table must have at least as many columns as the number of specified source columns.</td>
</tr>
<tr>
<td>Specify target columns</td>
<td>Match source columns to the named target columns. The number of named target columns must equal the number of columns in the source table.</td>
</tr>
</tbody>
</table>

**Node Failure During EXPORT**

See [Handling Node Failure During Copy/Export](#) in the Administrator's Guide.

**Examples**

See [Exporting Data to Another Vertica Database](#) in the Administrator's Guide.

**See Also**

COPY FROM VERTICA
**GRANT Statements**

GRANT statements grant privileges on database objects to users and roles.

Important: In a database with trust authentication, GRANT statements appear to work as expected but have no real effect on database security.

**GRANT (Authentication)**

Associates an authentication record to one or more users and roles.

**Syntax**

```
GRANT AUTHENTICATION auth-method-name TO grantee[,..]
```

**Parameters**

<table>
<thead>
<tr>
<th>auth-method-name</th>
<th>Name of the authentication method to associate with one or more users or roles.</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>Specifies who is associated with the authentication method, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• User name</td>
</tr>
<tr>
<td></td>
<td>• Role</td>
</tr>
<tr>
<td></td>
<td>• PUBLIC: The default role of all users.</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser
**Examples**

- Associate `v_ldap` authentication with user `jsmith`:
  ```sql
  => GRANT AUTHENTICATION v_ldap TO jsmith;
  ```

- Associate `v_gss` authentication to the role `DBprogrammer`:
  ```sql
  => CREATE ROLE DBprogrammer;
  => GRANT AUTHENTICATION v_gss TO DBprogrammer;
  ```

- Associate client authentication method `v_localpwd` with role `PUBLIC`, which is assigned by default to all users:
  ```sql
  => GRANT AUTHENTICATION v_localpwd TO PUBLIC;
  ```

**See Also**

- [REVOKE (Authentication)]
- [Granting and Revoking Privileges]

**GRANT (Database)**

Grants database privileges to users and roles.

**Syntax**

```sql
GRANT { privilege[,...] | ALL [ PRIVILEGES ] }
ON DATABASE db-spec
TO grantee[,...]
[ WITH GRANT OPTION ]
```

**Parameters**

<table>
<thead>
<tr>
<th>privilege</th>
<th>One of the following database privileges:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• CREATE: Create schemas.</td>
</tr>
</tbody>
</table>
- TEMP: Create temporary tables. By default, all users are granted this privilege through their DEFAULT role.

**ALL [PRIVILEGES]**

Grants all database privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard.

**db-spec**

Specifies the current database, set to the database name or DEFAULT.

**grantee**

Specifies who is granted privileges, one of the following:

- User name
- Role
- PUBLIC: The default role of all users

**WITH GRANT OPTION**

Gives *grantee* the privilege to grant the same privileges to other users or roles. For details, see How to Grant Privileges in the Administrator's Guide.

---

### Privileges

One of the following:

- Superuser

- Privileges granted who was given the option (WITH GRANT OPTION) of extending these privileges to other users

---

### Example

The following example grants user Fred the right to create schemas in the current database.

```sql
=> GRANT CREATE ON DATABASE DEFAULT TO Fred;
```
See Also

- REVOKE (Database)
- Granting and Revoking Privileges

GRANT (Library)

Grants usage privileges on one or more libraries to users and roles. To execute functions inside the library, users must have separate EXECUTE privileges on them.

For example, when working with the Connector Framework Service, you might need to grant a user usage privileges to a library to be able to set UDSession parameters. For more information see Implementing CFS.

Syntax

```sql
GRANT privilege
  ON LIBRARY [[database.]schema.]library[,..]
  TO grantee[,..]
  [ WITH GRANT OPTION ]
```

Parameters

<table>
<thead>
<tr>
<th>privilege</th>
<th>One of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• USAGE</td>
</tr>
<tr>
<td></td>
<td>• ALL [PRIVILEGES]: Grants all library privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>[database.]schema</th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
</tbody>
</table>
If you specify a database, it must be the current database.

**library**
The target library.

**grantee**
Specifies who is granted privileges, one of the following:

- User name
- Role
- PUBLIC: The default role of all users

**WITH GRANT OPTION**
Gives *grantee* the privilege to grant the same privileges to other users or roles. For details, see How to Grant Privileges in the Administrator's Guide.

### Privileges

One of the following:

- Superuser

- Privileges *grantee* who was given the option (WITH GRANT OPTION) of extending these privileges to other users

### Example

Grant USAGE privileges on the MyFunctions library to Fred:

```
=> GRANT USAGE ON LIBRARY MyFunctions TO Fred;
```

### See Also

- REVOKE (Library)
- Granting and Revoking Privileges

### GRANT (Model)

Grants usage privileges on a model to users and roles.
Syntax

```
GRANT privilege
   ON MODEL [[database.]schema.]model-name [,..]
   TO grantee[..]
   [ WITH GRANT OPTION ]
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>privilege</code></td>
<td>One of the following:</td>
</tr>
<tr>
<td></td>
<td>- USAGE</td>
</tr>
<tr>
<td></td>
<td>- ALL [PRIVILEGES]: Identical to USAGE. The optional keyword PRIVILEGES conforms with the SQL standard.</td>
</tr>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>model-name</code></td>
<td>The model on which to grant the privilege.</td>
</tr>
<tr>
<td><code>grantee</code></td>
<td>Specifies who is granted privileges, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- User name</td>
</tr>
<tr>
<td></td>
<td>- Role</td>
</tr>
<tr>
<td></td>
<td>- PUBLIC: The default role of all users</td>
</tr>
<tr>
<td><code>WITH GRANT OPTION</code></td>
<td>Gives <code>grantee</code> the privilege to grant the same privileges to other users or roles. For details, see How to Grant Privileges in the Administrator's Guide.</td>
</tr>
</tbody>
</table>

Privileges

One of the following:
- Superuser
- Privileges grantee who was given the option (WITH GRANT OPTION) of extending these privileges to other users

Example

This example grants USAGE privileges on the mySvmClassModel model to user1:

```sql
=> GRANT USAGE ON MODEL mySvmClassModel TO user1;
```

See Also

- `REVOKE (Model)`
- `Managing Model Security`

GRANT (Procedure)

Grants procedure privileges to `users` and `roles`. To grant privileges to a schema containing the procedure, users must have USAGE privileges on the schema (see `GRANT (Schema)`.

External procedures that you create with `CREATE PROCEDURE` are always run with Linux dbadmin privileges. If a dbadmin or pseudosuperuser grants a non-dbadmin permission to run a procedure using `GRANT (Procedure)`, be aware that the non-dbadmin user runs the procedure with full Linux dbadmin privileges.

Syntax

```
GRANT privilege
    ON PROCEDURE [[database.]schema.]procedure( [argument-list] )[,..]
    TO grantee[,..]
    [ WITH GRANT OPTION ]
```

Parameters

<table>
<thead>
<tr>
<th><code>privilege</code></th>
<th>One of the following:</th>
</tr>
</thead>
</table>
EXECUTE

ALL [PRIVILEGES]: Grants all procedure privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard.

(database.)schema

Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:

myschema.thisDbObject

If you specify a database, it must be the current database.

procedure

The target procedure.

argument-list

A comma-delimited list of procedure arguments, where each argument is specified as follows:

[ argname ] argtype

If the procedure is defined with no arguments, supply an empty argument list.

grantee

Specifies who is granted privileges, one of the following:

- User name
- Role
- PUBLIC: The default role of all users

WITH GRANT OPTION

Gives grantee the privilege to grant the same privileges to other users or roles. For details, see How to Grant Privileges in the Administrator’s Guide.

Privileges

One of the following:
- Superuser

- Privileges grantee who was given the option (WITH GRANT OPTION) of extending these privileges to other users

**Example**

The following command grants EXECUTE privileges on the *tokenize* procedure to users Bob and Jules, and to the Operator role:

```sql
=> GRANT EXECUTE ON PROCEDURE tokenize(varchar) TO Bob, Jules, Operator;
```

**See Also**

- **REVOKE (Procedure)**
- **Granting and Revoking Privileges**

**GRANT (Resource Pool)**

Grants privileges on resource pools to users and roles. After granted usage rights, users can access the resource pool with ALTER USER or SET SESSION RESOURCE POOL.

**Syntax**

```
GRANT privilege
    ON RESOURCE POOL resource-pool[,...]
    TO grantee[,...]
    [ WITH GRANT OPTION ]
```

**Parameters**

- **privilege**
  - One of the following:
    - USAGE
    - ALL [PRIVILEGES]: Grants all resource pool privileges that also belong to the grantor. Grantors cannot grant privileges
that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard.

<table>
<thead>
<tr>
<th>resource-pool</th>
<th>A resource pool on which to grant the specified privileges.</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>Specifies who is granted privileges, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- User name</td>
</tr>
<tr>
<td></td>
<td>- Role</td>
</tr>
<tr>
<td></td>
<td>- PUBLIC: The default role of all users</td>
</tr>
<tr>
<td>WITH GRANT OPTION</td>
<td>Gives grantee the privilege to grant the same privileges to other users or roles. For details, see How to Grant Privileges in the Administrator's Guide.</td>
</tr>
</tbody>
</table>

Privileges

One of the following:

- Superuser

- Privileges grantee who was given the option (WITH GRANT OPTION) of extending these privileges to other users

Examples

Grant user Joe usage privileges on resource pool Joe_pool.

```sql
g=> CREATE USER Joe;
CREATE USER
=> CREATE RESOURCE POOL Joe_pool;
CREATE RESOURCE POOL
=> GRANT USAGE ON RESOURCE POOL Joe_pool TO Joe;
GRANT PRIVILEGE
```
See Also

- `REVOKE (Resource Pool)`
- `Granting and Revoking Privileges`

**GRANT (Role)**

Assigns roles to users or other roles.

**Note:** Granting a role does not activate the role automatically; you must enable it with `SET ROLE` command.

**Syntax**

```sql
GRANT role[,..] TO grantee[,..] [ WITH ADMIN OPTION ]
```

**Parameters**

<table>
<thead>
<tr>
<th>role</th>
<th>A role to grant.</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>Designates users to be granted the specified roles, one of the following:</td>
</tr>
<tr>
<td></td>
<td>* User name</td>
</tr>
<tr>
<td></td>
<td>* Role</td>
</tr>
<tr>
<td></td>
<td>* PUBLIC: The default role of all users.</td>
</tr>
</tbody>
</table>

**WITH ADMIN OPTION**

Gives `grantee` the privilege to grant the same role to other users or roles. For details, see `How to Grant Privileges` in the Administrator's Guide.

**Privileges**

One of the following:
- Superuser
- Role grantee who was given WITH ADMIN OPTION

Examples

See Granting Access to Database Roles in the Administrator's Guide.

See Also

REVOKE (Role)

GRANT (Schema)

Grants schema privileges to users and roles.

Note: By default, new users cannot access schema PUBLIC. You must explicitly grant all new users USAGE privileges on the PUBLIC schema.

Syntax

GRANT { privilege[,...] | ALL [ PRIVILEGES ] }  
ON SCHEMA [database.]schema[,...]  
TO grantee[,...]  
[ WITH GRANT OPTION ]

Parameters

<table>
<thead>
<tr>
<th>privilege</th>
<th>One of the following privileges:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>USAGE: Enables access to objects in the specified schemas. Grantees can then be granted privileges on individual objects in these schemas in order to access them, through GRANT TABLE and GRANT VIEW.</td>
</tr>
<tr>
<td></td>
<td>CREATE: Create tables and views.</td>
</tr>
</tbody>
</table>

The following privileges are automatically granted on new
tables and views if inherited privileges are already enabled for the database and this schema:

- SELECT: Query tables and views of this schema.
- INSERT: Insert rows into tables of this schema, or and load data into tables with COPY.
- UPDATE: Update rows of tables of this schema.
- DELETE: Delete rows of tables of this schema.
- REFERENCES: Create foreign key constraints for tables of this schema. This privilege must also be set on both referencing and referenced tables.
- TRUNCATE: Truncate table contents.

<table>
<thead>
<tr>
<th>PRIVILEGES</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL [PRIVILEGES]</td>
<td>Grants CREATE and USAGE privileges. The optional keyword PRIVILEGES conforms with the SQL standard.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Specifies a target schema. If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>grantee</td>
<td>Specifies who is granted privileges, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- User name</td>
</tr>
<tr>
<td></td>
<td>- Role</td>
</tr>
<tr>
<td></td>
<td>- PUBLIC: The default role of all users</td>
</tr>
<tr>
<td>WITH GRANT OPTION</td>
<td>Gives grantee the privilege to grant the same privileges to other users or roles. For details, see How to Grant Privileges in the Administrator’s Guide.</td>
</tr>
</tbody>
</table>

**Privileges**

One of the following:
- Superuser

- Privileges grantee who was given the option (WITH GRANT OPTION) of extending these privileges to other users

Examples

This example shows how to grant user Joe usage on schema online_sales.

```
=> CREATE USER Joe; 
CREATE USER
=> GRANT USAGE ON SCHEMA online_sales TO Joe;
GRANT PRIVILEGE
```

See Also

- REVOKE (Schema)

- Granting and Revoking Privileges

GRANT (Sequence)

Grants sequence privileges to users and roles.

Syntax

```
GRANT privilege 
ON { 
  SEQUENCE [[database.]schema.]sequence[,..] 
  | ALL SEQUENCES IN SCHEMA [database.]schema[,..] } 
TO grantee[,..] 
[ WITH GRANT OPTION ]
```

Parameters

<table>
<thead>
<tr>
<th>privilege</th>
<th>One of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>SELECT: Grantees can execute functions CURRVAL and NEXTVAL on the specified sequences.</td>
</tr>
</tbody>
</table>
• ALL [PRIVILEGES]: Grants all sequence privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard.

[database.]schema

Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:

myschema.thisDbObject

If you specify a database, it must be the current database.

sequence

The sequence on which to grant privileges.

ALL SEQUENCES IN SCHEMA schema

Grants privileges on all sequences in the specified schema.

grantee

Specifies who is granted privileges, one of the following:

• User name
• Role
• PUBLIC: The default role of all users

WITH GRANT OPTION

Gives grantee the privilege to grant the same privileges to other users or roles. For details, see How to Grant Privileges in the Administrator's Guide.

Privileges

One of the following:

• Superuser

• Privileges grantee who was given the option (WITH GRANT OPTION) of extending these privileges to other users
Examples

This example shows how to grant user Joe all privileges on sequence my_seq.

```sql
=> CREATE SEQUENCE my_seq START 100;
CREATE SEQUENCE
=> GRANT ALL PRIVILEGES ON SEQUENCE my_seq TO Joe;
GRANT PRIVILEGE
```

See Also

- `REVOKE (Sequence)`
- `Granting and Revoking Privileges`

GRANT (Storage Location)

Grants privileges to users and roles on a USER-defined storage location. For more information, see `Creating Storage Locations` in the Administrator's Guide.

Syntax

```
GRANT { privilege[,...] | ALL [ PRIVILEGES ] } 
  ON LOCATION 'path' [ ON node ] 
  TO grantee[,...] 
  [ WITH GRANT OPTION ]
```

Parameters

<table>
<thead>
<tr>
<th>privilege</th>
<th>One of the following privileges:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• READ: Copy data from files in the storage location into a table.</td>
</tr>
<tr>
<td></td>
<td>• WRITE: Export data from the database to the storage location. With WRITE privileges, grantees can also save COPY statement rejected data and exceptions files to the storage location.</td>
</tr>
</tbody>
</table>
Grants all storage location privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack.

The optional keyword PRIVILEGES conforms with the SQL standard.

Specifies the path name mount point of the storage location. If qualified by ON NODE, Vertica grants access to the storage location residing on node.

If no node is specified, the grant operation applies to all nodes on the specified path. All nodes must be on the specified path; otherwise, the entire grant operation rolls back.

Specifies who is granted privileges, one of the following:

- User name
- Role
- PUBLIC: The default role of all users

Gives grantee the privilege to grant the same privileges to other users or roles. For details, see How to Grant Privileges in the Administrator's Guide.

Privileges

One of the following:

- Superuser
- Privileges grantee who was given the option (WITH GRANT OPTION) of extending these privileges to other users

Note: Only a superuser can add, alter, retire, drop, and restore a location.

Examples

In the following series of commands, a superuser creates a new storage location and grants it to user Bob:
Now the superuser grants a user named Bob all available privileges to the /BobStore location:

```sql
=> GRANT ALL ON LOCATION '/home/dbadmin/UserStorage/BobStore' TO Bob;
GRANT PRIVILEGE
```

Revoke all storage location privileges from Bob:

```sql
=> REVOKE ALL ON LOCATION '/home/dbadmin/UserStorage/BobStore' FROM Bob;
REVOKE PRIVILEGE
```

Grant privileges to Bob on the BobStore location again, specifying a node:

```sql
=> GRANT ALL ON LOCATION '/home/dbadmin/UserStorage/BobStore' ON v_mcdb_node0007 TO Bob;
GRANT PRIVILEGE
```

Revoke all storage location privileges from Bob:

```sql
=> REVOKE ALL ON LOCATION '/home/dbadmin/UserStorage/BobStore' ON v_mcdb_node0007 FROM Bob;
REVOKE PRIVILEGE
```

**See Also**

- Storage Management Functions
- REVOKE (Storage Location)
- Granting and Revoking Privileges

**GRANT (Table)**

Grants table privileges to users and roles. Users must also be granted USAGE on the schema that contains the table.

**Syntax**

```
GRANT { privilege[,..] | ALL [ PRIVILEGES ] } 
ON 
  [ TABLE ] [[database.]schema.]table[,..] 
  | ALL TABLES IN SCHEMA [database.]schema[,] }) 
TO grantee[,..] 
  [ WITH GRANT OPTION ]
```
## Parameters

<table>
<thead>
<tr>
<th>privilege</th>
<th>One of the following privileges:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Important</strong>: Only SELECT privileges can be granted on system tables.</td>
</tr>
<tr>
<td></td>
<td>- SELECT: Query tables of this schema. SELECT privileges are granted by default to the PUBLIC role.</td>
</tr>
<tr>
<td></td>
<td>- INSERT: Insert rows into tables of this schema, or and load data into tables with COPY.</td>
</tr>
<tr>
<td></td>
<td>Note: COPY FROM STDIN is allowed for users with INSERT privileges, while COPY FROM file requires admin privileges.</td>
</tr>
<tr>
<td></td>
<td>- UPDATE: Update rows of tables of this schema.</td>
</tr>
<tr>
<td></td>
<td>- DELETE: Delete rows of tables of this schema.</td>
</tr>
<tr>
<td></td>
<td>- REFERENCES: Create foreign key constraints for tables of this schema. This privilege must be set on both referencing and referenced tables.</td>
</tr>
<tr>
<td></td>
<td>- TRUNCATE: Truncate table contents. Non-owners of the tables can also execute the following partition operations on them:</td>
</tr>
<tr>
<td></td>
<td>- DROP_PARTITIONS</td>
</tr>
<tr>
<td></td>
<td>- SWAP_PARTITIONS_BETWEEN_TABLES</td>
</tr>
<tr>
<td></td>
<td>- MOVE_PARTITIONS_TO_TABLE</td>
</tr>
<tr>
<td>ALL [PRIVILEGES]</td>
<td>Invalid for system tables, grants all table privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard.</td>
</tr>
</tbody>
</table>
Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:

```
myschema.thisDbObject
```

One exception applies: you can specify system tables without their schema name.

If you specify a database, it must be the current database.

The table on which to grant privileges.

*Note:* The table can be a global temporary table, but not a local temporary table. See [Creating Temporary Tables](#) in the Administrator's Guide.

Grants privileges on all tables and views in the specified schema.

Specifies who is granted privileges, one of the following:

- User name
- Role
- PUBLIC: The default role of all users

Gives *grantee* the privilege to grant the same privileges to other users or roles. For details, see [How to Grant Privileges](#) in the Administrator's Guide.

### Privileges

One of the following:

- Superuser

- Privileges grantee who was given the option (WITH GRANT OPTION) of extending these privileges to other users
Examples

Grant user Joe all privileges on table customer_dimension:

=> CREATE USER Joe;
CREATE USER
=> GRANT ALL PRIVILEGES ON TABLE customer_dimension TO Joe;
GRANT PRIVILEGE

Grant user Joe SELECT privileges on all system tables:

=> GRANT SELECT on all tables in schema V_MONITOR, V_CATALOG TO Joe;
GRANT PRIVILEGE

See Also

- REVOKE (Table)
- Granting and Revoking Privileges

GRANT (User Defined Extension)

Grants privileges on user-defined extensions to users and roles.

Syntax

```
GRANT privilege
ON {
    UdX-type [[database.]schema.]function-name( [argument-list] )[,..]
        | ALL FUNCTIONS IN SCHEMA schema[,..] }
TO grantees[,..]
[ WITH GRANT OPTION ]
```

Parameters

<table>
<thead>
<tr>
<th>privilege</th>
<th>One of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>EXECUTE: Permission to call a user-defined extension.</td>
</tr>
</tbody>
</table>
- **ALL [PRIVILEGES]**: Grants all function privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard.

<table>
<thead>
<tr>
<th>ON <strong>UDx-type</strong></th>
<th>Specifies the function's user-defined extension (UDx) type, where <strong>UDx-type</strong> is one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- FUNCTION</td>
</tr>
<tr>
<td></td>
<td>- AGGREGATE FUNCTION</td>
</tr>
<tr>
<td></td>
<td>- ANALYTIC FUNCTION</td>
</tr>
<tr>
<td></td>
<td>- TRANSFORM FUNCTION</td>
</tr>
<tr>
<td></td>
<td>- FILTER</td>
</tr>
<tr>
<td></td>
<td>- PARSER</td>
</tr>
<tr>
<td></td>
<td>- SOURCE</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>[<strong>database.</strong>]schema</th>
<th>Specifies a schema, by default public. If <strong>schema</strong> is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>myschema.thisDbObject</strong></td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>

| **function-name**     | Name of the user-defined function on which to grant privileges.                                                             |

| ON ALL FUNCTIONS IN SCHEMA **schema** | Grants privileges on all functions in the specified schema.                                                               |

<table>
<thead>
<tr>
<th><strong>argument-list</strong></th>
<th>Required for all polymorphic functions, a comma-delimited list of function arguments, where each argument is specified as follows:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>[ argname ] argtype</strong></td>
</tr>
<tr>
<td></td>
<td>If the procedure is defined with no arguments, supply an empty argument list.</td>
</tr>
</tbody>
</table>
grantee

Specifies who is granted privileges, one of the following:

- User name
- Role
- PUBLIC: The default role of all users

Note: Grantees must have USAGE privileges on the schema.

WITH GRANT OPTION

Gives grantee the privilege to grant the same privileges to other users or roles. For details, see How to Grant Privileges in the Administrator's Guide.

Privileges

All grantees must have USAGE privileges on the schema, and be one of the following:

- Superuser or owner of the target function
- Privileges grantee who was given the option (WITH GRANT OPTION) of extending these privileges to other users

Examples

Grant EXECUTE privileges on the myzeroifnull SQL function to users Bob and Jules, and to the role Operator. The function takes one integer argument:

```sql
=> GRANT EXECUTE ON FUNCTION myzeroifnull (x INT) TO Bob, Jules, Operator;
```

Grant EXECUTE privileges on all functions in the zero-schema schema to user Bob:

```sql
=> GRANT EXECUTE ON ALL FUNCTIONS IN SCHEMA zero-schema TO Bob;
```

Grant EXECUTE privileges on the tokenize transform function to user Bob and the role Operator:

```sql
=> GRANT EXECUTE ON TRANSFORM FUNCTION tokenize(VARCHAR) TO Bob, Operator;
```

Grant EXECUTE privileges on the ExampleSource() source to user Alice:
CREATE USER Alice;
GRANT USAGE ON SCHEMA hdfs TO Alice;
GRANT EXECUTE ON SOURCE ExampleSource() TO Alice;

Grant all privileges on the ExampleSource() source to user Alice:
GRANT ALL ON SOURCE ExampleSource() TO Alice;

Grant all privileges on polymorphic function Pagerank to the dbadmin role:
GRANT ALL ON TRANSFORM FUNCTION Pagerank(z varchar) to dbadmin;

See Also
- REVOKE (User Defined Extension)
- Granting and Revoking Privileges in the Administrator’s Guide
- Developing User-Defined Extensions (UDxs) in Extending Vertica

GRANT (View)
Grants view privileges to users and roles.

Syntax
GRANT privilege
ON [[database.]schema.]view[,..]
TO grantee[,..]
[ WITH GRANT OPTION ]

Parameters
<table>
<thead>
<tr>
<th>privilege</th>
<th>One of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELECT: Query the specified views.</td>
<td></td>
</tr>
<tr>
<td>ALL [PRIVILEGES]: Grants all view privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL</td>
<td></td>
</tr>
<tr>
<td><strong>[database.]schema</strong></td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><strong>view</strong></td>
<td>The target view.</td>
</tr>
<tr>
<td><strong>view</strong></td>
<td>The target view.</td>
</tr>
<tr>
<td><strong>grantee</strong></td>
<td>Specifies who is granted privileges, one of the following:</td>
</tr>
<tr>
<td></td>
<td>* User name</td>
</tr>
<tr>
<td></td>
<td>* Role</td>
</tr>
<tr>
<td></td>
<td>* PUBLIC: The default role of all users</td>
</tr>
<tr>
<td><strong>WITH GRANT OPTION</strong></td>
<td>Gives grantee the privilege to grant the same privileges to other users or roles. For details, see How to Grant Privileges in the Administrator's Guide.</td>
</tr>
</tbody>
</table>

**Privileges**

One of the following:

- Superuser
- Privileges grantee who was given the option (WITH GRANT OPTION) of extending these privileges to other users

**Examples**

Grant user Joe all privileges on view ship.

```sql
=> CREATE VIEW ship AS SELECT * FROM public.shipping_dimension;
CREATE VIEW
=> GRANT ALL PRIVILEGES ON ship TO Joe;
GRANT PRIVILEGE
```
**INSERT**

Inserts values into all projections of the specified table. You must insert one complete tuple at a time. By default, INSERT first uses WOS. When WOS is full, the inserted tuple overflows to ROS.

If no projections are associated with the target table, Vertica creates a superprojection to store the inserted values.

**INSERT** works for flex tables as well as regular database tables.

**Syntax**

```
INSERT [ /*+ hint[, hint] */ ] INTO [[database.]schema.]table-name
... [ ( column-list ) ]
... { DEFAULT VALUES | VALUES ( values-list ) | SELECT query-expression }
```

**Parameters**

<table>
<thead>
<tr>
<th>**/<em>+ hint [, hint] <em>/</em></em></th>
<th>One or both of the following hints:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• A load hint, one of the following: AUTO, DIRECT, or TRICKLE</td>
</tr>
<tr>
<td></td>
<td>• LABEL</td>
</tr>
<tr>
<td><strong>[database.]schema</strong></td>
<td>Specifies a schema, by default public. If <strong>schema</strong> is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><strong>table-name</strong></td>
<td>The target table. You cannot invoke INSERT on a projection. This can be a flex table.</td>
</tr>
<tr>
<td><strong>column-list</strong></td>
<td>A comma-delimited list of one or more target columns in this table, listed in any order. VALUES clause values are mapped to columns in the same order. If you omit this list, Vertica maps VALUES clause values to columns according to column order in</td>
</tr>
</tbody>
</table>
the table definition.
A list of target columns is invalid with DEFAULT VALUES.

<table>
<thead>
<tr>
<th>DEFAULT VALUES</th>
<th>Fills all columns with their default values as specified in the table definition. You cannot specify a list of target columns with this option.</th>
</tr>
</thead>
</table>
| VALUES (values-list) | A comma-delimited list of one or more values to insert in the target columns, where each value is one of the following:  
• *expression* resolves to a value to insert in the target column. The expression must not nest other expressions or include Vertica meta-functions.  
• DEFAULT inserts the default value as specified in the table definition.  
If no value is supplied for a column, Vertica implicitly adds a DEFAULT value, if defined. Otherwise Vertica inserts a NULL value. If the column is defined as NOT NULL, INSERT returns an error. |
| SELECT query-expression | Specifies a query that returns the rows to insert. Isolation level applies only to the SELECT clauses and works like any query. |

**Privileges**

- Table owner or user with GRANT OPTION is grantor
- INSERT privilege on table
- USAGE privilege on schema that contains the table

**Restrictions**

- Vertica does not support subqueries as the target of an INSERT statement.
- If any primary key, unique key, or check constraints are enabled for automatic enforcement, Vertica enforces those constraints when you insert values into a table. If a violation occurs, Vertica rolls back the SQL statement and returns an error. This behavior occurs for INSERT,
UPDATE, COPY, and MERGE SQL statements.

Note: Automatic constraint enforcement requires that you have SELECT privileges on the table containing the constraint.

Examples

=> INSERT INTO t1 VALUES (101, 102, 103, 104);
=> INSERT INTO customer VALUES (10, 'male', 'DPR', 'MA', 35);
=> INSERT INTO retail.t1 (C0, C1) VALUES (1, 1001);
=> INSERT INTO films SELECT * FROM tmp_films WHERE date_prod < '2004-05-07';

Vertica does not support subqueries or nested expressions as the target of an INSERT statement. For example, the following query returns an error message:

=> INSERT INTO t1 (col1, col2) VALUES ('abc', (SELECT mycolumn FROM mytable));
ERROR 4821: Subqueries not allowed in target of insert

You can rewrite the above query as follows:

=> INSERT INTO t1 (col1, col2) (SELECT 'abc', mycolumn FROM mytable);

The following example shows how to use INSERT...VALUES with flex tables:

=> CREATE FLEX TABLE flex1();
CREATE TABLE
=> INSERT INTO flex1(a,b) VALUES (1, 'x');
OUTPUT
--------
  1
(1 row)
=> SELECT MapToString(_raw_) FROM flex1;
  MapToString
{ "a" : "1", "b" : "x" }
(1 row)

The next example shows how to use INSERT...SELECT with flex tables:

=> CREATE FLEX TABLE flex2();
CREATE TABLE
MERGE

Performs update and insert operations on a target table based on the results of a join with another data set, such as a table or view. The join can match a source row with only one target row; otherwise, Vertica returns an error.

A MERGE operation uses WOS by default. If WOS fills up, data overflows to ROS.

For detailed information, see Merging Table Data.

Syntax

MERGE [ /*+ hint[, hint] */ ]
... INTO [[database.]schema.]target-table [ [AS] alias ]
... USING source-dataset
... ON  join-condition
... matching-clause[ matching-clause ]

Returns

Number of target table rows updated or inserted

Parameters

/*+ hint[, hint]*/

One or both of the following hints:
- A load hint, one of the following: **AUTO**, **DIRECT**, or **TRICKLE**
- **LABEL**

### [database.]schema

Specifies a schema, by default public. If `schema` is any schema other than public, you must supply the schema name. For example:

```sql
myschema.thisDbObject
```

If you specify a database, it must be the current database.

### target-table

The table on which to perform update and insert operations. MERGE takes an X (exclusive) lock on the target table during the operation.

### source-dataset

The data to join to **target-table**, one of the following:

- `[[database.]schema.]table [ [AS] alias ]`
- `[[database.]schema.]view [ [AS] alias ]`
- `(subquery) sq-alias`

The specified data set typically supplies the data used to update the target table and populate new rows. You can specify an external table.

### ON join-condition

The conditions on which to join the target table and source data set.

**Tip:** The Vertica query optimizer can create an optimized query plan for a **MERGE** statement only if the target table join column has a unique or primary key constraint. For details, see **MERGE Optimization** in the Administrator's Guide.

### matching-clause

One of the following clauses:
**WHEN MATCHED THEN UPDATE**

**WHEN NOT MATCHED THEN INSERT**

MERGE supports one instance of each clause, and must include at least one.

<table>
<thead>
<tr>
<th>WHEN MATCHED THEN UPDATE</th>
<th>For each <em>target-table</em> row that is joined (matched) to <em>source-dataset</em>, specifies to update one or more columns:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>WHEN MATCHED [ AND update-filter ] THEN UPDATE</strong></td>
</tr>
<tr>
<td></td>
<td><strong>SET { column = expression }[,]</strong></td>
</tr>
</tbody>
</table>

*update-filter* optionally filters the set of matching rows. The update filter can specify any number of conditions. Vertica evaluates each matching row against this filter, and updates only the rows that evaluate to true. For details, see [Update and Insert Filters](#) in the Administrator's Guide.

*Note: Vertica also supports Oracle syntax for specifying update filters:*

<table>
<thead>
<tr>
<th>WHEN MATCHED THEN UPDATE</th>
<th><strong>SET { column = expression }[,]</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>[ WHERE update-filter ]</strong></td>
</tr>
</tbody>
</table>

The following requirements apply:

- A MERGE statement can contain only one WHEN MATCHED clause.
- *target-column* can only specify a column name in the target table. It cannot be qualified with a table name.

For details, see [Merging Table Data](#) in the Administrator's Guide.

<table>
<thead>
<tr>
<th>WHEN NOT MATCHED THEN INSERT</th>
<th>For each <em>source-dataset</em> row that is not joined (not matched) to <em>target-table</em>, specifies to:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Insert a new row into target-table.</strong></td>
</tr>
</tbody>
</table>
• Populate each new row with the values specified in `values-list`.

```
WHEN NOT MATCHED [ AND `insert-filter` ] THEN INSERT
[( `column-list` )] VALUES (`values-list`)
```

column-list is a comma-delimited list of one or more target columns in the target table, listed in any order. MERGE maps column-list columns to values-list values in the same order, and each column-value pair must be compatible. If you omit column-list, Vertica maps values-list values to columns according to column order in the table definition.

`insert-filter` optionally filters the set of non-matching rows. The insert filter can specify any number of conditions. Vertica evaluates each non-matching source row against this filter. For each row that evaluates to true, Vertica inserts a new row in the target table. For details, see Update and Insert Filters in the Administrator's Guide.

Note: Vertica also supports Oracle syntax for specifying insert filters:

```
WHEN NOT MATCHED THEN INSERT
[( `column-list` )] VALUES (`values-list`)
[ WHERE `insert-filter` ]
```

The following requirements apply:

• A MERGE statement can contain only one WHEN NOT MATCHED clause.

• column-list can only specify column names in the target table. It cannot be qualified with a table name.

• Insert filter conditions can only reference the source data. If any condition references the target table, Vertica returns an error.

For details, see Merging Table Data in the
Privileges

MERGE requires the following privileges:

- SELECT permissions on the source data and INSERT, UPDATE, and DELETE permissions on the target table.

- Automatic constraint enforcement requires SELECT permissions on the table containing the constraint.

- SELECT permissions on the target table if the condition in the syntax reads data from the target table. The following example grants user1 access to target table t2:

For example, the following GRANT statement grants user1 access to target table t2. This allows user1 to run the MERGE statement that follows:

```sql
=> GRANT SELECT, INSERT, UPDATE, DELETE ON TABLE t2 to user1;
GRANT PRIVILEGE
=>
You are now connected as user "user1".
=> MERGE INTO t2 USING t1 ON t1.a = t2.a
  WHEN MATCHED THEN UPDATE SET b = t1.b
  WHEN NOT MATCHED THEN INSERT (a, b) VALUES (t1.a, t1.b);
```

Improving MERGE Performance

You can improve MERGE performance in several ways:

- Design projections for optimal MERGE performance.

- Facilitate creation of optimized query plans.

- Use a source data set that is smaller than the target table.

For details, see MERGE Optimization in the Administrator's Guide.
Constraint Enforcement

MERGE respects all enforced constraints in the target table. If the merge operation attempts to copy values that violate those constraints, MERGE returns with an error and rolls back the merge operation.

Caution: If you run MERGE multiple times using the same target and source table, each iteration is liable to introduce duplicate values into the target columns and return with an error.

Columns Prohibited from Merge

The following columns cannot be specified in a merge operation; attempts to do so return with an error:

- Identity/auto-increment columns, or columns whose default value is set to a named sequence.
- Vmap columns such as __raw__ in flex tables.

Examples

In the Administrator's Guide, see:

- Basic MERGE Example
- MERGE Source Options
- MERGE Matching Clauses
- Update and Insert Filters

PROFILE

Profiles a single SQL statement.
Syntax

PROFILE { sql-statement }

Parameters

| sql-statement | A query (SELECT) statement or DML statement--for example, you can profile INSERT, UPDATE, COPY, and MERGE. |

Output

Writes profile summary to stderr, saves details to system catalog V_MONITOR.EXECUTION_ENGINE_PROFILES.

Privileges

The same privileges required to run the profiled statement

Description

PROFILE generates detailed information about how the target statement executes, and saves that information in the system catalog V_MONITOR.EXECUTION_ENGINE_PROFILES. Query output is preceded by a profile summary: profile identifiers transaction_id and statement_id, initiator memory for the query, and total memory required. For example:

```
=> PROFILE SELECT customer_name, annual_income FROM public.customer_dimension WHERE (customer_gender, annual_income) IN (SELECT customer_gender, MAX(annual_income) FROM public.customer_dimension GROUP BY customer_gender);
NOTICE 4788:  Statement is being profiled
HINT:  Select * from v_monitor.execution_engine_profiles where transaction_id=45035996274683334 and statement_id=7;
NOTICE 3557:  Initiator memory for query: [on pool general: 708421 KB, minimum: 554324 KB]
NOTICE 5077:  Total memory required by query: [708421 KB]
    customer_name | annual_income
-----------------+-------------
            Emily G. Vogel |   999998
```
Use profile identifiers to query the table for profile information on a given query.

See Also

Profiling Single Statements

**RELEASE SAVEPOINT**

Destroys a savepoint without undoing the effects of commands executed after the savepoint was established.

**Syntax**

```
RELEASE [ SAVEPOINT ] savepoint_name
```

**Parameters**

| savepoint_name | Specifies the name of the savepoint to destroy. |

**Privileges**

No special permissions required.

**Notes**

Once destroyed, the savepoint is unavailable as a rollback point.
Example

The following example establishes and then destroys a savepoint called my_savepoint. The values 101 and 102 are both inserted at commit.

```sql
=> INSERT INTO product_key VALUES (101);
=> SAVEPOINT my_savepoint;
=> INSERT INTO product_key VALUES (102);
=> RELEASE SAVEPOINT my_savepoint;
=> COMMIT;
```

See Also

- `SAVEPOINT`
- `ROLLBACK TO SAVEPOINT`
REVOKE Statements

REVOKE statements let you revoke privileges on database objects from users and roles.

Important: In a database with trust authentication, REVOKE statements appear to work as expected but have no real effect on database security.

REVOKE (Authentication)

Revolves privileges on an authentication method from users and roles.

Syntax

REVOKE AUTHENTICATION auth-method-name FROM grantee[,...]

Parameters

<table>
<thead>
<tr>
<th>auth-method-name</th>
<th>Name of the target authentication method.</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>Specifies whose privileges are revoked, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- User name</td>
</tr>
<tr>
<td></td>
<td>- Role</td>
</tr>
<tr>
<td></td>
<td>- PUBLIC: The default role of all users</td>
</tr>
</tbody>
</table>

Privileges

Superuser
Examples

- Revoke v_ldap authentication from user jsmith:
  
  ```sql
  => REVOKE AUTHENTICATION v_ldap FROM jsmith;
  ```

- Revoke v_gss authentication from the role DBprogrammer:
  
  ```sql
  => REVOKE AUTHENTICATION v_gss FROM DBprogrammer;
  ```

- Revoke localpwd as the default client authentication method:
  
  ```sql
  => REVOKE AUTHENTICATION localpwd FROM PUBLIC;
  ```

See Also

- ALTER AUTHENTICATION
- CREATE AUTHENTICATION
- DROP AUTHENTICATION
- GRANT (Authentication)

REVOKE (Database)

Revolves database privileges from users and roles.

Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[,..] | ALL [ PRIVILEGES ] } 
ON DATABASE db-spec 
FROM grantee[,..] 
[ CASCADE ]
```

Parameters

| GRANT OPTION FOR | Revoles the grant option for the specified privileges. Current |
privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.

privilege

The database privilege to revoke, one of the following:

- CREATE: Create schemas.
- TEMP: Create temporary tables.

ALL [PRIVILEGES]

Revolves all database privileges. The optional keyword PRIVILEGES is supported to comply with the SQL standard.

ON DATABASE db-spec

Specifies the current database, set to the database name or DEFAULT.

grantee

Specifies whose privileges are revoked, one of the following:

- User name
- Role
- PUBLIC: The default role of all users

CASCADE

If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.

Privileges

One of the following:

- Superuser
- Privileges grantor

Examples

Revoke user Fred's privilege to create schemas in the current database:

```sql
=> REVOKE CREATE ON DATABASE DEFAULT FROM Fred;
```

Revoke user Fred's privilege to create temporary tables in the current database:
REVOKE TEMP ON DATABASE DEFAULT FROM Fred;

See Also

- GRANT (Database)
- Granting and Revoking Privileges

REVOKE (Library)

Revoke library privileges from users and roles.

To revoke functions inside the library, a user must have separate REVOKE privileges for those functions.

Syntax

REVOKE [ GRANT OPTION FOR ] privilege
    ON LIBRARY [[database.]schema.]library[,..]
    FROM grantee[,..]
    [ CASCADE ]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT OPTION FOR</td>
<td>Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.</td>
</tr>
<tr>
<td>privilege</td>
<td>One of the following:</td>
</tr>
<tr>
<td></td>
<td>- USAGE</td>
</tr>
<tr>
<td></td>
<td>- ALL [PRIVILEGES]: Revokes all library privileges. The optional keyword PRIVILEGES conforms with the SQL standard.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
</tbody>
</table>
If you specify a database, it must be the current database.

<table>
<thead>
<tr>
<th><strong>Library</strong></th>
<th>The target library.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>grantee</strong></td>
<td>Specifies whose privileges are revoked, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• User name</td>
</tr>
<tr>
<td></td>
<td>• Role</td>
</tr>
<tr>
<td></td>
<td>• PUBLIC: The default role of all users</td>
</tr>
<tr>
<td><strong>CASCADE</strong></td>
<td>If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.</td>
</tr>
</tbody>
</table>

Examples

These commands show how to create a new library, and then grant and revoke user Fred's USAGE privilege on that library.

```
=> CREATE LIBRARY MyFunctions AS 'home/dbadmin/my_functions.so';
=> GRANT USAGE ON LIBRARY MyFunctions TO Fred;
=> REVOKE USAGE ON LIBRARY MyFunctions FROM Fred;
```

See Also

- GRANT (Library)
- Granting and Revoking Privileges

REVOKE (Model)

Revokes model privileges from users and roles.
Syntax

REVOKE [ GRANT OPTION FOR ] privilege
  ON MODEL [[database.]schema.]model-name [,]
  FROM grantee [,]
  [ CASCADE ]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT OPTION FOR</td>
<td>Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.</td>
</tr>
<tr>
<td>privilege</td>
<td>One of the following:</td>
</tr>
<tr>
<td></td>
<td>• USAGE</td>
</tr>
<tr>
<td></td>
<td>• ALL [PRIVILEGES]: Revokes all model privileges. The optional keyword PRIVILEGES conforms with the SQL standard.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>model-name</td>
<td>Name of the target model.</td>
</tr>
<tr>
<td>grantee</td>
<td>Specifies whose privileges are revoked, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• User name</td>
</tr>
<tr>
<td></td>
<td>• Role</td>
</tr>
<tr>
<td></td>
<td>• PUBLIC: The default role of all users</td>
</tr>
<tr>
<td>CASCADE</td>
<td>If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.</td>
</tr>
</tbody>
</table>
Privileges

One of the following:

- Superuser
- Privileges grantor

Example

Revoke user Fred's USAGE privilege on model mySvmClassModel:

```sql
=> REVOKE USAGE ON mySvmClassModel FROM Fred;
```

See Also

- **GRANT (Model)**
- **Managing Model Security**

REVOKE (Procedure)

Revolves procedure privileges from users and roles.

Syntax

```
REVOKE [ GRANT OPTION FOR ] privilege
    ON PROCEDURE [[database.]schema.]procedure([argument-list])[,...]
    FROM grantee[,..]
    [ CASCADE ]
```

Parameters

<table>
<thead>
<tr>
<th>GRANT OPTION FOR</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause,</td>
</tr>
</tbody>
</table>
Vertica revokes both the grant option and current privileges.

<table>
<thead>
<tr>
<th><strong>privilege</strong></th>
<th>One of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>EXECUTE</td>
</tr>
<tr>
<td></td>
<td>ALL [PRIVILEGES]: Revokes all procedure privileges. The optional keyword PRIVILEGES conforms with the SQL standard.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>[database.]schema</strong></th>
<th>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>procedure</strong></th>
<th>The target procedure.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th><strong>argument-list</strong></th>
<th>A comma-delimited list of procedure arguments, where each argument is specified as follows:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>[argname] argtype</td>
</tr>
<tr>
<td></td>
<td>If the procedure is defined with no arguments, supply an empty argument list.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>grantee</strong></th>
<th>Specifies whose privileges are revoked, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• User name</td>
</tr>
<tr>
<td></td>
<td>• Role</td>
</tr>
<tr>
<td></td>
<td>• PUBLIC: The default role of all users</td>
</tr>
</tbody>
</table>

| **CASCADE** | If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also. |

**Privileges**

One of the following:
• Superuser
• Privileges grantor

Examples

This example revokes user Bob's execute privilege on the tokenize procedure.

```sql
=> REVOKE EXECUTE ON PROCEDURE tokenize(varchar) FROM Bob;
```

See Also

• GRANT (Procedure)
• Granting and Revoking Privileges

REVOKE (Resource Pool)

Revolves resource pool access privileges from users and roles.

Vertica checks resource pool privileges at runtime. Revoking a user's privileges for a resource pool can have an immediate effect on the user's current session. For example, a user query might require USAGE privileges on a resource pool. If you revoke those privileges from that user, subsequent attempts by the user to execute that query fail and return with an error message.

Syntax

```
REVOKE [ GRANT OPTION FOR ] privilege
   ON RESOURCE POOL resource-pool[,]
   FROM grantee[,]
   [ CASCADE ]
```

Parameters

<table>
<thead>
<tr>
<th>GRANT OPTION FOR</th>
<th>Revoke the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.</th>
</tr>
</thead>
</table>
**privilege**

One of the following:

- USAGE
- ALL [PRIVILEGES]: Revokes all resource pool privileges. The optional keyword PRIVILEGES conforms with the SQL standard.

**resource-pool**

The target resource pool

**grantee**

Specifies whose privileges are revoked, one of the following:

- User name
- Role
- PUBLIC: The default role of all users

**CASCADE**

If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.

---

**Privileges**

One of the following:

- Superuser
- Privileges grantor

---

**Examples**

Revoke user Joe's USAGE privileges on the Joe_pool resource pool.

```sql
=> REVOKE USAGE ON RESOURCE POOL Joe_pool FROM Joe;
REVOKE PRIVILEGE
```
See Also

- GRANT (Resource Pool)
- Granting and Revoking Privileges

REVOKE (Role)

Revolves a role from users and roles.

Syntax

```
REVOKE [ ADMIN OPTION FOR ] role[,..]
    FROM grantee[,..]
    [ CASCADE ]
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADMIN OPTION FOR</td>
<td>Revokes the privilege of assigning the specified roles to other users or roles. Current roles for grantees remain unaffected. If you omit this clause, Vertica revokes role assignment privileges and the current roles. Revokes the access for the specified users or roles user or role's administration access to the role, and not the role itself.</td>
</tr>
<tr>
<td>role</td>
<td>Role to revoke.</td>
</tr>
<tr>
<td>grantee</td>
<td>Specifies whose privileges are revoked, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- User name</td>
</tr>
<tr>
<td></td>
<td>- Role</td>
</tr>
<tr>
<td></td>
<td>- PUBLIC: The default role of all users</td>
</tr>
<tr>
<td>CASCADE</td>
<td>If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.</td>
</tr>
</tbody>
</table>
Privileges

One of the following:

- Superuser
- Privileges grantee who was given the option (WITH ADMIN OPTION) of extending these privileges to other users

Examples

This example shows the revocation of the pseudosuperuser role from the dbadmin user:

```sql
=> REVOKE pseudosuperuser from dbadmin;
```

This example shows the revocation of administration access from the dbadmin user for the pseudosuperuser role. The ADMIN OPTION command does not remove the pseudosuperuser role.

```sql
=> REVOKE ADMIN OPTION FOR pseudosuperuser FROM dbadmin;
```

Notes

If the role you are trying to revoke was not already granted to the user, Vertica returns a NOTICE:

```sql
=> REVOKE commentor FROM Sue;
NOTICE 2022: Role "commentor" was not already granted to user "Sue"
REVOKE ROLE
```

See Also

- GRANT (Role)
- Granting and Revoking Privileges

REVOKE (Schema)

Revokes schema privileges from users and roles.
## Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[,] | ALL [ PRIVILEGES ] }
ON SCHEMA [ database . ]schema[,] FROM grantee[,] [ CASCADE ]
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>GRANT OPTION FOR</strong></td>
<td>Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.</td>
</tr>
<tr>
<td><strong>privilege</strong></td>
<td>The schema privilege to revoke, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- USAGE: Enables access to objects in the specified schemas.</td>
</tr>
<tr>
<td></td>
<td>- CREATE: Create tables and views.</td>
</tr>
<tr>
<td></td>
<td>- SELECT: Query tables of this schema.</td>
</tr>
<tr>
<td></td>
<td>- INSERT: Insert rows into tables of this schema, or and load data into tables with COPY.</td>
</tr>
<tr>
<td></td>
<td>- UPDATE: Update rows of tables of this schema.</td>
</tr>
<tr>
<td></td>
<td>- DELETE: Delete rows of tables of this schema.</td>
</tr>
<tr>
<td></td>
<td>- REFERENCES: Create foreign key constraints for tables of this schema. This privilege must be set on both referencing and referenced tables.</td>
</tr>
<tr>
<td></td>
<td>- TRUNCATE: Truncate table contents.</td>
</tr>
<tr>
<td><strong>ALL [ PRIVILEGES ]</strong></td>
<td>Revokes all schema privileges. The optional keyword PRIVILEGES conforms with the SQL standard.</td>
</tr>
<tr>
<td><strong>[ database . ]schema</strong></td>
<td>The schema on which to revoke privileges. If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><strong>grantee</strong></td>
<td>Specifies whose privileges are revoked, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- User name</td>
</tr>
</tbody>
</table>
### Role

- **PUBLIC**: The default role of all users

### CASCADE

If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.

### Privileges

One of the following:

- Superuser
- Privileges grantor

### Examples

Revoke user Joe's usage privileges on schema `online_sales`.

```sql
=> REVOKE USAGE ON SCHEMA online_sales FROM Joe;
REVOKE PRIVILEGE
```

### See Also

- [GRANT (Schema)]
- [Granting and Revoking Privileges]

### REVOKE (Sequence)

Revolves sequence privileges from users and roles.

### Syntax

```sql
REVOKE [ GRANT OPTION FOR ] { privilege[,...] | ALL [ PRIVILEGES ] }
on { 
  SEQUENCE [[database.]schema.]sequence[,..] 
  | ALL SEQUENCES IN SCHEMA [database.]schema[,..] 
}
FROM grantee[,–]  [ CASCADE ]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT OPTION FOR</td>
<td>Revoles the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.</td>
</tr>
<tr>
<td>privilege</td>
<td>One of the following:</td>
</tr>
<tr>
<td></td>
<td>• SELECT: Grantees can execute functions CURRVAL and NEXTVAL on the specified sequences.</td>
</tr>
<tr>
<td></td>
<td>• ALL [PRIVILEGES]: Revokes all sequence privileges. The optional keyword PRIVILEGES conforms with the SQL standard.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: mittesa.mySchema thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>sequence</td>
<td>The sequence on which to revoke privileges.</td>
</tr>
<tr>
<td>ALL SEQUENCES IN SCHEMA</td>
<td>Revokes privileges from all sequences in the specified schema.</td>
</tr>
<tr>
<td>schema</td>
<td></td>
</tr>
<tr>
<td>grantee</td>
<td>Specifies whose privileges are revoked, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• User name</td>
</tr>
<tr>
<td></td>
<td>• Role</td>
</tr>
<tr>
<td></td>
<td>• PUBLIC: The default role of all users</td>
</tr>
<tr>
<td>CASCADE</td>
<td>If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to</td>
</tr>
</tbody>
</table>
search for these users and revoke the privileges from them also.

Privileges

One of the following:

- Superuser
- Privileges grantor

Examples

Revoke user Joe's privileges on sequence my_seq.

```sql
=> REVOKE ALL PRIVILEGES ON SEQUENCE my_seq FROM Joe;
REVOKE PRIVILEGE
```

See Also

- **GRANT (Sequence)**
- **Granting and Revoking Privileges**

REVOKE (Storage Location)

Revolves privileges on a USER-defined storage location from users and roles. For more information, see Creating Storage Locations in the Administrator's Guide.

**Note:** If the storage location is dropped, Vertica automatically revokes all privileges on it.

Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[,..] | ALL [ PRIVILEGES ] }
    ON LOCATION 'path' [ ON node ]
    FROM grantee[,..]
    [ CASCADE ]
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>GRANT OPTION FOR</strong></td>
<td>Revoles the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.</td>
</tr>
</tbody>
</table>
| **privilege** | One of the following privileges:  
- **READ**: Copy data from files in the storage location into a table.  
- **WRITE**: Export data from the database to the storage location. With WRITE privileges, grantees can also save COPY statement rejected data and exceptions files to the storage location. |
| **ALL [PRIVILEGES]** | Revoles all storage location privileges. The optional keyword PRIVILEGES is supported to comply with the SQL standard. |
| **ON LOCATION 'path' [ ON node ]** | Specifies the path name mount point of the storage location. If qualified by **ON NODE**, Vertica revokes access to the storage location residing on node.  
If no node is specified, the revoke operation applies to all nodes on the specified path. All nodes must be on the specified path; otherwise, the entire revoke operation rolls back. |
| **grantee** | Specifies whose privileges are revoked, one of the following:  
- **User name**  
- **Role**  
- **PUBLIC**: The default role of all users |
| **CASCADE** | If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also. |

Privileges

One of the following:
- Superuser
- Privileges grantor

Examples
See GRANT (Storage Location).

See Also
Granting and Revoking Privileges

REVOKE (Table)
Revokes table privileges from users and roles.

Syntax
```sql
REVOKE [ GRANT OPTION FOR ] \{ privilege[,..] | ALL [ PRIVILEGES ] \}
ON \{
    [ TABLE ] [(database.]schema.]table[,..]
    | ALL TABLES IN SCHEMA [database.]schema[,..] \}
FROM grantee[,..]
[ CASCADE ]
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT OPTION FOR</td>
<td>Reverses the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.</td>
</tr>
<tr>
<td>privilege</td>
<td>One of the following privileges:</td>
</tr>
<tr>
<td></td>
<td>Important: Only SELECT privileges can be revoked on system tables.</td>
</tr>
<tr>
<td></td>
<td>• SELECT: Query tables of this schema.</td>
</tr>
</tbody>
</table>
- **INSERT**: Insert rows into tables of this schema, or and load data into tables with COPY.

  Note: COPY FROM STDIN is allowed all users with INSERT privileges, while COPY FROM file requires admin privileges.

- **UPDATE**: Update rows of tables of this schema.

- **DELETE**: Delete rows of tables of this schema.

- **REFERENCES**: Create foreign key constraints for tables of this schema.

- **TRUNCATE**: Truncate table contents. Non-owners of the tables can no longer execute the following partition operations on them:
  - DROP_PARTITIONS
  - SWAP_PARTITIONS_BETWEEN_TABLES
  - MOVE_PARTITIONS_TO_TABLE

<table>
<thead>
<tr>
<th><code>ALL [PRIVILEGES]</code></th>
<th>Revoks all table privileges. The optional keyword PRIVILEGES is supported to comply with the SQL standard.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code> One exception applies: you can specify system tables without their schema name. If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>table</code></td>
<td>The table on which to revoke privileges.</td>
</tr>
<tr>
<td><code>ALL SEQUENCES IN SCHEMA schema</code></td>
<td>Revoys privileges from all tables and views in the specified schema.</td>
</tr>
</tbody>
</table>
### grantees

Specifies whose privileges are revoked, one of the following:

- **User name**
- **Role**
- **PUBLIC**: The default role of all users

### CASCADE

If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.

---

### Privileges

One of the following:

- Superuser
- Privileges grantor

---

### Examples

Revoke user Joe's privileges on table customer_dimension.

```
=> REVOKE ALL PRIVILEGES ON TABLE customer_dimension FROM Joe;
REVOKE PRIVILEGE
```

See Also

- **GRANT (Table)**
- **Granting and Revoking Privileges**

---

### REVOKE (User Defined Extension)

Revolves privileges on one or more **user-defined extensions** from users and roles.
Syntax

```sql
REVOKE [ GRANT OPTION FOR ] privilege
ON {
    U Dx-type [[database.]schema.]function-name( [argument-list] )[,..]
    | ALL FUNCTIONS IN SCHEMA schema[,..] }
... FROM grantee[,..]
```

Parameters

<table>
<thead>
<tr>
<th>GRANT OPTION FOR</th>
<th>Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>privilege</code></td>
<td>One of the following:</td>
</tr>
<tr>
<td></td>
<td>• EXECUTE: Permission to call a user-defined extension.</td>
</tr>
<tr>
<td></td>
<td>• ALL [PRIVILEGES]: Revokes all privileges that pertain to functions that also belong to the grantor. Grantors cannot revoke privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard.</td>
</tr>
<tr>
<td>ON <code>UDx-type</code></td>
<td>Specifies the function's user-defined extension (UDx) type, where <code>UDx-type</code> is one of the following:</td>
</tr>
<tr>
<td></td>
<td>• FUNCTION</td>
</tr>
<tr>
<td></td>
<td>• AGGREGATE FUNCTION</td>
</tr>
<tr>
<td></td>
<td>• ANALYTIC FUNCTION</td>
</tr>
<tr>
<td></td>
<td>• TRANSFORM FUNCTION</td>
</tr>
<tr>
<td></td>
<td>• FILTER</td>
</tr>
<tr>
<td></td>
<td>• PARSER</td>
</tr>
<tr>
<td></td>
<td>• SOURCE</td>
</tr>
</tbody>
</table>
### Database/schema

Specifies a schema, by default public. If `schema` is any schema other than public, you must supply the schema name. For example:

```
myschema.thisDbObject
```

If you specify a database, it must be the current database.

---

### function-name

The name of the user-defined function on which to revoke privileges.

---

### ON ALL FUNCTIONS IN SCHEMA `schema`

Revolves privileges on all functions in the specified schema.

---

### argument-list

Required for all polymorphic functions, a comma-delimited list of function arguments, where each argument is specified as follows:

```
[argname] argtype
```

If the procedure is defined with no arguments, supply an empty argument list.

---

### grantee

Specifies whose privileges are revoked, one of the following:

- User name
- Role
- PUBLIC: The default role of all users

---

### CASCADE

If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.

---

### Privileges

One of the following:
- Superuser or owner of the target function
- Privileges grantee who was given the option (WITH GRANT OPTION) of extending these privileges to other users

**Examples**

Revoke EXECUTE privileges from user Bob on function myzeroifnull:

```sql
=> REVOKE EXECUTE ON FUNCTION myzeroifnull (x INT) FROM Bob;
```

Revoke all privileges from user Doug on function Pagerank:

```sql
=> REVOKE ALL ON TRANSFORM FUNCTION Pagerank (t float) FROM Doug;
```

Revoke EXECUTE privileges on all functions in the zero-schema schema from user Bob:

```sql
=> REVOKE EXECUTE ON ALL FUNCTIONS IN SCHEMA zero-schema FROM Bob;
```

Revoke EXECUTE privileges from user Bob on the tokenize function:

```sql
=> REVOKE EXECUTE ON TRANSFORM FUNCTION tokenize(VARCHAR) FROM Bob;
```

Revoke all privileges on the ExampleSource() source from user Alice:

```sql
=> REVOKE ALL ON SOURCE ExampleSource() FROM Alice;
```

**See Also**

- [GRANT (User Defined Extension)]
- [Granting and Revoking Privileges in the Administrator's Guide](#)
- [Developing User-Defined Extensions (UDxs) in Extending Vertica](#)

**REVOKE (View)**

Revoke privileges on a view from users and roles.
Syntax

REVOKE [ GRANT OPTION FOR ] { privilege[,] | ALL [ PRIVILEGES ] }
ON [[database.]schema.]view[,] 
FROM grantee[,] 
[ CASCADE ]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT OPTION FOR</td>
<td>Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.</td>
</tr>
<tr>
<td>privilege</td>
<td>One of the following:</td>
</tr>
<tr>
<td></td>
<td>• SELECT: Query the specified views.</td>
</tr>
<tr>
<td></td>
<td>• ALL [PRIVILEGES]: Revokes all privileges that pertain to views that also belong to the grantor. Grantors cannot revoke privileges that they themselves lack. The optional keyword PRIVILEGES conforms with the SQL standard.</td>
</tr>
<tr>
<td>[database.]schema</td>
<td>Specifies a schema, by default public. If schema is any schema other than public, you must supply the schema name. For example:</td>
</tr>
<tr>
<td></td>
<td>myschema.thisDbObject</td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td>view</td>
<td>The view on which to revoke privileges.</td>
</tr>
<tr>
<td>grantee</td>
<td>Specifies whose privileges are revoked, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• User name</td>
</tr>
<tr>
<td></td>
<td>• Role</td>
</tr>
<tr>
<td></td>
<td>• PUBLIC: The default role of all users</td>
</tr>
<tr>
<td>CASCADE</td>
<td>If the target grantees have a grant option to extend the specified privileges to other users, CASCADE specifies to search for these users and revoke the privileges from them also.</td>
</tr>
</tbody>
</table>
Examples

Revoke SELECT privileges from user Joe on view test_view.

```sql
REVOKE SELECT ON test_view FROM Joe;
REVOKE PRIVILEGE
```

See Also

- GRANT (View)
- Granting and Revoking Privileges

**ROLLBACK**

Ends the current transaction and discards all changes that occurred during the transaction.

**Syntax**

```
ROLLBACK [ WORK | TRANSACTION ]
```

**Parameters**

| WORK | TRANSACTION | Have no effect; they are optional keywords for readability. |

**Privileges**

No special permissions required.

**Notes**

When an operation is rolled back, any locks that are acquired by the operation are also rolled back.
ABORT is a synonym for ROLLBACK.

Examples

This example shows how to roll back from a DELETE transaction.

```sql
=> SELECT * FROM sample_table;
a
---
1
(1 row)
=> DELETE FROM sample_table WHERE a = 1;
=> SELECT * FROM sample_table;
a
---
(0 rows)
=> ROLLBACK;
=> SELECT * FROM sample_table;
a
---
1
(1 row)
```

This example shows how to roll back the changes you made since the BEGIN statement.

```sql
=> BEGIN TRANSACTION ISOLATION LEVEL READ COMMITTED READ ONLY;
BEGIN
=> ROLLBACK TRANSACTION;
ROLLBACK
```

See Also

- Transactions
- Creating Transactions
- BEGIN
- COMMIT
- END
- START TRANSACTION
ROLLBACK TO SAVEPOINT

Rolls back all commands that have been entered within the transaction since the given savepoint was established.

Syntax

ROLLBACK TO [SAVEPOINT] savepoint_name

Parameters

| savepoint_name | Specifies the name of the savepoint to roll back to. |

Privileges

No special permissions required.

Notes

- The savepoint remains valid and can be rolled back to again later if needed.
- When an operation is rolled back, any locks that are acquired by the operation are also rolled back.
- ROLLBACK TO SAVEPOINT implicitly destroys all savepoints that were established after the named savepoint.

Example

The following example rolls back the values 102 and 103 that were entered after the savepoint, my_savepoint, was established. Only the values 101 and 104 are inserted at commit.
See Also

- `RELEASE SAVEPOINT`
- `SAVEPOINT`

**SAVEPOINT**

Creates a special mark, called a savepoint, inside a transaction. A savepoint allows all commands that are executed after it was established to be rolled back, restoring the transaction to the state it was in at the point in which the savepoint was established.

Tip: Savepoints are useful when creating nested transactions. For example, a savepoint could be created at the beginning of a subroutine. That way, the result of the subroutine could be rolled back if necessary.

### Syntax

```
SAVEPOINT savepoint_name
```

### Parameters

<table>
<thead>
<tr>
<th>savepoint_name</th>
<th>Specifies the name of the savepoint to create.</th>
</tr>
</thead>
</table>

### Privileges

No special permissions required.
Notes

- Savepoints are local to a transaction and can only be established when inside a transaction block.
- Multiple savepoints can be defined within a transaction.
- If a savepoint with the same name already exists, it is replaced with the new savepoint.

Example

The following example illustrates how a savepoint determines which values within a transaction can be rolled back. The values 102 and 103 that were entered after the savepoint, my_savepoint, was established are rolled back. Only the values 101 and 104 are inserted at commit.

```sql
=> INSERT INTO T1 (product_key) VALUES (101);
=> SAVEPOINT my_savepoint;
=> INSERT INTO T1 (product_key) VALUES (102);
=> INSERT INTO T1 (product_key) VALUES (103);
=> ROLLBACK TO SAVEPOINT my_savepoint;
=> INSERT INTO T1 (product_key) VALUES (104);
=> COMMIT;
=> SELECT product_key FROM T1;
.  .  .
101 104
(2 rows)
```

See Also

- RELEASE SAVEPOINT
- ROLLBACK TO SAVEPOINT

SELECT

Retrieves a result set from one or more tables.
Syntax

```sql
[ { AT EPOCH (LATEST | epoch-number) | AT TIME 'timestamp') } ]
[ AT epoch ] SELECT [ /*+ LABEL(label-name)*/ ] [ ALL | DISTINCT ]
... [ * | expression [ [AS] output-name] ] [, ]
... [ INTO TABLE ]
... [ from-clause ]
... [ WHERE condition ]
... [ TIMESERIES slice-time ]
... [ GROUP BY expression[, ] ]
... [ HAVING condition[, ] ]
... [ MATCH ]
... [ UNION { ALL | DISTINCT } ]
... [ EXCEPT ]
... [ INTERSECT ]
... [ ORDER BY expression { ASC | DESC }[, ] ]
... [ LIMIT { count | ALL } ]
... [ OFFSET start ]
... [ FOR UPDATE [ OF table-name[, ] ] ]
```

Parameters

**Note:** SELECT clauses such as INTO and WHERE are discussed in sub-sections of this page.

| **AT epoch** | Returns data from the specified epoch, where epoch is one of the following:
| | - EPOCH LATEST: Return data from the latest committed DML transaction.
| | - EPOCH integer: Return data from the integer-specified epoch.
| | - TIME 'timestamp': Return data from the timestamp-specified epoch.
| | These options are ignored if used to query temporary tables.
| | For details, see Historical Queries in Analyzing Data.
| /*+ LABEL (label-name)*/ | Assigns a label to a query so you can identify it for profiling and debugging.
| | In a UNION statement, only the first SELECT statement can be
| labeled; Vertica ignores labels in subsequent SELECT statements. |
|------------------|------------------|
| **ALL | DISTINCT** | • ALL (default): Retains duplicate rows in result set or group.  
• DISTINCT: Removes duplicate rows from the result set or group.  
The ALL or DISTINCT qualifier must immediately follow the SELECT keyword. Only one instance of this keyword can appear in the select list. |
| **expression [[AS] output-name]** | A table column or column expression to select from the queried tables. You can optionally qualify expression with an output name, which can be used in several ways:  
• Label the column for display.  
• Refer to the column’s value in ORDER BY and GROUP BY clauses (it cannot be referenced in WHERE or HAVING clauses). |
| **from-clause** | A comma-separated list of data sources to query. |
| **FOR UPDATE** | Specifies to obtain an X lock on all tables specified in the query, most often used from READ COMMITTED isolation.  
FOR UPDATE requires update/delete permissions on the queried tables and cannot be issued from a read-only transaction. |

**Privileges**

You must have USAGE privileges on the schemas that contain the queried tables, as well as one, but not both, of the following:

• Owner or user with GRANT OPTION privileges  
• SELECT privilege

If the SELECT statement queries a view, the view owner must have SELECT privileges on the view’s anchor tables or views.
**Example**

When multiple clients run transactions as in the following example query, deadlocks can occur if `FOR UPDATE` is not used. Two transactions acquire an S lock, and when both attempt to upgrade to an X lock, they encounter deadlocks:

```sql
=> SELECT balance FROM accounts WHERE account_id=3476 FOR UPDATE;
=> UPDATE accounts SET balance = balance+10 WHERE account_id=3476;
=> COMMIT;
```

**See Also**

- **LOCKS**
- **Analytic Functions**
- **SQL Analytics**

- **Event Series Pattern Matching**
- **Subqueries**
- **Joins**

**EXCEPT Clause**

Combines two or more SELECT queries. EXCEPT returns distinct results of the left-hand query that are not also found in the right-hand query.

*Note: MINUS is an alias for EXCEPT.*

**Syntax**

```sql
SELECT 
  ... EXCEPT select 
  ... [ EXCEPT select ]... 
  ... [ ORDER BY { column-name 
  ... | ordinal-number } ]
```
Notes

- Use the EXCEPT clause to filter out specific results from a SELECT statement. The EXCEPT query operates on the results of two or more SELECT queries. It returns only those rows in the left-hand query that are not also present in the right-hand query.

- Vertica evaluates multiple EXCEPT clauses in the same SELECT query from left to right, unless parentheses indicate otherwise.

- You cannot use the ALL keyword with an EXCEPT query.

- The results of each SELECT statement must be union compatible. Each statement must return the same number of columns, and the corresponding columns must have compatible data types. For example, you cannot use the EXCEPT clause on a column of type INTEGER and a column of type VARCHAR. If statements do not meet these criteria, Vertica returns an error.

  Note: The Data Type Coercion Chart lists the data types that can be cast to other data types. If one data type can be cast to the other, those two data types are compatible.

- You can use EXCEPT in FROM, WHERE, and HAVING clauses.

- You can order the results of an EXCEPT operation by including an ORDER BY operation in the statement. When you write the ORDER BY list, specify the column names from the leftmost SELECT statement, or specify integers that indicate the position of the columns by which to sort.

- The rightmost ORDER BY, LIMIT, or OFFSET clauses in an EXCEPT query do not need to be enclosed in parentheses, because the rightmost query specifies that Vertica perform the operation on the results of the EXCEPT operation. Any ORDER BY, LIMIT, or OFFSET clauses contained in SELECT queries that appear earlier in the EXCEPT query must be enclosed in parentheses.

- Vertica supports EXCEPT noncorrelated subquery predicates. For example:

```sql
=> SELECT * FROM T1
WHERE T1.x IN
  (SELECT MAX(c1) FROM T2
   EXCEPT
...[ ASC | DESC ] [,] ...
...[ LIMIT { integer | ALL } ] ...
...[ OFFSET integer ]...
```
Examples

Consider the following three tables:

**Company_A**

<table>
<thead>
<tr>
<th>Id</th>
<th>emp_lname</th>
<th>dept</th>
<th>sales</th>
</tr>
</thead>
<tbody>
<tr>
<td>1234</td>
<td>Stephen</td>
<td>auto parts</td>
<td>1000</td>
</tr>
<tr>
<td>5678</td>
<td>Alice</td>
<td>auto parts</td>
<td>2500</td>
</tr>
<tr>
<td>9012</td>
<td>Katherine</td>
<td>floral</td>
<td>500</td>
</tr>
<tr>
<td>3214</td>
<td>Smithson</td>
<td>sporting goods</td>
<td>1500</td>
</tr>
</tbody>
</table>

(4 rows)

**Company_B**

<table>
<thead>
<tr>
<th>Id</th>
<th>emp_lname</th>
<th>dept</th>
<th>sales</th>
</tr>
</thead>
<tbody>
<tr>
<td>4321</td>
<td>Marvin</td>
<td>home goods</td>
<td>250</td>
</tr>
<tr>
<td>8765</td>
<td>Bob</td>
<td>electronics</td>
<td>20000</td>
</tr>
<tr>
<td>9012</td>
<td>Katherine</td>
<td>home goods</td>
<td>500</td>
</tr>
<tr>
<td>3214</td>
<td>Smithson</td>
<td>home goods</td>
<td>1500</td>
</tr>
</tbody>
</table>

(4 rows)

**Company_C**

<table>
<thead>
<tr>
<th>Id</th>
<th>emp_lname</th>
<th>dept</th>
<th>sales</th>
</tr>
</thead>
<tbody>
<tr>
<td>3214</td>
<td>Smithson</td>
<td>sporting goods</td>
<td>1500</td>
</tr>
<tr>
<td>5432</td>
<td>Madison</td>
<td>sporting goods</td>
<td>400</td>
</tr>
<tr>
<td>7865</td>
<td>Cleveland</td>
<td>outdoor</td>
<td>1500</td>
</tr>
<tr>
<td>1234</td>
<td>Stephen</td>
<td>floral</td>
<td>1000</td>
</tr>
</tbody>
</table>

(4 rows)

The following query returns the IDs and last names of employees that exist in Company_A, but not in Company_B:

```sql
>= SELECT id, emp_lname FROM Company_A
  EXCEPT
  SELECT id, emp_lname FROM Company_B;
```

<table>
<thead>
<tr>
<th>id</th>
<th>emp_lname</th>
</tr>
</thead>
<tbody>
<tr>
<td>1234</td>
<td>Stephen</td>
</tr>
<tr>
<td>5678</td>
<td>Alice</td>
</tr>
</tbody>
</table>

(2 rows)

The following query sorts the results of the previous query by employee last name:
=> SELECT id, emp_lname FROM Company_A
   EXCEPT
   SELECT id, emp_lname FROM Company_B
   ORDER BY emp_lname ASC;

<table>
<thead>
<tr>
<th>id</th>
<th>emp_lname</th>
</tr>
</thead>
<tbody>
<tr>
<td>5678</td>
<td>Alice</td>
</tr>
<tr>
<td>1234</td>
<td>Stephen</td>
</tr>
</tbody>
</table>

(2 rows)

If you order by the column position, the query returns the same results:

=> SELECT id, emp_lname FROM Company_A
   EXCEPT
   SELECT id, emp_lname FROM Company_B
   ORDER BY 2 ASC;

<table>
<thead>
<tr>
<th>id</th>
<th>emp_lname</th>
</tr>
</thead>
<tbody>
<tr>
<td>5678</td>
<td>Alice</td>
</tr>
<tr>
<td>1234</td>
<td>Stephen</td>
</tr>
</tbody>
</table>

(2 rows)

The following query returns the IDs and last names of employees that exist in Company_A, but not in Company_B or Company_C:

=> SELECT id, emp_lname FROM Company_A
   EXCEPT
   SELECT id, emp_lname FROM Company_B
   EXCEPT
   SELECT id, emp_lname FROM Company_C;

<table>
<thead>
<tr>
<th>id</th>
<th>emp_lname</th>
</tr>
</thead>
<tbody>
<tr>
<td>5678</td>
<td>Alice</td>
</tr>
</tbody>
</table>

(1 row)

The following query shows the results of mismatched data types:

=> SELECT id, emp_lname FROM Company_A
   EXCEPT
   SELECT emp_lname, id FROM Company_B;

ERROR 3429: For 'EXCEPT', types int and varchar are inconsistent
DETAIL: Columns: id and emp_lname

Using the VMart example database, the following query returns information about all Connecticut-based customers who bought items through stores and whose purchases amounted to more than $500, except for those customers who paid cash:

=> SELECT customer_key, customer_name FROM public.customer_dimension
   WHERE customer_key IN (SELECT customer_key FROM store.store_sales_fact
   WHERE sales_dollar_amount > 500
   EXCEPT
   SELECT customer_key FROM store.store_sales_fact
   WHERE tender_type = 'Cash')
   AND customer_state = 'CT';
See Also

- SELECT
- INTERSECT Clause
- UNION Clause
- Subqueries

FROM Clause

A comma-separated list of data sources to query.

Syntax

```sql
FROM dataset[,...] [ TABLESAMPLE(percent) ]
```

Parameters

<table>
<thead>
<tr>
<th>dataset</th>
<th>A set of data to query, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Table reference</td>
</tr>
<tr>
<td></td>
<td>• Joined tables</td>
</tr>
<tr>
<td></td>
<td>• Named subquery:</td>
</tr>
<tr>
<td></td>
<td>subquery [AS] name</td>
</tr>
</tbody>
</table>
TABLESAMPLE (percent)

Valid only for user-defined tables, specifies to return a random sampling of records, where `percent` specifies the approximate sampling size. The `percent` value must be between 1 and 99, inclusive, and can include decimal values. The number of records returned is not guaranteed to be the exact percentage specified.

All rows of the data have equal opportunities to be selected. Vertica performs this sampling before applying all other query filters.

Examples

Count all records in `customer_dimension` table:

```sql
=> SELECT COUNT(*) FROM customer_dimension;
COUNT
-------
50000
(1 row)
```

Return a small sampling of rows in table `customer_dimension`:

```sql
=> SELECT customer_name, customer_state FROM customer_dimension TABLESAMPLE(0.5) WHERE customer_state='IL';
customer_name | customer_state
---------------|---------------
Amy Y. McNulty  | IL
Daniel C. Nguyen | IL
Midori O. Greenwood | IL
Meghan U. Lampert | IL
Tiffany Y. Lang  | IL
Laura S. King    | IL
Steve T. Nguyen  | IL
Craig S. Webber  | IL
Luigi A. Lewis   | IL
Mark W. Williams | IL
(10 rows)
```

Table-Reference

Syntax

```
[[database.]schema.]table[ AS alias]
```
Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: &lt;br&gt;myschema.thisDbObject</td>
</tr>
<tr>
<td><code>table</code></td>
<td>A table in the logical schema.</td>
</tr>
<tr>
<td><code>[AS] alias</code></td>
<td>A temporary name used for references to <code>table</code>.</td>
</tr>
</tbody>
</table>

Joined-Table

Specifies how to join tables.

Syntax

`table-reference [join-type] JOIN table-reference [ TABLESAMPLE(sampling-pct) ] [ ON join-predicate ]`

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>table-reference</code></td>
<td>A table or another <code>joined-table</code>.</td>
</tr>
<tr>
<td><code>join-type</code></td>
<td>Valid Values: &lt;br&gt;• <code>INNER</code> (default). <code>INNER JOIN</code> is equivalent to a query that specifies its join predicate in a <code>WHERE</code> clause. &lt;br&gt;• <code>LEFT [ OUTER ]</code> &lt;br&gt;• <code>RIGHT [ OUTER ]</code> &lt;br&gt;• <code>FULL [ OUTER ]</code> &lt;br&gt;• <code>NATURAL</code> &lt;br&gt;• <code>CROSS</code></td>
</tr>
</tbody>
</table>
TABLESAMPLE specifies to use simple random sampling to return an approximate percentage of records. All rows in the total potential return set are equally eligible to be included in the sampling. Vertica performs this sampling before other filters in the query are applied. The number of records returned is not guaranteed to be the exact percentage of records defined by `sampling-pct`.

The TABLESAMPLE option is valid only with user-defined tables and Data Collector (DC) tables. Views and system tables are not supported.

<table>
<thead>
<tr>
<th>sampling-pct</th>
<th>Specifies the percentage of records to be returned as a part of sampling. The value must be greater than 0 and less than 100.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ON join-predicate</td>
<td>An equi-join based on one or more columns in the joined tables. invalid for NATURAL and CROSS joins, required for all other join types.</td>
</tr>
</tbody>
</table>

**Alternative JOIN Syntax Options**

Vertica supports two older join syntax conventions:

- Table joins specified by join predicate in a WHERE clause
- Table joins specified by a USING clause

For details, see Join Syntax in Analyzing Data.

**Examples**

The following SELECT statement qualifies its JOIN clause with the TABLESAMPLE option:

```sql
=> SELECT user_id.id, user_name.name FROM user_name TABLESAMPLE(50)
    JOIN user_id TABLESAMPLE(50) ON user_name.id = user_id.id;

<table>
<thead>
<tr>
<th>id</th>
<th>name</th>
</tr>
</thead>
<tbody>
<tr>
<td>489</td>
<td>Markus</td>
</tr>
<tr>
<td>2234</td>
<td>Cato</td>
</tr>
<tr>
<td>763</td>
<td>Pompey</td>
</tr>
</tbody>
</table>

(3 rows)
```
GROUP BY Clause

Use the GROUP BY clause with aggregate functions in a SELECT statement to collect data across multiple records. Vertica groups the results into one or more sets of rows that match an expression.

The GROUP BY clause without aggregates is similar to using SELECT DISTINCT. ROLLUP is an extension to the GROUP BY clause. ROLLUP performs subtotal aggregations.

Syntax

```
GROUP BY [/*+GBYTYPE(algorithm)*/] { expression | aggregate-expression }[,…]
```

Arguments

<table>
<thead>
<tr>
<th>/<em>+GBYTYPE (algorithm)</em>/</th>
<th>Specifies which algorithm has precedence for implementing this GROUP BY clause, over the algorithm the Vertica query optimizer might otherwise choose. You can set algorithm to one of the following values:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• HASH: GROUPBY HASH algorithm</td>
</tr>
<tr>
<td></td>
<td>• PIPE: GROUPBY PIPELINED algorithm</td>
</tr>
<tr>
<td>expression</td>
<td>Any expression, including constants and column references in the tables specified in the FROM clause. For example: column,... column, (expression)</td>
</tr>
<tr>
<td>aggregate-expression</td>
<td>An ordered list of columns, expressions, CUBE, GROUPING SETS, or ROLLUP aggregates. You can include CUBE and ROLLUP aggregates within a GROUPING SETS aggregate. CUBE and ROLLUP aggregates can result in a large amount of output. In that case, use GROUPING SETS to return only certain results.</td>
</tr>
</tbody>
</table>
You cannot include any aggregates within a CUBE or ROLLUP expression.

You can append multiple GROUPING SETS, CUBE, or ROLLUP aggregates in the same query. Examples:

GROUP BY a,b,c,d, ROLLUP(a,b)
GROUP BY a,b,c,d, CUBE((a,b),c,d)
GROUP BY a,b,c,d, CUBE(a,b), ROLLUP (c,d)
GROUP BY ROLLUP(a), CUBE(b), GROUPING SETS(c)
GROUP BY a,b,c,d, GROUPING SETS ((a,d),(b,c),CUBE(a,b))
GROUP BY a,b,c,d, GROUPING SETS ((a,d),(b,c),(a,b),(a),(b),())

Usage Considerations

- *expression* cannot include aggregate functions. However, you can use the GROUP BY clause with CUBE, GROUPING SETS, and ROLLUP to return summary values for each group.

- When you create a GROUP BY clause, you must include all non-aggregated columns that appear in the SELECT list.

- If the GROUP BY clause includes a WHERE clause, Vertica ignores all rows that do not satisfy the WHERE clause.

Examples

This example shows how to use the WHERE clause with GROUP BY. In this case, the example retrieves all employees whose last name begins with S, and ignores all rows that do not meet this criteria. The GROUP BY clause uses the ILIKE function to retrieve only last names beginning with S. The aggregate function SUM computes the total vacation days for each group.

```sql
=> SELECT employee_last_name, SUM(vacation_days)
FROM employee_dimension
   WHERE employee_last_name ILIKE 'S%'
GROUP BY employee_last_name;

employee_last_name | SUM
-------------------+-------
Sanchez            | 2892
Smith              | 2672
Stein              | 2660
(3 rows)
```

The GROUP BY clause in the following example groups results by vendor region, and vendor region's biggest deal:
The following query modifies the previous one with a HAVING clause, which specifies to return only groups whose maximum deal size exceeds $900,000:

```sql
=> SELECT vendor_region, MAX(deal_size) as "Biggest Deal"
    FROM vendor_dimension
    GROUP BY vendor_region;
```

<table>
<thead>
<tr>
<th>vendor_region</th>
<th>Biggest Deal</th>
</tr>
</thead>
<tbody>
<tr>
<td>East</td>
<td>990889</td>
</tr>
<tr>
<td>Midwest</td>
<td>699163</td>
</tr>
<tr>
<td>Northwest</td>
<td>76101</td>
</tr>
<tr>
<td>South</td>
<td>854136</td>
</tr>
<tr>
<td>Southwest</td>
<td>609807</td>
</tr>
<tr>
<td>West</td>
<td>964005</td>
</tr>
</tbody>
</table>

(6 rows)

The GROUP BY clause without aggregates is similar to using `SELECT  DISTINCT`. For example, the following two queries return the same results:

```sql
=> SELECT DISTINCT household_id FROM customer_dimension;
=> SELECT household_id FROM customer_dimension GROUP BY household_id;
```

See Also

- CUBE Aggregate
- GROUP_ID
- GROUPING
- GROUPING_ID
- GROUPING SETS Aggregate
- ROLLUP
ROLLUP Aggregate

Automatically performs subtotal aggregations as an extension to the GROUP BY clause. ROLLUP performs these aggregations across multiple dimensions, at different levels, within a single SQL query.

You can use the ROLLUP clause with three grouping functions:

- GROUPING
- GROUP_ID
- GROUPING_ID

Syntax

ROLLUP grouping-expression[, ...]

Parameters
group-expression | One or both of the following:
|------------------|---------------------------------------------------------------
|                  | - An expression that is not an aggregate or a grouping function
|                  |   that includes constants and column references in FROM-
|                  |   specified tables. For example:
|                  |   column1, (column2+1), column3+column4
|                  | - A multilevel expression, one of the following:
|                  |   - ROLLUP
|                  |   - CUBE
|                  |   - GROUPING SETS

Restrictions

GROUP BY ROLLUP does not sort results. To sort data, an ORDER BY clause must follow the GROUP BY clause.
Levels of Aggregation

If \( n \) is the number of grouping columns, ROLLUP creates \( n+1 \) levels of subtotals and grand total. Because ROLLUP removes the right-most column at each step, specify column order carefully.

Suppose that ROLLUP(\( A, B, C \)) creates four groups:

- \( (A, B, C) \)
- \( (A, B) \)
- \( (A) \)
- \( () \)

Because ROLLUP removes the right-most column at each step, there are no groups for \( (A, C) \) and \( (B, C) \).

If you enclose two or more columns in parentheses, GROUP BY treats them as a single entity. For example:

- ROLLUP(\( A, B, C \)) creates four groups:
  - \( (A, B, C) \)
  - \( (A, B) \)
  - \( (A) \)
  - \( () \)

- ROLLUP((\( A, B \), \( C \))) treats \( (A, B) \) as a single entity and creates three groups:
  - \( (A, B, C) \)
  - \( (A, B) \)
  - \( () \)

Example: Aggregating the Full Data Set

The following example shows how to use the GROUP BY clause to determine family expenses for electricity and books over several years. The SUM aggregate function computes the total amount of money spent in each category per year.

Suppose you have a table that contains information about family expenses for books and electricity:

```sql
=> SELECT * FROM expenses ORDER BY Category, Year;

<table>
<thead>
<tr>
<th>Year</th>
<th>Category</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>2005</td>
<td>Books</td>
<td>39.98</td>
</tr>
<tr>
<td>2007</td>
<td>Books</td>
<td>29.99</td>
</tr>
<tr>
<td>2008</td>
<td>Books</td>
<td>29.99</td>
</tr>
</tbody>
</table>
```
For the expenses table, ROLLUP computes the subtotals in each category between 2005–2007:

- Books: $99.96
- Electricity: $449.96
- Grand total: $549.92.

Use the ORDER BY clause to sort the results:

```sql
=> SELECT Category, Year, SUM(Amount) FROM expenses
GROUP BY ROLLUP(Category, Year) ORDER BY 1,2, GROUPING_ID();
```

```
<table>
<thead>
<tr>
<th>Category</th>
<th>Year</th>
<th>SUM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Books</td>
<td>2005</td>
<td>39.98</td>
</tr>
<tr>
<td>Books</td>
<td>2007</td>
<td>29.99</td>
</tr>
<tr>
<td>Books</td>
<td>2008</td>
<td>29.99</td>
</tr>
<tr>
<td>Books</td>
<td></td>
<td>99.96</td>
</tr>
<tr>
<td>Electricity</td>
<td>2005</td>
<td>109.99</td>
</tr>
<tr>
<td>Electricity</td>
<td>2006</td>
<td>109.99</td>
</tr>
<tr>
<td>Electricity</td>
<td>2007</td>
<td>229.98</td>
</tr>
<tr>
<td>Electricity</td>
<td></td>
<td>449.96</td>
</tr>
<tr>
<td></td>
<td></td>
<td>549.92</td>
</tr>
</tbody>
</table>
```

Example: Using ROLLUP with the HAVING Clause

This example shows how to use the HAVING clause with ROLLUP to restrict the GROUP BY results. The following query produces only those ROLLUP categories where year is subtotaled, based on the expression in the GROUPING function:

```sql
=> SELECT Category, Year, SUM(Amount) FROM expenses
GROUP BY ROLLUP(Category, Year) HAVING GROUPING(Year)=1
ORDER BY 1, 2, GROUPING_ID();
```

```
<table>
<thead>
<tr>
<th>Category</th>
<th>Year</th>
<th>SUM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Books</td>
<td></td>
<td>99.96</td>
</tr>
<tr>
<td>Electricity</td>
<td></td>
<td>449.96</td>
</tr>
<tr>
<td></td>
<td></td>
<td>549.92</td>
</tr>
</tbody>
</table>
```

The next example rolls up on (Category, Year), but not on the full results. The GROUPING_ID function specifies to aggregate less than three levels:

```sql
=> SELECT Category, Year, SUM(Amount) FROM expenses
GROUP BY ROLLUP(Category, Year) HAVING GROUPING_ID(Category,Year)<3
```
```sql
ORDER BY 1, 2, GROUPING_ID();
```

<table>
<thead>
<tr>
<th>Category</th>
<th>Year</th>
<th>SUM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Books</td>
<td>2005</td>
<td>39.98</td>
</tr>
<tr>
<td>Books</td>
<td>2007</td>
<td>29.99</td>
</tr>
<tr>
<td>Books</td>
<td>2008</td>
<td>29.99</td>
</tr>
<tr>
<td>Books</td>
<td></td>
<td>99.96</td>
</tr>
<tr>
<td>Electricity</td>
<td>2005</td>
<td>109.99</td>
</tr>
<tr>
<td>Electricity</td>
<td>2006</td>
<td>109.99</td>
</tr>
<tr>
<td>Electricity</td>
<td>2007</td>
<td>229.98</td>
</tr>
<tr>
<td>Electricity</td>
<td></td>
<td>449.96</td>
</tr>
</tbody>
</table>

- Data Aggregation
- CUBE Aggregate
- GROUPING
- GROUP_ID
- GROUPING_ID
- GROUP BY Clause
- GROUPING SETS Aggregate

**GROUP_ID**

Uniquely identifies duplicate sets for GROUP BY queries that return duplicate grouping sets. This function returns one or more integers, starting with zero (0), as identifiers.

For the number of duplicates \( n \) for a particular grouping, GROUP_ID returns a range of sequential numbers, 0 to \( n-1 \). For the first each unique group it encounters, GROUP_ID returns the value 0. If GROUP_ID finds the same grouping again, the function returns 1, then returns 2 for the next found grouping, and so on.

**Note:** Use GROUP_ID only in SELECT statements that contain a GROUP BY aggregate: CUBE, GROUPING SETS, and ROLLUP.
Behavior Type

Immutable
Syntax

GROUP_ID ()
Examples

This example shows how GROUP_ID creates unique identifiers when a query produces duplicate groupings. For an expenses table, the following query groups the results by category of expense and year and rolls up the sum for those two columns. The results have duplicate groupings for category and NULL. The first grouping has a GROUP_ID of 0, and the second grouping has a GROUP_ID of 1.

```
=> SELECT Category, Year, SUM(Amount), GROUPING_ID(Category, Year),
   GROUP_ID() FROM expenses GROUP BY Category, ROLLUP(Category, Year)
ORDER BY Category, Year, GROUPING_ID();
```

<table>
<thead>
<tr>
<th>Category</th>
<th>Year</th>
<th>SUM</th>
<th>GROUPING_ID</th>
<th>GROUP_ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>Books</td>
<td>2005</td>
<td>39.98</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Books</td>
<td>2007</td>
<td>29.99</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Books</td>
<td>2008</td>
<td>29.99</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Books</td>
<td></td>
<td>99.96</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>Books</td>
<td></td>
<td>99.96</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>Electricity</td>
<td>2005</td>
<td>189.99</td>

- ROLLUP Aggregate

GROUPING

Disambiguates the use of NULL values when GROUP BY queries with multilevel aggregates generate NULL values to identify subtotals in grouping columns. Such NULL values from the original data can also occur in rows. GROUPING returns 1, if the value of expression is:

- NULL, representing an aggregated value
- 0 for any other value, including NULL values in rows

**Note:** Use GROUPING only in SELECT statements that contain a GROUP BY aggregate: CUBE, GROUPING SETS, and ROLLUP.
Behavior Type

Immutable
Syntax

GROUPING ( expression )
# Parameters

| expression | An expression in the GROUP BY clause |
Examples

The following query uses the GROUPING function, taking one of the GROUP BY expressions as an argument. For each row, GROUPING returns one of the following:

- 0: The column is part of the group for that row
- 1: The column is not part of the group for that row

The 1 in the GROUPING(Year) column for electricity and books indicates that these values are subtotals. The right-most column values for both GROUPING(Category) and GROUPING (Year) are 1. This value indicates that neither column contributed to the GROUP BY. The final row represents the total sales.

```
=> SELECT Category, Year, SUM(Amount),
    GROUPING(Category), GROUPING(Year) FROM expenses
    GROUP BY ROLLUP(Category, Year) ORDER BY Category, Year, GROUPING_ID();
```

<table>
<thead>
<tr>
<th>Category</th>
<th>Year</th>
<th>SUM</th>
<th>GROUPING</th>
<th>GROUPING</th>
</tr>
</thead>
<tbody>
<tr>
<td>Books</td>
<td>2005</td>
<td>39.98</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Books</td>
<td>2007</td>
<td>29.99</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Books</td>
<td>2008</td>
<td>29.99</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Books</td>
<td></td>
<td>99.96</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>Electricity</td>
<td>2005</td>
<td>109.99</td>
<td>0</td>
<td>0</td>
</tr>
<tr>

- GROUPING_ID
- GROUPING SETS Aggregate
- GROUP BY Clause
- ROLLUP Aggregate

GROUPING_ID

Concatenates the set of Boolean values generated by the GROUPING function into a bit vector. GROUPING_ID treats the bit vector as a binary number and returns it as a base-10 value that identifies the grouping set combination.

By using GROUPING_ID you avoid the need for multiple, individual GROUPING functions. GROUPING_ID simplifies row-filtering conditions, because rows of interest are identified using a single return from GROUPING_ID = n. Use GROUPING_ID to identify grouping combinations.

Note: Use GROUPING_ID only in SELECT statements that contain a GROUP BY aggregate: CUBE, GROUPING SETS, and ROLLUP.
Behavior Type

Immutable
## Syntax

```plaintext
GROUPING_ID ( [expression[,..] )
```

| expression | An expression that matches one of the expressions in the GROUP BY clause. If the GROUP BY clause includes a list of expressions, GROUPING_ID returns a number corresponding to the GROUPING bit vector associated with a row. |
Examples

This example shows how calling GROUPING_ID without an expression returns the GROUPING bit vector associated with a full set of multilevel aggregate expressions. The GROUPING_ID value is comparable to GROUPING_ID(a,b) because GROUPING_ID() includes all columns in the GROUP BY ROLLUP:

```sql
=> SELECT a,b,COUNT(*), GROUPING_ID() FROM T GROUP BY ROLLUP(a,b);
```

In the following query, the GROUPING(Category) and GROUPING(Year) columns have three combinations:

- 0,0
- 0,1
- 1,1

```sql
=> SELECT Category, Year, SUM(Amount),
   GROUPING(Category), GROUPING(Year) FROM expenses
   GROUP BY ROLLUP(Category, Year) ORDER BY Category, Year, GROUPING_ID();
```

<table>
<thead>
<tr>
<th>Category</th>
<th>Year</th>
<th>SUM</th>
<th>GROUPING</th>
<th>GROUPING</th>
</tr>
</thead>
<tbody>
<tr>
<td>Books</td>
<td>2005</td>
<td>39.98</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Books</td>
<td>2007</td>
<td>29.99</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Books</td>
<td>2008</td>
<td>29.99</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Books</td>
<td></td>
<td>99.96</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>Electricity</td>
<td>2005</td>
<td>109.99</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Electricity</td>
<td>2006</td>
<td>109.99</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Electricity</td>
<td>2007</td>
<td>229.98</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Electricity</td>
<td></td>
<td>449.96</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>549.92</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

GROUPING_ID converts these values as follows:

<table>
<thead>
<tr>
<th>Binary Set Values</th>
<th>Decimal Equivalents</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>0</td>
</tr>
<tr>
<td>01</td>
<td>1</td>
</tr>
<tr>
<td>11</td>
<td>3</td>
</tr>
<tr>
<td>0</td>
<td>Category, Year</td>
</tr>
</tbody>
</table>

The following query returns the single number for each GROUP BY level that appears in the grid_id column:
=> SELECT Category, Year, SUM(Amount),
       GROUPING(Category), GROUPING(Year), GROUPING_ID(Category, Year) AS gr_id
FROM expenses GROUP BY ROLLUP(Category, Year);

<table>
<thead>
<tr>
<th>Category</th>
<th>Year</th>
<th>SUM</th>
<th>GROUPING</th>
<th>GROUPING</th>
<th>gr_id</th>
</tr>
</thead>
<tbody>
<tr>
<td>Books</td>
<td>2008</td>
<td>29.99</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Books</td>
<td>2005</td>
<td>39.98</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Electricity</td>
<td>2007</td>
<td>229.98</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Books</td>
<td>2007</td>
<td>29.99</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Electricity</td>
<td>2005</td>
<td>109.99</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Electricity</td>
<td></td>
<td>449.96</td>
<td>0</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>Electricity</td>
<td></td>
<td>549.92</td>
<td>1</td>
<td>1</td>
<td>3</td>
</tr>
<tr>
<td>Electricity</td>
<td>2006</td>
<td>109.99</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Books</td>
<td></td>
<td>99.96</td>
<td>0</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

The gr_id value determines the GROUP BY level for each row:

<table>
<thead>
<tr>
<th>GROUP BY Level</th>
<th>GROUP BY Row Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>Total sum</td>
</tr>
<tr>
<td>1</td>
<td>Category</td>
</tr>
<tr>
<td>0</td>
<td>Category, year</td>
</tr>
</tbody>
</table>

You can also use the DECODE function to give the values more meaning by comparing each search value individually:

=> SELECT Category, Year, SUM(AMOUNT), DECODE(GROUPING_ID(Category, Year),
       3, 'Total',
       1, 'Category',
       0, 'Category, Year')
AS GROUP_NAME FROM expenses GROUP BY ROLLUP(Category, Year);

<table>
<thead>
<tr>
<th>Category</th>
<th>Year</th>
<th>SUM</th>
<th>GROUP_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electricity</td>
<td>2006</td>
<td>109.99</td>
<td>Category,Year</td>
</tr>
<tr>
<td>Books</td>
<td>2006</td>
<td>99.96</td>
<td>Category</td>
</tr>
<tr>
<td>Electricity</td>
<td>2007</td>
<td>229.98</td>
<td>Category,Year</td>
</tr>
<tr>
<td>Books</td>
<td>2007</td>
<td>29.99</td>
<td>Category,Year</td>
</tr>
<tr>
<td>Electricity</td>
<td>2005</td>
<td>109.99</td>
<td>Category,Year</td>
</tr>
<tr>
<td>Electricity</td>
<td></td>
<td>449.96</td>
<td>Category</td>
</tr>
<tr>
<td></td>
<td></td>
<td>549.92</td>
<td>Total</td>
</tr>
<tr>
<td>Books</td>
<td>2005</td>
<td>39.98</td>
<td>Category,Year</td>
</tr>
<tr>
<td>Books</td>
<td>2008</td>
<td>29.99</td>
<td>Category,Year</td>
</tr>
</tbody>
</table>

- CUBE Aggregate
- GROUP_ID
- GROUPING
- GROUPING SETS Aggregate
- GROUP BY Clause
- ROLLUP Aggregate

CUBE Aggregate

Automatically performs all possible aggregations of the specified columns, as an extension to the GROUP BY clause.

You can use the ROLLUP clause with three grouping functions:

- GROUPING
- GROUP_ID
- GROUPING_ID

Syntax

GROUP BY group-expression[, ...]

Parameters

<table>
<thead>
<tr>
<th>group-expression</th>
<th>One or both of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>An expression that is not an aggregate or a grouping function that includes constants and column references in FROM-specified tables. For example:</td>
</tr>
<tr>
<td></td>
<td>column1, (column2+1), column3+column4</td>
</tr>
</tbody>
</table>
A multilevel expression, one of the following:
- ROLLUP
- CUBE
- GROUPING SETS

Restrictions

- GROUP BY CUBE does not order data. If you want to sort data, use the ORDER BY Clause. The ORDER BY clause must come after the GROUP BY clause.
- You can use CUBE inside a GROUPING SETS expression, but not inside a ROLLUP expression or another CUBE expression.

Levels of CUBE Aggregation

If \( n \) is the number of grouping columns, CUBE creates \( 2^n \) levels of aggregations. For example:

CUBE (A, B, C) creates all possible permutations, resulting in eight groups:

- (A, B, C)
- (A, B)
- (A, C)
- (B, C)
- (A)
- (B)
- (C)
- ()

If you increase the number of CUBE columns, the number of CUBE groupings increases exponentially. The CUBE query may be resource intensive and produce combinations that are not of interest. In that case, consider using the GROUPING SETS Aggregate, which allows you to choose specific groupings.
Example: Using CUBE to Return All Groupings

Suppose you have a table that contains information about family expenses for books and electricity:

```sql
=> SELECT * FROM expenses ORDER BY Category, Year;

<table>
<thead>
<tr>
<th>Year</th>
<th>Category</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>2005</td>
<td>Books</td>
<td>39.98</td>
</tr>
<tr>
<td>2007</td>
<td>Books</td>
<td>29.99</td>
</tr>
<tr>
<td>2008</td>
<td>Books</td>
<td>29.99</td>
</tr>
<tr>
<td>2005</td>
<td>Electricity</td>
<td>109.99</td>
</tr>
<tr>
<td>2006</td>
<td>Electricity</td>
<td>109.99</td>
</tr>
<tr>
<td>2007</td>
<td>Electricity</td>
<td>229.98</td>
</tr>
</tbody>
</table>
```

To aggregate the data by both Category and Year using the CUBE aggregate:

```sql
=> SELECT Category, Year, SUM(Amount) FROM expenses
  GROUP BY CUBE(Category, Year) ORDER BY 1, 2, GROUPING_ID();

<table>
<thead>
<tr>
<th>Category</th>
<th>Year</th>
<th>SUM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Books</td>
<td>2005</td>
<td>39.98</td>
</tr>
<tr>
<td>Books</td>
<td>2007</td>
<td>29.99</td>
</tr>
<tr>
<td>Books</td>
<td>2008</td>
<td>29.99</td>
</tr>
<tr>
<td>Books</td>
<td></td>
<td>99.96</td>
</tr>
<tr>
<td>Electricity</td>
<td>2005</td>
<td>109.99</td>
</tr>
<tr>
<td>Electricity</td>
<td>2006</td>
<td>109.99</td>
</tr>
<tr>
<td>Electricity</td>
<td>2007</td>
<td>229.98</td>
</tr>
<tr>
<td>Electricity</td>
<td></td>
<td>449.96</td>
</tr>
<tr>
<td>Electricity</td>
<td>2005</td>
<td>149.97</td>
</tr>
<tr>
<td>Electricity</td>
<td>2006</td>
<td>109.99</td>
</tr>
<tr>
<td>Electricity</td>
<td>2007</td>
<td>259.97</td>
</tr>
<tr>
<td>Electricity</td>
<td>2008</td>
<td>29.99</td>
</tr>
<tr>
<td>Electricity</td>
<td></td>
<td>549.92</td>
</tr>
</tbody>
</table>
```

The results include subtotals for each category and year, and a grand total ($549.92).

Example: Using CUBE with the HAVING Clause

This example shows how you can restrict the GROUP BY results, use the HAVING clause with the CUBE aggregate. This query returns only the category totals and the full total:

```sql
=> SELECT Category, Year, SUM(Amount) FROM expenses
  GROUP BY CUBE(Category, Year) HAVING GROUPING_YEAR()=1;

<table>
<thead>
<tr>
<th>Category</th>
<th>Year</th>
<th>SUM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Books</td>
<td></td>
<td>99.96</td>
</tr>
<tr>
<td>Electricity</td>
<td></td>
<td>449.96</td>
</tr>
<tr>
<td>Electricity</td>
<td></td>
<td>549.92</td>
</tr>
</tbody>
</table>
```

The next query returns only the aggregations for the two categories for each year. The GROUPING ID function specifies to omit the grand total ($549.92):
=> SELECT Category, Year, SUM(Amount) FROM expenses
   GROUP BY CUBE(Category, Year) HAVING GROUPING_ID(Category, Year)<2
   ORDER BY 1, 2, GROUPING_ID();

<table>
<thead>
<tr>
<th>Category</th>
<th>Year</th>
<th>SUM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Books</td>
<td>2005</td>
<td>39.98</td>
</tr>
<tr>
<td>Books</td>
<td>2007</td>
<td>29.99</td>
</tr>
<tr>
<td>Books</td>
<td>2008</td>
<td>29.99</td>
</tr>
<tr>
<td>Books</td>
<td></td>
<td>99.96</td>
</tr>
<tr>
<td>Electrical</td>
<td>2005</td>
<td>109.99</td>
</tr>
<tr>
<td>Electrical</td>
<td>2006</td>
<td>109.99</td>
</tr>
<tr>
<td>Electrical</td>
<td>2007</td>
<td>229.98</td>
</tr>
<tr>
<td>Electrical</td>
<td></td>
<td>449.96</td>
</tr>
</tbody>
</table>

GROUPING SETS Aggregate

The GROUPING SETS aggregate is an extension to the GROUP BY clause that automatically performs subtotal aggregations on groupings that you specify.

You can use the GROUPING SETS clause with three grouping functions:

- GROUPING
- GROUP_ID
- GROUPING_ID

To sort data, use the ORDER BY clause. The ORDER BY clause must follow the GROUP BY clause.
Syntax

`GROUP BY group-expression[, ...]`

Parameters

```
<table>
<thead>
<tr>
<th>group-expression</th>
<th>One or both of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>An expression that is not an aggregate or a grouping function that includes constants and column references in FROM-specified tables. For example:</td>
</tr>
<tr>
<td></td>
<td>column1, (column2+1), column3+column4</td>
</tr>
<tr>
<td></td>
<td>A multilevel expression, one of the following:</td>
</tr>
<tr>
<td></td>
<td>- ROLLUP</td>
</tr>
<tr>
<td></td>
<td>- CUBE</td>
</tr>
<tr>
<td></td>
<td>- GROUPING SETS</td>
</tr>
</tbody>
</table>
```

Defining the Groupings

GROUPING SETS allows you to specify exactly which groupings you want in the results. You can also concatenate the groupings as follows:

The following example clauses result in the groupings shown.

<table>
<thead>
<tr>
<th>This clause...</th>
<th>Defines groupings...</th>
</tr>
</thead>
</table>
| ...GROUP BY GROUPING SETS(A,B,C,D)...
| ...GROUP BY GROUPING SETS((A),(B),(C),(D))...
| ...GROUP BY GROUPING SETS((A,B,C,D))...
| ...GROUP BY GROUPING SETS(A,B),GROUPING SETS(C,D)...
| ...GROUP BY GROUPING SETS((A,B)),GROUPING SETS(C,D)...
| ...GROUP BY GROUPING SETS(A,B),GROUPING SETS(ROLLUP(C,D))... | (A), (B), (C), (D) |
| (A), (B), (C), (D) |
| (A, B, C, D) |
| (A, C), (B, C), (A, D), (B, C) |
| (A, B, C), (A, B, D) |
| (A,B), (A,B,C), (A,B,C,D) |
This clause... Defines groupings...

```sql
...GROUP BY A,B,C,GROUPING SETS(ROLLUP(C, D))...
(A, B, C, D), (A, B, C), (A, B, C)
```

The clause contains two groups (A, B, C). In the HAVING clause, use the GROUP_ID function as a predicate, to eliminate the second grouping.

---

**Example: Selecting Groupings**

This example shows how to select only those groupings you want. Suppose you want to aggregate on columns only, and you do not need the grand total. The first query omits the total. In the second query, you add () to the GROUPING SETS list to get the total. Use the ORDER BY clause to sort the results by grouping:

```sql
=> SELECT Category, Year, SUM(Amount) FROM expenses
GROUP BY GROUPING SETS((Category, Year), (Year))
ORDER BY 1, 2, GROUPING_ID();
```

<table>
<thead>
<tr>
<th>Category</th>
<th>Year</th>
<th>SUM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Books</td>
<td>2005</td>
<td>39.98</td>
</tr>
<tr>
<td>Books</td>
<td>2007</td>
<td>29.99</td>
</tr>
<tr>
<td>Books</td>
<td>2008</td>
<td>29.99</td>
</tr>
<tr>
<td>Electrical</td>
<td>2005</td>
<td>109.99</td>
</tr>
<tr>
<td>Electrical</td>
<td>2006</td>
<td>109.99</td>
</tr>
<tr>
<td>Electrical</td>
<td>2007</td>
<td>229.98</td>
</tr>
<tr>
<td></td>
<td>2005</td>
<td>149.97</td>
</tr>
<tr>
<td></td>
<td>2006</td>
<td>109.99</td>
</tr>
<tr>
<td></td>
<td>2007</td>
<td>259.97</td>
</tr>
<tr>
<td></td>
<td>2008</td>
<td>29.99</td>
</tr>
</tbody>
</table>

```sql
=> SELECT Category, Year, SUM(Amount) FROM expenses
GROUP BY GROUPING SETS((Category, Year), (Year), ())
ORDER BY 1, 2, GROUPING_ID();
```

<table>
<thead>
<tr>
<th>Category</th>
<th>Year</th>
<th>SUM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Books</td>
<td>2005</td>
<td>39.98</td>
</tr>
<tr>
<td>Books</td>
<td>2007</td>
<td>29.99</td>
</tr>
<tr>
<td>Books</td>
<td>2008</td>
<td>29.99</td>
</tr>
<tr>
<td>Electrical</td>
<td>2005</td>
<td>109.99</td>
</tr>
<tr>
<td>Electrical</td>
<td>2006</td>
<td>109.99</td>
</tr>
<tr>
<td>Electrical</td>
<td>2007</td>
<td>229.98</td>
</tr>
<tr>
<td></td>
<td>2005</td>
<td>149.97</td>
</tr>
<tr>
<td></td>
<td>2006</td>
<td>109.99</td>
</tr>
<tr>
<td></td>
<td>2007</td>
<td>259.97</td>
</tr>
<tr>
<td></td>
<td>2008</td>
<td>29.99</td>
</tr>
<tr>
<td></td>
<td></td>
<td>549.92</td>
</tr>
</tbody>
</table>

- CUBE Aggregate
- GROUPING
- GROUP_ID
- GROUPING_ID
- GROUP BY Clause
- ROLLUP Aggregate

HAVING Clause

Restricts the results of a GROUP BY Clause.

Syntax

HAVING condition [, ...]

Parameters

| condition | Must unambiguously reference a grouping column, unless the reference appears within an aggregate function |

Notes

- Semantically, the HAVING clause occurs after the GROUP BY operation.
- You can use expressions in the HAVING clause.
- The HAVING clause was added to the SQL standard because you cannot use WHERE with Aggregate Functions.
Example

The following example returns the employees with salaries greater than $50,000:

```sql
=> SELECT employee_last_name, MAX(annual_salary) as "highest_salary"
    FROM employee_dimension
    GROUP BY employee_last_name
    HAVING MAX(annual_salary) > 50000;
```

<table>
<thead>
<tr>
<th>employee_last_name</th>
<th>highest_salary</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bauer</td>
<td>920149</td>
</tr>
<tr>
<td>Brown</td>
<td>569079</td>
</tr>
<tr>
<td>Campbell</td>
<td>649998</td>
</tr>
<tr>
<td>Carcetti</td>
<td>195175</td>
</tr>
<tr>
<td>Dobisz</td>
<td>840902</td>
</tr>
<tr>
<td>Farmer</td>
<td>804890</td>
</tr>
<tr>
<td>Fortin</td>
<td>481490</td>
</tr>
<tr>
<td>García</td>
<td>811231</td>
</tr>
<tr>
<td>Garnett</td>
<td>963104</td>
</tr>
<tr>
<td>Gauthier</td>
<td>927335</td>
</tr>
</tbody>
</table>

(10 rows)

INTERSECT Clause

Calculates the intersection of the results of two or more SELECT queries. INTERSECT returns distinct values by both the query on the left and right sides of the INTERSECT operand.

Syntax

```
SELECT ...
     INTERSECT select ...
     [ INTERSECT select ]...
     [ ORDER BY { column-name | ordinal-number } [ ASC | DESC ] [,..] ]
     [ LIMIT { integer | ALL } ]
     [ OFFSET integer ]
```

Notes

- Use the INTERSECT clause to return all elements that are common to the results of all the SELECT queries. The INTERSECT query operates on the results of two or more SELECT queries. INTERSECT returns only the rows that are returned by all the specified queries.
- You cannot use the ALL keyword with an INTERSECT query.
• The results of each SELECT query must be union compatible; they must return the same number of columns, and the corresponding columns must have compatible data types. For example, you cannot use the INTERSECT clause on a column of type INTEGER and a column of type VARCHAR. If the SELECT queries do not meet these criteria, Vertica returns an error.

  Note: The Data Type Coercion Chart lists the data types that can be cast to other data types. If one data type can be cast to the other, those two data types are compatible.

• Order the results of an INTERSECT operation by using an ORDER BY clause. In the ORDER BY list, specify the column names from the leftmost SELECT statement or specify integers that indicate the position of the columns by which to sort.

• You can use INTERSECT in FROM, WHERE, and HAVING clauses.

• The rightmost ORDER BY, LIMIT, or OFFSET clauses in an INTERSECT query do not need to be enclosed in parentheses because the rightmost query specifies that Vertica perform the operation on the results of the INTERSECT operation. Any ORDER BY, LIMIT, or OFFSET clauses contained in SELECT queries that appear earlier in the INTERSECT query must be enclosed in parentheses.

• The order by column names is from the first select.

• Vertica supports INTERSECT noncorrelated subquery predicates. For example:

  => SELECT * FROM T1
      WHERE T1.x IN
        (SELECT MAX(c1) FROM T2
         INTERSECT
         SELECT MAX(cc1) FROM T3
         INTERSECT
         SELECT MAX(d1) FROM T4);

Examples

Consider the following three tables:

Company_A

<table>
<thead>
<tr>
<th>id</th>
<th>emp_name</th>
<th>dept</th>
<th>sales</th>
</tr>
</thead>
<tbody>
<tr>
<td>1234</td>
<td>Stephen</td>
<td>auto parts</td>
<td>1000</td>
</tr>
<tr>
<td>5678</td>
<td>Alice</td>
<td>auto parts</td>
<td>2500</td>
</tr>
<tr>
<td>9012</td>
<td>Katherine</td>
<td>floral</td>
<td>500</td>
</tr>
<tr>
<td>3214</td>
<td>Smithson</td>
<td>sporting goods</td>
<td>1500</td>
</tr>
</tbody>
</table>

Company_B

The following query returns the IDs and last names of employees that exist in both Company\_A and Company\_B:

```sql
=> SELECT id, emp\_lname FROM Company\_A
    INTERSECT
    SELECT id, emp\_lname FROM Company\_B;
```

<table>
<thead>
<tr>
<th>id</th>
<th>emp_lname</th>
<th>dept</th>
<th>sales</th>
</tr>
</thead>
<tbody>
<tr>
<td>4321</td>
<td>Marvin</td>
<td>home goods</td>
<td>250</td>
</tr>
<tr>
<td>9012</td>
<td>Katherine</td>
<td>home goods</td>
<td>500</td>
</tr>
<tr>
<td>8765</td>
<td>Bob</td>
<td>electronics</td>
<td>20000</td>
</tr>
<tr>
<td>3214</td>
<td>Smithson</td>
<td>home goods</td>
<td>1500</td>
</tr>
</tbody>
</table>

(2 rows)

The following query returns the same two employees in descending order of sales:

```sql
=> SELECT id, emp\_lname, sales FROM Company\_A
    INTERSECT
    SELECT id, emp\_lname, sales FROM Company\_B
    ORDER BY sales DESC;
```

<table>
<thead>
<tr>
<th>id</th>
<th>emp_lname</th>
<th>sales</th>
</tr>
</thead>
<tbody>
<tr>
<td>3214</td>
<td>Smithson</td>
<td>1500</td>
</tr>
<tr>
<td>9012</td>
<td>Katherine</td>
<td>500</td>
</tr>
</tbody>
</table>

(2 rows)

You can also use the integer that represents the position of the sales column (3) to return the same result:

```sql
=> SELECT id, emp\_lname, sales FROM Company\_A
    INTERSECT
    SELECT id, emp\_lname, sales FROM Company\_B
    ORDER BY 3 DESC;
```

<table>
<thead>
<tr>
<th>id</th>
<th>emp_lname</th>
<th>sales</th>
</tr>
</thead>
<tbody>
<tr>
<td>3214</td>
<td>Smithson</td>
<td>1500</td>
</tr>
<tr>
<td>9012</td>
<td>Katherine</td>
<td>500</td>
</tr>
</tbody>
</table>

(2 rows)
The following query returns the employee who works for both companies whose sales in Company_B are greater than 1000:

```sql
=> SELECT id, emp_lname, sales FROM Company_A
    INTERSECT
    (SELECT id, emp_lname, sales FROM company_B WHERE sales > 1000)
    ORDER BY sales DESC;
```

<table>
<thead>
<tr>
<th>id</th>
<th>emp_lname</th>
<th>sales</th>
</tr>
</thead>
<tbody>
<tr>
<td>3214</td>
<td>Smithson</td>
<td>1500</td>
</tr>
</tbody>
</table>

(1 row)

In the following query returns the ID and last name of the employee who works for all three companies:

```sql
=> SELECT id, emp_lname FROM Company_A
    INTERSECT
    SELECT id, emp_lname FROM Company_B
    INTERSECT
    SELECT id, emp_lname FROM Company_C;
```

<table>
<thead>
<tr>
<th>id</th>
<th>emp_lname</th>
</tr>
</thead>
<tbody>
<tr>
<td>3214</td>
<td>Smithson</td>
</tr>
</tbody>
</table>

(1 row)

The following query shows the results of a mismatched data types; these two queries are not union compatible:

```sql
=> SELECT id, emp_lname FROM Company_A
    INTERSECT
    SELECT emp_lname, id FROM Company_B;
```

`ERROR 3429: For 'INTERSECT', types int and varchar are inconsistent`

`DETAIL: Columns: id and emp_lname`

Using the VMart example database, the following query returns information about all Connecticut-based customers who bought items online and whose purchase amounts were between $400 and $500:

```sql
=> SELECT customer_key, customer_name FROM public.customer_dimension
    WHERE customer_key IN (SELECT customer_key
                              FROM online_sales.online_sales_fact
                              WHERE sales_dollar_amount > 400
                              INTERSECT
                              SELECT customer_key FROM online_sales.online_sales_fact
                              WHERE sales_dollar_amount < 500)
    AND customer_state = 'CT';
```

<table>
<thead>
<tr>
<th>customer_key</th>
<th>customer_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>39</td>
<td>Sarah S. Winkler</td>
</tr>
<tr>
<td>44</td>
<td>Meghan H. Overstreet</td>
</tr>
<tr>
<td>70</td>
<td>Jack X. Cleveland</td>
</tr>
<tr>
<td>103</td>
<td>Alexandra I. Vu</td>
</tr>
<tr>
<td>110</td>
<td>Matt. Farmer</td>
</tr>
<tr>
<td>173</td>
<td>Mary R. Reyes</td>
</tr>
</tbody>
</table>
The previous query returns the same data as:

```sql
=> SELECT customer_key, customer_name FROM public.customer_dimension
   WHERE customer_key IN (SELECT customer_key
                           FROM online_sales.online_sales_fact
                           WHERE sales_dollar_amount > 400
                           AND sales_dollar_amount < 500)
   AND customer_state = 'CT';
```

INTO TABLE Clause

Creates a table from a query result set.

Syntax

**Permanent table**

```
INTO [TABLE] [[database.]schema.]table
```

**Temporary table**

```
INTO [scope] TEMP[ORARY] [TABLE] [[database.]schema.]table
... [ ON COMMIT { PRESERVE | DELETE } ROWS ]
```
**Parameters**

<table>
<thead>
<tr>
<th><strong>scope</strong></th>
<th>Specifies visibility of a temporary table definition:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- <strong>GLOBAL</strong> (default): The table definition is visible to all sessions, and persists until you explicitly drop the table.</td>
</tr>
<tr>
<td></td>
<td>- <strong>LOCAL</strong>: The table definition is visible only to the session in which it is created, and is dropped when the session ends.</td>
</tr>
</tbody>
</table>

Regardless of this setting, retention of temporary table data is set by the keywords `ON COMMIT DELETE ROWS` and `ON COMMIT PRESERVE ROWS` (see below).

For more information, see [Creating Temporary Tables](#) in the Administrator's Guide.

<table>
<thead>
<tr>
<th><code>[database.]schema</code></th>
<th>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>myschema.thisDbObject</code></td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>table</strong></th>
<th>The name of the table to create.</th>
</tr>
</thead>
</table>

| **ON COMMIT** | **{ PRESERVE | DELETE } ROWS** | Specifies whether data is transaction- or session-scoped: |
|---------------|---------------------|-----------------------------------------------------|
|               |                     | - DELETE (default) marks the temporary table for transaction-scoped data. Vertica removes all table data after each commit. |
|               |                     | - PRESERVE marks the temporary table for session-scoped data, which is preserved beyond the lifetime of a single transaction. Vertica removes all table data when the session ends. |
Examples

The following SELECT statement has an INTO TABLE clause that creates table newTable from customer_dimension:

```sql
=> SELECT * INTO TABLE newTable FROM customer_dimension;
```

The following SELECT statement creates temporary table newTempTable. By default, temporary tables are created at a global scope, so its definition is visible to other sessions and persists until it is explicitly dropped. No customer_dimension data is copied into the new table, and Vertica issues a warning accordingly:

```sql
=> SELECT * INTO TEMP TABLE newTempTable FROM customer_dimension;
WARNING 4102: No rows are inserted into table "public"."newTempTable" because
  ON COMMIT DELETE ROWS is the default for create tempory table
HINT: Use "ON COMMIT PRESERVE ROWS" to preserve the data in temporary table
CREATE TABLE
```

The following SELECT statement creates local temporary table newTempTableLocal. This table is visible only to the session in which it was created, and is automatically dropped when the session ends. The INTO TABLE clause includes ON COMMIT PRESERVE ROWS, so Vertica copies all selection data into the new table:

```sql
=> SELECT * INTO LOCAL TEMP TABLE newTempTableLocal ON COMMIT PRESERVE ROWS
  FROM customer_dimension;
CREATE TABLE
```

LIMIT Clause

Specifies the maximum number of result set rows to return.

Syntax

```sql
LIMIT { rows | ALL }
```

Parameters

<table>
<thead>
<tr>
<th>rows</th>
<th>The maximum number of rows to return.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL</td>
<td>(default) Returns all rows.</td>
</tr>
</tbody>
</table>
Dependencies

- Use an ORDER BY clause with LIMIT. Otherwise, the query returns an undefined subset of the result set. For example, the following SELECT statement omits ORDER BY. Successive iterations of this query are liable to return a different set of five records from the customer_dimension table:

```
=> SELECT customer_name, customer_city FROM customer_dimension LIMIT 5;
  customer_name | customer_city
-----------------|------------------
  Craig S. Robinson  | Fayetteville
  Mark M. Kramer    | Joliet
  Barbara S. Farmer | Alexandria
  Julie S. McNulty  | Grand Prairie
  Meghan R. Garcia | Athens
(5 rows)
```

In contrast, the following SELECT statement includes an ORDER BY clause and returns a consistent set of results:

```
=> SELECT customer_name, customer_city FROM customer_dimension
  ORDER BY customer_city, customer_name LIMIT 5;
  customer_name | customer_city
-----------------|------------------
  Alexander J. Dobisz  | Abilene
  Alexander B. McCabe | Abilene
  Alexander J. Goldberg | Abilene
  Alexander M. Fortin | Abilene
  Alexander P. Moore  | Abilene
(5 rows)
```

- LIMIT must follow the SELECT statement's ORDER BY clause.

- When a SELECT statement specifies both LIMIT and OFFSET, Vertica first processes the OFFSET statement, and then applies the LIMIT statement to the remaining rows.

MATCH Clause

A SQL extension that lets you screen large amounts of historical data in search of event patterns, the MATCH clause provides subclasses for analytic partitioning and ordering and matches rows from the result table based on a pattern you define.

You specify a pattern as a regular expression, which is composed of event types defined in the DEFINE subclause, where each event corresponds to a row in the input table. Then you can search for the pattern within a sequence of input events. Pattern matching returns the contiguous sequence of rows that conforms to PATTERN subclause. For example, pattern P (A
B* C) consist of three event types: A, B, and C. When Vertica finds a match in the input table, the associated pattern instance must be an event of type A followed by 0 or more events of type B, and an event of type C.

Pattern matching is particularly useful for clickstream analysis where you might want to identify users' actions based on their Web browsing behavior (page clicks). A typical online clickstream funnel is:

Company home page -> product home page -> search -> results -> purchase online

Using the above clickstream funnel, you can search for a match on the user's sequence of web clicks and identify that the user:

- Landed on the company home page
- Navigated to the product page
- Ran a search
- Clicked a link from the search results
- Made a purchase

For examples that use this clickstream model, see Event Series Pattern Matching in Analyzing Data.

**Syntax**

```sql
MATCH ( [ PARTITION BY table_column ] ORDER BY table_column
... DEFINE event_name AS boolean_expr [, ...]
... PATTERN pattern_name AS ( regexp )
... [ ROWS MATCH { ALL EVENTS | FIRST EVENT } ] )
```

**Parameters**

| PARTITION BY | [Optional] Defines the window data scope in which the pattern, defined in the PATTERN subclause, is matched. The partition clause partitions the data by matched patterns defined in the PATTERN subclause. For each partition, data is sorted by the ORDER BY clause. If the partition clause is omitted, the entire data set is considered a single partition. |
| ORDER BY | Defines the window data scope in which the pattern, defined in the PATTERN subclause, is matched. For each partition, the order clause |
specifies how the input data is ordered for pattern matching.

**Note:** The **ORDER BY** clause is mandatory.

<table>
<thead>
<tr>
<th>DEFINE</th>
<th>Defines the <strong>boolean</strong> expressions that make up the event types in the regular expressions. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEFINE</td>
<td>DEFINE Entry AS RefURL NOT ILIKE '%website2.com%' AND PageURL ILIKE '%website2.com%',</td>
</tr>
<tr>
<td></td>
<td>Onsite AS PageURL ILIKE '%website2.com%' AND Action='V',</td>
</tr>
<tr>
<td></td>
<td>Purchase AS PageURL ILIKE '%website2.com%' AND Action='P'</td>
</tr>
</tbody>
</table>

The DEFINE subclause accepts a maximum of 52 events. See **Event Series Pattern Matching** in Machine Learning for Predictive Analytics for examples.

<table>
<thead>
<tr>
<th>event_name</th>
<th>Is the name of the event to evaluate for each row; for example, Entry, Onsite, Purchase.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Note:</strong> Event names are case insensitive and follow the same naming conventions as those used for tables and columns.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>boolean_expr</th>
<th>Is an expression that returns true or false. <strong>boolean_expr</strong> can include <strong>Boolean Operators</strong> and relational (comparison) operators. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Purchase AS PageURL ILIKE '%website2.com%' AND Action = 'P'</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>PATTERN pattern_name</th>
<th>Is the name of the pattern, which you define in the PATTERN subclause; for example, P is the pattern name defined below:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>PATTERN P AS (...)</td>
</tr>
</tbody>
</table>

A PATTERN is a **search pattern** that is comprised of a name and a regular expression.

**Note:** Vertica supports one pattern per query.

<table>
<thead>
<tr>
<th>regexp</th>
<th>Is a regular expression comprised of event types (defined in the DEFINE subclause), and one or more of the quantifiers below. When Vertica evaluates the MATCH clause, the regular expression identifies the rows that meet the expression criteria.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td>-----</td>
<td>----------------------------------------------------</td>
</tr>
<tr>
<td>*</td>
<td>Match 0 or more times</td>
</tr>
<tr>
<td>*?</td>
<td>Match 0 or more times, not greedily</td>
</tr>
<tr>
<td>+</td>
<td>Match 1 or more times</td>
</tr>
<tr>
<td>+?</td>
<td>Match 1 or more times, not greedily</td>
</tr>
<tr>
<td>?</td>
<td>Match 0 or 1 time</td>
</tr>
<tr>
<td>??</td>
<td>Match 0 or 1 time, not greedily</td>
</tr>
<tr>
<td>*+</td>
<td>Match 0 or more times, possessive</td>
</tr>
<tr>
<td>++</td>
<td>Match 1 or more times, possessive</td>
</tr>
<tr>
<td>?+</td>
<td>Match 0 or 1 time, possessive</td>
</tr>
<tr>
<td></td>
<td>Alternation. Matches expression before or after the vertical bar. Similar to a Boolean or.</td>
</tr>
</tbody>
</table>

**ROWS MATCH**

[Optional] Defines how to resolve more than one event evaluating to true for a single row.

- If you use ROWS MATCH ALL EVENTS, Vertica returns the following run-time error if more than one event evaluates to true for a single row:

```
ERROR: pattern events must be mutually exclusive
HINT: try using ROWS MATCH FIRST EVENT
```

- For ROWS MATCH FIRST EVENT, if more than one event evaluates to true for a single row, Vertica chooses the event defined first in the SQL statement to be the event it uses for the row.

**Pattern Semantic Evaluation**

- The semantic evaluating ordering of the SQL clauses is: FROM -> WHERE -> PATTERN MATCH -> SELECT.

- Data is partitioned as specified in the PARTITION BY clause. If the partition clause is omitted, the entire data set is considered a single partition.
For each partition, the order clause specifies how the input data is ordered for pattern matching.

Events are evaluated for each row. A row could have 0, 1, or N events evaluate to true. If more than one event evaluates to true for the same row, Vertica returns a run-time error unless you specify ROWS MATCH FIRST EVENT. If you specify ROWS MATCH FIRST EVENT and more than one event evaluates to TRUE for a single row, Vertica chooses the event that was defined first in the SQL statement to be the event it uses for the row.

Vertica performs pattern matching by finding the contiguous sequence of rows that conforms to the pattern defined in the PATTERN subclause.

For each match, Vertica outputs the rows that contribute to the match. Rows not part of the match (do not satisfy one or more predicates) are not output.

Vertica reports only non-overlapping matches. If an overlap occurs, Vertica chooses the first match found in the input stream. After finding the match, Vertica looks for the next match, starting at the end of the previous match.

Vertica reports the longest possible match, not a subset of a match. For example, consider pattern: A*B with input: AAAB. Because A uses the greedy regular expression quantifier (*), Vertica reports all A inputs (AAAB), not AAB, AB, or B.

Notes and Restrictions

DISTINCT and GROUP BY/HAVING clauses are not allowed in pattern match queries.

The following expressions are not allowed in the DEFINE subclause:

- Subqueries, such as DEFINE X AS c IN (SELECT c FROM table1)
- Analytic functions, such as DEFINE X AS c < LEAD(1) OVER (ORDER BY 1)
- Aggregate functions, such as DEFINE X AS c < MAX(1)

You cannot use the same pattern name to define a different event; for example, the following is not allowed for X:

```sql
DEFINE X AS c1 < 3
X AS c1 >= 3
```
• Used with MATCH clause, Vertica Pattern Matching Functions provide additional data about the patterns it finds. For example, you can use the functions to return values representing the name of the event that matched the input row, the sequential number of the match, or a partition-wide unique identifier for the instance of the pattern that matched.

Examples
For examples, see Event Series Pattern Matching in Machine Learning for Predictive Analytics.

• EVENT_NAME
• MATCH_ID
• PATTERN_ID

MINUS Clause
MINUS is an alias for EXCEPT.

OFFSET Clause
Omits a specified number of rows from the beginning of the result set.

Syntax
OFFSET rows

Parameters
| rows | Specifies the number of result set rows to omit. |
Dependencies

- Use an **ORDER BY clause** with OFFSET. Otherwise, the query returns an undefined subset of the result set.

- OFFSET must follow the **ORDER BY clause** in a SELECT statement or UNION clause.

- When a SELECT statement or UNION clause specifies both **LIMIT** and OFFSET, Vertica first processes the OFFSET statement, and then applies the LIMIT statement to the remaining rows.

Example

The following query returns 14 rows from the `customer_dimenstion` table:

```sql
=> SELECT customer_name, customer_gender FROM customer_dimenstion
   WHERE occupation='Dancer' AND customer_city = 'San Francisco' ORDER BY customer_name;
```

<table>
<thead>
<tr>
<th>customer_name</th>
<th>customer_gender</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amy X. Lang</td>
<td>Female</td>
</tr>
<tr>
<td>Anna H. Li</td>
<td>Female</td>
</tr>
<tr>
<td>Brian O. Weaver</td>
<td>Male</td>
</tr>
<tr>
<td>Craig O. Pavlov</td>
<td>Male</td>
</tr>
<tr>
<td>Doug Z. Goldberg</td>
<td>Male</td>
</tr>
<tr>
<td>Harold S. Jones</td>
<td>Male</td>
</tr>
<tr>
<td>Jack E. Perkins</td>
<td>Male</td>
</tr>
<tr>
<td>Joseph W. Overstreet</td>
<td>Male</td>
</tr>
<tr>
<td>Kevin . Campbell</td>
<td>Male</td>
</tr>
<tr>
<td>Raja Y. Wilson</td>
<td>Male</td>
</tr>
<tr>
<td>Samantha O. Brown</td>
<td>Female</td>
</tr>
<tr>
<td>Steve H. Gauthier</td>
<td>Male</td>
</tr>
<tr>
<td>William . Nielson</td>
<td>Male</td>
</tr>
<tr>
<td>William Z. Roy</td>
<td>Male</td>
</tr>
</tbody>
</table>

(14 rows)

If you modify the previous query to specify an offset of 8 (**OFFSET 8**) clause, Vertica skips the first eight rows of the previous result set. The query returns the following results:

```sql
=> SELECT customer_name, customer_gender FROM customer_dimenstion
   WHERE occupation='Dancer' AND customer_city = 'San Francisco' ORDER BY customer_name OFFSET 8;
```

<table>
<thead>
<tr>
<th>customer_name</th>
<th>customer_gender</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kevin . Campbell</td>
<td>Male</td>
</tr>
<tr>
<td>Raja Y. Wilson</td>
<td>Male</td>
</tr>
<tr>
<td>Samantha O. Brown</td>
<td>Female</td>
</tr>
<tr>
<td>Steve H. Gauthier</td>
<td>Male</td>
</tr>
<tr>
<td>William . Nielson</td>
<td>Male</td>
</tr>
<tr>
<td>William Z. Roy</td>
<td>Male</td>
</tr>
</tbody>
</table>

(6 rows)
ORDER BY Clause

Sorts a query result set on one or more columns.

Syntax

ORDER BY expression [ ASC | DESC ] [,..]

Parameters

<table>
<thead>
<tr>
<th>expression</th>
<th>One of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Name or ordinal number of a SELECT list item. You cannot use an integer value for an ORDER BY clause that is inside an analytic function's OVER clause.</td>
</tr>
<tr>
<td></td>
<td>• Arbitrary expression formed from columns that do not appear in the SELECT list</td>
</tr>
<tr>
<td></td>
<td>• CASE expression</td>
</tr>
</tbody>
</table>

Notes

- The ordinal number refers to the position of the result column, counting from the left beginning at one. This makes it possible to order by a column that does not have a unique name. (You can assign a name to a result column using the AS clause.)

- While the user's current locale and collation sequence are used to compare strings and determine the results of the ORDER BY clause of a query, Vertica projection data is always stored sorted by the ASCII (binary) collating sequence.

- For INTEGER, INT, and DATE/TIME data types, NULL appears first (smallest) in ascending order.

- For FLOAT, BOOLEAN, CHAR, and VARCHAR, NULL appears last (largest) in ascending order.

- The ORDER BY clause may contain only columns or expressions that are in the window partition clause (see Window Partition Clause).
Examples

The following example returns all the city and deal size for customer Metamedia, sorted by deal size in descending order.

```
=> SELECT customer_city, deal_size FROM customer_dimension WHERE customer_name = 'Metamedia'
  ORDER BY deal_size DESC;
```

<table>
<thead>
<tr>
<th>customer_city</th>
<th>deal_size</th>
</tr>
</thead>
<tbody>
<tr>
<td>El Monte</td>
<td>4479561</td>
</tr>
<tr>
<td>Athens</td>
<td>3815416</td>
</tr>
<tr>
<td>Ventura</td>
<td>3792937</td>
</tr>
<tr>
<td>Peoria</td>
<td>3227765</td>
</tr>
<tr>
<td>Arvada</td>
<td>2671849</td>
</tr>
<tr>
<td>Coral Springs</td>
<td>2643674</td>
</tr>
<tr>
<td>Fontana</td>
<td>2374465</td>
</tr>
<tr>
<td>Rancho Cucamonga</td>
<td>2214002</td>
</tr>
<tr>
<td>Wichita Falls</td>
<td>2117962</td>
</tr>
<tr>
<td>Beaumont</td>
<td>1898295</td>
</tr>
<tr>
<td>Arvada</td>
<td>1321897</td>
</tr>
<tr>
<td>Waco</td>
<td>1026854</td>
</tr>
<tr>
<td>Joliet</td>
<td>945404</td>
</tr>
<tr>
<td>Hartford</td>
<td>445795</td>
</tr>
</tbody>
</table>

(14 rows)

The following example uses a transform function. It returns an error because the ORDER BY column is not in the window partition.

```
=> CREATE TABLE t(geom geometry(200), geog geography(200));
=> SELECT PolygonPoint(geom) OVER(PARTITION BY geom)
  AS SEL_0 FROM t ORDER BY geog;
ERROR 2521: Cannot specify anything other than user defined transforms and partitioning expressions in the ORDER BY list
```

The following example, using the same table, corrects this error.

```
=> SELECT PolygonPoint(geom) OVER(PARTITION BY geom)
  AS SEL_0 FROM t ORDER BY geom;
```

TIMESERIES Clause

Provides gap-filling and interpolation (GFI) computation, an important component of time series analytics computation. See Time Series Analytics in Analyzing Data for details and examples.
Syntax

TIMESERIES slice-time AS 'length-and-time-unit-expr' OVER ( ...
... [ PARTITION BY (column-expr[,...] ]
... ORDER BY time-expr )
... [ ORDER BY table-column[,...] ]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>slice-time</td>
<td>A time column produced by the TIMESERIES clause, which stores the time slice start times generated from gap filling.</td>
</tr>
<tr>
<td>length-and-time-unit-expr</td>
<td>An INTERVAL DAY TO SECOND literal that specifies the length of time unit of time slice computation. For example: TIMESERIES slice_time AS '3 seconds' ...</td>
</tr>
<tr>
<td>OVER()</td>
<td>Specifies partitioning and ordering for the function. OVER() also specifies that the time series function operates on a query result set—that is, the rows that are returned after the FROM, WHERE, GROUP BY, and HAVING clauses are evaluated.</td>
</tr>
<tr>
<td>PARTITION BY (column-expr[,...] )</td>
<td>Partitions the data by the specified column expressions. Gap filling and interpolation is performed on each partition separately.</td>
</tr>
<tr>
<td>ORDER BY time-expr</td>
<td>Sorts the data by the TIMESTAMP expression time-expr, which computes the time information of the time series data.</td>
</tr>
</tbody>
</table>

Note: The TIMESERIES clause requires an ORDER BY operation on the timestamp column.
Notes

If the window-partition-clause is not specified in TIMESERIES OVER(), for each defined time slice, exactly one output record is produced; otherwise, one output record is produced per partition per time slice. Interpolation is computed there.

Given a query block that contains a TIMESERIES clause, the following are the semantic phases of execution (after evaluating the FROM and the optional WHERE clauses):

1. Compute time-expression.
2. Perform the same computation as the TIME_SLICE() function on each input record based on the result of time-exp and 'length-and-time-unit-expr'.
   a. Perform gap filling to generate time slices missing from the input.
   b. Name the result of this computation as slice_time, which represents the generated “time series” column (alias) after gap filling.
3. Partition the data by expression, slice-time. For each partition, do step 4.
4. Sort the data by time-exp. Interpolation is computed here.

There is semantic overlap between the TIMESERIES clause and the TIME_SLICE function with the following key differences:

- TIMESERIES only supports the interval qualifier DAY TO SECOND; it does not allow YEAR TO MONTH.

- Unlike TIME_SLICE, the time slice length and time unit expressed in length-and-time-unit-expr must be constants so gaps in the time slices are well-defined.

- TIMESERIES performs gap filling; the TIME_SLICE function does not.

- TIME_SLICE can return the start or end time of a time slice, depending on the value of its fourth input parameter (start-or-end). TIMESERIES, on the other hand, always returns the start time of each time slice. To output the end time of each time slice, write a SELECT statement like the following:

  => SELECT slice_time + <slice_length>;
Restrictions

- When the TIMESERIES clause occurs in a SQL query block, only the following clauses can be used in the same query block:
  - SELECT
  - FROM
  - WHERE
  - ORDER BY

- GROUP BY and HAVING clauses are not allowed. If a GROUP BY operation is needed before or after gap-filling and interpolation (GFI), use a subquery and place the GROUP BY in the outer query. For example:

```sql
-> SELECT symbol, AVG(first_bid) as avg_bid FROM (  
    SELECT symbol, slice_time, TS_FIRST_VALUE(bid1) AS first_bid  
    FROM Tickstore  
    WHERE symbol IN ('MSFT', 'IBM')  
    TIMESERIES slice_time AS '5 seconds' OVER (PARTITION BY symbol ORDER BY ts)  
    ) AS resultOfGFI  
GROUP BY symbol;
```

- When the TIMESERIES clause is present in the SQL query block, the SELECT list can include only the following:
  - Time series aggregate functions such as `TS_FIRST_VALUE` and `TS_LAST_VALUE`
  - `slice_time` column
  - `PARTITION BY` expressions
  - `TIME_SLICE` function

For example, the following two queries return a syntax error because `bid1` is not a `PARTITION BY` or `GROUP BY` column:

```sql
-> SELECT bid, symbol, TS_FIRST_VALUE(bid) FROM Tickstore  
  TIMESERIES slice_time AS '5 seconds' OVER (PARTITION BY symbol ORDER BY ts);  
ERROR: column "Tickstore.bid" must appear in the PARTITION BY list of Timeseries clause or be used in a Timeseries Output function
-> SELECT bid, symbol, AVG(bid) FROM Tickstore  
  GROUP BY symbol;  
ERROR: column "Tickstore.bid" must appear in the GROUP BY clause or be used in an aggregate function
```
Examples

For examples, see Gap Filling and Interpolation (GFI) in Analyzing Data.

- TIME_SLICE
- TS_FIRST_VALUE
- TS_LAST_VALUE
- Gap Filling and Interpolation (GFI)

UNION Clause

Combines the results of multiple SELECT statements. You can include UNION in FROM, WHERE, and HAVING clauses.

Syntax

```
select-stmt UNION { ALL | DISTINCT } select-stmt [ UNION { ALL | DISTINCT } select-stmt ]...
... [ ORDER BY expression { ASC | DESC }[,..] ]
... [ LIMIT { count | ALL } ]
... [ OFFSET start ]
```

Parameters

<table>
<thead>
<tr>
<th><strong>select-stmt</strong></th>
<th>A SELECT statement that returns one or more rows, depending on whether you specify keywords DISTINCT or ALL. The following options also apply:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• The first SELECT statement can include the hint LABEL. Vertica ignores LABEL hints in subsequent SELECT statements.</td>
</tr>
<tr>
<td></td>
<td>• Each SELECT statement can specify its own ORDER BY, LIMIT, and OFFSET clauses. A SELECT statement with one or more of these clauses must be enclosed by parentheses. See also:</td>
</tr>
<tr>
<td>DISTINCT</td>
<td>ALL</td>
</tr>
<tr>
<td>----------</td>
<td>-----</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Requirements

- All rows of the UNION result set must be in the result set of at least one of its SELECT statements.
- Each SELECT statement must specify the same number of columns.
- Data types of corresponding SELECT statement columns must be compatible, otherwise Vertica returns an error.

### ORDER BY, LIMIT, and OFFSET Clauses in UNION

A UNION statement can specify its own **ORDER BY**, **LIMIT**, and **OFFSET** clauses. For example, given the tables described below in **Examples**, the following query orders the UNION result set by `emp_name` and limits output to the first two rows:

```sql
=> SELECT id, emp_name FROM company_a UNION ALL SELECT id, emp_name FROM company_b ORDER BY emp_name LIMIT 2;
  id | emp_name
----------
 5678 | Alice
 8765 | Bob
(2 rows)
```

Each SELECT statement in a UNION clause can specify its own **ORDER BY**, **LIMIT**, and **OFFSET** clauses. In this case, the SELECT statement must be enclosed by parentheses. Vertica processes the SELECT statement **ORDER BY**, **LIMIT**, and **OFFSET** clauses before it processes the UNION clauses.

For example, each SELECT statement in the following UNION specifies its own **ORDER BY** and **LIMIT** clauses. Vertica processes the individual queries and then concatenates the two result sets:

```sql
=> (SELECT id, emp_name FROM company_a ORDER BY emp_name LIMIT 2)
     UNION ALL
(SELECT id, emp_name FROM company_b ORDER BY emp_name LIMIT 2);
```
The following requirements and restrictions determine how Vertica processes a UNION clause that contains ORDER BY, LIMIT, and OFFSET clauses:

- A UNION's ORDER BY clause must specify columns from the first (leftmost) SELECT statement.
- Always use an ORDER BY clause with LIMIT and OFFSET. Otherwise, the query returns an undefined subset of the result set.
- ORDER BY must precede LIMIT and OFFSET.
- When a SELECT or UNION statement specifies both LIMIT and OFFSET, Vertica first processes the OFFSET statement, and then applies the LIMIT statement to the remaining rows.

**UNION in Non-Correlated Subqueries**

Vertica supports UNION in noncorrelated subquery predicates. For example:

```sql
=> SELECT DISTINCT customer_key, customer_name FROM public.customer_dimension WHERE customer_key IN
   (SELECT customer_key FROM store.store_sales_fact WHERE sales_dollar_amount > 500
    UNION ALL
    SELECT customer_key FROM online_sales.online_sales_fact WHERE sales_dollar_amount > 500)
   AND customer_state = 'CT';
```

<table>
<thead>
<tr>
<th>customer_key</th>
<th>customer_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>7021</td>
<td>Luigi T. Dobisz</td>
</tr>
<tr>
<td>1971</td>
<td>Betty V. Dobisz</td>
</tr>
<tr>
<td>46284</td>
<td>Ben C. Gauthier</td>
</tr>
<tr>
<td>33885</td>
<td>Tanya Y. Taylor</td>
</tr>
<tr>
<td>5449</td>
<td>Sarah O. Robinson</td>
</tr>
<tr>
<td>29059</td>
<td>Sally Z. Fortin</td>
</tr>
<tr>
<td>11200</td>
<td>Foodhope</td>
</tr>
<tr>
<td>15582</td>
<td>John J. McNulty</td>
</tr>
<tr>
<td>24638</td>
<td>Alexandra F. Jones</td>
</tr>
</tbody>
</table>
```

**Examples**

The examples that follow use these two tables:
Find all employee IDs and names from company_a and company_b
The UNION statement specifies DISTINCT to combine unique IDs and last names of employees; Katherine works for both companies, so she appears only once in the result set. DISTINCT is the default and can be omitted:

```
=> SELECT id, emp_name FROM company_a UNION DISTINCT SELECT id, emp_name FROM company_b ORDER BY id;
 id | emp_name
---|----------
1234 | Stephen
4321 | Marvin
5678 | Alice
8765 | Bob
9012 | Katherine
(5 rows)
```

The next UNION statement specifies the option ALL. Katherine works for both companies, so the query returns two records for her:

```
=> SELECT id, emp_name FROM company_a UNION ALL SELECT id, emp_name FROM company_b ORDER BY id;
 id | emp_name
---|----------
1234 | Stephen
4321 | Marvin
5678 | Alice
8765 | Bob
9012 | Katherine
9012 | Katherine
(6 rows)
```

Find the top two top performing salespeople in each company
Each SELECT statement specifies its own ORDER BY and LIMIT clauses, so the UNION statement concatenates the result sets as returned by each query:

```
=> (SELECT id, emp_name, sales FROM company_a ORDER BY sales DESC LIMIT 2)
 UNION ALL
 (SELECT id, emp_name, sales FROM company_b ORDER BY sales DESC LIMIT 2);
 id | emp_name | sales
---|----------|------
1234 | Stephen |   1000
5678 | Alice   |   2500
9012 | Katherine |   500
4321 | Marvin  |   250
9012 | Katherine |   500
8765 | Bob     |  20000
(6 rows)
```
Find all employee orders by sales

The UNION statement specifies its own ORDER BY clause, which Vertica applies to the entire result:

```sql
e=> SELECT id, emp_name, sales FROM company_a
UNION
SELECT id, emp_name, sales FROM company_b
ORDER BY sales;
```

<table>
<thead>
<tr>
<th>id</th>
<th>emp_name</th>
<th>sales</th>
</tr>
</thead>
<tbody>
<tr>
<td>4321</td>
<td>Marvin</td>
<td>250</td>
</tr>
<tr>
<td>9012</td>
<td>Katherine</td>
<td>500</td>
</tr>
<tr>
<td>1234</td>
<td>Stephen</td>
<td>1000</td>
</tr>
<tr>
<td>5678</td>
<td>Alice</td>
<td>2500</td>
</tr>
<tr>
<td>8765</td>
<td>Bob</td>
<td>20000</td>
</tr>
</tbody>
</table>

(5 rows)

Calculate the sum of sales for each company grouped by department

Each SELECT statement has its own GROUP BY clause. UNION combines the aggregate results from each query:

```sql
e=> (SELECT 'Company A' as company, dept, SUM(sales) FROM company_a
  GROUP BY dept)
UNION
(SELECT 'Company B' as company, dept, SUM(sales) FROM company_b
  GROUP BY dept)
ORDER BY 1;
```

<table>
<thead>
<tr>
<th>company</th>
<th>dept</th>
<th>sum</th>
</tr>
</thead>
<tbody>
<tr>
<td>Company A</td>
<td>auto parts</td>
<td>3500</td>
</tr>
<tr>
<td>Company A</td>
<td>floral</td>
<td>500</td>
</tr>
<tr>
<td>Company B</td>
<td>electronics</td>
<td>20000</td>
</tr>
<tr>
<td>Company B</td>
<td>home goods</td>
<td>750</td>
</tr>
</tbody>
</table>

(4 rows)

See Also

- SELECT
- EXCEPT Clause
INTERSECT Clause

Subqueries

WHERE Clause

Eliminates rows from the result table that do not satisfy one or more predicates.

Syntax

```sql
WHERE boolean-expression [ subquery ] ...
```

Parameters

<table>
<thead>
<tr>
<th>boolean-expression</th>
<th>Is an expression that returns true or false. Only rows for which the expression is true become part of the result set.</th>
</tr>
</thead>
</table>

The `boolean-expression` can include `Boolean Operators` and the following elements:

- BETWEEN-predicate
- Boolean-Predicate
- Column-Value-Predicate
- IN-predicate
- Join-Predicate
- LIKE-predicate
- NULL-predicate

Notes

You can use parentheses to group expressions, predicates, and boolean operators. For example:

```sql
=> ... WHERE NOT (A=1 AND B=2) OR C=3;
```
Example

The following example returns the names of all customers in the Eastern region whose name starts with 'Amer'. Without the WHERE clause filter, the query returns all customer names in the customer_dimension table.

```sql
=> SELECT DISTINCT customer_name
    FROM customer_dimension
    WHERE customer_region = 'East'
    AND customer_name ILIKE 'Amer%';
```

```
Americare
Americom
Americore
Americorp
Ameridata
Amerigen
Amerihope
Amerimedia
Amerishop
Ameristar
Ameritech
```

(11 rows)

WITH Clause

WITH clauses are individually-evaluated SELECT statements for use in a larger container query. You can use WITH clauses to simplify complicated queries and reduce statement repetition.

WITH clauses are evaluated through inline expansion or (optionally) through materialization. For details, see WITH Clauses in SELECT.

Syntax

The following syntax statement is illustrative, rather than syntactically exact, to show the possibility of numerous successive WITH queries in use with others:

```sql
WITH ...
    with-query-1 [(col-name[,..])] AS (SELECT...),
    with-query-2 [(col-name[,..])] AS (SELECT... [with-query-1]),
    ...
    with-query-n [(col-name[,..])] AS (SELECT... [with-query-1, with-query-2, with-query-n[,..]])
SELECT ...
    ...
```
Restrictions

- Each WITH clause query must be uniquely named. Same-name aliases for WITH clause query names return with an error.

- WITH clauses do not support INSERT, UPDATE, or DELETE statements.

- WITH clauses cannot be used recursively; they can only be specified in succession.

Examples

See WITH Clauses in SELECT.

See Also

- SELECT
- Subqueries
- WITH Clauses in SELECT

**SET DATESTYLE**

Specifies how to format date/time output for the current session. Use `SHOW DATESTYLE` to verify the current output settings.

Syntax

```
SET DATESTYLE TO { arg | 'arg' }[ , arg | 'arg' ]
```

Parameters

SET DATESTYLE has a single parameter, which can be set to one or two arguments that specify date ordering and style. Each argument can be specified singly or in combination with the other; if combined, they can be specified in any order.
The following table describes each style and the date ordering arguments it supports:

<table>
<thead>
<tr>
<th>Date style arguments</th>
<th>Order arguments</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISO (ISO 8601/SQL standard)</td>
<td>n/a</td>
<td>2016-03-16 00:00:00</td>
</tr>
<tr>
<td>GERMAN</td>
<td>n/a</td>
<td>16.03.2016 00:00:00</td>
</tr>
<tr>
<td>SQL</td>
<td>MDY (default)</td>
<td>03/16/2016 00:00:00</td>
</tr>
<tr>
<td></td>
<td>DMY</td>
<td>16/03/2016 00:00:00</td>
</tr>
<tr>
<td>POSTGRES</td>
<td>MDY (default)</td>
<td>Wed Mar 16 00:00:00 2016</td>
</tr>
<tr>
<td></td>
<td>DMY</td>
<td>Wed 16 Mar 00:00:00 2016</td>
</tr>
</tbody>
</table>

Vertica ignores the order argument for date styles ISO and GERMAN. If the date style is SQL or POSTGRES, the order setting determines whether dates are output in MDY or DMY order. Neither SQL nor POSTGRES support YMD order. If you specify YMD for SQL or POSTGRES, Vertica ignores it and uses their default MDY order.

Date styles and ordering can also affect how Vertica interprets input values. For more information, see Date/Time Literals.

Privileges

None

Input Dependencies

In some cases, input format can determine output, regardless of date style and order settings:

- Vertica ISO output for DATESTYLE is ISO long form, but several input styles are accepted. If the year appears first in the input, YMD is used for input and output, regardless of the DATESTYLE value.

- INTERVAL input and output share the same format, with the following exceptions:
  - Units like CENTURY or WEEK are converted to years and days.
  - AGO is converted to the appropriate sign.

If the date style is set to ISO, output follows this format:
Example

```sql
=> CREATE TABLE t(a DATETIME);
CREATE TABLE
=> INSERT INTO t values ('3/16/2016');
OUTPUT
--------
 1
(1 row)
=> SHOW DATESTYLE;
 name | setting
-------+----------
datestyle | ISO, MDY
(1 row)
=> SELECT * FROM t;
  a
---------------------
2016-03-16 00:00:00
(1 row)
=> SET DATESTYLE TO German;
SET
=> SHOW DATESTYLE;
 name | setting
-------+----------
datestyle | German, DMY
(1 row)
=> SELECT * FROM t;
  a
---------------------
16.03.2016 00:00:00
(1 row)
=> SET DATESTYLE TO SQL;
SET
=> SHOW DATESTYLE;
 name | setting
-------+----------
datestyle | SQL, DMY
(1 row)
=> SELECT * FROM t;
  a
---------------------
16/03/2016 00:00:00
(1 row)
=> SET DATESTYLE TO Postgres, MDY;
SET
=> SHOW DATESTYLE;
```
### SET ESCAPE_STRING_WARNING

Issues a warning when a backslash is used in a string literal during the current session.

#### Syntax

```
SET ESCAPE_STRING_WARNING TO { ON | OFF }
```

#### Parameters

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ON</td>
<td>[Default] Issues a warning when a back slash is used in a string literal. <strong>Tip:</strong> Organizations that have upgraded from earlier versions of Vertica can use this as a debugging tool for locating backslashes that used to be treated as escape characters, but are now treated as literals.</td>
</tr>
<tr>
<td>OFF</td>
<td>Ignores back slashes within string literals.</td>
</tr>
</tbody>
</table>

#### Privileges

No special permissions required.

#### Notes

- This statement works under vsqql only.
- Turn off standard conforming strings before you turn on this parameter.
Tip: To set escape string warnings across all sessions, use the EscapeStringWarnings configuration parameter. See the Internationalization Parameters in the Administrator's Guide.

Examples

The following example shows how to turn OFF escape string warnings for the session.

```
=> SET ESCAPE_STRING_WARNING TO OFF;
```

See Also

- SET STANDARD_CONFORMING_STRINGS

SET INTERVALSTYLE

Specifies whether to include units in interval output for the current session.

Syntax

```
SET INTERVALSTYLE TO [ plain | units ]
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plain</td>
<td>Sets the default interval output to omit units. PLAIN is the default value.</td>
</tr>
<tr>
<td>units</td>
<td>Enables interval output to include subtype unit identifiers. When INTERVALSTYLE is set to units, the DATESTYLE parameter controls output. If you enable units and they do not display in the output, check the DATESTYLE parameter value, which must be set to ISO or POSTGRES for interval units to display.</td>
</tr>
</tbody>
</table>

Privileges

None
Examples

See Setting Interval Unit Display.

SET LOCALE

Specifies locale for the current session.
You can also set the current locale with the vsql command \locale.

Syntax

SET LOCALE TO ICU-locale-identifier

Parameters

<table>
<thead>
<tr>
<th>locale-identifier</th>
<th>Specifies the ICU locale identifier to use, by default set to: en_US@collation=binary</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>If set to an empty string, Vertica sets locale to en_US_POSIX.</td>
</tr>
<tr>
<td></td>
<td>The following requirements apply:</td>
</tr>
<tr>
<td></td>
<td>• Vertica only supports the COLLATION keyword.</td>
</tr>
<tr>
<td></td>
<td>• Single quotes are mandatory to specify collation.</td>
</tr>
</tbody>
</table>

Privileges

None

Commonly Used Locales

For details on identifier options, see About Locale in the Administrator's Guide. For a complete list of locale identifiers, see the ICU Project.
<table>
<thead>
<tr>
<th>Locale</th>
<th>Language (Country)</th>
</tr>
</thead>
<tbody>
<tr>
<td>de_DE</td>
<td>German (Germany)</td>
</tr>
<tr>
<td>en_GB</td>
<td>English (Great Britain)</td>
</tr>
<tr>
<td>es_ES</td>
<td>Spanish (Spain)</td>
</tr>
<tr>
<td>fr_FR</td>
<td>French (France)</td>
</tr>
<tr>
<td>pt_BR</td>
<td>Portuguese (Brazil)</td>
</tr>
<tr>
<td>pt_PT</td>
<td>Portuguese (Portugal)</td>
</tr>
<tr>
<td>ru_RU</td>
<td>Russian (Russia)</td>
</tr>
<tr>
<td>ja_JP</td>
<td>Japanese (Japan)</td>
</tr>
<tr>
<td>zh_CN</td>
<td>Chinese (China, simplified Han)</td>
</tr>
<tr>
<td>zh_Hant_TW</td>
<td>Chinese (Taiwan, traditional Han)</td>
</tr>
</tbody>
</table>

**Examples**

Set session locale to en_GB:

```sql
=> SET LOCALE TO en_GB;
INFO 2567: Canonical locale: 'en_GB'
Standard collation: 'LEN'
English (United Kingdom)
SET
```

Use the short form of a locale:

```sql
=> SET LOCALE TO LEN;
INFO 2567: Canonical locale: 'en'
Standard collation: 'LEN'
English
SET
```

Specify collation:

```sql
=> SET LOCALE TO 'tr_tr@collation=standard';
INFO 2567: Canonical locale: 'tr_TR@collation=standard'
Standard collation: 'LTR'
Turkish (Turkey, collation=standard) Türkçe (Türkiye, Sıralama=standard)
SET
```
See Also

- Implement Locales for International Data Sets
- About Locale

**SET ROLE**

Enables a role for the user's current session. The user can access privileges that have been granted to the role.

**Note:** If you set EnableAllRolesOnLogin=1, this eliminates the need for the user to run SET ROLE <rolenames> to enable any roles that have been granted to any user. For more information see Security Parameters.

**Syntax**

```
SET ROLE { role [,...] | NONE | ALL | ALL EXCEPT [,...] | DEFAULT }
```  

**Parameters**

<table>
<thead>
<tr>
<th>role [,...]</th>
<th>NONE</th>
<th>ALL</th>
<th>ALL EXCEPT [,...]</th>
<th>DEFAULT</th>
</tr>
</thead>
</table>

The name of one or more roles to set as the current role, or one of the following keywords:

- NONE disables all roles for the current user session.
- ALL enables all of the roles to which the user has been granted access. Use GRANT (Role) to assign a role to a user.
- ALL EXCEPT enable all the roles to which the user has access, with the exception of the role or roles indicated with this
Privileges

As a user, you can only set a role that has been granted to you. Use the `SHOW AVAILABLE ROLES` command to retrieve a list of the roles available to you.

Notes

- The DBADMIN user creates default roles that the DBADMIN then grants to a user. The DBADMIN can also grant a default role to a user using `ALTER USER`.

- Enabling a role does not affect any other roles that are currently enabled. A user session can have more than one role enabled at a time. The user’s permissions are the union of all the roles that are currently active, plus any permissions granted directly to the user.

Examples

This example shows the following:

- `SHOW AVAILABLE_ROLES`; lists the roles available to the user, but not enabled.

- `SET ROLE applogs`; enables the applogs role for the user.

- `SHOW ENABLED_ROLES`; lists the applogs role as enabled (SET) for the user.

- `SET ROLE appuser`; enables the appuser role for the user.

- `SHOW ENABLED_ROLES` now lists both applogs and appuser as enabled roles for the user.

- `SET ROLE NONE` disables all the users' enabled roles.

- `SHOW ENABLED_ROLES` shows that no roles are enabled for the user.

```sql
=> SHOW AVAILABLE_ROLES;  
name     | setting  
----------+---------------------
```
available roles | applogs, appadmin, appuser
(1 row)

=> SET ROLE applogs;
SET

=> SHOW ENABLED_ROLES;
  name   | setting
  ---------
  enabled roles | applogs
(1 row)

=> SET ROLE appuser;
SET

=> SHOW ENABLED_ROLES;
  name   | setting
  ---------
  enabled roles | applogs, appuser
(1 row)

=> SET ROLE NONE;SET

=> SHOW ENABLED_ROLES;
  name   | setting
  ---------
  enabled roles |
(1 row)

Set User Default Roles

Though the DBADMIN user is normally responsible for setting a user's default roles, as a user you can set your own role. For example, if you run SET ROLE NONE all of your enabled roles are disabled. Then it was determined you need access to role1 as a default role. The DBADMIN uses ALTER USER to assign you a default role:

=> ALTER USER user1 default role role1;

This example sets role1 as user1's default role because the DBADMIN assigned this default role using ALTER USER.

user1 => SET ROLE default;
user1 => SHOW ENABLED_ROLES;
  name   | setting
  ---------
  enabled roles | role1
(1 row)

Set All Roles as Default

This example makes all roles granted to user1 default roles:

user1 => SET ROLE all;
user1 => show enabled roles;
<table>
<thead>
<tr>
<th>name</th>
<th>setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled roles</td>
<td>role1, role2, role3</td>
</tr>
</tbody>
</table>

(1 row)

**Set All Roles as Default With EXCEPT**

This example makes all the roles granted to the user default roles with the exception of role1.

```
user1 => set role all except role1;
user1 => SHOW ENABLED_ROLES
```

<table>
<thead>
<tr>
<th>name</th>
<th>setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled roles</td>
<td>role2, role3</td>
</tr>
</tbody>
</table>

(1 row)

**SET SEARCH_PATH**

Specifies the order in which Vertica searches schemas when a SQL statement specifies a table name that is unqualified by a schema name. SET SEARCH_PATH overrides the current session's search path, which is initially set from the user profile. This search path remains in effect until the next SET SEARCH_PATH statement, or the session ends. For details, see Setting Search Paths in the Administrator's Guide.

To view the current search path, use SHOW SEARCH_PATH.

**Syntax**

```
SET SEARCH_PATH { TO | = } { schema-list | DEFAULT }
```

**Parameters**

<p>| schema-list | A comma-delimited list of schemas that indicates the order in which Vertica searches schemas for a table whose name is unqualified by a schema name. If the search path includes a schema that does not exist, or for which the user lacks access privileges, Vertica silently skips over that schema. |</p>
<table>
<thead>
<tr>
<th>DEFAULT</th>
<th>Sets the search path to the database default:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&quot;$user&quot;, public, v_catalog, v_monitor, v_internal</td>
</tr>
</tbody>
</table>

Privileges

None

Examples

Show the current search path:

`=> SHOW SEARCH_PATH;`

```plaintext```
+----------------+-----------------------------------------------+
| name           | setting                                      |
|----------------+-----------------------------------------------+
| search_path    | "$user", public, v_catalog, v_monitor, v_internal |
(1 row)
```  

Reset the search path to schemas `store` and `public`:

`=> SET SEARCH_PATH TO store, public;`  
`=> SHOW SEARCH_PATH;`

```plaintext```
+----------------+-----------------------------------------------+
| name           | setting                                      |
|----------------+-----------------------------------------------+
| search_path    | store, public, v_catalog, v_monitor, v_internal |
(1 row)
```  

Reset the search path to the database default settings:

`=> SET SEARCH_PATH TO DEFAULT;`  
`SET`  
`=> SHOW SEARCH_PATH;`

```plaintext```
+----------------+-----------------------------------------------+
| name           | setting                                      |
|----------------+-----------------------------------------------+
| search_path    | "$user", public, v_catalog, v_monitor, v_internal |
(1 row)
```  

**SET SESSION AUTOCOMMIT**

Sets whether statements automatically commit their transactions on completion. This statement is primarily used by the client drivers to enable and disable autocommit, you should never have to directly call it.
Syntax

SET SESSION AUTOCOMMIT TO { ON | OFF }

Parameters

<table>
<thead>
<tr>
<th>ON</th>
<th>Enable autocommit. Statements automatically commit their transactions when they complete. This is the default setting for connections made using the Vertica client libraries.</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td>Disable autocommit. Transactions are not automatically committed. This is the default for interactive sessions (connections made through vsqI).</td>
</tr>
</tbody>
</table>
**SET SESSION CHARACTERISTICS AS TRANSACTION**

Sets the isolation level and access mode of all transactions that start after this statement is issued.

A transaction retains its isolation level until it completes, even if the session's isolation level changes during the transaction. Vertica internal processes (such as the Tuple Mover and refresh operations) and DDL operations always run at the SERIALIZABLE isolation level to ensure consistency.

**Syntax**

```
SET SESSION CHARACTERISTICS AS TRANSACTION setting[, setting]
```

*setting* = one or both of the following:

- **ISOLATION LEVEL argument**
- **READ ONLY | READ WRITE**

**ISOLATION LEVEL Arguments**

The ISOLATION LEVEL clause determines what data the transaction can access when other transactions run concurrently. You cannot change the isolation level after the first query (SELECT) or DML statement (INSERT, DELETE, UPDATE) if a transaction has run.

Set ISOLATION LEVEL to one of the following arguments:

<table>
<thead>
<tr>
<th>SERIALIZABLE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sets the strictest level of SQL transaction isolation. This level emulates transactions serially, rather than concurrently. It holds locks and blocks write operations until the transaction completes. Applications that use SERIALIZABLE must be prepared to retry transactions in the event of serialization failures. This isolation level is not recommended for normal query operations. Setting the transaction isolation level to SERIALIZABLE does not apply to temporary tables. Temporary tables are isolated by their</td>
</tr>
</tbody>
</table>
transaction scope.

<table>
<thead>
<tr>
<th>TRANSACTION_SCOPE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REPEATABLE READ</td>
<td>Automatically converted to SERIALIZABLE.</td>
</tr>
<tr>
<td>READ COMMITTED</td>
<td>The default setting, allows concurrent transactions.</td>
</tr>
<tr>
<td>READ UNCOMMITTED</td>
<td>Automatically converted to READ COMMITTED.</td>
</tr>
</tbody>
</table>

**READ WRITE/READ ONLY**

You can set the transaction access mode with one of the following:

<table>
<thead>
<tr>
<th>TRANSACTION_ACCESS_MODE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>READ WRITE</td>
<td>Default</td>
</tr>
<tr>
<td>READ ONLY</td>
<td>Disallows SQL statements that require write access:</td>
</tr>
<tr>
<td></td>
<td>- INSERT, UPDATE, DELETE, and COPY operations on any non-temporary table.</td>
</tr>
<tr>
<td></td>
<td>- CREATE, ALTER, and DROP</td>
</tr>
<tr>
<td></td>
<td>- GRANT, REVOKE</td>
</tr>
<tr>
<td></td>
<td>- EXPLAIN if the SQL statement to explain requires write access.</td>
</tr>
</tbody>
</table>

**Note:** Setting the transaction session mode to read-only does not prevent all write operations.

**Privileges**

None

**Viewing Session Transaction Characteristics**

`SHOW TRANSACTION_ISOLATION` and `SHOW TRANSACTION_READ_ONLY` show the transaction settings for the current session:

```sql
=> SHOW TRANSACTION_ISOLATION;
+------------+--------------------------+
<table>
<thead>
<tr>
<th>name</th>
<th>setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>------------+--------------------------</td>
<td></td>
</tr>
</tbody>
</table>
```
transaction_isolation | SERIALIZABLE
(1 row)

=> SHOW TRANSACTION_READ_ONLY;

<table>
<thead>
<tr>
<th>name</th>
<th>setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>transaction_read_only</td>
<td>true</td>
</tr>
</tbody>
</table>
(1 row)

**SET SESSION GRACEPERIOD**

Sets how long a session socket remains blocked while awaiting client input or output for a given query. If the socket is blocked for a continuous period that exceeds the grace period setting, the server shuts down the socket and throws a fatal error. The session is then terminated. If no grace period is set, the query can maintain its block on the socket indefinitely.

Vertica applies a session's grace period and **RUNTIMECAP** settings independently. If no grace period is set, a query can continue to block indefinitely on a session socket, regardless of the query's RUNTIMECAP setting.

**Syntax**

```
SET SESSION GRACEPERIOD duration
```

**Parameters**

<table>
<thead>
<tr>
<th>duration</th>
<th>Specifies how long a query can block on any session socket, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>'interval': Specifies as an interval the maximum grace period for current session queries, up to 20 days.</td>
<td></td>
</tr>
<tr>
<td>=DEFAULT: Sets the grace period for queries in this session to the user's GRACEPERIOD value. A new session is initially set to this value.</td>
<td></td>
</tr>
<tr>
<td>NONE: Valid only for superusers, removes any grace period previously set on session queries.</td>
<td></td>
</tr>
</tbody>
</table>
Privileges

- Superusers can increase session grace period to any value, regardless of database or node settings.

- Non-superusers can only set the session grace period to a value equal to or lower than their own user setting. If no grace period is explicitly set for a user, the grace period for that user is inherited from the node or database settings.

Examples

See Handling Session Socket Blocking in the Administrator's Guide.

**SET SESSION IDLESESSIONTIMEOUT**

Sets the maximum amount of time that a session can remain idle before it exits.

**Note:** An idle session has no queries running.

Syntax

```
SET SESSION IDLESESSIONTIMEOUT duration
```

Parameters

<table>
<thead>
<tr>
<th><strong>duration</strong></th>
<th>Specifies the amount of time a session can remain idle before it exits:</th>
</tr>
</thead>
<tbody>
<tr>
<td>NONE</td>
<td>No idle timeout set on the session.</td>
</tr>
<tr>
<td>'interval'</td>
<td>Specifies as an interval the maximum amount of time a session can remain idle.</td>
</tr>
<tr>
<td>=DEFAULT</td>
<td>Sets the idle timeout period for this session to the user's IDLESESSIONTIMEOUT value.</td>
</tr>
</tbody>
</table>
Privileges

- Superusers can increase the time a session can remain idle to any value, regardless of database or node settings.

- Non-superusers can only set the session idle time to a value equal to or lower than their own user setting. If no session idle time is explicitly set for a user, the session idle time for that user is inherited from the node or database settings.

Examples

See Managing Client Connections in the Administrator's Guide.

**SET SESSION MEMORYCAP**

Limits how much memory can be allocated to any request in this session. This limit only applies to the current session; it does not limit the total amount of memory used by multiple sessions.

Syntax

```
SET SESSION MEMORYCAP limit
```

Parameters

<table>
<thead>
<tr>
<th>limit</th>
<th>One of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <em>max-expression</em>: A string value that specifies the memory limit, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• <em>int%</em> — Expresses the maximum as a percentage of total memory available to the Resource Manager, where <em>int</em> is an integer value between 0 and 100. For example:</td>
</tr>
<tr>
<td></td>
<td>MEMORYCAP '40%'</td>
</tr>
</tbody>
</table>
- `int{K|M|G|T}` — Expresses memory allocation in kilobytes, megabytes, gigabytes, or terabytes. For example:

  ```
  MEMORYCAP '10G'
  ```

- `=DEFAULT`: Sets the memory cap for queries in this session to the user's MEMORYCAP value. A new session is initially set to this value.

- `NONE`: Valid only for superusers, removes any grace period previously set on session queries.

### Privileges

- Superusers can increase session memory cap to any value.

- Non-superusers can only set the session memory cap to a value equal to or lower than their own user setting.

### Examples

Set the session memory cap to 2 gigabytes:

```sql
=> SET SESSION MEMORYCAP '2G';
SET => SHOW MEMORYCAP;
      name | setting
-----------
    memorycap | 2097152
(1 row)
```

Revert the memory cap to the default setting as specified in the user profile:

```sql
=> SET MEMORYCAP=DEFAULT;
SET => SHOW MEMORYCAP;
      name | setting
-----------
    memorycap | 2013336
(1 row)
```

[Managing Workloads](#)
SET SESSION MULTIPLEACTIVERESULTSETS

Enables or disable the execution of multiple active result sets (MARS) on a single JDBC connection. Using this option requires an active JDBC connection.

Syntax

```
SET SESSION MULTIPLEACTIVERESULTSETS TO { ON | OFF }
```

Parameters

<table>
<thead>
<tr>
<th>ON</th>
<th>Enable MultipleActiveResultSets. Allows you to execute multiple result sets on a single connection.</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td>Disable MultipleActiveResultSets. Allows only one active result set per connection. (Default value.)</td>
</tr>
</tbody>
</table>

Privileges

No special permissions required.

Examples

This example shows how you can set MultipleActiveResultSets to on and then to off:

```
=> SET SESSION MULTIPLEACTIVERESULTSETS TO on;
SET
=> SET SESSION MULTIPLEACTIVERESULTSETS TO off;
SET
```

SET SESSION RESOURCE_POOL

Associates the user session with the specified resource pool.
Syntax

```sql
SET SESSION RESOURCE_POOL = { pool-name | DEFAULT }
```

Parameters

<table>
<thead>
<tr>
<th>pool-name</th>
<th>The name of an existing resource pool to associate with the current session.</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEFAULT</td>
<td>Sets the session's resource pool to the user's default resource pool.</td>
</tr>
</tbody>
</table>

Privileges

- Superusers can assign their session to any available resource pool.
- Non-superusers must have USAGE privileges for the resource pool.

Examples

This example sets ceo_pool as the session resource pool:

```sql
=> SET SESSION RESOURCE_POOL = ceo_pool;
SET
```

See Also

- ALTER RESOURCE POOL
- CREATE RESOURCE POOL
- CREATE USER
- DROP RESOURCE POOL
- GRANT (Resource Pool)
• SET SESSION MEMORYCAP

• Managing Workloads

**SET SESSION RUNTIMECAP**

Sets the maximum amount of time queries can run in a given session. If a query exceeds its session's RUNTIMECAP setting, Vertica terminates the query and returns an error. You cannot increase the RUNTIMECAP beyond the limit that is set in your user profile.

**Note:** Vertica does not strictly enforce session RUNTIMECAP settings. If you time a query, you might discover that it runs longer than the RUNTIMECAP setting.

**Syntax**

```
SET SESSION RUNTIMECAP duration
```

**Parameters**

<table>
<thead>
<tr>
<th><strong>duration</strong></th>
<th>Specifies how long a given query can run in the current session, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>NONE (default):</td>
<td>Removes a runtime limit for all current session queries.</td>
</tr>
<tr>
<td>'interval':</td>
<td>Specifies as an interval the maximum runtime for current session queries, up to one year—for example, 1 minute or 100 seconds.</td>
</tr>
<tr>
<td>=DEFAULT:</td>
<td>Sets maximum runtime for queries in this session to the user's RUNTIMECAP value.</td>
</tr>
</tbody>
</table>
Privileges

- Superusers can increase session RUNTIMECAP to any value.
- Non-superusers can only set the session RUNTIMECAP to a value equal to or lower than their own user RUNTIMECAP.

Examples

Set the maximum query runtime for the current session to 10 minutes:

```sql
=> SET SESSION RUNTIMECAP '10 minutes';
```

Revert the session RUNTIMECAP to your user default setting:

```sql
=> SET SESSION RUNTIMECAP = DEFAULT;
```

```sql
=> SHOW RUNTIMECAP;
   name | setting
-------+--------
 runtimecap | UNLIMITED
(1 row)
```

See Also

- Setting a Runtime Limit for Queries
- Managing Workloads

**SET SESSION TEMPSPACECAP**

Sets the maximum amount of temporary file storage space that any request issued by the session can consume.

Syntax

```
SET SESSION TEMPSPACECAP 'space-limit' / = default | NONE
```
Parameters

| 'space-limit' | The maximum amount of temporary file space the session can use. To set a limit, use a numeric value followed by a unit (for example: '10G'). The unit can be one of the following:
| | • % percentage of total temporary storage space available. (In this case, the numeric value must be 0-100).
| | • K—Kilobytes
| | • M—Megabytes
| | • G—Gigabytes
| | • T—Terabytes
| |
| Setting this value to = default sets the session's TEMPSPACECAP to the user's TEMPSPACECAP value.
| Setting this value to NONE results in the session having unlimited temporary storage space. This is the default value.

Privileges

• This command requires superuser privileges to increase the TEMPSPACECAP over the user's TEMPSPACECAP limit.

• Regular users can change the TEMPSPACECAP associated with their own sessions to any value less than or equal to their own TEMPSPACECAP. They cannot increase its value beyond their own TEMPSPACECAP value.

Notes

• This limit is per session, not per user. A user could open multiple sessions, each of which could use up to the TEMPSPACECAP.
• Any execution plan that exceeds its TEMPSPACECAP usage results in the error:

ERROR: Exceeded temp space cap.

Examples

The following command sets a TEMPSPACECAP of 20gigabytes on the session:

```
=> SET SESSION TEMPSPACECAP '20G';
SET
=> SHOW TEMPSPACECAP;
   name     | setting
   --------------
   tempspacecap  | 20971520
(1 row)
```

Note: SHOW displays the TEMPSPACECAP in kilobytes.

To return the memorycap to the previous setting:

```
=> SET SESSION TEMPSPACECAP NONE;
SET
=> SHOW TEMPSPACECAP;
   name     | setting
   --------------
   tempspacecap  | UNLIMITED
(1 row)
```

**SET STANDARD_CONFORMING_STRINGS**

Treats backslashes as escape characters for the current session.
Syntax

```sql
SET STANDARD_CONFORMING_STRINGS TO { ON | OFF }
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ON</td>
<td>Makes ordinary string literals ('...') treat back slashes () literally. This means that back slashes are treated as string literals, not escape characters. (This is the default.)</td>
</tr>
<tr>
<td>OFF</td>
<td>Treats back slashes as escape characters.</td>
</tr>
</tbody>
</table>

Privileges

No special permissions required.

Notes

- This statement works under vsql only.
- When standard conforming strings are on, Vertica supports SQL:2008 string literals within Unicode escapes.
- Standard conforming strings must be ON to use Unicode-style string literals (U"\nnnn").

Tip: To set conforming strings across all sessions (permanently), use the `StandardConformingStrings` as described in Internationalization Parameters in the Administrator's Guide.

Examples

The following example shows how to turn off conforming strings for the session.

```
=> SET STANDARD_CONFORMING_STRINGS TO OFF;
```

The following command lets you verify the settings:
SHOW STANDARD_CONFORMING_STRINGS;

name | setting
-------------------------------------
standard_conforming_strings | off

The following example shows how to turn on conforming strings for the session.

=> SET STANDARD_CONFORMING_STRINGS TO ON;

See Also

- SET ESCAPE_STRING_WARNING

SET TIME ZONE

Changes the TIME_ZONE run-time parameter for the current session. Use SHOW TIMEZONE to show the session's current time zone.

If you set the timezone using POSIX format, the timezone abbreviation you use overrides the default timezone abbreviation. If the date style is set to POSTGRES, the timezone abbreviation you use is also used when converting a timestamp to a string.

Syntax

SET TIME_ZONE TO { value | 'value' }

Note: Vertica treats literals TIME_ZONE and TIMEZONE as synonyms.

Parameters

<table>
<thead>
<tr>
<th>value</th>
<th>One of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- A time zone literal supported by Vertica. To view the default list of valid literals, see the files in the following directory:</td>
</tr>
<tr>
<td></td>
<td>/opt/vertica/share/timezonesets</td>
</tr>
<tr>
<td></td>
<td>- A signed integer representing an offset from UTC in hours</td>
</tr>
</tbody>
</table>
A list of time zone names recognized by Vertica, sorted by commonly used zone names. The table is primarily sorted by commonly used zone names. In addition to the names listed in the table, Vertica accepts time zone names of the form STDoffset or STDoffsetDST, where STD is a zone abbreviation, offset is a numeric offset in hours from UTC, and DST represents a daylight savings time rule.
west from UTC, and DST is an optional daylight-savings zone abbreviation, assumed to stand for one hour ahead of the given offset. For example, if EST5EDT were not already a recognized zone name, it would be accepted and would be functionally equivalent to USA East Coast time. When a daylight-savings zone name is present, it is assumed to be used according to USA time zone rules, so this feature is of limited use outside North America. Be wary that this provision can lead to silently accepting bogus input, since there is no check on the reasonableness of the zone abbreviations. For example, SET TIME ZONE TO FOOBANKO works, leaving the system effectively using a rather peculiar abbreviation for GMT.

<table>
<thead>
<tr>

**SHOW**

Shows run-time parameters for the current session.

**Syntax**

SHOW { parameter | ALL }

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTOCOMMIT</td>
<td>Shows whether statements automatically commit their transactions when they complete.</td>
</tr>
<tr>
<td>AVAILABLE_ROLES</td>
<td>Lists all roles available to the user.</td>
</tr>
<tr>
<td>DATESTYLE</td>
<td>Shows the current style of date values. See SET DATESTYLE.</td>
</tr>
<tr>
<td>ENABLED_ROLES</td>
<td>Shows the roles enabled for the current session. See SET ROLE.</td>
</tr>
<tr>
<td>ESCAPE_STRING_WARNING</td>
<td>Shows whether warnings are issued when backslash escapes are found in strings. See SET ESCAPE_STRING_</td>
</tr>
<tr>
<td>WARNING</td>
<td></td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------</td>
</tr>
<tr>
<td>IDLESESSIONTIMEOUT</td>
<td>Specifies how long the session can remain idle before it times out.</td>
</tr>
<tr>
<td>INTERVALSTYLE</td>
<td>Shows whether units are output when printing intervals. See SET INTERVALSTYLE.</td>
</tr>
<tr>
<td>LOCALE</td>
<td>Shows the current locale. See SET LOCALE.</td>
</tr>
<tr>
<td>MEMORYCAP</td>
<td>Shows the maximum amount of memory that any request use. See SET MEMORYCAP.</td>
</tr>
<tr>
<td>MULTIPLEACTIVERESULTSETS</td>
<td>Shows whether multiple active result sets on one connection are allowed. See SET SESSION MULTIPLEACTIVERESULTSETS</td>
</tr>
<tr>
<td>RESOURCE_POOL</td>
<td>Shows the resource pool that the session is using. See SET RESOURCE_POOL.</td>
</tr>
<tr>
<td>RUNTIMECAP</td>
<td>Shows the maximum amount of time that queries can run in the session. See SET RUNTIMECAP</td>
</tr>
<tr>
<td>SEARCH_PATH</td>
<td>Shows the order in which Vertica searches schemas. See SET SEARCH_PATH.</td>
</tr>
<tr>
<td>STANDARD_CONFORMING_STRINGS</td>
<td>Shows whether backslash escapes are enabled for the session. See SET STANDARD_CONFORMING_STRINGS.</td>
</tr>
<tr>
<td>TEMPSPACECAP</td>
<td>Shows the maximum amount of temporary file space that queries can use in the session. See SET TEMPSPACECAP.</td>
</tr>
<tr>
<td>TIMEZONE</td>
<td>Shows the timezone set in the current session. See SET TIMEZONE.</td>
</tr>
<tr>
<td>TRANSACTION_ISOLATION</td>
<td>Shows the current transaction isolation setting, as described in SET SESSION CHARACTERISTICS AS TRANSACTION.</td>
</tr>
<tr>
<td>TRANSACTION_READ_ONLY</td>
<td>Shows the current read-only setting, as described in SET SESSION CHARACTERISTICS AS TRANSACTION.</td>
</tr>
<tr>
<td>ALL</td>
<td>Shows all run-time settings.</td>
</tr>
</tbody>
</table>
Privileges

None

Examples

Display all current runtime parameter settings:

```sql
=> SHOW ALL;

<table>
<thead>
<tr>
<th>name</th>
<th>setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>locale</td>
<td>en_US@collation=binary (LEN_KBINARY)</td>
</tr>
<tr>
<td>autocommit</td>
<td>off</td>
</tr>
<tr>
<td>standard_conforming_strings</td>
<td>on</td>
</tr>
<tr>
<td>escape_string_warning</td>
<td>on</td>
</tr>
<tr>
<td>datestyle</td>
<td>ISO, MDY</td>
</tr>
<tr>
<td>intervalstyle</td>
<td>plain</td>
</tr>
<tr>
<td>timezone</td>
<td>US/Eastern</td>
</tr>
<tr>
<td>search_path</td>
<td>&quot;$user&quot;, public, v_catalog, v_monitor, v_internal</td>
</tr>
<tr>
<td>transaction_isolation</td>
<td>READ COMMITTED</td>
</tr>
<tr>
<td>transaction_read_only</td>
<td>false</td>
</tr>
<tr>
<td>resource_pool</td>
<td>general</td>
</tr>
<tr>
<td>memorycap</td>
<td>UNLIMITED</td>
</tr>
<tr>
<td>tempspacecap</td>
<td>UNLIMITED</td>
</tr>
<tr>
<td>runtimecap</td>
<td>UNLIMITED</td>
</tr>
<tr>
<td>enabled roles</td>
<td></td>
</tr>
</tbody>
</table>
| available roles               | applogs, appadmin                                                      
(15 rows)
```

Return current search path settings:

```sql
=> SHOW SEARCH_PATH;

<table>
<thead>
<tr>
<th>name</th>
<th>setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>search_path</td>
<td>&quot;$user&quot;, public, v_catalog, v_monitor, v_internal</td>
</tr>
</tbody>
</table>
(1 row)
```

Show the session's transaction isolation level:

```sql
=> SHOW TRANSACTION_ISOLATION;

<table>
<thead>
<tr>
<th>name</th>
<th>setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>transaction_isolation</td>
<td>READ COMMITTED</td>
</tr>
</tbody>
</table>
(1 row)
```

Return the current transaction isolation level, as set by `SET SESSION CHARACTERISTICS AS TRANSACTION`. False indicates that the default read/write setting is in effect:
SHOW TRANSACTION_READ_ONLY;

<table>
<thead>
<tr>
<th>name</th>
<th>setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>transaction_read_only</td>
<td>false</td>
</tr>
</tbody>
</table>

(1 row)

To change to read only:

=> SET SESSION CHARACTERISTICS AS TRANSACTION READ ONLY;

The same SHOW command now returns true:

=> SHOW TRANSACTION_READ_ONLY;

<table>
<thead>
<tr>
<th>name</th>
<th>setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>transaction_read_only</td>
<td>true</td>
</tr>
</tbody>
</table>

(1 row)

SHOW CURRENT

Displays active configuration parameter values that are set at all levels. Vertica first checks values set at the session level. If a value is not set for a configuration parameter at the session level, Vertica next checks if the value is set for the node where you are logged in, and then checks the database level. If no values are set, SHOW CURRENT shows the default value for the configuration parameter. If the configuration parameter requires a restart to take effect, the active values shown might differ from the set values.

Syntax

SHOW CURRENT { parameter-name[,..] | ALL }

Parameters

<table>
<thead>
<tr>
<th>parameter-name</th>
<th>Names of any configuration parameters you want to show.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL</td>
<td>Shows all configuration parameters set at all levels.</td>
</tr>
</tbody>
</table>
Privileges

- Superusers only

Examples

Show configuration parameters and their settings at all levels.

```sql
g=> SHOW CURRENT ALL;
```

<table>
<thead>
<tr>
<th>level</th>
<th>name</th>
<th>setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEFAULT</td>
<td>ActivePartitionCount</td>
<td>1</td>
</tr>
<tr>
<td>DEFAULT</td>
<td>AdvanceAHMInterval</td>
<td>180</td>
</tr>
<tr>
<td>DEFAULT</td>
<td>AHMBackupManagement</td>
<td>0</td>
</tr>
<tr>
<td>DATABASE</td>
<td>AnalyzeRowCountInterval</td>
<td>3600</td>
</tr>
<tr>
<td>SESSION</td>
<td>ForceUDxFencedMode</td>
<td>1</td>
</tr>
<tr>
<td>NODE</td>
<td>MaxClientSessions</td>
<td>0</td>
</tr>
</tbody>
</table>
```

SHOW DATABASE

Displays configuration parameter values that are set for the database.

Note: If the configuration parameter is set but requires a database restart to take effect, the value shown might differ from the active value.

Syntax

```sql
SHOW DATABASE db-spec { parameter-name[,] | ALL }
```

Parameters

- `db-spec` Specifies the current database, set to the database name or DEFAULT.
Names of one or more configuration parameters to show. Non-superusers can only specify parameters whose settings are not masked by SHOW DATABASE...ALL, otherwise Vertica returns an error.

If you specify a single parameter that is not set, SHOW DATABASE returns an empty row for that parameter.

To obtain the names of database-level parameters, query system table CONFIGURATION_PARAMETERS.

<table>
<thead>
<tr>
<th>parameter-name</th>
<th>ALL</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Shows all configuration parameters set at the database level. For non-superusers, Vertica masks settings of security parameters, which only superusers can access.</td>
</tr>
</tbody>
</table>

Privileges

- **Superuser:** Shows all database parameter settings.
- **Non-superuser:** Masks all security parameter settings, which only superusers can access. To determine which parameters require superuser privileges, query system table CONFIGURATION_PARAMETERS.

Examples

Show to a non-superuser all configuration parameters that are set on the database:

```
=> SHOW DATABASE DEFAULT ALL;

<table>
<thead>
<tr>
<th>name</th>
<th>setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>AllowNumericOverflow</td>
<td>1</td>
</tr>
<tr>
<td>CopyFaultTolerantExpressions</td>
<td>1</td>
</tr>
<tr>
<td>EnableSSL</td>
<td>1</td>
</tr>
<tr>
<td>GlobalHeirUsername</td>
<td>********</td>
</tr>
<tr>
<td>MaxClientSessions</td>
<td>50</td>
</tr>
<tr>
<td>NumericSumExtraPrecisionDigits</td>
<td>0</td>
</tr>
</tbody>
</table>
(6 rows)
```

Show settings for two configuration parameters:

```
=> SHOW DATABASE DEFAULT AllowNumericOverflow, NumericSumExtraPrecisionDigits;

<table>
<thead>
<tr>
<th>name</th>
<th>setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>AllowNumericOverflow</td>
<td>1</td>
</tr>
<tr>
<td>NumericSumExtraPrecisionDigits</td>
<td>0</td>
</tr>
</tbody>
</table>
```
SHOW NODE

Displays configuration parameter values that are set for a node. If you specify a parameter that is not set, SHOW NODE returns an empty row for that parameter.

**Note:** If the configuration parameter is set but requires a database restart to take effect, the value shown might differ from the active value.

**Syntax**

```
SHOW NODE node-name { parameter-name [, ... ] | ALL }
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-name</td>
<td>Name of the target node.</td>
</tr>
<tr>
<td>parameter-name</td>
<td>Names of one or more node-level configuration parameters. To obtain the names of node-level parameters, query system table CONFIGURATION_PARAMETERS.</td>
</tr>
<tr>
<td>ALL</td>
<td>Shows all configuration parameters set at the node level.</td>
</tr>
</tbody>
</table>

**Privileges**

None

**Examples**

View all configuration parameters and their settings for node v_vmart_node0001:

```
=> SHOW NODE v_vmart_node0001 ALL;
```
### SHOW SESSION

Displays configuration parameter values that are set for the current session. If you specify a parameter that is not set, SHOW SESSION returns an empty row for that parameter.

**Note:** If the configuration parameter is set but requires a database restart to take effect, the value shown might differ from the active value.

#### Syntax

```sql
SHOW SESSION { parameter-name[,..] | ALL }
```

#### Parameters

<table>
<thead>
<tr>
<th>parameter-name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter-name</td>
<td>Names of one or more session-level configuration parameters. To obtain the names of session-level parameters, query system table <code>CONFIGURATION_PARAMETERS</code>.</td>
</tr>
<tr>
<td>ALL</td>
<td>Shows all configuration parameters set at the session level.</td>
</tr>
</tbody>
</table>

#### Privileges

None

#### Examples

View all configuration parameters and their settings for the current session:

```sql
=> SHOW SESSION ALL;
```
START TRANSACTION

Starts a transaction block.

Syntax

START TRANSACTION [ isolation_level ]

where isolation_level is one of:

ISOULATION LEVEL ( SERIALIZABLE | REPEATABLE READ | READ COMMITTED | READ UNCOMMITTED )READ { ONLY | WRITE }

Parameters

Isolation level, described in the following table, determines what data the transaction can access when other transactions are running concurrently. The isolation level cannot be changed after the first query (SELECT) or DML statement (INSERT, DELETE, UPDATE) has run. A transaction retains its isolation level until it completes, even if the session's isolation level changes during the transaction. Vertica internal processes (such as the Tuple Mover and refresh operations) and DDL operations always run at the SERIALIZABLE isolation level to ensure consistency.
<table>
<thead>
<tr>
<th>WORK</th>
<th>TRANSACTION</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Have no effect; they are optional keywords for readability.</td>
</tr>
</tbody>
</table>

**ISOLATION LEVEL**

- **SERIALIZABLE**—Sets the strictest level of SQL transaction isolation. This level emulates transactions serially, rather than concurrently. It holds locks and blocks write operations until the transaction completes. Not recommended for normal query operations.

- **REPEATABLE READ**—Automatically converted to SERIALIZABLE by Vertica.

- **READ COMMITTED** (Default)—Allows concurrent transactions. Use READ COMMITTED isolation for normal query operations, but be aware that there is a subtle difference between them. See Transactions for more information.

- **READ UNCOMMITTED**—Automatically converted to READ COMMITTED by Vertica.

**READ (WRITE | ONLY)**

Determines whether the transaction is read/write or read-only. Read/write is the default.

Setting the transaction session mode to read-only disallows the following SQL commands, but does not prevent all disk write operations:

- INSERT, UPDATE, DELETE, and COPY if the table they would write to is not a temporary table
- All CREATE, ALTER, and DROP commands
- GRANT, REVOKE, and EXPLAIN if the command it would run is among those listed.

---

**Privileges**

No special permissions required.

**Notes**

BEGIN performs the same function as START TRANSACTION.
Examples

This example shows how to start a transaction.

```
=> START TRANSACTION ISOLATION LEVEL READ COMMITTED READ WRITE;
START TRANSACTION
=> CREATE TABLE sample_table (a INT);
CREATE TABLE
=> INSERT INTO sample_table (a) VALUES (1);
OUTPUT
-------
1
(1 row)
```

See Also

- Transactions
- Creating Transactions
- COMMIT
- END
- ROLLBACK

**TRUNCATE TABLE**

Removes all storage associated with a table, while leaving the table definition intact. TRUNCATE TABLE auto-commits the current transaction after statement execution and cannot be rolled back.

TRUNCATE TABLE removes all table history preceding the current epoch, regardless of where that data resides (WOS or ROS) or how it is segmented. Immediately after TRUNCATE TABLE returns, AT EPOCH queries on the truncated table return nothing.

Syntax

```
TRUNCATE TABLE [[database.]schema.]table-name
```
Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[database.]schema</code></td>
<td>Specifies a schema, by default public. If <code>schema</code> is any schema other than public, you must supply the schema name. For example: <code>myschema.thisDbObject</code> If you specify a database, it must be the current database.</td>
</tr>
<tr>
<td><code>table-name</code></td>
<td>The name of the anchor table or temporary table to truncate. You cannot truncate an external table.</td>
</tr>
</tbody>
</table>

Privileges

One of the following privileges is required:

- Superuser
- Table owner
- User with USAGE privileges on the table's schema—see `GRANT (Schema)`

A schema owner can drop a table but cannot truncate a table.

Examples

See `Truncating Tables` in the Administrator's Guide.

See Also

- `DELETE`
- `DROP TABLE`
- `Best Practices for DELETE and UPDATE`
**UPDATE**

Replaces the values of the specified columns in all rows for which a specific condition is true. All other columns and rows in the table are unchanged. If successful, UPDATE returns the number of rows updated. A count of 0 indicates no rows matched the condition.

UPDATE inserts new records into the WOS and marks the old records for deletion. If the WOS fills up, the operation overflows to the ROS.

**Syntax**

```
... SET set-expression [,...]
... [ FROM from-list ]
... [ where-clause ]
```

**Parameters**

<table>
<thead>
<tr>
<th>/*+ hint [, hint] */</th>
<th>One or both of the following hints:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• A load hint, one of the following: <strong>AUTO</strong>, <strong>DIRECT</strong>, or <strong>TRICKLE</strong></td>
</tr>
<tr>
<td></td>
<td>• <strong>LABEL</strong></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>[database.]schema</th>
<th>Specifies a schema, by default public. If <strong>schema</strong> is any schema other than public, you must supply the schema name. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>myschema.thisDbObject</strong></td>
</tr>
<tr>
<td></td>
<td>If you specify a database, it must be the current database.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>table-reference</th>
<th>Specifies a table, one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• An optionally qualified table name with optional table aliases, column aliases, and outer joins.</td>
</tr>
<tr>
<td></td>
<td>• An outer join table.</td>
</tr>
<tr>
<td></td>
<td>You cannot update a projection.</td>
</tr>
<tr>
<td>alias</td>
<td>A temporary name used to reference the table.</td>
</tr>
<tr>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>SET set-expression [, …]</td>
<td>Specifies the columns to update. Each <code>set-expression</code> in the SET clause specifies a target column and its new value as follows:</td>
</tr>
<tr>
<td></td>
<td>column-name = { expression</td>
</tr>
<tr>
<td></td>
<td>where:</td>
</tr>
<tr>
<td></td>
<td>• <code>column-name</code> is any column that does not have primary key or foreign key referential integrity constraints.</td>
</tr>
<tr>
<td></td>
<td>• <code>expression</code> specifies a value to assign to the column. The expression can use the current values of this and other table columns. For example:</td>
</tr>
<tr>
<td></td>
<td>UPDATE T1 SET C1 = C1 + 1</td>
</tr>
<tr>
<td>FROM from-list</td>
<td>A list of table expressions, allowing columns from other tables to appear in the WHERE condition and the UPDATE expressions. This is similar to the list of tables that can be specified in the FROM Clause of a SELECT command.</td>
</tr>
<tr>
<td></td>
<td>Important: <code>from-list</code> must not include the target table.</td>
</tr>
</tbody>
</table>

**Privileges**

Table owner or user with GRANT OPTION is grantor.

- UPDATE privilege on table
- USAGE privilege on schema that contains the table
- SELECT privilege on the table when executing an UPDATE statement that references table column values in a WHERE or SET clause
Subqueries and Joins

UPDATE supports subqueries and joins, which is useful for updating values in a table based on values that are stored in other tables. For details, see Subqueries in UPDATE and DELETE Statements in Analyzing Data.

Restrictions

- The table you specify in the UPDATE list cannot also appear in the FROM list (no self joins); for example, the following UPDATE statement is not allowed:

```sql
BEGIN;
UPDATE result_table
  SET address='new' || r2.address
FROM result_table r2
WHERE r2.cust_id = result_table.cust_id + 10;
ERROR: Self joins in UPDATE statements are not allowed
DETAIL: Target relation result_table also appears in the FROM list
```

- If the joins specified in the WHERE predicate produce more than one copy of the row in the table to be updated, the new value of the row in the table is chosen arbitrarily.

- If any primary key, unique key, or check constraints are enabled for automatic enforcement, Vertica enforces those constraints when you insert values into a table. If a violation occurs, Vertica rolls back the SQL statement and returns an error. This behavior occurs for INSERT, UPDATE, COPY, and MERGE SQL statements.

  Note: Automatic constraint enforcement requires that you have SELECT privileges on the table containing the constraint.

Examples

In the fact table, modify the price column value for all rows where the cost column value is greater than 100:

```sql
UPDATE fact SET price = price - cost * 80 WHERE cost > 100;
```

In the retail.customer table, set the state column to NH when the CID column value is greater than 100:
=> UPDATE retail.customer SET state = 'NH' WHERE CID > 100;

To use table aliases in UPDATE queries, consider the following two tables:

=> SELECT * FROM result_table;
cust_id | address
---------+------------------
   20 | Lincoln Street
   30 | Beach Avenue
   30 | Booth Hill Road
   40 | Mt. Vernon Street
   50 | Hillside Avenue
(5 rows)

=> SELECT * FROM new_addresses;
new_cust_id | new_address
-------------+------------------
       20 | Infinite Loop
       30 | Loop Infinite
       60 | New Addresses
(3 rows)

The following query and subquery use table aliases to update the address column in result_table (alias r) with the new address from the corresponding column in the new_addresses table (alias n):

=> UPDATE result_table r
   SET address=n.new_address
   FROM new_addresses n
   WHERE r.cust_id = n.new_cust_id;

result_table shows the address field updates made for customer IDs 20 and 30:

=> SELECT * FROM result_table ORDER BY cust_id;
cust_id | address
---------+------------------
       20 | Infinite Loop
       30 | Loop Infinite
       30 | Loop Infinite
       40 | Mt. Vernon Street
       50 | Hillside Avenue
(5 rows)
Vertica System Tables

Vertica provides system tables that let you monitor your database. Query these tables the same way you perform query operations on base or temporary tables—by using SELECT statements.

The following sections contains detailed information of the content of the Vertica system tables.

For information about monitoring your Vertica database using system tables, see the following sections:

- Using System Tables
- Monitoring Vertica
V_CATALOG Schema

The system tables in this section reside in the v_catalog schema. These tables provide information (metadata) about the objects in a database; for example, tables, constraints, users, projections, and so on.

ACCESS_POLICY

Provides information about access policies associated with specific tables.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCESS_POLICY_OID</td>
<td>INTEGER</td>
<td>A unique identifier for the access policy.</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR</td>
<td>Name of the table with which the access policy is assigned.</td>
</tr>
<tr>
<td>IS_POLICY_ENABLED</td>
<td>BOOLEAN</td>
<td>Indicates whether or not you have enabled the access policy.</td>
</tr>
<tr>
<td>POLICY_TYPE</td>
<td>VARCHAR</td>
<td>The type of access policy assigned to the table, valid values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Column Policy</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Row Policy</td>
</tr>
<tr>
<td>EXPRESSION</td>
<td>VARCHAR</td>
<td>The expression used when creating the access policy.</td>
</tr>
<tr>
<td>TRIGGERED_BY</td>
<td>VARCHAR</td>
<td>The SQL statement that triggers the access policy.</td>
</tr>
<tr>
<td>COLUMN_NAME</td>
<td>VARCHAR</td>
<td>The column to which the access policy is assigned.</td>
</tr>
</tbody>
</table>

ALL_TABLES

Provides summary information about tables in a Vertica database.
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMA_NAME</td>
<td>VARCHAR</td>
<td>The name of the schema that contains the table.</td>
</tr>
<tr>
<td>TABLE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the table.</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR</td>
<td>The table name.</td>
</tr>
<tr>
<td>TABLE_TYPE</td>
<td>VARCHAR</td>
<td>The type of table, which can be one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• TABLE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• SYSTEM TABLE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• VIEW</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• GLOBAL TEMPORARY</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• LOCAL TEMPORARY</td>
</tr>
<tr>
<td>REMARKS</td>
<td>VARCHAR</td>
<td>A brief comment about the table. You define this field by using the <code>COMMENT ON TABLE</code> and <code>COMMENT ON VIEW</code> commands.</td>
</tr>
</tbody>
</table>

### Example

```sql
onenode=> SELECT DISTINCT table_name, table_type FROM all_tables
WHERE table_name ILIKE 't%';
```

<table>
<thead>
<tr>
<th>table_name</th>
<th>table_type</th>
</tr>
</thead>
<tbody>
<tr>
<td>types</td>
<td>SYSTEM TABLE</td>
</tr>
<tr>
<td>trades</td>
<td>TABLE</td>
</tr>
<tr>
<td>tuple_mover_operations</td>
<td>SYSTEM TABLE</td>
</tr>
<tr>
<td>tables</td>
<td>SYSTEM TABLE</td>
</tr>
<tr>
<td>tuning_recommendations</td>
<td>SYSTEM TABLE</td>
</tr>
<tr>
<td>testid</td>
<td>TABLE</td>
</tr>
<tr>
<td>table_constraints</td>
<td>SYSTEM TABLE</td>
</tr>
<tr>
<td>transactions</td>
<td>SYSTEM TABLE</td>
</tr>
</tbody>
</table>

(8 rows)

```sql
onenode=> SELECT table_name, table_type FROM all_tables
WHERE table_name ILIKE 'my%';
```

<table>
<thead>
<tr>
<th>table_name</th>
<th>table_type</th>
</tr>
</thead>
<tbody>
<tr>
<td>mystocks</td>
<td>VIEW</td>
</tr>
</tbody>
</table>

(1 row)

```sql
=> SELECT * FROM all_tables LIMIT 4;
```

[1 RECORD 1]-----------------------------

<table>
<thead>
<tr>
<th>schema_name</th>
<th>v_catalog</th>
</tr>
</thead>
</table>
AUDIT_MANAGING_USERS_PRIVILEGES

Provides summary information about privileges, creating, modifying, and deleting users, and authentication changes. This table is a join of LOG_PARAMS, LOG_QUERIES, and LOG_TABLES filtered on the Managing_Users_Privileges category.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISSUED_TIME</td>
<td>VARCHAR</td>
<td>The time at which the query was executed.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>Name of the user who issued the query at the time Vertica recorded the session.</td>
</tr>
<tr>
<td>USER_ID</td>
<td>INTEGER</td>
<td>Numeric representation of the user who ran the query.</td>
</tr>
<tr>
<td>HOSTNAME</td>
<td>VARCHAR</td>
<td>The hostname, IP address, or URL of the database server.</td>
</tr>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.</td>
</tr>
<tr>
<td>AUDIT_TYPE</td>
<td>VARCHAR</td>
<td>The type of operation for the audit:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Query</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Parameter</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Table</td>
</tr>
<tr>
<td>AUDIT_TAG_NAME</td>
<td>VARCHAR</td>
<td>The tag name for the specific parameter, query, or table.</td>
</tr>
<tr>
<td>REQUEST_TYPE</td>
<td>VARCHAR</td>
<td>The type of query request. Examples include, but are not limited to:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- QUERY</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- DDL</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- LOAD</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- UTILITY</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- TRANSACTION</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- PREPARE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- EXECUTE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- SET</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- SHOW</td>
</tr>
<tr>
<td>REQUEST_ID</td>
<td>INTEGER</td>
<td>The ID of the privilege request.</td>
</tr>
<tr>
<td>SUBJECT</td>
<td>VARCHAR</td>
<td>The name of the table or parameter that was queried or the subject of a query.</td>
</tr>
<tr>
<td>REQUEST</td>
<td>VARCHAR</td>
<td>Lists the privilege request.</td>
</tr>
<tr>
<td>SUCCESS</td>
<td>VARCHAR</td>
<td>Indicates whether or not the operation was successful.</td>
</tr>
<tr>
<td>CATEGORY</td>
<td>VARCHAR</td>
<td>The audit parent category, Managing_Users_Privileges.</td>
</tr>
</tbody>
</table>
## CATALOGSYNCSTATE

Indicates the last time a node on an Eon Mode database synchronized its catalog to communal storage.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The node name for which information is listed.</td>
</tr>
<tr>
<td>SYNC_CATALOG_VERSION</td>
<td>INTEGER</td>
<td>The version number of the catalog being synchronized.</td>
</tr>
<tr>
<td>SYNC_TRAILING_INTERVAL</td>
<td>INTEGER</td>
<td>The difference between the global catalog version and the synchronized catalog version for a node.</td>
</tr>
<tr>
<td>LAST_SYNC_AT</td>
<td>TIMESTAMPZ</td>
<td>The date and time the last time the catalog was synchronized.</td>
</tr>
</tbody>
</table>

### Example

```sql
=> SELECT * FROM CATALOGSYNCSTATE;
- [ RECORD 1 ]----------------------------------------------------------------
node_name | v_verticadb_node0002
sync_catalog_version | 773
sync_trailing_interval | 0
last_sync_at | 2018-02-07 16:18:32.968146+00
```

## CATALOGTRUNCATIONSTATUS

Indicates how up to date the catalog is on communal storage. It is completely up to date when the current catalog version is the same as the catalog truncation version.

The catalog truncation version (CTV) is the version that a Vertica cluster revives to after a crash, shutdown, or hibernation. There is only one CTV for all nodes in a cluster.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CURRENT_CATALOG_VERSION</td>
<td>INTEGER</td>
<td>The version number of the catalog currently on the cluster.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>TRUNCATION_CATALOG_VERSION</td>
<td>INTEGER</td>
<td>The version number as of the last time the catalog was synced on communal storage.</td>
</tr>
</tbody>
</table>

**Example**

```sql
=> SELECT * FROM CATALOG_TRUNCATION_STATUS;
-[ RECORD 1 ]-------------------
current_catalog_version | 773
truncation_catalog_version | 0
```

**CLIENT_AUTH**

Provides information about the client authentication methods that you created.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTH_OID</td>
<td>INTEGER</td>
<td>Unique identifier for the authentication method.</td>
</tr>
<tr>
<td>AUTH_NAME</td>
<td>VARCHAR</td>
<td>Name that you gave to the authentication method.</td>
</tr>
<tr>
<td>IS_AUTH_ENABLED</td>
<td>BOOLEAN</td>
<td>Indicates whether you enabled the authentication method.</td>
</tr>
<tr>
<td>AUTH_HOST_TYPE</td>
<td>VARCHAR</td>
<td>The authentication host type, one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• LOCAL</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• HOST</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• HOSTSSL</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• HOSTNOSSL</td>
</tr>
<tr>
<td>AUTH_HOST_ADDRESS</td>
<td>VARCHAR</td>
<td>If AUTH_HOST_TYPE is HOST, AUTH_HOST_ADDRESS is the IP address (or address range) of the remote host.</td>
</tr>
</tbody>
</table>
### Column Name | Data Type | Description
--- | --- | ---
**AUTH_METHOD** | VARCHAR | Authentication method to be used.  
**Valid values:**  
- IDENT  
- GSS  
- HASH  
- LDAP  
- REJECT  
- TLS  
- TRUST

**AUTH_PARAMETERS** | VARCHAR | The parameter names and values assigned to the authentication method.

### Examples

This example shows how to get information about each client authentication method that you created:

```sql
=> SELECT auth_name, is_auth_enabled, auth_host_type, auth_host_address, 
    auth_method FROM CLIENT_AUTH;

<table>
<thead>
<tr>
<th>auth_name</th>
<th>is_auth_enabled</th>
<th>auth_host_type</th>
<th>auth_host_address</th>
<th>auth_method</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_ident</td>
<td>True</td>
<td>LOCAL</td>
<td></td>
<td>IDENT</td>
</tr>
<tr>
<td>v_gss</td>
<td>True</td>
<td>HOST</td>
<td>0.0.0.0/0</td>
<td>GSS</td>
</tr>
<tr>
<td>v_trust</td>
<td>False</td>
<td>LOCAL</td>
<td></td>
<td>TRUST</td>
</tr>
<tr>
<td>v ldap</td>
<td>True</td>
<td>HOST</td>
<td>10.19.133.123/</td>
<td>LDAP</td>
</tr>
<tr>
<td>RejectNoSSL</td>
<td>True</td>
<td>HOSTNOSSL</td>
<td>0.0.0.0/0</td>
<td>REJECT</td>
</tr>
<tr>
<td>RejectWithSSL</td>
<td>True</td>
<td>HOSTSSL</td>
<td>0.0.0.0/0</td>
<td>REJECT</td>
</tr>
<tr>
<td>v_hash</td>
<td>False</td>
<td>LOCAL</td>
<td></td>
<td>HASH</td>
</tr>
<tr>
<td>v_tls</td>
<td>True</td>
<td>HOSTSSL</td>
<td>1.1.1.1/0</td>
<td>TLS</td>
</tr>
<tr>
<td>v_trust</td>
<td>True</td>
<td>HOSTSSL</td>
<td>2001:db8:ab:123/128</td>
<td>TLS</td>
</tr>
</tbody>
</table>
```

(9 rows)
CLIENT_AUTH_PARAMS

Provides information about client authentication methods that have parameter values assigned.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTH_OID</td>
<td>INTEGER</td>
<td>A unique identifier for the authentication method.</td>
</tr>
<tr>
<td>AUTH_NAME</td>
<td>VARCHAR</td>
<td>Name that you defined for the authentication method.</td>
</tr>
<tr>
<td>AUTH_PARAMETER_NAME</td>
<td>VARCHAR</td>
<td>Parameter name required by the authentication method. Some examples are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- system_users</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- binddn_prefix</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- host</td>
</tr>
<tr>
<td>AUTH_PARAMETER_VALUE</td>
<td>VARCHAR</td>
<td>Value of the specified parameter.</td>
</tr>
</tbody>
</table>

Examples

This example shows how to retrieve parameter names and values for all authentication methods that you created. The authentication methods that have parameters are:

- v_ident
- v_ldap
- v_ldap1

```sql
=> SELECT * FROM CLIENT_AUTH_PARAMS;
auth_oid | auth_name | auth_parameter_name | auth_parameter_value
---------|----------|--------------------|---------------------
45035996273741304 | v_ident | system_users | root 45035996273741332 |
| v_gss | 45035996273741350 | v_password | 45035996273741368 |
| v_trust | 45035996273741388 | v_ldap | host |
ldap://172.16.65.177 45035996273741388 | v_ldap | binddn_prefix | cn=45035996273741388 | v_ldap | binddn_suffix | ,dc=qa_domain,dc=com 45035996273741406 | RejectNoSSL | | 45035996273741424 | RejectWithSSL | | 45035996273741450 | v_md5 | | 45035996273904044 | 1_tls | | 45035996273906566 | v_hash | | 45035996273910432 | v_ldap1 | host | ldap://172.16.65.177 45035996273910432 | v_ldap1 | basedn | dc=qa_domain,dc=com 45035996273910432 | v_ldap1 | binddn | cn=Manager,dc=qa_domain,dc=com 45035996273910432 | v_ldap1 | bind_password | secret 45035996273910432 | v_ldap1 | search_attribute | cn (17 rows)

**CLUSTER_LAYOUT**

Shows the relative position of the actual arrangement of the nodes participating in the cluster and the fault groups that affect them. Ephemeral nodes are not shown in the cluster layout ring because they hold no resident data.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLUSTER_POSITION</td>
<td>INTEGER</td>
<td>Position of the node in the cluster ring, counting forward from 0.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> An output value of 0 has no special meaning other than there are no nodes in position before the node assigned 0.</td>
</tr>
<tr>
<td>NODE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the node.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The name of the node in the cluster ring. Only permanent nodes participating in database activity appear in the cluster layout. Ephemeral nodes are not shown in the output.</td>
</tr>
<tr>
<td>FAULT_GROUP_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the fault group.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> This value matches the FAULT_GROUP.MEMBER_ID value, but only if this node is in a fault group; otherwise the value is NULL.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>FAULT_GROUP_NAME</td>
<td>VARCHAR</td>
<td>The name of the fault group for the node.</td>
</tr>
<tr>
<td>FAULT_GROUP_TIER</td>
<td>INTEGER</td>
<td>The node's depth in the fault group tree hierarchy. For example is the node:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Is not in a fault group, output is null</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Is in the top level fault group, output is 0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Is in a fault group's child, output is 1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Is a fault group's grandchild, output is 2</td>
</tr>
</tbody>
</table>

COLUMNS

Provides table column information.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TABLE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the table.</td>
</tr>
<tr>
<td>TABLE_SCHEMA</td>
<td>VARCHAR</td>
<td>Schema name for which information is listed in the database.</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR</td>
<td>Table name for which information is listed in the database.</td>
</tr>
<tr>
<td>IS_SYSTEM_TABLE</td>
<td>BOOLEAN</td>
<td>Specifies whether the table is a system table.</td>
</tr>
<tr>
<td>COLUMN_ID</td>
<td>VARCHAR</td>
<td>A unique VARCHAR ID, assigned by the Vertica catalog, that identifies a column in a table.</td>
</tr>
<tr>
<td>COLUMN_NAME</td>
<td>VARCHAR</td>
<td>The column name for which information is listed in the database.</td>
</tr>
<tr>
<td>DATA_TYPE</td>
<td>VARCHAR</td>
<td>Column's data type, for example VARCHAR(16),</td>
</tr>
</tbody>
</table>
### Column Name | Data Type | Description
--- | --- | ---
 |  | INTEGER, or FLOAT. |
DATA_TYPE_ID | INTEGER | Unique numeric ID assigned by the Vertica catalog, which identifies the data type. |
DATA_TYPE_LENGTH | INTEGER | Maximum allowable length of the data type. |
CHARACTER_MAXIMUM_LENGTH | VARCHAR | Maximum allowable length of the column. |
NUMERIC_PRECISION | INTEGER | Number of significant decimal digits. |
NUMERIC_SCALE | INTEGER | Number of fractional digits. |
DATETIME_PRECISION | INTEGER | For TIMESTAMP data type, returns the declared precision; returns NULL if no precision was declared. |
INTERVAL_PRECISION | INTEGER | Number of fractional digits retained in the seconds field. |
ORDINAL_POSITION | INTEGER | Column position respective to other columns in the table. |
IS_NULLABLE | BOOLEAN | Specifies whether the column can contain NULL values. |
COLUMN_DEFAULT | VARCHAR | Expression set on a column with the constraint DEFAULT. |
COLUMN_SET_USING | VARCHAR | Expression set on a column with the constraint SET USING. |
IS_IDENTITY | BOOLEAN | Specifies whether the column is an identity column. See Column-Constraint. |

### Examples

Retrieve table and column information from the COLUMNS table:

```sql
=> SELECT table_schema, table_name, column_name, data_type, is_nullable
FROM columns WHERE table_schema = 'store'
AND data_type = 'Date';
```

<table>
<thead>
<tr>
<th>table_schema</th>
<th>table_name</th>
<th>column_name</th>
<th>data_type</th>
<th>is_nullable</th>
</tr>
</thead>
<tbody>
<tr>
<td>store</td>
<td></td>
<td></td>
<td>Date</td>
<td></td>
</tr>
</tbody>
</table>
DATETIME_PRECISION is NULL because the table definition declares no precision:

```sql
=> CREATE TABLE c (c TIMESTAMP);
CREATE TABLE
=> SELECT table_name, column_name, datetime_precision FROM columns
   WHERE table_name = 'c';
table_name | column_name | datetime_precision
------------|-------------|-------------------------
c           | c           |                         
(1 row)
```

DATETIME_PRECISION is 4 because the table definition declares precision as 4:

```sql
=> DROP TABLE c;
=> CREATE TABLE c (c TIMESTAMP(4));
CREATE TABLE
=> SELECT table_name, column_name, datetime_precision FROM columns
   WHERE table_name = 'c';
table_name | column_name | datetime_precision
------------|-------------|-------------------------
c           | c           | 4                       
```

An identity column is a sequence available only for numeric column types. To identify what column in a table, if any, is an identity column, search the COLUMNS table to find the identity column in a table testid:

```sql
=> CREATE TABLE testid (c1 IDENTITY(1, 1, 1000), c2 INT);
=> \
Expanded display is on.
=> SELECT * FROM COLUMNS WHERE is_identity='t' AND table_name='testid';
-[- RECORD 1 ]------------------------------
table_id | 45035996273719486
table_schema | public
table_name | testid
is_system_table | f
column_id | 45035996273719486-1
column_name | c1
data_type | int
data_type_id | 6
data_type_length | 8
character_maximum_length | 
numeric_precision | 
numeric_scale | 
datetime_precision | 
interval_precision | 
ordinal_position | 1
is_nullable | f
```
Use the SEQUENCES table to get detailed information about the sequence in testid:

```sql
=> SELECT * FROM sequences WHERE identity_table_name='testid';
- [ RECORD 1 ]----------------------------------
sequence_schema | public
sequence_name    | testid_c1_seq
owner_name       | dbadmin
identity_table_name | testid
session_cache_count | 1000
allow_cycle     | f
output_ordered  | f
increment_by     | 1
minimum         | 1
maximum      | 9223372036854775807
current_value  | 0
sequence_schema_id | 45035996273704976
sequence_id     | 45035996273719486
owner_id        | 45035996273704962
identity_table_id | 45035996273719486

For more information about sequences and identity columns, see Sequences.

COMMENTS

Returns information about comments associated with objects in the database.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMENT_ID</td>
<td>INTEGER</td>
<td>The comment's internal ID number</td>
</tr>
<tr>
<td>OBJECT_ID</td>
<td>INTEGER</td>
<td>The internal ID number of the object associated with the comment</td>
</tr>
<tr>
<td>OBJECT_TYPE</td>
<td>VARCHAR</td>
<td>The type of object associated with the comment. Possible values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• COLUMN</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• CONSTRAINT</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• FUNCTION</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• LIBRARY</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• NODE</td>
</tr>
</tbody>
</table>
### CONSTRAINT_COLUMN

Records information about table column constraints.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONSTRAINT_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the constraint.</td>
</tr>
<tr>
<td>TABLE_SCHEMA</td>
<td>VARCHAR</td>
<td>Name of the schema that contains this table.</td>
</tr>
<tr>
<td>TABLE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the table.</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR</td>
<td>Name of the table in which the column resides.</td>
</tr>
<tr>
<td>COLUMN_NAME</td>
<td>VARCHAR</td>
<td>Name of the column that is constrained. For check constraints, if more than one column is referenced,</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>each appears as a separate row.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>CONSTRAINT_NAME</td>
<td>VARCHAR</td>
<td>Constraint name for which information is listed.</td>
</tr>
<tr>
<td>CONSTRAINT_TYPE</td>
<td>CHAR</td>
<td>Indicates the constraint type.</td>
</tr>
<tr>
<td>Valid Values:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• c — check</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• f — foreign</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• n — not null</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• p — primary</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• u — unique</td>
<td></td>
<td></td>
</tr>
<tr>
<td>IS_ENABLED</td>
<td>BOOLEAN</td>
<td>Indicates if a constraint for a primary key, unique key, or check constraint is currently enabled. Can be t (True) or f (False).</td>
</tr>
<tr>
<td>REFERENCE_TABLE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the referenced table</td>
</tr>
<tr>
<td>REFERENCE_TABLE_SCHEMA</td>
<td>VARCHAR</td>
<td>Schema name for which information is listed.</td>
</tr>
<tr>
<td>REFERENCE_TABLE_NAME</td>
<td>VARCHAR</td>
<td>References the TABLE_NAME column in the PRIMARY_KEY table.</td>
</tr>
<tr>
<td>REFERENCE_COLUMN_NAME</td>
<td>VARCHAR</td>
<td>References the COLUMN_NAME column in the PRIMARY_KEY table.</td>
</tr>
</tbody>
</table>

**Privileges**

No explicit privileges are required. You only see the records for tables that you have privileges to view.

**DATABASES**

Provides information about the databases in this Vertica installation.
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATABASE_ID</td>
<td>INTEGER</td>
<td>The database's internal ID number</td>
</tr>
<tr>
<td>DATABASE_NAME</td>
<td>VARCHAR</td>
<td>The database's name</td>
</tr>
<tr>
<td>OWNER_ID</td>
<td>INTEGER</td>
<td>The database owner's ID</td>
</tr>
<tr>
<td>OWNER_NAME</td>
<td>INTEGER</td>
<td>The database owner's name</td>
</tr>
<tr>
<td>START_TIME</td>
<td>TIMESTAMPTZ</td>
<td>The date and time the database last started</td>
</tr>
<tr>
<td>COMPLIANCE_MESSAGE</td>
<td>VARCHAR</td>
<td>Message describing the current state of the database's license compliance.</td>
</tr>
<tr>
<td>EXPORT_SUBNET</td>
<td>VARCHAR</td>
<td>Can be either of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The subnet (on the public network) used by the database for import/export.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The public address of the subnet that the Vertica native load balancing</td>
</tr>
<tr>
<td></td>
<td></td>
<td>uses for load balancing.</td>
</tr>
<tr>
<td>LOAD_BALANCE_POLICY</td>
<td>VARCHAR</td>
<td>The current native connection load balance policy, which controls whether</td>
</tr>
<tr>
<td></td>
<td></td>
<td>client connection requests are redirected to other hosts in the database.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>See About Native Connection Load Balancing in the Administrator's Guide.</td>
</tr>
</tbody>
</table>

Example

=> SELECT * FROM DATABASES;
- [ RECORD 1 ]----------------------------------------------------------------
database_id     | 45035996273704976
database_name   | VMart
owner_id        | 45035996273704962
owner_name      | dbadmin
start_time      | 2017-10-22 05:16:22.066961-04
compliance_message | The database is in compliance with respect to raw data size.
export_subnet   | none
load_balance_policy | none
backend_address_family | ipv4
DIRECTED_QUERIES

Returns information about directed queries.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY_NAME</td>
<td>VARCHAR</td>
<td>This directed query's unique identifier, used by statements such as ACTIVATE DIRECTED QUERY.</td>
</tr>
<tr>
<td>IS_ACTIVE</td>
<td>BOOLEAN</td>
<td>Specifies whether the directed query is active.</td>
</tr>
<tr>
<td>VERTICA_VERSION</td>
<td>VARCHAR</td>
<td>The Vertica version used when this directed query was created.</td>
</tr>
<tr>
<td>COMMENT</td>
<td>VARCHAR</td>
<td>A user-supplied comment specified on creation of the directed query, up to 128 characters.</td>
</tr>
<tr>
<td>CREATION_DATE</td>
<td>TIMESTAMPTZ</td>
<td>Specifies when the directed query was created.</td>
</tr>
<tr>
<td>INPUT_QUERY</td>
<td>VARCHAR</td>
<td>The input query that is associated with this directed query. Multiple directed queries can map to the same input query.</td>
</tr>
<tr>
<td>ANNOTATED_QUERY</td>
<td>VARCHAR</td>
<td>The directed query that was saved with CREATE DIRECTED QUERY.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

Truncated Query Results

Query results for the fields INPUT_QUERY and INPUT_QUERY are truncated after 8192 characters. You can get the full content of both fields in two ways:

- Use the statement GET DIRECTED QUERY.
- Use EXPORT_CATALOG to export directed queries.
DUAL

DUAL is a single-column "dummy" table with one record whose value is X; for example:

```
=> SELECT * FROM DUAL;
    dummy
    ------
       X
    (1 row)
```

You can write the following types of queries:

```
=> SELECT 1 FROM dual;
       ?column?
      ------
        1
    (1 row)
=> SELECT current_timestamp, current_user FROM dual;
       ?column? | current_user
        --------------- | ---------------
2010-03-08 12:57:32.065841-05 | release
(1 row)
=> CREATE TABLE t1(col1 VARCHAR(20), col2 VARCHAR(2));
=> INSERT INTO t1(SELECT 'hello' AS col1, 1 AS col2 FROM dual);
=> SELECT * FROM t1;
   col1 | col2
    ----+----
      hello | 1
    (1 row)
```

Restrictions

You cannot create projections for DUAL.

ELASTIC_CLUSTER

Returns information about cluster elasticity, such as whether Elastic Cluster is running.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCALING_FACTOR</td>
<td>INTEGER</td>
<td>This value is only meaningful when you enable local segments. SCALING_FACTOR influences the number of local segments on each node. Initially—</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td>before a rebalance runs—there are <code>scaling_factor</code> number of local segments per node. A large SCALING_FACTOR is good for rebalancing a potentially wide range of cluster configurations quickly. However, too large a value could lead to ROS pushback, particularly in a database with a table with a large number of partitions. See <code>SET_SCALING_FACTOR</code> for more details.</td>
</tr>
<tr>
<td>MAXIMUM_SKEW_PERCENT</td>
<td>INTEGER</td>
<td>This value is only meaningful when you enable local segments. MAXIMUM_SKEW_PERCENT is the maximum amount of skew a rebalance operation tolerates, which preferentially redistributes local segments; however, if after doing so the segment ranges of any two nodes differs by more than this amount, rebalance will separate and distribute storage to even the distribution.</td>
</tr>
<tr>
<td>SEGMENT_LAYOUT</td>
<td>VARCHAR</td>
<td>Current, offset=0, segment layout. New segmented projections will be created with this layout, with segments rotated by the corresponding offset. Existing segmented projections will be rebalanced into an offset of this layout.</td>
</tr>
<tr>
<td>LOCAL_SEGMENT_LAYOUT</td>
<td>VARCHAR</td>
<td>Similar to SEGMENT_LAYOUT but includes details that indicate the number of local segments, their relative size and node assignment.</td>
</tr>
<tr>
<td>VERSION</td>
<td>INTEGER</td>
<td>Number that gets incremented each time the cluster topology changes (nodes added, marked ephemeral, marked permanent, etc). Useful for monitoring active and past rebalance operations.</td>
</tr>
<tr>
<td>IS_ENABLED</td>
<td>BOOLEAN</td>
<td>True if Elastic Cluster is enabled, otherwise false.</td>
</tr>
<tr>
<td>IS_LOCAL_SEGMENT_ENABLED</td>
<td>BOOLEAN</td>
<td>True if local segments are enabled, otherwise false.</td>
</tr>
<tr>
<td>IS_REBALANCE_RUNNING</td>
<td>BOOLEAN</td>
<td>True if rebalance is currently running, otherwise false.</td>
</tr>
</tbody>
</table>
Privileges

Superuser

- `ENABLE_ELASTIC_CLUSTER`
- `DISABLE_ELASTIC_CLUSTER`
- `Elastic Cluster`

EPOCHS

For all epochs, provides the date and time of the close and the corresponding epoch number of the closed epoch. This information lets you determine which time periods pertain to which epochs.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EPOCH_CLOSE_TIME</td>
<td>DATETIME</td>
<td>The date and time of the close of the epoch.</td>
</tr>
<tr>
<td>EPOCH_NUMBER</td>
<td>INTEGER</td>
<td>The corresponding epoch number of the closed epoch.</td>
</tr>
</tbody>
</table>

- Epoch Management Parameters
- Epoch Management Functions

FAULT_GROUPS

View the fault groups and their hierarchy in the cluster.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td>catalog that identifies the fault group.</td>
</tr>
<tr>
<td>MEMBER_TYPE</td>
<td>VARCHAR</td>
<td>The type of fault group. Values can be either NODE or FAULT GROUP.</td>
</tr>
<tr>
<td>MEMBER_NAME</td>
<td>VARCHAR</td>
<td>Name associated with this fault group. Values will be the node name or the fault group name.</td>
</tr>
<tr>
<td>PARENT_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the parent fault group. The parent fault group can contain:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Nodes</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Other fault groups</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Nodes and other fault groups</td>
</tr>
<tr>
<td>PARENT_TYPE</td>
<td>VARCHAR</td>
<td>The type of parent fault group, where the default/root parent is the DATABASE object. Can be one of the following objects:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- FAULT GROUP</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- DATABASE</td>
</tr>
<tr>
<td>PARENT_NAME</td>
<td>VARCHAR</td>
<td>The name of the fault group that contains nodes or other fault groups or both nodes and fault groups.</td>
</tr>
<tr>
<td>IS_AUTOMATICALLYGENERATED</td>
<td>BOOLEAN</td>
<td>If true, denotes whether Vertica Analytic Database created fault groups for you to manage the fault tolerance of control nodes in large cluster configurations. If false, denotes that you created fault groups manually. See Fault Groups for more information</td>
</tr>
</tbody>
</table>

**Examples**

Show the current hierarchy of fault groups in the cluster:
vmartdb=> SELECT member_type, member_name, parent_type, CASE
    WHEN parent_type = 'DATABASE' THEN ''
    ELSE parent_name END FROM fault_groups
ORDER BY member_name;

<table>
<thead>
<tr>
<th>member_type</th>
<th>member_name</th>
<th>parent_type</th>
<th>parent_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE</td>
<td>v_vmart_node0001</td>
<td>FAULT GROUP</td>
<td>two</td>
</tr>
<tr>
<td>NODE</td>
<td>v_vmart_node0002</td>
<td>FAULT GROUP</td>
<td>two</td>
</tr>
<tr>
<td>NODE</td>
<td>v_vmart_node0003</td>
<td>FAULT GROUP</td>
<td>three</td>
</tr>
<tr>
<td>FAULT GROUP</td>
<td>one</td>
<td>DATABASE</td>
<td></td>
</tr>
<tr>
<td>FAULT GROUP</td>
<td>three</td>
<td>DATABASE</td>
<td></td>
</tr>
<tr>
<td>FAULT GROUP</td>
<td>two</td>
<td>FAULT GROUP</td>
<td>one</td>
</tr>
</tbody>
</table>

View the distribution of the segment layout:

vmartdb=> SELECT segment_layout from elastic_cluster;

<table>
<thead>
<tr>
<th>segment_layout</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_vmart_node0001[33.3%] v_vmart_node0003[33.3%] v_vmart_node0004[33.3%]</td>
</tr>
</tbody>
</table>

(1 row)

FOREIGN_KEYS

Provides foreign key information.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONSTRAINT_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the constraint.</td>
</tr>
<tr>
<td>CONSTRAINT_NAME</td>
<td>VARCHAR</td>
<td>The constraint name for which information is listed.</td>
</tr>
<tr>
<td>COLUMN_NAME</td>
<td>VARCHAR</td>
<td>The name of the column that is constrained.</td>
</tr>
<tr>
<td>ORDINAL_POSITION</td>
<td>VARCHAR</td>
<td>The position of the column within the key. The numbering of columns starts at 1.</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR</td>
<td>The table name for which information is listed.</td>
</tr>
<tr>
<td>REFERENCE_TABLE_NAME</td>
<td>VARCHAR</td>
<td>References the TABLE_NAME column in the</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CONSTRAINT_TYPE</td>
<td>VARCHAR</td>
<td>The constraint type, f, for foreign key.</td>
</tr>
<tr>
<td>REFERENCE_COLUMN_NAME</td>
<td>VARCHAR</td>
<td>References the COLUMN_NAME column in the PRIMARY_KEY table.</td>
</tr>
<tr>
<td>TABLE_SCHEMA</td>
<td>VARCHAR</td>
<td>The schema name for which information is listed.</td>
</tr>
<tr>
<td>REFERENCE_TABLE_SCHEMA</td>
<td>VARCHAR</td>
<td>References the TABLE_SCHEMA column in the PRIMARY_KEY table.</td>
</tr>
</tbody>
</table>

Example

```
mydb=> SELECT
    constraint_name,
    table_name,
    ordinal_position,
    reference_table_name
FROM foreign_keys ORDER BY 3;

<table>
<thead>
<tr>
<th>constraint_name</th>
<th>table_name</th>

</table>
```

(26 rows)
GRANTS

Provides information about privileges granted on various objects, the granting user, and grantee user. The order of columns in the table corresponds to the order in which they appear in the GRANT command. The GRANTS table does not retain the role grantor.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANTEE</td>
<td>VARCHAR</td>
<td>The user being granted permission.</td>
</tr>
<tr>
<td>GRANTEE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the user granted permissions.</td>
</tr>
<tr>
<td>GRANT_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the</td>
</tr>
<tr>
<td>GRANTOR</td>
<td>VARCHAR</td>
<td>The user granting the permission.</td>
</tr>
<tr>
<td>GRANTOR_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the user who performed the grant operation.</td>
</tr>
<tr>
<td>OBJECT_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the object granted.</td>
</tr>
<tr>
<td>OBJECT_NAME</td>
<td>VARCHAR</td>
<td>The name of the object that is being granted privileges. Note that for schema privileges, the schemaname appears in the OBJECT_NAME column instead of the OBJECT_SCHEMA column.</td>
</tr>
<tr>
<td>OBJECT_SCHEMA</td>
<td>VARCHAR</td>
<td>The name of the schema that is being granted privileges.</td>
</tr>
<tr>
<td>OBJECT_TYPE</td>
<td>VARCHAR</td>
<td>The object type on which the grant was applied; for example, ROLE, SCHEMA, DATABASE, RESOURCEPOOL. Output from this column is useful in cases where a schema, resource pool, or user share the same name.</td>
</tr>
<tr>
<td>PRIVILEGES_DESCRIPTION</td>
<td>VARCHAR</td>
<td>A readable description of the privileges being granted; for example INSERT, SELECT. An asterisk in PRIVILEGES_DESCRIPTION output indicates a privilege WITH GRANT OPTION.</td>
</tr>
</tbody>
</table>
Notes

The vsql commands \dp and \z both include the schema name in the output. For example:

```plaintext
=> \dp
Access privileges for database "vmartdb"
Grantee | Grantor | Privileges | Schema | Name
---------|---------|------------|--------|------
| dbadmin | USAGE   |            | public |      
| dbadmin | USAGE   |            | v_internal |     
| dbadmin | USAGE   |            | v_catalog |      
| dbadmin | USAGE   |            | v_monitor |      
| dbadmin | USAGE   |            | v_internal |     
| dbadmin | USAGE   |            | v_catalog |      
| dbadmin | USAGE   |            | v_monitor |      
| dbadmin | USAGE   |            | v_internal |     
| dbadmin | USAGE   |            | designer_system | 

(9 rows)
```

The vsql command \dp *.tablename displays table names in all schemas. This command lets you distinguish grants for same-named tables in different schemas:

```plaintext
=> \dp *.events
Access privileges for database "dbadmin"
Grantee | Grantor | Privileges | Schema | Name
---------|---------|------------|--------|------
user2    | dbadmin | INSERT, SELECT, UPDATE, DELETE, REFERENCES | schema1 | events
user1    | dbadmin | SELECT     | schema1 | events
user2    | dbadmin | INSERT, SELECT, UPDATE, DELETE, REFERENCES | schema2 | events
user1    | dbadmin | INSERT, SELECT | schema2 | events

(4 rows)
```

The vsql command \dp schemaname.* displays all tables in the named schema:

```plaintext
=> \dp schema1.*
Access privileges for database "dbadmin"
Grantee | Grantor | Privileges | Schema | Name
---------|---------|------------|--------|------
user2    | dbadmin | INSERT, SELECT, UPDATE, DELETE, REFERENCES | schema1 | events
user1    | dbadmin | SELECT     | schema1 | events

(2 rows)
```

Examples

This example shows CREATE and USAGE privileges granted to Bob in the fictitious apps database:

```sql
=> SELECT grantor, privileges_description, object_schema, object_name, grantee
    FROM grants;
```
This next query looks for privileges granted to a particular set of grantees. The asterisk in `privileges_description` column for User1 means that user has WITH GRANT OPTION privileges.

```sql
=> SELECT grantor, privileges_description, object_schema, object_name, grantee
    FROM grants WHERE grantee 'User%';
```

In the following example, `online_sales` is the schema that first gets privileges, and then inside that schema the anchor table gets SELECT privileges:

```sql
=> SELECT grantee, grantor, privileges_description, object_schema, object_name
    FROM grants WHERE grantee='u1' ORDER BY object_name;
```

The following statement shows all grants for user Bob:

```sql
-> SELECT * FROM GRANTS WHERE grantee = 'Bob';
```

<table>
<thead>
<tr>
<th>grantor</th>
<th>privileges_description</th>

HCATALOG_COLUMNS

Describes the columns of all tables available through the HCatalog Connector. Each row in this table corresponds to a column in a table accessible through the HCatalog Connector. See [Using the HCatalog Connector](https://vertica.com/docs/integration-guide) in [Integrating with Apache Hadoop](https://vertica.com/docs/integration-guide) for more information.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TABLE_SCHEMA</td>
<td>VARCHAR (128)</td>
<td>The name of the Vertica Analytic Database schema that contains the table containing this column</td>
</tr>
<tr>
<td>HCATALOG_SCHEMA</td>
<td>VARCHAR (128)</td>
<td>The name of the Hive schema or database that contains the table containing this column</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR (128)</td>
<td>The name of the table that contains the column</td>
</tr>
<tr>
<td>IS_PARTITION_COLUMN</td>
<td>BOOLEAN</td>
<td>Whether the table is partitioned on this column</td>
</tr>
<tr>
<td>COLUMN_NAME</td>
<td>VARCHAR (128)</td>
<td>The name of the column</td>
</tr>
<tr>
<td>HCATALOG_DATA_TYPE</td>
<td>VARCHAR (128)</td>
<td>The Hive data type of this column</td>
</tr>
<tr>
<td>DATA_TYPE</td>
<td>VARCHAR (128)</td>
<td>The Vertica Analytic Database data type of this column</td>
</tr>
<tr>
<td>DATA_TYPE_ID</td>
<td>INTEGER</td>
<td>Numeric ID of the column's Vertica Analytic Database data type</td>
</tr>
<tr>
<td>DATA_TYPE_LENGTH</td>
<td>INTEGER</td>
<td>The number of bytes used to store this data type</td>
</tr>
<tr>
<td>CHARACTER_MAXIMUM_LENGTH</td>
<td>INTEGER</td>
<td>For string data types, the maximum number of characters it can hold</td>
</tr>
<tr>
<td>NUMERIC_PRECISION</td>
<td>INTEGER</td>
<td>For numeric types, the precision of the values in the column</td>
</tr>
<tr>
<td>NUMERIC_SCALE</td>
<td>INTEGER</td>
<td>For numeric data types, the scale of the values in the column</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DATETIME_</td>
<td>INTEGER</td>
<td>For datetime data types, the precision of the values in the column</td>
</tr>
<tr>
<td>PRECISION</td>
<td></td>
<td></td>
</tr>
<tr>
<td>INTERVAL_</td>
<td>INTEGER</td>
<td>For interval data types, the precision of the values in the column</td>
</tr>
<tr>
<td>PRECISION</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ORDINAL_</td>
<td>INTEGER</td>
<td>The position of the column within the table</td>
</tr>
<tr>
<td>POSITION</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Privileges**

No explicit permissions are required; however, users see only the records that correspond to schemas they have permissions to access.

**Notes**

If you are using WebHCat instead of HiveServer2, querying this table results in one web service call to the WebHCat server for each table in each HCatalog schema. If you need to perform multiple queries on this table in a short period of time, consider creating a copy of the table using a CREATE TABLE AS statement to improve performance. The copy does not reflect any changes made to the schema of the Hive tables after it was created, but it is much faster to query.

**Example**

The following example demonstrates finding the column information for a specific table:

```sql
=> SELECT * FROM HCATALOG_COLUMNS WHERE table_name = 'hcatalogtypes'
-> ORDER BY ordinal_position;
-[ RECORD 1 ]-------------------------
table_schema | hcat
hcatalog_schema | default
table_name | hcatalogtypes
is_partition_column | f
column_name | intcol
hcatalog_data_type | int
data_type | int
data_type_id | 6
data_type_length | 8
character_maximum_length |
numeric_precision |
numeric_scale |
```
<table>
<thead>
<tr>
<th>datetime_precision</th>
<th>interval_precision</th>
<th>ordinal_position</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>1</td>
</tr>
</tbody>
</table>

```
[RECORD 2]-----------------------------
table_schema | hcat
catalog_schema | default
table_name | hcatalogtypes
is_partition_column | f
column_name | floatcol
catalog_data_type | float
data_type | float
data_type_id | 7
data_type_length | 8
character_maximum_length |       
numeric_precision |       
numeric_scale |       
datetime_precision |       
interval_precision |       
ordinal_position | 2
```

```
[RECORD 3]-----------------------------
table_schema | hcat

#### HCATALOG_SCHEMATA

Lists all of the schemas defined using the HCatalog Connector. See [Using the HCatalog Connector](#) in Integrating with Apache Hadoop.

Unlike other HCatalog Connector-related system tables, this table makes no calls to Hive, so querying incurs very little overhead.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMA_ID</td>
<td>INTEGER</td>
<td>The Vertica Analytic Database ID number for the schema</td>
</tr>
<tr>
<td>SCHEMA_NAME</td>
<td>VARCHAR(128)</td>
<td>The name of the schema defined in the Vertica Analytic Database catalog</td>
</tr>
<tr>
<td>SCHEMA_OWNER_ID</td>
<td>INTEGER</td>
<td>The ID number of the user who owns the Vertica Analytic Database schema</td>
</tr>
<tr>
<td>SCHEMA_OWNER</td>
<td>VARCHAR(128)</td>
<td>The username of the Vertica Analytic Database schema's owner</td>
</tr>
<tr>
<td>CREATE_TIME</td>
<td>TIMESTAMPTZ</td>
<td>The date and time the schema as created</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>HOSTNAME</td>
<td>VARCHAR(128)</td>
<td>The host name or IP address of the database server that holds the Hive metadata</td>
</tr>
<tr>
<td>PORT</td>
<td>INTEGER</td>
<td>The port number on which the metastore database listens for connections</td>
</tr>
<tr>
<td>HIVESERVER2_HOSTNAME</td>
<td>VARCHAR(128)</td>
<td>The host name or IP address of the HiveServer2 server for the Hive database</td>
</tr>
<tr>
<td>WEBSERVICE_HOSTNAME</td>
<td>VARCHAR(128)</td>
<td>The host name or IP address of the WebHCat server for the Hive database, if used</td>
</tr>
<tr>
<td>WEBSERVICE_PORT</td>
<td>INTEGER</td>
<td>The port number on which the WebHCat server listens for connections</td>
</tr>
<tr>
<td>WEBHDFS_ADDRESS</td>
<td>VARCHAR (128)</td>
<td>The host and port (&quot;host:port&quot;) for the WebHDFS service, used for reading ORC and Parquet files</td>
</tr>
<tr>
<td>HCATALOG_SCHEMA_NAME</td>
<td>VARCHAR(128)</td>
<td>The name of the schema or database in Hive to which the Vertica Analytic Database schema is mapped/</td>
</tr>
<tr>
<td>HCATALOG_USER_NAME</td>
<td>VARCHAR(128)</td>
<td>The username the HCatalog Connector uses to authenticate itself to the Hive database.</td>
</tr>
<tr>
<td>HCATALOG_CONNECTION_TIMEOUT</td>
<td>INTEGER</td>
<td>The number of seconds the HCatalog Connector waits for a successful connection to the HiveServer or WebHCat server. A value of 0 means wait indefinitely.</td>
</tr>
<tr>
<td>HCATALOG_SLOW_TRANSFER_LIMIT</td>
<td>INTEGER</td>
<td>The lowest data transfer rate (in bytes per second) from the HiveServer2 or WebHCat server that the HCatalog Connector accepts.</td>
</tr>
<tr>
<td>HCATALOG_SLOW_TRANSFER_TIME</td>
<td>INTEGER</td>
<td>The number of seconds the HCatalog Connector waits before enforcing the data transfer rate lower limit by breaking the connection and terminating the query.</td>
</tr>
<tr>
<td>SSL_CONFIG</td>
<td>VARCHAR(128)</td>
<td>The path of the Hadoop ssl-client.xml configuration file, if using HiveServer2 with SSL wire encryption.</td>
</tr>
</tbody>
</table>
### Privileges

No explicit permissions are required; however, users see only the records that correspond to schemas they have permissions to access.

</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR(128)</td>
<td>The name of the table</td>
</tr>
<tr>
<td>HCATALOG_USER_NAME</td>
<td>VARCHAR(128)</td>
<td>The name of the HCatalog user whose credentials are used to access the table's data</td>
</tr>
<tr>
<td>MIN_FILE_SIZE_BYTES</td>
<td>INTEGER</td>
<td>The file size of the table's smallest data file, if using WebHCat; null if using HiveServer2</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>TOTAL_NUMBER_FILES</td>
<td>INTEGER</td>
<td>The number of files used to store this table's data in HDFS</td>
</tr>
<tr>
<td>LOCATION</td>
<td>VARCHAR(8192)</td>
<td>The URI for the directory containing this table's data, normally an HDFS URI</td>
</tr>
<tr>
<td>LAST_UPDATE_TIME</td>
<td>TIMESTAMPTZ</td>
<td>The last time data in this table was updated, if using WebHCat; null if using HiveServer2</td>
</tr>
<tr>
<td>OUTPUT_FORMAT</td>
<td>VARCHAR(128)</td>
<td>The Hive SerDe class used to output data from this table</td>
</tr>
<tr>
<td>LAST_ACCESS_TIME</td>
<td>TIMESTAMPTZ</td>
<td>The last time data in this table was accessed, if using WebHCat; null if using HiveServer2</td>
</tr>
<tr>
<td>MAX_FILE_SIZE_BYTES</td>
<td>INTEGER</td>
<td>The size of the largest data file for this table, if using WebHCat; null if using HiveServer2</td>
</tr>
<tr>
<td>IS_PARTITIONED</td>
<td>BOOLEAN</td>
<td>Whether this table is partitioned</td>
</tr>
<tr>
<td>PARTITION_EXPRESSION</td>
<td>VARCHAR(128)</td>
<td>The expression used to partition this table</td>
</tr>
<tr>
<td>TABLE_OWNER</td>
<td>VARCHAR(128)</td>
<td>The Hive user that owns this table in the Hive database, if using WebHCat; null if using HiveServer2</td>
</tr>
<tr>
<td>INPUT_FORMAT</td>
<td>VARCHAR(128)</td>
<td>The SerDe class used to read the data from this table</td>
</tr>
<tr>
<td>TOTAL_FILE_SIZE_BYTES</td>
<td>INTEGER</td>
<td>Total number of bytes used by all of this table's data files</td>
</tr>
<tr>
<td>HCATALOG_GROUP</td>
<td>VARCHAR(128)</td>
<td>The permission group assigned to this table, if using WebHCat; null if using HiveServer2</td>
</tr>
<tr>
<td>PERMISSION</td>
<td>VARCHAR(128)</td>
<td>The Unix file permissions for this group, as shown by the 1s -1 command, if using WebHCat; null if using HiveServer2</td>
</tr>
</tbody>
</table>
Privileges

No explicit permissions are required; however, users see only the records that correspond to schemas they have permissions to access.

- HCATALOG_SCHEMATA
- HCATALOG_COLUMNS
- HCATALOG_TABLE_LIST

HCATALOG_TABLE_LIST

A concise list of all tables contained in all Hive schemas and databases available through the HCatalog Connector. See Using the HCatalog Connector in Integrating with Apache Hadoop.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TABLE_SCHEMA_ID</td>
<td>INTEGER</td>
<td>Internal ID number for the schema containing the table</td>
</tr>
<tr>
<td>TABLE_SCHEMA</td>
<td>VARCHAR(128)</td>
<td>Name of the Vertica Analytic Database schema through which the table is available</td>
</tr>
<tr>
<td>HCATALOG_SCHEMA</td>
<td>VARCHAR(128)</td>
<td>Name of the Hive schema or database containing the table</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR(128)</td>
<td>The name of the table</td>
</tr>
<tr>
<td>HCATALOG_USER_NAME</td>
<td>VARCHAR(128)</td>
<td>Name of Hive user used to access the table</td>
</tr>
</tbody>
</table>

Privileges

No explicit permissions are required; however, users see only the records that correspond to schemas they have permissions to access.
Notes

- Querying this table results in one call to HiveServer2 for each Hive schema defined using the HCatalog Connector. This means that the query usually takes longer than querying other system tables.

- Querying this table is faster than querying HCATALOG_TABLES. Querying HCATALOG_TABLE_LIST only makes one HiveServer2 call per HCatalog schema versus one call per table for HCATALOG_TABLES.

Example

The following example demonstrates defining a new HCatalog schema then querying HCATALOG_TABLE_LIST. Note that one table defined in a different HCatalog schema also appears. HCATALOG_TABLE_LIST lists all of the tables available in any of the HCatalog schemas:

```sql
=> CREATE HCATALOG SCHEMA hcat WITH hostname='hcathost'
-> HCATALOG_SCHEMA='default' HCATALOG_DB='default' HCATALOG_USER='hcatuser';
CREATE SCHEMA
=> \x
Expanded display is on.
=> SELECT * FROM v_catalog.hcatalog_table_list;
- [ RECORD 1 ] ------------------------------
  table_schema_id | 45035996273748980
  table_schema    | hcat
  hcatalog_schema | default
  table_name      | weblogs
  hcatalog_user_name | hcatuser
- [ RECORD 2 ] ------------------------------
  table_schema_id | 45035996273748980
  table_schema    | hcat
  hcatalog_schema | default
  table_name      | tweets
  hcatalog_user_name | hcatuser
- [ RECORD 3 ] ------------------------------
  table_schema_id | 45035996273748980
  table_schema    | hcat
  hcatalog_schema | default
  table_name      | messages
  hcatalog_user_name | hcatuser
- [ RECORD 4 ] ------------------------------
  table_schema_id | 45035996273864948
  table_schema    | hiveschema
  hcatalog_schema | default
  table_name      | weblogs
  hcatalog_user_name | hcatuser
```

### KEYWORDS

Identifies Vertica reserved and non-reserved keywords.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KEYWORD</td>
<td>VARCHAR</td>
<td>Vertica reserved or non-reserved keyword.</td>
</tr>
<tr>
<td>RESERVED</td>
<td>VARCHAR</td>
<td>Indicates whether a keyword is reserved or non-reserved:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- R: reserved</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- N: non-reserved</td>
</tr>
</tbody>
</table>

### Examples

The following is a small sample of the contents of the KEYWORDS table:

```
=> SELECT * FROM KEYWORDS;
  keyword | reserved
----------+----------
  ABORT   | N        
  ABSOLUTE| N        
  ACCESS  | N        
  ACCESSRANK| N     
  ACCOUNT | N        
  ACTION  | N        
  ACTIVATE| N        
  ACTIVEPARTITIONCOUNT| N 
  ADD     | N        
  ADMIN   | N        
  AFTER   | N        
  AGGREGATE| N      
  ALL     | R        
  ALSO    | N        
  ALTER   | N        
  ANALYZE | N        
  ANALYTIC| N       
```

Keywords

LARGE_CLUSTER_CONFIGURATION_STATUS

Shows the current cluster nodes and control node (spread hosts) designations in the Catalog so you can see if they match.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The name of the node in the cluster.</td>
</tr>
<tr>
<td>SPREAD_HOST_NAME</td>
<td>VARCHAR</td>
<td>The host name of the control node (the host that manages control message responsibilities)</td>
</tr>
<tr>
<td>CONTROL_NODE_NAME</td>
<td>VARCHAR</td>
<td>The name of the control node</td>
</tr>
</tbody>
</table>

<tr>
<td>CELL_COUNT</td>
<td>INTEGER</td>
<td>The number of cells in the database</td>
</tr>
<tr>
<td>AUDITED_DATA</td>
<td>VARCHAR</td>
<td>The type of data audited, which includes regular (non-flex), flex, external, and total data</td>
</tr>
</tbody>
</table>

**LICENSES**

For all licenses, provides information on license types, the dates for which licenses are valid, and the limits the licenses impose.
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LICENSE_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID assigned by the Vertica catalog, which identifies the license.</td>
</tr>
<tr>
<td>NAME</td>
<td>VARCHAR</td>
<td>The license’s name. (The license name in this column could be represented by a long license key.)</td>
</tr>
<tr>
<td>LICENSEE</td>
<td>VARCHAR</td>
<td>The entity to which the product is licensed.</td>
</tr>
<tr>
<td>START_DATE</td>
<td>VARCHAR</td>
<td>The start date for which the license is valid.</td>
</tr>
<tr>
<td>END_DATE</td>
<td>VARCHAR</td>
<td>The end date until which the license is valid (or &quot;Perpetual&quot; if the license has no expiration).</td>
</tr>
<tr>
<td>LICENSETYPE</td>
<td>VARCHAR</td>
<td>The type of the license (for example, Premium Edition).</td>
</tr>
<tr>
<td>PARENT</td>
<td>VARCHAR</td>
<td>The parent license (field is blank if there is no parent).</td>
</tr>
<tr>
<td>SIZE</td>
<td>VARCHAR</td>
<td>The size limit for data on the license.</td>
</tr>
<tr>
<td>IS_SIZE_LIMIT_ENFORCED</td>
<td>BOOLEAN</td>
<td>Indicates whether the license includes enforcement of data and node limits, where t is true and f is false.</td>
</tr>
<tr>
<td>NODE_RESTRICTION</td>
<td>VARCHAR</td>
<td>The node limit the license imposes.</td>
</tr>
<tr>
<td>CONFIGURED_ID</td>
<td>INTEGER</td>
<td>A long license key.</td>
</tr>
</tbody>
</table>

**LOG_PARAMS**

Provides summary information about changes to configuration parameters related to authentication and security run in your database.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISSUED_TIME</td>
<td>VARCHAR</td>
<td>The time at which the query was executed.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>Name of the user who issued the query at the time Vertica recorded the session.</td>
</tr>
<tr>
<td>USER_ID</td>
<td>INTEGER</td>
<td>Numeric representation of the user who ran the query.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>HOSTNAME</td>
<td>VARCHAR</td>
<td>The hostname, IP address, or URL of the database server.</td>
</tr>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.</td>
</tr>
<tr>
<td>AUDIT_TYPE</td>
<td>VARCHAR</td>
<td>The type of operation for the audit, in this case, Parameter.</td>
</tr>
<tr>
<td>AUDIT_TAG_NAME</td>
<td>VARCHAR</td>
<td>The tag for the specific parameter.</td>
</tr>
<tr>
<td>REQUEST_TYPE</td>
<td>VARCHAR</td>
<td>The type of query request.</td>
</tr>
<tr>
<td>REQUEST_ID</td>
<td>INTEGER</td>
<td>Unique identifier of the query request in the user session.</td>
</tr>
<tr>
<td>SUBJECT</td>
<td>VARCHAR</td>
<td>The new value of the parameter.</td>
</tr>
<tr>
<td>REQUEST</td>
<td>VARCHAR</td>
<td>Lists the query request.</td>
</tr>
<tr>
<td>SUCCESS</td>
<td>VARCHAR</td>
<td>Indicates whether or not the operation was successful.</td>
</tr>
<tr>
<td>CATEGORY</td>
<td>VARCHAR</td>
<td>The audit parent category, such as Authentication.</td>
</tr>
</tbody>
</table>

### Example

The following example queries the LOG_PARAMS system table and shows only the most recent configuration parameter for this user under the Authentication category:

```sql
=> SELECT * FROM log_params limit 1;
```

```sql
<table>
<thead>
<tr>
<th>issued_time</th>
<th>2018-02-12 13:41:20.837452-05</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_name</td>
<td>dbadmin</td>
</tr>
<tr>
<td>user_id</td>
<td>45035996273704962</td>
</tr>
<tr>
<td>hostname</td>
<td>::1:50690</td>
</tr>
<tr>
<td>session_id</td>
<td>v_vmart_node0001-341751:0x13878</td>
</tr>
<tr>
<td>audit_type</td>
<td>Param</td>
</tr>
<tr>
<td>audit_tag_name</td>
<td>SecurityAlgorithm</td>
</tr>
<tr>
<td>request_type</td>
<td>UTILITY</td>
</tr>
<tr>
<td>request_id</td>
<td>8</td>
</tr>
<tr>
<td>subject</td>
<td>MD5</td>
</tr>
<tr>
<td>request</td>
<td>select set_config_parameter('SecurityAlgorithm','MD5',null);</td>
</tr>
<tr>
<td>success</td>
<td>t</td>
</tr>
</tbody>
</table>
```
LOG_QUERIES

Provides summary information about some queries related to authentication and security run in your database.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISSUED_TIME</td>
<td>VARCHAR</td>
<td>The time at which the query was executed.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>Name of the user who issued the query at the time Vertica recorded the session.</td>
</tr>
<tr>
<td>USER_ID</td>
<td>INTEGER</td>
<td>Numeric representation of the user who ran the query.</td>
</tr>
<tr>
<td>HOSTNAME</td>
<td>VARCHAR</td>
<td>The hostname, IP address, or URL of the database server.</td>
</tr>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.</td>
</tr>
<tr>
<td>AUDIT_TYPE</td>
<td>VARCHAR</td>
<td>The type of operation for the audit, in this case, Query.</td>
</tr>
<tr>
<td>AUDIT_TAG_NAME</td>
<td>VARCHAR</td>
<td>The tag for the specific query.</td>
</tr>
<tr>
<td>REQUEST_TYPE</td>
<td>VARCHAR</td>
<td>The type of query request. Examples include, but are not limited to:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• QUERY</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• DDL</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• LOAD</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• UTILITY</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• TRANSACTION</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• PREPARE</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td>EXECUTE</td>

<tr>
<td></td>
<td></td>
<td>SHOW</td>
</tr>
<tr>
<td>REQUEST_ID</td>
<td>INTEGER</td>
<td>The ID of the query request.</td>
</tr>
<tr>
<td>SUBJECT</td>
<td>VARCHAR</td>
<td>The subject of the query.</td>
</tr>
<tr>
<td>REQUEST</td>
<td>VARCHAR</td>
<td>Lists the query request.</td>
</tr>
<tr>
<td>SUCCESS</td>
<td>VARCHAR</td>
<td>Indicates whether or not the operation was successful.</td>
</tr>
<tr>
<td>CATEGORY</td>
<td>VARCHAR</td>
<td>The audit parent category, such as Managing_Users_Privileges.</td>
</tr>
</tbody>
</table>

**Example**

The following example queries the LOG QUERIES system table and shows only the most recent query for this user under the Managing_Users_Privileges category:

```sql
=> SELECT * FROM log_queries limit 1;
```

<table>
<thead>
<tr>
<th>issued_time</th>
<th>user_name</th>
<th>user_id</th>
<th>hostname</th>
<th>session_id</th>
<th>audit_type</th>
<th>audit_tag_name</th>
<th>request_type</th>
<th>request_id</th>
<th>subject</th>
<th>request</th>
<th>success</th>
<th>category</th>
</tr>
</thead>
<tbody>
<tr>
<td>2018-01-22</td>
<td>dbadmin</td>
<td>45035996273704962</td>
<td></td>
<td>v_vmart_node0001-237210:0x37e1d</td>
<td>Query</td>
<td>REVOKE ROLE</td>
<td>DDL</td>
<td>2</td>
<td>revoke all privileges from Joe;</td>
<td>f</td>
<td>Managing_Users_Privileges</td>
<td></td>
</tr>
</tbody>
</table>

1 row

**LOG_TABLES**

Provides summary information about system tables that are being queried or accessed in your database.
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISSUED_TIME</td>
<td>VARCHAR</td>
<td>The time at which the query was executed.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>Name of the user who issued the query at the time Vertica recorded the session.</td>
</tr>
<tr>
<td>USER_ID</td>
<td>INTEGER</td>
<td>Numeric representation of the user who ran the query.</td>
</tr>
<tr>
<td>HOSTNAME</td>
<td>VARCHAR</td>
<td>The hostname, IP address, or URL of the database server.</td>
</tr>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.</td>
</tr>
<tr>
<td>AUDIT_TYPE</td>
<td>VARCHAR</td>
<td>The type of operation for the audit, in this case, Table.</td>
</tr>
<tr>
<td>AUDIT_TAG_NAME</td>
<td>VARCHAR</td>
<td>The tag for the specific table.</td>
</tr>
<tr>
<td>REQUEST_TYPE</td>
<td>VARCHAR</td>
<td>The type of query request. In this case, QUERY.</td>
</tr>
<tr>
<td>REQUEST_ID</td>
<td>INTEGER</td>
<td>Unique identifier of the query request in the user session.</td>
</tr>
<tr>
<td>SUBJECT</td>
<td>VARCHAR</td>
<td>The name of the table that was queried.</td>
</tr>
<tr>
<td>REQUEST</td>
<td>VARCHAR</td>
<td>Lists the query request.</td>
</tr>
<tr>
<td>SUCCESS</td>
<td>VARCHAR</td>
<td>Indicates whether or not the operation was successful.</td>
</tr>
<tr>
<td>CATEGORY</td>
<td>VARCHAR</td>
<td>The audit parent category, such as Managing_Config_Parameters.</td>
</tr>
</tbody>
</table>

**Example**

The following example queries the LOG_TABLES system table and shows only the most recent table for this user under the Managing_Config_Parameters category:

```
=> SELECT * FROM log_tables limit 1;

| issued_time | 2018-01-18 11:37:56.939267-05 |
```
user_name   | dadmin
user_id      | 45035996273704962
hostname     |
session_id   | v_vmart_node0001-236982:0x16
audit_type   | Table
audit_tag_name| vs_nodes
request_type | QUERY
request_id   | 12
subject      |
request      | select oid,name,address,catalogpath,clientport,controlnode from v_internal.vs_nodes where name = 'v_vmart_node0001';
success      | t
category     | Managing_Users_Privileges
(1 row)

MATERIALIZE_FLEXTABLE_COLUMNS_RESULTS

Returns the results after you run the flex table function, MATERIALIZE_FLEXTABLE_COLUMNS. The system table includes the following information:

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TABLE_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID assigned by the Vertica catalog, which identifies the license.</td>
</tr>
<tr>
<td>TABLE_SCHEMA</td>
<td>VARCHAR</td>
<td>The license’s name.</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR</td>
<td>The Vertica product toward which the license is applied.</td>
</tr>
<tr>
<td>CREATION_TIME</td>
<td>VARCHAR</td>
<td>The start date for which the license is valid.</td>
</tr>
<tr>
<td>KEY_NAME</td>
<td>VARCHAR</td>
<td>The end date until which the license is valid (or &quot;Perpetual&quot; if the license has no expiration).</td>
</tr>
<tr>
<td>STATUS</td>
<td>VARCHAR</td>
<td>The function status, which can be one of these values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- ADDED</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- EXISTS</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- ERROR</td>
</tr>
<tr>
<td>MESSAGE</td>
<td>BOOLEAN</td>
<td>The message associated with the status in the previous</td>
</tr>
</tbody>
</table>
### Column Name | Data Type | Description
---|---|---
| | | column, one of the following:
| | | - Added successfully
| | | - Column of same name already exists in table definition
| | | - Add operation failed
| | | - No data type guess provided to add column

**Example**

```sql
=> SELECT table_name, creation_time, key_name, status, message FROM v_catalog.materialize_flextable_columns_results WHERE table_name = 'twitter_r';
```

<table>
<thead>
<tr>
<th>table_name</th>
<th>creation_time</th>
<th>key_name</th>
<th>status</th>
<th>message</th>
</tr>
</thead>
<tbody>
<tr>
<td>twitter_r</td>
<td>2013-11-20 17:00:27.945484-05</td>
<td>contributors</td>
<td>ADDED</td>
<td>Added successfully</td>
</tr>
<tr>
<td>twitter_r</td>
<td>2013-11-20 17:00:27.94551-05</td>
<td>entities.hashtags</td>
<td>ADDED</td>
<td>Added successfully</td>
</tr>
<tr>
<td>twitter_r</td>
<td>2013-11-20 17:00:27.945519-05</td>
<td>entities.urls</td>
<td>ADDED</td>
<td>Added successfully</td>
</tr>
<tr>
<td>twitter_r</td>
<td>2013-11-20 17:00:27.945532-05</td>
<td>created_at</td>
<td>EXISTS</td>
<td>Column of same name already exists in table definition</td>
</tr>
</tbody>
</table>

(4 rows)

### MODELS

Lists details about the machine-learning models in the database.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MODEL_ID</td>
<td>INTEGER</td>
<td>The model's internal ID.</td>
</tr>
<tr>
<td>MODEL_NAME</td>
<td>VARCHAR(128)</td>
<td>The name of the model.</td>
</tr>
<tr>
<td>SCHEMA_ID</td>
<td>INTEGER</td>
<td>The schema's internal ID.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>---------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SCHEMA_NAME</td>
<td>VARCHAR(128)</td>
<td>The name of the schema.</td>
</tr>
<tr>
<td>OWNER_ID</td>
<td>INTEGER</td>
<td>The model owner's ID.</td>
</tr>
<tr>
<td>OWNER_NAME</td>
<td>VARCHAR(128)</td>
<td>The user who created the model.</td>
</tr>
<tr>
<td>CATEGORY</td>
<td>VARCHAR(128)</td>
<td>The type of model. By default, models created in Vertica are assigned to the Vertica_Models category.</td>
</tr>
<tr>
<td>MODEL_TYPE</td>
<td>VARCHAR(128)</td>
<td>The type of algorithm used to create the model.</td>
</tr>
<tr>
<td>IS_COMPLETE</td>
<td>VARCHAR(128)</td>
<td>Denotes whether the model is complete and ready for use in machine learning functions. This field is usually false when the model is being trained. Once the training is complete, the field is set to true.</td>
</tr>
<tr>
<td>CREATE_TIME</td>
<td>TIMESTAMPTZ</td>
<td>The time the model was created.</td>
</tr>
<tr>
<td>SIZE</td>
<td>INTEGER</td>
<td>The size of the model in bytes.</td>
</tr>
</tbody>
</table>

**Example**

```sql
=> SELECT * FROM models;
```

<table>
<thead>
<tr>
<th>RECORD 1</th>
<th>-----------------</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_id</td>
<td>45035996273714020</td>
</tr>
<tr>
<td>model_name</td>
<td>myLinearRegModel</td>
</tr>
<tr>
<td>schema_id</td>

</tr>
<tr>
<td>schema_name</td>
<td>public</td>
</tr>
<tr>
<td>owner_id</td>
<td>45035996273704962</td>
</tr>
<tr>
<td>owner_name</td>
<td>dbadmin</td>
</tr>
<tr>
<td>category</td>
<td>VERTICA_MODELS</td>
</tr>
<tr>
<td>model_type</td>
<td>LINEAR_REGRESSION</td>
</tr>
<tr>
<td>is_complete</td>
<td>t</td>
</tr>
<tr>
<td>create_time</td>
<td>2018-01-22 11:13:35.018412-05</td>
</tr>
<tr>
<td>size</td>
<td>1671</td>
</tr>
</tbody>
</table>

**NODES**

Lists details about the nodes in the database.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR(128)</td>
<td>The name of the node.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>NODE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the node.</td>
</tr>
<tr>
<td>NODE_STATE</td>
<td>VARCHAR(128)</td>
<td>The node's current state, one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• UP</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• DOWN</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• READY</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• UNSAFE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• SHUTDOWN</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• SHUTDOWN ERROR</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• RECOVERING</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• RECOVERY ERROR</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• RECOVERED</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• INITIALIZING</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• STAND BY</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• NEEDS CATCH UP</td>
</tr>
<tr>
<td>NODE_ADDRESS</td>
<td>VARCHAR(80)</td>
<td>The host address of the node.</td>
</tr>
<tr>
<td>NODE_ADDRESS_FAMILY</td>
<td>VARCHAR(10)</td>
<td>The IP Version of the node_address. For example, ipv4.</td>
</tr>
<tr>
<td>EXPORT_ADDRESS</td>
<td>VARCHAR(8192)</td>
<td>The IP address of the node (on the public network) used for import/export operations and native load-balancing.</td>
</tr>
<tr>
<td>EXPORT_ADDRESS_FAMILY</td>
<td>VARCHAR(10)</td>
<td>The IP Version of the export_address. For example, ipv4.</td>
</tr>
<tr>
<td>CATALOG_PATH</td>
<td>VARCHAR(8192)</td>
<td>The absolute path to the catalog on the node.</td>
</tr>
<tr>
<td>NODE_TYPE</td>
<td>VARCHAR(9)</td>
<td>The type of the node. For more information on the</td>
</tr>
</tbody>
</table>
### Types of Nodes

- **IS_EPHEMERAL**: BOOLEAN
  - (Deprecated) True if this node has been marked as ephemeral. (in preparation for removing it from the cluster).

- **STANDING_IN_FOR**: VARCHAR(128)
  - The name of the node that this node is currently replacing.

- **LAST_MSG_FROM_NODE_AT**: TIMESTAMPZ
  - The date and time the last message was received from this node.

- **NODE_DOWN_SINCE**: TIMESTAMPZ
  - The amount of time that the replaced node has been unavailable.

### Node Subscriptions

Lists the node subscriptions in the database.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUBSCRIPTION_OID</td>
<td>INTEGER</td>
<td>The OID of the subscription.</td>
</tr>
<tr>
<td>NODE_OID</td>
<td>INTEGER</td>
<td>The OID of the node subscribed.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node.</td>
</tr>
<tr>
<td>SHARD_OID</td>
<td>INTEGER</td>
<td>The OID of the shard to which the node is subscribed.</td>
</tr>
<tr>
<td>SHARD_NAME</td>
<td>VARCHAR</td>
<td>The name of the shard to which the node is subscribed.</td>
</tr>
<tr>
<td>SUBSCRIPTION_STATE</td>
<td>VARCHAR</td>
<td>The current subscription state of the node.</td>
</tr>
<tr>
<td>IS_PRIMARY</td>
<td>BOOLEAN</td>
<td>Defines whether the node is currently the primary subscriber.</td>
</tr>
<tr>
<td>IS_RESUBSCRIBING</td>
<td>BOOLEAN</td>
<td>Indicates whether a subscription is resubscribing to a node, as follows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>t (true) - a subscription is resubscribing, only applies to PENDING</td>
</tr>
<tr>
<td></td>
<td></td>
<td>subscriptions created during the</td>
</tr>
</tbody>
</table>
### Column Name | Data Type | Description
--- | --- | ---
cluster/node startup. |  | f (false) - a subscription is not resubscribing, applies to PENDING subscriptions created with `REBALANCE_SHARDS` that have transitioned to an ACTIVE state.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HAS_CURRENT_METADATA</td>
<td>BOOLEAN</td>
<td>Indicates whether or not the subscription contains the most recent metadata.</td>
</tr>
<tr>
<td>DEPOT_WARM</td>
<td>BOOLEAN</td>
<td>Indicates whether or not the subscription contains the most recent depot updates.</td>
</tr>
</tbody>
</table>

#### Example

```sql
=> SELECT * FROM NODE_SUBSCRIPTIONS;
subscription_oid | 45035996273704986
node_oid         | 45035996273704978
node_name        | initiator
shard_oid        | 45035996273704984
shard_name       | segment0001
subscription_state | ACTIVE
is_primary       | t
is_resubscribing | f
has_current_metadata | t
depot_warm       | t
...```

#### ODBC_COLUMNS

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMA_NAME</td>
<td>VARCHAR</td>
<td>The name of the schema in which the column resides. If the column does not reside in a schema, this field is empty.</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR</td>
<td>The name of the table in which the column resides.</td>
</tr>
<tr>
<td>COLUMN_NAME</td>
<td>DATA_TYPE</td>
<td>DATA_TYPE_NAME</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------</td>
<td>----------------</td>
</tr>
<tr>
<td>COLUMNS_NAME</td>
<td>VARCHAR</td>
<td>The name of the column.</td>
</tr>
<tr>
<td>DATA_TYPE</td>
<td>INTEGER</td>
<td>The data type of the column. This can be an ODBC SQL data type or a driver-specific SQL data type. This column corresponds to the ODBC_TYPE column in the TYPES table.</td>
</tr>
<tr>
<td>DATA_TYPE_NAME</td>
<td>VARCHAR</td>
<td>The driver-specific data type name.</td>
</tr>
<tr>
<td>COLUMNS_SIZE</td>
<td>INTEGER</td>
<td>The ODBC-defined data size of the column.</td>
</tr>
<tr>
<td>BUFFER_LENGTH</td>
<td>INTEGER</td>
<td>The transfer octet length of a column is the maximum number of bytes returned to the application when data is transferred to its default C data type. See <a href="http://msdn.microsoft.com/en-us/library/windows/desktop/ms713979%28v=vs.85%29.aspx">http://msdn.microsoft.com/en-us/library/windows/desktop/ms713979%28v=vs.85%29.aspx</a></td>
</tr>
<tr>
<td>DECIMAL_DIGITS</td>
<td>INTEGER</td>
<td>The total number of significant digits to the right of the decimal point. This value has no meaning for non-decimal data types.</td>
</tr>
<tr>
<td>NUMPREC_RADIX</td>
<td>INTEGER</td>
<td>The radix Vertica reports decimal_digits and columns_size as. This value is always 10, because it refers to a number of decimal digits, rather than a number of bits.</td>
</tr>
<tr>
<td>NULLABLE</td>
<td>BOOLEAN</td>
<td>Indicates whether the column can contain null values. Values are 0 or 1.</td>
</tr>
<tr>
<td>REMARKS</td>
<td>VARCHAR</td>
<td>The textual remarks for the column.</td>
</tr>
<tr>
<td>COLUMNS_DEFAULT</td>
<td>VARCHAR</td>
<td>The default value of the column.</td>
</tr>
<tr>
<td>SQL_TYPE_ID</td>
<td>INTEGER</td>
<td>The SQL data type of the column.</td>
</tr>
<tr>
<td>SQL_DATETIME_SUB</td>
<td>VARCHAR</td>
<td>The subtype for a datetime data type. This value has no meaning for non-datetime data types.</td>
</tr>
<tr>
<td>CHAR_OCTET_LENGTH</td>
<td>INTEGER</td>
<td>The maximum length of a string or binary data column.</td>
</tr>
<tr>
<td>ORDINAL_POSITION</td>
<td>INTEGER</td>
<td>Indicates the position of the column in the table definition.</td>
</tr>
</tbody>
</table>
### IS_NULLABLE

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VARCHAR</td>
<td>Values can be YES or NO, determined by the value of the NULLABLE column.</td>
</tr>
</tbody>
</table>

### IS_IDENTITY

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOLEAN</td>
<td>Indicates whether the column is a sequence, for example, an auto-increment column.</td>
</tr>
</tbody>
</table>

### PASSWORD_AUDITOR

Stores information about individual users and their password information. This table also indicates if users are using hash authentication, which is the associated security algorithm.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>USER_ID</td>
<td>INTEGER</td>
<td>Unique ID for the user.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>Name of the user.</td>
</tr>
<tr>
<td>ACCTEXPIRED</td>
<td>BOOLEAN</td>
<td>Indicates if the user’s password expires. 'f' indicates that it does not expire. 't' indicates that it does expire.</td>
</tr>
</tbody>
</table>
| SECURITY_ALGORITHM     | VARCHAR   | User-level security algorithm for hash authentication. **Valid values:**
|                        |           | - 'NONE' (Default. System-level security algorithm is used.)
|                        |           | - 'MD5'
|                        |           | - 'SHA512'

| SYSTEM_SECURITY_ALGORITHM | VARCHAR | System-level security algorithm for hash authentication. **Default value:**
|                         |         | 'NONE' (Uses MD5 algorithm.)
|                         |         | **Valid values:**
|                         |         | - 'MD5'
|                         |         | - 'SHA512' |
**Column Name** | **Data Type** | **Description**
---|---|---
EFFECTIVE_SECURITY_ALGORITHM | VARCHAR | The resulting security algorithm, depending on the values of SECURITY_ALGORITHM and SYSTEM_SECURITY_ALGORITHM.

**PASSWORDS**

Contains user passwords information. This table stores current passwords and past passwords if any Profiles have PASSWORD_REUSE_TIME or PASSWORD_REUSE_MAX parameters set. See CREATE PROFILE for details.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>USER_ID</td>
<td>INTEGER</td>
<td>The ID of the user who owns the password.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>The name of the user who owns the password.</td>
</tr>
<tr>
<td>PASSWORD</td>
<td>VARCHAR</td>
<td>The encrypted password.</td>
</tr>
<tr>
<td>PASSWORD_CREATE_TIME</td>
<td>DATETIME</td>
<td>The date and time when the password was created.</td>
</tr>
<tr>
<td>IS_CURRENT_PASSWORD</td>
<td>BOOLEAN</td>
<td>Denotes whether this is the user's current password. Non-current passwords are retained to enforce password reuse limitations.</td>
</tr>
<tr>
<td>PROFILE_ID</td>
<td>INTEGER</td>
<td>The ID number of the profile to which the user is assigned.</td>
</tr>
<tr>
<td>PROFILE_NAME</td>
<td>VARCHAR</td>
<td>The name of the profile to which the user is assigned.</td>
</tr>
<tr>
<td>PASSWORD_REUSE_MAX</td>
<td>VARCHAR</td>
<td>The number password changes that must take place before an old password can be reused.</td>
</tr>
<tr>
<td>PASSWORD_REUSE_TIME</td>
<td>VARCHAR</td>
<td>The amount of time that must pass before an old password can be reused.</td>
</tr>
</tbody>
</table>

**PRIMARY_KEYS**

Provides primary key information.
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONSTRAINT_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the constraint.</td>
</tr>
<tr>
<td>CONSTRAINT_NAME</td>
<td>VARCHAR</td>
<td>The constraint name for which information is listed.</td>
</tr>
<tr>
<td>COLUMN_NAME</td>
<td>VARCHAR</td>
<td>The column name for which information is listed.</td>
</tr>
<tr>
<td>ORDINAL_POSITION</td>
<td>VARCHAR</td>
<td>The position of the column within the key. The numbering of columns starts at 1.</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR</td>
<td>The table name for which information is listed.</td>
</tr>
<tr>
<td>CONSTRAINT_TYPE</td>
<td>VARCHAR</td>
<td>The constraint type, p, for primary key.</td>
</tr>
<tr>
<td>IS_ENABLED</td>
<td>BOOLEAN</td>
<td>Indicates if a table column constraint for a PRIMARY KEY is enabled by default. Can be t (True) or f (False).</td>
</tr>
<tr>
<td>TABLE_SCHEMA</td>
<td>VARCHAR</td>
<td>The schema name for which information is listed.</td>
</tr>
</tbody>
</table>

**PROFILE_PARAMETERS**

Defines what information is stored in profiles.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROFILE_ID</td>
<td>INTEGER</td>
<td>The ID of the profile to which this parameter belongs.</td>
</tr>
<tr>
<td>PROFILE_NAME</td>
<td>VARCHAR</td>
<td>The name of the profile to which this parameter belongs.</td>
</tr>
<tr>
<td>PARAMETER_TYPE</td>
<td>VARCHAR</td>
<td>The policy type of this parameter (password_complexity, password_security, etc.)</td>
</tr>
<tr>
<td>PARAMETER_NAME</td>
<td>VARCHAR</td>
<td>The name of the parameter.</td>
</tr>
<tr>
<td>PARAMETER_LIMIT</td>
<td>VARCHAR</td>
<td>The parameter's value.</td>
</tr>
</tbody>
</table>

**PROFILES**

Provides information about password policies that you set using the `CREATE PROFILE` statement.
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROFILE_ID</td>
<td>INTEGER</td>
<td>Unique identifier for the profile.</td>
</tr>
<tr>
<td>PROFILE_NAME</td>
<td>VARCHAR</td>
<td>Profile name.</td>
</tr>
<tr>
<td>PASSWORD_LIFE_TIME</td>
<td>VARCHAR</td>
<td>Number of days before the user's password expires. After expiration, the user is forced to change passwords during login or warned that their password has expired if password_grace_time is set to a value other than zero or unlimited.</td>
</tr>
<tr>
<td>PASSWORD_GRACE_TIME</td>
<td>VARCHAR</td>
<td>Number of days users are allowed to log in after their passwords expire. During the grace time, users are warned about their expired passwords when they log in. After the grace period, the user is forced to change passwords if he or she hasn't already.</td>
</tr>
<tr>
<td>PASSWORD_REUSE_MAX</td>
<td>VARCHAR</td>
<td>Number of password changes that must occur before the current password can be reused.</td>
</tr>
<tr>
<td>PASSWORD_REUSE_TIME</td>
<td>VARCHAR</td>
<td>Number of days that must pass after setting a password before it can be used again.</td>
</tr>
<tr>
<td>FAILED_LOGIN_ATTEMPTS</td>
<td>VARCHAR</td>
<td>Number of consecutive failed login attempts that triggers Vertica to lock the account.</td>
</tr>
<tr>
<td>PASSWORD_LOCK_TIME</td>
<td>VARCHAR</td>
<td>Number of days an account is locked after being locked due to too many failed login attempts.</td>
</tr>
<tr>
<td>PASSWORD_MAX_LENGTH</td>
<td>VARCHAR</td>
<td>Maximum number of characters allowed in a password.</td>
</tr>
<tr>
<td>PASSWORD_MIN_LENGTH</td>
<td>VARCHAR</td>
<td>Minimum number of characters required in a password.</td>
</tr>
<tr>
<td>PASSWORD_MIN_LETTERS</td>
<td>VARCHAR</td>
<td>The minimum number of letters (either uppercase or lowercase) required in a password.</td>
</tr>
<tr>
<td>PASSWORD_MIN_LOWERCASE_LETTERS</td>
<td>VARCHAR</td>
<td>The minimum number of lowercase.</td>
</tr>
</tbody>
</table>
### Column Name | Data Type | Description
--- | --- | ---
PASSWORD_MIN_UPPERCASE_LETTERS | VARCHAR | The minimum number of uppercase letters required in a password.
PASSWORD_MIN_DIGITS | VARCHAR | The minimum number of digits required in a password.
PASSWORD_MIN_SYMBOLS | VARCHAR | The minimum of symbols (for example, !, #, $, etc.) required in a password.

### Notes
Non-superusers querying this table see only the information for the profile to which they are assigned.

### See Also

- ALTER PROFILE

### PROJECTION_CHECKPOINT_EPOCHS
Provides details on checkpoint epochs.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_ID</td>
<td>INTEGER</td>
<td>Unique numeric identifier of this projection's node.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of this projection's node.</td>
</tr>
<tr>
<td>PROJECTION_SCHEMA_ID</td>
<td>INTEGER</td>
<td>Unique numeric identifier of the projection schema.</td>
</tr>
<tr>
<td>PROJECTION_SCHEMA</td>
<td>VARCHAR</td>
<td>Name of the projection schema.</td>
</tr>
<tr>
<td>PROJECTION_ID</td>
<td>INTEGER</td>
<td>Unique numeric identifier of this projection.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>PROJECTION_NAME</td>
<td>VARCHAR</td>
<td>Name of this projection.</td>
</tr>
<tr>
<td>IS_UP_TO_DATE</td>
<td>BOOLEAN</td>
<td>Specifies whether the projection is <em>up to date</em> and available to participate in query execution.</td>
</tr>
<tr>
<td>CHECKPOINT_EPOCH</td>
<td>INTEGER</td>
<td>Checkpoint epoch of the projection on the corresponding node. Data up to and including this epoch is in persistent storage, and can be recovered in the event of node failure.</td>
</tr>
<tr>
<td>WOULD_RECOVER</td>
<td>BOOLEAN</td>
<td>Determines whether data up to and including CHECKPOINT_EPOCH can be used to <em>recover from an unclean shutdown</em>:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• t: CHECKPOINT_EPOCH is less than or equal to the cluster's Last Good Epoch, so data up to and including this epoch can be used during recovery.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• f: Vertica must use Last Good Epoch to recover data for this projection.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>See also: GET_LAST_GOOD_EPOCH</td>
</tr>
<tr>
<td>IS_BEHIND_AHM</td>
<td>BOOLEAN</td>
<td>Specifies whether CHECKPOINT_EPOCH is less than the AHM (ancient history mark). If set to t (true), data for this projection cannot rolled back.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>See also: GET_AHM_EPOCH</td>
</tr>
</tbody>
</table>

**Privileges**

No explicit privileges are required. You only see the records for tables that you have privileges to view.

**Examples**

```sql
=> SELECT epoch FROM t;
epoch
------
52
```

PROJECTION_COLUMNS

Provides information about projection columns, such as encoding type, sort order, type of statistics, and the time at which columns statistics were last updated.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROJECTION_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the projection.</td>
</tr>
<tr>
<td>PROJECTION_NAME</td>
<td>VARCHAR</td>
<td>The projection name for which information is listed.</td>
</tr>
<tr>
<td>PROJECTION_COLUMN_NAME</td>
<td>VARCHAR</td>
<td>The projection column name.</td>
</tr>
<tr>
<td>COLUMN_POSITION</td>
<td>INTEGER</td>
<td>The ordinal position of a projection's column used in the \texttt{CREATE PROJECTION} statement.</td>
</tr>
<tr>
<td>SORT_POSITION</td>
<td>INTEGER</td>
<td>The projection's column sort specification, as specified in \texttt{CREATE PROJECTION .. ORDER BY} clause. If the column is not included in the</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td>projection's sort order, SORT_POSITION output is NULL.</td>
</tr>
<tr>
<td>COLUMN_ID</td>
<td>INTEGER</td>
<td>A unique numeric object ID (OID) that identifies the associated projection column object and is assigned by the Vertica catalog. This field is helpful as a key to other system tables.</td>
</tr>
<tr>
<td>DATA_TYPE</td>
<td>VARCHAR</td>
<td>Matches the corresponding table column data type (see V_CATALOG.COLUMNS). DATA_TYPE is provided as a complement to ENCODING_TYPE.</td>
</tr>
<tr>
<td>ENCODING_TYPE</td>
<td>VARCHAR</td>
<td>The encoding type defined on the projection column.</td>
</tr>
<tr>
<td>ACCESS_RANK</td>
<td>INTEGER</td>
<td>The access rank of the projection column. See the ACCESSRANK parameter in the CREATE PROJECTION statement for more information.</td>
</tr>
<tr>
<td>GROUP_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID (OID) that identifies the group and is assigned by the Vertica catalog.</td>
</tr>
<tr>
<td>TABLE_SCHEMA</td>
<td>VARCHAR</td>
<td>The name of the schema in which the projection is stored.</td>
</tr>
<tr>
<td>TABLE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the table.</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR</td>
<td>The table name that contains the projection.</td>
</tr>
<tr>
<td>TABLE_COLUMN_ID</td>
<td>VARCHAR</td>
<td>A unique VARCHAR ID, assigned by the Vertica catalog, that identifies a column in a table.</td>
</tr>
<tr>
<td>TABLE_COLUMN_NAME</td>
<td>VARCHAR</td>
<td>The projection's corresponding table column name.</td>
</tr>
<tr>
<td>STATISTICS_TYPE</td>
<td>VARCHAR</td>
<td>The type of statistics the column contains:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• NONE: No statistics</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ROWCOUNT: Created from existing catalog metadata, which Vertica automatically and periodically updates</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>----------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• FULL: Created by running <strong>ANALYZE_STATISTICS</strong></td>
</tr>
<tr>
<td><strong>STATISTICS_UPDATED_TIMESTAMP</strong></td>
<td>TIMESTAMPTZ</td>
<td>The time at which the columns statistics were last updated. By querying this column, along with <strong>STATISTICS_TYPE</strong> and <strong>PROJECTION_COLUMN_NAME</strong>, you can identify projection columns whose statistics need updating. See also <strong>V_CATALOG.PROJECTIONS.HAS_STATISTICS</strong>.</td>
</tr>
<tr>
<td><strong>IS_EXPRESSION</strong></td>
<td>BOOLEAN</td>
<td>Indicates whether this projection column is calculated with an expression. For aggregate columns, <strong>IS_EXPRESSION</strong> is always true.</td>
</tr>
<tr>
<td><strong>IS_AGGREGATE</strong></td>
<td>BOOLEAN</td>
<td>Indicates whether the column is an aggregated column in a live aggregate projection. <strong>IS_AGGREGATE</strong> is always false for Top-K projection columns.</td>
</tr>
<tr>
<td><strong>PARTITION_BY_POSITION</strong></td>
<td>INTEGER</td>
<td>Position of that column in the <strong>PARTITION BY</strong> and <strong>GROUP BY</strong> clauses, if applicable.</td>
</tr>
<tr>
<td><strong>ORDER_BY_POSITION</strong></td>
<td>INTEGER</td>
<td>Set only for <strong>Top-K projections</strong>, specifies the column's position in the <strong>ORDER BY</strong> clause, as defined in the projection definition's <strong>window partition clause</strong>. If the column is omitted from the <strong>ORDER BY</strong> clause, <strong>ORDER_BY_POSITION</strong> output is NULL.</td>
</tr>
<tr>
<td><strong>ORDER_BY_TYPE</strong></td>
<td>INTEGER</td>
<td>Type of sort order:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ASC NULLS FIRST</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ASC NULLS LAST</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• DESC NULLS FIRST</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• DESC NULLS LAST</td>
</tr>
<tr>
<td><strong>COLUMN_EXPRESSION</strong></td>
<td>VARCHAR</td>
<td>Expression that calculates the column value.</td>
</tr>
</tbody>
</table>
Examples

See Determining When Statistics Were Last Updated.

PROJECTION_DELETE_CONCERNS

Lists projections whose design may cause performance issues when deleting data. This table is generated by calling the EVALUATE_DELETE_PERFORMANCE function. See DELETE and UPDATE Optimization in the Administrator's Guide for more information.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROJECTION_ID</td>
<td>INTEGER</td>
<td>The ID number of the projection</td>
</tr>
<tr>
<td>PROJECTION_SCHEMA</td>
<td>VARCHAR</td>
<td>The schema containing the projection</td>
</tr>
<tr>
<td>PROJECTION_NAME</td>
<td>VARCHAR</td>
<td>The projection's name</td>
</tr>
<tr>
<td>CREATION_TIME</td>
<td>TIMESTAMPTZ</td>
<td>When the projection was created</td>
</tr>
<tr>
<td>LAST_MODIFIED_TIME</td>
<td>TIMESTAMPTZ</td>
<td>When the projection was last modified</td>
</tr>
<tr>
<td>COMMENT</td>
<td>VARCHAR</td>
<td>A comment describing the potential delete performance issue.</td>
</tr>
</tbody>
</table>

PROJECTIONS

Provides information about projections.
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROJECTION_SCHEMA_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID that identifies the specific schema that contains the projection and is assigned by the Vertica catalog.</td>
</tr>
<tr>
<td>PROJECTION_SCHEMA</td>
<td>VARCHAR</td>
<td>The name of the schema that contains the projection.</td>
</tr>
<tr>
<td>PROJECTION_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID that identifies the projection and is assigned by the Vertica catalog.</td>
</tr>
<tr>
<td>PROJECTION_NAME</td>
<td>VARCHAR</td>
<td>The projection name for which information is listed.</td>
</tr>
<tr>
<td>PROJECTION_BASENAME</td>
<td>VARCHAR</td>
<td>The base name used for other projections. For auto-created projections, <code>projection_baseiname</code> is identical to the anchor_table_name. For a manually-created projection, <code>projection_baseiname</code> is the name you supply.</td>
</tr>
<tr>
<td>OWNER_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID that identifies the projection owner and is assigned by the Vertica catalog.</td>
</tr>
<tr>
<td>OWNER_NAME</td>
<td>VARCHAR</td>
<td>The name of the projection's owner.</td>
</tr>
<tr>
<td>ANCHOR_TABLE_ID</td>
<td>INTEGER</td>
<td>For pre-join projections, the unique numeric identification (OID) of the anchor table. If the projection is not a pre-join projection, this value is the OID of the table from which the projection was created. A projection has only one anchor (fact) table.</td>
</tr>
<tr>
<td>ANCHOR_TABLE_NAME</td>
<td>VARCHAR</td>
<td>For pre-join projections, the name of the anchor table. If the projection is not a pre-join projection, the name of the table from which the projection was created.</td>
</tr>
<tr>
<td>NODE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID (OID) for any nodes that contain any unsegmented projections.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The names of any nodes that contain the projection. This column returns information for unsegmented projections only.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>IS_PREJOIN</td>
<td>BOOLEAN</td>
<td>Specifies whether the projection is a pre-join projection.</td>
</tr>
<tr>
<td>CREATED_EPOCH</td>
<td>INTEGER</td>
<td>The epoch in which the projection was created.</td>
</tr>
<tr>
<td>CREATE_TYPE</td>
<td>VARCHAR</td>
<td>The method in which the projection was created:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- CREATE_PROJECTION: A custom projection created using a CREATE_PROJECTION statement.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- CREATE_TABLE: A superprojection that was automatically created when its associated table was created using a CREATE_TABLE statement.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- ALTER_TABLE: The system automatically created the key projection in response to a non-empty table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- CREATE TABLE WITH PROJ CLAUSE: A superprojection created using a CREATE_TABLE statement.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- DELAYED_CREATION: A superprojection that was automatically created when data was loaded into its associated table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- DESIGNER: A new projection created by the Database Designer.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- SYSTEM_TABLE: A projection that was automatically created for a system table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Rebalancing does not change the CREATE_TYPE value for a projection.</td>
</tr>
<tr>
<td>VERIFIEDFAULTTOLERANCE</td>
<td>INTEGER</td>
<td>The projection K-safe value. This value can be greater than the database K-safety value (if more replications of a projection exist than are required to meet the database K-safety). This value cannot be less than the database K-safe setting.</td>
</tr>
<tr>
<td>IS_UP_TO_DATE</td>
<td>BOOLEAN</td>
<td>Specifies whether projection data is up to date. Only up-to-date projections are available to participate in query execution.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| HAS_STATISTICS            | BOOLEAN     | Specifies whether there are statistics for any column in the projection:  
  • This column returns true only when all non-epoch columns for a table have full statistics. Otherwise, the column returns false. See ANALYZE_STATISTICS.  
  • Projections that have no data never have full statistics. Use system table PROJECTION_STORAGE to determine whether your projection contains data. |
| IS_SEGMENTED              | BOOLEAN     | Specifies whether the projection is segmented.                                                                                           |
| SEGMENT_EXPRESSION        | VARCHAR     | The segmentation expression used for the projection. In the following example for the clicks_agg projection, the following values:  
  hash(clicks.user_id, (clicks.click_time)::date)  
  indicate that the projection was created with the following expression:  
  SEGMENTED BY HASH(    
    clicks.user_id, (clicks.click_time)::date) |
| SEGMENT_RANGE             | VARCHAR     | The percentage of projection data stored on each node, according to the segmentation expression. For example, segmenting a projection by the HASH function on all nodes results in a SEGMENT_RANGE value such as the following:  
  implicit range: v_testcr_node0005[33.3%]    
  v_testcr_node0006[33.3%]    
  v_testcr_node0004[33.3%] |
| IS_SUPER_PROJECTION       | BOOLEAN     | Specifies whether a projection is a superprojection.                                                                                     |
| IS_KEY_CONSTRAINT_PROJECTION | BOOLEAN  | Indicates whether a projection is a key constraint projection:  
  • t: A key constraint projection that validates a key constraint. (Vertica uses the projection to efficiently enforce at least one enabled key constraint.) |
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HAS_EXPRESSIONS</td>
<td>BOOLEAN</td>
<td>Specifies whether this projection has expressions that define the column values. HAS_EXPRESSIONS is always true for live aggregate projections.</td>
</tr>
<tr>
<td>IS_AGGREGATE_PROJECTION</td>
<td>BOOLEAN</td>
<td>Specifies whether this projection is a live aggregate projection.</td>
</tr>
<tr>
<td>AGGREGATE_TYPE</td>
<td>VARCHAR</td>
<td>Specifies the type of live aggregate projection:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• GROUPBY</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• TOPK</td>
</tr>
<tr>
<td>IS_SHARED</td>
<td>BOOLEAN</td>
<td>Indicates whether the projection is located on shared storage.</td>
</tr>
</tbody>
</table>

**Example**

```sql

PROJECTION_COLUMNS

RESOURCE_POOL_DEFAULTS

Returns default parameter settings for built-in and user-defined resource pools. Use ALTER RESOURCE_POOL to restore resource pool parameters to their default settings.

For information about valid parameters for built-in resource pools and their default settings, see Built-In Resource Pools Configuration.

To obtain a resource pool’s current settings, query system table RESOURCE_POOLS.

Privileges

None

RESOURCE_POOLS

Displays settings for built-in and user-defined resource pools. For information about defining resource pools, see CREATE RESOURCE_POOL and ALTER RESOURCE_POOL.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME</td>
<td>VARCHAR</td>
<td>The name of this resource pool.</td>
</tr>
<tr>
<td>IS_INTERNAL</td>
<td>BOOLEAN</td>
<td>Specifies whether this pool is a built-in pool.</td>
</tr>
<tr>
<td>MEMORYSIZE</td>
<td>VARCHAR</td>
<td>The amount of memory allocated to this resource pool.</td>
</tr>
<tr>
<td>MAXMEMORYSIZE</td>
<td>VARCHAR</td>
<td>Value assigned as the maximum size this resource pool can grow by borrowing memory from the GENERAL pool.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MAXQUERYMEMORYSIZE</td>
<td>VARCHAR</td>
<td>The maximum amount of memory allocated by this pool to process any query</td>
</tr>
<tr>
<td>EXECUTIONPARALLELISM</td>
<td>INTEGER</td>
<td>Limits the number of threads used to process any single query issued in this resource pool</td>
</tr>
<tr>
<td>PRIORITY</td>
<td>INTEGER</td>
<td>Specifies priority of queries in this pool when they compete for resources in the GENERAL pool.</td>
</tr>
<tr>
<td>RUNTIMEPRIORITY</td>
<td>VARCHAR</td>
<td>The run-time priority defined for this pool, indicates how many run-time resources (CPU, I/O bandwidth) the Resource Manager should dedicate to running queries in the resource pool. Valid values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- HIGH</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- MEDIUM (default)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- LOW</td>
</tr>
<tr>
<td></td>
<td></td>
<td>These values are relative to each other. Queries with a HIGH run-time priority are given more CPU and I/O resources than those with a MEDIUM or LOW run-time priority.</td>
</tr>
<tr>
<td>RUNTIMEPRIORITYTHRESHOLD</td>
<td>INTEGER</td>
<td>Limits in seconds how soon a query must finish before the Resource Manager assigns to it the resource pool's RUNTIMEPRIORITY setting.</td>
</tr>
<tr>
<td>QUEUETIMEOUT</td>
<td>INTEGER INTERVAL</td>
<td>The maximum length of time requests can wait for resources to become available before being rejected, specified in seconds or as an interval. This value is set by the pool's QUEUETIMEOUT parameter.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>

<tr>
<td>PLANNEDCONCURRENCY</td>
<td>INTEGER</td>
<td>The preferred number of queries that execute concurrently in this resource pool, specified by the pool's PLANNEDCONCURRENCY parameter.</td>
</tr>
<tr>
<td>MAXCONCURRENCY</td>
<td>INTEGER</td>
<td>The maximum number of concurrent execution slots available to the resource pool, specified by the poolMAXCONCURRENCY parameter.</td>
</tr>
<tr>
<td>RUNTIMECAP</td>
<td>INTERVAL</td>
<td>The maximum time a query in the pool can execute.</td>
</tr>
<tr>
<td>SINGLEINITIATOR</td>
<td>BOOLEAN</td>
<td>Set for backward compatibility.</td>
</tr>
<tr>
<td>CPUAFFINITYSET</td>
<td>VARCHAR</td>
<td>The set of CPUs on which queries associated with this pool are executed. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 0, 2-4 : Specifies CPUs 0, 2, 3, and 4</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 25%: A percentage of available CPUs, rounded down to whole CPUs.</td>
</tr>
<tr>
<td>CPUAFFINITYMODE</td>
<td>VARCHAR</td>
<td>Specifies whether to share usage of the CPUs assigned to this resource pool by CPUAFFINITYSET, one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- SHARED: Queries that run in this pool share its CPUAFFINITYSET CPUs with other Vertica resource pools.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- EXCLUSIVE: Dedicates CPUAFFINITYSET CPUs to this resource pool only, and excludes other Vertica resource pools. If CPUAFFINITYSET is set as a percentage, then that percentage of CPU resources available to Vertica is assigned solely for this resource pool.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>l</td>
<td>ANY</td>
<td>Queries in this resource pool can run on any CPU.</td>
</tr>
<tr>
<td>CASCADETO</td>
<td>VARCHAR</td>
<td>A secondary resource pool for executing queries that exceed the RUNTIMECAP setting of this resource pool.</td>
</tr>
</tbody>
</table>

**ROLES**

Contains the names of all roles the user can access, along with any roles that have been assigned to those roles.

**Tip:** You can also use the function `HAS_ROLE` to see if a role is available to a user.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASSIGNED.Roles</td>
<td>VARCHAR</td>
<td>The names of any roles that have been granted to this role. By enabling the role, the user also has access to the privileges of these additional roles.</td>
</tr>
<tr>
<td>Note: If you see an asterisk in the ASSIGNED.Roles column output, it means the user has roles WITH ADMIN OPTION.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>NAME</td>
<td>VARCHAR</td>
<td>The name of a role that the user can access.</td>
</tr>
<tr>
<td>ROLE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the role.</td>
</tr>
<tr>
<td>LDAP_DN</td>
<td>VARCHAR</td>
<td>Indicates whether or not the Vertica Analytic Database role maps to an LDAP Link group. When the column is set to dn, the Vertica role maps to LDAP Link.</td>
</tr>
<tr>
<td>LDAP_URI_HASH</td>
<td>VARCHAR</td>
<td>The URI hash number for the LDAP role.</td>
</tr>
<tr>
<td>IS_ORPHANED_FROM_LDAP</td>
<td>VARCHAR</td>
<td>Indicates if the role is disconnected (orphaned) from LDAP, valid values are:</td>
</tr>
<tr>
<td>t - role is orphaned</td>
<td></td>
<td></td>
</tr>
<tr>
<td>f - role is not orphaned</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### SCHEMATA

Provides information about schemas in the database.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMA_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID assigned by the Vertica catalog, which identifies the specific schema.</td>
</tr>
<tr>
<td>SCHEMA_NAME</td>
<td>VARCHAR</td>
<td>Schema name for which information is listed.</td>
</tr>
<tr>
<td>SCHEMA_OWNER_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID assigned by the Vertica catalog, which identifies the owner who created the schema.</td>
</tr>
<tr>
<td>SCHEMA_OWNER</td>
<td>VARCHAR</td>
<td>Name of the owner who created the schema.</td>
</tr>
<tr>
<td>SYSTEM_SCHEMA_CREATOR</td>
<td>VARCHAR</td>
<td>Creator information for system schema or NULL for non-system schema</td>
</tr>
<tr>
<td>CREATE_TIME</td>
<td>TIMESTAMPTZ</td>
<td>Time when the schema was created.</td>
</tr>
<tr>
<td>IS_SYSTEM_SCHEMA</td>
<td>BOOLEAN</td>
<td>Indicates whether the schema was created for system use, where t is true and f is false.</td>
</tr>
</tbody>
</table>
Privileges

No explicit privileges are required. You only see the records for tables that you have privileges to view.

SEQUENCES

Displays information about the parameters specified for a sequence using the `CREATE SEQUENCE` statement.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SEQUENCE_SCHEMA</td>
<td>VARCHAR</td>
<td>Schema in which the sequence was created.</td>
</tr>
<tr>
<td>SEQUENCE_NAME</td>
<td>VARCHAR</td>
<td>Name of the sequence defined in the CREATE SEQUENCE statement.</td>
</tr>
<tr>
<td>OWNER_NAME</td>
<td>VARCHAR</td>
<td>Name of the owner.</td>
</tr>
<tr>
<td>IDENTITY_TABLE_NAME</td>
<td>VARCHAR</td>
<td>If created by an auto_increment or identity column, the name of the table to which it belongs. See column constraints in the CREATE TABLE statement.</td>
</tr>
<tr>
<td>SESSION_CACHE_COUNT</td>
<td>INTEGER</td>
<td>Count of values cached in a session.</td>
</tr>
<tr>
<td>ALLOW_CYCLE</td>
<td>BOOLEAN</td>
<td>Values allowed to cycle when a sequence reaches its minimum or maximum value. See CYCLE</td>
</tr>
<tr>
<td>OUTPUT_ORDERED</td>
<td>BOOLEAN</td>
<td>Values guaranteed to be ordered (always false).</td>
</tr>
<tr>
<td>INCREMENT_BY</td>
<td>INTEGER</td>
<td>Sequence values are incremented by this number (negative for reverse sequences).</td>
</tr>
<tr>
<td>MINIMUM</td>
<td>INTEGER</td>
<td>Minimum value the sequence can generate.</td>
</tr>
<tr>
<td>MAXIMUM</td>
<td>INTEGER</td>
<td>Maximum value the sequence can generate.</td>
</tr>
<tr>
<td>CURRENT_</td>
<td>INTEGER</td>
<td>Specifies how many sequence numbers Vertica has</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>VALUE</td>
<td></td>
<td>distributed to the nodes in your cluster. Includes all nodes.</td>
</tr>
<tr>
<td>SEQUENCE_SCHEMA_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the schema.</td>
</tr>
<tr>
<td>SEQUENCE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the sequence.</td>
</tr>
<tr>
<td>OWNER_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the user who created the sequence.</td>
</tr>
<tr>
<td>IDENTITY_TABLE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the table to which the column belongs (if created by an auto_increment or identity column).</td>
</tr>
</tbody>
</table>

**Examples**

Create a simple sequence:

```sql
=> CREATE SEQUENCE my_seq MAXVALUE 5000 START 150;
CREATE SEQUENCE
```

Return information about the sequence you just created:

```sql
=> \
Expanded display is on.
=> SELECT * FROM sequences;
-[
  RECORD 1 ]------------------------
  sequence_schema | public
  sequence_name   | my_seq
  owner_name      | dbadmin
  identity_table_name | |
  session_cache_count | 250000
  allow_cycle     | f
  output_ordered  | f
  increment_by    | 1
  minimum         | 1
  maximum         | 5000
  current_value   | 149
  sequence_schema_id | 45035996273704966
  sequence_id     | 45035996273844996
  owner_id        | 45035996273844996
  identity_table_id | 0
```

An identity column is a sequence available only for numeric column types. To identify what column in a table, if any, is an identity column, search the COLUMNS table to find the identity column in a table:
CREATE TABLE testid (c1 IDENTITY(1, 1, 1000), c2 INT);

Expanded display is on.

SELECT * FROM COLUMNS WHERE is_identity='t' AND table_name='testid';

<table>
<thead>
<tr>
<th>RECORD 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_id</td>
</tr>
<tr>
<td>table_schema</td>
</tr>
<tr>
<td>table_name</td>
</tr>
<tr>
<td>is_system_table</td>
</tr>
<tr>
<td>column_name</td>
</tr>
<tr>
<td>data_type</td>
</tr>
<tr>
<td>data_type_id</td>
</tr>
<tr>
<td>data_type_length</td>
</tr>
<tr>
<td>character_maximum_length</td>
</tr>
<tr>
<td>numeric_precision</td>
</tr>
<tr>
<td>numeric_scale</td>
</tr>
<tr>
<td>datetime_precision</td>
</tr>
<tr>
<td>interval_precision</td>
</tr>
<tr>
<td>ordinal_position</td>
</tr>
<tr>
<td>is_nullable</td>
</tr>
<tr>
<td>column_default</td>
</tr>
<tr>
<td>is_identity</td>
</tr>
</tbody>
</table>

Use the SEQUENCES table to get detailed information about the sequence in testid:

SELECT * FROM sequences WHERE identity_table_name='testid';

<table>
<thead>
<tr>
<th>RECORD 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>sequence_schema</td>
</tr>
<tr>
<td>sequence_name</td>
</tr>
<tr>
<td>owner_name</td>
</tr>
<tr>
<td>identity_table_name</td>
</tr>
<tr>
<td>session_cache_count</td>
</tr>
<tr>
<td>allow_cycle</td>
</tr>
<tr>
<td>output_ordered</td>
</tr>
<tr>
<td>increment_by</td>
</tr>
<tr>
<td>minimum</td>
</tr>
<tr>
<td>maximum</td>
</tr>
<tr>
<td>current_value</td>
</tr>
<tr>
<td>sequence_schema_id</td>
</tr>
<tr>
<td>sequence_id</td>
</tr>
<tr>
<td>owner_id</td>
</tr>
<tr>
<td>identity_table_id</td>
</tr>
</tbody>
</table>

Use the vsql command \ds to return a list of sequences. The following results show the two sequences created in the preceding examples. If more sequences existed, the table would list them.

The CurrentValue of the new sequence is one less than the start number you specified in the CREATE SEQUENCE and IDENTITY commands, because you have not yet used NEXTVAL to instantiate the sequences to assign their cache or supply their first start values.
### SEQUENCE

<table>
<thead>
<tr>
<th>Sequence</th>
<th>my_seq</th>
</tr>
</thead>
<tbody>
<tr>
<td>CurrentValue</td>
<td>149</td>
</tr>
<tr>
<td>IncrementBy</td>
<td>1</td>
</tr>
<tr>
<td>Minimum</td>
<td>1</td>
</tr>
<tr>
<td>Maximum</td>
<td>5000</td>
</tr>
<tr>
<td>AllowCycle</td>
<td>f</td>
</tr>
<tr>
<td>Comment</td>
<td></td>
</tr>
</tbody>
</table>

### SESSION_SUBSCRIPTIONS

Lists the session subscriptions in the database. Shows the session view of the node subscriptions. Session subscriptions are used when running queries within the session.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_OID</td>
<td>INTEGER</td>
<td>The OID of the node.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The name of the subscribed node.</td>
</tr>
<tr>
<td>SHARD_OID</td>
<td>INTEGER</td>
<td>The OID of the shard.</td>
</tr>
<tr>
<td>SHARD_NAME</td>
<td>VARCHAR</td>
<td>The name of the shard the node is subscribed to.</td>
</tr>
<tr>
<td>IS_PARTICIPATING</td>
<td>BOOLEAN</td>
<td>Defines whether or not the subscription is participating in the session.</td>
</tr>
</tbody>
</table>

#### Example

```sql
=> SELECT * FROM SESSION_SUBSCRIPTIONS;
- [ RECORD 1 ]-----------------------------
node_oid    | 45035996273704978
node_name   | v_eon_db_node0001
shard_oid   | 45035996273704980
shard_name  | replica
is_participating | t
...```
SHARDS

Lists the shards in your database.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHARD_OID</td>
<td>INTEGER</td>
<td>The OID of the shard.</td>
</tr>
<tr>
<td>SHARD_NAME</td>
<td>VARCHAR</td>
<td>The name of the shard.</td>
</tr>
<tr>
<td>SHARD_TYPE</td>
<td>VARCHAR</td>
<td>The type of the shard.</td>
</tr>
<tr>
<td>LOWER_HASH_BOUND</td>
<td>VARCHAR</td>
<td>The lower hash bound of the shard.</td>
</tr>
<tr>
<td>UPPER_HASH_BOUND</td>
<td>VARCHAR</td>
<td>The upper hash bound of the shard.</td>
</tr>
<tr>
<td>IS_REPLICATED</td>
<td>BOOLEAN</td>
<td>Defines if the shard is replicated.</td>
</tr>
<tr>
<td>HAS_OBJECTS</td>
<td>BOOLEAN</td>
<td>Defines if the shard contains objects.</td>
</tr>
</tbody>
</table>

Example

```sql
=> SELECT * FROM SHARDS;
- [ RECORD 1 ]----------------------------------------
  shard_oid | 45035996273704980
  shard_name | replica
  shard_type | Replica
  lower_hash_bound | Replica
  upper_hash_bound | Replica
  is_replicated | t
  has_objects | t
  ...
```

STORAGE_LOCATIONS

Provides information about storage locations, their IDs labels, and status.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCATION_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the storage location.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The node name on which the storage location exists.</td>
</tr>
<tr>
<td>LOCATION_PATH</td>
<td>VARCHAR</td>
<td>The path where the storage location is mounted.</td>
</tr>
<tr>
<td>LOCATION_USAGE</td>
<td>VARCHAR</td>
<td>The type of information stored in the location:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- DATA: Only data is stored in the location.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- TEMP: Only temporary files that are created during loads or queries are stored in the location.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- DATA,TEMP: Both types of files are stored in the location.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- USER: The storage location can be used by non-dbadmin users, who are granted access to the storage location</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- CATALOG: The area is used for the Vertica catalog. This usage is set internally and cannot be removed or changed.</td>
</tr>
<tr>
<td>SHARING_TYPE</td>
<td>VARCHAR</td>
<td>How this location is shared among database nodes, if it is:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- SHARED: The path used by the storage location is used by all nodes. See the SHARED parameter to CREATE LOCATION.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- COMMUNAL: the location is used for communal storage in Eon Mode.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- NONE: The location is not shared among nodes.</td>
</tr>
<tr>
<td>IS_RETIRE</td>
<td>BOOLEAN</td>
<td>Whether the storage location has been retired. This column has a value of t (true) if the location is retired, or f (false) if it is not.</td>
</tr>
<tr>
<td>LOCATION_LABEL</td>
<td>VARCHAR</td>
<td>The label associated with a specific storage location, added with the ALTER_LOCATION_LABEL function.</td>
</tr>
<tr>
<td>RANK</td>
<td>INTEGER</td>
<td>The Access Rank value either assigned or supplied to the storage location, as described in Prioritizing Column Access Speed.</td>
</tr>
<tr>
<td>THROUGHPUT</td>
<td>INTEGER</td>
<td>The throughput performance of the storage location, measured in MB/sec. You can get location performance</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td>values using <code>MEASURE_LOCATION_PERFORMANCE</code>, and set them with the <code>SET_LOCATION_PERFORMANCE</code> function.</td>
</tr>
<tr>
<td>LATTENCY</td>
<td>INTEGER</td>
<td>The measured latency of the storage location as number of data seeks per second. You can get location performance values using <code>MEASURE_LOCATION_PERFORMANCE</code>, and set them with the <code>SET_LOCATION_PERFORMANCE</code> function.</td>
</tr>
<tr>
<td>MAX_SIZE</td>
<td>INTEGER</td>
<td>Maximum size of the storage location in bytes.</td>
</tr>
</tbody>
</table>

**Privileges**

Must be a superuser.

**Example**

```sql
=> SELECT * FROM STORAGE_LOCATIONS;

- [ RECORD 1 ]-+----------------------------------------+
| location_id | 45035996273704984 |
| node_name   | v_vmart_node0001 |
| location_path | /home/dbadmin/VMart/v_vmart_node0001_data |
| location_usage | DATA,TEMP |
| sharing_type | NONE |
| is_retired   | f |
| location_label | |
| rank         | 0 |
| throughput   | 0 |
| latency      | 0 |
| max_size     | 20G |

- [ RECORD 2 ]-+----------------------------------------+
| location_id | 45035996273705108 |
| node_name   | v_vmart_node0002 |
| location_path | /home/dbadmin/VMart/v_vmart_node0002_data |
| location_usage | DATA,TEMP |
| sharing_type | NONE |
| is_retired   | f |
| location_label | |
| rank         | 0 |
| throughput   | 0 |
| latency      | 0 |
| max_size     | 10G |
```

SYSTEM_COLUMNS

Provides table column information for SYSTEM_TABLES.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TABLE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the table.</td>
</tr>
<tr>
<td>TABLE_SCHEMA</td>
<td>VARCHAR</td>
<td>The schema name for which information is listed.</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR</td>
<td>The table name for which information is listed.</td>
</tr>
<tr>
<td>IS_SYSTEM_TABLE</td>
<td>BOOLEAN</td>
<td>Indicates whether the table is a system table, where t is true and f is false.</td>
</tr>
<tr>
<td>COLUMN_ID</td>
<td>VARCHAR</td>
<td>A unique VARCHAR ID, assigned by the Vertica catalog, that identifies a column in a table.</td>
</tr>
<tr>
<td>COLUMN_NAME</td>
<td>VARCHAR</td>
<td>The column name for which information is listed in the database.</td>
</tr>
<tr>
<td>DATA_TYPE</td>
<td>VARCHAR</td>
<td>The data type assigned to the column; for example VARCHAR(16).</td>
</tr>
<tr>
<td>DATA_TYPE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the data type.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DATA_TYPE_LENGTH</td>
<td>INTEGER</td>
<td>The maximum allowable length of the data type.</td>
</tr>
<tr>
<td>CHARACTER_MAXIMUM_LENGTH</td>
<td>INTEGER</td>
<td>The maximum allowable length of the column.</td>
</tr>
<tr>
<td>NUMERIC_PRECISION</td>
<td>INTEGER</td>
<td>The number of significant decimal digits.</td>
</tr>
<tr>
<td>NUMERIC_SCALE</td>
<td>INTEGER</td>
<td>The number of fractional digits.</td>
</tr>
<tr>
<td>DATETIME_PRECISION</td>
<td>INTEGER</td>
<td>For TIMESTAMP data type, returns the declared precision; returns null if no precision was declared.</td>
</tr>
<tr>
<td>INTERVAL_PRECISION</td>
<td>INTEGER</td>
<td>The number of fractional digits retained in the seconds field.</td>
</tr>
<tr>
<td>ORDINAL_POSITION</td>
<td>INTEGER</td>
<td>The position of the column respective to other columns in the table.</td>
</tr>
<tr>
<td>IS_NONNULL</td>
<td>BOOLEAN</td>
<td>Indicates whether the column can contain null values, where t is true and f is false.</td>
</tr>
<tr>
<td>COLUMN_DEFAULT</td>
<td>VARCHAR</td>
<td>The default value of a column, such as empty or expression.</td>
</tr>
</tbody>
</table>

**SYSTEM_TABLES**

Returns a list of all system table names.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TABLE_SCHEMA_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the schema.</td>
</tr>
<tr>
<td>TABLE_SCHEMA</td>
<td>VARCHAR</td>
<td>The schema name in which the system table resides. Values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• V_CATALOG</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• V_MONITOR</td>
</tr>
<tr>
<td>TABLE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the table.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR</td>
<td>The name of the system table.</td>
</tr>
<tr>
<td>TABLE_DESCRIPTION</td>
<td>VARCHAR</td>
<td>A description of the system table's purpose.</td>
</tr>
</tbody>
</table>
| IS_SUPERUSER_ONLY          | BOOLEAN   | Indicates if the table is accessible only by a user with superuser privileges. Values are:  
|                            |           | t - table is accessible by superuser only  
|                            |           | f - table is accessible by other users                                    |
| IS_MONITORABLE             | BOOLEAN   | Indicates if the table is accessible by a user with the SYSMONITOR role enabled. Values are:  
|                            |           | t - table is accessible by SYSMONITOR role  
|                            |           | f - table is not accessible by SYSMONITOR role  
|                            |           | See SYSMONITOR Role.                                                      |
| IS_ACCESSIBLE_DURING_LOCKDOWN | BOOLEAN | Indicates if the table is restricted. See System Table Restriction and Access.  
|                            |           | When you use the RESTRICT_SYSTEM_TABLES_ACCESS() function, the following conditions take affect:  
|                            |           | • System tables with built-in restrictions that determine who can access information remain accessible. For example, the SESSIONS table allows a user to see only information on that user's current session.  
|                            |           | • System tables that contain settings that a user should be allowed to see are accessible. For example, the TYPES system table.  
|                            |           | • System tables that contain information about other users are restricted.  
|                            |           | • System tables that contain information about database settings are restricted.  
|                            |           | • The behavior of the SYSMONITOR Role does not change.  |
# TABLE_CONSTRAINTS

Provides information about table constraints.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONSTRAINT_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the constraint.</td>
</tr>
<tr>
<td>CONSTRAINT_NAME</td>
<td>VARCHAR</td>
<td>The name of the constraint, if specified as UNIQUE, FOREIGN KEY, NOT NULL, PRIMARY KEY, or CHECK.</td>
</tr>
<tr>
<td>CONSTRAINT_SCHEMA_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the schema containing the constraint.</td>
</tr>
<tr>
<td>CONSTRAINT_KEY_COUNT</td>
<td>INTEGER</td>
<td>The number of constraint keys.</td>
</tr>
<tr>
<td>FOREIGN_KEY_COUNT</td>
<td>INTEGER</td>
<td>The number of foreign keys.</td>
</tr>
<tr>
<td>TABLE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the table.</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR</td>
<td>The name of the table that contains the UNIQUE, FOREIGN KEY, NOT NULL, or PRIMARY KEY constraint</td>
</tr>
<tr>
<td>FOREIGN_TABLE_ID</td>
<td>INTEGER</td>
<td>The unique object ID of the foreign table referenced in a foreign key constraint (zero if not a foreign key constraint).</td>
</tr>
<tr>
<td>CONSTRAINT_TYPE</td>
<td>CHAR</td>
<td>Indicates the constraint type.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Valid Values:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• c — check</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• f — foreign</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• p — primary</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• u — unique</td>
</tr>
<tr>
<td>IS_ENABLED</td>
<td>BOOLEAN</td>
<td>Indicates if a constraint for a primary key, unique key, or check constraint is currently enabled. Can be t (True) or f (False).</td>
</tr>
</tbody>
</table>

ANALYZE_CONSTRAINTS

TABLES

Provides information about all tables in the database.

Tip: Columns TABLE_SCHEMA and TABLE_NAME are case sensitive. To query TABLES on these columns, use the case-insensitive ILIKE predicate. For example:

```
SELECT table_schema, table_name FROM v_catalog.tables WHERE table_schema ILIKE 'Store%';
```

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TABLE_SCHEMA_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID that identifies the schema and is assigned by the Vertica catalog.</td>
</tr>
<tr>
<td>TABLE_SCHEMA</td>
<td>VARCHAR</td>
<td>The schema name for which information is listed.</td>
</tr>
<tr>
<td>TABLE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID that identifies the table and is assigned by the Vertica catalog.</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR</td>
<td>The table name for which information is listed.</td>
</tr>
<tr>
<td>OWNER_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID that identifies the owner and is assigned by the Vertica catalog.</td>
</tr>
<tr>
<td>OWNER_NAME</td>
<td>VARCHAR</td>
<td>The name of the user who created the table.</td>
</tr>
<tr>
<td>IS_TEMP_TABLE</td>
<td>BOOLEAN</td>
<td>Indicates whether this table is a temporary table.</td>
</tr>
<tr>
<td>IS_SYSTEM_TABLE</td>
<td>BOOLEAN</td>
<td>Indicates whether table is a system table.</td>
</tr>
<tr>
<td>FORCE OUTER</td>
<td>INTEGER</td>
<td>Specifies whether this table is joined to another as an inner or outer input. For details, see Controlling Join</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Inputs in Analyzing Data</td>
<td></td>
<td>Inputs in Analyzing Data.</td>
</tr>
<tr>
<td>IS_FLEXTABLE</td>
<td>BOOLEAN</td>
<td>Indicates whether the table is a Flex table.</td>
</tr>
<tr>
<td>IS_SHARED</td>
<td>BOOLEAN</td>
<td>Indicates whether the table is located on shared storage.</td>
</tr>
<tr>
<td>HAS_AGGREGATE_PROJECTION</td>
<td>BOOLEAN</td>
<td>Indicates whether the table has live aggregate projections.</td>
</tr>
<tr>
<td>SYSTEM_TABLE_CREATOR</td>
<td>VARCHAR</td>
<td>The name of the process that created the table, such as Designer.</td>
</tr>
<tr>
<td>PARTITION_EXPRESSION</td>
<td>VARCHAR</td>
<td>The table's partition expression.</td>
</tr>
<tr>
<td>CREATE_TIME</td>
<td>TIMESTAMP</td>
<td>Returns the timestamp, indicating when the table was created.</td>
</tr>
<tr>
<td>TABLE_DEFINITION</td>
<td>VARCHAR</td>
<td>The COPY statement table definition. This column is applicable only to external tables.</td>
</tr>
<tr>
<td>RECOVER_PRIORITY</td>
<td>INTEGER</td>
<td>The priority rank for the table for a Recovery By Table.</td>
</tr>
<tr>
<td>STORAGE_MODE</td>
<td>INTEGER</td>
<td>Specifies the load method a table uses, set to one of the following integer values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0: The initial value for all tables that pre-date Vertica 9.1.x</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1: Direct</td>
</tr>
<tr>
<td></td>
<td></td>
<td>5: Trickle</td>
</tr>
<tr>
<td></td>
<td></td>
<td>6: Auto (default)</td>
</tr>
<tr>
<td>PARTITION_GROUP_EXPRESSION</td>
<td>VARCHAR</td>
<td>The expression of a GROUP BY clause that qualifies a table's partition clause.</td>
</tr>
<tr>
<td>ACTIVE_PARTITION_COUNT</td>
<td>INTEGER</td>
<td>Specifies a table's active partition count as set by CREATE TABLE or ALTER TABLE. If null, the table gets its active partition count from configuration parameter ActivePartitionCount. For details, see Active and</td>
</tr>
</tbody>
</table>
### Examples

**Find when tables were created:**

```sql
=> SELECT table_schema, table_name, create_time FROM tables;
```

<table>
<thead>
<tr>
<th>table_schema</th>
<th>table_name</th>
<th>create_time</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>customer_dimension</td>
<td>2011-08-15 11:18:25.784203-04</td>
</tr>
<tr>
<td>public</td>
<td>promotion_dimension</td>
<td>2011-08-15 11:18:25.850592-04</td>
</tr>
<tr>
<td>public</td>
<td>date_dimension</td>
<td>2011-08-15 11:18:25.892347-04</td>
</tr>
<tr>
<td>public</td>
<td>vendor_dimension</td>
<td>2011-08-15 11:18:25.942805-04</td>
</tr>
<tr>
<td>public</td>
<td>employee_dimension</td>
<td>2011-08-15 11:18:25.966985-04</td>
</tr>
<tr>
<td>public</td>
<td>shipping_dimension</td>
<td>2011-08-15 11:18:25.999394-04</td>
</tr>
<tr>
<td>online_sales</td>
<td>online_page_dimension</td>
<td>2011-08-15 11:18:27.007329-04</td>
</tr>
<tr>
<td>online_sales</td>
<td>call_center_dimension</td>
<td>2011-08-15 11:18:27.476844-04</td>
</tr>
<tr>
<td>online_sales</td>
<td>online_sales_fact</td>
<td>2011-08-15 11:18:27.49749-04</td>
</tr>
</tbody>
</table>

(15 rows)

**Find out whether certain tables are temporary and flex tables:**

```sql
=> SELECT distinct table_name, table_schema, is_temp_table, is_flextable FROM v_catalog.tables
   WHERE table_name ILIKE 't%';
```

<table>
<thead>
<tr>
<th>table_name</th>
<th>table_schema</th>
<th>is_temp_table</th>
<th>is_flextable</th>
</tr>
</thead>
<tbody>
<tr>
<td>t2_temp</td>
<td>public</td>
<td>t</td>
<td>t</td>
</tr>
<tr>
<td>tt_keys</td>
<td>public</td>
<td>f</td>
<td>f</td>
</tr>
<tr>
<td>t2_temp_keys</td>
<td>public</td>
<td>f</td>
<td>f</td>
</tr>
<tr>
<td>t3</td>
<td>public</td>
<td>t</td>
<td>f</td>
</tr>
<tr>
<td>t1</td>
<td>public</td>
<td>f</td>
<td>f</td>
</tr>
<tr>
<td>t9_keys</td>
<td>public</td>
<td>f</td>
<td>f</td>
</tr>
<tr>
<td>t2_keys</td>
<td>public</td>
<td>f</td>
<td>f</td>
</tr>
<tr>
<td>t6</td>
<td>public</td>
<td>t</td>
<td>f</td>
</tr>
<tr>
<td>t5</td>
<td>public</td>
<td>f</td>
<td>f</td>
</tr>
<tr>
<td>t2</td>
<td>public</td>
<td>f</td>
<td>t</td>
</tr>
<tr>
<td>t8</td>
<td>public</td>
<td>f</td>
<td>f</td>
</tr>
<tr>
<td>t7</td>
<td>public</td>
<td>t</td>
<td>f</td>
</tr>
<tr>
<td>tt</td>
<td>public</td>
<td>t</td>
<td>t</td>
</tr>
<tr>
<td>t2_keys_keys</td>
<td>public</td>
<td>f</td>
<td>f</td>
</tr>
<tr>
<td>t9</td>
<td>public</td>
<td>t</td>
<td>t</td>
</tr>
</tbody>
</table>

(15 rows)
TEXT_INDICES

Provides summary information about the text indices in Vertica.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INDEX_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID that identifies the index and is assigned by the Vertica catalog.</td>
</tr>
<tr>
<td>INDEX_NAME</td>
<td>VARCHAR</td>
<td>The name of the text index.</td>
</tr>
<tr>
<td>INDEX_SCHEMA_NAME</td>
<td>VARCHAR</td>
<td>The schema name of the text index.</td>
</tr>
<tr>
<td>SOURCE_TABLE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID that identifies the table and is assigned by the Vertica catalog.</td>
</tr>
<tr>
<td>SOURCE_TABLE_NAME</td>
<td>VARCHAR</td>
<td>The name of the source table used to build the index.</td>
</tr>
<tr>
<td>SOURCE_TABLE_SCHEMA_NAME</td>
<td>VARCHAR</td>
<td>The schema name of the source table.</td>
</tr>
<tr>
<td>TOKENIZER_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID that identifies the tokenizer and is assigned by the Vertica catalog.</td>
</tr>
<tr>
<td>TOKENIZER_NAME</td>
<td>VARCHAR</td>
<td>The name of the tokenizer used when building the index.</td>
</tr>
<tr>
<td>TOKENIZER_SCHEMA_NAME</td>
<td>VARCHAR</td>
<td>The schema name of the tokenizer.</td>
</tr>
<tr>
<td>STEMMER_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID that identifies the stemmer and is assigned by the Vertica catalog.</td>
</tr>
<tr>
<td>STEMMER_NAME</td>
<td>VARCHAR</td>
<td>The name of the stemmer used when building the index.</td>
</tr>
<tr>
<td>STEMMER_SCHEMA_NAME</td>
<td>VARCHAR</td>
<td>The schema name of the stemmer.</td>
</tr>
<tr>
<td>TEXT_COL</td>
<td>VARCHAR</td>
<td>The text column used to build the index.</td>
</tr>
</tbody>
</table>

TYPES

Provides information about supported data types.
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the specific data type.</td>
</tr>
<tr>
<td>ODBC_TYPE</td>
<td>INTEGER</td>
<td>The numerical ODBC type.</td>
</tr>
<tr>
<td>ODBC_SUBTYPE</td>
<td>INTEGER</td>
<td>The numerical ODBC subtype, used to differentiate types such as time and interval that have multiple subtypes.</td>
</tr>
<tr>
<td>MIN_SCALE</td>
<td>INTEGER</td>
<td>The minimum number of digits supported to the right of the decimal point for the data type.</td>
</tr>
<tr>
<td>MAX_SCALE</td>
<td>INTEGER</td>
<td>The maximum number of digits supported to the right of the decimal point for the data type. A value of 0 is used for types that do not use decimal points.</td>
</tr>
<tr>
<td>COLUMN_SIZE</td>
<td>INTEGER</td>
<td>The number of characters required to display the type. See: <a href="http://msdn.microsoft.com/en-us/library/windows/desktop/ms711786%28v=VS.85%29.aspx">http://msdn.microsoft.com/en-us/library/windows/desktop/ms711786%28v=VS.85%29.aspx</a> for the details on COLUMN_SIZE for each type.</td>
</tr>
<tr>
<td>INTERVAL_MASK</td>
<td>INTEGER</td>
<td>For data types that are intervals, the bitmask to determine the range of the interval from the Vertica TYPE_ID. Details are available in the Vertica SDK.</td>
</tr>
<tr>
<td>TYPE_NAME</td>
<td>VARCHAR</td>
<td>The data type name associated with a particular data type ID.</td>
</tr>
<tr>
<td>CREATION_PARAMETERS</td>
<td>VARCHAR</td>
<td>A list of keywords, separated by commas, corresponding to each parameter that the application may specify in parentheses when using the name that is returned in the TYPE_NAME field. The keywords in the list can be any of the following: length, precision, or scale. They appear in the order that the syntax requires them to be used.</td>
</tr>
</tbody>
</table>

**USER_AUDITS**

Lists the results of database and object size audits generated by users calling the AUDIT function. See Monitoring Database Size for License Compliance in the Administrator’s Guide for more information.
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIZE_BYTES</td>
<td>INTEGER</td>
<td>The estimated raw data size of the database</td>
</tr>
<tr>
<td>USER_ID</td>
<td>INTEGER</td>
<td>The ID of the user who generated the audit</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>The name of the user who generated the audit</td>
</tr>
<tr>
<td>OBJECT_ID</td>
<td>INTEGER</td>
<td>The ID of the object being audited</td>
</tr>
<tr>
<td>OBJECT_TYPE</td>
<td>VARCHAR</td>
<td>The type of object being audited (table, schema, etc.)</td>
</tr>
<tr>
<td>OBJECT_SCHEMA</td>
<td>VARCHAR</td>
<td>The schema containing the object being audited</td>
</tr>
<tr>
<td>OBJECT_NAME</td>
<td>VARCHAR</td>
<td>The name of the object being audited</td>
</tr>
<tr>
<td>AUDITED_SCHEMA_NAME</td>
<td>VARCHAR</td>
<td>The name of the schema on which you want to query HISTORICAL data. After running audit on a table, you can drop the table. In this case, object_schema becomes NULL.</td>
</tr>
<tr>
<td>AUDITED_OBJECT_NAME</td>
<td>VARCHAR</td>
<td>The name of the object on which you want to query HISTORICAL data. After running audit on a table, you can drop the table. In this case, object_name becomes NULL.</td>
</tr>
<tr>
<td>LICENSE_NAME</td>
<td>VARCHAR</td>
<td>The name of the license. After running a compliance audit, the value for this column is always vertica.</td>
</tr>
<tr>
<td>AUDIT_START_TIMESTAMP</td>
<td>TIMESTAMPTZ</td>
<td>When the audit started</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>----------------</td>
<td>------------------------------------------------------------------</td>
</tr>
<tr>
<td>AUDIT_END_TIMESTAMP</td>
<td>TIMESTAMPTZ</td>
<td>When the audit finished</td>
</tr>
<tr>
<td>CONFIDENCE_LEVEL_PERCENT</td>
<td>FLOAT</td>
<td>The confidence level of the size estimate</td>
</tr>
<tr>
<td>ERROR_TOLERANCE_PERCENT</td>
<td>FLOAT</td>
<td>The error tolerance used for the size estimate</td>
</tr>
<tr>
<td>USED_SAMPLING</td>
<td>BOOLEAN</td>
<td>Whether data was randomly sampled (if false, all of the data was analyzed)</td>
</tr>
<tr>
<td>CONFIDENCE_INTERVAL_LOWER_BOUND_BYTES</td>
<td>INTEGER</td>
<td>The lower bound of the data size estimate within the confidence level</td>
</tr>
<tr>
<td>CONFIDENCE_INTERVAL_UPPER_BOUND_BYTES</td>
<td>INTEGER</td>
<td>The upper bound of the data size estimate within the confidence level</td>
</tr>
<tr>
<td>SAMPLE_COUNT</td>
<td>INTEGER</td>
<td>The number of data samples used to generate the estimate</td>
</tr>
<tr>
<td>CELL_COUNT</td>
<td>INTEGER</td>
<td>The number of cells in the database</td>
</tr>
</tbody>
</table>

**USER_CLIENT_AUTH**

Provides information about the client authentication methods that are associated with database users. You associate an authentication method with a user using `GRANT (Authentication)`.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>USER_OID</td>
<td>INTEGER</td>
<td>A unique identifier for that user.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>Name of the user.</td>
</tr>
<tr>
<td>AUTH_OID</td>
<td>INTEGER</td>
<td>A unique identifier for the authentication method you are using.</td>
</tr>
<tr>
<td>AUTH_NAME</td>
<td>VARCHAR</td>
<td>Name that you gave to the authentication method.</td>
</tr>
</tbody>
</table>
### Column Name | Data Type | Description
--- | --- | ---
GRANTED_TO | BOOLEAN | Name of the user with whom you have associated the authentication method using `GRANT (Authentication)`.

### USER_FUNCTION_PARAMETERS

Provides information about the parameters of a C++ user-defined function (UDx). You can only view parameters that have the `Properties.visible` parameter set to TRUE.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMA_NAME</td>
<td>VARCHAR (128)</td>
<td>The schema to which the function belongs.</td>
</tr>
<tr>
<td>FUNCTION_NAME</td>
<td>VARCHAR (128)</td>
<td>The name assigned by the user to the User-Defined Function.</td>
</tr>
<tr>
<td>FUNCTION_TYPE</td>
<td>VARCHAR (128)</td>
<td>The type of user-defined function. For example, 'User Defined Function'.</td>
</tr>
<tr>
<td>FUNCTION_ARGUMENT_TYPE</td>
<td>VARCHAR (8192)</td>
<td>The number and data types of input arguments for the function.</td>
</tr>
<tr>
<td>PARAMETER_NAME</td>
<td>VARCHAR (128)</td>
<td>The name of the parameter for the user-defined function.</td>
</tr>
<tr>
<td>DATA_TYPE</td>
<td>VARCHAR (128)</td>
<td>The data type of the parameter.</td>
</tr>
<tr>
<td>DATA_TYPE_ID</td>
<td>INTEGER</td>
<td>A number specifying the ID for the parameter's data type.</td>
</tr>
<tr>
<td>DATA_TYPE_LENGTH</td>
<td>INTEGER</td>
<td>The maximum length of the parameter's data type.</td>
</tr>
<tr>
<td>IS_REQUIRED</td>
<td>BOOLEAN</td>
<td>Indicates whether the parameter is required or not. If set to TRUE, and you don't provide the parameter, Vertica throws an error.</td>
</tr>
<tr>
<td>CAN_BE_NULL</td>
<td>BOOLEAN</td>
<td>Indicates whether the parameter can be passed as a NULL value.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>------------</td>
<td>------------------------------------------------------</td>
</tr>
<tr>
<td>SCHEMA_NAME</td>
<td>VARCHAR</td>
<td>The name of the schema in which this function exists.</td>
</tr>
<tr>
<td>FUNCTION_NAME</td>
<td>VARCHAR</td>
<td>The name assigned by the user to the SQL function or User-Defined Function.</td>
</tr>
<tr>
<td>PROCEDURE_TYPE</td>
<td>VARCHAR</td>
<td>The type of user-defined function. For example, 'User Defined Function'.</td>
</tr>
<tr>
<td>FUNCTION_RETURN_TYPE</td>
<td>VARCHAR</td>
<td>The data type name that the SQL function returns.</td>
</tr>
<tr>
<td>FUNCTION_ARGUMENT_TYPE</td>
<td>VARCHAR</td>
<td>The number and data types of parameters for the function.</td>
</tr>
<tr>
<td>FUNCTION_DEFINITION</td>
<td>VARCHAR</td>
<td>The SQL expression that the user defined in the SQL function's function body.</td>
</tr>
</tbody>
</table>

**Privileges**

Any user can query the USER_FUNCTION_PARAMETERS table. However, users can only see table information about those UDx functions which the user has permission to use.

**See Also**

- Developing User-Defined Extensions (UDxs)
- UDx Parameters

**USER_FUNCTIONS**

Returns metadata about user-defined SQL functions (which store commonly used SQL expressions as a function in the Vertica catalog) and User-Defined Functions (UDx).
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VOLATILITY</td>
<td>VARCHAR</td>
<td>The SQL function's volatility (whether a function returns the same output given the same input). Can be immutable, volatile, or stable.</td>
</tr>
<tr>
<td>IS STRICT</td>
<td>BOOLEAN</td>
<td>Indicates whether the SQL function is strict, where t is true and f is false.</td>
</tr>
<tr>
<td>IS FENCED</td>
<td>BOOLEAN</td>
<td>Indicates whether the function runs in Fenced Mode or not.</td>
</tr>
<tr>
<td>COMMENT</td>
<td>VARCHAR</td>
<td>A comment about this function provided by the function creator.</td>
</tr>
</tbody>
</table>

**Notes**

- The volatility and strictness of a SQL function are automatically inferred from the function definition in order that Vertica determine the correctness of usage, such as where an immutable function is expected but a volatile function is provided.

- The volatility and strictness of a UDx is defined by the UDx's developer.

**Example**

Create a SQL function called `myzeroifnull` in the public schema:

```sql
=> CREATE FUNCTION myzeroifnull(x INT) RETURN INT
   AS BEGIN
       RETURN (CASE WHEN (x IS NOT NULL) THEN x ELSE 0 END);
   END;
```

Now query the USER_FUNCTIONS table. The query returns just the `myzeroifnull` macro because it is the only one created in this schema:

```sql
=> SELECT * FROM user_functions;
-[ RECORD 1 ]-+---------------------------------+-
schema_name   | public                          |
function_name | myzeroifnull                    |
procedure_type | User Defined Function           |
function_return_type | Integer                       |
function_argument_type | x Integer                   |
function_definition | RETURN CASE WHEN (x IS NOT NULL) THEN x ELSE 0 END |
volatility     | immutable                       |
is_strict      | f                              |
```
See Also

- CREATE FUNCTION (SQL Functions)
- ALTER FUNCTION (UDF)
- DROP FUNCTION

USER_PROCEDURES

Provides information about external procedures that have been defined for Vertica. User see only the procedures they can execute.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROCEDURE_NAME</td>
<td>VARCHAR</td>
<td>The name given to the external procedure through the CREATE PROCEDURE statement.</td>
</tr>
<tr>
<td>PROCEDURE_ARGUMENTS</td>
<td>VARCHAR</td>
<td>Lists arguments for the external procedure.</td>
</tr>
<tr>
<td>SCHEMA_NAME</td>
<td>VARCHAR</td>
<td>Indicates the schema in which the external procedure is defined.</td>
</tr>
</tbody>
</table>

Example

```sql
=> SELECT * FROM user_procedures;
procedure_name | procedure_arguments | schema_name
---------------|--------------------|-----------------|
helloplanet    | arg1 Varchar       | public          
(1 row)
```

USER_TRANSFORMS

Lists the currently-defined user-defined transform functions (UDTFs).
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMA_NAME</td>
<td>VARCHAR (128)</td>
<td>The name of the schema containing the UDTF.</td>
</tr>
<tr>
<td>FUNCTION_NAME</td>
<td>VARCHAR (128)</td>
<td>The SQL function name assigned by the user.</td>
</tr>
<tr>
<td>FUNCTION_RETURN_TYPE</td>
<td>VARCHAR (128)</td>
<td>The data types of the columns the UDTF returns.</td>
</tr>
<tr>
<td>FUNCTION_ARGUMENT_TYPE</td>
<td>VARCHAR (8192)</td>
<td>The data types of the columns that make up the input row.</td>
</tr>
<tr>
<td>FUNCTION_DEFINITION</td>
<td>VARCHAR (128)</td>
<td>A string containing the name of the factory class for the UDTF, and the name of the library that contains it.</td>
</tr>
<tr>
<td>IS_FENCED</td>
<td>BOOLEAN</td>
<td>Whether the UDTF runs in fenced mode.</td>
</tr>
</tbody>
</table>

**Privileges**

No explicit permissions are required; however, users see only UDTFs contained in schemas to which they have read access.

**See Also**

- Transform Functions (UDTFs)
- CREATE TRANSFORM FUNCTION

**USERS**

Provides information about all users in the database.

**Tip**: To see if a role has been assigned to a user, call the function `HAS_ROLE`.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>USER_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog,</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>The user name for which information is listed.</td>
</tr>
<tr>
<td>IS_SUPER_USER</td>
<td>BOOLEAN</td>
<td>A system flag, where t (true) identifies the superuser created at the time of installation. All other users are denoted by f (false).</td>
</tr>
<tr>
<td>PROFILE_NAME</td>
<td>VARCHAR</td>
<td>The name of the profile to which the user is assigned. The profile controls the user's password policy.</td>
</tr>
<tr>
<td>IS_LOCKED</td>
<td>BOOLEAN</td>
<td>Whether the user's account is locked. A locked user cannot log into the system.</td>
</tr>
<tr>
<td>LOCK_TIME</td>
<td>TIMESTAMPTZ</td>
<td>When the user's account was locked. Used to determine when to automatically unlock the account, if the user's profile has a PASSWORD_LOCK_TIME parameter set.</td>
</tr>
<tr>
<td>RESOURCE_POOL</td>
<td>VARCHAR</td>
<td>The resource pool to which the user is assigned.</td>
</tr>
<tr>
<td>MEMORY_CAP_KB</td>
<td>VARCHAR</td>
<td>The maximum amount of memory a query run by the user can consume, in kilobytes.</td>
</tr>
<tr>
<td>TEMP_SPACE_CAP_KB</td>
<td>VARCHAR</td>
<td>The maximum amount of temporary disk space a query run by the user can consume, in kilobytes.</td>
</tr>
<tr>
<td>RUN_TIME_CAP</td>
<td>VARCHAR</td>
<td>The maximum amount of time any of the user's queries are allowed to run.</td>
</tr>
<tr>
<td>MAX_CONNECTIONS</td>
<td>VARCHAR</td>
<td>The maximum number of connections allowed for this user.</td>
</tr>
<tr>
<td>CONNECTION_LIMIT_MODE</td>
<td>VARCHAR</td>
<td>Indicates whether the user sets connection limits through the node or in database mode.</td>
</tr>
<tr>
<td>IDLE_SESSION_TIMEOUT</td>
<td>VARCHAR</td>
<td>The time the system waits before timing out the user's idle session. Maximum value is 1 year. See Interval Subtype Units for valid intervals.</td>
</tr>
<tr>
<td>GRACE_PERIOD</td>
<td>VARCHAR</td>
<td>Specifies how long a user query can block on any session socket, while awaiting client input or output.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>--------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If the socket is blocked for a continuous period that exceeds the grace period setting, the server shuts down the socket and throws a fatal error. The session is then terminated.</td>
</tr>
<tr>
<td>ALL_ROLES</td>
<td>VARCHAR</td>
<td>Roles assigned to the user. An asterisk in ALL_ROLES output means role granted WITH ADMIN OPTION. See Database Roles in the Administrator's Guide.</td>
</tr>
<tr>
<td>DEFAULT_ROLES</td>
<td>VARCHAR</td>
<td>Default roles assigned to the user. An asterisk in DEFAULT_ROLES output means role granted WITH ADMIN OPTION. See Default Roles for Database Users in the Administrator's Guide.</td>
</tr>
<tr>
<td>SEARCH_PATH</td>
<td>VARCHAR</td>
<td>Sets the default schema search path for the user. See Setting Search Paths in the Administrator's Guide.</td>
</tr>
<tr>
<td>LDAP_DN</td>
<td>VARCHAR</td>
<td>Indicates whether or not the Vertica Analytic Database user maps to an LDAP Link user. When the column is set to dn, the Vertica user maps to LDAP Link..</td>
</tr>
<tr>
<td>LDAP_URI_HASH</td>
<td>INTEGER</td>
<td>The URI hash number for the LDAP user.</td>
</tr>
<tr>
<td>IS_ORPHANED_FROM_LDAP</td>
<td>BOOLEAN</td>
<td>Indicates if the user is disconnected (orphaned) from LDAP, set to one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- t: User is orphaned</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- f: User is not orphaned</td>
</tr>
<tr>

VIEW_COLUMN
V_MONITOR Schema

The system tables in this section reside in the v_monitor schema. These tables provide information about the health of the Vertica database.

ACTIVE_EVENTS

Returns all active events in the cluster. See Monitoring Events.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The node name where the event occurred.</td>
</tr>
<tr>
<td>EVENT_CODE</td>
<td>INTEGER</td>
<td>A numeric ID that indicates the type of event. See Event Types for a list of event type codes.</td>
</tr>
<tr>
<td>EVENT_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the specific event.</td>
</tr>
<tr>
<td>EVENT_SEVERITY</td>
<td>VARCHAR</td>
<td>The severity of the event from highest to lowest. These events are based on standard syslog severity types.</td>
</tr>
<tr>
<td>EVENT_POSTED_TIMESTAMP</td>
<td>TIMESTAMP</td>
<td>The year, month, day, and time the event was posted.</td>
</tr>
<tr>

<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>------------</td>
<td>------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td>reported. The time is posted in military time.</td>
</tr>
<tr>
<td>EVENT_EXPIRATION</td>
<td>VARCHAR</td>
<td>The year, month, day, and time the event expire. The time is posted in military time. If the cause of the event is still active, the event is posted again.</td>
</tr>
<tr>
<td>EVENT_CODE_DESCRIPTION</td>
<td>VARCHAR</td>
<td>A brief description of the event and details pertinent to the specific situation.</td>
</tr>
<tr>
<td>EVENT_PROBLEM_DESCRIPTION</td>
<td>VARCHAR</td>
<td>A generic description of the event.</td>
</tr>
<tr>
<td>REPORTING_NODE</td>
<td>VARCHAR</td>
<td>The name of the node within the cluster that reported the event.</td>
</tr>
<tr>
<td>EVENT_SENT_TO_CHANNELS</td>
<td>VARCHAR</td>
<td>The event logging mechanisms that are configured for Vertica. These can include <code>vertica.log</code>, (configured by default) syslog, and SNMP.</td>
</tr>
<tr>
<td>EVENT_POSTED_COUNT</td>
<td>INTEGER</td>
<td>Tracks the number of times an event occurs. Rather than posting the same event multiple times, Vertica posts the event once and then counts the number of additional instances in which the event occurs.</td>
</tr>
</tbody>
</table>

**ALLOCATOR_USAGE**

Provides real-time information on the allocation and reuse of memory pools for a Vertica node.

There are two memory pools in Vertica, global and SAL. The global memory pool is related to Vertica catalog objects. The SAL memory pool is related to the system storage layer. These memory pools are physical structures from which Vertica allocates and reuses portions of memory.

Within the memory pools, there are two allocation types. Both global and SAL memory pools include chunk and object memory allocation types.

- **Chunk** allocations are from tiered storage, and are grouped into sizes, in bytes, that are powers of 2.
Object allocations are object types, for example, a table or projection. Each object assumes a set size.

The table provides detailed information on these memory pool allocations.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The name of the node from which Vertica has collected this allocator information.</td>
</tr>
<tr>
<td>POOL_NAME</td>
<td>VARCHAR</td>
<td>One of two memory pools:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• global: Memory pool is related to Vertica catalog objects.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• SAL: Memory pool is related to the system storage layer.</td>
</tr>
<tr>
<td>ALLOCATION_TYPE</td>
<td>VARCHAR</td>
<td>One of two memory allocation types:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• chunk: Chunk allocations are grouped into sizes that are powers of 2.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• object: Object allocations assume a set amount of memory based upon the specific object.</td>
</tr>
<tr>
<td>UNIT_SIZE</td>
<td>INTEGER</td>
<td>The size, in bytes, of the memory allocation.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For example, if the allocation type is a table (an object type), then Vertica allots 8 bytes.</td>
</tr>
<tr>
<td>FREE_COUNT</td>
<td>INTEGER</td>
<td>Indicates the count of blocks of freed memory that Vertica has reserved for future memory needs.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For example, if you delete a table, Vertica reserves the 8 bytes originally allotted for the table. The 8 bytes freed become 1 unit of memory that Vertica adds to this column.</td>
</tr>
<tr>
<td>FREE_BYTES</td>
<td>INTEGER</td>
<td>Indicates the number of freed memory bytes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For example, with a table deletion, Vertica adds 8 bytes to this column.</td>
</tr>
</tbody>
</table>

Note: Vertica does not release memory after
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>originally allocating it, unless the node or database is restarted.</td>
</tr>
<tr>
<td><strong>USED_COUNT</strong></td>
<td>INTEGER</td>
<td>Indicates the count of in-use blocks for this allocation. For example, if your database includes two table objects, Vertica adds 2 to this column.</td>
</tr>
<tr>
<td><strong>USED_BYTES</strong></td>
<td>INTEGER</td>
<td>The number of bytes of in-use blocks of memory. For example, if your database includes two table objects, each of which assume 8 bytes, Vertica adds 16 to this column.</td>
</tr>
<tr>
<td><strong>TOTAL_SIZE</strong></td>
<td>INTEGER</td>
<td>Indicates the number of bytes that is the sum of all free and used memory.</td>
</tr>
<tr>
<td><strong>CAPTURE_TIME</strong></td>
<td>TIMESTAMPTZ</td>
<td>Indicates the current timestamp for when Vertica collected the for this table.</td>
</tr>
<tr>
<td><strong>ALLOCATION_NAME</strong></td>
<td>VARCHAR</td>
<td>Provides the name of the allocation type.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If the allocation is an object type, provides the name of the object. For example, CAT::Schema. Object types can also have the name internal, meaning that the object is an internal data structure.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Those object types that are not internal are prefaced with either CAT or SAL. Those prefaced with CAT indicate memory from the global memory pool. SAL indicates memory from the system storage memory pool.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If the allocation type is chunk, indicates a power of 2 in this field to represent the number of bytes assumed by the chunk. For example, 2^5.</td>
</tr>
</tbody>
</table>

Vertica Analytic Database (9.1.x)
Sample: How Memory Pool Memory is Allotted, Retained, and Freed

The following table shows sample column values based upon a hypothetical example. The sample illustrates how column values change based upon addition or deletion of a table object.

- When you add a table object (t1), Vertica assumes a UNIT_SIZE of 8 bytes, with a USED_COUNT of 1.

- When you add a second table object (t2), the USED_COUNT increases to 2. Since each object assumes 8 bytes, USEDgetBytes increases to 16.

- When you delete one of the two table objects, Vertica USED_COUNT decreases to 1, and USEDgetBytes decreases to 8. Since Vertica retains the memory for future use, FREEgetBytes increases to 8, and FREE_COUNT increases to 1.

- Finally, when you create a new table object (t3), Vertica frees the memory for reuse. FREE_COUNT and FREEgetBytes return to 0.

<table>

```
**CATALOG_SUBSCRIPTION_CHANGES**

Lists the changes made to catalog subscriptions.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EVENT_TIMESTAMP</td>
<td>TIMESTAMP</td>
<td>The time a catalog subscription changed.</td>
</tr>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the session for which profiling information is captured. This identifier is unique within the cluster at any point in time but can be reused when the session closes.</td>
</tr>
<tr>
<td>USER_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the user.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>The user who made changes to the subscriptions.</td>
</tr>
<tr>
<td>TRANSACTION_ID</td>
<td>INTEGER</td>
<td>Identifier for the transaction within the session, if any. If a session is active but no transaction has begun, TRANSACTION_ID returns NULL.</td>
</tr>
<tr>
<td>SHARD_NAME</td>
<td>VARCHAR</td>
<td>The name of the shard.</td>
</tr>
<tr>
<td>SHARD_OID</td>
<td>INTEGER</td>
<td>The OID of the shard.</td>
</tr>
<tr>
<td>SUBSCRIBER_NODE_NAME</td>
<td>VARCHAR</td>
<td>The node name or names subscribed to the shard.</td>
</tr>
<tr>
<td>SUBSCRIBER_NODE_OID</td>
<td>INTEGER</td>
<td>The OID of the subscribing node or nodes.</td>
</tr>
<tr>
<td>OLD_STATE</td>
<td>VARCHAR</td>
<td>The previous state of the node subscription.</td>
</tr>
<tr>
<td>NEW_STATE</td>
<td>VARCHAR</td>
<td>The current state of the node subscription.</td>
</tr>
<tr>
<td>WAS_PRIMARY</td>
<td>BOOLEAN</td>
<td>Defines whether the node was the primary subscriber.</td>
</tr>
<tr>
<td>IS_PRIMARY</td>
<td>BOOLEAN</td>
<td>Defines whether the node is currently the primary subscriber.</td>
</tr>
<tr>
<td>CATALOG_VERSION</td>
<td>INTEGER</td>
<td>The version of the catalog at the time of the subscription change.</td>
</tr>
</tbody>
</table>
**COLUMN_STORAGE**

Returns the amount of disk storage used by each column of each projection on each node. WOS data is stored by row, so per-column byte counts are not available.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The node name for which information is listed.</td>
</tr>
<tr>
<td>COLUMN_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the column.</td>
</tr>
<tr>
<td>COLUMN_NAME</td>
<td>VARCHAR</td>
<td>The column name for which information is listed.</td>
</tr>
<tr>
<td>ROW_COUNT</td>
<td>INTEGER</td>
<td>The number of rows in the column.</td>
</tr>
<tr>
<td>USED_BYTES</td>
<td>INTEGER</td>
<td>The disk storage allocation of the column in bytes.</td>
</tr>
<tr>
<td>ENCODINGS</td>
<td>VARCHAR</td>
<td>The encoding type for the column.</td>
</tr>
<tr>
<td>COMPRESSION</td>
<td>VARCHAR</td>
<td>The compression type for the column. You can compare ENCODINGS and COMPRESSION columns to see how different encoding types affect column storage when optimizing for compression.</td>
</tr>
<tr>
<td>WOS_ROW_COUNT</td>
<td>INTEGER</td>
<td>The number of WOS rows in the column.</td>
</tr>
<tr>
<td>ROS_ROW_COUNT</td>
<td>INTEGER</td>
<td>The number of ROS rows in the column.</td>
</tr>
<tr>
<td>ROS_USED_BYTES</td>
<td>INTEGER</td>
<td>The number of ROS bytes in the column.</td>
</tr>
<tr>
<td>ROS_COUNT</td>
<td>INTEGER</td>
<td>The number of ROS containers.</td>
</tr>
<tr>
<td>PROJECTION_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the projection.</td>
</tr>
<tr>
<td>PROJECTION_NAME</td>
<td>VARCHAR</td>
<td>The associated projection name for the column.</td>
</tr>
<tr>
<td>PROJECTION_SCHEMA</td>
<td>VARCHAR</td>
<td>The name of the schema associated with the projection.</td>
</tr>
<tr>
<td>ANCHOR_TABLE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the anchor table.</td>
</tr>
</tbody>
</table>
### COMMUNAL_CLEANUP_RECORDS

This system table lists files that Vertica considers leaked on an Eon Mode communal storage. Leaked files are files that are detected as needing deletion but were missed by the normal cleanup mechanisms. This information helps you determine how much space on the communal storage you can reclaim or have reclaimed by cleaning up the leaked files.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>detection_timestamp</td>
<td>TIMESTAMPZ</td>
<td>Timestamp at which the file was detected as leaked.</td>
</tr>
<tr>
<td>location_path</td>
<td>VARCHAR</td>
<td>The path of communal storage location.</td>
</tr>
<tr>
<td>file_name</td>
<td>VARCHAR</td>
<td>The name of the leaked file.</td>
</tr>
<tr>
<td>size_in_bytes</td>
<td>INTEGER</td>
<td>The size of the leaked file in bytes.</td>
</tr>
<tr>
<td>queued_for_delete</td>
<td>BOOLEAN</td>
<td>Whether or not the file was queued for deletion. Note that files queued for deletion might not be deleted right away. Also, a subsequent clean_communal_storage will still report these files as leaked if the files hadn't already been deleted.</td>
</tr>
</tbody>
</table>

**Example**

```sql
=> SELECT clean_communal_storage('true');
clean_communal_storage

-------------------------------------------------------------
CLEAN COMMUNAL STORAGE
```
Total leaked files: 10
Total size: 217088
Files have been queued for deletion.
Check communal_cleanup_records for more information.

(1 row)

```
=> SELECT * FROM communal_cleanup_records;
  detection_timestamp | location_path   | file_name
                   | size_in_bytes | queued_for_delete

CLEAN_COMMUNAL_STORAGE

COMMUNAL_TRUNCATION_STATUS

Stores information on the state of the cluster in the case of a catalog truncation event.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CURRENT_CATALOG_VERSION</td>
<td>VARCHAR</td>
<td>Current value of the catalog truncation version (CTV).</td>
</tr>
<tr>
<td>CLUSTER_TRUNCATION_VERSION</td>
<td>VARCHAR</td>
<td>The value of the CTV from the cluster_config.json file.</td>
</tr>
</tbody>
</table>
Example

```sql
=> SELECT * FROM COMMUNAL_TRUNCATION_STATUS;
current_catalog_version | cluster_truncation_version
------------------------+------------------------
35                     | 35
```

**CONFIGURATION_CHANGES**

Records the change history of system **configuration parameters**. This information is useful for identifying:

- Who changed the configuration parameter value
- When the configuration parameter was changed
- Whether nonstandard settings were in effect in the past

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EVENT_TIMESTAMP</td>
<td>TIMESTAMPTZ</td>
<td>Time when the row was recorded.</td>

<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that is reporting the requested information.</td>
</tr>
<tr>
<td>USER_ID</td>
<td>INTEGER</td>
<td>Identifier of the user who changed configuration parameters.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>Name of the user who changed configuration parameters at the time Vertica recorded the session.</td>
</tr>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.</td>
</tr>
<tr>
<td>PARAMETER</td>
<td>VARCHAR</td>
<td>Name of the changed parameter. See Configuration Parameters in the Administrator's Guide for a detailed list of supported parameters.</td>
</tr>
<tr>
<td>VALUE</td>
<td>VARCHAR</td>
<td>New value of the configuration parameter.</td>
</tr>
</tbody>
</table>
Privileges
Superuser

CONFIGURATION_PARAMETERS

Provides information about configuration parameters currently in use by the system that are configurable at the database, node, or session level.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The node names on the cluster for which information is listed. ALL indicates that all the nodes have the same value.</td>
</tr>
<tr>
<td>PARAMETER_NAME</td>
<td>VARCHAR</td>
<td>The name of the configurable parameter. For names of supported parameters, see Configuration Parameter Categories in the Administrator's Guide.</td>
</tr>
<tr>
<td>CURRENT_VALUE</td>
<td>VARCHAR</td>
<td>The value of the current setting for the parameter.</td>
</tr>
<tr>
<td>RESTART_VALUE</td>
<td>VARCHAR</td>
<td>The value of the parameter after the next restart.</td>
</tr>
<tr>
<td>DATABASE_VALUE</td>
<td>VARCHAR</td>
<td>The value that is set at the database level. If no database-level value is set, the value reflects the default value.</td>
</tr>
<tr>
<td>DEFAULT_VALUE</td>
<td>VARCHAR</td>
<td>The default value for the parameter.</td>
</tr>
<tr>
<td>CURRENT_LEVEL</td>
<td>VARCHAR</td>
<td>Level at which CURRENT_VALUE is set. Valid values: Node, database, session, or default.</td>
</tr>
<tr>
<td>RESTART_LEVEL</td>
<td>VARCHAR</td>
<td>Level at which the parameter will be set after the next restart.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Valid values</strong>: Node, database, or default.</td>
</tr>
<tr>
<td>IS_MISMATCH</td>
<td>BOOLEAN</td>
<td>A <code>t</code> (true) setting indicates CURRENT_VALUE and RESTART_VALUE do not match.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Valid values</strong>: Node, database, or default.</td>
</tr>
<tr>
<td>GROUPS</td>
<td>VARCHAR</td>
<td>Any group to which the parameter belongs (for example, Security Parameters).</td>
</tr>
<tr>
<td>ALLOWED_LEVELS</td>
<td>VARCHAR</td>
<td>Indicates level or levels at which the specified parameter can be set.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Valid values</strong>: Node, database, or session.</td>
</tr>
<tr>
<td>SUPERUSER_ONLY</td>
<td>BOOLEAN</td>
<td>Indicates if the parameter settings are viewable by the superuser only.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If true, the following columns will be masked if viewed by a non-superuser:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- current_value</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- restart_value</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- database_value</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- default_value</td>
</tr>
<tr>
<td>CHANGE_UNDER_SUPPORT_GUIDANCE</td>
<td>BOOLEAN</td>
<td>A <code>t</code> (true) setting indicates parameters intended for use only by Vertica.</td>
</tr>
<tr>
<td>CHANGEQUIRES_RESTART</td>
<td>BOOLEAN</td>
<td>Indicates whether the configuration change requires a restart, where <code>t</code> is true and <code>f</code> is false.</td>
</tr>
<tr>
<td>DESCRIPTION</td>
<td>VARCHAR</td>
<td>A description of the parameter's purpose.</td>
</tr>
</tbody>
</table>

**Example**

The following example shows a case where the parameter requires a restart for the new setting to take effect:

```sql
=> SELECT * FROM CONFIGURATION_PARAMETERS WHERE parameter_name = 'EnableSSL';
-[ RECORD 1 ]-+---------------------------------------------------------------+
```
The following example shows a case where a non-superuser is viewing a parameter where `superuser_only` is true.

```sql
=> \c VMart nonSuperuser
You are now connected to database "VMart" as user "nonSuperuser".
=> SELECT * FROM CONFIGURATION_PARAMETERS WHERE superuser_only = 't';
```

```

[Configuration Parameters](#) in the Administrator's Guide

**CPU USAGE**

Records CPU usage history on the system.
### Column Name | Data Type | Description
--- | --- | ---
NODE_NAME | VARCHAR | Name of the node that is reporting the requested information.
START_TIME | TIMESTAMP | Beginning of history interval.
END_TIME | TIMESTAMP | End of history interval.
AVERAGE_CPU_USAGE_PERCENT | FLOAT | Average CPU usage in percent of total CPU time (0-100) during history interval.

**Privileges**

Superuser

### CRITICAL_HOSTS

Lists the critical hosts whose failure would cause the database to become unsafe and force a shutdown.

### Column Name | Data Type | Description
--- | --- | ---
HOST_NAME | VARCHAR | Name of a critical host

**Privileges**

None

### CRITICAL_NODES

Lists the critical nodes whose failure would cause the database to become unsafe and force a shutdown.

### Column Name | Data Type | Description
--- | --- | ---
NODE_ID | INTEGER | A unique numeric ID assigned by the Vertica catalog that identifies the node.
### CURRENT_SESSION

Returns information about the current active session. Use this table to find out the current session's sessionID and get the duration of the previously-run query.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>

<td>VARCHAR</td>
<td>Identifies the user that logged into the database, also set for unsuccessful login attempts.</td>
</tr>
<tr>
<td>REQUESTED_PROTOCOL</td>
<td>VARCHAR</td>
<td>Communication protocol version that the ODBC client driver sends to Vertica server, used to support backward compatibility with earlier server versions.</td>
</tr>
<tr>
<td>EFFECTIVE_PROTOCOL</td>
<td>VARCHAR</td>
<td>Minimum protocol version supported by client and driver.</td>
</tr>
</tbody>
</table>

**Profiling Settings**

The following columns show settings for different profiling categories:
EXECUTION_ENGINE_PROFILING_CONFIGURATION

QUERY_PROFILING_CONFIGURATION

SESSION_PROFILING_CONFIGURATION

These are set to one of the following:

<table>
<thead>
<tr>
<th>Empty</th>
<th>No profiling is set</th>
</tr>
</thead>
<tbody>
<tr>
<td>Session</td>
<td>On for current session</td>
</tr>
<tr>
<td>Global</td>
<td>On by default for all sessions</td>
</tr>
<tr>
<td>Session, Global</td>
<td>On by default for all sessions, including current session.</td>
</tr>
</tbody>
</table>

For information about controlling profiling settings, see Enabling Profiling in the Administrator's Guide.

DATA_COLLECTOR

Shows the Data Collector components, their current retention policies, and statistics about how much data is retained and how much has been discarded for various reasons. DATA_COLLECTOR also calculates approximate collection rate, to aid in sizing calculations.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The node name on which information is retained.</td>
</tr>
<tr>
<td>COMPONENT</td>
<td>VARCHAR</td>
<td>The name of the component and its policy.</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR</td>
<td>The data collector (dc) table name for which information is listed.</td>
</tr>
<tr>
<td>DESCRIPTION</td>
<td>VARCHAR</td>
<td>A short description about the component.</td>
</tr>
<tr>
<td>IN_DB_LOG</td>
<td>BOOLEAN</td>
<td>Denotes if monitoring information is retained in the dbLog file.</td>
</tr>
<tr>
<td>IN_VERTICA_LOG</td>
<td>BOOLEAN</td>
<td>Denotes if monitoring information is retained in the vertica.log file.</td>
</tr>
<tr>
<td>MEMORY_BUFFER_SIZE_KB</td>
<td>INTEGER</td>
<td>The size of the memory buffer in kilobytes.</td>
</tr>
</tbody>
</table>
### Column Name | Data Type | Description
--- | --- | ---
DISK_SIZE_KB | INTEGER | The on-disk size of the table in kilobytes.
SET_INTERVAL | BOOLEAN | A `t` (true) setting indicates time-based retention is set.
INTERVAL_TIME_S | INTERVAL | The time of retention expressed as an INTERVAL type. To turn time-based retention off, set the value to 0.
RECORD_TOO_BIG_ERRORS | INTEGER | A number that increments by one each time an error is thrown because data did not fit in memory (based on the data collector retention policy).
LOST_BUFFERS | INTEGER | The number of buffers lost.
LOST_RECORDS | INTEGER | The number of records lost.
RETIRED_FILES | INTEGER | The number of retired files.
RETIRED_RECORDS | INTEGER | The number of retired records.
CURRENT_MEMORY_RECORDS | INTEGER | The current number of rows in memory.
CURRENT_DISK_RECORDS | INTEGER | The current number of rows stored on disk.
CURRENT_MEMORY_BYTES | INTEGER | Total current memory used in kilobytes.
CURRENT_DISK_BYTES | INTEGER | Total current disk space used in kilobytes.
FIRST_TIME | TIMESTAMP | Timestamp of the first record.
LAST_TIME | TIMESTAMP | Timestamp of the last record
KB_PER_DAY | FLOAT | Total kilobytes used per day.

### Notes
- **Data Collector is on by default.** To turn it off, see [Enabling and Disabling Data Collector](#).
- **You can configure monitoring information retention policies.** See [Data Collector Functions](#) and [Configuring Data Retention Policies](#) for more information.
Examples

The following example shows how to return all component names and their descriptions. This is a useful query if you want to change the retention policy for a particular component and don't remember its name:

```sql
=> SELECT DISTINCT component, description FROM data_collector ORDER BY 1 ASC;

<table>
<thead>
<tr>
<th>component</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AllocationPoolStatistics</td>
<td>Information about global memory pools</td>
</tr>
<tr>
<td>AllocationPoolStatisticsByDay</td>
<td>Information about global memory pools, ... (historical, by day)</td>
</tr>
<tr>
<td>AllocationPoolStatisticsByHour</td>
<td>Information about global memory pools, ... (historical, by hour)</td>
</tr>
<tr>
<td>AllocationPoolStatisticsByMinute</td>
<td>Information about global memory pools, ... (historical, by minute)</td>
</tr>
<tr>
<td>AnalyzeStatistics</td>
<td>History of statistics collection</td>
</tr>
<tr>
<td>Backups</td>
<td>Monitoring successful backups</td>
</tr>
<tr>
<td>CatalogInfoByDay</td>
<td>Catalog statistics and history</td>
</tr>
<tr>
<td>CatalogInfoByHour</td>
<td>Catalog statistics and history (historical, by hour)</td>
</tr>
<tr>
<td>CatalogInfoByMinute</td>
<td>Catalog statistics and history (historical, by minute)</td>
</tr>
<tr>
<td>CpuAggregate</td>
<td>Aggregate CPU information</td>
</tr>
<tr>
<td>CpuAggregateByDay</td>
<td>Aggregate CPU information (historical, by day)</td>
</tr>
<tr>
<td>CpuAggregateByHour</td>
<td>Aggregate CPU information (historical, by hour)</td>
</tr>
<tr>
<td>CpuAggregateByMinute</td>
<td>Aggregate CPU information (historical, by minute)</td>
</tr>
<tr>
<td>CpuAggregateBySecond</td>
<td>Aggregate CPU information (historical, by second)</td>
</tr>
<tr>
<td>CpuInfo</td>
<td>CPU information</td>
</tr>
<tr>
<td>CpuInfoByDay</td>
<td>CPU information (historical, by day)</td>
</tr>
<tr>
<td>CpuInfoByHour</td>
<td>CPU information (historical, by hour)</td>
</tr>
<tr>
<td>CpuInfoByMinute</td>
<td>CPU information (historical, by minute)</td>
</tr>
<tr>
<td>CpuInfoBySecond</td>
<td>CPU information (historical, by second)</td>
</tr>
<tr>
<td>DeploymentsCompleted</td>
<td>History of designs deployed</td>
</tr>
<tr>
<td>DesignsCompleted</td>
<td>History of designs executed</td>
</tr>
<tr>
<td>DiskResourceRejections</td>
<td>Disk Resource Rejection Records</td>
</tr>
<tr>
<td>Errors</td>
<td>History of all errors+warnings encountered</td>
</tr>
<tr>
<td>ExecutionEngineEvents</td>
<td>History of important events during local planning and execution</td>
</tr>
<tr>
<td>ExecutionEngineProfiles</td>
<td>History of EE profiles</td>
</tr>
</tbody>
</table>

DATABASE_BACKUPS

Lists historical information for each backup that successfully completed after running the vbr utility. This information is useful for determining whether to create a new backup before you advance the AHM. Because this system table displays historical information, its contents do not always reflect the current state of a backup repository. For example, if you delete a backup from a repository, the DATABASE_BACKUPS system table continues to display information about it.

To list existing backups, run vbr as described in Viewing Backups in the Administrator's Guide.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BACKUP_TIMESTAMP</td>
<td>TIMESTAMP</td>
<td>The timestamp of the backup.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The name of the initiator node that performed the backup logging.</td>
</tr>
<tr>
<td>SNAPSHOT_NAME</td>
<td>VARCHAR</td>
<td>The name of the backup, as specified in the snapshotName parameter of the vbr configuration file.</td>
</tr>
<tr>
<td>BACKUP_EPOCH</td>
<td>INTEGER</td>
<td>The database epoch at which the backup was saved.</td>
</tr>
<tr>
<td>NODE_COUNT</td>
<td>INTEGER</td>
<td>The number of nodes backed up in the completed backup, and as listed in the [Mappingn] sections of the configuration file.</td>
</tr>
<tr>
<td>OBJECTS</td>
<td>VARCHAR</td>
<td>The name of the object(s) contained in an object-level backup. This column is empty if the record is for a full cluster backup.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>FILE_SYSTEM_TYPE</td>
<td>VARCHAR</td>
<td>The type of file system, such as Linux.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

**DATABASE_CONNECTIONS**

Lists the connections to other databases for importing and exporting data. See Importing and Exporting Data Across Databases in the Administrator's Guide.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATABASE</td>
<td>VARCHAR</td>
<td>The name of the connected database</td>
</tr>
<tr>
<td>USERNAME</td>
<td>VARCHAR</td>
<td>The username used to create the connection</td>
</tr>
<tr>
<td>HOST</td>
<td>VARCHAR</td>
<td>The host name used to create the connection</td>
</tr>
<tr>
<td>PORT</td>
<td>VARCHAR</td>
<td>The port number used to create the connection</td>
</tr>
<tr>
<td>ISVALID</td>
<td>BOOLEAN</td>
<td>Whether the connection is still open and usable or not</td>
</tr>
</tbody>
</table>

Example

```sql
=> CONNECT TO VERTICA vmart USER dbadmin PASSWORD '' ON '10.10.20.150',5433;
CONNECT
=> SELECT * FROM DATABASE_CONNECTIONS;
  database | username | host    | port | isvalid
-----------------------------------------------
  vmart     | dbadmin  | 10.10.20.150 | 5433 | t
(1 row)
```

**DELETE_VECTORS**

Holds information on deleted rows to speed up the delete process.
### Column Name | Data Type | Description
---|---|---
NODE_NAME | VARCHAR | The name of the node storing the deleted rows.
SCHEMA_NAME | VARCHAR | The name of the schema where the deleted rows are located.
PROJECTION_NAME | VARCHAR | The name of the projection where the deleted rows are located.
STORAGE_TYPE | VARCHAR | The type of storage containing the delete vector (WOS or ROS).
DV_OID | INTEGER | The unique numeric ID (OID) that identifies this delete vector.
STORAGE_OID | INTEGER | The unique numeric ID (OID) that identifies the storage container that holds the delete vector.
SAL_STORAGE_ID | VARCHAR | Unique hexadecimal numeric ID assigned by the Vertica catalog, which identifies the storage.
DELETED_ROW_COUNT | INTEGER | The number of rows deleted.
USEDgetBytes | INTEGER | The number of bytes used to store the deletion.
START_EPOCH | INTEGER | The start epoch of the data in the delete vector.
END_EPOCH | INTEGER | The end epoch of the data in the delete vector.
IS_SORTED | BOOLEAN | Whether the storage container's data is sorted (WOS containers only).

### Example

After you delete data from a Vertica table, that data is marked for deletion. To see the data that is marked for deletion, query the DELETE_VECTORS system table.

Run PURGE to remove the delete vectors from ROS containers.

```sql
=> SELECT * FROM test1;
number
-------
   3
   12
```
33
87
43
99
(6 rows)

=> DELETE FROM test1 WHERE number > 50;

OUTPUT
-------
  2
(1 row)

=> SELECT * FROM test1;

number
-------
  43
  3
  12
  33
(4 rows)

=> SELECT node_name, projection_name, deleted_row_count FROM DELETE_VECTORS;

<table>
<thead>
<tr>
<th>node_name</th>
<th>projection_name</th>
<th>deleted_row_count</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_vmart_node0002</td>
<td>test1_b1</td>
<td>1</td>
</tr>
<tr>
<td>v_vmart_node0001</td>
<td>test1_b1</td>
<td>1</td>
</tr>
<tr>
<td>v_vmart_node0001</td>
<td>test1_b0</td>
<td>1</td>
</tr>
<tr>
<td>v_vmart_node0003</td>
<td>test1_b0</td>
<td>1</td>
</tr>
</tbody>
</table>

(4 rows)

=> SELECT PURGE();

...

After the ancient history mark (AHM) advances:

=> SELECT * FROM DELETE_VECTORS;

(No rows)

DEPLOY_STATUS

Records the history of deployed Database Designer designs and their deployment steps.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EVENT_TIME</td>
<td>TIMESTAMP</td>
<td>Time when the row recorded the event.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>Name of the user who deployed a design at the time Vertica recorded the session.</td>
</tr>
<tr>
<td>DEPLOY_NAME</td>
<td>VARCHAR</td>
<td>Name the deployment, same as the user-specified design name.</td>
</tr>
<tr>
<td>DEPLOY_STEP</td>
<td>VARCHAR</td>
<td>Steps in the design deployment.</td>
</tr>
<tr>
<td>DEPLOY_STEP_STATUS</td>
<td>VARCHAR</td>
<td>Textual status description of the current step in the deploy process.</td>
</tr>
<tr>
<td>DEPLOY_STEP_COMPLETE_PERCENT</td>
<td>FLOAT</td>
<td>Progress of current step in percentage (0–100).</td>
</tr>
<tr>
<td>DEPLOY_COMPLETE_PERCENT</td>
<td>FLOAT</td>
<td>Progress of overall deployment in percentage (0–100).</td>
</tr>
<tr>
<td>ERROR_MESSAGE</td>
<td>VARCHAR</td>
<td>Error or warning message during deployment.</td>
</tr>
</tbody>
</table>

Privileges

No explicit privileges are required. You only see the records for tables that you have privileges to view.

DEPLOYMENT_PROJECTION_STATEMENTS

Contains information about CREATE PROJECTION statements used to deploy a database design. Each row contains information about a different CREATE PROJECTION statement. The function DESIGNER_RUN_POPULATEDESIGN_AND_DEPLOY populates this table.
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Column Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEPLOYMENT_ID</td>
<td>INTEGER</td>
<td>Unique ID that Database Designer assigned to the deployment.</td>
</tr>
<tr>
<td>DESIGN_NAME</td>
<td>VARCHAR</td>
<td>Unique name that the user assigned to the design.</td>
</tr>
<tr>
<td>DEPLOYMENT_PROJECTION_ID</td>
<td>INTEGER</td>
<td>Unique ID assigned to the output projection by Database Designer.</td>
</tr>
<tr>
<td>STATEMENT_ID</td>
<td>INTEGER</td>
<td>Unique ID assigned to the statement type that creates the projection.</td>
</tr>
<tr>
<td>STATEMENT</td>
<td>VARCHAR</td>
<td>Text for the statement that creates the projection.</td>
</tr>
</tbody>
</table>

**DEPLOYMENT_PROJECTIONS**

Contains information about projections created and dropped during the design. Each row contains information about a different projection. Database Designer populates this table after the design is deployed.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Column Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>deployment_id</td>
<td>INTEGER</td>
<td>Unique ID that Database Designer assigned to the deployment.</td>
</tr>
<tr>
<td>deployment_projection_id</td>
<td>INTEGER</td>
<td>Unique ID that Database Designer assigned to the output projection.</td>
</tr>
<tr>
<td>design_name</td>
<td>VARCHAR</td>
<td>Name of the design being deployed.</td>
</tr>
<tr>
<td>deployment_projection_name</td>
<td>VARCHAR</td>
<td>Name that Database Designer assigned to the projection.</td>
</tr>
<tr>
<td>anchor_table_schema</td>
<td>VARCHAR</td>
<td>Name of the schema that contains the table the projection is based on.</td>
</tr>
<tr>
<td>anchor_table_name</td>
<td>VARCHAR</td>
<td>Name of the table the projection is based on.</td>
</tr>
<tr>
<td>deployment</td>
<td>VARCHAR</td>
<td>Action being taken on the projection, for example, add</td>
</tr>
</tbody>
</table>
### Column Name | Column Type | Description
--- | --- | ---
operation | or drop. |  
**deployment_projection_type** | VARCHAR | Indicates whether Database Designer has proposed new projections for this design (DBD) or is using the existing catalog design (CATALOG). The REENCODED suffix indicates that the projection sort order and segmentation are the same, but the projection columns have new encodings:
- DBD
- CATALOG
- DBD_REENCODED
- CATALOG_REENCODED
**deploy_weight** | INTEGER | Weight of this projection in creating the design. This field is always 0 for projections that have been dropped.
**estimated_size_on_disk** | INTEGER | Approximate size of the projection on disk, in MB.

### DEPOT_EVICTIONS

Lists the details of the files that have been evicted from the depot when the database is in Eon Mode.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EVICTION_TIME</td>
<td>TIMESTAMP</td>
<td>The time a catalog subscription changed.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of a node where an eviction occurred.</td>
</tr>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the session for which profiling information is captured. This identifier is unique within the cluster at any point in time but can be reused when the session closes.</td>
</tr>
</tbody>
</table>
### Column Name | Data Type | Description
--- | --- | ---
USER_ID | INTEGER | A unique numeric ID assigned by the Vertica catalog, which identifies the user.
USER_NAME | VARCHAR | The user who made changes to the depot.
TRANSACTION_ID | INTEGER | Identifier for the transaction within the session, if any. If a session is active but no transaction has begun, TRANSACTION_ID returns NULL.
STATEMENT_ID | INTEGER | Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID and STATEMENT_ID uniquely identifies a statement within a session; these columns are useful for creating joins with other system tables.
REQUEST_ID | INTEGER | Unique identifier of the query request in the user session.
STORAGE_ID | VARCHAR | The OID of the evicted file.
FILE_SIZE_BYTES | INTEGER | The size of the file in bytes that was evicted.
NUMBER_HITS | INTEGER | The number of times the file was accessed.
LAST_ACCESS_TIME | TIMESTAMP | The last time the file was read.

### DEPOT_FETCH_QUEUE

Lists the queued fetches from communal storage for a depot. This table will only contain entries when a node has queued a file to be fetched.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The name of the node fetching the file.</td>
</tr>
<tr>
<td>SAL_STORAGE_ID</td>
<td>VARCHAR</td>
<td>Unique hexadecimal numeric ID assigned by the Vertica catalog, which identifies the storage.</td>
</tr>
<tr>
<td>PLAN_ID</td>
<td>VARCHAR</td>
<td>A unique node-specific numeric ID for each plan that the optimizer runs. These values are not reused.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SOURCE_FILE_NAME</td>
<td>VARCHAR</td>
<td>The full path of the file in the communal storage being fetched.</td>
</tr>
<tr>
<td>DESTINATION_FILE_NAME</td>
<td>VARCHAR</td>
<td>The destination path of the file being fetched.</td>
</tr>
</tbody>
</table>

Example

```sql
=> \
x
Expanded display is on.
=> SELECT * FROM depot_fetch_queue;
-[ RECORD 1 ]---------------------------------------------
  node_name     | v_example_db_node002
  sal_storage_id | 029b6fac864e1982531dce47d00edc500d000000001d5e7
  plan_id       | 45035996273705983
  source_file_name | s3://mydata/mydb/14a/029b6fac864e1982531dce47d00edc500d000000001d5e7_0.gt
  destination_file_name | /scratch_b/depot/example_db/v_example_db_node002_depot/747/029b6fac864e1982531dce47d00edc500d000000001d5e7_0.gt
-[ RECORD 2 ]---------------------------------------------
  node_name     | v_example_db_node002
  sal_storage_id | 026635d69719c45e8d2d86f5a4d62c7b00b000000001d5e7
  plan_id       | 45035996273705983
  source_file_name | s3://mydata/mydb/4a5/029b6fac864e1982531dce47d00edc500d000000001d5e7_0.gt
  destination_file_name | /scratch_b/depot/example_db/v_example_db_node002_depot/751/026635d69719c45e8d2d86f5a4d62c7b00b000000001d5e7_0.gt
```

DEPOT_FETCHES

Lists the details about files the depot fetched when the database is in Eon Mode.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>START_TIME</td>
<td>TIMESTAMP</td>
<td>Timestamp from the beginning of the fetch.</td>
</tr>
<tr>
<td>END_TIME</td>
<td>TIMESTAMP</td>
<td>Timestamp from the completion of the fetch.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that fetched from the depot.</td>
</tr>
<tr>
<td>PLAN_ID</td>
<td>VARCHAR</td>
<td>A unique node-specific numeric ID for each plan that the optimizer runs.</td>

<td>VARCHAR</td>
<td>The destination file path.</td>
</tr>
<tr>
<td>SOURCE_NODE</td>
<td>VARCHAR</td>
<td>The source node used.</td>
</tr>
</tbody>
</table>

**DEPOT_UPLODES**

Lists the details about uploads to communal storage from the depot.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>START_TIME</td>
<td>TIMESTAMP</td>
<td>Timestamp from the beginning of the upload.</td>
</tr>
<tr>
<td>END_TIME</td>
<td>TIMESTAMP</td>
<td>Timestamp from the completion of the upload.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of a node where an upload occurred.</td>
</tr>
<tr>
<td>PLAN_ID</td>
<td>VARCHAR</td>
<td>A unique node-specific numeric ID for each plan that the optimizer runs. These values are not reused.</td>
</tr>
<tr>
<td>FILE_SIZE_BYTES</td>
<td>INTEGER</td>
<td>The size of the file in bytes that was uploaded.</td>
</tr>
<tr>
<td>SOURCE_FILE</td>
<td>VARCHAR</td>
<td>The source file path used.</td>
</tr>
<tr>
<td>DESTINATION_FILE</td>
<td>VARCHAR</td>
<td>The destination file path.</td>
</tr>
</tbody>
</table>

**DESIGN_QUERIES**

Contains info about design queries for a given design. The following functions populate this table:

- DESIGNER_ADD DESIGN QUERIES
- DESIGNER_ADD DESIGN QUERIES_FROM_RESULTS
- DESIGNER_ADD DESIGN QUERY
### Vertica Analytic Database (9.1.x)

**Example**

Add queries to VMART_DESIGN and query the DESIGN_QUERIES table:
=> SELECT DESIGNER_ADD DESIGN QUERIES('VMART DESIGN', '/tmp/examples/vmart_queries.sql','true');
DESIGNER_ADD DESIGN QUERIES
----------------------------------
Number of accepted queries = 9
Number of queries referencing non-design tables = 0
Number of unsupported queries = 0
Number of illegal queries = 0
=> \x
Expanded display is on.
=> SELECT * FROM V_MONITOR.DESIGN.QUERIES
- [RECORD 1 ]------------------------
design_id | 45035996273705090

**DESIGN_TABLES**

Contains information about all the design tables for all the designs for which you are the owner. Each row contains information about a different design table. Vertica creates this table when you run `DESIGNER_CREATEDESIGN`.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Column Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DESIGN_NAME</td>
<td>VARCHAR</td>
<td>Unique name that the user specified for the design.</td>
</tr>
<tr>
<td>DESIGN_TABLE_ID</td>
<td>INTEGER</td>
<td>Unique ID that Database Designer assigned to the design table.</td>
</tr>
<tr>
<td>TABLE_SCHEMA</td>
<td>VARCHAR</td>
<td>Name of the schema that contains the design table.</td>
</tr>
<tr>
<td>TABLE_ID</td>
<td>INTEGER</td>
<td>System object identifier (OID) assigned to the design table.</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR</td>
<td>Name of the design table.</td>
</tr>
</tbody>
</table>

**Example**

Add all the tables from the VMart database to the design VMART_DESIGN. This operation populates the DESIGN_TABLES table:

```sql
=> SELECT DESIGNER_ADD DESIGN TABLES ('VMART_DESIGN', 'online_sales.*');  
DESIGNER_ADD DESIGN TABLES
-----------------------------
 3
(1 row)
```
```sql
=> SELECT DESIGNER_ADD DESIGN TABLES('VMARTDESIGN', 'public.*');
DESIGNER_ADD DESIGN TABLES
-----------------------------
9
(1 row)
=> SELECT DESIGNER_ADD DESIGN TABLES('VMARTDESIGN', 'store.*');
DESIGNER_ADD DESIGN TABLES
-----------------------------
3
(1 row)
=> SELECT * FROM DESIGN TABLES;
```

<table>

**DESIGNS**

Contains information about a Database Designer design. After you create a design and specify certain parameters for Database Designer, `DESIGNER_CREATE DESIGN` creates this table in the `V_MONITOR` schema.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Column Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DESIGN_ID</td>
<td>INTEGER</td>
<td>Unique ID that Database Designer assigns to this design.</td>
</tr>
<tr>
<td>DESIGN_NAME</td>
<td>VARCHAR</td>
<td>Name that the user specifies for the design.</td>
</tr>
<tr>
<td>KSAFETY_LEVEL</td>
<td>INTEGER</td>
<td>K-safety level for the design. Database Designer assigns a K-safety value of 0 for clusters with 1 or 2 nodes, and assigns a value of 1 for clusters with 3 or more nodes.</td>
</tr>
<tr>
<td>OPTIMIZATION_OBJECTIVE</td>
<td>VARCHAR</td>
<td>Name of the optimization objective for the design. Valid values are:</td>
</tr>
<tr>
<td>Column Name</td>
<td>Column Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>QUERY</td>
<td></td>
</tr>
<tr>
<td></td>
<td>LOAD</td>
<td></td>
</tr>
<tr>
<td></td>
<td>BALANCED (default)</td>
<td></td>
</tr>
<tr>
<td>DESIGN_TYPE</td>
<td>VARCHAR</td>
<td>Name of the design type. Valid values are:</td>
</tr>
<tr>
<td></td>
<td>COMPREHENSIVE (default)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>INCREMENTAL</td>
<td></td>
</tr>
<tr>
<td>PROPOSE_SUPER_FIRST</td>
<td>BOOLEAN</td>
<td>Specifies to propose superprojections before projections, by default f. If DESIGN_MODE is COMPREHENSIVE, this field has no impact.</td>
</tr>
<tr>
<td>DESIGNAVAILABLE</td>
<td>BOOLEAN</td>
<td>t if the design is currently available, otherwise, f (default).</td>
</tr>
<tr>
<td>COLLECTED_STATISTICS</td>
<td>BOOLEAN</td>
<td>t if statistics are to be collected when creating the design, otherwise, f (default).</td>
</tr>
<tr>
<td>POPULATE_DESIGN_TABLES_FROM QUERIES</td>
<td>BOOLEAN</td>
<td>t if you want to populate the design tables from the design queries, otherwise, f (default).</td>
</tr>
<tr>
<td>ENCODING_DESIGN</td>
<td>BOOLEAN</td>
<td>t if the design is an encoding optimization design on pre-existing projections, otherwise, f (default).</td>
</tr>
<tr>
<td>DEPLOYMENT_PARALLELISM</td>
<td>INTEGER</td>
<td>Number of tables to be deployed in parallel when the design is complete. Default: 0</td>
</tr>
<tr>
<td>PROPOSE_UNSEGMENTED_PROJECTIONS</td>
<td>BOOLEAN</td>
<td>t if you specify unsegmented projections, otherwise, f (default).</td>
</tr>
<tr>
<td>ANALYZE_CORRELATIONS_MODE</td>
<td>INTEGER</td>
<td>Specifies how Database Designer should handle existing column correlations in a design and whether or not Database Designer should reanalyze existing column correlations.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0—(default) Ignore column correlations when creating the design.</td>
</tr>
</tbody>
</table>
1—Consider the existing correlations in the tables when creating the design.

2—Analyze column correlations if not previously performed, and consider the column correlations when creating the design.

3—Analyze all column correlations in the tables and consider them when creating the design, even if they have been analyzed previously.

**DISK_RESOURCE_REJECTIONS**

Returns requests for resources that are rejected due to disk space shortages. Output is aggregated by both RESOURCE_TYPE and REJECTED_REASON to provide more comprehensive information.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The node name for which information is listed.</td>
</tr>
<tr>
<td>RESOURCE_TYPE</td>
<td>VARCHAR</td>
<td>The resource request requester (example: Temp files).</td>
</tr>
<tr>
<td>REJECTED_REASON</td>
<td>VARCHAR</td>
<td>One of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Insufficient disk space</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Failed volume</td>
</tr>
<tr>
<td>REJECTED_COUNT</td>
<td>INTEGER</td>
<td>Number of times this REJECTED_REASON has been given for this RESOURCE_TYPE.</td>
</tr>
<tr>
<td>FIRST_REJECTED_TIMESTAMP</td>
<td>TIMESTAMP</td>
<td>The time of the first rejection for this REJECTED_REASON and RESOURCE_TYPE.</td>
</tr>
<tr>
<td>LAST_REJECTED_TIMESTAMP</td>
<td>TIMESTAMP</td>
<td>The time of the most recent rejection for this REJECTED_REASON and RESOURCE_TYPE.</td>
</tr>
<tr>
<td>LAST_REJECTED_VALUE</td>
<td>INTEGER</td>
<td>The value of the most recent rejection for this REJECTED_REASON and RESOURCE_TYPE.</td>
</tr>
</tbody>
</table>
See Also

- RESOURCE_REJECTIONS
- CLEAR_RESOURCE_REJECTIONS

DISK_STORAGE

Returns the amount of disk storage used by the database on each node. Each node can have one or more storage locations, and the locations can be on different disks with separate properties, such as free space, used space, and block size. The information in this system table is useful in determining where data files reside.

All returned values for this system table are in the context of the file system of the host operating system, and are not specific to Vertica-specific space.

The storage usage annotation called CATALOG indicates that the location is used to store the catalog. Each CATALOG location is specified only when creating a new database. You cannot add a CATALOG location annotation using CREATE LOCATION, nor remove an existing CATALOG annotation.

Storage Location Performance

The performance of a storage location is measured with two values:

- Throughput in MB/sec
- Latency in seeks/sec

These two values are converted to a single number (Speed) with the following formula:

ReadTime (time to read 1MB) = 1 / throughput + 1 / latency

- 1/throughput is the time taken to read 1MB of data
- 1/latency is the time taken to seek to the data.
- ReadTime is the time taken to read 1MB of data.

A disk is faster than another disk if its ReadTime is less.
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The node name for which information is listed.</td>
</tr>
<tr>
<td>STORAGE_PATH</td>
<td>VARCHAR</td>
<td>The path where the storage location is mounted.</td>
</tr>
<tr>
<td>STORAGE_USAGE</td>
<td>VARCHAR</td>
<td>The type of information stored in the location:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- DATA: Only data is stored in the location.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- TEMP: Only temporary files that are created during loads or queries are stored in the location.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- DATA,TEMP: Both types of files are stored in the location.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- USER: The storage location can be used by non-dbaadmin users, who are granted access to the storage location</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- CATALOG: The area is used for the Vertica catalog. This usage is set internally and cannot be removed or changed.</td>
</tr>
<tr>
<td>RANK</td>
<td>INTEGER</td>
<td>The rank assigned to the storage location based on its performance. Ranks are used to create a storage locations on which projections, columns, and partitions are stored on different disks based on predicted or measured access patterns. See Managing Storage Locations in the Administrator's Guide.</td>
</tr>
<tr>
<td>THROUGHPUT</td>
<td>INTEGER</td>
<td>The measure of a storage location's performance in MB/sec. 1/throughput is the time taken to read 1MB of data.</td>
</tr>
<tr>
<td>LATENCY</td>
<td>INTEGER</td>
<td>The measure of a storage location's performance in seek/sec. 1/latency is the time taken to seek to the data.</td>
</tr>
<tr>
<td>STORAGE_STATUS</td>
<td>VARCHAR</td>
<td>The status of the storage location: active or retired.</td>
</tr>
<tr>
<td>DISK_BLOCK_SIZE_BYTES</td>
<td>INTEGER</td>
<td>The block size of the disk in bytes.</td>
</tr>
</tbody>
</table>
### DISK SPACE USED BLOCKS
**Data Type:** INTEGER  
The number of disk blocks in use.

### DISK SPACE USED MB
**Data Type:** INTEGER  
The number of megabytes of disk storage in use.

### DISK SPACE FREE BLOCKS
**Data Type:** INTEGER  
The number of free disk blocks available.

### DISK SPACE FREE MB
**Data Type:** INTEGER  
The number of megabytes of free storage available.

### DISK SPACE FREE PERCENT
**Data Type:** VARCHAR  
The percentage of free disk space remaining.

---

**ERROR_MESSAGES**

Lists system error messages and warnings Vertica encounters while processing queries. Some errors occur when no transaction is in progress, so the transaction identifier or statement identifier columns might return NULL.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EVENT_TIMESTAMP</td>
<td>TIMESTAMPTZ</td>
<td>Time when the row recorded the event.</td>

</tr>
<tr>
<td></td>
<td></td>
<td>• INTERNAL</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• FATAL</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• PANIC</td>
</tr>
<tr>
<td>ERROR_CODE</td>
<td>INTEGER</td>
<td>Error code that Vertica reports.</td>
</tr>
<tr>
<td>MESSAGE</td>
<td>VARCHAR</td>
<td>Textual output of the error message.</td>
</tr>
<tr>
<td>DETAIL</td>
<td>VARCHAR</td>
<td>Additional information about the error message, in greater detail.</td>
</tr>
<tr>
<td>HINT</td>
<td>VARCHAR</td>
<td>Actionable hint about the error. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>HINT: Set the locale in this session to en_US@collation=binary using the command &quot;\locale en_US@collation=binary&quot;</td>
</tr>
</tbody>
</table>

**Privileges**

No explicit privileges are required. You only see the records for tables that you have privileges to view.
EVENT_CONFIGURATIONS

Monitors the configuration of events.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EVENT_ID</td>
<td>VARCHAR</td>
<td>The name of the event.</td>
</tr>
<tr>
<td>EVENT_DELIVERY_CHANNELS</td>
<td>VARCHAR</td>
<td>The delivery channel on which the event occurred.</td>
</tr>
</tbody>
</table>

EXECUTION_ENGINE_PROFILES

Provides profiling information about runtime query execution. The hierarchy of IDs, from highest level to actual execution is:

- PATH_ID
- BASEPLAN_ID
- LOCALPLAN_ID
- OPERATOR_ID

Counters (output from the COUNTER_NAME column) are collected for each actual Execution Engine (EE) operator instance.

The following columns combine to form a unique key:

- TRANSACTION_ID
- STATEMENT_ID
- NODE_NAME
- OPERATOR_ID
- COUNTER_NAME
- COUNTER_TAG
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Node name for which information is listed.</td>
</tr>
<tr>
<td>USER_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID assigned by the Vertica catalog, which identifies the user.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>User name for which query profile information is listed.</td>
</tr>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>Identifier of the session for which profiling information is captured. This identifier is unique within the cluster at any point in time but can be reused when the session closes.</td>
</tr>
<tr>
<td>TRANSACTION_ID</td>
<td>INTEGER</td>
<td>Identifier for the transaction within the session if any; otherwise NULL.</td>
</tr>
<tr>
<td>STATEMENT_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed.</td>
</tr>
<tr>
<td>OPERATOR_NAME</td>
<td>VARCHAR</td>
<td>Name of the Execution Engine (EE) component; for example, NetworkSend.</td>
</tr>
<tr>
<td>OPERATOR_ID</td>
<td>INTEGER</td>
<td>Identifier assigned by the EE operator instance that performs the work. OPERATOR_ID is different from LOCALPLAN_ID because each logical operator, such as Scan, may be executed by multiple threads concurrently. Each thread operates on a different operator instance, which has its own ID.</td>
</tr>
<tr>
<td>BASEPLAN_ID</td>
<td>INTEGER</td>
<td>Assigned by the optimizer on the initiator to EE operators in the original base (EXPLAIN) plan. Each EE operator in the base plan gets a unique ID.</td>
</tr>
<tr>
<td>PATH_ID</td>
<td>INTEGER</td>
<td>Identifier that Vertica assigns to a query operation or path; for example to a logical grouping operation that might be performed by multiple execution engine operators. For each path, the same PATH ID is shared between the query plan (using EXPLAIN output) and in error messages that refer to joins.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>LOCALPLAN_ID</td>
<td>INTEGER</td>
<td>Identifier assigned by each local executor while preparing for plan execution (local planning). Some operators in the base plan, such as the Root operator, which is connected to the client, do not run on all nodes. Similarly, certain operators, such as ExprEval, are added and removed during local planning due to implementation details.</td>
</tr>
<tr>
<td>ACTIVITY_ID</td>
<td>INTEGER</td>
<td>Identifier of the plan activity.</td>
</tr>
<tr>
<td>RESOURCE_ID</td>
<td>INTEGER</td>
<td>Identifier of the plan resource.</td>
</tr>
<tr>
<td>COUNTER_NAME</td>
<td>VARCHAR</td>
<td>Name of the counter. See the &quot;COUNTER_NAME Values&quot; section below this table. The counter counts events for one statement.</td>
</tr>
<tr>
<td>COUNTER_TAG</td>
<td>VARCHAR</td>
<td>String that uniquely identifies the counter for operators that might need to distinguish between different instances. For example, COUNTER_TAG is used to identify to which of the node bytes are being sent to or received from for the NetworkSend operator.</td>
</tr>
<tr>
<td>COUNTER_VALUE</td>
<td>INTEGER</td>
<td>Value of the counter.</td>
</tr>
<tr>
<td>IS_EXECUTING</td>
<td>BOOLEAN</td>
<td>Indicates whether the profile is active or completed, where t is active and f is completed.</td>
</tr>
</tbody>
</table>

**Privileges**

No explicit privileges are required. You only see the records for tables that you have privileges to view.

**COUNTER_NAME Values**

The value of COUNTER_NAME can be any of the following:

<table>
<thead>
<tr>
<th>COUNTER_NAME</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>active threads</td>
<td>A counter of the LoadUnion operator, which indicates</td>
</tr>
<tr>
<td>COUNTER_NAME</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>blocks analyzed by SIPs expression</td>
<td>The number of data blocks analyzed by SIPS expression from the Scan operator.</td>
</tr>
<tr>
<td>blocks filtered by SIPS expression</td>
<td>The number of data blocks filtered by SIPS expression from the Scan operator.</td>
</tr>
<tr>
<td>blocks filtered by SIPS value lists</td>
<td>The number of data blocks filtered by SIPS sorted value lists from the Scan operator.</td>
</tr>
<tr>
<td>buffers spilled</td>
<td>[NetworkSend] Buffers spilled to disk by NetworkSend.</td>
</tr>
<tr>
<td>bytes read from cache</td>
<td>[DataSource] The number of bytes read from Vertica cache when an EE DataSource operator is reading from ROS containers.</td>
</tr>
<tr>
<td>bytes read from disk</td>
<td>[DataSource] The number of bytes read from disk when an EE DataSource operator is reading from ROS containers.</td>
</tr>
<tr>
<td>bytes received</td>
<td>[NetworkRecv] The number of bytes received over the network for query execution.</td>
</tr>
<tr>
<td>bytes sent</td>
<td>[NetworkSend] Size of data after encoding and compression sent over the network (actual network bytes).</td>
</tr>
<tr>
<td>bytes spilled</td>
<td>[NetworkSend] Bytes spilled to disk by NetworkSend.</td>
</tr>
<tr>
<td>bytes total</td>
<td>Only relevant to SendFiles operator (that is, recover-by-container plan) total number of bytes to send / receive.</td>
</tr>
<tr>
<td>clock time (µs)</td>
<td>Real-time clock time spent processing the query, in microseconds.</td>
</tr>
<tr>
<td>completed merge phases</td>
<td>Number of merge phases already completed by an LSort or DataTarget operator. Compare to the total merge phases. Variants on this value include</td>
</tr>
<tr>
<td>COUNTER_NAME</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>join inner completed merge phases.</td>
<td></td>
</tr>
<tr>
<td>cumulative size of raw temp data (bytes)</td>
<td>Total amount of temporary data the operator has written to files. Compare to cumulative size of temp files (bytes) to understand impact of encoding and compression in an externalizing operator. Variants on this value include join inner cumulative size of raw temp files (bytes).</td>
</tr>
<tr>
<td>cumulative size of temp files (bytes)</td>
<td>For externalizing operators only, the total number of encoded and compressed temp data the operator has written to files. A sort operator might go through multiple merge phases, where at each pass sorted chunks of data are merged into fewer chunks. This counter remembers the cumulative size of all temp files past and present. Variants on this value include join inner cumulative size of temp files (bytes).</td>
</tr>
<tr>
<td>current allocated rid memory (bytes)</td>
<td>Per-rid memory tracking: current allocation amount under this rid.</td>
</tr>
<tr>
<td>current file handles</td>
<td>Number of files open.</td>
</tr>
<tr>
<td>current memory allocations (count)</td>
<td>Number of actual allocator calls made.</td>
</tr>
<tr>
<td>current memory capacity (bytes)</td>
<td>Amount of system memory held, which includes chunks that are only partially consumed.</td>
</tr>
<tr>
<td>current memory overhead (bytes)</td>
<td>Memory consumed, for example, by debug headers. (Normally no overhead.)</td>
</tr>
<tr>
<td>current memory padding (bytes)</td>
<td>Memory padding for free list tiers (2^n bytes).</td>
</tr>
<tr>
<td>current memory requested (bytes)</td>
<td>Memory actually requested by the caller.</td>
</tr>
<tr>
<td>current size of temp files (bytes)</td>
<td>For externalizing operators only, the current size of the encoded and compressed temp data that the operator has written to files. Variants on this value include</td>
</tr>
<tr>

EXTERNAL_TABLE_DETAILS

Returns the amount of disk storage used by the source files backing external tables in the database. The information in this system table is useful in determining Hadoop license compliance.

When computing the size of an external table, Vertica counts all data found in the location specified by the COPY FROM clause. If you have a directory that contains ORC and delimited files, for example, and you define your external table with "COPY FROM *", instead of "COPY FROM *.orc", this table includes the size of the delimited files. (You would probably also
encounter errors when querying that external table.) When you query this system table Vertica does not validate your table definition; it just uses the path to find files to report.

Restrict your queries to filter by schema, table, or format to avoid expensive queries. Vertica calculates the values in this table at query time, so "SELECT *" accesses every input file contributing to every external table.

Predicates in queries may use only the TABLE_SCHEMA, TABLE_NAME, and SOURCE_FORMAT columns. Values are case-sensitive.

This table includes TEMP external tables.

This table reports only data that the current user can read. To include all the data backing external tables, either query this table as a user that has access to all HDFS data or use a session delegation token that grants this access. For more information about using delegation tokens, see Accessing Kerberized HDFS Data.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMA_OID</td>
<td>INTEGER</td>
<td>The unique identification number of the schema in which the external table resides.</td>
</tr>
<tr>
<td>TABLE_SCHEMA</td>
<td>VARCHAR</td>
<td>The name of the schema in which the external table resides.</td>
</tr>
<tr>
<td>TABLE_OID</td>
<td>VARCHAR</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the table.</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>INTEGER</td>
<td>The table name.</td>
</tr>
<tr>
<td>SOURCE_FORMAT</td>
<td>VARCHAR</td>
<td>The data format the source file used, one of ORC, PARQUET, DELIMITED, USER DEFINED, or NULL if another format.</td>
</tr>
<tr>
<td>TOTAL_FILE_COUNT</td>
<td>INTEGER</td>
<td>The number of files used to store this table's data, expanding globs and partitions.</td>
</tr>
<tr>
<td>TOTAL_FILE_SIZE_BYTES</td>
<td>INTEGER</td>
<td>Total number of bytes used by all of this table's data files.</td>
</tr>
<tr>
<td>SOURCE_STATEMENT</td>
<td>VARCHAR</td>
<td>The load statement used to copy data from the source files.</td>
</tr>
<tr>
<td>FILE_ACCESS_ERROR</td>
<td>VARCHAR</td>
<td>The access error returned during the source statement. NULL, if there was no access error during the source statement.</td>
</tr>
</tbody>
</table>
HIVE_CUSTOM_PARTITIONS_ACCESSSED

This table provides information about all custom locations for Hive partition data that Vertica has accessed. It applies when Hive uses a non-default location for partition data, the HCatalog Connector is used to access that data, and the CREATE HCATALOG SCHEMA statement for the schema sets the CUSTOM_PARTITIONS parameter.

<table>
<thead>
<tr>

<td>VARCHAR(128)</td>
<td>If the filesystem is HDFS, this value is the nameservice. If the filesystem is S3, it is the name of the bucket.</td>
</tr>
<tr>
<td>URL</td>
<td>VARCHAR(6400)</td>
<td>Full path to the partition.</td>
</tr>
</tbody>
</table>

Privileges

No explicit permissions are required; however, users see only the records that correspond to schemas they have permissions to access.

HOST_RESOURCES

Provides a snapshot of the node. This is useful for regularly polling the node with automated tools or scripts.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOST_NAME</td>
<td>VARCHAR</td>
<td>The host name for which information is listed.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>OPEN_FILES_LIMIT</td>
<td>INTEGER</td>
<td>The maximum number of files that can be open at one time on the node.</td>
</tr>
<tr>
<td>THREADS_LIMIT</td>
<td>INTEGER</td>
<td>The maximum number of threads that can coexist on the node.</td>
</tr>
<tr>
<td>CORE_FILE_LIMIT_MAX_SIZE_BYTES</td>
<td>INTEGER</td>
<td>The maximum core file size allowed on the node.</td>
</tr>
<tr>
<td>PROCESSOR_COUNT</td>
<td>INTEGER</td>
<td>The number of system processors.</td>
</tr>
<tr>
<td>PROCESSOR_CORE_COUNT</td>
<td>INTEGER</td>
<td>The number of processor cores in the system.</td>
</tr>
<tr>
<td>PROCESSOR_DESCRIPTION</td>
<td>VARCHAR</td>
<td>A description of the processor. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Inter(R) Core(TM)2 Duo CPU T8100 @2.10GHz (1 row)</td>
</tr>
<tr>
<td>OPENED_FILE_COUNT</td>
<td>INTEGER</td>
<td>The total number of open files on the node.</td>
</tr>
<tr>
<td>OPENED_SOCKET_COUNT</td>
<td>INTEGER</td>
<td>The total number of open sockets on the node.</td>
</tr>
<tr>
<td>OPENED_NONFILE_NONSOCKET_COUNT</td>
<td>INTEGER</td>
<td>The total number of other file descriptions open in which 'other' could be a directory or FIFO. It is not an open file or socket.</td>
</tr>
<tr>
<td>TOTAL_MEMORY_BYTES</td>
<td>INTEGER</td>
<td>The total amount of physical RAM, in bytes, available on the system.</td>
</tr>
<tr>
<td>TOTAL_MEMORY_FREE_BYTES</td>
<td>INTEGER</td>
<td>The amount of physical RAM, in bytes, left unused by the system.</td>
</tr>
<tr>
<td>TOTAL_BUFFER_MEMORY_BYTES</td>
<td>INTEGER</td>
<td>The amount of physical RAM, in bytes, used for file buffers on the system</td>
</tr>
<tr>
<td>TOTAL_MEMORY_CACHE_BYTES</td>
<td>INTEGER</td>
<td>The amount of physical RAM, in bytes, used as cache memory on the system.</td>
</tr>
<tr>
<td>TOTAL_SWAP_MEMORY_BYTES</td>
<td>INTEGER</td>
<td>The total amount of swap memory available, in bytes, on the system.</td>
</tr>
<tr>
<td>TOTAL_SWAP_MEMORY_FREE_BYTES</td>
<td>INTEGER</td>
<td>The total amount of swap memory free, in bytes, on the system.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DISK_SPACE_FREE_MB</td>
<td>INTEGER</td>
<td>The free disk space available, in megabytes, for all storage location file systems (data directories).</td>
</tr>
<tr>
<td>DISK_SPACE_USED_MB</td>
<td>INTEGER</td>
<td>The disk space used, in megabytes, for all storage location file systems.</td>
</tr>
<tr>
<td>DISK_SPACE_TOTAL_MB</td>
<td>INTEGER</td>
<td>The total free disk space available, in megabytes, for all storage location file systems.</td>
</tr>
</tbody>
</table>

**IO_USAGE**

Provides disk I/O bandwidth usage history for the system.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that is reporting the requested information.</td>
</tr>
<tr>
<td>START_TIME</td>
<td>TIMESTAMP</td>
<td>Beginning of history interval.</td>
</tr>
<tr>
<td>END_TIME</td>
<td>TIMESTAMP</td>
<td>End of history interval.</td>
</tr>
<tr>
<td>READ_KBYTES_PER_SEC</td>
<td>FLOAT</td>
<td>Counter history of the number of bytes read measured in kilobytes per second.</td>
</tr>
<tr>
<td>WRITTEN_KBYTES_PER_SEC</td>
<td>FLOAT</td>
<td>Counter history of the number of bytes written measured in kilobytes per second.</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser
LDAP_LINK_EVENTS

Monitors events that occurred during an LDAP Link synchronization.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EVENT_TIMESTAMP</td>
<td>TIMESTAMP</td>
<td>The time the event occurred.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The name of the node or nodes for which the information is listed.</td>
</tr>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>The identification number of the LDAP Link session.</td>
</tr>
<tr>
<td>USER_ID</td>
<td>INTEGER</td>
<td>The unique, system-generated user identification number.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>The name of the user for which the information is listed.</td>
</tr>
<tr>
<td>TRANSACTION_ID</td>
<td>INTEGER</td>
<td>The system-generated transaction identification number. Is NULL if a transaction id does not exist.</td>
</tr>
<tr>
<td>EVENT_TYPE</td>
<td>VARCHAR</td>
<td>The type of event being logged, for example USER_CREATED and PROCESSING_STARTED.</td>
</tr>
<tr>
<td>ENTRY_NAME</td>
<td>VARCHAR</td>
<td>The name of the object on which the event occurred, if applicable. For example, the event SYNC-STARTED does not use an object.</td>
</tr>
<tr>
<td>ENTRY_OID</td>
<td>INTEGER</td>
<td>The unique identification number for the object on which the event occurred, if applicable.</td>
</tr>
<tr>
<td>LDAPURIHASH</td>
<td>INTEGER</td>
<td>The URI hash number for the LDAP user.</td>
</tr>
</tbody>
</table>

LOAD_SOURCES

Like LOAD_STREAMS, monitors active and historical load metrics on each node. The LOAD_SOURCES table breaks information down by source and portion. Rows appear in this table only for COPY operations that are profiled or run for more than one second. LOAD_SOURCES does not record information about loads from ORC or Parquet files or COPY LOCAL.
A row is added to this table when the loading of a source or portion begins. Column values related to the progress of the load are updated during the load operation.

The columns uniquely identifying the load source (the various ID and name columns) and IS_EXECUTING always have non-NULL values.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>Identifier of the session for which Vertica captures load stream information. This identifier is unique within the cluster for the current session but can be reused in a subsequent session.</td>
</tr>
<tr>
<td>TRANSACTION_ID</td>
<td>INTEGER</td>
<td>Identifier for the transaction within a session. If a session is active, but no transaction has begun, this value is NULL.</td>
</tr>
<tr>
<td>STATEMENT_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID for the currently running statement. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID, STATEMENT_ID uniquely identifies a statement within a session.</td>
</tr>
<tr>
<td>STREAM_NAME</td>
<td>VARCHAR</td>
<td>Load stream identifier. If the user does not supply a specific name, the STREAM_NAME default value is tablename-ID, where:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- tablename is the table into which data is being loaded.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- ID is an integer value. ID is guaranteed to be unique within the current session on a node.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This system table includes stream names for every COPY statement that takes more than 1 second to run. The 1-second duration includes the time to plan and execute the statement.</td>
</tr>
<tr>
<td>SCHEMA_NAME</td>
<td>VARCHAR</td>
<td>Schema name for which load information is listed. Lets you identify two streams that are targeted at tables with the same name in different schemas. NULL, if selecting from an external table.</td>
</tr>
<tr>
<td>TABLE_OID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR</td>
<td>Name of the table being loaded. NULL, if selecting from an external table.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node loading the source.</td>
</tr>
</tbody>
</table>
| SOURCE_NAME      | VARCHAR     | • Full file path if copying from a file.  
• Value returned by `getUris()` if the source is a user-defined source.  
• STDIN if loading from standard input.                                                                                                           |
| PORTION_OFFSET   | INTEGER     | Offset of the source portion, or NULL if not apportioned.                                                                                                                                                    |
| PORTION_SIZE     | INTEGER     | Size of the source portion, or NULL if not apportioned.                                                                                                                                                      |
| IS_EXECUTING     | BOOLEAN     | Whether this source is currently being parsed, where `t` is true and `f` is false.                                                                                                                           |
| READ_BYTES       | INTEGER     | Number of bytes read from the input file.                                                                                                                                                                    |
| ROWS_PRODUCED    | INTEGER     | Number of rows produced from parsing the source.                                                                                                                                                             |
| ROWS_REJECTED    | INTEGER     | Number of rows rejected from parsing the source. If `CopyFaultTolerantExpressions` is true, also includes rows rejected during expression evaluation.                                                   |
| INPUT_SIZE       | INTEGER     | Size of the input source in bytes, or NULL for unsized sources. For UDSources, this value is the value returned by `getSize()`.                                                                               |
| PARSE_COMPLETE_PERCENT | INTEGER | Percent of rows from the input file that have been parsed.                                                                                                                                                    |
| FAILURE_REASON   | VARCHAR     | For load failures, error message indicating why loading from this source failed or was cancelled:  
• In cases of a node failure, exception, or |
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cancellation</td>
<td></td>
<td>cancellation, this column contains the associated error message.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If ERROR TOLERANCE was not used and a failure occurred, &quot;Source aborted due to exception while loading from (name)&quot;.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For any other failure, &quot;Exception occurred during load&quot;.</td>
</tr>
<tr>
<td>PEAK_COOPERATING_THREADS</td>
<td>INTEGER</td>
<td>The peak number of threads parsing this source in parallel.</td>
</tr>
</tbody>
</table>

**Privileges**

No explicit privileges are required. You only see the records for tables that you have privileges to view.

**Examples**

The following example shows the values you would see in the LOAD_SOURCES table after some loads with various errors.

```sql
=> CREATE TABLE tt (i int);
=> COPY tt FROM '/tmp/load_sources_large.dat';
^CCancel request sent
ERROR 3322: Execution canceled by operator

=> COPY tt FROM '/tmp/load_sources_large.dat' ON ANY NODE;
Rows Loaded
-------------
1000000
(1 row)

=> COPY tt FROM '/tmp/load_sources_* .txt' ON ANY NODE;
ERROR 2018: COPY: Could not open file ['/tmp/load_sources_perm .txt'] for reading; Permission denied
HINT: Make sure the file is available on the specified node. If using ON ANY NODE, it must be available at this path on all nodes in the cluster since any node could load the file.

=> COPY tt FROM '/tmp/load_sources_* .txt' ON ANY NODE ERROR TOLERANCE;
WARNING 7177: Error loading from 'load_sources_perm .txt' on node 'e1'
DETAIL: ERROR 2018: COPY: Could not open file ['/tmp/load_sources_perm .txt'] for reading; Permission denied
WARNING 7176: Error loading from 1/4 sources

(22 rows)
maintains system table metrics until they reach a designated size quota (in kilobytes). This quota is set through internal processes, which you cannot set or view directly.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>Identifier of the session for which Vertica captures load stream information. This identifier is unique within the cluster for the current session, but can be reused in a subsequent session.</td>
</tr>
<tr>
<td>TRANSACTION_ID</td>
<td>INTEGER</td>
<td>Identifier for the transaction within a session. If a session is active but no transaction has begun, this is NULL.</td>
</tr>
<tr>
<td>STATEMENT_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID, STATEMENT_ID uniquely identifies a statement within a session.</td>
</tr>
<tr>
<td>STREAM_NAME</td>
<td>VARCHAR</td>
<td>Load stream identifier. If the user does not supply a specific name, the STREAM_NAME default value is: \texttt{tablename-ID} [where \texttt{tablename} is the table into which data is being loaded, and \texttt{ID} is an integer value, guaranteed to be unique with the current session on a node.] This system table includes stream names for every COPY statement that takes more than 1-second to run. The 1-second duration includes the time to plan and execute the statement.</td>
</tr>
<tr>
<td>SCHEMA_NAME</td>
<td>VARCHAR</td>
<td>Schema name for which load stream information is listed. Lets you identify two streams that are targeted at tables with the same name in different schemas.</td>
</tr>
<tr>
<td>TABLE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the table.</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR</td>
<td>Name of the table being loaded.</td>
</tr>
<tr>
<td>LOAD_START</td>
<td>VARCHAR</td>
<td>Linux system time when the load started.</td>
</tr>
<tr>
<td>LOAD_DURATION_MS</td>
<td>NUMERIC</td>
<td>Duration of the load stream in milliseconds.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>------------</td>
<td>-------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>(54,0)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>IS_EXECUTING</td>
<td>BOOLEAN</td>
<td>Indicates whether the load is executing, where t is true and f is false.</td>
</tr>
<tr>
<td>ACCEPTED_ROW_COUNT</td>
<td>INTEGER</td>
<td>Number of rows loaded.</td>
</tr>
<tr>
<td>REJECTED_ROW_COUNT</td>
<td>INTEGER</td>
<td>Number of rows rejected.</td>
</tr>
<tr>
<td>READ_BYTES</td>
<td>INTEGER</td>
<td>Number of bytes read from the input file.</td>
</tr>
<tr>
<td>INPUT_FILE_SIZE_BYTES</td>
<td>INTEGER</td>
<td>Size of the input file in bytes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> When using STDIN as input, the input file size is zero (0).</td>
</tr>
<tr>
<td>PARSE_COMPLETE_PERCENT</td>
<td>INTEGER</td>
<td>Percent of rows from the input file that have been parsed.</td>
</tr>
<tr>
<td>UNSORTED_ROW_COUNT</td>
<td>INTEGER</td>
<td>Cumulative number rows not sorted across all projections.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> UNSORTED_ROW_COUNT could be greater than ACCEPTED_ROW_COUNT because data is copied and sorted for every projection in the target table.</td>
</tr>
<tr>
<td>SORTED_ROW_COUNT</td>
<td>INTEGER</td>
<td>Cumulative number of rows sorted across all projections.</td>
</tr>
<tr>
<td>SORT_COMPLETE_PERCENT</td>
<td>INTEGER</td>
<td>Percent of rows from the input file that have been sorted.</td>
</tr>
</tbody>
</table>

**Privileges**

If you have the SYSMONITOR role or are the dbadmin user, this table shows all loads. Otherwise it shows only your loads.
**LOCK_USAGE**

Provides aggregate information about lock requests, releases, and attempts, such as wait time/count and hold time/count. Vertica records:

- Lock attempts at the end of the locking process
- Lock releases after lock attempts are released

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that is reporting the requested information on which lock interaction occurs.</td>
</tr>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.</td>
</tr>
<tr>
<td>OBJECT_NAME</td>
<td>VARCHAR</td>
<td>Name of object being locked; can be a table or an internal structure (projection, global catalog, or local catalog).</td>
</tr>
<tr>
<td>MODE</td>
<td>VARCHAR</td>
<td>Intended operations of the transaction. Otherwise, this value is NONE. For a list of lock modes and compatibility, see Lock Modes.</td>
</tr>
<tr>
<td>AVG_HOLD_TIME</td>
<td>INTERVAL</td>
<td>Average time (measured in intervals) that Vertica holds a lock.</td>
</tr>
<tr>
<td>MAX_HOLD_TIME</td>
<td>INTERVAL</td>
<td>Maximum time (measured in intervals) that Vertica holds a lock.</td>
</tr>
<tr>
<td>HOLD_COUNT</td>
<td>INTEGER</td>
<td>Total number of times the lock was granted in the given mode.</td>
</tr>
<tr>
<td>AVG_WAIT_TIME</td>
<td>INTERVAL</td>
<td>Average time (measured in intervals) that Vertica waits on the lock.</td>
</tr>
<tr>
<td>MAX_WAIT_TIME</td>
<td>INTERVAL</td>
<td>Maximum time (measured in intervals) that Vertica waits on a lock.</td>
</tr>
<tr>
<td>WAIT_COUNT</td>
<td>INTEGER</td>
<td>Total number of times lock was unavailable at the time it was first requested.</td>
</tr>
</tbody>
</table>
Privileges

No explicit privileges are required. You only see the records for tables that you have privileges to view.

LOCKS

Monitors lock grants and requests for all nodes. A table call with no results indicates that no locks are in use.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAMES</td>
<td>VARCHAR</td>
<td>Nodes on which lock interaction occurs.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Node Rollup:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>NODE_NAMES are separated by commas. A transaction can have the same lock in</td>
</tr>
<tr>
<td></td>
<td></td>
<td>the same mode in the same scope on multiple nodes. However, the transaction</td>
</tr>
<tr>
<td></td>
<td></td>
<td>gets only one (1) line in the table.</td>
</tr>
<tr>
<td>OBJECT_NAME</td>
<td>VARCHAR</td>
<td>Name of object being locked; can be a table or an internal structure</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(projection, global catalog, or local catalog).</td>
</tr>
<tr>
<td>OBJECT_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID assigned by the Vertica catalog that identifies the object</td>
</tr>
<tr>
<td></td>
<td></td>
<td>being locked.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>TRANSACTION_ID</td>
<td>VARCHAR</td>
<td>Identification of transaction within the session, if any; otherwise NULL. Useful for creating joins to other system tables.</td>
</tr>
<tr>
<td>TRANSACTION_DESCRIPTION</td>
<td>VARCHAR</td>
<td>Identification of transaction and associated description. Typically this query caused the transaction's creation.</td>
</tr>
<tr>
<td>LOCK_MODE</td>
<td>VARCHAR</td>
<td>Intended operation of the transaction. For a list of lock modes and compatibility, see <a href="#">Lock Modes</a></td>
</tr>
</tbody>
</table>
| LOCK_SCOPE          | VARCHAR   | Expected duration of the lock after it is granted. Before the lock is granted, Vertica lists the scope as REQUESTED. Once a lock has been granted, the following scopes are possible:  
  - STATEMENT_LOCALPLAN  
  - STATEMENT_COMPILE  
  - STATEMENT_EXECUTE  
  - TRANSACTION_POSTCOMMIT  
  - TRANSACTION  
  All scopes, other than TRANSACTION, are transient and are used only as part of normal query processing.                                                                                     |
| REQUEST_TIMESTAMP   | TIMESTAMP | Time when the transaction began waiting on the lock.                                                                                                                                                                                                                                                                                |
| GRANT_TIMESTAMP     | TIMESTAMP | Time the transaction acquired or upgraded the lock:  
  - Return values are NULL until the grant occurs.  
  - If the grant occurs immediately, values might be the same as REQUEST_TIMESTAMP.                                                                                                                                                                                                 |

LOGIN_FAILURES

This system table lists failures for each failed login attempt. This information helps you determine if a user is having difficulty getting into the database or identify a possible intrusion attempt.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOGIN_TIMESTAMP</td>
<td>TIMESTAMPTZ</td>
<td>Time when Vertica recorded the login.</td>
</tr>
<tr>
<td>DATABASE_NAME</td>
<td>VARCHAR</td>
<td>The name of the database for the login attempt.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that is reporting the requested information.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>Name of the user whose login failed at the time Vertica recorded the session.</td>
</tr>
<tr>
<td>CLIENT_HOSTNAME</td>
<td>VARCHAR</td>
<td>Host name and port of the TCP socket from which the client connection was made. NULL if the session is internal.</td>
</tr>
<tr>
<td>CLIENT_PID</td>
<td>INTEGER</td>
<td>Identifier of the client process that issued this connection.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------</td>
<td>-------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td>In some cases, the client process is on a different machine from the server.</td>
</tr>
<tr>
<td>CLIENT_VERSION</td>
<td>VARCHAR</td>
<td>Unused.</td>
</tr>
<tr>
<td>CLIENT_OS_USER_NAME</td>
<td>VARCHAR</td>
<td>The name of the user that logged into, or attempted to log into, the database. This is logged even when the login attempt is unsuccessful.</td>
</tr>
</tbody>
</table>
| AUTHENTICATION_METHOD       | VARCHAR       | Name of the authentication method used to validate the client application or user who is trying to connect to the server using the database user name provided. **Valid values:**  
  - Trust  
  - Reject  
  - GSS  
  - LDAP  
  - Ident  
  - Hash  
  - TLS  
| CLIENT_AUTHENTICATION_NAME  | VARCHAR       | Locally created name of the client authentication method.                     |
| REASON                      | VARCHAR       | Description of login failure reason. **Valid values:**  
  - INVALID USER  
  - ACCOUNT LOCKED |
### Table

<table>
<thead>
<tr>

</table>

### Privileges

Superuser

### MEMORY_USAGE

Records system resource history for memory usage. This is useful for comparing memory that Vertica uses versus memory in use by the entire system.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that is reporting the requested information.</td>
</tr>
<tr>
<td>START_TIME</td>
<td>TIMESTAMP</td>
<td>Beginning of history interval.</td>
</tr>
<tr>
<td>END_TIME</td>
<td>TIMESTAMP</td>
<td>End of history interval.</td>
</tr>
<tr>
<td>AVERAGE_MEMORY_USAGE_PERCENT</td>
<td>FLOAT</td>
<td>Records the average memory usage in percent of total memory (0-100) during the history interval.</td>
</tr>
</tbody>
</table>

### Privileges

Superuser

### MONITORING_EVENTS

Reports significant events that can affect database performance and functionality if you do not address their root causes.
See Monitoring Events in the Administrator's Guide for details.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that is reporting the requested information.</td>
</tr>
<tr>
<td>EVENT_CODE</td>
<td>INTEGER</td>
<td>Numeric identifier that indicates the type of event. See Event Types in Monitoring Events in the Administrator's Guide for a list of event type codes.</td>
</tr>
<tr>
<td>EVENT_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID that identifies the specific event.</td>
</tr>
<tr>
<td>EVENT_SEVERITY</td>
<td>VARCHAR</td>
<td>Severity of the event from highest to lowest. These events are based on standard syslog severity types: 0 - Emergency 1 - Alert 2 - Critical 3 - Error 4 - Warning 5 - Notice 6 - Info 7 - Debug</td>
</tr>
<tr>
<td>EVENT_POSTED_TIMESTAMP</td>
<td>TIMESTAMPTZ</td>
<td>When this event was posted.</td>
</tr>
<tr>
<td>EVENT_CLEARED_TIMESTAMP</td>
<td>TIMESTAMPTZ</td>
<td>When this event was cleared.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> You can also query the ACTIVE_EVENTS system table to see events that have not been cleared.</td>
</tr>
<tr>
<td>EVENT_EXPIRATION</td>
<td>TIMESTAMPTZ</td>
<td>Time at which this event expires. If the same event is posted again prior to its expiration time, this field gets updated to a new expiration time.</td>
</tr>
<tr>
<td>EVENT_CODE_DESCRIPTION</td>
<td>VARCHAR</td>
<td>Brief description of the event and details pertinent to the specific situation.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------</td>
<td>------------------------------------------------------------</td>
</tr>
<tr>
<td>EVENT_PROBLEM_DESCRIPTION</td>
<td>VARCHAR</td>
<td>Generic description of the event.</td>
</tr>
</tbody>
</table>

### NETWORK_INTERFACES

Provides information about network interfaces on all Vertica nodes.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_ID</td>
<td>INTEGER</td>
<td>Unique identifier for the node that recorded the row.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that is reporting the requested information.</td>
</tr>
<tr>
<td>INTERFACE</td>
<td>VARCHAR</td>
<td>Network interface name.</td>
</tr>
<tr>
<td>IP_ADDRESS_FAMILY</td>
<td>VARCHAR</td>
<td>Network address protocol.</td>
</tr>
<tr>
<td>IP_ADDRESS</td>
<td>VARCHAR</td>
<td>IP address for this interface.</td>
</tr>
<tr>
<td>SUBNET</td>
<td>VARCHAR</td>
<td>IP subnet for this interface.</td>
</tr>
<tr>
<td>MASK</td>
<td>VARCHAR</td>
<td>IP network mask for this interface.</td>
</tr>
<tr>
<td>BROADCAST_ADDRESS</td>
<td>VARCHAR</td>
<td>IP broadcast address for this interface.</td>
</tr>
</tbody>
</table>

**Privileges**

None
NETWORK_USAGE

Provides network bandwidth usage history on the system. This is useful for determining if Vertica is using a large percentage of its available network bandwidth.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that is reporting the requested information.</td>
</tr>
<tr>
<td>START_TIME</td>
<td>TIMESTAMP</td>
<td>Beginning of history interval.</td>
</tr>
<tr>
<td>END_TIME</td>
<td>TIMESTAMP</td>
<td>End of history interval.</td>
</tr>
<tr>
<td>TX_KBYTES_PER_SEC</td>
<td>FLOAT</td>
<td>Counter history of outgoing (transmitting) usage in kilobytes per second.</td>
</tr>
<tr>
<td>RX_KBYTES_PER_SEC</td>
<td>FLOAT</td>
<td>Counter history of incoming (receiving) usage in kilobytes per second.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

NODE_EVICTIONS

Monitors node evictions on the system.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EVICTION_TIMESTAMP</td>
<td>TIMESTAMPTZ</td>
<td>Timestamp when the eviction request was made.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The node name logging the information.</td>
</tr>
<tr>
<td>EVICTED_NODE_NAME</td>
<td>VARCHAR</td>
<td>The node name of the evicted node.</td>
</tr>
<tr>
<td>EVICTED_NODE_ID</td>
<td>INTEGER</td>
<td>The evicted node ID.</td>
</tr>
<tr>
<td>NODE_STATE_BEFORE_</td>
<td>VARCHAR</td>
<td>The previous node state at the time of eviction.</td>
</tr>
</tbody>
</table>
NODE/Resources

Provides a snapshot of the node. This is useful for regularly polling the node with automated tools or scripts.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The node name for which information is listed.</td>
</tr>
<tr>
<td>HOST_NAME</td>
<td>VARCHAR</td>
<td>The hostname associated with a particular node.</td>
</tr>
<tr>
<td>PROCESS_SIZE BYTES</td>
<td>INTEGER</td>
<td>The total size of the program.</td>
</tr>
<tr>
<td>PROCESS_RESIDENT_SET_SIZE_BYTES</td>
<td>INTEGER</td>
<td>The total number of bytes that the process has in memory.</td>
</tr>
<tr>
<td>PROCESS_SHARED_MEMORY_SIZE_BYTES</td>
<td>INTEGER</td>
<td>The amount of shared memory used.</td>
</tr>
<tr>
<td>PROCESS_TEXT_MEMORY_SIZE_BYTES</td>
<td>INTEGER</td>
<td>The total number of text bytes that the process has in physical memory. This does not include any shared libraries.</td>
</tr>
<tr>
<td>PROCESS_DATA_MEMORY_SIZE_BYTES</td>
<td>INTEGER</td>
<td>The amount of physical memory, in bytes, used for performing processes. This does not include the executable code.</td>
</tr>
<tr>
<td>PROCESS_LIBRARY_MEMORY_SIZE_BYTES</td>
<td>INTEGER</td>
<td>The total number of library bytes that the process has in physical memory.</td>
</tr>
<tr>
<td>PROCESS_DIRTY_MEMORY_SIZE_BYTES</td>
<td>INTEGER</td>
<td>The number of bytes that have been modified since they were last written to disk.</td>
</tr>
<tr>
<td>SPREAD_HOST</td>
<td>VARCHAR</td>
<td>The node name of the spread host.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>NODE_PORT</td>
<td>VARCHAR</td>
<td>The port used for intra-cluster communication.</td>
</tr>
<tr>
<td>DATA_PORT</td>
<td>VARCHAR</td>
<td>The port used by the Vertica client.</td>
</tr>
</tbody>
</table>

### NODE STATES

Monitors node recovery state-change history on the system. Vertica returns information only on nodes whose state is currently UP. To determine which nodes are not up, query the NODES table.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EVENT_TIMESTAMP</td>
<td>TIMESTAMPTZ</td>
<td>Time when Vertica recorded the event.</td>
</tr>
<tr>
<td>NODE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the node.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node.</td>
</tr>
<tr>
<td>NODE_STATE</td>
<td>VARCHAR</td>
<td>The node's state, one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• UP</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• DOWN</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• READY</td>
</tr>
<tr>

<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>• STAND BY</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• NEEDS CATCH UP</td>
</tr>
</tbody>
</table>
Privileges

None

NOTIFIER_ERRORS

Reports errors encountered by notifiers.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ERROR_TIME</td>
<td>TIMESTAMPZ</td>
<td>The time that the error occurred.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that encountered the error.</td>
</tr>
<tr>
<td>NOTIFIER_NAME</td>
<td>VARCHAR</td>
<td>Name of the notifier that triggered the error.</td>
</tr>
<tr>
<td>DESCRIPTION</td>
<td>VARCHAR</td>
<td>A description of the error.</td>
</tr>
</tbody>
</table>

Privileges

Superuser

OUTPUT_DEPLOYMENT_STATUS

Contains information about the deployment status of all the projections in your design. Each row contains information about a different projection. Vertica populates this table when you deploy the database design by running the function DESIGER_RUN_POPULATEDESIGN_AND_DEPLOY.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Column Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>deployment_id</td>
<td>INTEGER</td>
<td>Unique ID that Database Designer assigned to the deployment.</td>
</tr>
<tr>
<td>design_name</td>
<td>VARCHAR</td>
<td>Unique name that the user assigned to the design.</td>
</tr>
<tr>
<td>deployment_projection_id</td>
<td>INTEGER</td>
<td>Unique ID that Database Designer assigned to the output projection.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Column Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>deployment_projection_name</td>
<td>VARCHAR</td>
<td>Name that Database Designer assigned to the output projection or the name of the projection to be dropped.</td>
</tr>
<tr>
<td>deployment_status</td>
<td>VARCHAR</td>
<td>Status of the deployment:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- pending</td>

- Design in progress: Storage optimization phase
- Design completed successfully
- Setting up deployment metadata
- Identifying projections to be dropped
- Running deployment
- Deployment completed successfully

Example

The following example shows the steps that Database Designer performs while optimizing the VMart example database:

```sql
=> SELECT DESIGNER_CREATE_DESIGN('VMART_DESIGN');
=> SELECT DESIGNER_ADD DESIGN TABLES('VMART_DESIGN','public.*');
=> SELECT DESIGNER_ADD DESIGN QUERIES('VMART_DESIGN','/tmp/examples/vmart_queries.sql',);
...
=> \x
Expanded display is on.
=> SELECT * FROM OUTPUT EVENT HISTORY;
```

<table>
<thead>
<tr>
<th>table_id</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
</tr>
</tbody>
</table>
PARTITION_COLUMNS

For each projection of each partitioned table, shows the disk space used by each column on each node. The column disk_space_bytes shows how much disk space the partitioned data uses, including deleted data. So, if you delete rows but do not purge them, the view’s deleted_row_count column changes to show the number of deleted rows in each column; however, disk_space_bytes remains the same. After the deleted rows are purged, Vertica reclaims the disk space: disk_space_bytes changes accordingly, and deleted_row_count is reset to 0.

For grouped partitions, PARTITION_COLUMNS shows the cumulative disk space used for each column per grouped partition. The column grouped_partition_key, if not null, identifies the partition in which a given column is grouped.

<table>
<thead>
<tr>
<th>Column Name</th>

**Privileges**

No explicit privileges are required. You only see the records for tables that you have privileges to view.

**Example**

Given the following table definition:

```sql
=> CREATE TABLE messages
  (  
    time_interval timestamp NOT NULL,
    thread_id varchar(32) NOT NULL,
    unique_id varchar(53) NOT NULL,
    msg_id varchar(65),
    ...
  )
PARTITION BY ((messages.time_interval)::date);
```

A query on `partition_columns` might return the following (truncated) results:

```sql
=> SELECT * FROM partition_columns order by table_name, column_name;
```

<table>
<thead>
<tr>
<th>msg_id</th>
<th>messages</th>
<th>messages_super</th>
<th>45035996273743182</th>
<th>v_vmart_node0002</th>
<th>2010-07-03</th>

</tbody>
</table>
PARTITION_REORGANIZE_ERRORS

new column projection_id

Monitors all background partitioning tasks, and if Vertica encounters an error, creates an entry in this table with the appropriate information. Does not log repartitioning tasks that complete successfully.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>Name of the user who received the error at the time Vertica recorded the session.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that is reporting the requested information.</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR</td>
<td>Name of the partitioned table.</td>
</tr>
<tr>
<td>PROJECTION_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the projection.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>PROJECTION_NAME</td>
<td>VARCHAR</td>
<td>Projection name for which information is listed.</td>
</tr>
<tr>
<td>MESSAGE</td>
<td>VARCHAR</td>
<td>Textual output of the error message.</td>
</tr>
<tr>
<td>HINT</td>
<td>VARCHAR</td>
<td>Actionable hint about the error.</td>
</tr>
</tbody>
</table>

**Privileges**

No explicit privileges are required. You only see the records for tables that you have privileges to view.

**PARTITION_STATUS**

For each projection of each partitioned table, shows the fraction of its data that is actually partitioned according to the current partition expression. When the partitioning of a table is altered, the value in PARTITION_REORGANIZE_PERCENT for each of its projections drops to zero and goes back up to 100 when all the data is repartitioned.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROJECTION_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID assigned by the Vertica catalog, which identifies the projection.</td>
</tr>
<tr>
<td>TABLE_SCHEMA</td>
<td>VARCHAR</td>
<td>Name of the schema that contains the partitioned table.</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR</td>
<td>Table name that is partitioned.</td>
</tr>
<tr>
<td>TABLE_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID assigned by the Vertica, which identifies the table.</td>
</tr>
<tr>
<td>PROJECTION_SCHEMA</td>
<td>VARCHAR</td>
<td>Schema containing the projection.</td>
</tr>
<tr>
<td>PROJECTION_NAME</td>
<td>VARCHAR</td>
<td>Projection name for which information is listed.</td>
</tr>
<tr>
<td>PARTITION_REORGANIZE_PERCENT</td>
<td>INTEGER</td>
<td>For each projection, drops to zero and goes back up to 100 when all the data is repartitioned after the partitioning of a table has been altered. Ideally all rows will show 100 (%).</td>
</tr>
</tbody>
</table>
Privileges

No explicit privileges are required. You only see the records for tables that you have privileges to view.

PARTITIONS

Displays partition metadata, one row per partition key, per ROS container.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PARTITION_KEY</td>
<td>VARCHAR</td>
<td>The partition value(s).</td>
</tr>
<tr>
<td>PROJECTION_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID assigned by the Vertica catalog, which identifies the projection.</td>
</tr>
<tr>
<td>TABLE_SCHEMA</td>
<td>VARCHAR</td>
<td>The schema name for which information is listed.</td>
</tr>
<tr>
<td>PROJECTION_NAME</td>
<td>VARCHAR</td>
<td>The projection name for which information is listed.</td>
</tr>
<tr>
<td>ROS_ID</td>
<td>VARCHAR</td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the ROS container.</td>
</tr>
<tr>
<td>ROS_SIZE_BYTES</td>
<td>INTEGER</td>
<td>The ROS container size in bytes.</td>
</tr>
<tr>
<td>ROS_ROW_COUNT</td>
<td>INTEGER</td>
<td>Number of rows in the ROS container.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Node where the ROS container resides.</td>
</tr>
<tr>
<td>DELETED_ROW_COUNT</td>
<td>INTEGER</td>
<td>The number of rows in the partition.</td>
</tr>
<tr>
<td>LOCATION_LABEL</td>
<td>VARCHAR</td>
<td>The location label of the default storage location.</td>
</tr>
</tbody>
</table>
Notes

- A many-to-many relationship exists between partitions and ROS containers. PARTITIONS displays information in a denormalized fashion.
- To find the number of ROS containers having data of a specific partition, aggregate PARTITIONS over the partition_key column.
- To find the number of partitions stored in a ROS container, aggregate PARTITIONS over the ros_id column.

Example

See Viewing Partition Storage Data in the Administrator's Guide.

**PROCESS_SIGNALS**

Returns a history of signals that were received and handled by the Vertica process. For details about signals, see the Linux documentation.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIGNAL_TIMESTAMP</td>
<td>TIMESTAMPTZ</td>
<td>Time when Vertica recorded the signal.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that is reporting the requested information.</td>
</tr>
<tr>
<td>SIGNAL_NUMBER</td>
<td>INTEGER</td>
<td>Signal number, refers to POSIX SIGNAL_NUMBER</td>
</tr>
<tr>
<td>SIGNAL_CODE</td>
<td>INTEGER</td>
<td>Signal code.</td>
</tr>
<tr>
<td>SIGNAL_PID</td>
<td>INTEGER</td>
<td>Linux process identifier of the signal.</td>
</tr>
<tr>
<td>SIGNAL_UID</td>
<td>INTEGER</td>
<td>Process ID of sending process.</td>
</tr>
<tr>
<td>SIGNAL_ADDRESS</td>
<td>INTEGER</td>
<td>Address at which fault occurred.</td>
</tr>
</tbody>
</table>

**Privileges**

Superuser
PROJECTION_RECOVERIES

Retains history about projection recoveries. Because Vertica adds an entry per recovery plan, a projection/node pair might appear multiple times in the output.

Note: You cannot query this or other system tables during cluster recovery; the cluster must be UP to accept connections.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that is recovering or has recovered the corresponding projection.</td>
</tr>
<tr>
<td>PROJECTION_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID assigned by the Vertica catalog, which identifies the projection.</td>
</tr>
<tr>
<td>PROJECTION_NAME</td>
<td>VARCHAR</td>
<td>Name of the projection that is being or has been recovered on the corresponding node.</td>
</tr>
<tr>
<td>TRANSACTION_ID</td>
<td>INTEGER</td>
<td>Identifier for the transaction within the session, if any. TRANSACTION_ID initializes as NO_TRANSACTIONS with a value of 0. Vertica will ignore the recovery query and keep (0) if there's no action to take (no data in the table, etc). When no recovery transaction starts, ignored value appears in this table's STATUS column.</td>
</tr>
<tr>
<td>STATEMENT_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID, STATEMENT_ID uniquely identifies a statement within a session.</td>
</tr>
<tr>
<td>METHOD</td>
<td>VARCHAR</td>
<td>Recovery method that Vertica chooses. Possible values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• incremental</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• incremental-replay-delete</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• split</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• recovery-by-container</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| STATUS      | VARCHAR    | Current projection-recovery status on the corresponding node. STATUS can be "queued," which indicates a brief period between the time the query is prepared and when it runs. Possible values are:  
  - queued  
  - running  
  - finished  
  - ignored  
  - error-retry  
  - error-fatal |
| PROGRESS    | INTEGER    | An estimate (value in the range $[0,100]$) of percent complete for the recovery task described by this information.  
  **Note:** The actual amount of time it takes to complete a recovery task depends on a number of factors, including concurrent workloads and characteristics of the data; therefore, accuracy of this estimate can vary.  
  The PROGRESS column value is NULL after the task completes. |
| DETAIL      | VARCHAR    | More detailed information about PROGRESS. The values returned for this column depend on the type of recovery plan:  
  - General recovery plans – value displays the estimated progress, as a percent, of the three primary parts of the plan: Scan, Sort, and Write.  
  - Recovery-by-container plans – value begins with CopyStorage: and is followed by the number of bytes copied over the total number of bytes to copy.
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>• Replay delete plans – value begins with Delete: and is followed by the number of deletes replayed over an estimate of the total number of deletes to replay. The DETAIL column value becomes NULL after the recovery plan completes.</td>
</tr>
<tr>
<td>START_TIME</td>
<td>TIMESTAMPTZ</td>
<td>Time the recovery task described by this information started.</td>
</tr>
<tr>
<td>END_TIME</td>
<td>TIMESTAMPTZ</td>
<td>Time the recovery task described by this information ended.</td>
</tr>
<tr>
<td>RUNTIME_PRIORITY</td>
<td>VARCHAR</td>
<td>Determines the amount of runtime resources (CPU, I/O bandwidth) the Resource Manager should dedicate to running queries in the resource pool. Valid values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• HIGH</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• MEDIUM</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• LOW</td>
</tr>
</tbody>
</table>

**Privileges**

No explicit privileges are required. You only see the records for tables that you have privileges to view.

**See Also**

[RECOVERY_STATUS](#)

**PROJECTION_REFRESHES**

System table `PROJECTION_REFRESHES` records information about refresh operations, successful and unsuccessful. `PROJECTION_REFRESHES` retains refresh data until one of the
following events occurs:

- **CLEAR_PROJECTION_REFRESHES** is called.
- The table's storage quota is exceeded.

Tables and projections can be dropped while a query runs against them. The query continues to run, even after the drop occurs. Only when the query finishes does it notice the drop, which might cause a rollback. The same is true for refresh queries. Thus, **PROJECTION_REFRESHES** might report that a projection failed to be refreshed before the refresh query completes. In this case, the **REFRESH_DURATION_SEC** column continues to increase until the refresh query completes.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Node where the refresh was initiated.</td>
</tr>
<tr>
<td>PROJECTION_SCHEMA</td>
<td>VARCHAR</td>
<td>Name of the projection schema.</td>
</tr>
<tr>
<td>PROJECTION_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the projection.</td>
</tr>
<tr>
<td>PROJECTION_NAME</td>
<td>VARCHAR</td>
<td>Name of the refreshed projection.</td>
</tr>
<tr>
<td>ANCHOR_TABLE_NAME</td>
<td>VARCHAR</td>
<td>Name of the projection's anchor table.</td>
</tr>
<tr>
<td>REFRESH_STATUS</td>
<td>VARCHAR</td>
<td>Status of refresh operations for this projection, one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Queued: Projection is queued for refresh.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Refreshing: Projection refresh is in progress.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Refreshed: Projection refresh is complete.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Failed: Projection refresh failed.</td>
</tr>
<tr>
<td>REFRESH_PHASE</td>
<td>VARCHAR</td>
<td>Indicates how far the refresh has progressed:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Historical: Refresh reached the first phase and is refreshing data from historical data. This refresh phase requires the most amount of time.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Current: Refresh reached the final phase and is attempting to refresh data from the current epoch. To complete this phase, refresh must obtain a lock on the table. If the table is locked by another transaction, refresh is blocked until that transaction completes. The LOCKS system table is useful for determining if a refresh is blocked on a table lock. To determine if a refresh has been blocked, locate the term &quot;refresh&quot; in the transaction description. A refresh has been blocked when the scope for the refresh is REQUESTED and other transactions acquired a lock on the table. This field is NULL until the projection starts to refresh and is NULL after the refresh completes.</td>
</tr>
<tr>
<td>REFRESH_METHOD</td>
<td>VARCHAR</td>
<td>Method used to refresh the projection:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Buddy: Projection refreshed from the contents of a buddy projection. This method maintains historical data, so the projection can used for historical queries.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Scratch: Projection refreshed without using a buddy projection. This method does not generate historical data, so the projection cannot participate in historical queries on data that precedes the refresh.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Rebalance: If the projection is segmented, it is refreshed from scratch; if unsegmented, it is refreshed from a buddy projection.</td>
</tr>
<tr>
<td>REFRESH_FAILURE_COUNT</td>
<td>INTEGER</td>
<td>Number of times a refresh failed for the projection. REFRESH_FAILURE_COUNT does not indicate whether the projection was eventually refreshed. See REFRESH_STATUS to determine whether the refresh operation is progressing.</td>
</tr>
<tr>
<td>SESSION_ID</td>

<tr>
<td></td>
<td></td>
<td>• LOW</td>
</tr>
<tr>
<td>TRANSACTION_ID</td>
<td>INTEGER</td>
<td>Identifier for the transaction within the session, if any; otherwise NULL.</td>
</tr>
</tbody>
</table>

Note: The transaction_id is correlated with the execution plan only when refreshing from scratch. When refreshing from a buddy, multiple sub-transactions are created.

Privileges

No explicit privileges are required. You only see the records for tables that you have privileges to view.

**PROJECTION_STORAGE**

Monitors the amount of disk storage used by each projection on each node.
**Note:** Projections that have no data never have full statistics. Querying this system table lets you see if your projection contains data.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The node name for which information is listed.</td>
</tr>
<tr>
<td>PROJECTION_ID</td>
<td>VARCHAR</td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the projection.</td>
</tr>
<tr>
<td>PROJECTION_NAME</td>
<td>VARCHAR</td>
<td>The projection name for which information is listed.</td>
</tr>
<tr>
<td>PROJECTION_SCHEMA</td>
<td>VARCHAR</td>
<td>The name of the schema associated with the projection.</td>
</tr>
<tr>
<td>PROJECTION_COLUMN_COUNT</td>
<td>INTEGER</td>
<td>The number of columns in the projection.</td>
</tr>
<tr>
<td>ROW_COUNT</td>
<td>INTEGER</td>
<td>The number of rows in the table's projections, including any rows marked for deletion.</td>
</tr>
<tr>
<td>USED_BYTES</td>
<td>INTEGER</td>
<td>The number of bytes of disk storage used by the projection.</td>
</tr>
<tr>
<td>WOS_ROW_COUNT</td>
<td>INTEGER</td>
<td>The number of WOS rows in the projection.</td>
</tr>
<tr>
<td>WOS_USED_BYTES</td>
<td>INTEGER</td>
<td>The number of WOS bytes in the projection.</td>
</tr>
<tr>
<td>ROS_ROW_COUNT</td>
<td>INTEGER</td>
<td>The number of ROS rows in the projection.</td>
</tr>
<tr>
<td>ROS_USED_BYTES</td>
<td>INTEGER</td>
<td>The number of ROS bytes in the projection.</td>
</tr>
<tr>
<td>ROS_COUNT</td>
<td>INTEGER</td>
<td>The number of ROS containers in the projection.</td>
</tr>
<tr>
<td>ANCHOR_TABLE_NAME</td>
<td>VARCHAR</td>
<td>The associated table name for which information is listed.</td>
</tr>
<tr>
<td>ANCHOR_TABLE_SCHEMA</td>
<td>VARCHAR</td>
<td>The associated table schema for which information is listed.</td>
</tr>
<tr>
<td>ANCHOR_TABLE_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID, assigned by the Vertica catalog, which identifies the anchor table.</td>
</tr>
</tbody>
</table>
See Also

- PROJECTIONS
- ANALYZE_STATISTICS

**PROJECTION_USAGE**

Records information about projections Vertica used in each processed query.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY_START_TIMESTAMP</td>
<td>TIMESTAMPTZ</td>
<td>Value of query at beginning of history interval.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that is reporting the requested information.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>Name of the user at the time Vertica recorded the session.</td>
</tr>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.</td>
</tr>
<tr>
<td>REQUEST_ID</td>
<td>INTEGER</td>
<td>Unique identifier of the query request in the user session.</td>
</tr>
<tr>
<td>TRANSACTION_ID</td>
<td>INTEGER</td>
<td>Identifier for the transaction within the session, if any; otherwise NULL.</td>
</tr>
<tr>
<td>STATEMENT_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID, STATEMENT_ID, and REQUEST_ID uniquely identifies a statement within a session.</td>
</tr>
<tr>
<td>IO_TYPE</td>
<td>VARCHAR</td>
<td>Input/output.</td>
</tr>
<tr>
<td>PROJECTION_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID assigned by the Vertica catalog, which identifies the projection.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>PROJECTION_NAME</td>
<td>VARCHAR</td>
<td>Projection name for which information is listed.</td>
</tr>
<tr>
<td>ANCHOR_TABLE_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID assigned by the Vertica, which identifies the anchor table.</td>
</tr>
<tr>
<td>ANCHOR_TABLE_SCHEMA</td>
<td>VARCHAR</td>
<td>Name of the schema that contains the anchor table.</td>
</tr>
<tr>
<td>ANCHOR_TABLE_NAME</td>
<td>VARCHAR</td>
<td>Name of the projection's associated anchor table.</td>
</tr>
</tbody>
</table>

**Privileges**

No explicit privileges are required. You only see the records for tables that you have privileges to view.

**QUERY_CONSUMPTION**

Summarizes execution of individual queries. Columns STATEMENT_ID and TRANSACTION_ID combine as unique keys to these queries. One exception applies: a query with multiple plans has as many records.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>END_TIME</td>
<td>TIMESTAMP</td>
<td>Query completion time, whether successful or not.</td>
</tr>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>Identifies the session where profiling information was captured. This identifier is unique within the cluster at any point in time, but can be reused when the session closes.</td>
</tr>
<tr>
<td>USER_ID</td>
<td>INTEGER</td>
<td>Unique numeric user identifier assigned by the Vertica catalog.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>User name specified by this query profile.</td>
</tr>
<tr>
<td>TRANSACTION_ID</td>
<td>INTEGER</td>
<td>Identifies the transaction in which the query ran</td>
</tr>
<tr>
<td>STATEMENT_ID</td>
<td>INTEGER</td>
<td>Numeric identifier of this query, unique within the query transaction.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CPU_CYCLES_US</td>
<td>INTEGER</td>
<td>Specifies, in microseconds, the sum of CPU cycles spent by all threads to process this query.</td>
</tr>
<tr>
<td>NETWORK_BYTES_SENT</td>
<td>INTEGER</td>
<td>Total amount of data sent/received over the network by execution engine operators.</td>
</tr>
<tr>
<td>NETWORK_BYTES_RECEIVED</td>
<td>INTEGER</td>
<td></td>
</tr>
<tr>
<td>DATA_BYTES_READ</td>
<td>INTEGER</td>
<td>Excluding WOS, total amount of data read/written by storage operators from and to disk, includes all locations: local, HDFS, S3.</td>
</tr>
<tr>
<td>DATA_BYTES_WRITTEN</td>
<td>INTEGER</td>
<td></td>
</tr>
<tr>
<td>DATA_BYTES_LOADED</td>
<td>INTEGER</td>
<td>Total amount of data loaded from external sources: COPY, external tables, and data load.</td>
</tr>
<tr>
<td>BYTES_SPILLED</td>
<td>INTEGER</td>
<td>Total amount of data spilled to disk—for example, by SortManager, Join, and NetworkSend operators.</td>
</tr>
<tr>
<td>INPUT_ROWS</td>
<td>INTEGER</td>
<td>The number of unfiltered input rows from DataSource and Load operators. INPUT_ROWS shows the number of input rows that the query plan worked with, but excludes intermediate processing. For example, INPUT_ROWS excludes how many times SortManager spilled and read the same row.</td>
</tr>
<tr>
<td>INPUT_ROWS_PROCESSED</td>
<td>INTEGER</td>
<td>The value of INPUT_ROWS minus what was filtered by applying query predicates (valindex) and SIPs, and rows rejected by COPY.</td>
</tr>
<tr>
<td>THREAD_COUNT</td>
<td>INTEGER</td>
<td>The maximum number of threads that were opened to process this query.</td>
</tr>
<tr>
<td>DURATION_MS</td>
<td>INTEGER</td>
<td>Specifies, in milliseconds, the total wall clock time spent to process this query.</td>
</tr>
<tr>
<td>RESOURCE_POOL</td>
<td>VARCHAR</td>
<td>Name of the resource pool where the query was executed</td>
</tr>
<tr>
<td>OUTPUT_ROWS</td>
<td>INTEGER</td>
<td>Number of rows output to the client.</td>
</tr>
</tbody>
</table>
### QUERY_EVENTS

Returns information about query planning, optimization, and execution events.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EVENT_TIMESTAMP</td>
<td>TIMESTAMPTZ</td>
<td>Time when Vertica recorded the event.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that is reporting the requested information.</td>
</tr>
<tr>
<td>USER_ID</td>
<td>INTEGER</td>
<td>Identifier of the user for the query event.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>Name of the user for which Vertica lists query information at the time it recorded the session.</td>
</tr>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.</td>
</tr>
<tr>
<td>REQUEST_ID</td>
<td>INTEGER</td>
<td>Unique identifier of the query request in the user session.</td>
</tr>
<tr>
<td>TRANSACTION_ID</td>
<td>INTEGER</td>
<td>Identifier for the transaction within the session, if any; otherwise NULL.</td>
</tr>
<tr>
<td>STATEMENT_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID, STATEMENT_ID, and REQUEST_ID uniquely identifies a statement within a session.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>EVENT_CATEGORY</td>
<td>VARCHAR</td>
<td>Category of event: OPTIMIZATION or EXECUTION.</td>
</tr>
<tr>
<td>EVENT_TYPE</td>
<td>VARCHAR</td>
<td>Type of event. For more information, refer to the following sections below:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Informational Event Types</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Event Types for Corrective Action</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Critical Event Types</td>
</tr>
<tr>
<td>EVENT_DESCRIPTION</td>
<td>VARCHAR</td>
<td>Generic description of the event.</td>
</tr>
<tr>
<td>OPERATOR_NAME</td>
<td>VARCHAR</td>
<td>Name of the Execution Engine component that generated the event, if applicable; for example, NetworkSend. Values from the OPERATOR_NAME and PATH_ID columns let you tie a query event back to a particular operator in the query plan. If the event did not come from a specific operator, the OPERATOR_NAME column is NULL.</td>
</tr>
<tr>
<td>PATH_ID</td>
<td>INTEGER</td>
<td>Unique identifier that Vertica assigns to a query operation or path in a query plan. If the event did not come from a specific operator, the PATH_ID column is NULL. See EXECUTION_ENGINE_PROFILES for more information.</td>
</tr>
<tr>
<td>OBJECT_ID</td>
<td>INTEGER</td>
<td>Object identifier (such as projection or table) to which the event refers.</td>
</tr>
<tr>
<td>EVENT_DETAILS</td>
<td>VARCHAR</td>
<td>Free-form text describing the specific event.</td>
</tr>
<tr>
<td>SUGGESTED_ACTION</td>
<td>VARCHAR</td>
<td>Suggested user action, if any is available.</td>
</tr>
</tbody>
</table>

### Informational Event Types

<table>
<thead>
<tr>
<th>Event Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIP_FALLBACK</td>
<td>This optimization did not apply to this query type.</td>
</tr>
<tr>
<td>Event Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SMALL_MERGE_REPLACED</td>
<td>Vertica has chosen a more efficient way to access the data by replacing a merge.</td>
</tr>
<tr>
<td>STORAGE_CONTAINERS_ELIMINATED</td>
<td>Vertica has performed partition pruning for the purpose of optimization.</td>
</tr>
<tr>
<td>GROUPBY PUSHDOWN</td>
<td>(Message is Internal to Vertica.)</td>
</tr>
<tr>
<td>NO GROUPBY PUSHDOWN</td>
<td>(Message is Internal to Vertica.)</td>
</tr>
<tr>
<td>VALUE_TRUNCATED</td>
<td>A character value is too long.</td>
</tr>
<tr>
<td>GROUP_BY_PREPASS_FALLBACK</td>
<td>Vertica could not run an optimization. In-memory prepass is disabled. The projection may not be optimal.</td>
</tr>
<tr>
<td>MERGE_CONVERTED_TO_UNION</td>
<td>Vertica has converted a merge operator to a union operator due to the sort order of the multi-threaded storage access stream.</td>
</tr>
<tr>
<td>TRANSITIVE.Predicate</td>
<td>Vertica has optimized by adding predicates to joins where it makes logical sense to do so.</td>
</tr>
<tr>
<td></td>
<td>For example, for the statement, SELECT * FROM A, B WHERE A.a = B.a AND A.a = 1; Vertica may add a predicate B.a = 1 as a filter for better storage access of table B.</td>
</tr>
<tr>
<td>NODE PRUNING</td>
<td>Vertica has performed node pruning, which is similar to partition pruning, but at the node level.</td>
</tr>
<tr>
<td>SEQUENCE CACHE REFILLED</td>
<td>Vertica has refilled sequence cache.</td>
</tr>
<tr>
<td>OUTER OVERRIDE USED</td>
<td>For efficiency and optimization, Vertica has swapped the inner/outer tables in a join. Vertica used the smaller table as the inner table.</td>
</tr>
<tr>
<td>OUTER OVERRIDE NOT USED</td>
<td>Vertica found swapping inner/outer tables in a join unnecessary because the inner/outer tables were in good order. (For example, a smaller table was used in an inner join.)</td>
</tr>
<tr>
<td>EXTERNAL_PREDICATE_PUSHDOWN_NOT_SUPPORTED</td>
<td>Predicate pushdown for older Hive versions may</td>
</tr>
<tr>
<td>Event Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>LibHDFS++ UNSUPPORTED OPERATION</td>
<td>Vertica accessed HDFS using the hdfs URL scheme, but the HDFS cluster uses an unsupported feature such as wire encryption or HTTPS_ONLY or the Vertica session uses delegation tokens. Vertica fell back to WebHDFS.</td>
</tr>
<tr>
<td>LibHDFS++ MANUAL Fallback</td>
<td>Vertica accessed HDFS using the hdfs URL scheme but HDFSUserWebHDFS is set. Vertica fell back to WebHDFS.</td>
</tr>
<tr>
<td>LibHDFS++ FAILOVER RETRY</td>
<td>Vertica attempted to contact a Name Node on an HDFS cluster that uses High Availability Name Node and did not receive a response. Vertica retried with a different Name Node.</td>
</tr>
</tbody>
</table>

**Event Types for Corrective Action**

Review the following event types for possible corrective action:

<table>
<thead>
<tr>
<th>Event Type</th>
<th>Description</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>GROUP_BY_SPILLED</td>
<td>This event type is typically related to a specific type of query, which you might need to adjust.</td>
<td>Identify the type of query and make adjustments accordingly. You might need to adjust resource pools, projections, or the amount of RAM available. Try running the query on a cluster with no additional workload.</td>
</tr>
<tr>
<td>RESEGMENTED_MANY_ROWS</td>
<td>This event type is typically related to a specific type of query, which you might need to adjust.</td>
<td>Do projections need to be segmented in a different way to allow for join locality? Can you rewrite the query to filter out more rows at storage access time?</td>
</tr>
<tr>
<td>Event Type</td>
<td>Description</td>
<td>Action</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>RLE_OVERRIDDEN</td>
<td>The average run counts are not large enough for Run Length Encoding (RLE). This event occurs with queries where the filtered results for certain columns do not work with RLE because cardinality is less than 10.</td>
<td>Review and rewrite your query, if necessary.</td>
</tr>
<tr>
<td>PREDICATE OUTSIDE HISTOGRAM</td>
<td>A predicate value you are trying to match does not exist in a set of possible values for a specific column. For example, you try to match a VARCHAR value WHERE mystring = &quot;ABC&lt;newline&gt;&quot;. In this case, the newline character throws off the predicate matching optimizations.</td>
<td>Review and rewrite your query, if necessary.</td>
</tr>
</tbody>
</table>

### Critical Event Types

Review the following event types, and resolve issues as recommended:

<table>
<thead>
<tr>
<th>Event Type</th>
<th>Description</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>WOS_SPILL</td>
<td>WOS ran out of memory, and began spilling to ROS.</td>
<td>Try one or more of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Adjust the load process to run bigger batches less frequently.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Give the WOS resource pool more memory.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Increase how often the Tuple Mover moveout and mergeout</td>
</tr>
<tr>
<td>Event Type</td>
<td>Description</td>
<td>Action</td>
</tr>
<tr>
<td>----------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>processes run for high ingest rates. (Adjustment of the moveout process helps avoid ROS issues.)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>NO HISTOGRAM</td>
<td>Indicates a table does not have an updated column histogram.</td>
<td>Running the function <code>ANALYZE_STATISTICS</code> most often corrects this issue.</td>
</tr>
<tr>
<td>MEMORY LIMIT HIT</td>
<td>Indicates query complexity or, possibly, lack of available system memory.</td>
<td>Consider adjusting the <code>MAXMEMORYSIZE</code> and <code>PLANNEDCONCURRENCY</code> resource pools so that the optimizer has sufficient memory. On a heavily used system, this event may occur more frequently.</td>
</tr>
<tr>
<td>DELETE WITH NON OPTIMIZED PROJECTION</td>
<td>One or more projections do not have your delete filter column in their sort order, causing Vertica difficulty identifying rows to mark as deleted.</td>
<td>Add the delete filter column to the end of every projection sort order for your target delete table.</td>
</tr>
<tr>
<td>JOIN_SPILLED</td>
<td>Vertica has spilled a join to disk. A join spill event slows down the subject query and all other queries as it</td>
<td>Try the following (in sequence):</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Review the explain plan. The query could be too ambitious, for example, cross joining two large tables.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Consider adding the query to a lower priority pool to reduce</td>
</tr>
<tr>
<td>Event Type</td>
<td>Description</td>
<td>Action</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>consumes resources while using disk as virtual memory.</td>
<td>impact on other queries.</td>
<td>Create projections that allow for a merge join instead of a hash join.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Adjust the PLANNEDCONCURRENCY resource pool so that queries have more memory to execute.</td>
</tr>
</tbody>
</table>

**Privileges**

No explicit privileges are required. You only see the records for tables that you have privileges to view.

**See Also**

- EXECUTION_ENGINE_PROFILES
- QUERY_CONSUMPTION
- QUERY_PLAN_PROFILES

**QUERY_METRICS**

Monitors the sessions and queries running on each node.

*Note: Totals in this table are reset each time the database restarts.*

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The node name for which information is listed.</td>
</tr>
<tr>
<td>ACTIVE_USER_SESSION_COUNT</td>
<td>INTEGER</td>
<td>The number of active user sessions (connections).</td>
</tr>
<tr>
<td>ACTIVE_SYSTEM_SESSION_COUNT</td>
<td>INTEGER</td>
<td>The number of active system sessions.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>TOTAL_USER_SESSION_COUNT</td>
<td>INTEGER</td>
<td>The total number of user sessions.</td>
</tr>
<tr>
<td>TOTAL_SYSTEM_SESSION_COUNT</td>
<td>INTEGER</td>
<td>The total number of system sessions.</td>
</tr>
<tr>
<td>TOTAL_ACTIVE_SESSION_COUNT</td>
<td>INTEGER</td>
<td>The total number of active user and system sessions.</td>
</tr>
<tr>
<td>TOTAL_SESSION_COUNT</td>
<td>INTEGER</td>
<td>The total number of user and system sessions.</td>
</tr>
<tr>
<td>RUNNINGQUERY_COUNT</td>
<td>INTEGER</td>
<td>The number of queries currently running.</td>
</tr>
<tr>
<td>EXECUTED_QUERY_COUNT</td>
<td>INTEGER</td>
<td>The total number of queries that ran.</td>
</tr>
</tbody>
</table>

**QUERY_PLAN_PROFILES**

Provides detailed execution status for queries that are currently running in the system. Output from the table shows the real-time flow of data and the time and resources consumed for each path in each query plan.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRANSACTION_ID</td>
<td>INTEGER</td>
<td>An identifier for the transaction within the session if any; otherwise NULL.</td>
</tr>
<tr>
<td>STATEMENT_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID and STATEMENT_ID uniquely identifies a statement within a session; these columns are useful for creating joins with other system tables.</td>
</tr>
<tr>
<td>PATH_ID</td>
<td>INTEGER</td>
<td>Unique identifier that Vertica assigns to a query operation or path in a query plan. Textual representation for this path is output in the PATH_LINE column.</td>
</tr>
<tr>
<td>PATH_LINE_INDEX</td>
<td>INTEGER</td>
<td>Each plan path in QUERY_PLAN_PROFILES could be represented with multiple rows. PATH_LINE_INDEX returns the relative line order. You should include the PATH_LINE_INDEX column in the QUERY_PLAN_</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td>PROFILES ... ORDER BY clause so rows in the result set appear as they do in EXPLAIN-generated query plans.</td>
</tr>
<tr>
<td>PATH_IS_EXECUTING</td>
<td>BOOLEAN</td>
<td>Status of a path in the query plan. True (t) if the path has started running, otherwise false.</td>
</tr>
<tr>
<td>PATH_IS_COMPLETE</td>
<td>BOOLEAN</td>
<td>Status of a path in the query plan. True (t) if the path has finished running, otherwise false.</td>
</tr>
<tr>
<td>IS_EXECUTING</td>
<td>BOOLEAN</td>
<td>Status of a running query. True if the query is currently active (t), otherwise false (f).</td>
</tr>
<tr>
<td>RUNNING_TIME</td>
<td>INTERVAL</td>
<td>The amount of elapsed time the query path took to execute.</td>
</tr>
<tr>
<td>MEMORY_ALLOCATED_BYTES</td>
<td>INTEGER</td>
<td>The amount of memory the path used, in bytes.</td>
</tr>
<tr>
<td>READ_FROM_DISK_BYTES</td>
<td>INTEGER</td>
<td>The number of bytes the path read from disk (or the disk cache).</td>
</tr>
<tr>
<td>RECEIVED_BYTES</td>
<td>INTEGER</td>
<td>The number of bytes received over the network.</td>
</tr>
<tr>
<td>SENT_BYTES</td>
<td>INTEGER</td>
<td>Size of data sent over the network by the path.</td>
</tr>
<tr>
<td>PATH_LINE</td>
<td>VARCHAR</td>
<td>The query plan text string for the path, associated with the PATH ID and PATH_LINE_INDEX columns.</td>
</tr>
</tbody>
</table>

**Privileges**

Non-superusers see only the records of tables they have permissions to view.

**Best Practices**

Table results can be very wide. For best results when you query QUERY_PLAN_PROFILES, sort on these columns:

- TRANSACTION_ID
- STATEMENT_ID
For example:

```sql
=> SELECT ... FROM query_plan_profiles
    WHERE ...
    ORDER BY transaction_id, statement_id, path_id, path_line_index;
```

Example

See Profiling Query Plans in the Administrator's Guide

- EXECUTION_ENGINE_PROFILES
- EXPLAIN
- PROFILE
- QUERY_CONSUMPTION
- QUERY_EVENTS

**QUERY_PROFILES**

Provides information about executed queries.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>The identification of the session for which profiling information is captured. This identifier is unique within the cluster at any point in time but can be reused when the session closes.</td>
</tr>
<tr>
<td>TRANSACTION_ID</td>
<td>INTEGER</td>
<td>An identifier for the transaction within the session if any; otherwise NULL.</td>
</tr>
<tr>
<td>STATEMENT_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID for the currently-running statement.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>IDENTIFIER</td>
<td>VARCHAR</td>
<td>A string to identify the query in system tables. <strong>Note:</strong> You can query the IDENTIFIER column to quickly identify queries you have labeled for profiling and debugging. See <a href="#">Labeling Queries</a> in the Administrator's Guide for details.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The node name for which information is listed.</td>
</tr>
<tr>
<td>QUERY</td>
<td>VARCHAR</td>
<td>The query string used for the query.</td>
</tr>
<tr>
<td>QUERY_SEARCH_PATH</td>
<td>VARCHAR</td>
<td>A list of schemas in which to look for tables.</td>
</tr>
<tr>
<td>SCHEMA_NAME</td>
<td>VARCHAR</td>
<td>The schema name in which the query is being profiled, set only for load operations.</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR</td>
<td>The table name in the query being profiled, set only for load operations.</td>
</tr>
<tr>
<td>QUERY_DURATION_US</td>
<td>NUMERIC (18, 0)</td>
<td>The duration of the query in microseconds.</td>
</tr>
<tr>
<td>QUERY_START_EPOCH</td>
<td>INTEGER</td>
<td>The epoch number at the start of the given query.</td>
</tr>
<tr>
<td>QUERY_START</td>
<td>VARCHAR</td>
<td>The Linux system time of query execution in a format that can be used as a DATE/TIME expression.</td>
</tr>
<tr>
<td>QUERY_TYPE</td>
<td>VARCHAR</td>
<td>Is one of INSERT, SELECT, UPDATE, DELETE, UTILITY, or UNKNOWN.</td>
</tr>
<tr>
<td>ERROR_CODE</td>
<td>INTEGER</td>
<td>The return error code for the query.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>The name of the user who ran the query.</td>
</tr>
<tr>
<td>PROCESSED_ROW_COUNT</td>
<td>INTEGER</td>
<td>The number of rows returned by the query.</td>
</tr>
</tbody>
</table>
### Column Name | Data Type | Description
---|---|---
RESERVED_EXTRA_MEMORY_B | INTEGER | Shows how much unused memory (in bytes) remains that is reserved for a given query but is unassigned to a specific operator. This is the memory from which unbounded operators pull first.

The MEMORY_INUSE_KB column in system table RESOURCE_ACQUISITIONS shows how much total memory was acquired for each query.

If operators acquire all memory acquired for the query, the plan must request more memory from the Vertica resource manager.

IS_EXECUTING | BOOLEAN | Displays information about actively running queries, regardless of whether profiling is enabled.

### QUERY_REQUESTS

Returns information about user-issued query requests.

| Column Name | Data Type | Description |
---|---|---|
NODE_NAME | VARCHAR | Name of the node that is reporting the requested information. |
USER_NAME | VARCHAR | Name of the user who issued the query at the time Vertica recorded the session. |
SESSION_ID | VARCHAR | Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes. |
REQUEST_ID | INTEGER | Unique identifier of the query request in the user session. |
TRANSACTION_ID | INTEGER | Identifier for the transaction within the session, if any; otherwise NULL. |
STATEMENT_ID | INTEGER | Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed. The combination of |

<tr>
<td>START_TIMESTAMP</td>
<td>TIMESTAMPTZ</td>
<td>Beginning of history interval.</td>
</tr>
<tr>
<td>END_TIMESTAMP</td>
<td>TIMESTAMPTZ</td>
<td>End of history interval.</td>
</tr>
<tr>
<td>REQUEST_DURATION</td>
<td>TIMESTAMPTZ</td>
<td>Length of time in days, hours, minutes, seconds, and milliSeconds.</td>
</tr>
</tbody>
</table>
### Column Name |
| Data Type |
| Description |
|---|---|---|
| REQUEST_DURATION_MS | INTEGER | Length of time the query ran in milliseconds. |
| IS_EXECUTING | BOOLEAN | Distinguishes between actively-running (t) and completed (f) queries. |

### Privileges

No explicit privileges are required. You can only see the records for requests associated with your user name. Users with **SYSMONITOR Role** or **DBADMIN Role** can see all records from all users.

### Example

```
=> SELECT * FROM QUERY_REQUESTS;
- [ RECORD 1 ]---------------------------------------------
---------------------------------------------
node_name | v_vmart_node0001
user_name | dbadmin
session_id | v_vmart_node0001-321039:0x3a
request_id | 404
transaction_id | 45035996274380645
statement_id | 1
request_type | DDL
request | GRANT EXECUTE ON FUNCTION public.STV_SetExportShapefileDirectory() TO dbadmin;
request_label | 
search_path | "$user", public, v_catalog, v_monitor, v_internal
memory_acquired_mb | 
success | t
error_count | 
start_timestamp | 2018-04-22 04:14:37.517756-04
end_timestamp | 2018-04-22 04:14:37.52971-04
request_duration | 00:00:00.011954
request_duration_ms | 12
is_executing | f
```

**Privileges**

None

**See Also**

PROJECTION_RECOVERIES

**REMOTE_REPLICATION_STATUS**

Provides the status of replication tasks to alternate clusters.
Privileges

None

**REPARENTED_ON_DROP**

Lists re-parenting events of objects dropped from their original owner but still remain in Vertica. For example, a user may leave the organization and needs to be removed from the database. When the dbadmin drops the user from the database that user's objects are re-parented to another user.

In some cases a Vertica user's objects are reassigned based on the GlobalHeirUserName parameter. In this case a user's objects are re-parented to the user indicated by this parameter.
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>event. For example, a dbadmin user may have dropped a user thus re-parenting that user’s objects.</td>
</tr>
<tr>
<td>TRANSACTION_ID</td>
<td>INTEGER</td>
<td>The system-generated transaction identification number. Is NULL if a transaction id does not exist.</td>
</tr>
<tr>
<td>OLD_OWNER_NAME</td>
<td>VARCHAR</td>
<td>The name of the dropped user who used to own the re-parented object.</td>
</tr>
<tr>
<td>OLD_OWNER_OID</td>
<td>INTEGER</td>
<td>The unique identification number of the user who used to own the re-parented object.</td>
</tr>
<tr>
<td>NEW_OWNER_NAME</td>
<td>VARCHAR</td>
<td>The name of the user who now owns the re-parented objects.</td>
</tr>
<tr>

<td>INTEGER</td>
<td>The unique identification number of the user who now owns the re-parented objects.</td>
</tr>
<tr>
<td>OBJ_NAME</td>
<td>VARCHAR</td>
<td>The name of the object being re-parented.</td>
</tr>
<tr>
<td>OBJ_OID</td>
<td>INTEGER</td>
<td>The unique identification number of the object being re-parented.</td>
</tr>
<tr>
<td>SCHEMA_NAME</td>
<td>VARCHAR</td>
<td>The name of the schema in which the object resides.</td>
</tr>
<tr>
<td>SCHEMA_OID</td>
<td>INTEGER</td>
<td>The unique identification number of the schema in which the re-parented object resides.</td>
</tr>
</tbody>
</table>

**RESOURCE_ACQUISITIONS**

Retains information about resources (memory, open file handles, threads) acquired by each running request. Each request is uniquely identified by its transaction and statement IDs within a given session.

**Important:** If a request cascades to one or more resource pools beyond the original pool, this table contains multiple records for the same request—one record for each resource pool. The following values are specific to each resource pool:
- Timestamp values: QUEUE_ENTRY_TIMESTAMP, ACQUISITION_TIMESTAMP, and RELEASE_TIMESTAMP
- DURATION_MS
- IS_EXECUTING

You can trace the history of cascade events by querying system table RESOURCE_POOL_MOVE.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Node name for which information is listed.</td>
</tr>
<tr>
<td>TRANSACTION_ID</td>
<td>INTEGER</td>
<td>Transaction identifier for this request.</td>
</tr>
<tr>
<td>STATEMENT_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID for each statement within a transaction. NULL indicates that no statement is currently being processed.</td>
</tr>
<tr>
<td>REQUEST_TYPE</td>
<td>VARCHAR</td>
<td>Type of request issued to a resource pool. End users always see this column set to Reserve, to indicate that the request is query-specific.</td>
</tr>
<tr>
<td>POOL_ID/POOL_NAME</td>
<td>INTEGER/VARCHAR</td>
<td>Each resource pool that participated in handling this request:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• POOL_ID: A unique numeric ID assigned by the Vertica catalog that uniquely identifies the resource pool.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• POOL_NAME: Name of the resource pool.</td>
</tr>
<tr>
<td>THREAD_COUNT</td>
<td>INTEGER</td>
<td>Number of threads in use by this request.</td>
</tr>
<tr>
<td>OPEN_FILE_HANDLE_COUNT</td>
<td>INTEGER</td>
<td>Number of open file handles in use by this request.</td>
</tr>
<tr>
<td>MEMORY_INUSE_KB</td>
<td>INTEGER</td>
<td>Total amount of memory in kilobytes acquired by this query.</td>
</tr>
</tbody>
</table>

Column RESERVED_EXTRA_MEMORY_B in system table QUERY_PROFILES shows how much unused memory (in bytes) remains that is reserved for a
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>given query but is unassigned to a specific operator. If operators for a query acquire all memory specified by MEMORY_INUSE_KB, the plan must request more memory from the Vertica Resource Manager.</td>
</tr>
<tr>
<td>QUEUE_ENTRY_TIMESTAMP</td>
<td>TIMESTAMPTZ</td>
<td>Timestamp when the request was queued in this resource pool.</td>
</tr>
<tr>
<td>ACQUISITION_TIMESTAMP</td>
<td>TIMESTAMPTZ</td>
<td>Timestamp when the request was admitted to run.</td>
</tr>
<tr>
<td>RELEASE_TIMESTAMP</td>
<td>TIMESTAMPTZ</td>
<td>Time when Vertica released this resource acquisition.</td>
</tr>
<tr>
<td>DURATION_MS</td>
<td>INTEGER</td>
<td>Duration in milliseconds of request execution. If the request cascaded across multiple resource pools, DURATION_MS applies only to this resource pool.</td>
</tr>
<tr>
<td>IS_EXECUTING</td>
<td>BOOLEAN</td>
<td>Set to true if the resource pool is still executing this request. A value of false can indicate one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The request was completed or denied.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The request cascaded to another resource pool.</td>
</tr>
</tbody>
</table>

### Privileges

No explicit privileges are required. You only see the records for tables that you have privileges to view.

### Queue Wait Time

You can calculate how long a resource pool queues a given request before it begins execution by subtracting QUEUE_ENTRY_TIMESTAMP from ACQUISITION_TIMESTAMP. For example:

```sql
=> SELECT pool_name, queue_entry_timestamp, acquisition_timestamp,
   (acquisition_timestamp - queue_entry_timestamp) AS 'queue wait'
FROM V_MONITOR.RESOURCE_ACQUISITIONS WHERE node_name ILIKE '%node0001';
```

RESOURCE_POOL_MOVE

Displays the cascade event information on each node.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Node name for which information is listed.</td>
</tr>
<tr>
<td>MOVE_TIMESTAMP</td>
<td>TIMESTAMPZ</td>
<td>Time when the query attempted to move to the target pool.</td>
</tr>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.</td>
</tr>
<tr>
<td>USER_ID</td>
<td>INTEGER</td>
<td>Identifies the query event user.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>Name of the user for which Vertica lists query information at the time it records the session.</td>
</tr>
<tr>
<td>TRANSACTION_ID</td>
<td>INTEGER</td>
<td>Transaction identifier for the request.</td>
</tr>
<tr>
<td>STATEMENT_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID for the statement.</td>
</tr>
<tr>
<td>SOURCE_POOL_NAME</td>
<td>VARCHAR</td>
<td>Name of the resource pool where the query was executing when Vertica attempted the move.</td>
</tr>
<tr>
<td>TARGET_POOL_NAME</td>
<td>VARCHAR</td>
<td>Name of resource pool where the query attempted to move.</td>
</tr>
<tr>
<td>MOVE_CAUSE</td>
<td>VARCHAR</td>
<td>Denotes why the query attempted to move. Valid values:</td>
</tr>
</tbody>
</table>

Valid values:
<table>
<thead>
<tr>
<th>Column Name</th>

<td>Value of RUNTIME_PRIORITY_THRESHOLD as defined for the pool.</td>
</tr>
<tr>
<td>SINGLE_INITIATOR</td>
<td>BOOLEAN</td>
<td>Value of SINGLEINITIATOR parameter, set for backward compatibility.</td>
</tr>
<tr>
<td>QUERY_BUDGET_KB</td>
<td>INTEGER</td>
<td>The current amount of memory that queries are tuned to use. The calculation that Vertica uses to determine this value is described in Query Budgeting.</td>
</tr>
<tr>
<td>Note</td>
<td></td>
<td>The calculated value can change when one or more running queries needs more than the budgeted amount to run.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For a detailed example of query budget calculations, see Do You Need to Put Your Query on a Budget? in the Vertica User Community.</td>
</tr>
<tr>
<td>CPU_AFFINITY_SET</td>
<td>VARCHAR</td>
<td>The set of CPUs on which queries associated with this pool are executed. Can be:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- A percentage of CPUs on the system</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CPU_AFFINITY_MASK</td>
<td>VARCHAR</td>
<td>The bit mask of CPUs available for use in this pool, read from right to left. See Examples below.</td>
</tr>
<tr>
<td>CPU_AFFINITY_MODE</td>
<td>VARCHAR</td>
<td>The mode for the CPU affinity, one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ANY</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• EXCLUSIVE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• SHARED</td>
</tr>
</tbody>
</table>

**Examples**

The following query returns bit masks that show CPU assignments for three user-defined resource pools. Resource pool bigqueries runs queries on CPU 0, ceo_pool on CPU 1, and testrp on CPUs 0 and 1:

```sql
=> SELECT pool_name, node_name, cpu_affinity_set, cpu_affinity_mode,
FROM resource_pool_status WHERE IS_INTERNAL = 'false' order by pool_name, node_name;
```

<table>

| REJECTED_VALUE | INTEGER     | Amount of the specific resource requested by the last rejection |

**Privileges**

No explicit privileges are required. You only see the records for tables that you have privileges to view.

**See Also**

RESOURCE_REJECTIONS
RESOURCES

Monitors requests for resources that are rejected by the Resource Manager. Information is valid only as long as the node is up and the counters reset to 0 upon node restart.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The node name for which information is listed.</td>
</tr>
<tr>
<td>POOL_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog that identifies the resource pool.</td>
</tr>
<tr>
<td>POOL_NAME</td>
<td>VARCHAR</td>
<td>The name of the resource pool.</td>
</tr>
<tr>
<td>REASON</td>
<td>VARCHAR</td>
<td>The reason for rejecting this request; for example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Usage of single request exceeds high limit</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Timed out waiting for resource reservation</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Canceled waiting for resource reservation</td>
</tr>
<tr>
<td>RESOURCE_TYPE</td>
<td>VARCHAR</td>
<td>Memory, threads, file handles or execution slots.</td>
</tr>
</tbody>
</table>

The following list shows the resources that are limited by the resource manager. A query might need some amount of each resource, and if the amount needed is not available, the query is queued and could eventually time out of the queue and be rejected.

- Number of running plans
- Number of running plans on initiator node (local)
- Number of requested threads
- Number of requested file handles
- Number of requested KB of memory
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REJECTION_COUNT</td>
<td>INTEGER</td>
<td>Number of requests rejected due to specified reason and RESOURCE_TYPE.</td>
</tr>
<tr>
<td>FIRST_REJECTED_TIMESTAMP</td>
<td>TIMESTAMPTZ</td>
<td>The time of the first rejection for this pool</td>
</tr>
<tr>
<td>LAST_REJECTED_TIMESTAMP</td>
<td>TIMESTAMPTZ</td>
<td>The time of the last rejection for this pool</td>
</tr>
<tr>
<td>LAST_REJECTED_VALUE</td>
<td>INTEGER</td>
<td>The amount of the specific resource requested by the last rejection</td>
</tr>
</tbody>
</table>

**Reasons for Rejection**

- Usage of single request exceeds high limit
- Timed out waiting for resource reservation
- Canceled waiting for resource reservation

**Example**

```sql
-> SELECT node_name, pool_name, reason, resource_type,
    rejection_count AS count,
    last_rejected_value AS value
FROM resource_rejections;
```

<table>
<thead>
<tr>
<th>node_name</th>
<th>pool_name</th>
<th>reason</th>
<th>resource_type</th>
<th>count</th>
</tr>
</thead>
<tbody>
<tr>
<td>initiator</td>
<td>alsohassome</td>
<td>Request exceeded high limit</td>
<td>Memory(KB)</td>
<td>1</td>
</tr>
<tr>
<td>initiator</td>
<td>ceo 102400</td>
<td>Timedout waiting for resource request</td>
<td>Memory(KB)</td>
<td>1</td>
</tr>
<tr>
<td>initiator</td>
<td>empty 102400</td>
<td>Request exceeded high limit</td>
<td>Queries</td>
<td>1</td>
</tr>
<tr>
<td>initiator</td>
<td>general 45035996273704970</td>
<td>Request exceeded high limit</td>
<td>Address space(KB)</td>

- `DISK_RESOURCE_REJECTIONS`

**RESOURCE_USAGE**

Monitors system resource management on each node.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The node name for which information is listed.</td>
</tr>
<tr>
<td>REQUEST_COUNT</td>
<td>INTEGER</td>
<td>The cumulative number of requests for threads, file handles, and memory (in kilobytes).</td>
</tr>
<tr>
<td>LOCAL_REQUEST_COUNT</td>
<td>INTEGER</td>
<td>The cumulative number of local requests.</td>
</tr>
<tr>
<td>REQUEST_QUEUE_DEPTH</td>
<td>INTEGER</td>
<td>The current request queue depth.</td>
</tr>
<tr>
<td>ACTIVE_THREAD_COUNT</td>
<td>INTEGER</td>
<td>The current number of active threads.</td>
</tr>
<tr>
<td>OPEN_FILE_HANDLE_COUNT</td>
<td>INTEGER</td>
<td>The current number of open file handles.</td>
</tr>
</tbody>
</table>
### Column Name | Data Type | Description
--- | --- | ---
MEMORY_REQUESTED_KB | INTEGER | The memory requested in kilobytes.
ADDRESS_SPACE_REQUESTED_KB | INTEGER | The address space requested in kilobytes.
WOS_USED_BYTES | INTEGER | The size of the WOS in bytes.
WOS_ROW_COUNT | INTEGER | The number of rows in the WOS.
ROS_USED_BYTES | INTEGER | The size of the ROS in bytes.
ROS_ROW_COUNT | INTEGER | The number of rows in the ROS.
TOTAL_USED_BYTES | INTEGER | The total size of storage (WOS + ROS) in bytes.
TOTAL_ROW_COUNT | INTEGER | The total number of rows in storage (WOS + ROS).
RESOURCE_REQUEST_REJECT_COUNT | INTEGER | The number of rejected plan requests.
RESOURCE_REQUEST_TIMEOUT_COUNT | INTEGER | The number of resource request timeouts.
RESOURCE_REQUEST_CANCEL_COUNT | INTEGER | The number of resource request cancelations.
DISK_SPACE_REQUEST_REJECT_COUNT | INTEGER | The number of rejected disk write requests.
FAILED_VOLUME_REJECT_COUNT | INTEGER | The number of rejections due to a failed volume.
TOKENS_USED | INTEGER | For internal use only.
TOKENS_AVAILABLE | INTEGER | For internal use only.

### SESSION_MARS_STORE
Shows Multiple Active Result Sets (MARS) storage information.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that is reporting the requested information.</td>
</tr>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>Identifier of the Vertica session. This identifier is unique within the cluster for the current session but can be</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------</td>
<td>------------------------------------------------------------------</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>The username used to create the connection.</td>
</tr>
<tr>
<td>RESULTSET_ID</td>
<td>INTEGER</td>
<td>Identifier assigned to the result set.</td>
</tr>
<tr>
<td>ROW_COUNT</td>
<td>INTEGER</td>
<td>Number of rows requested by the query.</td>
</tr>
<tr>
<td>REMAINING_ROW_COUNT</td>
<td>INTEGER</td>
<td>Number of rows that still need to be returned.</td>
</tr>
<tr>
<td>BYTES_USED</td>
<td>INTEGER</td>
<td>The number of bytes requested.</td>
</tr>
</tbody>
</table>

**SESSIOON_PARAMETERS**

Provides information about current parameters that are configurable at the session level. To view parameters configurable at all levels, see the `CONFIGURATION_PARAMETERS` system table.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>The unique identifier for the session.</td>
</tr>
<tr>
<td>SCHEMA_NAME</td>
<td>VARCHAR</td>
<td>The name of the schema on which the session is running.</td>
</tr>
<tr>
<td>LIB_NAME</td>
<td>VARCHAR</td>
<td>The name of the user library running the UDx, if necessary.</td>
</tr>
<tr>
<td>LIB_OID</td>
<td>VARCHAR</td>
<td>The object ID of the library containing the function, if one is running.</td>
</tr>
<tr>
<td>PARAMETER_NAME</td>
<td>VARCHAR</td>
<td>The name of the session parameter.</td>
</tr>
<tr>
<td>CURRENT_VALUE</td>
<td>VARCHAR</td>
<td>The value of the session parameter.</td>
</tr>
</tbody>
</table>

LOCKS
SESSIONS

Monitors external sessions. Use this table to perform the following tasks:

- Identify users who are running lengthy queries.
- Identify users who hold locks because of an idle but uncommitted transaction.
- Determine the details of the database security used for a particular session, either Secure Socket Layer (SSL) or client authentication.
- Identify client-specific information, such as client version.

Note: During session initialization and termination, you might see sessions running only on nodes other than the node on which you ran the virtual table query. This is a temporary situation that corrects itself when session initialization and termination complete.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The node name for which information is listed.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>The name used to log in to the database or NULL if the session is internal.</td>
</tr>
<tr>
<td>CLIENT_HOSTNAME</td>
<td>VARCHAR</td>
<td>The host name and port of the TCP socket from which the client connection was made; NULL if the session is internal. Vertica accepts either IPv4 or IPv6 connections from a client machine. If the client machine contains mappings for both IPv4 and IPv6, the server randomly chooses one IP address family to make a connection. This can cause the CLIENT_HOSTNAME column to display either IPv4 or IPv6 values, based on which address family the server chooses.</td>
</tr>
<tr>
<td>CLIENT_PID</td>
<td>INTEGER</td>
<td>The process identifier of the client process that issued this connection. Remember that the client process could be on a different machine than the server.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>

**Privileges**

No explicit privileges are required. You only see the records for tables that you have privileges to view.

**STORAGE_POLICIES**

Monitors the current storage policies in effect for one or more database objects.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMA_NAME</td>
<td>VARCHAR</td>
<td>Schema name for which information is listed.</td>
</tr>
<tr>
<td>OBJECT_NAME</td>
<td>VARCHAR</td>
<td>The name of the database object associated through the storage policy.</td>
</tr>
<tr>
<td>POLICYDETAILS</td>
<td>VARCHAR</td>
<td>The object type of the storage policy.</td>
</tr>
<tr>
<td>LOCATION_LABEL</td>
<td>VARCHAR (128)</td>
<td>The label for this storage location.</td>
</tr>
</tbody>
</table>
Privileges

No explicit privileges are required. You only see the records for tables that you have privileges to view.

STORAGE_TIERS

Provides information about all storage locations with the same label across all cluster nodes. This table lists data totals for all same-name labeled locations.

The system table shows what labeled locations exist on the cluster, as well as other cluster-wide data about the locations.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCATION_LABEL</td>
<td>VARCHAR</td>
<td>The label associated with a specific storage location. The storage_tiers system table includes data totals for unlabeled locations, which are considered labeled with empty strings (&quot;&quot;).</td>
</tr>
<tr>
<td>NODE_COUNT</td>
<td>INTEGER</td>
<td>The total number of nodes that include a storage location named location_label.</td>
</tr>
</tbody>
</table>
| LOCATION_COUNT       | INTEGER   | The total number of storage locations named location_label. This value can differ from node_count if you create labeled locations with the same name at different paths on different nodes. For example: 
  v_vmart_node0001: Create one labeled location, FAST
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V_vmart_node0002: Create two labeled locations, FAST, at different directory paths</td>
<td></td>
<td>In this case, node_count value = 2, while location_count value = 3.</td>
</tr>
<tr>
<td>ROS_CONTAINER_COUNT</td>
<td>INTEGER</td>
<td>The total number of ROS containers stored across all cluster nodes for location_label.</td>
</tr>
<tr>
<td>TOTAL_OCCUPIED_SIZE</td>
<td>INTEGER</td>
<td>The total number of bytes that all ROS containers for location_label occupy across all cluster nodes.</td>
</tr>
</tbody>
</table>

**STRATA**

Contains internal details of how the Tuple Mover combines ROS containers in each projection, broken down by stratum and classifies the ROS containers by size and partition. The related STRATA_STRUCTURES table provides a summary of the strata values.

**Mergeout** in the Administrator's Guide describes how the Tuple Mover combines ROS containers.
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The node name for which information is listed.</td>
</tr>
<tr>
<td>SCHEMA_NAME</td>
<td>VARCHAR</td>
<td>The schema name for which information is listed.</td>
</tr>
<tr>
<td>PROJECTION_ID</td>
<td>INTEGER</td>
<td>A unique numeric ID assigned by the Vertica catalog, which identifies the projection.</td>
</tr>
<tr>
<td>PROJECTION_NAME</td>
<td>VARCHAR</td>
<td>The projection name for which information is listed on that node.</td>
</tr>
<tr>
<td>PARTITION_KEY</td>
<td>VARCHAR</td>
<td>Deprecated in favor of STRATUM_KEY, references the partition or partition group for which information is listed.</td>
</tr>
<tr>
<td>STRATUM_KEY</td>
<td>VARCHAR</td>
<td>References the partition or partition group for which information is listed.</td>
</tr>
<tr>
<td>STRATA_COUNT</td>
<td>INTEGER</td>
<td>The total number of strata for this projection partition.</td>
</tr>
<tr>
<td>MERGING_STRATA_COUNT</td>
<td>INTEGER</td>
<td>The number of strata the Tuple Mover can merge out.</td>
</tr>
<tr>
<td>STRATUM_CAPACITY</td>
<td>INTEGER</td>
<td>The maximum number of ROS containers for the stratum before they must be merged.</td>
</tr>
<tr>
<td>STRATUM_HEIGHT</td>
<td>FLOAT</td>
<td>The size ratio between the smallest and largest ROS container in this stratum.</td>
</tr>
<tr>
<td>STRATUM_NO</td>
<td>INTEGER</td>
<td>The stratum number. Strata are numbered starting at 0, for the stratum containing the smallest ROS containers.</td>
</tr>
<tr>
<td>STRATUM_LOWER_SIZE</td>
<td>VARCHAR</td>
<td>The smallest ROS container size allowed in this stratum.</td>
</tr>
<tr>
<td>STRATUM_UPPER_SIZE</td>
<td>VARCHAR</td>
<td>The largest ROS container size allowed in this stratum.</td>
</tr>
<tr>
<td>ROS_CONTAINER_COUNT</td>
<td>INTEGER</td>
<td>The current number of ROS containers in the projection partition.</td>
</tr>
</tbody>
</table>
STRATA_STRUCTURES

This table provides an overview of Tuple Mover internal details. It summarizes how the ROS containers are classified by size. A more detailed view can be found in the STRATA virtual table.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>The node name for which information is listed.</td>

### Privileges

Superuser

### SYSTEM_SERVICES

Provides information about background system services that the Workload Analyzer monitors.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that is reporting the requested information.</td>
</tr>
<tr>
<td>SERVICE_TYPE</td>
<td>VARCHAR</td>
<td>Type of service; can be one of:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• SYSTEM</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• TUPLE MOVER</td>
</tr>
<tr>
<td>SERVICE_GROUP</td>
<td>VARCHAR</td>
<td>Group name, if there are multiple services of the same type.</td>
</tr>
<tr>
<td>SERVICE_NAME</td>
<td>VARCHAR</td>
<td>Name of the service.</td>
</tr>
<tr>
<td>SERVICE_INTERVAL_SEC</td>
<td>INTEGER</td>
<td>How often the service is executed (in seconds) during the history interval.</td>
</tr>
<tr>
<td>IS_ENABLED</td>
<td>BOOLEAN</td>
<td>Denotes if the service is enabled.</td>
</tr>
<tr>
<td>LAST_RUN_START</td>
<td>TIMESTAMPTZ</td>
<td>Denotes when the service was started last time.</td>
</tr>
</tbody>
</table>
### Privileges

No explicit privileges are required. You only see the records for tables that you have privileges to view.

**SYSTEM_SESSIONS**

Provides information about system internal session history by system task.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that is reporting the requested information.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>Name of the user at the time Vertica recorded the session.</td>
</tr>
<tr>
<td>SESSION_ID</td>
<td>INTEGER</td>
<td>Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.</td>
</tr>
<tr>
<td>TRANSACTION_ID</td>
<td>INTEGER</td>
<td>Identifier for the transaction within the session, if any. If a session is active but no transaction has begun, TRANSACTION_ID returns NULL.</td>
</tr>
<tr>
<td>STATEMENT_ID</td>
<td>VARCHAR</td>
<td>Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID and STATEMENT_ID uniquely identifies a statement within a session.</td>
</tr>
<tr>
<td>SESSION_TYPE</td>
<td>VARCHAR</td>
<td>Session type. Can be one of:</td>

</tbody>
</table>

**Privileges**

Superuser

**TABLE_RECOVERIES**

Provides detailed information about recovered and recovering tables during a recovery by table.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that is performing the recovery.</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>VARCHAR</td>
<td>The name of the table being recovered.</td>
</tr>
<tr>
<td>TABLE_OID</td>
<td>INTEGER</td>
<td>The object ID of the table being recovered.</td>
</tr>
<tr>
<td>STATUS</td>
<td>VARCHAR</td>
<td>The status of the table. Tables can have the following status:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• recovered: The table is fully recovered</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• recovering: The table is in the process of recovery</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• error_retry: Vertica has attempted to recover the table, but the recovery</td>
</tr>
<tr>
<td></td>
<td></td>
<td>failed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Tables that have not yet begun the recovery process do not have a status.</td>
</tr>
</tbody>
</table>
### Column Name | Data Type | Description
--- | --- | ---
**PHASE** | VARCHAR | The *phase of the recovery*.  
**THREAD_ID** | VARCHAR | The ID of the thread that performed the recovery.  
**START_TIME** | TIMESTAMPZ | The date and time that the table began recovery.  
**END_TIME** | TIMESTAMPZ | The date and time that the table completed recovery.  
**RECOVER_PRIORITY** | INTEGER | The *recovery priority* of the table being recovered.  
**RECOVER_ERROR** | VARCHAR | Error that caused the recovery to fail.  
**IS_HISTORICAL** | BOOLEAN | If f, the record contains recovery information for the current process.  

### Privileges
None

### Example

```sql
=> SELECT * FROM TABLE_RECOVERIES;

```
TABLE_RECOVERY_STATUS

Provides node recovery information during a Recovery By Table.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that is performing the recovery.</td>
</tr>
<tr>
<td>NODE_RECOVERY_START_TIME</td>
<td>TIMESTAMPZ</td>
<td>The timestamp for when the node began recovering.</td>
</tr>
<tr>
<td>RECOVER_EPOCH</td>
<td>INTEGER</td>
<td>The epoch that the recovery operation is trying to recover to.</td>
</tr>
<tr>
<td>RECOVERING_TABLE_NAME</td>
<td>VARCHAR</td>
<td>The name of the table currently recovering.</td>
</tr>
<tr>
<td>TABLES_REMAIN</td>
<td>INTEGER</td>
<td>The total number of tables on the node.</td>
</tr>
<tr>
<td>IS_RUNNING</td>
<td>BOOLEAN</td>
<td>Indicates if the recovery process is still running.</td>
</tr>
</tbody>
</table>

Privileges

None

Example

```sql
=> SELECT * FROM TABLE_RECOVERY_STATUS;
-[ RECORD 1 ]-----------------------------
node_name | v_vmart_node001
node_recovery_start_time |
recover_epoch |
recovering_table_name |
tables_remain | 0
is_running | f
-[ RECORD 2 ]-----------------------------
node_name | v_vmart_node002
node_recovery_start_time |
recover_epoch |
recovering_table_name |
tables_remain | 0
is_running | f
-[ RECORD 3 ]-----------------------------
node_name | v_vmart_node003
node_recovery_start_time | 2017-12-13 08:47:28.282377-05
```
### TRANSACTIONS

Records the details of each transaction.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>START_TIMESTAMP</td>
<td>TIMESTAMPTZ</td>
<td>Beginning of history interval.</td>
</tr>
<tr>
<td>END_TIMESTAMP</td>
<td>TIMESTAMPTZ</td>
<td>End of history interval.</td>
</tr>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that is reporting the requested information.</td>
</tr>
<tr>
<td>USER_ID</td>
<td>INTEGER</td>
<td>Unique numeric ID assigned by the Vertica catalog, which identifies the user.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>Name of the user for which transaction information is listed.</td>
</tr>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.</td>
</tr>
<tr>
<td>TRANSACTION_ID</td>
<td>INTEGER</td>
<td>Identifier for the transaction within the session, if any; otherwise NULL.</td>
</tr>
<tr>
<td>DESCRIPTION</td>
<td>VARCHAR</td>
<td>Textual description of the transaction.</td>
</tr>
<tr>
<td>START_EPOCH</td>
<td>INTEGER</td>
<td>Number of the start epoch for the transaction.</td>
</tr>
<tr>
<td>END_EPOCH</td>
<td>INTEGER</td>
<td>Number of the end epoch for the transaction</td>
</tr>
<tr>
<td>NUMBER_OF_STATEMENTS</td>
<td>INTEGER</td>
<td>Number of query statements executed in this transaction.</td>
</tr>
<tr>
<td>ISOLATION</td>
<td>VARCHAR</td>
<td>Denotes the transaction mode as &quot;READ COMMITTED&quot; or &quot;SERIALIZABLE&quot;.</td>
</tr>
<tr>
<td>IS_READ_ONLY</td>
<td>BOOLEAN</td>
<td>Denotes &quot;READ ONLY&quot; transaction mode.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>IS_COMMITTED</td>
<td>BOOLEAN</td>
<td>Determines if the transaction was committed. False means ROLLBACK.</td>
</tr>
<tr>
<td>IS_LOCAL</td>
<td>BOOLEAN</td>
<td>Denotes transaction is local (non-distributed).</td>
</tr>
<tr>
<td>IS_INITIATOR</td>
<td>BOOLEAN</td>
<td>Denotes if the transaction occurred on this node (t).</td>
</tr>
<tr>
<td>IS_DDL</td>
<td>BOOLEAN</td>
<td>Distinguishes between a DDL transaction (t) and non-DDL transaction (f).</td>
</tr>
</tbody>
</table>

### Privileges

No explicit privileges are required. You only see the records for tables that you have privileges to view.

Transactions

### TRUNCATED_SCHEMA

Lists the original names of restored schemas that were truncated due to name lengths exceeding 128 characters.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RESTORE_TIME</td>
<td>TIMESTAMPZ</td>
<td>The time that the table was restored.</td>
</tr>
<tr>
<td>SESSION_ID</td>
<td>VARCHAR</td>
<td>Identifier for the restoring session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.</td>
</tr>
<tr>
<td>USER_ID</td>
<td>INTEGER</td>
<td>Identifier of the user for the restore event.</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>VARCHAR</td>
<td>Name of the user for which Vertica lists restore information at the time it recorded the session.</td>
</tr>
<tr>
<td>TRANSACTION_ID</td>
<td>INTEGER</td>
<td>Identifier for the transaction within the session, if</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>any; otherwise NULL.</td>
<td></td>
<td>Original name of the schema prior to the restore.</td>
</tr>
<tr>
<td>ORIGINAL_SCHEMA_NAME</td>
<td>VARCHAR</td>
<td>The original name of the schema prior to the restore.</td>
</tr>
<tr>
<td>NEW_SCHEMA_NAME</td>
<td>VARCHAR</td>
<td>The name of the schema after it was truncated.</td>
</tr>
</tbody>
</table>

**Privileges**
None

**TUNING_RECOMMENDATIONS**

Returns tuning recommendation results from the last call to `ANALYZE_WORKLOAD`. This information is useful for letting you build filters on the Workload Analyzer result set.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>observation_count</td>
<td>INTEGER</td>
<td>Integer for the total number of events observed for this tuning recommendation. For example, if you see a return value of 1, WLA is making its first tuning recommendation for the event in 'scope'.</td>
</tr>
<tr>
<td>first_observatio_n_time</td>
<td>TIMESTAMPTZ</td>
<td>Timestamp when the event first occurred. If this column returns a null value, the tuning recommendation is from the current status of the system instead of from any prior event.</td>
</tr>
<tr>
<td>last_observatio_n_time</td>
<td>TIMESTAMPTZ</td>
<td>Timestamp when the event last occurred. If this column returns a null value, the tuning recommendation is from the current status of the system instead of from any prior event.</td>
</tr>
<tr>
<td>tuning_parameter</td>
<td>VARCHAR</td>
<td>Objects on which you should perform a tuning action. For example, a return value of:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- public.t informs the DBA to run Database Designer on table t in the public schema</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>--------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>tuning_description</td>
<td>VARCHAR</td>
<td>Textual description of the tuning recommendation from the Workload Analyzer to perform on the tuning_parameter object. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Run database designer on table schema.table</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Create replicated projection for table schema.table</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Consider incremental design on query</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Re-segment projection projection-name on high-cardinality column(s)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Drop the projection projection-name</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Alter a table's partition expression</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Reorganize data in partitioned table</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Decrease the MoveOutInterval configuration parameter setting</td>
</tr>
<tr>
<td>tuning_command</td>
<td>VARCHAR</td>
<td>Command string if tuning action is a SQL command. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Update statistics on a particular schema's table.column:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><code>SELECT ANALYZE_STATISTICS('public.table.column');</code></td>
</tr>
</tbody>
</table>
|                     |              | Resolve mismatched configuration parameter  
|                     |              | **LockTimeout**:                                                                                                                                                                                  |
|                     |              | `SELECT * FROM CONFIGURATION_PARAMETERS WHERE parameter_name = 'LockTimeout';`                                                                   |
|                     |              | Set the password for user bsmith:                                                                                                         |
|                     |              | `ALTER USER (bsmith) IDENTIFIED BY ('new_password');`                                                                                      |
| tuning_cost         | VARCHAR      | Cost is based on the type of tuning recommendation and is one of:                                                                            |

- **bsmith notifies a DBA to set a password for user bsmith**
<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPERATION_START_</td>
<td>TIMESTAMP</td>
<td>Start time of a Tuple Mover operation.</td>
</tr>
</tbody>
</table>

Depending on the size of your database or table, consider running high-cost operations after hours instead of during peak load times.

### Privileges

Superuser

### Examples

See `ANALYZE_WORKLOAD`.

<tr>
<td>END_TIME</td>
<td>TIMESTAMPTZ</td>
<td>Ending time of the event.</td>
</tr>
<tr>
<td>FILESYSTEM</td>
<td>VARCHAR</td>
<td>Name of the file system, such as S3.</td>
</tr>
<tr>
<td>PATH</td>
<td>VARCHAR</td>
<td>Complete file path.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>EVENT</td>
<td>VARCHAR</td>
<td>The function call that was made, for example &quot;virtual size_t SAL::S3FileOperator::read(void*, size_t)&quot;.</td>
</tr>
<tr>
<td>STATUS</td>
<td>VARCHAR</td>
<td>Status of the event: OK, CANCEL, or FAIL.</td>
</tr>
<tr>
<td>DESCRIPTION</td>
<td>VARCHAR</td>
<td>Other details of the event. For example, a read event reports the size of what was read.</td>
</tr>
</tbody>
</table>

**UDFS_OPS_PER_HOUR**

This table summarizes the S3 file system statistics for each minute.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node the file system is on.</td>
</tr>
<tr>
<td>FILESYSTEM</td>
<td>VARCHAR</td>
<td>Name of the file system, such as S3.</td>
</tr>
<tr>
<td>START_TIME</td>
<td>TIMESTAMP</td>
<td>Start time for statistics gathering.</td>
</tr>
<tr>
<td>END_TIME</td>
<td>TIMESTAMP</td>
<td>Stop time for statistics gathering.</td>
</tr>
<tr>
<td>AVG_OPERATIONS_PER_SECOND</td>
<td>INTEGER</td>
<td>Average number of operations per second during the specified hour.</td>
</tr>
<tr>
<td>AVG_ERRORS_PER_SECOND</td>
<td>INTEGER</td>
<td>Average number of errors per second during the specified hour.</td>
</tr>
<tr>
<td>RETRIES</td>
<td>INTEGER</td>
<td>Number of retry events during the specified hour.</td>
</tr>
<tr>
<td>METADATA_READS</td>
<td>INTEGER</td>
<td>Number of requests to write metadata during the specified hour. For example, S3 POST and DELETE requests are metadata writes.</td>
</tr>
<tr>
<td>METADATA_WRITES</td>
<td>INTEGER</td>
<td>Number of requests to write metadata during the specified hour. For example, S3 POST and DELETE requests are metadata writes.</td>
</tr>
<tr>
<td>DATA_READS</td>
<td>INTEGER</td>
<td>Number of read operations, such as S3 GET requests to</td>
</tr>
<tr>
<td>Column Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>download</td>
<td></td>
<td>download files, during the specified hour.</td>
</tr>
<tr>
<td>DATA_WRITES</td>
<td>INTEGER</td>
<td>Number of write operations, such as S3 PUT requests to upload files, during the specified hour.</td>
</tr>
<tr>
<td>UPSTREAMBYTES</td>
<td>INTEGER</td>
<td>Number of bytes received during the specified hour.</td>
</tr>
<tr>
<td>DOWNSTREAMBYTES</td>
<td>INTEGER</td>
<td>Number of bytes sent during the specified hour.</td>
</tr>
</tbody>
</table>

Example

```sql
=> \x
Expanded display is on.
=> SELECT * FROM UDFS_OPS_PER_HOUR;
- [ RECORD 1 ]------------------------------------------------
node_name | e1
filesystem | S3
start_time | 2018-04-06 04:00:00

UDFS_OPS_PER_HOUR

UDFS_STATISTICS

Records aggregate information about file-system operations. This table records information about the S3 file system, and records information about metadata (but not data) for the Libhdfs++ file system. This table does not record information for Webhdfs or the Linux file system.

An operation can be made up of many individual read, write, or retry requests. SUCCESSFUL_OPERATIONS and FAILED_OPERATIONS count operations; the other counters count individual requests. When an operation finishes, one of the OPERATIONS counters is incremented once, but several other counters could be incremented several times each.

The following query gets the total number of metadata RPCs for Libhdfs++ operations:

```sql
=> SELECT SUM(metadata_reads) FROM UDFS_STATISTICS WHERE filesystem = 'Libhdfs++';
```

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FILESYSTEM</td>
<td>VARCHAR</td>
<td>Name of the file system, such as S3 or Libhdfs++.</td>
</tr>
<tr>
<td>SUCCESSFUL_OPERATIONS</td>
<td>INTEGER</td>
<td>Number of successful file-system operations.</td>
</tr>
<tr>
<td>FAILED_OPERATIONS</td>
<td>INTEGER</td>
<td>Number of failed file-system operations.</td>
</tr>
<tr>
<td>RETRIES</td>
<td>INTEGER</td>
<td>Number of retry events.</td>
</tr>
<tr>
<td>METADATA_READS</td>
<td>INTEGER</td>
<td>Number of requests to read metadata. For example, S3 list bucket and HEAD requests are metadata reads.</td>
</tr>
</tbody>
</table>
### Column Names and Descriptions

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>METADATA_WRITES</td>
<td>INTEGER</td>
<td>Number of requests to write metadata. For example, S3 POST and DELETE requests are metadata writes.</td>
</tr>
<tr>
<td>DATA_READS</td>
<td>INTEGER</td>
<td>Number of read operations, such as S3 GET requests to download files.</td>
</tr>
<tr>
<td>DATA_WRITES</td>
<td>INTEGER</td>
<td>Number of write operations, such as S3 PUT requests to upload files.</td>
</tr>
<tr>
<td>DOWNSTREAM_BYTES</td>
<td>INTEGER</td>
<td>Number of bytes received.</td>
</tr>
<tr>
<td>UPSTREAM_BYTES</td>
<td>INTEGER</td>
<td>Number of bytes sent.</td>
</tr>
</tbody>
</table>

### UDX_FENCED_PROCESSES

Provides information about processes Vertica uses to run user-defined extensions in fenced mode.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE_NAME</td>
<td>VARCHAR</td>
<td>Name of the node that is reporting the requested information.</td>
</tr>
<tr>
<td>PROCESS_TYPE</td>
<td>VARCHAR</td>
<td>Indicates what kind of side process this row is for and can be one of the following values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <strong>UDxZygoteProcess</strong> — Master process that creates worker side processes, as needed, for queries. There will be, at most, 1 UP UDxZygoteProcess for each Vertica instance.</td>

Appendix: Compatibility with Other RDBMS

This section describes compatibility of Vertica with other relational database management systems.

Information in this appendix is intended to simplify database migration to Vertica.

Data Type Mappings Between Vertica and Oracle

Oracle uses proprietary data types for all main data types (for example, VARCHAR, INTEGER, FLOAT, DATE), if you plan to migrate your database from Oracle to Vertica, [[[[Undefined variable _Branding_Variables._Company_Acronym]]]] strongly recommends that you convert the schema—a simple and important exercise that can minimize errors and time lost spent fixing erroneous data issues.

The following table compares the behavior of Oracle data types to Vertica data types.

<table>
<thead>
<tr>
<th>Oracle</th>
<th>Vertica</th>
<th>Notes</th>
</tr>
</thead>
</table>
| NUMBER (no explicit precision) | INTEGER, NUMERIC or FLOAT | In Oracle, the NUMBER data type with no explicit precision stores each number N as an integer M, together with a scale S. The scale can range from -84 to 127, while the precision of M is limited to 38 digits. So N = M * 10^S. When precision is specified, precision/scale applies to all entries in the column. If omitted, the scale defaults to 0. For the common case where Oracle’s NUMBER with no explicit precision data type is used to store only integer values, INTEGER is the best suited and the fastest Vertica data type. However, INTEGER (the same as BIGINT) is limited to a little less than 19 digits, with a scale of 0; if the Oracle column contains integer values outside of the range [-9223372036854775807, +9223372036854775807], use the Vertica data type NUMERIC(p,0) where p is the maximum number of digits required to represent the
values of N.

Even though no explicit scale is specified for an Oracle NUMBER column, Oracle allows non-integer values, each with its own scale. If the data stored in the column is approximate, Vertica recommends using the Vertica data type FLOAT, which is standard IEEE floating point, like Oracle BINARY_DOUBLE. If the data is exact with fractional places, for example dollar amounts, Vertica recommends NUMERIC(p,s) where p is the precision (total number of digits) and s is the maximum scale (number of decimal places).

Vertica conforms to standard SQL, which requires that p >= s and s >= 0. Vertica’s NUMERIC data type is most effective for p=18, and increasingly expensive for p=37, 58, 67, etc., where p <= 1024.

Vertica recommends against using the data type NUMERIC(38,s) as a default "failsafe" mapping to guarantee no loss of precision. NUMERIC(18,s) is better, and INTEGER or FLOAT are better yet, if one of these data types will do the job.

---

</tbody>
</table>
Vertica provides tools and features that allow you to ensure your system is secure as well as to prevent unauthorized users from accessing sensitive information.

**Client Authentication** establish the identity of the requesting client and determines whether that client is authorized to connect to the Vertica server.
Client Authentication

Implementing strong security programs provides Vertica users the assurance that access to sensitive information is closely guarded. Vertica uses several approaches to manage data access.

The database server uses client authentication to establish the identity of the requesting client and determines whether that client is authorized to connect to the Vertica server using the supplied credentials.

Encrypting Client-Server Communication

Vertica uses Secure Socket Layer (SSL) and Transport Layer Security (TLS) to establish a secure connection between the client machine and the server. Configure SSL/TLS to:

- Authenticate the server so the client can confirm the server's identity. Vertica supports mutual authentication in which the server can also confirm the identity of the client. This authentication helps prevent "man-in-the-middle" attacks.

- Encrypt data sent between the client and database server to significantly reduce the likelihood that the data can be read if the connection between the client and server is compromised.

- Verify that data sent between the client and server has not been altered during transmission.

For details see TLS/SSL Server Authentication.

Authentication Management

Users with the DBADMIN Role can manage the following authentication tasks:

- Create authentication records using CREATE AUTHENTICATION.
Important: Configure client authentication so that the DBADMIN user can always access the database locally. If a problem occurs with the authentication that blocks all users from logging in, the DBADMIN user needs access to correct the problem.

- Assign a specific authentication method to a user using `GRANT (Authentication)`.  
- Use `ALTER AUTHENTICATION` to:
  - Enable/disable authentication methods.  
  - Define a default authentication method to be used if a user has not been assigned a specific authentication method.  
- Define parameters required by `LDAP`, `Ident`, and `Kerberos` authentication methods.  
- Revoke a user's authentication record using `REVOKE Authentication`. This user now uses the default authentication.  
- Delete an authentication record from the database using `DROP AUTHENTICATION`. Any users assigned the dropped record now use the default authentication method.  

For details about managing authentication records, see:

- `DBADMIN Authentication Access`  
- `Creating Authentication Records`  
- `Enabling and Disabling Authentication Methods`  
- `Granting and Revoking Authentication Methods`  
- `Modifying Authentication Records`  

See `Implementing Client Authentication`.

**User Authorization**

Database users should have access to just the database resources they need to perform their required tasks. For example, some users need to query only specific sets of data. To prevent unauthorized access to additional data, you can limit their access to just the data that they need to run their queries. Other users should be able to read the data but not be able to modify or insert new data. Still other users might need more permissive access, including the
right to create and modify schemas, tables, and views, or grant other users access to database resources.

For information on controlling data access, see the following:

- [Database Users](Database Users and Privileges) in Database Users and Privileges
- [Database Roles](Database Roles) to grant users access to a set of privileges.
- [Access Policies](Access Policies) to limit user’s from viewing data from a specific table.

## Implementing Client Authentication

Vertica restricts which database users can connect through client authentication. The database server uses client authentication to establish the identity of the requesting client and determines whether that client is authorized to connect to the Vertica server using the supplied credentials.

When a user or client application connect to the Vertica database server, it supplies a unique user name and password to gain access.

Vertica offers several client authentication methods. You can configure Vertica to require just a user name for connections, you likely require more secure means of authentication, such as a password at a minimum.

**Note:** Topics in this section describe authentication methods supported at the database server layer. For information on authentication between server and client, see [TLS/SSL Server Authentication](TLS/SSL Server Authentication).

## How Client Authentication Works

When connecting to a Vertica database, a user or client application must supply the name of a valid user account. In addition, the application usually includes a means of authentication, such as a password or security certificate.

There are two types of client authentication:

- **LOCAL**—Authenticating users or applications that are trying to connect from the same node that the database is running on.
HOST—Authenticating users or applications that are trying to connect from a node that has a different IPv4 or IPv6 address than the database.

The DBADMIN user manages the client authentication information that the database uses to authenticate users.

Vertica takes the following steps to authenticate users:

1. When a user or application attempts to connect to a Vertica database, the system checks to see if the user is a DBADMIN user. If so, authentication occurs using the assigned authentication method, local trust or local hash authentication.

2. For non-DBADMIN users, the database checks to see if the user is associated with an authentication method through a GRANT statement. If so, the database allows the user to log in if they match the parameters required for that authentication method.

   Note: For detailed information on how authentication priorities work, see Priorities for Client Authentication Methods.

The DBADMIN user can grant an authentication method to users or user roles. The DBADMIN user can also create a default authentication method that Vertica uses when no authentication has been associated with a user or role.

3. If the user has not been granted an authentication method, the database checks to see if the DBADMIN has established a default authentication method.

4. If the DBADMIN has specified a default authentication method, the database authenticates the user using that default method.

5. If you have not specified a default authentication method, the database checks to see if the DBADMIN user has defined any authentication methods. If not, no authentication information exists in the database. However, if a password exists, the DBADMIN user can log in.

6. If authentication information exists, Vertica rejects the user request to connect to the database. The DBADMIN has not granted an authentication method for that user nor has the DBADMIN defined a default authentication method for all users ("public").

7. If no authentication records exist in the database, Vertica uses implicit trust/implicit password to authenticate the user.

The following image illustrates the steps involved in client authentication:
IPv4 and IPv6 for Client Authentication

Vertica supports clients using either the IPv4 or the IPv6 protocol to connect to the database server. Internal communication between database servers must consistently use one address.
family (IPv4 or IPv6). The client, however, can connect to the database from either type of IP address.

If the client will be connecting from either IPv4 or IPv6, you must create two authentication methods, one for each address. Any authentication method that uses HOST authentication requires an IP address.

For example, the first statement allows users to connect from any IPv4 address. The second statement allows users to connect from any IPv6 address:

```plaintext
=> CREATE AUTHENTICATION <name> METHOD 'gss' HOST '0.0.0.0/0'; --IPv4
=> CREATE AUTHENTICATION <name> METHOD 'gss' HOST '::/0'; --IPv6
```

If you are using a literal IPv6 address in a URL, you must enclose the IPv6 address in square brackets as shown in the following examples:

```plaintext
=> ALTER AUTHENTICATION Ldap SET host='ldap://[1dfa:2bfa:3:45:5:6:7:877]';
=> ALTER AUTHENTICATION Ldap SET host='ldap://[fdfb:dbfa:0:65::177]';
=> ALTER AUTHENTICATION Ldap SET host='ldap://[fdfb::177]';
=> ALTER AUTHENTICATION Ldap SET host='ldap://::1';
=> ALTER AUTHENTICATION Ldap SET host='ldap://[1dfa:2bfa:3:45:5:6:7:877]:5678';
```

If you are working with a multi-node cluster, any IP/netmask settings in (HOST, HOST TLS, HOST NO TLS) must match all nodes in the cluster. This setup allows the database owner to authenticate with and administer every node in the cluster. For example, specifying 10.10.0.8/30 allows a CIDR address range of 10.10.0.8–10.10.0.11.

For detailed information about IPv6 addresses, see RFC 1924 and RFC 2732.

**Supported Client Authentication Methods**

Vertica supports the following types of authentication to prove a client's identity.

- **Trust**—Authorizes any user that connects to the database using a valid user name, no password is required and authentication is not performed.

- **Reject**—Rejects the connection attempt when a user with an invalid user name attempts to connect to the database.

- **Kerberos (GSS)**—Authorizes connecting to the database using a MIT Kerberos implementation. The KDC must support Kerberos 5 using GSS-API. This API also provides compatibility with non-MIT Kerberos implementations, such as Java and Windows clients.
- **Hash**—Sends encrypted passwords hashed by the MD5 algorithm or the more secure SHA-512 method over the network. The server provides the client with salt.

- **LDAP**—Works like password authentication except the LDAP method authenticates the client against a Lightweight Directory Access Protocol or Active Directory server.

- **Ident**—Authenticates the client against the username in an Ident server.

- **TLS authentication**—Authenticates the client using digital certificates that contain a public key. Transport Layer Security (TLS) is the successor to Secure Sockets Layer (SSL) authentication.

### Local and Host Authentication

You can define a client authentication method as:

- **Local**: Local connection to the database.

- **Host**: Remote connection to the database from different hosts, each with their own IPv4 or IPv6 address and host parameters. For more information see [IPv4 and IPv6 for Client Authentication](#) above.

Some authentication methods cannot be designated as local, as listed in this table:

<table>
<thead>
<tr>
<th>Authentication Method</th>
<th>Local?</th>
<th>Host?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kerberos (GSS)</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>Ident</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>LDAP</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Hash</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Reject</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Trust</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
**Authentication for Chained Users and Roles**

Vertica supports creating chained users and roles, where you can grant ROLE2 privileges to ROLE1. All users in ROLE1 use the same authentication assigned to ROLE2. For example:

```
=> CREATE USER user1;
=> CREATE ROLE role1;
=> CREATE ROLE role2;
=> CREATE AUTHENTICATION h1 method 'hash' local;
=> GRANT AUTHENTICATION h1 to role2;
=> GRANT role2 to role1;
=> GRANT role1 to user1;
```

The user and role chain in the example above can be illustrated as follows:

auth1 -> role2 -> role1 -> user1

In this example, since role2 privileges are granted to role1 you only need to grant authentication to role2 to also enable it for role1.

**DBADMIN Authentication Access**

The DBADMIN user must have access to the database at all times.

The DBADMIN account must authenticate against the database using local trust or local hash authentication.

Vertica recommends that you create an authentication method (LOCAL TRUST or LOCAL PASSWORD) with a very high priority, say, 10,000. Grant this method to the DBADMIN user and set the priority using ALTER AUTHENTICATION.

With the high priority, this new authentication method supersedes any authentication methods you create for PUBLIC (which includes the DBADMIN user). Even if you make changes to PUBLIC authentication methods, the DBADMIN user can now connect to the database at any time.

This example shows how you configure local trust authentication for the DBADMIN user. As a result, the user can use vsq1 with the -h option and does not need to enter a password:

```
=> CREATE AUTHENTICATION v_dbadmin_trust METHOD 'trust' LOCAL;
=> GRANT AUTHENTICATION v_dbadmin_trust TO dbadmin;
=> ALTER AUTHENTICATION v_dbadmin_trust PRIORITY 10000;
```
The next example shows how you configure host hash authentication for DBADMIN. They allow the user to access the Vertica database using the assigned password from any IPv4 address. The DBADMIN user can access the database using vsq1 -h --host, the Administration Tools, or any other tools that connects to Vertica:

```sql
=> CREATE AUTHENTICATION v_dbadmin_hash METHOD 'hash' HOST '0.0.0.0/0';
=> GRANT AUTHENTICATION v_dbadmin_hash TO dbadmin;
=> ALTER AUTHENTICATION v_dbadmin_hash PRIORITY 10000;
=> SELECT SET_CONFIG_PARAMETER('SecurityAlgorithm', 'SHA512');
```

Note: Vertica supports IPv4 and IPv6 addresses. For more information, see IPv4 and IPv6 for Client Authentication.

Creating Authentication Records

You can manage client authentication records using vsq1 commands. To use these statements, you must be connected to the database.

Important: You cannot modify client authentication records using the Administration Tools. The Administration Tools interface allows you to modify the contents of the vertica.conf file. However, Vertica ignores any client authentication information stored in that file.

You create authentication records with `CREATE AUTHENTICATION`, which Vertica stores in the catalog and automatically enables.

Examples

The following examples show how to create authentication records.

Create authentication method localpwd to authenticate users who are trying to log in from a local host using a password:

```sql
=> CREATE AUTHENTICATION localpwd METHOD 'hash' LOCAL;
```

Create authentication method v_ldap that uses LDAP over TLS to authenticate users logging in from the host with the IPv4 address 10.0.0.0/23:

```sql
=> CREATE AUTHENTICATION v_ldap METHOD 'ldap' HOST TLS '10.0.0.0/23';
```

Create authentication method v_kerberos to authenticate users who are trying to connect from any host in the networks 2001:0db8:0001:12xx:

```sql
=> CREATE AUTHENTICATION v_kerberos METHOD 'kerberos' HOST '2001:0db8:0001:12xx';
```
=> CREATE AUTHENTICATION v_kerberos METHOD 'gss' HOST '2001:db8:1::1200/56';

Create authentication method RejectNoSSL that rejects users from any IP address that are trying to authenticate without SSL/TLS:

=> CREATE AUTHENTICATION RejectNoSSL_IPv4 METHOD 'reject' HOST NO TLS '0.0.0.0/0'; --IPv4
=> CREATE AUTHENTICATION RejectNoSSL_IPv6 METHOD 'reject' HOST NO TLS '::/0'; --IPv6

- Granting and Revoking Authentication Methods
- Modifying Authentication Records

Modifying Authentication Records

To modify existing authentication records, you must first be connected to your database. The following examples show how to make changes to your authentication records. For more information see ALTER AUTHENTICATION.

Rename an Authentication Method

Rename the v_kerberos authentication method to K5, and enable it. All users who have been associated with the v_kerberos authentication method are now associated with the K5 method granted instead.

=> ALTER AUTHENTICATION v_kerberos RENAME TO K5 ENABLE;
Specify a Priority for an Authentication Method

Specify a priority of 10 for K5 authentication:

```sql
=> ALTER AUTHENTICATION K5 PRIORITY 10;
```

For more information see Priorities for Client Authentication Methods.

Change a Parameter

Set the `system_users` parameter for `ident1` authentication to `root`:

```sql
=> CREATE AUTHENTICATION ident1 METHOD 'ident' LOCAL;
=> ALTER AUTHENTICATION ident1 SET system_users='root';
```

Change the IP address and specify the parameters for an LDAP authentication method named Ldap1.

In this example, you specify the bind parameters for the LDAP server. Vertica connects to the LDAP server, which authenticates the Vertica client. If the authentication succeeds, Vertica authenticates any users who have been granted the Ldap1 authentication method on the designated LDAP server:

```sql
=> CREATE AUTHENTICATION Ldap1 METHOD 'ldap' HOST '172.16.65.196';
=> ALTER AUTHENTICATION Ldap1 SET host='ldap://172.16.65.177',
    binddn_prefix='cn=', binddn_suffix=',dc=qa_domain,dc=com';
```

Change the IP address, and specify the parameters for an LDAP authentication method named Ldap1. Assume that Vertica does not have enough information to create the distinguished name (DN) for a user attempting to authenticate. Therefore, in this case, you must specify to use LDAP search and bind:

```sql
=> CREATE AUTHENTICATION Ldap1 METHOD 'ldap' HOST '172.16.65.196';
=> ALTER AUTHENTICATION Ldap1 SET host='ldap://172.16.65.177',
    basedn='dc=qa_domain,dc=com', binddn='cn=Manager,dc=qa_domain,
    dc=com', search_attribute='cn', bind_password='secret';
```
Change the Associated Method

Change the localpwd authentication from trust to hash:

```sql
=> CREATE AUTHENTICATION localpwd METHOD 'trust' LOCAL;
=> ALTER AUTHENTICATION localpwd METHOD 'hash';
```

ALTER AUTHENTICATION validates the parameters you enter. If there are errors, it disables the authentication method that you are trying to modify.

Using the Administration Tools

The advantages of using the Administration Tools are:

- You do not have to connect to the database
- The editor verifies that records are correctly formed
- The editor maintains records so they are available to you to edit later

**Note:** You must restart the database to implement your changes.

For information about using the Administration Tools to create and edit authentication records, see Creating Authentication Records.

Using the Client Authentication Configuration Parameter

The advantage of using the ClientAuthentication configuration parameter is that the changes are implemented immediately across all nodes within the database cluster. You do not need to restart the database.

However, all the database nodes must be up and you must connect to the database before you set this parameter. Most importantly, this method does not verify that records are correctly formed and it does not maintain the records so you can modify them later.
New authentication records are appended to the list of existing authentication records. Because Vertica scans the list of records from top to bottom and uses the first record that matches the incoming connection, you might find your newly-added record does not have an effect if Vertica used an earlier record instead.

To configure client authentication through a connection parameter, use the ALTER DATABASE statement:

```sql
=> ALTER DATABASE exampledb SET ClientAuthentication = 'connection type user name address method';
```

When you specify authentication records, make sure to adhere to the following guidelines:

- Fields that make up the record can be separated by white space or tabs
- Other than IP addresses and mask columns, field values cannot contain white space

**Examples**

The following example creates an authentication record for the trust method:

```sql
=> ALTER DATABASE exampledb SET ClientAuthentication = 'hostnossl dbadmin 0.0.0.0/0 trust';
```

The following example creates an authentication record for the LDAP method:

```sql
=> ALTER DATABASE exampledb SET ClientAuthentication = 'host all 10.0.0.0/8
ldap "ldap://summit.vertica.com;cn=;,dc=vertica,dc=com"';
```

The following example specifies three authentication records. In a single command, separate each authentication record by a comma:

```sql
=> ALTER DATABASE exampledb SET ClientAuthentication = 'hostnossl dbadmin 0.0.0.0/0 trust, hostnossl all 0.0.0.0/0 md5, local all trust';
```

**Deleting Authentication Records**

To delete client authentication record, use DROP AUTHENTICATION. To use this approach, you have to be connected to your database.

To delete an authentication record for md5_auth use the following command:

```sql
=> DROP AUTHENTICATION md5_auth;
```

To delete an authentication record for a method that has been granted to a user, use the CASCADE keyword:

- Creating Authentication Records
- Granting and Revoking Authentication Methods

Priorities for Client Authentication Methods

You can associate one or more authentication methods to a connection or user. For a user who has multiple authentication methods, specify the order in which Vertica should try them. To do so, assign a priority to each authentication method using ALTER AUTHENTICATION. All priority values should be a non-negative INTEGER.

Higher values indicate higher priorities. Vertica tries to authenticate a user with an authentication method in order of priority from highest to lowest. For example:

- A priority of 10 is higher than a priority of 5.
- A priority 0 is the lowest possible value.

Important: Vertica does not support authentication chaining where you can configure multiple authentication modules to identify a specific user. For example, chaining to try a password authentication method after an LDAP authentication method failed is not supported.

Priority Order for Authentication Methods

When you associate multiple authentication methods with a connection, Vertica uses the following order to determine how to authenticate the client:

- Administrator-assigned priority for an individual method
- The most specific IP addresses have priority over the least specific IP addresses
For example, the IPv4 address 10.3.4.128/25 has priority over 10.3.0.0/24, which in turn has priority over 10.3.0.0/16. The IPv6 address 2001:db8:ab::123/128 has priority over 2001:db8:1::1200/56.

- Reject
- GSS | LDAP | Ident
- Hash
- Trust

**Authentication Attempts Using Multiple Methods**

If there is only one authentication method associated with a user, Vertica uses that method to authenticate the login attempt.

If the administrator has associated multiple authentication methods with a given user or IP address, Vertica tries to authenticate as follows:

- If the highest priority authentication method is Ident and authentication fails, Vertica tries the next highest priority authentication method, regardless of what method it uses.

  If the next attempt does not use Ident authentication and fails, the authentication process ends. However, if the next attempt uses Ident and fails, Vertica continues to the next highest priority method. This process continues until authentication is successful or a non-Ident authentication attempt fails.

- If the highest priority method is LDAP and authentication fails, Vertica searches for the next highest priority LDAP method. Authentication attempts continue until the authentication is successful, or there are no additional LDAP authentication methods that satisfy the connection criteria.

  Note that if a user not found error occurs during LDAP authentication, the retry connection attempt initiates only if you set the `ldap_continue` parameter to yes.

- For all other authentication types, Vertica tries the highest priority authentication method associated with that user. If that authentication fails, the authentication process stops.

For example, suppose there are two client authentication methods associated with a user, as follows:
When user tries to connect to the database, Vertica first tries auth_name2 to authenticate because it has a higher priority. If that fails, Vertica tries auth_name1. If that fails, authentication fails.

Specifying Authentication Method Priority

To specify priorities for client authentication methods, use ALTER AUTHENTICATION. The priority value must be a non-negative INTEGER. Higher numbers indicate a higher priority. The default value, 0, is the lowest possible priority.

The syntax is:

```
ALTER AUTHENTICATION <name> ... PRIORITY <priority_value>;
```

If you do not specify a priority, or omit the `<priority_value>` when using ALTER AUTHENTICATION, Vertica sets the priority to 0.

DBADMIN and Authentication Priority

To allow the DBADMIN user to connect to the database at any time, Vertica recommends that you create an authentication method (LOCAL TRUST or LOCAL PASSWORD) with a very high priority, such as 10,000. Grant this method to the DBADMIN user, and set the priority using ALTER AUTHENTICATION.

With the high priority, this new authentication method supersedes any authentication methods you create for PUBLIC (which includes the DBADMIN user). Even if you make changes to PUBLIC authentication methods, the DBADMIN still has access.

Note: For the DBADMIN user to be able to perform all Admintools functions, the DBADMIN must always be able to authenticate by LOCAL TRUST or LOCAL PASSWORD (the default for DBADMIN user). If you have changed DBADMIN user authentication from LOCAL TRUST or LOCAL PASSWORD, use the ALTER AUTHENTICATION statement to once again give the DBADMIN user LOCAL TRUST or LOCAL PASSWORD authentication.
Viewing Information About Client Authentication Records

For information about client authentication records that you have configured for your database, query the following system tables in the V_CATALOG schema:

- CLIENT_AUTH
- CLIENT_AUTH_PARAMS
- PASSWORD_AUDITOR
- USER_CLIENT_AUTH

To determine the details behind the client authentication used for a particular user session, query the following tables in the V_MONITOR schema:

- SESSIONS
- USER_SESSIONS

Enabling and Disabling Authentication Methods

When you create an authentication method, Vertica stores it in the catalog and enables it automatically. To enable or disable an authentication method, use the ALTER AUTHENTICATION statement. To use this approach, you must be connected to your database.

If an authentication method has not been enabled, Vertica cannot use it to authenticate users and clients trying to connect to the database.

To enable an authentication method:

```
ALTER AUTHENTICATION v_kerberos ENABLE;
```

To disable this authentication method:

```
ALTER AUTHENTICATION v_kerberos DISABLE;
```
Granting and Revoking Authentication Methods

Before Vertica can validate a user or client through an authentication method, you must first associate that authentication method with the user or role that requires it, with GRANT (Authentication). When that user or role no longer needs to connect to Vertica using that method, you can disassociate that authentication from that user with REVOKE AUTHENTICATION.

Grant Authentication Methods

You can grant an authentication method to a specific user or role. You can also specify the default authentication method by granting an authentication method to PUBLIC, as in the following examples.

- Associate v_ldap authentication with user jsmith:

  ```
  => GRANT AUTHENTICATION v_ldap TO jsmith;
  ```

- Associate v_gss authentication to the role DBprogrammer:

  ```
  => CREATE ROLE DBprogrammer;
  => GRANT AUTHENTICATION v_gss TO DBprogrammer;
  ```

- Associate client authentication method v_localpwd with role PUBLIC, which is assigned by default to all users:

  ```
  => GRANT AUTHENTICATION v_localpwd TO PUBLIC;
  ```
Revoke Authentication Methods

If you no longer want to authenticate a user or client with a given authentication method, use the **REVOKE (Authentication)** statement as in the following examples.

- Revoke v_ldap authentication from user jsmith:
  
  ```
  => REVOKE AUTHENTICATION v_ldap FROM jsmith;
  ```

- Revoke v_gss authentication from the role DBprogrammer:
  
  ```
  => REVOKE AUTHENTICATION v_gss FROM DBprogrammer;
  ```

- Revoke localpwd as the default client authentication method:
  
  ```
  => REVOKE AUTHENTICATION localpwd FROM PUBLIC;
  ```

Hash Authentication

Vertica provides a hash authentication method that allows you to use the MD5 algorithm or the more secure algorithm, SHA-512, to store user passwords. SHA-512 is one of the industry-standard SHA-2 family of hash algorithms that address weaknesses in SHA-1 and MD5. For information on creating passwords to be hashed during authentication see [Passwords](#).

**Note:** Vertica strongly recommends that you use SHA-512 for hash authentication because it is more secure than MD5.

Before you perform hash authentication, review the following topics:

- **Hash Authentication Parameters**—Describes the two hash authentication parameters that specify which hashing algorithm to use.

- **Upgrade Considerations for Hash Authentication**—Before you implement the SHA-512 algorithm for one or more users, you must be aware of several issues. For details, review this topic before proceeding.

- **How to Configure Hash Authentication**—After you decide to implement hash authentication in your database, follow the steps described in this topic.
Hash Authentication Parameters

Two parameters control which algorithm hash authentication uses for hashing and storing user passwords:

- A user-level parameter, Security_Algorithm:

  ```
  => ALTER USER username SECURITY_ALGORITHM 'MD5' IDENTIFIED BY 'newpassword';
  => ALTER USER username SECURITY_ALGORITHM 'SHA512' IDENTIFIED BY 'newpassword';
  ```

- A system-level configuration parameter, SecurityAlgorithm:

  ```
  => SELECT SET_CONFIG_PARAMETER('SecurityAlgorithm', 'MD5');
  => SELECT SET_CONFIG_PARAMETER('SecurityAlgorithm', 'SHA512');
  ```

Both parameters can have the following values:

- 'NONE'
- 'MD5'
- 'SHA512'

**Note:** If your current password is in the MD5 format you cannot rename a user with `ALTER USER`.

The user-level parameter usually has precedence over the system-level parameter. However, if the user-level parameter is 'NONE', Vertica hashes passwords with the algorithm assigned to the system-level parameter value. If both parameters are 'NONE', Vertica uses the MD5 algorithm.

These values, which are stored in the PASSWORD_AUDITOR system table, affect the security algorithm that is actually used for hash authentication.

<table>
<thead>
<tr>
<th>User-Level Parameter Value</th>
<th>System-Level Parameter Value</th>
<th>Algorithm Used for Hash Authentication</th>
<th>Algorithm Used for Hash Authentication - FIPS mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>'NONE'</td>
<td>'NONE'</td>
<td>MD5</td>
<td>SHA-512</td>
</tr>
<tr>
<td>'NONE'</td>
<td>'MD5'</td>
<td>MD5</td>
<td>SHA-512</td>
</tr>
</tbody>
</table>
### How to Configure Hash Authentication

Follow these steps to configure hash authentication:

1. Create an authentication method that is based on hash encryption. When you create an authentication method, it is automatically enabled for use.

   The following example shows how to create an authentication method `v_hash` for users logging in from the IP address 10.0.0.0/0.

   ```sql
   => CREATE AUTHENTICATION v_hash METHOD 'hash' HOST '10.0.0.0/0';
   ```

   If users are trying to connect from an IPv6 address, the statement might look like this example:

   ```sql
   => CREATE AUTHENTICATION v_hash METHOD 'hash' HOST '2001:db8:ab::123/128';
   ```

2. Decide which password-hashing algorithm you want to use: MD5 or the more secure SHA-512.

3. Specify the security algorithm as follows:

<table>
<thead>
<tr>
<th>User-Level Parameter Value</th>
<th>System-Level Parameter Value</th>
<th>Algorithm Used for Hash Authentication</th>
<th>Algorithm Used for Hash Authentication - FIPS mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>'NONE'</td>
<td>'SHA512'</td>
<td>SHA-512</td>
<td>SHA-512</td>
</tr>
<tr>
<td>'MD5'</td>
<td>'NONE'</td>
<td>MD5</td>
<td>SHA-512</td>
</tr>
<tr>
<td>'MD5'</td>
<td>'MD5'</td>
<td>MD5</td>
<td>SHA-512</td>
</tr>
<tr>
<td>'MD5'</td>
<td>'SHA512'</td>
<td>MD5</td>
<td>SHA-512</td>
</tr>
<tr>
<td>'SHA512'</td>
<td>'NONE'</td>
<td>SHA-512</td>
<td>SHA-512</td>
</tr>
<tr>
<td>'SHA512'</td>
<td>'MD5'</td>
<td>SHA-512</td>
<td>SHA-512</td>
</tr>
<tr>
<td>'SHA512'</td>
<td>'SHA512'</td>
<td>SHA-512</td>
<td>SHA-512</td>
</tr>
</tbody>
</table>
At the system level, set the SecurityAlgorithm configuration parameter. This setting applies to all users, unless their user-level security is set to another value:

```
=> ALTER DATABASE mydb SET SecurityAlgorithm = 'MD5';
=> ALTER DATABASE mydb SET SecurityAlgorithm = 'SHA512';
```

If you want users to inherit the system-level security, set their passwords to expire immediately. Users must change their passwords before they log in again. Alternatively, you can ask users to change their passwords. Vertica hashes all new passwords using the system-level security algorithm.

At the user level, use `ALTER USER` to set the Security_Algorithm user parameter. Changing this parameter at the user level overrides the system-level value:

```
=> ALTER USER username SECURITY_ALGORITHM 'MD5' IDENTIFIED BY 'newpassword';
=> ALTER USER username SECURITY_ALGORITHM 'SHA512' IDENTIFIED BY 'newpassword';
```

4. Associate the `v_hash` authentication method with the desired users or user roles, using a `GRANT` statement:

```
=> GRANT AUTHENTICATION v_hash to user1, user2, ...;
```

For more information about how these parameters work, see Hash Authentication Parameters.

Upgrade Considerations for Hash Authentication

For Vertica releases before 7.1, MD5 is the only algorithm used for hashing passwords. In Vertica 7.1, you can use either the MD5 algorithm or the more secure SHA-512 algorithm. Before you upgrade, you must consider the following behaviors to avoid problems.

Upgrade the Client and Server

To implement the more secure SHA-512 algorithm for hashing passwords, you must upgrade BOTH the client and the server to Vertica 7.1 or higher. If you upgrade the server but not the client and specify that one or more users store their passwords using SHA-512, the client does not understand hashing with SHA-512. When it sends a message to the server, the server returns an error.
Change Existing Users to SHA-512 Hash Algorithm

When you upgrade from a pre-7.1 database, the user-level parameter Security_Algorithm, is set to 'NONE'. This allows all existing users to continue connecting to the Vertica server and their passwords are hashed using MD5.

If you want one or more users to use the SHA-512 algorithm, set the system-level parameter Security Algorithm to 'SHA512' and change the user passwords.

Use one of three methods to change the user password:

- Manually set the user's user-level security algorithm to 'SHA512'. Then, change the user's password, as in the following statement:

  ```sql
  => ALTER USER username SECURITY_ALGORITHM 'SHA512' IDENTIFIED BY 'newpassword';
  ```

- Set the user's password to expire immediately as in the following statement. After the password expires, the user responds by changing it.

  ```sql
  => ALTER USER username PASSWORD EXPIRE;
  ```

- Ask the user to change the password.

All new passwords inherit the system-level security algorithm, which is SHA-512.

Passwords

Assign a password to a user to allow that user to connect to the database using password authentication. When the user supplies the correct password a connection to the database occurs.

Vertica stores passwords in an encrypted format to prevent potential theft. However, the transmission of the password to Vertica is in plain text. Thus, it is possible for a "man-in-the-middle" attack to intercept the password.

Implementing Hash Authentication ensures secure login using passwords.

About Password Creation and Modification

You must be a superuser to create passwords for user accounts using the CREATE USER statement. A superuser can set any user account's password.
To add a password, use the ALTER USER statement.

To change a password, use ALTER USER or the vsq1 meta-command \password.

Users can also change their own passwords.

To make password authentication more effective, Vertica recommends that you enforce password policies that control how often users are forced to change passwords and the required content of a password. You set these policies using Profiles.

Default Password Authentication

When you have not specified any authentication methods, Vertica defaults to using password authentication for user accounts that have passwords.

If you create authentication methods, even for remote hosts, password authentication is disabled. In such cases, you must explicitly enable password authentication. The following commands create the local_pwd authentication method and make it the default for all users. When you create an authentication method, Vertica enables it automatically:

```
=> CREATE AUTHENTICATION local_pwd METHOD hash' LOCAL;
=> GRANT AUTHENTICATION local_pwd To Public;
```

Profiles

You can set password policies for users by assigning them profiles. You can create multiple profiles to manage the password policies for several categories of users. For example, you might create one profile for interactive users, requiring them to frequently change their passwords. You might create another profile for user accounts that are not required to change passwords.

Defining Assigning Profiles

You create profiles with CREATE PROFILE statement, and change existing profiles with ALTER PROFILE. Both statements let you set one or more profile parameters.

Each profile can specify one or more of the following policies:

- How often users must change their passwords.
- How many times users must change their passwords before they can reuse an old password.
• How many times a user can fail to log in before the account is locked.

• The required length and content of the password:
  ■ Maximum and minimum number of characters
  ■ Minimum number of capital letters, lowercase letters, digits, and symbols required in a password.

Assigning Profiles

After you define a profile, you can assign it to new and existing users with CREATE USER and ALTER USER, respectively.

Changes to profile policies for password content—for example, PASSWORD_MAX_LENGTH and PASSWORD_MIN_SYMBOLS—affect users only when they change their passwords. Vertica does not test existing passwords to verify that they comply with new password requirements. To enforce immediate compliance with new profile requirements, use ALTER USER...PASSWORD_EXPIRE to force immediate expiration of the user's current password. On the user's next login, Vertica prompts this user to supply a new password, which must comply with the new policy.

Default Profile

Each database contains a profile named DEFAULT. Vertica assigns the default profile to users who are not explicitly assigned a profile. The default profile also sets parameters of non-default profiles in two cases:

• Profile parameters that are not explicitly set by CREATE PROFILE

• Parameters that ALTER PROFILE sets to DEFAULT

All parameters in the default profile are initially set to unlimited. You can use ALTER PROFILE to change these settings. For example, the following statement modifies the default profile parameter PASSWORD_MIN_SYMBOLS. The change requires passwords to contain at least one symbol, such as $, #, @. This change affects all profiles where PASSWORD_MIN_SYMBOLS is set to default:

```
ALTER PROFILE DEFAULT LIMIT PASSWORD_MIN_SYMBOLS 1;
```

Profile Settings and Client Authentication

The following profile settings affect client authentication methods, such as LDAP or GSS:
- FAILEDLOGINATTEMPTS
- PASSWORD_LOCK_TIME

All other profile settings are used only by Vertica to manage its passwords.

- PROFILES
- Creating a Database Name and Password

Password Guidelines

For passwords to be effective, they must be hard to guess. You need to protect passwords from:

- Dictionary-style, brute-force attacks
- Users who have knowledge of the password holder (family names, birth dates, etc.)

Use Profiles to enforce good password practices (password length and required content). Make sure database users know the password guidelines, and encourage them not to use personal information in their passwords.

For guidelines on creating strong passwords go to Microsoft Tips for Creating a Strong Password.

See Also

- Creating a Database Name and Password

Password Expiration

User profiles control how often users must change their passwords. Initially, the DEFAULT profile is set so that passwords never expire.

Important: Password expiration has no effect on any of the user's current sessions.
Set Password Expiration and Grace Period

You can change the default value to set a password expiration. Alternatively, you can create additional profiles that set time limits for passwords and assign users to them.

When a password expires, the user must change the password on the next login. However, you can set a PASSWORD_GRACE_TIME in any individual user's profile, allowing that user to log in after the expiration. After the password expires, Vertica issues a warning about the password expiration but continues to recognize the password.

After the grace period ends, users must change their passwords to log in, unless they have changed them already in response to the warning.

Expire a Password

You can expire a user's password immediately using the ALTER USER statement's PASSWORD EXPIRE parameter. By expiring a password, you can:

- Force users to comply with a change to password policy.
- Set a new password when a user forgets the old password.

Account Locking

In a profile, you can set a password policy for how many consecutive failed login attempts a user account is allowed before locking. This locking mechanism helps prevent dictionary-style brute-force attempts to guess users' passwords.

Set Account Locking

Set this value using the FAILED_LOGIN_ATTEMPTS parameter using the CREATE PROFILE or ALTER PROFILE statement.

Vertica locks any user account that has more consecutive failed login attempts than the value to which you set FAILED_LOGIN_ATTEMPTS. The user cannot log in to a locked account, even by supplying the correct password.

Unlock a Locked Account

You can unlock accounts in one of two ways, depending on your privileges.
Manually: If you are a superuser, you can manually unlock the account using the `ALTER USER` command.

Note: A superuser account cannot be locked, because it is the only user that can unlock accounts. For this reason, choose a very secure password for a superuser account. See Password Guidelines for suggestions.

Password Lock Time Setting: Specify the number of days until an account unlocks in the `PASSWORD_LOCK_TIME` parameter of the user's profile. Vertica automatically unlocks the account after the specified number of days has passed. If you set this parameter to `UNLIMITED`, the user's account is never automatically unlocked, and a superuser must manually unlock it.

**Ident Authentication**

The Ident protocol, defined in RFC 1413, authenticates a database user with a system user name. To see if that system user can log in without specifying a password, you configure Vertica client authentication to query an Ident server. With this feature, the DBADMIN user can run automated scripts to execute tasks on the Vertica server.

**Caution:** Ident responses can be easily spoofed by untrusted servers. Use Ident authentication only on local connections, where the Ident server is installed on the same computer as the Vertica database server.

Following the instructions in these topics to install, set up, and configure Ident authentication for your database:

- **Installing and Setting Up an Ident Server**
- **Configuring Ident Authentication for Database Users**

**Examples**

The following examples show several ways to configure Ident authentication.

Allow `system_user1` to connect to the database as `Vertica vuser1`:

```
=> CREATE AUTHENTICATION v_ident METHOD 'ident' LOCAL;
=> ALTER AUTHENTICATION v_ident SET system_users='system_user1';
=> GRANT AUTHENTICATION v_ident to vuser1;
```
Allow system_user1, system_user2, and system_user3 to connect to the database as vuser1. Use colons (:) to separate the user names:

```
=> ALTER AUTHENTICATION v_ident ENABLE;
```

Associate the authentication with Public using a GRANT AUTHENTICATION statement. The users, system_user1, system_user2, and system_user3 can now connect to the database as any database user:

```
=> CREATE AUTHENTICATION v_ident METHOD 'ident' LOCAL;
=> ALTER AUTHENTICATION v_ident SET system_users='system_user1:system_user2:system_user3';
=> GRANT AUTHENTICATION v_ident TO vuser1;
=> ALTER AUTHENTICATION v_ident ENABLE;
```

Set the system_users parameter to * to allow any system user to connect to the database as vuser1:

```
=> CREATE AUTHENTICATION v_ident METHOD 'ident' LOCAL;
=> ALTER AUTHENTICATION v_ident SET system_users='*';
=> GRANT AUTHENTICATION v_ident TO vuser1;
=> ALTER AUTHENTICATION v_ident ENABLE;
```

Using a GRANT statement, associate the v_ident authentication with Public to allow system_user1 to log into the database as any database user:

```
=> CREATE AUTHENTICATION v_ident METHOD 'ident' LOCAL;
=> ALTER AUTHENTICATION v_ident SET system_users='system_user1';
=> GRANT AUTHENTICATION v_ident TO Public;
=> ALTER AUTHENTICATION v_ident ENABLE;
```

### Installing and Setting Up an Ident Server

To use Ident authentication, you must install one or more packages, depending on your operating system, and enable the Ident server on your Vertica server. oidentd is an Ident daemon that is compatible with Vertica and compliant with RFC 1413.

**Note:** You can find the source code and installation instructions for oidentd at the [oidentd website](http://www.oident.com/).

To install and configure Ident authentication for use with your Vertica database, follow the appropriate steps for your operating system:
Red Hat 6.x/CentOS 6.x

Install `oidentd` on Red Hat 6.x or CentOS 6.x by running this command:

```bash
$ yum install oidentd
```

Depending on your configuration, you might receive the following error message:

```
No package oidentd available.
```

In this case, you must install the Red Hat/CentOS Extras Repository. Download and install the Extras Repository from the following location: https://dl.fedoraproject.org/pub/epel/epel-release-latest-6.noarch.rpm

Red Hat 7.x/CentOS 7.x

Install an Ident server on Red Hat 7.x or CentOS 7.x by installing the `authd` and `xinetd` packages:

```bash
$ yum install authd
$ yum install xinetd
```

Ubuntu/Debian

Install `oidentd` on Ubuntu or Debian by running this command:

```bash
$ sudo apt-get install oidentd
```

SUSE Linux Enterprise Server

Install the `pidentd` and `xinetd` RPMs from the following locations:

Post-Installation Steps for Red Hat 6.x/CentOS 6.x and Ubuntu/Debian

After you install `oidentd` on your Red Hat 6.x/CentOS 6.x or Ubuntu/Debian system, continue with the following steps:

1. Verify that the Ident server accepts IPv6 connections to prevent authentication failure. To do so, you must enable this capability. In the script `/etc/init.d/oidentd`, change the line from:

   ```bash
   exec="/usr/sbin/oidentd"
   ```

   to

   ```bash
   exec="/usr/sbin/oidentd -a ::"
   ```

   Then, at the Linux prompt, start `oidentd` with `-a ::`.

2. Restart the server with the following command:

   ```bash
   $ /etc/init.d/oidentd restart
   ```

Post-Installation Steps for Red Hat 7.x/CentOS 7.x and SUSE Linux Enterprise Server

After you install the required packages on your Red Hat 7.x/CentOS 7.x or SUSE Linux Enterprise Server system, continue with the following steps:

1. Enable the auth service in the configuration file located at the following location:

   `/etc/xinet.d/auth`

   Enter no for the disable option, as this sample configuration file shows.

   ```ini
   [auth]
   disable = no
   socket_type = stream
   wait = no
   user = ident
   cps = 4096 10
   ```
instances = UNLIMITED
server = /usr/sbin/in.authd
server_args = -t60 --xerror --os
}

2. Restart the xinetd service with the following command:

$ service xinetd restart

Configuring Ident Authentication for Database Users

To configure Ident authentication, take the following steps:

1. Create an authentication method that uses Ident.

   The Ident server must be installed on the same computer as your database, so specify the keyword LOCAL. Vertica requires that the Ident server and database always be on the same computer as the database.

   => CREATE AUTHENTICATION v_ident METHOD 'ident' LOCAL;

2. Set the Ident authentication parameters, specifying the system users who should be allowed to connect to your database.

   => ALTER AUTHENTICATION v_ident SET system_users='user1:user2:user3';

3. Associate the authentication method with the Vertica user. Use a GRANT statement that allows the system user user1 to log in using Ident authentication:

   => GRANT AUTHENTICATION v_ident TO user1;

Kerberos Authentication

Kerberos authentication uses the following components to perform user authentication.
Client Package

The Kerberos 5 client package communicates with the KDC server. This package is not included as part of the Vertica Analytics Platform installation. Kerberos software is built into Microsoft Windows. If you are using another operating system, you must obtain and install the client package.

If you do not already have the Kerberos 5 client package on your system, download it from the MIT Kerberos Distribution page. Install the package on each Vertica server and client used in Kerberos authentication, except the KDC itself.

Refer to the Kerberos documentation for installation instructions.

Service Principals

A service principal consists of a host name, a service name, and a realm to which a set of credentials gets assigned (service/hostname@REALM). These credentials connect to the service, which is a host that you connect to over your network and authenticate using the KDC.

See Specify KDC Information and Configure Realms to create the realm name. The host name must match the value supplied by the operating system. Typically this is the fully qualified host name. If the host name part of your principal does not match the value supplied by the operating system, Kerberos authentication fails.

Some systems use a hosts file (/etc/hosts or /etc/主持names) to define host names. A hosts file can define more than one name for a host. The operating system supplies the first entry, so use that in your principal. For example, if your hosts file contains:

```
192.168.1.101 v_vmart_node0001.example.com v_vmart_node0001
```

then use v_vmart_node0001.example.com as the hostname value.

Note: Depending on your configuration it may be safer to use the fully qualified domain name rather than the hostname.

Configure the following as Kerberos principals:

- Each client (users or applications that connects to Vertica)
- The Vertica server

See the following topics for more information:
Configure Vertica for Kerberos Authentication

Configure Clients for Kerberos Authentication

Keytab Files

Principals are stored in encrypted keytab files. The keytab file contains the credentials for the Vertica principal. The keytab allows the Vertica server to authenticate itself to the KDC. You need the keytab so that Vertica Analytic Database does not have to prompt for a password.

Create one service principal for each node in your cluster. You can then either create individual keytab files (one for each node containing only that node's principal) or create one keytab file containing all the principals.

- Create one keytab file with all principals to simplify setup: all nodes have the same file, making initial setup easier. If you add nodes later you either update (and redistribute) the global keytab file or make separate keytabs for the new nodes. If a principal is compromised it is compromised on all nodes where it is present in a keytab file.

- Create separate keytab files on each node to simplify maintenance. Initial setup is more involved as you must create a different file on each node, but no principals are shared across nodes. If you add nodes later you create keytabs on the new nodes. Each node's keytab contains only one principal, the one to use for that node.

Ticket-Granting Ticket

The Ticket-Granting Ticket (TGT) retrieves service tickets that authenticates users to servers in the domain. Future login requests use the cached HTTP Service Ticket for authentication, unless it has expired as set in the ticket_lifetime parameter in krb5.conf.

Multi-realm Support

Vertica provides multi-realm support for Kerberos authentication using the SET param=value parameter in ALTER AUTHENTICATION with REALM as the parameter:

```
=> ALTER AUTHENTICATION krb_auth_users set REALM='USERS.COM';
=> ALTER AUTHENTICATION krb_auth_realmad set REALM='REALM_AD.COM';
```

This allows you to assign a different realm so that users from another realm can authenticate to Vertica.
Multi-realm support applies to GSS authentication types only. You can have one realm per authentication method. If you have multiple authentication methods, each can have its own realm:

<table>
<thead>
<tr>
<th>auth_oid</th>
<th>auth_name</th>
<th>is_auth_enabled</th>
<th>auth_host_type</th>
<th>auth_host_address</th>
<th>auth_method</th>
<th>auth_parameters</th>
<th>auth_priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>45035996</td>
<td>krb001</td>
<td>True</td>
<td>HOST</td>
<td>0.0.0.0/0</td>
<td>GSS</td>
<td></td>
<td></td>
</tr>
<tr>
<td>realm=USERS.COM</td>
<td>0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>45035997</td>
<td>user_auth</td>
<td>True</td>
<td>LOCAL</td>
<td></td>
<td>TRUST</td>
<td></td>
<td></td>
</tr>
<tr>
<td>45035737</td>
<td>krb002</td>
<td>True</td>
<td>HOST</td>
<td>0.0.0.0/0</td>
<td>GSS</td>
<td></td>
<td></td>
</tr>
<tr>
<td>realm=REALM_AD.COM</td>
<td>1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Configure Vertica for Kerberos Authentication**

Kerberos provides a strong cryptographic authentication against the devices which lets the client & servers to communicate in a more secured manner. It addresses network security problems.

Your system must have one or more Kerberos Key Distribution Centers (KDC) installed and configured. The KDCs must be accessible from every node in your Vertica Analytic Database cluster.

The KDC must support Kerberos 5 using GSS-API. For details, see the MIT Kerberos Distribution Page.

**In This Section**

Create the Vertica Principals and Keytabs on Linux KDC

Vertica uses service principals for system-level operations. These principals identify the Vertica service and are used as follows:
Kerberized Vertica clients request access to this service when they authenticate to the database.

System processes like the Tuple Mover use this identity when they authenticate to external services such as Hadoop.

Create principals and keys as follows:

1. Start the Kerberos 5 database administration utility (kadmin or kadmin.local) to create Vertica principals on a Linux KDC.
   - Use kadmin if you are accessing the KDC on a remote server. If you have access to the Kerberos administrator password, you can use kadmin on any machine where the Kerberos 5 client package is installed. When you start kadmin, the utility prompts you for the Kerberos administrator's password. You might need root privileges on the client to run kadmin.
   - Use kadmin.local if:
     - The KDC is on the machine that you are logging in to.
     - You have root privileges on that server.

   kadmin.local does not require the administrators login credentials.

   For more information about the kadmin and kadmin.local commands, see the kadmin documentation.

2. Create one service principal for Vertica on each node. The host name must match the value supplied by the operating system. The following example creates the service principal vertica for the node named v_vmart_node0001.example.com:

   ```
   $ sudo /usr/kerberos/sbin/kadmin.local
   kadmin.local add_principal vertica/v_vmart_node0001.example.com
   
   Repeat the ktadd command once per principal. You can create separate keytabs for each principal user or add them all to a single keytab file (such as krb5.keytab). If you are using a single file, see the documentation for the -glob option in the MIT Kerberos documentation.
   
   You must have a user principal for each Vertica Analytic Database user that uses Kerberos Authentication. For example:
   
   ```
   $ sudo /usr/kerberos/sbin/kadmin.local
   kadmin.local add_principal [options] VerticaUser1
   ```
3. Copy each keytab file to the /etc folder on the corresponding cluster node. Use the same path and file name on all nodes.

4. On each node, make the keytab file readable by the file owner who is running the database process (typically, the Linux dbadmin user). For example, you can change ownership of the files to dbadmin as follows:

   $ sudo chown dbadmin *.keytab

   **Important:** In a production environment, you must control who can access the keytab file to prevent unauthorized users from delegating your server. For more information about delegation (also known as impersonation), see [Technet.Microsoft.com](http://Technet.Microsoft.com).

   After you create a keytab file, you can use the `klist` command to view keys stored in the file:

   $ sudo /usr/kerberos/bin/klist -ke -t

   Keytab name: FILE:/etc/krb5.keytab
   KVNO  Timestamp               Principal
   -------  ----------------------  -------------------------------------------
   4        08/15/2017 7:35:41    vertica/v_mart_node0001.example.com@EXAMPLE.COM (aes256-cts-hmac-sha1-96)
   4        08/15/2017 7:35:41    vertica/v_mart_node0001.example.com@EXAMPLE.COM (aes128-cts-hmac-sha1-96)

5. On Vertica run the following to ensure the Kerberos parameters are set correctly:

   ```sql
   => select parameter_name, current_value from configuration_parameters where parameter_name like 'Ker%';
   parameter_name     | current_value
   -------------------|-------------------
   KerberosHostname   | v_mart_node0001.example.com
   KerberosKeytabFile | /scratch_b/ga/krbTest/v_krbtest_node0001_catalog/krb5.keytab
   KerberosRealm      | EXAMPLE.COM
   KerberosTicketDuration | 0
   KerberosServiceName | vertica
   (5 rows)
   ```

6. On Vertica, run `KERBEROS_CONFIG_CHECK` to verify the Kerberos configuration.

   `KERBEROS_CONFIG_CHECK` verifies the following:
   - The existence of the `kinit` and `kb5.conf` files.
   - Whether the keytab file exists and is set
The Kerberos configuration parameters set in the database:
  - KerberosServiceName
  - KerberosHostname
  - KerberosRealm
  - Vertica Principal

That Kerberos can read the Vertica keys

That Kerberos can get the tickets for the Vertica principal

That Vertica can initialize the keys with kinit

Creating the Principals and Keytab on Active Directory

Active Directory stores information about members of the Windows domain, including users and hosts.

Vertica uses the Kerberos protocol to access this information in order to authenticate Windows users to the Vertica database. The Kerberos protocol uses principals to identify users and keytab files to store their cryptographic information. You need to install the keytab files into Vertica to enable the Vertica database to cryptographically authenticate windows users.

This procedure describes:

- Creating a Vertica service principal.
- Exporting the keytab files for these principals
- Installing the keytab files in the Vertica database. This allows Vertica to authenticate Windows users and grant them access to the Vertica database.

1. Create a Windows account (principal) for the Vertica service and one Vertica host for each node/host in the cluster. This procedure creates Windows accounts for host `verticanode01` and service `vertica` running on this node.

   When you create these accounts, select the following:

   - User cannot change password
   - Password never expires
Note: You can deselect Password never expires. However, if you change these user passwords, you must recreate the keytab files and reinstall them into Vertica. This includes repeating the entire procedure.

2. If you are using external tables on HDFS that are secured by Kerberos authentication, you must enable Delegation. To do so, access the Active Directory Users and Computers dialog, right-click the Windows account (principal) for the Vertica service, and select Delegation. Trust this user for delegation to any service.

3. Run the following command to create the keytab for the host verticanode01.dc.com node/host:

```
$ ktpass -out ./host.verticanode01.dc.com.keytab -princ host/verticanode01.dc.com@DC.COM -mapuser verticanode01 -mapop set -pass secret -ptype KRB5_NT_SRV_HST
```

4. Run the following command to create the keytab for the vertica service:

```
$ ktpass -out ./vertica.verticanode01dc.com.keytab -princ vertica/verticanode01.dc.com@DC.COM -mapuser vertica -mapop set -pass secret -ptype KRB5_NT_PRINCIPAL
```

For more information about keytab files, see Technet.Microsoft.com.

5. Run the following commands to verify that the service principal name is mapped correctly. You must run these commands for each node in your cluster:

```
$ setspn -L vertica
  Registered ServicePrincipalName for CN=vertica,CN=Users,DC=dc,DC=com
  vertica/verticanode01.dc.com

$ setspn -L verticanode01
  Registered ServicePrincipalName for CN=verticanode01,CN=Users,DC=dc,DC=com
  host/verticanode01.dc.com
```

7. Combine the keytab files into a single keytab:

```
[release@vertica krbTest]$ /usr/kerberos/sbin/ktutil
ktutil: rkt host.verticanode01.dc.com.keytab
ktutil: rkt vertica.verticanode01.dc.com.keytab
ktutil: list
slot KVNO Principal
```
This creates a single keytab file that contains the server principal for authentication.

8. Copy the new keytab file to the catalog directory. For example:

```bash
$ cp verticanode01.dc.com.keytab /home/dbadmin/VMart/v_vmart_nodennnn_catalog
```

9. Test the keytab file's ability to retrieve a ticket to ensure it works from the Vertica node:

```bash
$ kinit vertica/verticanode01.dc.com -k -t verticanode01.dc.com.keytab
$ klist
Ticket cache: KFILE:/tmp/krb_ccache_1003
Default principal: vertica/verticanode01.dc.com@DC.COM

Valid starting Expires Service principal
04/08/2017 13:35:25 04/08/2017 23:35:25 krbtgt/DC.COM@DC.COM
renew until 04/15/2017 14:35:25
```

When the ticket expires or not automatically retrieved you need to manually run the kinit command. See Get the Kerberos Ticket and Authenticate Vertica.

10. Set the right permissions and ownership on the keytab files:

```bash
$ chmod 600 verticanode01.dc.com.keytab
$ chown dbadmin:verticadba verticanode01.dc.com.keytab
```

11. Set the following Kerberos Configuration Parameters using ALTER DATABASE to inform Vertica about the Kerberos principal:

```
KerberosKeytabFile=<CATALOGDIR>/verticanode01.dc.com.keytab
KerberosRealm=DC.COM
KerberosServiceName=vertica
KerberosTicketDuration = 0
KerberosHostname=verticanode01.dc.com
```

12. Restart the Vertica server.

13. Test your Kerberos setup as follows to ensure that all clients use the gss authentication method.

   From Vertica:
=> CREATE USER windowsuser1;
CREATE USER

=> CREATE AUTHENTICATION v_kerberos method 'gss' host '0.0.0.0/0';
CREATE AUTHENTICATION

=> ALTER AUTHENTICATION v_kerberos enable;
ALTER AUTHENTICATION

=> GRANT AUTHENTICATION v_kerberos to windowsuser1;
GRANT AUTHENTICATION

From the operating system command line:

$ kinit windowsuser1

$ vsql -U windowsuser1 -k vertica -K verticanode01.dc.com -h verticanode01.dc.com -c "select client_authentication_name, authentication_method from sessions;"

<table>
<thead>
<tr>
<th>client_authentication_name</th>
<th>authentication_method</th>
</tr>
</thead>
<tbody>
<tr>
<td>v_kerberos</td>
<td>GSS-Kerberos</td>
</tr>
</tbody>
</table>

(1 row)

14. Run KERBEROS_CONFIG_CHECK to verify the Kerberos configuration. KERBEROS_CONFIG_CHECK verifies the following:

- The existence of the kinit and kb5.conf files.
- Whether the keytab file exists and is set
- The Kerberos configuration parameters set in the database:
  - KerberosServiceName
  - KerberosHostname
  - KerberosRealm
  - Vertica Principal
- That Kerberos can read the Vertica keys
- That Kerberos can get the tickets for the Vertica principal
- That Vertica can initialize the keys with kinit
Get the Kerberos Ticket and Authenticate Vertica

If your organization uses Kerberos as part of the login process, Kerberos tickets are automatically retrieved upon login. Otherwise, you need to run `kinit` to retrieve the Kerberos ticket.

The following example shows how to retrieve the ticket and authenticate Vertica Analytic Database with the KDC using the `kinit` command. EXAMPLE.COM is the realm name. You must use the realm name with your username to retrieve a Kerberos ticket. See Specify KDC Information and Configure Realms.

```
$ kinit
Password for principal_user@EXAMPLE.COM: kpasswd
```

You are prompted for the password of the principal user name created when you created the principals and keytabs (see Create the Vertica Principals and Keytabs on Linux KDC).

The Kerberos ticket gets cached for a pre-determined length of time. See Ticket Management in the Kerberos documentation for more information on setting expiration parameters.

Upon expiration, you need to run the `kinit` command again to retrieve another Kerberos ticket.

Configure Clients for Kerberos Authentication

Each supported platform has a different security framework. Thus, the steps required to configure and authenticate against Kerberos differ among clients.

On the server side, you construct the Vertica Kerberos service name principal using this format:

```
Kerberos_Service_Name/Kerberos_Host_Name@Kerberos_Realm
```

For each client, the GSS libraries require the following format for the Vertica service principal:

```
Kerberos_Service_Name@Kerberos_Host_Name
```

You can omit the realm portion of the principal because GSS libraries use the realm name of the configured default (`Kerberos_Realm`) realm.

For information about client connection strings, see the following topics in Connecting to Vertica:
In This Section

- Configure ODBC and vsq1 Clients on Non-Windows Platforms
- Configure ODBC and vsq1 Clients on Windows and ADO.NET
- Configure JDBC Clients on all Platforms

Configure ODBC and vsq1 Clients on Non-Windows Platforms

To configure an ODBC or vsq1 client on Linux, HP-UX, AIX, or MAC OSX, you must first install the Kerberos 5 client package. See Configuring Kerberos Authentication.

After you install the Kerberos 5 client package, you must provide clients with a valid Kerberos configuration file (krb5.conf). To communicate with the KDC, each client participating in Kerberos authentication must have a valid, identically configured krb5.conf file. The default location for the Kerberos configuration file is /etc/krb5.conf.

**Tip:** To enforce consistency among clients, Vertica Analytic Database, and the KDC, copy the /etc/krb5.conf file from the KDC to the client's/etc directory.

The Kerberos configuration (krb5.conf) file contains Kerberos-specific information, including:

- How to reach the KDC
- Default realm name
- Domain
- Path to log files

**Note:** A few scenarios exist in which the Vertica server principal name might not match the host name in the connection string. See Troubleshooting Kerberos Authentication for more information.
- DNS lookup
- Encryption types to use
- Ticket lifetime

The default location for the Kerberos configuration file is `/etc/krb5.conf`.

When configured properly, the client can authenticate with Kerberos and retrieve a ticket through the `kinit` utility (see Acquire an ODBC Authentication Request and Connection below). Likewise, the server can then use `ktutil` to store its credentials in a keytab file.

Authenticating ODBC and vsq1 Clients Requests and Connections on Non-Windows Platforms

ODBC and vsq1 use the client's ticket established by `kinit` to perform Kerberos authentication. These clients rely on the security library's default mechanisms to find the ticket file and the Kerberos configuration file.

To authenticate against Kerberos, call the `kinit` utility to obtain a ticket from the Kerberos KDC server. The following two examples show how to send the ticket request using ODBC and vsq1 clients.

**Acquire an ODBC Authentication Request and Connection**

1. On an ODBC client, acquire a ticket for the `kuser` user by calling the `kinit` utility.

   ```
   $ kinit kuser@EXAMPLE.COM
   Password for kuser@EXAMPLE.COM:
   ```

2. Connect to Vertica, and provide the principals in the connection string:

   ```
   char outStr[100];
   SQLLEN len;
   SQLDriverConnect(handle, NULL, "Database=VMart;User=kuser;
   Server=myserver.example.com;Port=5433;KerberosHostname=vcluster.example.com",
   SQL_NTS, outStr, &len);
   ```

**Acquire a vsq1 Authentication Request Connection**

If the vsq1 client is on the same machine you are connecting to, vsq1 connects through a UNIX domain socket. This connection bypasses Kerberos authentication. When you authenticate
with Kerberos, especially if the client authentication method is configured as 'local', you must include the -h hostname option. See Command Line Options in Connecting to Vertica.

1. On the vsql client, call the kinit utility:

   $ kinit kuser@EXAMPLE.COM
   Password for kuser@EXAMPLE.COM:

2. Connect to Vertica, and provide the host and user principals in the connection string:

   $ ./vsql -K vcluster.example.com -h myserver.example.com -U kuser
   Welcome to vsql, the Vertica Analytic Database
   interactive terminal.
   Type: \h or \? for help with vsql commands
   \g or terminate with semicolon to execute query
   \q to quit

In the future, when you log in to vsql as kuser, vsql uses your cached ticket without prompting you for a password.

Verify the Authentication Method

You can verify the authentication method by querying the SESSIONS system table:

   => SELECT authentication_method FROM sessions;
   authentication_method
   ------------------------
   GSS-Kerberos
   (1 row)

See Also

- Data Source Name (DSN) Connection Properties in Connecting to Vertica
- (vsql) Command-Line Options in Connecting to Vertica

Configure ADO.NET, ODBC, and vsql Clients on Windows

The Vertica client drivers support the Windows SSPI library for Kerberos authentication. Windows Kerberos configuration is stored in the registry.

You can choose between two different setup scenarios for Kerberos authentication on ODBC and vsql clients on Windows and ADO.NET:
- **Windows KDC on Active Directory with Windows Built-in Kerberos Client and Vertica**

- **Linux KDC with Windows Built-in Kerberos Client and Vertica**

**Windows KDC on Active Directory with Windows Built-in Kerberos Client and Vertica**

Kerberos authentication on Windows is commonly used with Active Directory, Microsoft's enterprise directory service/Kerberos implementation. Typically your organization's network or IT administrator performs the setup.

Windows clients have Kerberos authentication built into the authentication process. You do not need any additional software.

Your login credentials authenticate you to the Kerberos server (KDC) when you:

- Log in to Windows from a client machine
- Use a Windows instance that has been configured to use Kerberos through Active Directory

To use Kerberos authentication on Windows clients, log in as REALM\user.

Important: When you use the ADO.NET driver to connect to Vertica, you can optionally specify **IntegratedSecurity=true** in the connection string. This informs the driver to authenticate the calling user against the user's Windows credentials. As a result, you do not need to include a user name or password in the connection string. Any **user=**<username> entry to the connection string is ignored.

**Linux KDC with Windows Built-in Kerberos Client and Vertica**

A simple, but less common scenario is to configure Windows to authenticate against a non-Windows KDC. In this implementation, you use the ksetup utility to point the Windows operating system native Kerberos capabilities at a non-Active Directory KDC. By logging in to Windows, you obtain a ticket-granting ticket, similar to the Active Directory implementation. However, in this case, Windows is internally communicating with a Linux KDC. See the Microsoft Windows Server **Ksetup page** for more information.

When a database/windows user logs into their Windows machine (or after performing a kinit on Windows) the Kerberos ticket MUST have ok_as_delegate and forwardable flag set to be able to access webhdfs based external tables as follows:

```bash
$ CMD \> klist
#2> Client: release @ VERTQA.LOCAL
    Server: vertica/vqatest108.verticacorp.com @ VERTQA.LOCAL
KerbTicket Encryption Type: RSADSI RC4-HMAC(NT)
```
Ticket Flags 0x40a50000 forwardable renewable pre_authent ok_as_delegate name_canonicalize
End Time: 9/27/2017 20:34:45 (local)
Renew Time: 10/3/2017 15:04:45 (local)
Session Key Type: RSADSI RC4-HMAC(NT)
Cache Flags: 0
Kdc Called: ADKDC01

**Note:** The Ticket Flags setting above must contain ok_as_delegate and forwardable entries. For information on these parameters see Kerberos documentation.

Configure Windows Clients for Kerberos Authentication

Depending on which implementation you want to configure, refer to one of the following pages on the Microsoft Server website:

- To set up Windows clients with Active Directory, refer to Step-by-Step Guide to Kerberos 5 (krb5 1.0) Interoperability.

- To set up Windows clients with the ksetup utility, refer to the Ksetup page.

Authenticate and Connect Clients

The KDC can authenticate both an ADO.NET and a vsql client.

**Note:** Use the fully-qualified domain name as the server in your connection string; for example, use host.example.com instead of just host. That way, if the server moves location, you do not have to change your connection string.

Verify an ADO.NET Authentication Request and Connection

This example shows how to use the IntegratedSecurity=true, setting to specify that the ADO.NET driver authenticate the calling user's Windows credentials:

```csharp
VerticaConnection conn = new VerticaConnection("Database=VMart;Server=host.example.com;Port=5433;IntegratedSecurity=true;KerberosServiceName=vertica;KerberosHostname=vcluster.example.com");
conn.open();
```
Verify a vsql Authentication Request and Connection

1. Log in to your Windows client, for example, as EXAMPLE\kuser.

2. Run the vsql client and supply the connection string to Vertica:

   C:\Users\kuser\Desktop>vsq.exe -h host.example.com -K vcluster -U kuser

   Welcome to vsq1, the Vertica Analytic Database interactive terminal.
   Type: \h or \? for help with vsq1 commands
   \g or terminate with semicolon to execute query
   \q to quit

Configure JDBC Clients on All Platforms

Kerberos authentication on JDBC clients uses Java Authentication and Authorization Service (JAAS) to acquire the initial Kerberos credentials. JAAS is an API framework that hides platform-specific authentication details and provides a consistent interface for other applications.

You specify the client login process through the JAAS Login Configuration File. This file contains options that specify the authentication method and other settings to use for Kerberos. A class called the LoginModule defines valid options in the configuration file.

The JDBC client principal is crafted as jdbc-username@server-from-connection-string.

Implement the LoginModule

Vertica recommends that you use the JAAS public class com.sun.security.auth.module.Krb5LoginModul provided in the Java Runtime Environment (JRE).

The Krb5LoginModule authenticates users using Kerberos protocols and is implemented differently on non-Windows and Windows platforms:
On non-Windows platforms: The Krb5LoginModule defers to a native Kerberos client implementation. Thus, you can use the same /etc/krb5.conf setup as you use to configure ODBC and vsql clients on Linux, HP-UX, AIX, and MAC OSX platforms.

On Windows platforms: The Krb5LoginModule uses a custom Kerberos client implementation bundled with the Java Runtime Environment (JRE). Windows settings are stored in a %WINDIR%\krb5.ini file, which has similar syntax and conventions to the non-Windows krb5.conf file. You can copy a krb5.conf from a non-Windows client to %WINDIR%\krb5.ini.

You can find documentation for the LoginModules in the com.sun.security.auth package, and on the Krb5LoginModule web page.

Create the JAAS Login Configuration

The JAASConfigName connection property identifies a specific configuration within a JAAS configuration that contains the Krb5LoginModule and its settings. The JAASConfigName setting lets multiple JDBC applications with different Kerberos settings coexist on a single host. The default configuration name is verticajdbc.

Important: Carefully construct the JAAS login configuration file. If syntax is incorrect, authentication fails.

You can configure JAAS-related settings in the java.security master security properties file. This file resides in the lib/security directory of the JRE. For more information, see Appendix A in the Java™ Authentication and Authorization Service (JAAS) Reference Guide.

Create a JDBC Login Context

The following example shows how to create a login context for Kerberos authentication on a JDBC client. The client uses the default JAASConfigName of verticajdbc and specifies that:

- The ticket-granting ticket will be obtained from the ticket cache
- The user will not be prompted for a password if credentials cannot be obtained from the cache, keytab file, or through a shared state.

```java
verticajdbc {
   com.sun.security.auth.module.Krb5LoginModule
   required
   useTicketCache=true
   doNotPrompt=true;
};
```
JDBC Authentication Request and Connection

You can configure the Krb5LoginModule to use a cached ticket or keytab. The driver can also acquire a ticket or keytab automatically if the calling user provides a password.

In the preceding example, the login process uses a cached ticket and does not prompt for a password because both useTicketCache and doNotPrompt are set to true. If doNotPrompt=false and you provide a user name and password during the login process, the driver provides that information to the LoginModule. The driver then calls the kinit utility on your behalf.

1. On a JDBC client, call the kinit utility to acquire a ticket:

```bash
$ kinit kuser@EXAMPLE.COM
```

If you prefer to use a password instead of calling the kinit utility, see the next section.

2. Connect to Vertica:

```java
Properties props = new Properties();
props.setProperty("user", "kuser");
props.setProperty("KerberosServiceName", "vertica");
props.setProperty("KerberosHostName", "vcluster.example.com");
props.setProperty("JAASConfigName", "verticajdbc");
Connection conn = DriverManager.getConnection("jdbc:vertica://myserver.example.com:5433/VMart", props);
```

Have the Driver Acquire a Ticket

Sometimes, you may want to bypass calling the kinit utility yourself but still use encrypted, mutual authentication. In such cases, you can optionally pass the driver a clear text password to acquire the ticket from the KDC. The password is encrypted when sent across the network. For example, useTicketCache and doNotPrompt are both false in the following example. Thus, the calling user's credentials are not obtained through the ticket cache or keytab.

```bash
$ verticajdbc {
    com.sun.security.auth.module.Krb5LoginModule
    required
    useTicketCache=false
    doNotPrompt=false;
};
```

The preceding example demonstrates the flexibility of JAAS. The driver no longer looks for a cached ticket, and you do not have to call kinit. Instead, the driver takes the password and user name and calls kinit on your behalf.

Troubleshooting Kerberos Authentication

These tips can help you avoid issues related to Kerberos authentication with Vertica Analytic Database and to troubleshoot any problems that occur.

JDBC Client Authentication Fails

If Kerberos authentication fails on a JDBC client, check the JAAS login configuration file for syntax issues. If syntax is incorrect, authentication fails.

Working Domain Name Service (DNS) Not Configured

Verify that the DNS entries and the system host file (/etc/hosts or /etc/hostnames) on the network are all properly configured for your environment. If you are using a fully qualified domain name, ensure that is properly configured as well. Refer to the Kerberos documentation for your platform for details.

System Clocks Out of Sync

**All Systems Except Red Hat 7/CentOS 7**

System clocks in your network must remain in sync for Kerberos authentication to work properly. To do so:

1. Install NTP on the Kerberos server (KDC).
2. Install NTP on each server in your network.
3. Synchronize system clocks on all machines that participate in the Kerberos realm within a few minutes of the KDC and each other.
Clock skew can be a problem on Linux virtual machines that need to sync with the Windows Time Service. Use the following steps to keep time in sync:

1. Using any text editor, open `/etc/ntp.conf`.

2. Under the Undisciplined Local Clock section, add the IP address for the Vertica Analytic Database server. Then, remove existing server entries.

3. Log in to the server as root, and set up a cron job to sync time with the added IP address every half hour, or as often as needed. For example:

   ```
   # 0 */2 * * * /etc/init.d/ntpd restart
   ```

4. Alternatively, run the following command to force clock sync immediately:

   ```
   $ sudo /etc/init.d/ntpd restart
   ```

For more information, see Verify That NTP Is Running in Installing Vertica and the Network Time Protocol website.

**Red Hat 7/CentOS 7 Systems**

In Red Hat 7/CentOS 7, `ntpd` is deprecated in favor of `chrony`. To keep system clocks in your network in sync for Kerberos authentication to work properly, do the following:

1. Install `chrony` on the Kerberos server (KDC).

2. Install `chrony` on each server in your network.

3. Synchronize system clocks on all machines that participate in the Kerberos realm within a few minutes of the KDC and each other.

**Clock Skew on Linux Virtual Machines**

Clock skew can be problematic on Linux virtual machines that need to sync with the Windows Time Service. Try the following to keep time in sync:

1. Using any text editor, open `/etc/chrony.conf`.

2. Under the Undisciplined Local Clock section, add the IP address for the Vertica Analytic Database server. Then, remove existing server entries.
3. Log in to the server as root, and set up a cron job to sync time with the added IP address every half hour, or as often as needed. For example:

```
# @ */2 * * * systemctl start chronyd
```

4. Alternatively, run the following command to force clock sync immediately:

```
$ sudo systemctl start chronyd
```

For more information, see Set Up Time Synchronization in Installing Vertica and the Red Hat chrony guide.

**Kerberos Ticket Is Valid, But Hadoop Access Fails**

Vertica uses Kerberos tickets to obtain Hadoop tokens. It then uses the Hadoop tokens to access the Hadoop data. Hadoop tokens expire after a period of time, so Vertica periodically refreshes them. However, if your Hadoop cluster is set to expire tokens frequently, it is possible that tokens might not be refreshed in time. If the token expires, you cannot access data.

Setting the HadoopFSTokenRefreshFrequency configuration parameter allows you to specify how often Vertica should refresh the token. Specify this value, in seconds, to be smaller than the expiration period set for Hadoop. For example:

```
=> ALTER DATABASE exampledb SET HadoopFSTokenRefreshFrequency = '86400';
```

**Encryption Algorithm Choices**

Kerberos is based on symmetric encryption. Be sure that all Kerberos parties used in the Kerberos realm agree on the encryption algorithm to use. If they do not agree, authentication fails. You can review the exceptions in the vertica.log.

On a Windows client, be sure the encryption types match the types set on Active Directory. See Configure Vertica for Kerberos Authentication.

Be aware that Kerberos is used only for securing the login process. After the login process completes, by default, information travels between client and server without encryption. If you want to encrypt traffic, use SSL. For details, see Implementing SSL.
Kerberos Passwords Not Recognized

If you change your Kerberos password, you must re-create all of your keytab files.

Using the ODBC Data Source Configuration Utility

On Windows vsq1 clients, you may choose to use the ODBC Data Source Configuration utility and supply a client Data Source. If so, be sure you enter a Kerberos host name in the Client Settings tab to avoid client connection failures with the Vertica Analytic Database server.

Authentication Failure in Backup, Restore, or Admin Tools

This problem can arise in configurations where each Vertica node uses its own Kerberos principal. (This configuration is recommended.) When using vbr or admintools you might see an error such as the following:

$ vsq1: GSSAPI continuation error: Miscellaneous failure
GSSAPI continuation error: Server not found in Kerberos database

Backup/restore and the admin tools use the value of KerberosHostname, if it is set, in the Kerberos principal used to authenticate. The same value is used on all nodes. If you have defined one Kerberos principal per node, as recommended, this value does not match. To correct this, unset the KerberosHostname parameter:

```sql
=> ALTER DATABASE mydb CLEAR KerberosHostname;
```

Server's Principal Name Does Not Match Host Name

This problem can arise in configurations where a single Kerberos principal is used for all nodes. OpenText recommends against using a single Kerberos principal for all nodes. Instead, use one principal per node and do not set the KerberosHostname parameter.

In some cases during client connection, the Vertica server's principal name might not match the host name in the connection string. (See also Using the ODBC Data Source Configuration Utility in this topic.)

On Windows vsq1 clients, you may choose to use the ODBC Data Source Configuration utility and supply a client Data Source. If so, be sure you enter a Kerberos host name in the Client Settings tab to avoid client connection failures with the Vertica Analytic Database server.
On ODBC, JDBC, and ADO.NET clients, set the host name portion of the server's principal using the KerberosHostName connection string.

**Tip:** On vsql clients, you set the host name portion of the server's principal name using the -K KRB_HOST command-line option. The default value is specified by the -h switch, which is the host name of the machine on which the Vertica server is running. -K is equivalent to the drivers' KerberosHostName connection string value.

For details, see Command Line Options in Connecting to Vertica.

### Principal/Host Mismatch Issues and Resolutions

This section lists potential issues that may occur if the principal and host are mismatched.

- The KerberosHostName configuration parameter has been overridden.

  For example, consider the following connection string:

  ```
  jdbc:vertica://v_vmart_node0001.example.com/vmart?user=kuser
  ```

  Because the this connection string includes no explicit KerberosHostName parameter, the driver defaults to the host in the URL (v_vmart_node0001.example.com). If you overwrite the server-side KerberosHostName parameter as “abc”, the client generates an incorrect principal.

  To resolve this issue, explicitly set the client’s KerberosHostName to the connection string, as in this example:

  ```
  jdbc:vertica://v_vmart_node0001.example.com/vmart?user=kuser&kerberoshostname=abc
  ```

- Connection load balancing is enabled, but the node against which the client authenticates might not be the node in the connection string.

  In this situation, consider changing all nodes to use the same KerberosHostName setting. When you use the default to the host that was originally specified in the connection string, load balancing cannot interfere with Kerberos authentication.

- You have a DNS name that does not match the Kerberos host name.

  For example, imagine a cluster of six servers, where you want hr-servers and finance-servers to connect to different nodes on the Vertica Analytic Database cluster. Kerberos
authentication, however, occurs on a single (the same) KDC. In the following example, the Kerberos service host name of the servers is server.example.com.

Suppose you have the following list of example servers:

<table>
<thead>
<tr>
<th>Server Name</th>
<th>IP Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>server1.example.com</td>
<td>192.16.10.11</td>
</tr>
<tr>
<td>server2.example.com</td>
<td>192.16.10.12</td>
</tr>
<tr>
<td>server3.example.com</td>
<td>192.16.10.13</td>
</tr>
<tr>
<td>server4.example.com</td>
<td>192.16.10.14</td>
</tr>
<tr>
<td>server5.example.com</td>
<td>192.16.10.15</td>
</tr>
<tr>
<td>server6.example.com</td>
<td>192.16.10.16</td>
</tr>
</tbody>
</table>

Now, assume you have the following DNS entries:

<table>
<thead>
<tr>
<th>Server Name</th>
<th>IP Addresses</th>
</tr>
</thead>
<tbody>
<tr>
<td>finance-servers.example.com</td>
<td>192.168.10.11, 192.168.10.12, 192.168.10.13</td>
</tr>
<tr>
<td>hr-servers.example.com</td>
<td>192.168.10.14, 192.168.10.15, 192.168.10.16</td>
</tr>
</tbody>
</table>

When you connect to finance-servers.example.com, specify:

- Kerberos -h host name option as server.example.com
- -K host option for hr-servers.example.com

For example:

```
$ vsql -h finance-servers.example.com -K server.example.com
```

- You do not have DNS set up on the client machine, so you must connect by IP only.

To resolve this issue, specify:

- Kerberos -h host name option for the IP address
- -K host option for server.example.com

For example:

```
$ vsql -h 192.168.1.12 -K server.example.com
```

- There is a load balancer involved (Virtual IP), but there is no DNS name for the VIP.

Specify:
- Kerberos -h host name option for the Virtual IP address
- -K host option for server.example.com

For example:

```
$ vsql -h <virtual IP> -K server.example.com
```

- You connect to Vertica using an IP address, but there is no host name to construct the Kerberos principal name.

  Provide the instance or host name for the Vertica as described in Inform About the Kerberos Principal

- You set the server-side KerberosHostName configuration parameter to a name other than the Vertica node's host name, but the client cannot determine the host name based on the host name in the connection string alone.

  Rename the KerberosHostName

  Rename the KerberosHostName to match the name of the Vertica node's host name. For more information, see the following topics in Connecting to Vertica:

  - ODBC DSN Parameters
  - JDBC Connection Properties
  - ADO.NET Connection Properties

**LDAP Authentication**

Lightweight Directory Access Protocol (LDAP) is an authentication method that works like password authentication. The main difference is that the LDAP method authenticates clients trying to access your Vertica database against an LDAP or Active Directory server. Use LDAP authentication when your database needs to authenticate a user with an LDAP or Active Directory server.
LDAP Prerequisites and Definitions

Prerequisites

Before you configure LDAP authentication for your Vertica database you must have:

- IP address and host name for the LDAP server. Vertica supports IPv4 and IPv6 addresses.
- Your organization's Active Directory information.
- A service account for search and bind.
- Administrative access to your Vertica database.
- open-ldap-tools package installed on at least one node. This package includes ldapsearch.

Definitions

The following definitions are important to remember for LDAP authentication:

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>IP address or host name of the LDAP server. Vertica supports IPv4 and IPv6 addresses. For more information, see IPv4 and IPv6 for Client Authentication.</td>
</tr>
<tr>
<td>Common name (CN)</td>
<td>Depending on your LDAP environment, this value can be either the username or the first and last name of the user.</td>
</tr>
<tr>
<td>Domain component (DC)</td>
<td>Comma-separated list that contains your organization's domain component broken up into separate values, for example:</td>
</tr>
<tr>
<td></td>
<td>dc=vertica, dc=com</td>
</tr>
<tr>
<td>Distinguished name (DN)</td>
<td>domain.com. A DN consists of two DC components, as in &quot;DC=example, DC= com&quot;.</td>
</tr>
<tr>
<td>Organizational unit (OU)</td>
<td>Unit in the organization with which the user is associated, for example, Vertica Users.</td>
</tr>
<tr>
<td>Parameter name</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>sAMAccountName</td>
<td>An Active Directory user account field. This value is usually the attribute to be searched when you use bind and search against the Microsoft Active Directory server.</td>
</tr>
<tr>
<td>UID</td>
<td>A commonly used LDAP account attribute used to store a username.</td>
</tr>
<tr>
<td>Bind</td>
<td>LDAP authentication method that allows basic binding using the DN.</td>
</tr>
<tr>
<td>Search and bind</td>
<td>LDAP authentication method that must log in to the LDAP server to search on the specified attribute.</td>
</tr>
<tr>
<td>Service account</td>
<td>An LDAP user account that can be used to log in to the LDAP server during bind and search. This account’s password is usually shared.</td>
</tr>
<tr>
<td>Anonymous binding</td>
<td>Allows a client to connect and search the directory (search and bind) without needing to log in.</td>
</tr>
<tr>
<td>ldapsearch</td>
<td>A command-line utility to search the LDAP directory. It returns information that you use to configure LDAP search and bind.</td>
</tr>
<tr>
<td>basedn</td>
<td>Distinguished name where the directory search should begin.</td>
</tr>
<tr>
<td>binddn</td>
<td>Domain name to find in the directory search.</td>
</tr>
<tr>
<td>search_attribute</td>
<td>Text to search for to locate the user record. The default is UID.</td>
</tr>
</tbody>
</table>

### LDAP Parameters

There are several parameters that you need to configure for LDAP authentication.

### General LDAP Parameters

Use the following parameters to configure for either LDAP bind or LDAP bind and search:

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>LDAP server URI in the following format:</td>
</tr>
<tr>
<td>Parameter name</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-------------</td>
</tr>
<tr>
<td><code>schema://host:optional_port</code></td>
<td><code>schema</code> is either ldap (for LDAP/Active Directory) or ldaps (for secure LDAP/Active Directory).</td>
</tr>
</tbody>
</table>
| starttls | Optional parameter that defines StartTLS behavior:  
- `soft`—If the server does not support TLS, continue authenticating the user in plain text. This value is equivalent to the `-Z` option in `ldapsearch`.  
- `hard`—If server does not support TLS, authentication should fail. This value is equivalent to the `-ZZ` in `ldapsearch`.  

Using `ldaps` is equivalent to `starttls='hard'`. However, if you use them together in the same connection string, authentication fails and the following error appears:  

```plaintext
FATAL 3846: LDAP authentication failed for user "<user_name>"  
```
| ldap_continue | When set to yes, this parameter allows a connection retry when a user not found error occurs during the previous connection attempt.  
For any other failure error, the system automatically retries the connection. |

## LDAP Bind Parameters

Use the following parameters when authenticating with LDAP bind to create the bind name string. For more information see [Workflow for Configuring LDAP Bind]( vertica.com).

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>binddn_prefix</td>
<td>First half of the bind string.</td>
</tr>
</tbody>
</table>
| binddn_suffix | Second half of bind string.  
You must use the `binddn_prefix` and `binddn_suffix` together. |
**Parameter name** | **Description**
--- | ---
In the following example, the bind name becomes `cn=<user_login_name>;ou=vertica users;dc=verticacorp;dc=com`.  
  
  `=> ALTER AUTHENTICATION auth_method_name SET binddn_prefix='cn=',binddn_suffix=''; ou=vertica users;dc=example;dc=com';`

| domain_prefix | The domain where to find the user name.  
In the following example, the bind name is `verticacorp/<user_login_name>`

  
  `ALTER AUTHENTICATION auth_method_name SET domain_prefix='Example';`

| email_suffix | The part of an email address that comes after the @ sign.  
In the following example, the bind name becomes `<user_login_name>@example.com`.

  
  `=> ALTER AUTHENTICATION auth_method_name SET email_suffix='Example.com';`

To create the bind name string, you must provide one of the following:

- Both `binddn_prefix` and `binddn_suffix`
- `domain_name`
- `email_suffix`

Otherwise, Vertica performs a bind and search operation instead of a bind operation.

## LDAP Search and Bind Parameters

Use the following parameters when authenticating with LDAP search and bind. For more information see [Workflow for Configuring LDAP Search and Bind](#).

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>basedn</td>
<td>Base DN for search.</td>
</tr>
<tr>
<td>binddn</td>
<td>Bind DN. Domain name to find in the directory search.</td>
</tr>
</tbody>
</table>
### Parameter name | Description
---|---
bind_password | Bind password. Required if you specify a binddn.
search_attribute | Optional attribute to search for on the LDAP server.

The following example shows how to set these three attributes. In this example, it sets

- binddn to cn=Manager,dc=example,dc=com
- bind_password to secret
- search_attribute to cn

```
=> ALTER AUTHENTICATION auth_method_name SET host='ldap://example13',
   basedn='dc=example,dc=com', binddn='cn=Manager,dc=example,dc=com',
   bind_password='secret', search_attribute='cn';
```

The binddn and bind_password parameters are optional. If you omit them, Vertica performs an anonymous search.

### Using LDAP Over SSL/TLS

Vertica supports Transport Layer Security (TLS) for client authentication.

The terms SSL and TLS are often used interchangeably. TLS is the successor to SSL and offers greater security. The original SSL standard was renamed TLS at the time it became open source. The introduction of TLS began with version 1, which is essentially equal to SSL 3. You use openssl commands to create certificates and keys and TLS syntax to create an authentication method.

For more information see the [Information Security website](#).

You use ALTER AUTHENTICATION to specify LDAP and SSL/TLS parameters. If you specify a host URL that starts with ldaps, the Vertica server authenticates using SSL/TLS on the specified port or on the secure LDAPS port (636).

```
ldaps://abc.dc.com
```

If the LDAP server does not support SSL on that port, authentication fails.

If you specify a host URL that starts with ldap and set the LDAP starttls parameter, the Vertica server sends a StartTLS request. This request determines if the LDAP server supports TLS on the specified port or on the default LDAP port (389).
=> ALTER AUTHENTICATION Ldap1 SET host='ldaps://abc.dc.com', binddn_prefix='CN=', binddn_suffix=',OU=Unit2,DC=dc,DC=com', basedn='dc=DC,dc=com', tls_cacert='/home/dc.com.ca.cer', tls_reqcert='never';

If the LDAP server does not support TLS on that port, the result depends on the value of the starttls parameter:

- **starttls = hard**: The Vertica server terminates the authentication process.
- **starttls = soft**: The Vertica server proceeds with the authentication but does not use TLS.

To configure LDAP over SSL/TLS, use the following configuration parameters:

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TLS_REQCERT</td>
<td>hard—If the client does not provide a certificate, or provides an invalid certificate, it cannot connect. This is the default behavior. never—The client does not request or verify a certificate. allow—If the client does not provide a certificate or provides an invalid certificate, it can connect anyway. try—If the client does not provide a certificate, they can connect. If the client provides an invalid certificate, they cannot connect.</td>
</tr>
<tr>
<td>TLS_CADIR</td>
<td>Path to the folder with the CA certificates. For example: ALTER AUTHENTICATION Ldap1 SET TLS_CADIR ='/scratch_b/qa/vertica/QA/VT_Scenario/V_SEC/';</td>
</tr>
<tr>
<td>TLS_CACERT</td>
<td>Path to the CA certificate. For example: ALTER AUTHENTICATION Ldap1 SET TLS_CACERT ='/scratch_b/qa/vertica/QA/VT_Scenario/V_SEC/dc.com.ca.cer';</td>
</tr>
</tbody>
</table>

If you do not provide one or more of these parameters, the LDAP server checks to see if the LDAPNOINIT environment variable points to the ldap.conf file. If it does, the server uses the parameters specified in the ldap.conf file. If the LDAP server cannot find the ldap.conf file, authentication fails.

The following example shows how to specify the TLS parameters and the LDAP parameters when configuring LDAP over SSL/TLS:

=> CREATE AUTHENTICATION LDAP1 METHOD 'ldap' HOST :clientIP = '172.16.65.177';
=> GRANT AUTHENTICATION ldap1 TO user1;
=> ALTER AUTHENTICATION Ldap1 SET host='ldaps://abc.dc.com', binddn_prefix='CN=', binddn_suffix=',OU=Unit2,DC=dc,DC=com', basedn='dc=DC,dc=com', tls_cacert='/home/dc.com.ca.cer', tls_reqcert='never';
Configuring Multiple LDAP Servers

If you need to configure multiple LDAP servers that have different URLs, create a separate authentication record for each server. Use the PRIORITY keyword to indicate which search the LDAP server performs first.

The following statements create two authentication methods, vldap1 and vldap2. They specify that the LDAP server first search the entire directory (basedn=dc=example,dc=com) for a DN with an OU attribute Sales. If the first search returns no results, or otherwise fails, the LDAP server next searches for a DN with the OU attribute Marketing:

```plaintext
=> CREATE AUTHENTICATION vldap1 method "ldap" HOST 10.0.0.0/8;
=> ALTER AUTHENTICATION vldap1 SET host='ldap://ldap.example.com/search', basedn='dc=example,dc=com', search_attribute='Sales' PRIORITY 1;
=> GRANT AUTHENTICATION vldap1 to public;
=> CREATE AUTHENTICATION vldap2 method "ldap" HOST 10.0.0.0/8;
=> ALTER AUTHENTICATION vldap2 SET host='ldap://ldap.example.com/search', basedn='dc=example,dc=com', search_attribute='Marketing' PRIORITY 0;
=> GRANT AUTHENTICATION vldap2 to public;
```

LDAP Bind Methods

There are two LDAP methods that you use to authenticate your Vertica database against an LDAP server.

- **Bind**—Use LDAP bind when Vertica connects to the LDAP server and binds using the CN and password. (These values are the username and password of the user logging into the database). Use the bind method when your LDAP account's CN field matches that of the username defined in your database. For more information see Workflow for Configuring LDAP Bind.

- **Search and Bind** —Use LDAP search and bind when your LDAP account's CN field is a user's full name or does not match the username defined in your database. For search and bind, the username is usually in another field such as UID or sAMAccountName in a standard
Active Directory environment. Search and bind requires your organization's Active Directory information. This information allows Vertica to log into the LDAP server and search for the specified field. For more information see Workflow for Configuring LDAP Search and Bind.

If you are using search and bind, having a service account simplifies your server side configuration. In addition, you do not need to store your Active Directory password.

LDAP Anonymous Binding

Anonymous binding is an LDAP server function. Anonymous binding allows a client to connect and search the directory (bind and search) without logging in because binddn and bindpasswd are not needed.

You also do not need to log in when you configure LDAP authentication using Management Console.

Workflow for Configuring LDAP Bind

To configure your Vertica database to authenticate clients using LDAP bind, follow these steps:

1. Obtain a service account. For information see the LDAP product documentation. You cannot use the service account in the connection parameters for LDAP bind.

2. Compare the user's LDAP account name to their Vertica username. For example, if John Smith's Active Directory (AD) sAMAccountName = jsmith, his Vertica username must also be jsmith.

However, the LDAP account does not have to match the database user name, as shown in the following example:

```sql
=> CREATE USER r1 IDENTIFIED BY 'password';
=> CREATE AUTHENTICATION ldap1 METHOD 'ldap' HOST '172.16.65.177';
=> ALTER AUTHENTICATION ldap1 SET HOST= 'ldap://172.16.65.10', basedn='dc=dc,dc=com', binddn_suffix='ou=unit2,dc=dc,dc=com', binddn_prefix='cn=use';
=> GRANT AUTHENTICATION ldap1 TO r1;

\! ${{TARGET}}/bin/vsql -p $PGPORT -U r1 -w $LDAP_USER_PASSWD -h ${{HOSTNAME}} -c
    "select user_name, client_authentication_name from sessions;"
user_name | client_authentication_name
-------------
```
3. Run `ldapsearch` from a Vertica node against your LDAP or AD server. Verify the connection to the server and identify the values of relevant fields. Running `ldapsearch` helps you build the client authentication string needed to configure LDAP authentication.

In the following example, `ldapsearch` returns the CN, DN, and sAMAccountName fields (if they exist) for any user whose CN contains the username `jsmith`. This search succeeds only for LDAP servers that allow anonymous binding:

```bash
$ ldapsearch -x -h 10.10.10.10 -b "ou=Vertica Users,dc=CompanyCorp,dc=com" '(cn=jsmith*)' cn dn uid sAMAccountName
```

`ldapsearch` returns the following results. The relevant information for LDAP bind is in bold:

```
# extended LDIF
#
# LDAPv3
# base <ou=Vertica Users,dc=CompanyCorp,dc=com> with scope subtree
# filter: (cn=jsmith*)
# requesting: cn dn uid sAMAccountName
#
# jsmith, Users, CompanyCorp.com
dn: cn=jsmith,ou=Vertica Users,dc=CompanyCorp,dc=com
cn: jsmith
uid: jsmith
# search result
search: 2
result: 0 Success
# numResponses: 2
# numEntries: 1
```

4. Create a new authentication record based on the information from `ldapsearch`. In the `ldapsearch` entry, the CN is username `jsmith`, so you do not need to set it. Vertica automatically sets the CN to the username of the user who is trying to connect. Vertica uses that CN to bind against the LDAP server.

```sql
=> CREATE AUTHENTICATION v_ldap_bind METHOD 'ldap' HOST '0.0.0.0/0';
=> GRANT AUTHENTICATION v_ldap_bind TO public;
=> ALTER AUTHENTICATION v_ldap_bind SET
host='ldap://10.10.10.10/',
basedn='DC=CompanyCorp,DC=com',
binddn_prefix='cn=',
binddn_suffix='OU=Vertica Users,DC=CompanyCorp,DC=com';
```

For more information see [LDAP Bind Parameters](#)
Workflow for Configuring LDAP Search and Bind

To configure your Vertica database to authenticate clients using LDAP search and bind, follow these steps:

1. Obtain a service account. For information see the LDAP product documentation.

2. From a Vertica node, run `ldapsearch` against your LDAP or AD server. Verify the connection to the server, and identify the values of relevant fields. Running `ldapsearch` helps you build the client authentication string needed to configure LDAP authentication.

   In the following example, `ldapsearch` returns the CN, DN, and sAMAccountName fields (if they exist) for any user whose CN contains the username, John. This search succeeds only for LDAP servers that allow anonymous binding:

   ```
   $ ldapsearch -x -h 10.10.10.10 -b 'OU=Vertica Users,DC=CompanyCorp,DC=com' -s sub -D 'CompanyCorp\jsmith' -W '(cn=John*)' cn dn uid sAMAccountName
   ```

3. Review the results that `ldapsearch` returns. The relevant information for search and bind is in bold:

   ```
   # extended LDIF
   #
   # LDAPv3
   # base <OU=Vertica Users,DC=CompanyCorp,DC=com> with scope subtree
   # filter: (cn=John*)
   # requesting: cn dn sAMAccountName
   #
   # John Smith, Vertica Users, CompanyCorp.com
   #
   #
   # dn: CN=jsmith,OU=Vertica Users,DC=CompanyCorp,DC=com
   # cn: Jsmith
   # sAMAccountName: jsmith
   #
   # search result
   # search: 2
   # result: 0 Success
   # numResponses: 2
   # numEntries: 1
   ```

4. Create the client authentication record. The cn attribute contains the username you want—jsmith. Set your search attribute to the CN field so that the search finds the appropriate account.

   ```
   => CREATE AUTHENTICATION v_ldap_bind_search METHOD 'ldap' HOST '10.10.10.10';
   => GRANT AUTHENTICATION v_ldap_bind_search TO public;
   ```
ALTER AUTHENTICATION v_ldap_bind_search SET
host='ldap://10.10.10.10',
basedn='OU=Vertica,DC=CompanyCorp,DC=com',
binddn='CN=jsmith,OU=Vertica Users,DC=CompanyCorp,DC=com',
bind_password='password',
search_attribute='CN';

For more information see LDAP Search and Bind Parameters
**TLS/SSL Server Authentication**

The terms SSL and TLS are often used interchangeably. This document uses SSL. **TLS** is the successor to SSL and offers greater security. The original SSL standard was renamed TLS at the time it became open source. The introduction of TLS began with version 1, which is essentially equal to SSL 3. You use `openssl` commands to create certificates and keys and TLS syntax to create an authentication method.

**SSL Authentication**

To protect privacy and verify data integrity, you can configure Vertica and database clients to use Secure Socket Layer (SSL). SSL allows secure connection and communication between the client and the server. The SSL protocol uses a trusted third party called a **Certificate Authority** (CA). Both the owner of a certificate and the party that relies on the certificate trust the CA.

Vertica supports the following authentication methods under Transport Layer Security (TLS) v1.0, v1.1, and v1.2 protocol:

- **SSL server authentication** — Lets the client confirm the server's identity. The client verifies that the server's certificate and public key are valid and were issued by a certificate authority (CA) listed in the client's list of trusted CAs. This authentication helps prevent man-in-the-middle attacks. See "Prerequisites for SSL Server Authentication and SSL Encryption" in **SSL Overview** and **Configuring SSL**.

- **SSL client authentication** — (Optional) Lets the server confirm the client's identity. The server verifies that the client's certificate and public key are valid and were issued by a certificate authority (CA) listed in the server's list of trusted CAs. Client authentication is optional because Vertica can authenticate the client at the application protocol level through user name and password credentials. See "Optional Prerequisites for SSL Server and Client Mutual Authentication" in **SSL Overview**.

- **Encryption** — Encrypts data sent between the client and database server. This method significantly reduces the likelihood that the data can be read if the connection between the client and server is compromised. Encryption works at both ends of a transaction, regardless of whether SSL Client Authentication is enabled. See "Prerequisites for SSL Server Authentication and SSL encryption" in **SSL Overview** and **Configuring SSL**.

- **Data integrity** — Verifies that data sent between the client and server has not been altered during transmission.
Note: For server authentication, Vertica supports using RSA encryption with ephemeral Diffie-Hellman (DH). DH is the key agreement protocol.

Certificate Authority

The CA issues electronic certificates to identify one or both ends of a transaction. These certificates to verify ownership of a public key by the name on the certificate.

Public and Private Keys

A CA issues digital certificates that contain a public key and the identity of the owner. The public key is available to all users through a publicly accessible directory. However, private keys are confidential to their respective owners. When you use a private/public key pair, the data is encrypted by one key and decrypted by its corresponding key.

- If encrypted with a public key, data can be decrypted by its corresponding private key only.
- If encrypted with a private key, data can be decrypted by its corresponding public key only.

For example, suppose Alice wants to send confidential data to Bob. Because she wants only Bob to read it, she encrypts the data with Bob's public key. Even if someone else gains access to the encrypted data, it remains protected. Because only Bob has access to his corresponding private key, he is the only person who can decrypt Alice's encrypted data back into its original form.

SSL Overview

Before you implement SSL security, including mutual mode, obtain the appropriate certificate signed by a certificate authority (CA) and private key files. Copy the certificate file to the database catalog directory. These files must use the Privacy-Enhanced Mail (PEM) format. PEM is the standard file format for Certificates and can be included in ascii or rich text documents. For reference information on SSL use the following links:

- [OpenSSL Documentation](#)
- [OpenSSL Support](#)
Use the following files for SSL authentication:

- root.crt - contains the top-level Certificate Authorities that are trusted for signing server certificates (server.crt).

- server.crt - must reside in the server's data directory and contains the trusted server certificate. This file gets sent to the client where root.crt identifies the server.

- server.key - must reside in the server's data directory and proves the server certificate was sent by the certificate owner. It does not indicate the certificate owner is trustworthy.

If you make changes to any of these files you must restart the server.

You can also implement SSL with LDAP authentication. For more information see Using LDAP Over SSL/TLS.

### Using wildcards

You can enter wildcard characters as part of the server names in root.crt. For example, server.crt contains server names called eng001.corptech.com, eng002.corptech.com, and eng003.corptech.com. You can enter *.corptech.com in root.crt and it locates the required server.

The wildcard must be the first character of the hostname followed by a period, for example:

```
*.hostname.com
```

### Set Up SSL Server Authentication and SSL Encryption

Follow these steps to set up server SSL authentication:

**Important:** If you do not perform these steps, database operation may be compromised. If the client cannot authenticate the server, the database does not start.

1. Enable SSL authentication in one of the following ways:

   Set `EnableSSL=1` in `vertica.conf`

   Enter `ALTER DATABASE mydb SET EnableSSL = 1;` in `vsql`.
2. Copy the server certificate file (server.crt) and private key (server.key) to one of your server hosts in the cluster, as follows:

3. Distribute these files to all server hosts using the instruction in Distributing Certificates and Keys.

   The public key contained in the certificate and the corresponding private key allow the SSL connection to encrypt the data to protect data integrity.

4. SSL Server mode requires that the client verify the server's certificate. The client must be able to access certificate authority file (root.crt), and the server must be set with server certificate and private key. Also, SSL Mutual mode requires that the server verify the client’s certificate. The server should be set with CA file and the client must have the client certificate and its private key.

   For vsq:

   If the VSQL_HOME environment variable is not set, copy the root.crt file to the .vsql subdir of the login user's home directory (for example, ~/.vsql/root.crt).

   If the VSQL_HOME environment variable is set, copy the root.crt file to the .vsql subdir of the target directory (for example, $vsql_home/.vsql/root.crt)

   The root.crt file contains the Certificate Authority that issued the server certificate.

   Set SSL Server for Mutual Mode Authentication

   Use SSL Mutual Mode to have both server and client mutually authenticate themselves with SSL keys. With SSL Mutual Mode the server requests a certificate from the client and the client requests a certificate from the server. Set up SSL Mutual Mode as follows:

   1. Enable SSL authentication in one of the following ways:

   Set EnableSSL=1 in vertica.conf

   Enter ALTER DATABASE mydb SET EnableSSL = 1; in vsq.
2. Copy the root.crt file to one server host in the cluster. This file is distributed to all server hosts when you distribute certificates and keys. See Distributing Certificates and Keys.

The root.crt file has the same name on the client and server though the file contents can differ. The contents are identical only if the client and server certificates were used by the same root certificate authority (CA).

3. Copy the client certificate file (client.crt) and private key (client.key) to each client. For vsqi:

- If the VSQL_HOME environment variable is set, copy the file to the .vsqi subdirectory of the target directory set up in the environment variable (e.g., $vsql_home/.vsqi/client.crt).

- If the VSQL_HOME environment variable is not set, copy the two files to the .vsqi subdir of the login user's home directory. (e.g., ~/.vsqi/client.crt).

If you are using either ODBC or JDBC, you can place the files anywhere on your system. Then, provide the location in the connection string (ODBC/JDBC) or ODBCINI (ODBC only). See Configuring SSL for ODBC Clients and Configuring SSL for JDBC Clients.

```
Important: If you're using ODBC, the private key file (client.key) must have read and write permissions only for the dbadmin user. For example:
chmod 600 client.key
```

Do not provide any additional permissions or extend them to any other users.

### Generating SSL Certificates and Keys

Generating SSL certificates and keys, you must perform the following tasks:

- Create a Certificate Authority Private Key and Public Certificate that can then be used to sign server and client keys.

```
Important: In a production environment, always use certificates signed by a Certificate Authority.
```

For more detailed information on creating signed certificates, OpenSSL recommends the OpenSSL Cookbook. You can download this book for free.
The documentation includes examples and sample procedures to show how to create certificates and keys. The commands shown allow many other possible options not used in these examples. Create commands based on your specific environment.

Create a Certificate Authority Private Key and Public Certificate

Create a Certificate Authority (CA) private key and public certificate. For more information on using the following commands, see the OpenSSL documentation.

1. Generate CA files serverca.crt and servercakey.pem. This allows the signing of server and client keys:

   ```
   $ openssl genrsa -out new_servercakey.pem
   $ openssl req -config openssl_req_CA.conf -new -x509 -key servercakey.pem -out serverca.crt
   ```

   You can add multiple CA files to the .crt file with the following command:

   ```
   $ cat serverca_new.crt >> serverca.crt
   ```

   This concatenates the serverca_new.crt file to the original CA file serverca.crt. You can run this command multiple times to concatenate additional CA files.

2. Create the server private key (server.crt) and public key (server.key):

   ```
   $ openssl genrsa -out server.key
   $ openssl req -config openssl_req_server.conf -new -key server.key -out server_reqout.txt
   $ openssl x509 -req -in server_reqout.txt -days 3650 -sha1 -CAcreateserial -CA serverca.crt -CAkey servercakey.pem -out server.crt
   ```

3. Create the client private key (client.crt) and public key (client.key):

   ```
   $ openssl genrsa -out client.key
   $ openssl req -config openssl_req_client.conf -new -key client.key -out client_reqout.txt
   $ openssl x509 -req -in client_reqout.txt -days 3650 -sha1 -CAcreateserial
   -CA serverca.crt -CAkey servercakey.pem -out client.crt
   ```

4. Enter the following sample CA certificate values in response to openssl command line prompts. The actual values you enter here will be different than the sample values.
Rather than enter these values from command line prompts, you can optionally provide the same information in .conf files. For example, openssl_req_ca.conf in the preceding example.

<table>
<thead>
<tr>
<th>Country Name (2 letter code) [GB]:US</th>
</tr>
</thead>
<tbody>
<tr>
<td>State or Province Name (full name) [Berkshire]:Massachusetts</td>
</tr>
<tr>
<td>Locality Name (e.g., city) [Newbury]:Cambridge</td>
</tr>
<tr>
<td>Organization Name (e.g., company) [My Company Ltd]:CorpName</td>
</tr>
<tr>
<td>Organizational Unit Name (e.g., section) []:TechSupport</td>
</tr>
<tr>
<td>Common Name (e.g., your name or server hostname) []:myhost</td>
</tr>
<tr>
<td>Email Address []:<a href="mailto:myhost@CorpName.com">myhost@CorpName.com</a></td>
</tr>
</tbody>
</table>

5. Include one unique Distinguished Name (DN) for each certificate that you create. In the preceding examples, the DN is the Organizational Unit Name.

6. Set file permissions:

   $ chmod 700 server.crt server.key
   $ chmod 700 client.crt client.key

7. Rename the CA file serverca.crt to root.crt, and do one of the following:

   - copy it to VSQL_HOME or
   - point to it in ODBC DSN Configuration dialog

8. Create a trusted Certificate Authority for the client for server mutual mode:

   ```
   =&gt; ALTER DATABASE <mydb> SET SSLCA = '<content of root.crt>'; 
   ```

You now have a CA private key, new_servercakey.pem. You also have a CA public certificate, new_serverca.crt. Use both the private key and the public certificate in the procedures that follow for creating server and client certificates.

**Generating Certificates and Keys for MC**

A certificate signing request (CSR) is a block of encrypted text generated on the server on which the certificate is used. You send the CSR to a certificate authority (CA) to apply for a digital identity certificate. The CA uses the CSR to create your SSL certificate from information in your certificate; for example, organization name, common (domain) name, city, and country.

Management Console (MC) uses a combination of OAuth (Open Authorization), Secure Socket Layer (SSL), and locally-encrypted passwords to secure HTTPS requests between a user’s
browser and MC, and between MC and the agents. Authentication occurs through MC and between agents within the cluster. Agents also authenticate and authorize jobs.

The MC configuration process sets up SSL automatically, but you must have the openssl package installed on your Linux environment first.

When you connect to MC through a client browser, Vertica assigns each HTTPS request a self-signed certificate, which includes a timestamp. To increase security and protect against password replay attacks, the timestamp is valid for several seconds only, after which it expires.

To avoid being blocked out of MC, synchronize time on the hosts in your Vertica cluster, and on the MC host if it resides on a dedicated server. To recover from loss or lack of synchronization, resync system time and the Network Time Protocol.

Create a Certificate and Submit it for Signing

For production, you must use certificates signed by a certificate authority. You can create and submit a certificate and when the certificate returns from the CA, import the certificate into MC.

Use the openssl command to generate a new CSR, entering the passphrase "password" when prompted:

```
$ sudo openssl req -new -key /opt/vconsole/config/keystore.key -out server.csr
Enter pass phrase for /opt/vconsole/config/keystore.key:
```

When you press Enter, you are prompted to enter information to be incorporated into your certificate request. Some fields contain a default value, which you should change for security reasons. Other fields you can leave blank, such as password and optional company name. To leave the field blank, type `.`.

```
Important: The keystore.key value for the -key option creates private key for the keystore. If you generate a new key and import it using the Management Console interface, the MC process does restart properly. You must restore the original keystore.jks file and restart Management Console.
```

This information is contained in the CSR and shows both the default and replacement values:

```
Country Name (2 letter code) [GB]:US
State or Province Name (full name) [Berkshire]:Massachusetts
Locality Name (eg, city) [Newbury]: Cambridge
Organization Name (eg, company) [My Company Ltd]:Vertica
Organizational Unit Name (eg, section) []:Information Management
Common Name (eg, your name or your server's hostname) []:console.vertica.com
Email Address []:mcadmin@vertica.com
```

The Common Name field is the fully qualified domain name of your server. Your entry must exactly match what you type in your web browser, or you receive a name mismatch error.
Self-Sign a Certificate for Testing

To test your new SSL implementation, you can self-sign a CSR using either a temporary certificate or your own internal CA, if one is available.

Note: A self-signed certificate generates a browser-based error notifying you that the signing certificate authority is unknown and not trusted. For testing purposes, accept the risks and continue.

The following command generates a temporary certificate, which expires after 365 days:

```
$ sudo openssl x509 -req -days 365 -in server.csr -signkey /opt/vconsole/config/keystore.key -out server.crt
Enter passphrase for /opt/vconsole/config/keystore.key:
Enter same passphrase again:
```

The previous example prompts you for a passphrase. This is required for Apache to start. To implement a passphrase you must put the SSLPassPhraseDialog directive in the appropriate Apache configuration file. For more information see your Apache documentation.

This example shows the command's output to the terminal window:

```
Signature ok
subject=/C=US/ST=Massachusetts/L=Cambridge/O=Vertica/OU=IT/CN=console.vertica.com/emailAddress=mcadmin@vertica.com
Getting Private key
```

You can now import the self-signed key, server.crt, into Management Console.

- Configuring SSL
- Key and Certificate Management Tool

Importing a New Certificate to MC

Use this procedure to import a new certificate into Management Console.

Note: To generate a new certificate for Management Console, you must use the keystore.key file, which is located in /opt/vconsole/config on the server on which you installed MC. Any other generated key/certificate pair causes MC to restart incorrectly. You will then have to restore the original keystore.jks file and restart Management.
**Console. See Generating Certifications and Keys for Management Console.**

1. Connect to Management Console, and log in as an administrator.
2. On the Home page, click MC Settings.
3. In the button panel on the left, click SSL certificates.
4. To the right of "Upload a new SSL certificate," click Browse to import the new key.
5. Click Apply.
6. Restart Management Console.

**Configuring SSL**

Configure SSL for each server in the cluster.

1. Verify that you have performed at least the minimum steps required in SSL Overview for server authentication and encryption and, optionally, for mutual authentication.
2. Verify that you have performed the steps in Distributing Certificates and Keys.

**Important:** Before you set the Security Parameters SSLCertificate and SSLPrivateKey, you must first set the EnableSSL parameter. Admintools sets these parameters for you when you perform the procedure steps listed in Distributing Certificates and Keys. Alternatively, you can use vsq1 to set the parameters using the ALTER DATABASE statement. For more information on setting configuration parameters see ALTER DATABASE.

These parameters are also automatically set during upgrade to 7.1 if you set EnableSSL=1 in the previous version.

3. Set the EnableSSL parameter to 1. By default, EnableSSL is set to 0 (disabled).

   ```sql
   => ALTER DATABASE mydb SET EnableSSL = 1;
   ```
4. Restart the database.
5. If you are using either ODBC or JDBC, configure SSL for the appropriate client:
Configuring SSL for ODBC Clients

Configuring SSL for JDBC Clients

vsql automatically tries to connect using SSL. If a connection fails, and your server is started in SSL Server Mode, vsql attempts to make a second connection over clear text. If you start the server in SSL Mutual Mode, the connection fails without vsql attempting to connect over clear text.

Configure JDBC for SSL Mutual Mode

In addition to the procedure above, you need to perform the following to configure SSL in Mutual Mode:

a. Edit openssl_req_server.conf as follows:

```
[req]
prompt = no
distinguished_name = C=Store4Ever
req_extensions = v3_req

[C=Store4Ever]
C = US
ST = Massachusetts
O = Corp Server
CN = engXXX
eemailAddress = foo@bar.com

[v3_req]
basicConstraints = CA:FALSE
keyUsage = nonRepudiation, digitalSignature, keyEncipherment
subjectAltName = @alt_names

[alt_names]
DNS.1 = engXXX.corp.com
DNS.2 = engXXX
DNS.3 = *.corp.com
IP = 10.20.40.XX
```

b. Create the server private key (server.crt) and public key (server.key):

```
$ openssl genrsa -out server.key
$ openssl req -config openssl_req_server.conf -new -key server.key -out server_reqout.txt
$ openssl x509 -req -in server_reqout.txt -days 3650 -sha1 -CAcreateserial -CA serverca.crt -CAkey servercakey.pem -extensions v3_req -extfile openssl_req_server.conf -out server.crt
```

Note: If you are using SSL mutual mode with JDBC, copy the root.crt file to a location on any one of the clients. After you copy the file to the client, root.crt is
Configuring SSL for ODBC Clients

Configuring SSL for ODBC clients requires that you set the SSLMode connection property. If you want to configure optional SSL client authentication, you must also configure the Security Parameters SSLKeyFile and SSLCertFile connection properties.

How you configure the DSN depends on your operating system:

- Linux and UNIX — Enter the connection properties in the odbc.ini file. See Creating an ODBC DSN for Linux, AIX, and HP-UX.

- Microsoft Windows — Enter the connection properties in the Windows Registry. See Creating an ODBC DSN for Windows Clients.

For Windows ODBC you can set connection string properties in the Client Settings tab on the ODBC DSN Configuration dialog. Connection string properties you can set are:

SSL CA file - the location of the root certificate file, for example root.crt.

SSL cert file - the location of the server certificate file, for example server.crt.

SSL key file - the location of the server key file, for example, server.key.

Set SSLMode Connection Property

Set the SSLMode connection property to one of the following options for the DSN:
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>verify_full</td>
<td>Encrypts data and connects to a user-specified trusted server.</td>
</tr>
<tr>
<td>verify_ca</td>
<td>Encrypts data and connects to a trusted server.</td>
</tr>
<tr>
<td>require</td>
<td>Requires the server to use SSL. If the server cannot provide an encrypted</td>
</tr>
<tr>
<td></td>
<td>channel, the connection fails.</td>
</tr>
<tr>
<td>prefer</td>
<td>(Default value) Indicates your preference that the server to use SSL. The</td>
</tr>
<tr>
<td></td>
<td>first connection to the database tries to use SSL. If that connection fails,</td>
</tr>
<tr>
<td></td>
<td>a second connection is attempted over a clear channel.</td>
</tr>
<tr>
<td>allow</td>
<td>Makes a connection to the server whether the server uses SSL or not. The</td>
</tr>
<tr>
<td></td>
<td>first connection attempt to the database is made over a clear channel. If</td>
</tr>
<tr>
<td></td>
<td>that connection fails, a second connection is attempted over SSL.</td>
</tr>
<tr>
<td>disable</td>
<td>Never connects to the server using SSL. This setting is typically used for</td>
</tr>
<tr>
<td></td>
<td>troubleshooting.</td>
</tr>
</tbody>
</table>

Using verify_ca and verify_full

You can use the SSL Mode properties verify_ca and verify_full exclusively on client authentication. These properties require:

- The root.crt to allow the client to access the server's authentication certificate. If root.crt does not exist, and verify_can or verify_full are set, the connection fails upon SSL initialization.

- A server.crt, which contains the authentication certificate.

- A server.key, which contains the server's private key that prevents the server from accessing external systems.

- A server hostname that matches the hostname specified by the client, verify_full only.

- A certificateAll nodes in the cluster must either share the same certificate or each certificate must contain all the hostnames or IP addresses in the Subject Alternate Name (SAN).

SSL Workflow

The following diagram shows an example workflow for SSL authentication. Your actual workflow may differ depending on what SSLMode Connection Properties you use.
In this workflow:
If the SSLMode Connection Property is set to none or allow, the client connects without authentication.

If the SSLMode Connection Property is set to verify_ca or verify_full, and root.crt does not exist, the SSL authentication fails. If root.crt exists, the authentication process proceeds.

During SSL authentication if the SSLMode Connection Property is set to verify_full, and the server hostname is not the same as the hostname specified by the client, authentication fails.

Enable SSL Mutual Mode Authentication

You can optionally configure SSL mutual mode by setting the following database Security Parameters:

- SSLKeyFile — Set this connection property to the file path and name of the client's private key. This key can reside anywhere on the client.

- SSLCertFile — Set this connection property to the file path and name of the client's public certificate. This file can reside anywhere on the client.

Configuring SSL for JDBC Clients

Configuring SSL Authentication for JDBC clients involves involves the following tasks:

- Set required properties

- Optionally run the SSL Debug Utility

- Configure for SSL Mutual Mode (optional)

Set Required Properties

Set Properties When Location or the Keystore/Truststore Is Not the Default

If you are using a location or the keystore/truststore that is not the default, set the following system properties so that the JRE can find your keystore/truststore:

$ javax.net.ssl.keyStore
$ javax.net.ssl.trustStore
Set Properties When Keystore/Truststore Is Password Protected

If your keystore/truststore is password protected, set the following system properties so that the JRE has access to it:

```
$ javax.net.ssl.keyStorePassword
$ javax.net.ssl.trustStorePassword
```

Run the SSL Debug Utility

After configuring SSL for JDBC, optionally run the following command to enable the debug utility for SSL:

```
$ -Djavax.net.debug=ssl
```

You can use several debug specifiers (options) with the debug utility. The specifiers help narrow the scope of the debugging information that is returned. For example, you could specify one of the options that prints handshake messages or session activity.

For information on the debug utility and its options, see Debugging Utilities in the Oracle document, JSSE Reference Guide.

For information on interpreting debug information, refer to the Oracle document, Debugging SSL/TLS Connections.

Distributing Certificates and Keys

Before you can distribute certifications and keys to all hosts in a cluster, you must obtain the appropriate certificate signed by a certificate authority (CA) and private key files. See SSL Overview.

To distribute certifications and keys to all hosts in a cluster:

1. Log on to a host that contains the certifications and keys you want to distribute.

2. Start the Administration Tools, as described in Using the Administration Tools

   Note: The database does not need to be running when you distribute the certificates and key files.
3. On the Main Menu in the Administration Tools, select Configuration Menu, and click OK.

4. On the Configuration Menu:
   a. Select Distribute Config Files, and click OK.
   b. Select SSL Keys, and click OK.

5. Select the database on which you want to distribute the files and click OK. The following appears:

![Select files to install](image)

6. [Optional] Modify the fields in the previous screenshot to add the file locations for the server.crt, server.key and root.crt files, and click OK to distribute the files.

   Admintools sets the parameters SSLCertificate, SSLPrivateKey, and, if applicable, SSLCA. See Security Parameters.

   - If you are upgrading to 7.1, the SSLCertificate and SSLPrivateKey parameters are automatically set by Admintools if you set EnableSSL=1 in the previous version.
   - If your server.crt SSL certificate file includes certificate chain (more than one certificate), Admintools accepts the whole chained certificate.

7. Configure SSL.

Internode Communication and Encryption

The communication between the server nodes uses two distinct channels:
- **Control Channel Configuration**: Implemented using spread
- **Data Channel Configuration**: Implemented using TCP sockets

Internode SSL allows you to use SSL to secure communication between nodes within a cluster. It is important to secure communications between nodes if you do not trust the network between the nodes.

Admintools generates or retrieves the spread key to encrypt all traffic on the control channel and ships the spread key to all nodes. Vertica uses TLS to encrypt all traffic on the data channel. TLS credentials are shared between nodes over the encrypted control channel.

The following graphic illustrates how these internode encryption steps work.
If you enable internode encryption, some of your queries may run slower than expected. The performance you experience depends on the data sent over the network.

Control Channel Configuration

Internode communication uses the control channel to exchange plan information and distribute calls. The control channel is implemented using Spread. For more information, visit spread.org.

The control channel uses a key to encrypt it. The EncryptSpreadComm parameter is a string with the following options:

- An empty parameter indicates the parameter is disabled. If the parameter is empty, encryption will not occur.

- The value vertica indicates that upon restarting the database, Vertica generates the spread encryption key for the cluster.

- The value aws-kms|<key_name>, such as my_test_key indicates that upon restarting the database, Vertica will fetch the named key from the KMS instead of generating its own.

For more information, see Security Parameters.

Data Channel Configuration

Internode communication uses the data channel to exchange table data during operations such as queries. The data channel is managed by the nodes in the cluster and implemented using normal TCP networking.

The data channel uses SSL to encrypt the data. The DataSSLParams configuration parameter is a string that must contain a comma-separated list of TLS credentials:

- SSL Certificate
- SSL Private Key
- SSL CA certificate

You must be a database administrator to set this parameter. You cannot set this parameter without setting the EncryptSpreadComm parameter. The EncryptSpreadComm parameter must be set as a completely separate step. It cannot be set at the same time as DataSSLParams in the same statement even if EncryptSpreadComm appears first in that statement. For more information, see Security Parameters.
TLS Authentication

Server authentication methods define how clients connect to a Vertica server. Before you define a TLS authentication method, you should understand what type of authentication methods your Vertica server supports. You should also perform any prerequisite tasks.

In regards to SSL, your server can operate with:

- No SSL
- SSL Server Mode — The client does not need certificate or key files.
- SSL Mutual Mode — The client needs certificate, key, and certificate authority files.

SSL modes are independent of authentication, except that the SSL client self-authentication method requires that your server be set-up in SSL Mutual Mode. Otherwise, if you are not implementing client self-authentication method, you can use TLS authentication with either SSL Server Mode or SSL Mutual Mode.

Before you create a TLS authentication method, perform the pre-requisite tasks necessary for your specific environment (for example, certificate creation). Refer to TLS/SSL Server Authentication and all subsections applicable to your environment.

To create a TLS authentication method, use the command CREATE AUTHENTICATION as documented in the SQL Reference Manual.

Implementing Client Self-Authentication

To use a client self-authentication method, your server must be in SSL Mutual Mode.

To create an authentication method for client self-authentication, use the CREATE AUTHENTICATION statement. Specify the `auth_type 'tls'` and with HOST TLS.

**Important:** You use the `auth_type 'tls'` only when you want to create an authentication method for client self-authentication. You must use the `auth_type 'tls'` with the HOST TLS syntax.
Create an Authentication Method with Client Self-Authentication Method

This section provides sample chronological steps for setting up a client for self-authentication, creating an authentication method, and associating the method with a user through a grant statement.

1. Follow all applicable procedures for implementing SSL and distributing certificates and keys. Refer to TLS/SSL Server Authentication as it applies to your environment.

   When you create a client key, make sure to include a Common Name (CN) that is the database user name you want to use with the target database.

   

   $ Common Name <server hostname> [[:<database username>]

2. Create the authentication method. Authentication methods are automatically enabled when you create them.

   

   => CREATE AUTHENTICATION myssltest METHOD 'tls' HOST TLS '10.0.0.0/23;

3. Associate the method with the user through a grant statement.

   

   => GRANT AUTHENTICATION myssltest TO mydatabaseusername;

Your client can now log on and be recognized.

For information on creating authentication methods, refer to the SQL Reference Manual topic, CREATE AUTHENTICATION.

Specify TLS for Client Connections

You can require clients to use TLS when connecting to Vertica. To do so, create a client authentication method for them that uses the HOST TLS syntax with the CREATE AUTHENTICATION statement.

Specific clients might connect through a network connection known to be insecure. In such cases, you can choose to limit specific users to connecting through TLS. You can also require all clients to use TLS.

See Creating Authentication Records for more information about creating client authentication methods.
LDAP Link Service

LDAP Link enables synchronization between the LDAP and Vertica servers. This eliminates the need for you to manage two sets of users and groups or roles, one on the LDAP server and another on the Vertica server. With LDAP synchronization, the Vertica server becomes a replication database for the LDAP server.

Automatic Synchronization

With LDAP Link the Vertica server closely integrates with an existing directory service such as MS Active Directory or OpenLDAP. The Vertica server automatically synchronizes:

- LDAP users to Vertica users
- LDAP groups to Vertica roles

You manage all user and group properties in the LDAP server. If you are the Vertica database administrator, you need only to set up permissions for Vertica Analytic Database access on the users and groups.

Configure LDAP Link with LDAP Link connection parameters that reside in the catalog. See Set LDAP Link Parameters for more information.

Enable LDAP Link

Enable LDAP Link as shown:

```
=> ALTER DATABASE dbname SET PARAMETER LDAPLinkURL='ldap://example.dc.com',
    LDAPLinkSearchBase='dc=DC,dc=com', LDAPLinkBindDN='CN=jsmith,OU=QA,DC=dc,DC=com,
    LDAPLinkBindPswd='password', LDAPLinkFilterUser='(objectClass=inetOrgPerson)',
    LDAPLinkFilterGroup='(objectClass=group)', LDAPLinkOn=1;
=> SELECT ldap_link_sync_start();
```

See LDAP Link Parameters.

LDAP Link Workflow

After you enable LDAP Link, synchronization occurs according to this workflow:
1. The System Administrator creates users and user groups on the LDAP server.

2. The System Administrator sets up LDAP Link service parameters as required and enables the service.

3. Using the LDAP Link service, Vertica Analytic Database replicates the users and user groups from the Application LDAP to the Vertica database, creating Vertica users and roles.

4. The LDAP server uses Kerberos (KDC) to authenticate the user logging in to Vertica.
   - The LDAP user can log into Vertica if assigned the appropriate authentication type.
   - After login, you can grant users privileges using GRANT statements or as part of a Group.

Note: After synchronization the Vertica Analytic Database user does not have an associated authentication method. To allow the user to login, you must assign an authentication method to the user. See Implementing Client Authentication.
Using LDAP Link

When you implement LDAP Link the following are directly affected and help you manage and monitor the LDAP Link - Vertica Analytic Database synchronization:

- User and Group management
- LDAP Link User Flag
- Blocked Commands
- Client Authentication types

User and Group Management

Users and groups created on the LDAP server have a specific relationship with those users and roles replicated to the Vertica server:

- The user-group relationship on the LDAP server is maintained when those users and groups (roles) are synchronized with Vertica Analytic Database.

- If a user or group name exists on the Vertica database and a user or group with the same names is synchronized from the LDAP Server using LDAP Link, the users or groups become conflicted. Vertica can not support multiple users with the same name. For a resolution of this conflict, see User Conflicts.

LDAP Link uses the entries in the dn: section of the LDAP configuration file as the unique user identifier when synchronizing a user to the Vertica Analytic Database:

```
  dn: cn=user1,ou=dev,dc=example,dc=com  
  cn: user1  
  ou: dev  
  id: user1
```

The uid parameter in the LDAP configuration file indicates the LDAP user name.

```
  uid: user1
```

Upon synchronization, the dn: entry gets mapped to the uid: to identify the Vertica Analytic Database user.
If you change a setting in the dn: and do not change the uid: LDAP Link interprets the user as a new user when re-synchronizing with the Vertica Analytic Database. In this case, the existing Vertica Analytic Database user with that uid: gets deleted from Vertica and a new Vertica Analytic Database user is created.

If you change the uid: and not the dn: on LDAP, the uid on the Vertica Analytic Database gets updated to the new uid. Since you did not change the dn: LDAP Link does not interpret the user as a new user.

**LDAP Link User Flag**

As a dbadmin user, you can access the vs_users table to monitor user behavior on the Vertica Analytic Database. The users table contains an ldap_dn field that identifies whether or not the Vertica Analytic Database user is also an LDAP Link user. This example shows the ldap_dn field set to dn indicating the Vertica Analytic Database user is also an LDAP Link user:

```
=> SELECT * FROM vs_users;
- [ RECORD 1 ]---------------------------------------------
user_id | 45035996273704962
user_name | dbadmin
is_super_user | t
profile_name | default
is_locked | f
lock_time | |
resource_pool | general
memory_cap_kb | unlimited
temp_space_cap_kb | unlimited
run_time_cap | unlimited
max_connections | unlimited
connection_limit_mode | database
idle_session_timeout | unlimited
all_roles | dbuser*, dbadmin*, pseudosuperuser*
default_roles | dbuser*, dbadmin*, pseudosuperuser*
search_path | |
ldap_dn | dn
ldap_uri_hash | |
is_orphaned_from_ldap | f
```

**Blocked Commands**

Be aware that the following SQL statements are blocked for Vertica Analytic Database users with ldapdn set to dn in the vs_users table:

- DROP USER and DROP ROLE
- ALTER ROLE RENAME
- `ALTER USER` name IDENTIFIED BY 'password' [REPLACE 'old_password']
- `ALTER USER` name PASSWORD EXPIRE
- `ALTER USER` name PROFILE
- `ALTER USER` name SECURITY_ALGORITHM...
- `ALTER USER` name DEFAULT ROLE role-name
- `GRANT (Role)`

**Client Authentication Types**

LDAP user and groups cannot log into Vertica if client authentication is not assigned to the user or group. You can use the following valid authentication types for LDAP users and groups:

- GSS
- Ident
- LDAP
- Reject
- Trust

**LDAP Link Parameters**

Use LDAP Link parameters to determine:

- LDAP Link operations, such as enabling or disabling LDAP Link and how often to perform replication
- Authentication parameters, including SSL authentication parameters
- Users and groups that inherit unowned objects
- How to resolve conflicts
Set LDAP Link Parameters

This example shows how you can set:

- The URL of the LDAP server (LDAPLinkURL) and
- The base DN from where to start replication (LDAPLinkSearchBase)

You also see how to set the LDAP Link Bind authentication parameters (LDAPLinkBindDN and LDAPLinkBindPswd) and enables LDAP Link (LDAPLinkOn).

```
=> ALTER DATABASE myDB1 SET PARAMETER LDAPLinkURL='ldap://10.60.55.128',
    LDAPLinkSearchBase='dc=corp,dc=com',LDAPLinkBindDN='dc=corp,dc=com',LDAPLinkBindPswd='password';
=> ALTER DATABASE myDB1 SET PARAMETER LDAPLinkOn = '1';
```

General and Connection Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDAPLinkOn</td>
<td>Enables or disables LDAP Link.</td>
</tr>
<tr>
<td></td>
<td><strong>Valid Values:</strong></td>

<td>LDAPLinkGroupMembers</td>
<td>The LDAP group name linked to a user.</td>
</tr>
<tr>
<td></td>
<td>Default Value: member</td>
</tr>
<tr>
<td>LDAPLinkUserName</td>
<td>The LDAP field to use when creating a user name in Vertica.</td>
</tr>
</tbody>
</table>

**Authentication Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDAPLinkBindDN</td>
<td>The LDAP Bind DN used for authentication.</td>
</tr>
<tr>
<td></td>
<td>Example:&lt;br&gt;SET PARAMETER LDAPLinkBindDN='CN=amir,OU=QA,DC=dc,DC=com';</td>
</tr>
<tr>
<td>LDAPLinkBindPswd</td>
<td>The valid password for the LDAP Bind DN to access the server. Only accessible by the dbadmin user.</td>
</tr>
<tr>
<td></td>
<td>Example:&lt;br&gt;SET PARAMETER LDAPLinkBindPswd='password';</td>
</tr>
</tbody>
</table>

**SSL Authentication Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDAPLinkStartTLS</td>
<td>[Optional] Specifies whether or not to use the StartTLS operation during bind. You can only use this parameter if the LDAP server’s URL is &quot;ldap://...&quot; (not &quot;ldaps://...&quot;)</td>
</tr>
<tr>
<td></td>
<td>Valid Values:&lt;br&gt;0 - Do not use starttls&lt;br&gt;1 - Use starttls&lt;br&gt;Default Value: 0</td>
</tr>
<tr>
<td>LDAPLinkTLSReqCert</td>
<td>[Optional] Specifies how Vertica behaves when verifying</td>
</tr>
</tbody>
</table>
### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDAPLinkTLSCACert</td>
<td>The LDAP server's certificate when using TLS. The connection between Vertica and the LDAP server will only succeed if conditions for the specified value are met.</td>
</tr>
<tr>
<td><strong>Valid Values:</strong></td>
<td>hard: LDAP server must provide a valid certificate.</td>
</tr>
<tr>
<td></td>
<td>allow: LDAP server does not have to provide a certificate.</td>
</tr>
<tr>
<td></td>
<td>try: LDAP server must either provide a valid certificate or not provide one at all.</td>
</tr>
<tr>
<td></td>
<td>never: No requirements (Vertica does not request the LDAP server's certificate).</td>
</tr>
<tr>
<td></td>
<td>For details, see Using LDAP Over SSL/TLS.</td>
</tr>
<tr>
<td></td>
<td><strong>Default Value:</strong> allow</td>
</tr>
</tbody>
</table>

| LDAPLinkTLSCACert     | [Optional] The path to the CA certificates.                                                                                                 |

### Miscellaneous Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDAPLinkConflictPolicy</td>
<td>Determines how to resolve a user conflict.</td>
</tr>
<tr>
<td><strong>Valid Values:</strong></td>
<td>IGNORE—Ignores the incoming LDAP user and maintains the existing Vertica user.</td>
</tr>
<tr>
<td></td>
<td>MERGE—Converts the existing user to an LDAP user.</td>
</tr>
<tr>
<td></td>
<td><strong>Default Value:</strong> MERGE</td>
</tr>
</tbody>
</table>

<p>| LDAPLinkStopIfZeroUsers| Enables or disables the shutdown of LDAPLink synchronization if no users are found in LDAP.                                                   |
| <strong>Valid values:</strong>     | 0 - Disables the LDAPLink synchronization shutdown if no users are found. This may lead to inadvertent dropping of Vertica users.               |
|                       | 1 - Enables the LDAPLink synchronization shutdown if no users are found.                                                                     |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>users</td>
<td>users are found. This prevents inadvertent dropping of Vertica users.</td>
</tr>
<tr>
<td>LDAPLinkDryRun</td>
<td>[Optional] Tests the connection to the LDAP server and logs the response without doing a synchronization. Also tests if parameters are correctly set. Valid Values: 0 - Disables LDAPLinkDryRun 1 - Enables LDAPLinkDryRun Default Value: 0</td>
</tr>
</tbody>
</table>

See [Managing Configuration Parameters: VSQL](#) for information on setting LDAP Link parameters.

**Note:** When you change any Connection or Authentication parameter, LDAP Link reconnects and re-initializes the synchronization.

## Troubleshooting LDAP Link Issues

Various issues can arise with LDAP Link Service, including:

- Disconnected (Orphaned) Users and Roles
- Lost Objects
- User Conflicts

### Disconnected (Orphaned) Users and Roles

Vertica Analytic Database users and roles synchronized through LDAP Link can become disconnected, or *orphaned*, if an issue arises with the LDAP Link service. For example, users and roles become orphaned when you change the connection to the LDAP server as the following scenario describes:
1. Create an LDAP connection as follows:

```sql
=> ALTER DATABASE MyDB1 SET PARAMETER LDAPLinkURL='ldap://ebuser',
   LDAPLinkSearchBase='dc=example,dc=com', LDAPLinkBindDN='mega',
   LDAPLinkBindPswd='$megapassword$';
=> ALTER DATABASE MyDB1 SET PARAMETER LDAPLinkOn = '1';
```

2. Run an LDAP Link session to synchronize LDAP and Vertica users.

3. Change one or more connection parameters from Step 1. You can change the connection only if you change one of the LDAPLinkURL or LDAPLinkSearchBase parameters.

4. Run another LDAP Link session. The system attempts to re-synchronize LDAP and Vertica users. Since the connection has changed, the existing Vertica users cannot be synchronized with the LDAP users from the new connection. These Vertica users become orphaned.

As a dbadmin user, you can identify orphaned users by checking the field is_orphaned_from_ldap in the users system table:

```sql
=> SELECT is_orphaned_from_ldap FROM users;
```

A field value of `t` indicates that the user is an orphaned user. Orphaned Vertica users cannot connect to the LDAP server and cannot login to Vertica using LDAP authentication (however, other authentication methods assigned to the user work). In this case, you can delete the orphaned Vertica user and run the LDAP Link service to resynchronize users.

**Re-parented Objects**

When you delete users or groups from linked LDAP, the LDAP Link service removes the same users and roles from Vertica Analytic Database. However, the service does not delete objects owned by the deleted user. Use the GlobalHeirUserName parameter to assign the objects to a new owner (re-parent).

Example:

```sql
=> ALTER DATABASE example_db SET PARAMETER GlobalHeirUserName=user1;
```

This creates a new user named user1, if it does not exist. The GlobalHeirUserName user serves as the new parent for all the objects owned by deleted users.

By default, this parameter is set to `<auto>` which re-parents the objects to the dbadmin user.

If you leave GlobalHeirUserName empty, the objects are not re-parented to another user.

For more information see [GlobalHeirUserName](https://docs.vertica.com) in Security Parameters.
User Conflicts

Vertica Analytic Database users and roles synchronized using LDAP Link can become conflicted. Such conflicts can occur, for example, when you create a new user or group on the LDAP server and another user or role with the same name exists on the Vertica Analytic Database.

As a dbadmin user, use one of the following parameters to resolve user conflicts:

- LDAPLinkConflictPolicy
- LDAPLinkStopIfZeroUsers

**LDAPLinkConflictPolicy**

Use LDAPLinkConflictPolicy to resolve any user conflicts:

- LDAPLinkConflictPolicy=IGNORE - Ignores the incoming LDAP users and maintains the existing Vertica user
- LDAPLinkConflictPolicy=MERGE - Merges the incoming LDAP user with the Vertica user and converts the database user to an LDAP user retaining the database user's objects

Example:

```sql
=> ALTER DATABASE example_db SET PARAMETER LDAPLinkConflictPolicy='MERGE';
```

The default is MERGE. If you change LDAPLinkConflictPolicy, the change takes affect on the next synchronization.

**LDAPLinkStopIfZeroUsers**

Use LDAPLinkStopIfZeroUsers to prevent an accidental dropping of Vertica users if the LDAP Link synchronization does not find any LDAP users.

- LDAPLinkStopIfZeroUsers=0 - Does not stop the LDAP Link synchronization if no users are found in LDAP. This drops all Vertica users during synchronization.
- LDAPLinkStopIfZeroUsers=1 - Stops the LDAP Link synchronization if no users are found in LDAP and displays an error. This prevents the dropping of Vertica users due to some issue.
Monitoring LDAP Link

Use the ldap_link_events table to monitor events that occurred during an LDAP Link synchronization:

```sql
=> SELECT transaction_id, event_type, entry_name, entry_oid FROM ldap_link_events;

transaction_id | event_type     | entry_name | entry_oid
---------------|----------------|------------|------------
45035996273705317 | SYNC_STARTED   | | 0
4506696273253589 | SYNC_FINISHED  | | 0
45066988112255317 | PROCESSING_STARTED | | 0
2341123456789765 | USER_CREATED   | tuser      | 234548899

(4 rows)
```
**Connector Framework Service**

The Connector Framework Service (CFS) allows secure indexing of documents from IDOL to the Vertica Analytic Database. Access control lists determine which users have permissions to access documents. Documents transferred from IDOL are stored in a flex table (Using Flex Tables).

**Important:** Vertica 9.1.1 does not support the IdolLib function library. If you have the IdolLib function library installed and are upgrading to Vertica 9.1.1, you see an error and you cannot access the IdolLib function library.

To determine if the IdolLib library is installed, run the following script:

```bash
$ /opt/vertica/packages/idol/ddl/isinstalled.sql
```

To uninstall the IdolLib library, run the following script:

```bash
$ /opt/vertica/packages/idol/ddl/uninstall.sql
```

**CFS Components**

Use the following CFS components to implement the service on the Vertica:

- IDOL document metadata
- CFS Configuration file

For detailed information, see Implementing CFS.

**IDOL Document Metadata**

Vertica Analytic Database stores IDOL document metadata in a flex table. Set the name of the flex table with the TableName parameter in the CFS configuration file (see Implementing CFS). The metadata includes the following:

- **AUTONOMYMETADATA (Mandatory):** An alphanumeric designation for the ACL designated for the document.
DREFIELD: Assigns permission levels to users and groups for accessing IDOL documents.

DRETITLE: The document title.

CFS Configuration File

You must index IDOL metadata in Vertica Analytic Database to be available for queries. See Implementing CFS

Implementing CFS

After Vertica ingests documents from IDOL into flex tables, you can implement CFS to secure those documents. Implementing the security requires that the Vertica database administrator modify the CFS configuration file.

Modify the CFS Configuration File

The database administrator must modify the following in the CFS configuration file to have CFS automatically index the metadata:

1. In the [Indexing] section, set the IndexerSections parameter to vertica:

   ```yaml
   [Indexing]
   IndexerSections=vertica
   IndexBatchSize=1
   IndexTimeInterval=30
   ```

2. Create a new section with the same name you entered in the IndexerSections parameter and enter the following parameters and keywords:

   ```yaml
   [vertica]
   IndexerType=Library
   ConnectionString=Driver=Vertica;Server=123.478.900;Database=myDb;UID=dbadmin;PWD=password
   TableName=myFlexTable
   LibraryDirectory= ./shared_library_indexers
   LibraryName=VerticalIndexer
   ```

   The VerticalIndexer (LibraryName above) is part of CFS. To use this tool, you must install and configure the Vertica ODBC drivers on the same machine as CFS. CFS sends JSON-formatted data to the Flex table using ODBC.
For more information, see Installing ODBC Drivers on Linux, AIX, and HP-UX.

Query the IDOL Data

To query the IDOL data in a flex table, run a simple SELECT query. In this example, idol_table is the name of the flex table:

```sql
=> SELECT * FROM idol_table;
```
Federal Information Processing Standard

When running on a certified FIPS-140-2 Red Hat 6.6 system, Vertica uses a certified OpenSSL FIPS 140-2 cryptographic module. This meets the security standards set by the National Institute of Standards and Technology (NIST) for Federal Agencies in the United States or other countries.

The standard specifies the security requirements that a cryptographic module needs in a system protecting sensitive information. For details on the standard see the Computer Security Resource Center.

Note: Vertica itself is not FIPS compliant but it is compatible with running on a FIPS-enabled system using FIPS resources.

For a list of FIPS prerequisites, see FIPS 140-2 Supported Platforms.

OpenSSL Behavior

Dynamic OpenSSL linking is a requirement for a FIPS implementation linking on the client and server. The Vertica server uses the OpenSSL that resides on the host system (version 1.0.1e as indicated in FIPS 140-2 Supported Platforms). OpenSSL dynamically links with LDAP and Kerberos.

For more information see Locate OpenSSL Libraries.

Libraries on CentOS 6.6 FIPS Systems

On a CentOS 6.6 FIPS system, Vertica runs only with the OpenSSL libraries libcrypto.so.1.0.1e and libssl.so.1.0.1e. Other versions of these libraries do not run on a FIPS system. This incompatibility occurs because the FIPS security policy checksums the library to which an application is linked and verifies that the library the application executes with the same checksum.
Library Versioning on Non-FIPS Systems

Be aware that on some non-FIPS systems, versioning anomalies can occur when you install a new version of OpenSSL. Sometimes, the default OpenSSL build procedure produces libraries with versions named 1.0.0. For Vertica to recognize that a library has a higher version number, you must provide the library name with a higher version number. For example, when installing OpenSSL version 1.0.1t, name the libraries libcrypto.so.1.0.1t or libssl.1.0.1t (symbolic links with these names are sufficient).

FIPS-Enabled Databases: Limitations

Manually creating a new database on a FIPS-enabled Vertica Analytic Database requires a different approach than for a non-FIPS machine. Be aware of the following limitations:

- You cannot create a FIPS-enabled database on a non-FIPS machine.
- You cannot create a non-FIPS database on a FIPS-enabled machine.
- Copying data generated with the MD5 hashing algorithm from a non-FIPS machine to a FIPS-enabled machine results in data corruption.
- Due to limitations in the FIPS cryptographic module, Vertica does not recommend enabling internode encryption in FIPS environments. If you use FIPS and internode encryption, you may experience occasional query failure due to socket closure in workloads that send a high volume of data across the network.

Implementing FIPS 140-2

Implementing FIPS 140-2 on your Vertica Analytic Database requires configuration on the server and client. The Vertica server uses FIPS-approved algorithms; however Vertica clients may be running on non-FIPS-approved systems. Therefore, you must implement FIPS 140-2 compliance from end to end.

For more information on implementing FIPS, see:

- Implement FIPS on the Server
- Implement FIPS on the Client
Implement FIPS on the Server

To implement FIPS on the Vertica server, you must:

- Generate a secure SSL certificate to establish a secure connection to the client.
- If necessary, set the LD_LIBRARY_PATH environment variable to locate the OpenSSL libraries.

RequireFIPS Parameter

Upon startup Vertica sets the RequireFIPS configuration parameter on the server to reflect the FIPS state of the system: 1 if FIPS is enabled and 0 if FIPS is disabled.

The value of RequireFIPS matches the value of crypto.fips_enabled file.

Depending on the FIPS state, the following behaviors can occur:

- If the file /proc/sys/crypto/fips_enabled exists and contains a 1 (FIPS-enabled), Vertica sets RequireFIPS to 1.
- If the file /proc/sys/crypto/fips_enabled does not exist, or exists and contains a 0 (non-FIPS), Vertica automatically sets RequireFIPS to 0.
- If the FIPS state of a node, as determined from the existence of /proc/sys/crypto/fips_enabled, differs from the state received from the cluster initiator, the node fails. This behavior prevents the creation of clusters of mixed FIPS and non-FIPS systems.

Important: If you attempt to restore a FIPS-enabled node to a non-FIPS cluster, the restore process fails.

Locate OpenSSL Libraries

Vertica must find and load the correct OpenSSL libraries: libcrypto.so.1.0.1e and libssl.so.1.0.1e. To do so, it searches the system directory where the libraries reside. If the SSL libraries are not found, Vertica uses its own OpenSSL libraries that reside under /opt/vertica/lib.
Note: If you do not use admintools to start Vertica, or have conflicting libraries in your system, you must manually set LD_LIBRARY_PATH and /opt/vertica/lib must appear first in the list. When admintools starts or reboots Vertica, the path is set automatically.

Secure Client-Server Connection

Vertica uses TLS 1.2 to support the server-client connection for a FIPS-enabled system. This specification includes using a server certificate issued by a Certificate Authority.

Note: Using TLS 1.2 prevents you from using the MD5 algorithm for hashing passwords. Vertica accepts only AuthenticatedClearTextPasswords hashed by SHA-512. Users with MD5 passwords must migrate to SHA-512 passwords. For more information, see Upgrade Considerations for Hash Authentication.

For instructions on generating a self-signed certificate see Generating SSL Certificates and Keys.

After generating a certificate, you need to distribute it to all hosts on the cluster. See Distributing Certificates and Keys. This distribution stores the certificate in the SSLCertificate parameter and the private key in the SSLPrivateKey parameter. For more information see Security Parameters.

Implement FIPS on the Client

Vertica provides a FIPS-compliant client driver, which you can install on a FIPS-enabled system. The 64-bit client includes vsql and ODBC drivers.

For information about installing the FIPS client, and installation, refer to the following

- Installing the FIPS Client Driver for ODBC and vsql
- Installing the FIPS Client Driver for JDBC

FIPS 140-2 Compliance Statement

Contents

1. Summary
2. Overview
3. Vertica and FIPS 140-2

1. Summary

Vertica complies with Federal Information Processing Standard 140-2 (FIPS 140-2), which defines the technical requirements to be used by Federal Agencies when these organizations specify cryptographic-based security systems for protection of sensitive or valuable data. The compliance of Vertica with FIPS 140-2 is ensured by: 1) Integrating validated and NIST-certified third party cryptographic module(s), and using the module(s) as the only provider(s) of cryptographic services; 2) Using FIPS-approved cryptographic functions; 3) Using FIPS-approved and NIST-validated technologies applicable for Vertica design, implementation and operation.

2. Overview

a. About Vertica

- Vertica is a high performance relational database management system used for advanced analytics applications. Its performance and scale is achieved through a columnar storage and execution architecture that offers a massively parallel processing solution. Aggressive encoding and compression allows Vertica analytics to perform by reducing CPU, memory and disk I/O Processing times.

- For more details about Vertica and its usage, see Vertica Concepts.

b. About FIPS 140-2

FIPS (Federal Information Processing Standard) 140-2, Security requirements for cryptographic modules, is the Federal standard for proper cryptography for computer systems purchased by the government.

The benefits of using FIPS 140-2 validated crypto module is that the crypto algorithms are deemed appropriate and that they perform the encrypt/decrypt/hash functions correctly. The standard specifies the security requirements for cryptographic modules utilized within a
security system that protects sensitive or valuable data. The requirements can be found in the following documents:

- SECURITY REQUIREMENTS FOR CRYPTOGRAPHIC MODULES
- Annex A: Approved Security Functions for FIPS PUB 140-2, Security Requirements for Cryptographic Modules

3. Vertica and FIPS 140-2

FIPS 140-2 validated third party module

Vertica conforms with FIPS 140-2 Level 1 compliance by dynamically linking to the FIPS 140-2 approved OpenSSL cryptographic module provided by the Operating System, which in our initial release is RedHat Enterprise Linux 6.6 OpenSSL Module.

Vertica can be configured to operate in FIPS-compliant mode ensuring its functions and procedures like SSL/TLS connections, which require cryptography (secure hash, encryption, digital signatures, etc.) makes use of the crypto services provided by RedHat Enterprise 6.6 OpenSSL module Version 3.0 which is validated for FIPS 140-2. If you are not running on RedHat 6.6 you will not be able to run Vertica on FIPS mode. The assurance that Vertica is using the right FIPS 140-2 encryption modules is managed at the operating system level by RedHat’s implementation.

Vertica checks the OS level flag setting /proc/sys/crypto/fips_enabled to kick off Vertica’s FIPS mode installation. Further details about how to install and configure Vertica and its components to conform to FIPS 140-2 standard appear in the installation and security guides:

- Installing Vertica with the Installation Script
- Federal Information Processing Standard

Modes of Operation

Vertica Server operates in one of two modes determined by the OS configuration.

- FIPS-compliant mode – supports FIPS 140-2 compliant cryptographic functions. In this mode, all cryptographic functions, default algorithms and key lengths are bound to those allowed by FIPS 140-2.

- Standard mode – non-FIPS 140-2 compliant mode which utilizes all existing Vertica cryptography functions.
**TLS/SSL3.x**

All the Vertica client/server communications can be secured with FIPS-compliant Transport Layer Security TLS1.2/SSL3.1 or higher. It is relying on FIPS 140-2 approved hash algorithms and ciphers.

- TLS handshake, key negotiation and authentication provides data integrity and uses secure hash and FIPS 140-2 approved cryptography and digital signature.
- TLS encryption of data in transit provides confidentiality and making use of FIPS 140-2 approved cryptography.

**Secure Hash**

Per FIPS 140-2 standards, Vertica, in the FIPS 140-2 compliant mode, can be configured to use only the SHA-512 algorithm.

**FIPS 140-2 Architecture**

Vertica is a relational database system that is comprised of a client component and a server component. On the Client Side, we offer a suite of drivers for host clients to access the Vertica Server Side component. Both client and server Vertica components conform to FIPS 140-2 Level 1 compliance by dynamically linking to the FIPS 140-2 approved OpenSSL cryptographic module provided by RedHat Enterprise Linux 6.6 OpenSSL Module.

**Supported platforms**

Supported operating systems (both client and server):

- RedHat Enterprise Linux 6.6 64 bit

Supported client drivers:

- ODBC only
Design Assurance

Vertica uses the security provider Red Hat Enterprise Linux 6.6 OpenSSL Module v3.0. This is the only supported security provider for FIPS 140-2.

Once you have configured Vertica to be compliant with FIPS 140-2, you cannot revert back to the standard configuration unless you disable FIPS 140-2 at the operating system level. Please reference the following documentation section for considerations:

- Implement FIPS on the Server
- Implement FIPS on the Client
Database Auditing

Database auditing often involves observing a database to be aware of the actions the database users are taking. Auditing can help with security, for example, to ensure that a user does not change information to which they should not have access. Audit categories make it easier to track changes within the database. You can see system tables that will bring together logged queries, tables, and changes to configuration parameters.

For example, the authentication audit category tracks queries, system tables, and configuration parameters related to security and authentication, such as:

- DROP AUTHENTICATION statement
- GRANT/REVOKE authentication statements
- LDAP Link related configuration parameters

You can also use the authentication audit category for weekly security reports to better understand attempts to gain access to data or to view unauthorized changes.

There are three system tables that can be used to track changes for queries, parameters, and tables as follows:

- LOG_PARAMS
- LOG_QUERIES
- LOG_TABLES

There is also a system table for tracking changes to privileges for users:

- AUDIT_MANAGING_USERS_PRIVILEGES
System Table Restriction and Access

Two functions let you restrict and open access to system tables for a given session:

- **RESTRICT_SYSTEM_TABLES_ACCESS** restricts access to non-superuser-only tables that are not accessible during lockdown.

- **RELEASE_SYSTEM_TABLES_ACCESS** allows access to non-superuser-only tables that are not accessible during lockdown.
Extending Vertica

You can extend Vertica to perform new operations or handle new types of data. There are several types of extensions:

- **External procedures** let you execute external scripts or programs that are installed on a host in your database cluster.

- **User-Defined SQL Functions** let you store frequently-used SQL expressions. They can help you simplify and standardize your SQL scripts.

- **User-Defined Extensions (UDxs)** let you develop your own analytic or data-loading tools using the C++, Python, Java, and R programming languages. They are useful when the type of data processing you want to perform is difficult or slow using SQL.

The following sections explain how to use extensions that have already been written:

- **Using External Procedures**

- **Using User-Defined SQL Functions**

- **Using User-Defined Extensions**

*Developing User-Defined Extensions (UDxs)* explains how to write new UDxs, including the following types:
- **Aggregate Functions (UDAFs)**
- **Analytic Functions (UDAnFs)**
- **Scalar Functions (UDSFs)**
- **Transform Functions (UDTFs)**
- **Load (UDLs)**
Using External Procedures

The external procedure feature lets you call a script or executable program on a host in your database cluster from within Vertica. You can pass literal values to this external procedure as arguments. The external procedure cannot communicate back to Vertica.

This chapter explains how to create, install, and use external procedures.
Implementing External Procedures

To implement an external procedure:

   
   See Requirements for External Procedures.

2. Enable the set-user-ID(SUID), user execute, and group execute attributes for the file. The file must either be readable by the dbadmin or the file owner's password must be given with the Administration Tools install_procedure command.

3. Install the external procedure executable file.

4. Create the external procedure in Vertica.

Once a procedure is created in Vertica, you can execute or drop it, but you cannot alter it.

Requirements for External Procedures

External procedures have requirements regarding their attributes, where you store them, and how you handle their output. You should also be cognizant of their resource usage.

Procedure File Attributes

The procedure file cannot be owned by root. It must have the set-user-ID (SUID), user execute, and group execute attributes set. If it is not readable by the Linux database administrator user, then the owner's password will have to be specified when installing the procedure.

Handling Procedure Output

Vertica does not provide a facility for handling procedure output. Therefore, you must make your own arrangements for handling procedure output, which should include writing error, logging, and program information directly to files that you manage.
Handling Resource Usage

The Vertica resource manager is unaware of resources used by external procedures. Additionally, Vertica is intended to be the only major process running on your system. If your external procedure is resource intensive, it could affect the performance and stability of Vertica. Consider the types of external procedures you create and when you run them. For example, you might run a resource-intensive procedure during off hours.

Sample Procedure File

```bash
#!/bin/bash
echo "hello planet argument: $1" >> /tmp/myprocedure.log
```

Installing External Procedure Executable Files

To install an external procedure, use the Administration Tools through either menu or the command line.

Using the Admin Tools Menus

a. Run the Administration Tools.

   ```bash
   $ /opt/vertica/bin/adminTools
   ```

b. On the AdminTools Main Menu, click Configuration Menu, and then click OK.

c. On the Configuration Menu, click Install External Procedure and then click OK.

d. Select the database on which you want to install the external procedure.

e. Either select the file to install or manually type the complete file path, and then click OK.

f. If you are not the superuser, you are prompted to enter your password and click OK.

The Administration Tools automatically create the `<database_catalog_path>/procedures` directory on each node in the database and installs the external
procedure in these directories for you.

g. Click OK in the dialog that indicates that the installation was successful.

Command Line

If you use the command line, be sure to specify the full path to the procedure file and the password of the Linux user who owns the procedure file;

For example:

```
$ admintools -t install_procedure -d vmartdb -f /scratch/helloworld.sh -p ownerpassword
Installing external procedure...
External procedure installed
```

Once you have installed an external procedure, you need to make Vertica aware of it. To do so, use the `CREATE PROCEDURE` statement, but review Creating External Procedures first.

Creating External Procedures

Once you have installed an external procedure, you need to make Vertica aware of it. To do so, use the `CREATE PROCEDURE` statement.

Only a superuser can create an external procedure. Initially, only superusers can execute an external procedure. However, a superuser can grant the right to execute a stored procedure to a user on the operating system. (See GRANT (Procedure).)

Once created, a procedure is listed in the V_CATALOG.USER_PROCEDURES system table. Users can see only those procedures that they have been granted the privilege to execute.

Example

This example creates a procedure named `helloplanet` for the `helloplanet.sh` external procedure file. This file accepts one VARCHAR argument. The sample code is provided in Requirements for External Procedures.

```
=> CREATE PROCEDURE helloplanet(arg1 VARCHAR) AS 'helloplanet.sh' LANGUAGE 'external'
   USER 'dbadmin';
```

This example creates a procedure named `proctest` for the `copy_vertica_database.sh` script. This script copies a database from one cluster to another, and it is included in the server RPM located in the `/opt/vertica/scripts` directory.
CREATE PROCEDURE proctest(shosts VARCHAR, thosts VARCHAR, dbdir VARCHAR) AS 'copy_vertica_database.sh' LANGUAGE 'external' USER 'dbadmin';

Overloading External Procedures

You can create multiple external procedures with the same name as long as they have a different signature (accept a different set of arguments). For example, you can overload the helloplanet external procedure to also accept an integer value:

CREATE PROCEDURE helloplanet(arg1 INT) AS 'helloplanet.sh' LANGUAGE 'external' USER 'dbadmin';

After executing the above statement, your database catalog will have two external procedures named helloplanet—one that accepts a VARCHAR argument and one that accepts an integer. When you call the external procedure, Vertica determines which procedure to call based on the arguments you passed in the procedure call.

See Also

- CREATE PROCEDURE
- GRANT (Procedure)

Executing External Procedures

Once you define a procedure through the CREATE PROCEDURE statement, you can use it as a meta command through a simple SELECT statement. Vertica does not support using procedures in more complex statements or in expressions.

The following example runs a procedure named helloplanet:

SELECT helloplanet('earthlings');

The following example runs a procedure named proctest. This procedure references the copy_vertica_database.sh script that copies a database from one cluster to another. It is installed by the server RPM in the /opt/vertica/scripts directory.
=> SELECT proctest(
    '-s qa01',
    '-t rbench1',
    '-D /scratch_b/qa/PROC_TEST' );

**Note:** External procedures have no direct access to database data. If available, use ODBC or JDBC for this purpose.

Procedures are executed on the initiating node. Vertica runs the procedure by forking and executing the program. Each procedure argument is passed to the executable file as a string. The parent fork process waits until the child process ends.

To stop execution, cancel the process by sending a cancel command (for example, CTRL+C) through the client. If the procedure program exits with an error, an error message with the exit status is returned.

**Permissions**

To execute an external procedure, the user needs:

- EXECUTE privilege on procedure
- USAGE privilege on schema that contains the procedure

**See Also**

- [CREATE PROCEDURE](#)
- [External Procedure Privileges](#)

**Dropping External Procedures**

Only a superuser can drop an external procedure. To drop the definition for an external procedure from Vertica, use the `DROP PROCEDURE` statement. Only the reference to the procedure is removed. The external file remains in the `<database>/procedures` directory on each node in the database.

**Note:** The definition Vertica uses for a procedure cannot be altered; it can only be dropped.
Example

```sql
=> DROP PROCEDURE helloplanet(arg1 varchar);
```

See Also

- [DROP PROCEDURE](#)
Using User-Defined SQL Functions

User-Defined SQL Functions let you define and store commonly-used SQL expressions as a function. User-Defined SQL Functions are useful for executing complex queries and combining Vertica built-in functions. You simply call the function name you assigned in your query.

A User-Defined SQL Function can be used anywhere in a query where an ordinary SQL expression can be used, except in the table partition clause or the projection segmentation clause.

For syntax and parameters for the commands and system table discussed in this section, see the following topics in the SQL Reference Manual:

- CREATE FUNCTION
- ALTER FUNCTION (UDF)
- DROP FUNCTION
- GRANT (User Defined Extension)
- REVOKE (User Defined Extension)
- V_CATALOG.USER_FUNCTIONS

Creating User-Defined SQL Functions

A user-defined SQL function can be used anywhere in a query where an ordinary SQL expression can be used, except in the table partition clause or the projection segmentation clause.

To create a SQL function, the user must have CREATE privileges on the schema. To use a SQL function, the user must have USAGE privileges on the schema and EXECUTE privileges on the defined function.

This following statement creates a SQL function called myzeroifnull that accepts an INTEGER argument and returns an INTEGER result.

```
=> CREATE FUNCTION myzeroifnull(x INT) RETURN INT
   AS BEGIN
      RETURN (CASE WHEN (x IS NOT NULL) THEN x ELSE 0 END);
   END;
```
You can use the new SQL function (myzeroifnull) anywhere you use an ordinary SQL expression. For example, create a simple table:

```sql
=> CREATE TABLE tabwnulls(col1 INT);
=> INSERT INTO tabwnulls VALUES(1);
=> INSERT INTO tabwnulls VALUES(NULL);
=> INSERT INTO tabwnulls VALUES(0);
=> SELECT * FROM tabwnulls;
```

<table>
<thead>
<tr>
<th>a</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
<tr>
<td>0</td>
</tr>
<tr>
<td>(3 rows)</td>
</tr>
</tbody>
</table>

Use the myzeroifnull function in a SELECT statement, where the function calls col1 from table tabwnulls:

```sql
=> SELECT myzeroifnull(col1) FROM tabwnulls;
myzeroifnull
----------
   1
   0
   0
(3 rows)
```

Use the myzeroifnull function in the GROUP BY clause:

```sql
=> SELECT COUNT(*) FROM tabwnulls GROUP BY myzeroifnull(col1);
count
-----
   2
   1
(2 rows)
```

If you want to change a user-defined SQL function's body, use the CREATE OR REPLACE syntax. The following command modifies the CASE expression:

```sql
=> CREATE OR REPLACE FUNCTION myzeroifnull(x INT) RETURN INT
   AS BEGIN
     RETURN (CASE WHEN (x IS NULL) THEN 0 ELSE x END);
   END;
```

To see how this information is stored in the Vertica catalog, see Viewing Information About SQL Functions in this guide.

**See Also**

- CREATE FUNCTION (SQL Functions)
- USER_FUNCTIONS
Altering and Dropping User-Defined SQL Functions

Vertica allows multiple functions to share the same name with different argument types. Therefore, if you try to alter or drop a SQL function without specifying the argument data type, the system returns an error message to prevent you from dropping the wrong function:

```
=> DROP FUNCTION myzeroifnull();
ROLLBACK: Function with specified name and parameters does not exist: myzeroifnull
```

**Note:** Only a superuser or owner can alter or drop a SQL Function.

Altering a User-Defined SQL Function

The `ALTER FUNCTION (UDF)` command lets you assign a new name to a user-defined function, as well as move it to a different schema.

In the previous topic, you created a SQL function called `myzeroifnull`. The following command renames the `myzeroifnull` function to `zerowhennull`:

```
=> ALTER FUNCTION myzeroifnull(x INT) RENAME TO zerowhennull;
ALTER FUNCTION
```

This next command moves the renamed function into a new schema called `macros`:

```
=> ALTER FUNCTION zerowhennull(x INT) SET SCHEMA macros;
ALTER FUNCTION
```

Dropping a SQL Function

The `DROP FUNCTION` command drops a SQL function from the Vertica catalog.

Like with `ALTER FUNCTION`, you must specify the argument data type or the system returns the following error message:

```
=> DROP FUNCTION zerowhennull();
ROLLBACK: Function with specified name and parameters does not exist: zerowhennull
```

Specify the argument type:
DROP FUNCTION macros.zerowhennull(x INT);
DROP FUNCTION

Vertica does not check for dependencies, so if you drop a SQL function where other objects reference it (such as views or other SQL Functions), Vertica returns an error when those objects are used, not when the function is dropped.

Tip: To view a list of all user-defined SQL functions on which you have EXECUTE privileges, (which also returns their argument types), query the V_CATALOG.USER_FUNCTIONS system table.

### See Also
- ALTER FUNCTION (UDF)
- DROP FUNCTION

### Managing Access to SQL Functions

Before a user can execute a user-defined SQL function, he or she must have USAGE privileges on the schema and EXECUTE privileges on the defined function. Only the superuser or owner can grant/revoke EXECUTE usage on a function.

To grant EXECUTE privileges to user Fred on the myzeroifnull function:

```sql
=> GRANT EXECUTE ON FUNCTION myzeroifnull (x INT) TO Fred;
```

To revoke EXECUTE privileges from user Fred on the myzeroifnull function:

```sql
=> REVOKE EXECUTE ON FUNCTION myzeroifnull (x INT) FROM Fred;
```

### See Also
- GRANT (User Defined Extension)
- REVOKE (User Defined Extension)
Viewing Information About User-Defined SQL Functions

You can access information about any User-Defined SQL Functions on which you have EXECUTE privileges. This information is available in the system table `V_CATALOG.USER_FUNCTIONS` and from the vsql meta-command `\df`.

To view all of the User-Defined SQL Functions on which you have EXECUTE privileges, query the `USER_FUNCTIONS` table:

```sql
=> SELECT * FROM USER_FUNCTIONS;
```

<table>
<thead>
<tr>
<th>schema_name</th>
<th>public</th>
</tr>
</thead>
<tbody>
<tr>
<td>function_name</td>
<td>myzeroifnull</td>
</tr>
<tr>
<td>function_return_type</td>
<td>Integer</td>
</tr>
<tr>
<td>function_argument_type</td>
<td>x Integer</td>
</tr>
<tr>
<td>function_definition</td>
<td>RETURN CASE WHEN (x IS NOT NULL) THEN x ELSE 0 END</td>
</tr>
<tr>
<td>volatility</td>
<td>immutable</td>
</tr>
<tr>
<td>is_strict</td>
<td>f</td>
</tr>
</tbody>
</table>

If you want to change a User-Defined SQL Function's body, use the CREATE OR REPLACE syntax. The following command modifies the CASE expression:

```sql
=> CREATE OR REPLACE FUNCTION myzeroifnull(x INT) RETURN INT
   AS BEGIN
       RETURN (CASE WHEN (x IS NULL) THEN 0 ELSE x END);
   END;
```

Now when you query the `USER_FUNCTIONS` table, you can see the changes in the `function_definition` column:

```sql
=> SELECT * FROM USER_FUNCTIONS;
```

<table>
<thead>
<tr>
<th>schema_name</th>
<th>public</th>
</tr>
</thead>
<tbody>
<tr>
<td>function_name</td>
<td>myzeroifnull</td>
</tr>
<tr>
<td>function_return_type</td>
<td>Integer</td>
</tr>
<tr>
<td>function_argument_type</td>
<td>x Integer</td>
</tr>
<tr>
<td>function_definition</td>
<td>RETURN CASE WHEN (x IS NULL) THEN 0 ELSE x END</td>
</tr>
<tr>
<td>volatility</td>
<td>immutable</td>
</tr>
<tr>
<td>is_strict</td>
<td>f</td>
</tr>
</tbody>
</table>

If you use CREATE OR REPLACE syntax to change only the argument name or argument type (or both), the system maintains both versions of the function. For example, the following command tells the function to accept and return a numeric data type instead of an integer for the `myzeroifnull` function:
CREATE OR REPLACE FUNCTION myzeroifnull(z NUMERIC) RETURN NUMERIC
AS BEGIN
    RETURN (CASE WHEN (z IS NULL) THEN 0 ELSE z END);
END;

Now query the USER_FUNCTIONS table, and you can see the second instance of myzeroifnull in Record 2, as well as the changes in the function_return_type, function_argument_type, and function_definition columns.

Note: Record 1 still holds the original definition for the myzeroifnull function:

<table>
<thead>
<tr>
<th>schema_name</th>
<th>public</th>
</tr>
</thead>
<tbody>
<tr>
<td>function_name</td>
<td>myzeroifnull</td>
</tr>
<tr>
<td>function_return_type</td>
<td>Integer</td>
</tr>
<tr>
<td>function_argument_type</td>
<td>x Integer</td>
</tr>
<tr>
<td>function_definition</td>
<td>RETURN CASE WHEN (x IS NULL) THEN 0 ELSE x END</td>
</tr>
<tr>
<td>volatility</td>
<td>immutable</td>
</tr>
<tr>
<td>is_strict</td>
<td>f</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>schema_name</th>
<th>public</th>
</tr>
</thead>
<tbody>
<tr>
<td>function_name</td>
<td>myzeroifnull</td>
</tr>
<tr>
<td>function_return_type</td>
<td>Numeric</td>
</tr>
<tr>
<td>function_argument_type</td>
<td>z Numeric</td>
</tr>
<tr>
<td>function_definition</td>
<td>RETURN (CASE WHEN (z IS NULL) THEN (0) ELSE z END)::numeric</td>
</tr>
<tr>
<td>volatility</td>
<td>immutable</td>
</tr>
<tr>
<td>is_strict</td>
<td>f</td>
</tr>
</tbody>
</table>

Because Vertica allows functions to share the same name with different argument types, you must specify the argument type when you alter or drop a function. If you do not, the system returns an error message:

=> DROP FUNCTION myzeroifnull();
ROLLBACK:  Function with specified name and parameters does not exist: myzeroifnull

See Also

- USER_FUNCTIONS

Migrating Built-In SQL Functions

If you have built-in SQL functions from another RDBMS that do not map to a Vertica-supported function, you can migrate them into your Vertica database by using a user-defined SQL function.
The example scripts below show how to create user-defined functions for the following DB2 built-in functions:

- **UCASE()**
- **LCASE()**
- **LOCATE()**
- **POSSTR()**

### UCASE()

This script creates a user-defined SQL function for the UCASE() function:

```sql
=> CREATE OR REPLACE FUNCTION UCASE (x VARCHAR)
   RETURN VARCHAR
AS BEGIN
   RETURN UPPER(x);
END;
```

### LCASE()

This script creates a user-defined SQL function for the LCASE() function:

```sql
=> CREATE OR REPLACE FUNCTION LCASE (x VARCHAR)
   RETURN VARCHAR
AS BEGIN
   RETURN LOWER(x);
END;
```

### LOCATE()

This script creates a user-defined SQL function for the LOCATE() function:

```sql
=> CREATE OR REPLACE FUNCTION LOCATE(a VARCHAR, b VARCHAR)
   RETURN INT
AS BEGIN
   RETURN POSITION(a IN b);
END;
```
POSSTR()

This script creates a user-defined SQL function for the POSSTR() function:

```sql
=> CREATE OR REPLACE FUNCTION POSSTR(a VARCHAR, b VARCHAR)
   RETURN INT
   AS BEGIN
   RETURN POSITION(b IN a);
END;
```
Using User-Defined Extensions

A User-Defined Extension (abbreviated as UDx) is a component that adds new abilities to the Vertica Analytics Platform. UDxs provide features such as new types of data analysis and the ability to parse and load new types of data.

This section provides an overview of how to install and use a UDx. If you are using a UDx developed by a third party, you should consult any documentation that accompanies it for detailed installation and usage instructions.

Loading UDxs

User-Defined Extensions (UDxs) are contained in libraries. A library can contain multiple UDxs. To add UDxs to Vertica you must:

1. Load the library (once per library).
2. Declare each UDx (once per UDx).

If you are using UDxs written in Java, you must also set up a Java runtime environment. See Installing Java on Vertica Hosts.

Loading Libraries

To deploy a library to your Vertica database:

1. Copy the UDx shared library file (.so), Python file, or JAR that contains your function to a node on your Vertica cluster. You do not need to copy it to every node.
2. Connect to the node where you copied the library (for example, using vsq1).
3. Add your library to the database catalog using the CREATE LIBRARY statement.

```=> CREATE LIBRARY libname AS '/path_to_lib/filename'
    LANGUAGE 'language';
```

Libname is the name you want to use to reference the library. path_to_lib/filename is the fully-qualified path to the library or JAR file you copied to the host. language is the implementation language.
For example, if you created a JAR file named TokenizeStringLib.jar and copied it to the dbadmin account's home directory, you would use this command to load the library:

```sql
=> CREATE LIBRARY tokenizelib AS '/home/dbadmin/TokenizeStringLib.jar'
    LANGUAGE 'Java';
```

You can load any number of libraries into Vertica.

### Declaring Individual UDxs

Once the library is loaded, define individual UDxs using SQL statements such as `CREATE FUNCTION` and `CREATE SOURCE`. These statements assign SQL function names to the extension classes in the library. They add the UDx to the database catalog and remain available after a database restart.

The statement you use depends on the type of UDx you are declaring, as shown in the following table.

<table>
<thead>
<tr>
<th>UDx Type</th>
<th>SQL Statement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aggregate Function (UDAF)</td>
<td>CREATE AGGREGATE FUNCTION</td>
</tr>
<tr>
<td>Analytic Function (UDAnF)</td>
<td>CREATE ANALYTIC FUNCTION</td>
</tr>
<tr>
<td>Scalar Function (UDSF)</td>
<td>CREATE FUNCTION (UDF)</td>
</tr>
<tr>
<td>Transform Function (UDTF)</td>
<td>CREATE TRANSFORM FUNCTION</td>
</tr>
<tr>
<td>Load (UDL): Source</td>
<td>CREATE SOURCE</td>
</tr>
<tr>
<td>Load (UDL): Filter</td>
<td>CREATE FILTER</td>
</tr>
<tr>
<td>Load (UDL): Parser</td>
<td>CREATE PARSER</td>
</tr>
</tbody>
</table>

After you add the UDx to the database, you can use your extension within SQL statements. The database superuser can grant access privileges to the UDx for users. See [GRANT (User Defined Extension)](https://docs.vertica.com/en-us/dm/dm_01_02_01_01.html) in the SQL Reference Manual for details.

When you call a UDx, Vertica creates an instance of the UDx class on each node in the cluster and provides it with the data it needs to process.
Installing Java on Vertica Hosts

If you are using UDxs written in Java, follow the instructions in this section.

You must install a Java Virtual Machine (JVM) on every host in your cluster in order for Vertica to be able to execute your Java UDxs.

Installing Java on your Vertica cluster is a two-step process:

1. Install a Java runtime on all of the hosts in your cluster.
2. Set the JavaBinaryForUDx configuration parameter to tell Vertica the location of the Java executable.

Installing a Java Runtime

For Java-based features, Vertica requires a 64-bit Java 6 (Java version 1.6) or later Java runtime. Vertica supports runtimes from either Oracle or OpenJDK. You can choose to install either the Java Runtime Environment (JRE) or Java Development Kit (JDK), since the JDK also includes the JRE.

Many Linux distributions include a package for the OpenJDK runtime. See your Linux distribution's documentation for information about installing and configuring OpenJDK.

To install the Oracle Java runtime, see the Java Standard Edition (SE) Download Page. You usually run the installation package as root in order to install it. See the download page for instructions.

Once you have installed a JVM on each host, ensure that the java command is in the search path and calls the correct JVM by running the command:

```
$ java -version
```

This command should print something similar to:

```
java version "1.8.0_102"
Java(TM) SE Runtime Environment (build 1.8.0_102-b14)
Java HotSpot(TM) 64-Bit Server VM (build 25.102-b14, mixed mode)
```

Note: Any previously installed Java VM on your hosts may interfere with a newly installed Java runtime. See your Linux distribution's documentation for instructions on configuring which JVM is the default. Unless absolutely required, you should uninstall any incompatible
version of Java before installing the Java 6 or Java 7 runtime.

Setting the JavaBinaryForUDx Configuration Parameter

The JavaBinaryForUDx configuration parameter tells Vertica where to look for the JRE to execute Java UDxs. After you have installed the JRE on all of the nodes in your cluster, set this parameter to the absolute path of the Java executable. You can use the symbolic link that some Java installers create (for example /usr/bin/java). If the Java executable is in your shell search path, you can get the path of the Java executable by running the following command from the Linux command line shell:

```
$ which java
/usr/bin/java
```

If the `java` command is not in the shell search path, use the path to the Java executable in the directory where you installed the JRE. Suppose you installed the JRE in /usr/java/default (which is where the installation package supplied by Oracle installs the Java 1.6 JRE). In this case the Java executable is /usr/java/default/bin/java.

You set the configuration parameter by executing the following statement as a database superuser:

```
=> ALTER DATABASE mydb SET JavaBinaryForUDx = '/usr/bin/java';
```

See `ALTER DATABASE` for more information on setting configuration parameters.

To view the current setting of the configuration parameter, query the `CONFIGURATION_PARAMETERS` system table:

```
=> \x
Expanded display is on.
=> SELECT * FROM CONFIGURATION_PARAMETERS WHERE parameter_name = 'JavaBinaryForUDx';
- [ RECORD 1 ] --------------------------------------------------------------------------------------
  node_name | ALL
  parameter_name | JavaBinaryForUDx
  current_value | /usr/bin/java
  default_value |
  change_under_support_guidance | f
  change_requires_restart | f
  description | Path to the java binary for executing UDx written in Java
```

Once you have set the configuration parameter, Vertica can find the Java executable on each node in your cluster.

**Note:** Since the location of the Java executable is set by a single configuration parameter for the entire cluster, you must ensure that the Java executable is installed in the same
path on all of the hosts in the cluster.

# Notes on Individual UDx Types

Some UDx types have special considerations or restrictions.

## Analytic Functions

UDAnFs do not support framing windows using ROWS.

As with Vertica's built-in analytic functions, UDAnFs cannot be used with Pattern Matching Functions.

## Scalar Functions

If the result of applying a UDSF is an invalid record, COPY aborts the load even if CopyFaultTolerantExpressions is set to true.

## Transform Functions

A query that includes a UDTF cannot contain:

- Any statements other than the SELECT statement containing the call to the UDTF and a PARTITION BY expression
- Any other analytic function
- A call to another UDTF
- A TIMESERIES clause
- A pattern matching clause
- A gap filling and interpolation clause
Load

Installing an untrusted UDL function can compromise the security of the server. UDx's can contain arbitrary code. In particular, UD Source functions can read data from any arbitrary location. It is up to the developer of the function to enforce proper security limitations. Superusers must not grant access to UDx's to untrusted users.

You cannot ALTER UDL functions.

Fenced Mode

User-Defined Extensions (UDxs) written in the C++ programming language have the option of running in unfenced mode, which means running directly within the Vertica process. Since they run within Vertica, unfenced UDxs have little overhead, and can perform almost as fast as Vertica's own built-in functions. However, since they run within Vertica directly, any bugs in their code (memory leaks, for example) can destabilize the main Vertica process that can bring one or more database nodes down.

You can instead opt to run most C++ UDxs in fenced mode, which runs the UDxs code outside of the main Vertica process in a separate zygote process. UDx code that crashes while running in fenced mode does not impact the core Vertica process. There is a small performance impact when running UDx code in fenced mode. On average, using fenced mode adds about 10% more time to execution compared to unfenced mode.

Fenced mode is currently available for all C++ UDxs with the exception of User-Defined Aggregates. All UDxs developed in the Python, R, and Java programming languages must run in fenced mode, since the Python, R, and Java runtimes cannot be directly run within the Vertica process.

Using fenced mode does not affect the development of your UDx. Fenced mode is enabled by default for UDx's that support fenced mode. The CREATE FUNCTION command can optionally be issued with the NOT FENCED modifier to disable fenced mode for the function. Also, you can enable or disable fenced mode on any fenced mode-supported C++ UDx by using the ALTER FUNCTION command.

About the Zygote Process

The Vertica zygote process starts when Vertica starts. Each node has a single zygote process. Side processes are created "on demand". The zygote listens for requests and spawns a UDx
side session that runs the UDx in fenced mode when a UDx is called by the user.

About Fenced Mode Logging:

UDx code that runs in fenced mode is logged in the `UDxZygote.log` and is stored in the `UDxLogs` directory in the catalog directory of Vertica. Log entries for the side process are denoted by the UDx language (for example, C++), node, and zygote process ID, and the UDxSideProcess ID.

For example, for the following processes...

```
=> SELECT * FROM UDx_FENCED PROCESSES;
     node_name     | process_type | session_id  | pid   | port   | status
-----------------|--------------|-------------|-------|--------|--------
v_vmart_node0001 | UDxZygoteProcess | 27468      | 51900 | 44123  | UP
v_vmart_node0001 | UDxSideProcess  | localhost.localdoma-27465:0x800b | 5677  | 44123  | UP
```

... the corresponding log file displays:

```
2016-05-16 11:24:43.990 [C++-localhost.localdoma-27465:0x800b-5677] 0x2b3ff17e7fd0 UDx side process started
11:24:43.996 [C++-localhost.localdoma-27465:0x800b-5677] 0x2b3ff17e7fd0 Finished setting up signal handlers.
11:24:43.996 [C++-localhost.localdoma-27465:0x800b-5677] 0x2b3ff17e7fd0 My port: 44123
11:24:43.996 [C++-localhost.localdoma-27465:0x800b-5677] 0x2b3ff17e7fd0 My address: 0.0.0.0
11:24:43.996 [C++-localhost.localdoma-27465:0x800b-5677] 0x2b3ff17e7fd0 Vertica port: 51900
11:24:43.996 [C++-localhost.localdoma-27465:0x800b-5677] 0x2b3ff17e7fd0 Vertica address: 127.0.0.1
11:25:19.749 [C++-localhost.localdoma-27465:0x800b-5677] 0x41837940 Setting memory resource limit to -1
11:30:11.523 [C++-localhost.localdoma-27465:0x800b-5677] 0x41837940 Exiting UDx side process
```

The last line indicates that the side process was killed. In this case it was killed when the user session (vsql) closed.

About Fenced Mode Configuration Parameters

Fenced mode supports three configuration parameters:

- **FencedUDxMemoryLimitMB** - The maximum memory size, in MB, to use for Fenced Mode processes. The default is -1 (no limit). The side process is killed if this limit is exceeded.

- **ForceUDxFencedMode** - When set to 1, force all UDx's that support fenced mode to run in fenced mode even if their definition specified NOT FENCED. The default is 0 (disabled).

- **UDxFencedBlockTimeout** - The maximum time, in seconds, that the Vertica server waits for a UDx to return before aborting with ERROR 3399. The default is 60.

Updating UDx Libraries

There are two cases where you need to update libraries that you have already deployed:

- When you have upgraded Vertica to a new version that contains changes to the SDK API. For your libraries to work with the new server version, you need to recompile them with new version of the SDK. See UDx Library Compatibility with New Server Versions for more information.

- When you have made changes to your UDxs and you want to deploy these changes. Before updating your UDx library, you need to determine if you have changed the signature of any of the functions contained in the library. If you have, you need to drop the functions from the Vertica catalog before you update the library.

UDx Library Compatibility with New Server Versions

The Vertica SDK defines an application programming interface (API) that UDxs use to interact with the database. When developers compile their UDx code, it is linked to the SDK code to form a library. This library is only compatible with Vertica servers that support the version of the SDK API used to compile the code. The library and servers that share the same API version are compatible on a binary level (referred to as "binary compatible").

The Vertica server returns an error message if you attempt to load a library that is not binary compatible with it. Similarly, if you upgrade your Vertica server to a version that supports a new SDK API, any existing UDx that relies on newly-incompatible libraries returns an error messages when you call it:

```plaintext
ERROR 2858: Could not find function definition
HINT: This usually happens due to missing or corrupt libraries, libraries built with the wrong SDK version, or due to a concurrent session dropping the library or function. Try recreating the library and function
```

To resolve this issue, you must install UDx libraries that have been recompiled with correct version of the SDK.

New versions of the Vertica server do not always change the SDK API version. The SDK API version changes whenever OpenText changes the components that make up the SDK. If the SDK API does not change in a new version of the server, then the old libraries remain compatible with the new server.
The SDK API almost always changes in Vertica releases (major, minor, service pack) as OpenText expands the SDK’s features. Vertica will never change the API in a hotfix patch.

These policies mean that you need to update UDx libraries when you upgrade between major versions. For example, if you upgrade from version 9.0 to 9.1, you need to update your UDx libraries.

**Note:** Since the R language is interpreted, a UDx written in R is not linked to the Vertica SDK. There is no binary compatibility that has to be maintained from one version to another. Therefore, changes to the Vertica SDK between Vertica versions do not make your R-based UDx libraries incompatible with a new server version. An R-based UDx only becomes incompatible if the APIs uses in the SDK actually change. For example, if the number of arguments to an API call changes, the UDx written in R has to be changed to use the new number of arguments.

**Pre-Upgrade Steps**

Before upgrading your Vertica server, consider whether you have any UDx libraries that may be incompatible with the new version. Consult the release notes of the new server version to determine whether the SDK API has changed between the version of Vertica server you currently have installed and the new version. As mentioned previously, only upgrades from a previous major version or from the initial release of a major version to a service pack release can cause your currently-loaded UDx libraries to become incompatible with the server.

Any UDx libraries that are incompatible with the new version of the Vertica server must be recompiled. If you got the UDx library from a third party (such as through the Vertica Marketplace), you need to see if a new version has been released. If so, download the UDx library and deploy it after you have upgraded the server (see [Deploying A New Version of Your UDx Library](#)).

If you developed the UDx yourself (or if whoever developed it supplied the UDx's source code) you must:

1. Recompile your UDx library using the new version of the Vertica SDK. See [Compiling Your C++ Library](#) or [Compiling and Packaging a Java Library](#) for more information.
2. Deploy the new version of your library. See [Deploying A New Version of Your UDx Library](#).

**Determining If a UDx Signature Has Changed**

You need to be careful when making changes to UDx libraries that contain functions you have already deployed in your Vertica database. When you deploy a new version of your UDx library,
Vertica does not ensure that the signatures of the functions that are defined in the library match the signature of the function that is already defined in the Vertica catalog. If you have changed the signature of a U Dx in the library then update the library in the Vertica database, calls to the altered U Dx will produce errors.

Making any of the following changes to a U Dx alters its signature:

- Changing the number of arguments accepted or the data type of any argument accepted by your function (not including polymorphic functions).
- Changing the number or data types of any return values or output columns.
- Changing the name of the factory class that Vertica uses to create an instance of your function code.
- Changing the null handling or volatility behavior of your function.
- Removed the function's factory class from the library completely.

The following changes do not alter the signature of your function, and do not require you to drop the function before updating the library:

- Changing the number or type of arguments handled by a polymorphic function. Vertica does not process the arguments the user passes to a polymorphic function.
- Changing the name, data type, or number of parameters accepted by your function. The parameters your function accepts are not determined by the function signature. Instead, Vertica passes all of the parameters the user included in the function call, and your function processes them at runtime. See U Dx Parameters for more information about parameters.
- Changing any of the internal processing performed by your function.
- Adding new U Dxs to the library.

After you drop any functions whose signatures have changed, you load the new library file, then re-create your altered functions. If you have not made any changes to the signature of your U Dxs, you can just update the library file in your Vertica database without having to drop or alter your function definitions. As long as the U Dx definitions in the Vertica catalog match the signatures of the functions in your library, function calls will work transparently after you have updated the library. See Deploying A New Version of Your U Dx Library.

**Deploying A New Version of Your U Dx Library**

You need to deploy a new version of your U Dx library if:
You have made changes to the library that you now want to roll out to your Vertica database.

You have upgraded your Vertica to a new version whose SDK is incompatible with the previous version.

The process of deploying a new version of your library is similar to deploying it initially.

1. If you are deploying a UDx library developed in C++ or Java, you must compile it with the current version of the Vertica SDK.

2. Copy your UDx's library file (a .so file for libraries developed in C++, a .py file for libraries developed in Python, or a .jar file for libraries developed in Java) or R source file to a host in your Vertica database.

3. Connect to the host using vsql.

4. If you have changed the signature of any of the UDxs in the shared library, you must drop them using DROP statements such as DROP FUNCTION or DROP SOURCE. If you are unsure whether any of the signatures of your functions have changed, see Determining If a UDx Signature Has Changed.

   Note: If all of the UDx signatures in your library have changed, you may find it more convenient to drop the library using the DROP LIBRARY statement with the CASCADE option to drop the library and all of the functions and loaders that reference it. Droping the library can save you the time it would take to drop each UDx individually. You can then reload the library and recreate all of the extensions using the same process you used to deploy the library in the first place. See CREATE LIBRARY in the SQL Reference Manual.

5. Use the ALTER LIBRARY statement to update the UDx library definition with the file you copied in step 1. For example, if you want to update the library named ScalarFunctions with a file named ScalarFunctions-2.0.so in the dbadmin user's home directory, you could use the command:

   ```
   => ALTER LIBRARY ScalarFunctions AS '/home/dbadmin/ScalarFunctions-2.0.so';
   ```

Once you have updated the UDx library definition to use the new version of your shared library, the UDxs that are defined using classes in your UDx library begin using the new shared library file without any further changes.
6. If you had to drop any functions in step 4, recreate them using the new signature defined by the factory classes in your library. See CREATE FUNCTION Statements in the SQL Reference Manual.
Listing the UDxs Contained in a Library

Once a library has been loaded using the `CREATE LIBRARY` statement, you can find the UDxs and UDLs it contains by querying the `USER_LIBRARY_MANIFEST` system table:

```sql
=> CREATE LIBRARY ScalarFunctions AS '/home/dbadmin/ScalarFunctions.so';
CREATE LIBRARY => \\nExpanded display is on.
=> SELECT * FROM USER_LIBRARY_MANIFEST WHERE lib_name = 'ScalarFunctions';
- [ RECORD 1 ]------------------------
schema_name | public
lib_name | ScalarFunctions
lib_oid | 45035996273792402
obj_name | RemoveSpaceFactory
obj_type | Scalar Function
arg_types | Varchar
return_type | Varchar
- [ RECORD 2 ]------------------------
schema_name | public
lib_name | ScalarFunctions
lib_oid | 45035996273792402
obj_name | Div2intsInfo
obj_type | Scalar Function
arg_types | Integer, Integer
return_type | Integer
- [ RECORD 3 ]------------------------
schema_name | public
lib_name | ScalarFunctions
lib_oid | 45035996273792402
obj_name | Add2intsInfo
obj_type | Scalar Function
arg_types | Integer, Integer
return_type | Integer
```

The `obj_name` column lists the factory classes contained in the library. These are the names you use to define UDxs and UDLs in the database catalog using statements such as `CREATE FUNCTION` and `CREATE SOURCE`.

Using Wildcards In Your UDx

Vertica supports wildcard * characters in the place of column names in user-defined functions.

You can use wildcards when:
Your query contains a table in the FROM clause
You are using a Vertica-supported development language
Your UDx is running in fenced or unfenced mode

Supported SQL Statements
The following SQL statements can accept wildcards:
- DELETE
- INSERT
- SELECT
- UPDATE

Unsupported Configurations
The following situations do not support wildcards:
- You cannot pass a wildcard in the OVER clause of a query
- You cannot use a wildcard with a DROP statement
- You cannot use wildcards with any other arguments

Examples
These examples show wildcards and user-defined functions in a range of data manipulation operations.

DELETE statements:

```sql
=> DELETE FROM tablename WHERE udf(tablename.*) = 5;
```

INSERT statements:
=> INSERT INTO table1 SELECT udf(*) FROM table2;

**SELECT statements:**

=> SELECT udf(*) FROM tablename;
=> SELECT udf(tablename.*) FROM tablename;
=> SELECT udf(f.*) FROM table f;
=> SELECT udf(*) FROM table1,table2;
=> SELECT udf1( udf2(*) ) FROM table1,table2;
=> SELECT udf( db.schema.table.*) FROM tablename;
=> SELECT udf(sub.*) FROM (select col1, col2 FROM table) sub;
=> SELECT x FROM tablename WHERE udf(*) = y;
=> WITH sub as (SELECT * FROM tablename) select x, udf(*) FROM sub;
=> SELECT udf( * using parameters x=1) FROM tablename;
=> SELECT udf(table1.*, table2.col2) FROM table1,table2;

**UPDATE statements:**

=> UPDATE tablename set col1 = 4 FROM tablename WHERE udf(*) = 3;
Developing User-Defined Extensions (UDxs)

User-Defined Extensions (UDxs) are functions contained in external shared libraries that are developed in C++, Python, Java, or R using the Vertica SDK. The external libraries are defined in the Vertica catalog using the `CREATE LIBRARY` statement. They are best suited for analytic operations that are difficult to perform in SQL, or need to be performed frequently enough that their speed is a major concern.

The primary strengths of UDxs are:

- They can be used anywhere an internal function can be used.
- They take full advantage of Vertica's distributed computing features. The extensions usually execute in parallel on each node in the cluster.
- Vertica handles the distribution of the UDx library to the individual nodes. You only need to copy the library to the initiator node.
- All of the complicated aspects of developing a distributed piece of analytic code are handled for you by Vertica. Your main programming task is to read in data, process it, and then write it out using the Vertica SDK APIs.

There are a few things to keep in mind about developing UDxs:

- UDxs can be developed in the programming languages C++, Python, Java, and R. (Not all UDx types support all languages.)
- UDxs written in Java always run in Fenced Mode, because the Java Virtual Machine that executes Java programs cannot run directly within the Vertica process.
- UDxs written in Python and R always run in Fenced Mode.
- UDxs developed in C++ have the option of running in unfenced mode, which means they load and run directly in the Vertica database process. This option provides the lowest overhead and highest speed. However, any bugs in the UDx's code can cause database instability. You must thoroughly test any UDxs you intend to run in unfenced mode before deploying them in a live environment. Consider whether the performance boost of running a C++ UDx unfenced is worth the potential database instability that a buggy UDx can cause.
Because a UDx runs on the Vertica cluster, it can take processor time and memory away from the database processes. A UDx that consumes large amounts of computing resources can negatively impact database performance.

Structure

Each UDx type consists of two classes. The main class does the primary work (a transformation, an aggregation, and so on). The class usually has at least three methods: one to set up, one to tear down (release reserved resources), and one to do the actual work. Sometimes additional methods are defined.

The main processing method receives an instance of the `ServerInterface` class as an argument. This object is used by the underlying Vertica SDK code to make calls back into the Vertica process, for example to allocate memory. You can use this class to write to the server log during UDx execution.

The second class is a singleton factory. It defines one method that produces instances of the first class, and might define other methods to manage parameters.

When implementing a UDx you must subclass both classes.

Conventions

The C++, Python, and Java APIs are nearly identical. Where possible, this documentation describes these interfaces without respect to language. Documentation specific to C++, Python, or Java is covered in language-specific sections.

Because some documentation is language-independent, it is not always possible to use ideal, language-based terminology. This documentation uses the term "method" to refer to a Java method or a C++ member function.

Setting Up a Development Environment

Before you start developing your UDx, you need to configure your development environment. You can choose to develop your UDx on a node in a development Vertica database (not in a production environment) or on another machine.

To test, you need access to a (non-production) Vertica database. You can install a single-node Vertica database on your development machine for easier development.

You should develop your UDx code on the same Linux platform that you use on your Vertica database cluster. This will ensure that your UDx library is compatible with the Vertica version deployed on your cluster.

The following sections describe language-specific requirements.

C++ Requirements

At a minimum, you need to install the following on your development machine:

- g++ and its associated tool chain such as ld. (Note: some Linux distributions package g++ separately from gcc.)

- A copy of the Vertica SDK. See Setting Up the C++ SDK for details.

Note: The Vertica binaries are compiled using the default version of g++ installed on the supported Linux platforms. Vertica requires a minimum of gcc version 4.8.4. The default versions of g++ on Amazon Linux 2.0 and Ubuntu 16.04 are not compatible; see Requirements for Amazon Linux 2.0 and Ubuntu 16.04.

While not required, the following additional software packages can ease development:

- make, or some other build-management tool.

- gdb, or some other debugger.

- Valgrind, or similar tools that detect memory leaks.

- Although not currently required, future versions of Vertica may require that you compile with the flag -std=c++11.
If you want to use any third-party libraries (for example, statistical analysis libraries), you need to install them on your development machine. If you do not statically link these libraries into your UDX library, you also have to install them on every node in the cluster. See Compiling Your C++ Library for details.

Requirements for Amazon Linux 2.0 and Ubuntu 16.04

Amazon Linux 2.0 and Ubuntu 16.04 ship with compilers that are incompatible with the Vertica C++ SDK. To compile UDxs on these platform, you must install packages for 4.8 compatibility.

1. Remove the existing gcc and gcc-c++ packages using your package manager.

3. Define symbolic links in /usr/bin for gcc and g++, pointing to the newly-installed packages.

4. On Amazon Linux 2.0, define symbolic links in /usr/lib64 as shown in this example. (Exact library names depend on what was installed in Step 2.)

   $ cd /usr/lib64
   $ sudo ln -s ./libstdc++.so.6.0.24 libstdc++.so
   $ sudo ln -s ./libgcc_s-7-20170915.so.1 libgcc_s.so

The following example demonstrates these steps for Ubuntu 16.04.

   $ sudo apt-get remove g++
   $ sudo apt-get remove gcc

   $ sudo apt-get install gcc-4.8
   $ sudo apt-get install g++-4.8

   $ cd /usr/bin
   $ sudo ln -s ./gcc-4.8 gcc
   $ sudo ln -s ./g++-4.8 g++

To test your environment, install the packages used by the SDK examples (if you haven't already) and then compile the examples:

   $ sudo apt-get install libbz2-dev
   $ sudo apt-get install libghc-zlib-dev
   $ sudo apt-get install libboost-dev
   $ sudo apt-get install libghc-curl-dev

   $ cd /opt/vertica/sdk/examples
   $ sudo make
Java Requirements

At a minimum, you need to install the following on your development machine:

- The Java Development Kit (JDK) version that matches the Java version you have installed on your database hosts (see Installing Java on Vertica Hosts).
- A copy of the Vertica SDK. See Setting Up the Java SDK for details.

While not required, make or some other build-management tool can ease development.

Python Requirements

Vertica does not require any additional files or packages. You can develop your Python UDx on any system with a text editor.

**Important:** When you begin UDx development, make sure that your code runs using Python 3.5.1. because you cannot change the version used by the Vertica Python interpreter.

When Vertica calls your UDx, it starts a side process that manages the interaction between the server and the Python interpreter.

R Requirements

Vertica does not require any additional files or packages. You can develop your R UDx on any system with a text editor.

**Downloading and Running UDx Example Code**

You can download all of the examples shown in this documentation, and many more, from the Vertica GitHub repository. This repository includes examples of all types of UDxs.

You can download the examples in either of two ways:
Download the ZIP file. Extract the contents of the file into a directory.

Clone the repository. Using a terminal window, run the following command:

```
$ git clone https://github.com/vertica/UDx-Examples.git
```

The repository includes a makefile that you can use to compile the C++ and Java examples. It also includes .sql files that load and use the examples. See the README file for instructions on compiling and running the examples. To compile the examples you will need g++ or a JDK and make. See Setting Up a Development Environment for related information.

Running the examples not only helps you understand how a UDx works, but also helps you ensure your development environment is properly set up to compile UDx libraries.

- Scalar Functions (UDSFs)
- Transform Functions (UDTFs)
- Load (UDLs)

Types of UDxs

Vertica supports five types of user-defined extensions:

- User-Defined Aggregate Functions (UDAF) allow you to create custom Aggregate Functions specific to your needs. They read one column of data, and return one output column. UDAFs can be developed in C++. Developing UDAFs is described in Aggregate Functions (UDAFs).

- User-Defined Analytic Functions (UDAnF) are similar to UDSFs, in that they read a row of data and return a single row. However, the function can read input rows independently of outputting rows, so that the output values can be calculated over several input rows.
UDAnFs can be developed in C++ and Java. Developing UDAnFs is described in Analytic Functions (UDAnFs).

- User-Defined Scalar Functions (UDSFs) take in a single row of data and return a single value. These functions can be used anywhere a native function can be used, except CREATE TABLE BY PARTITION and SEGMENTED BY expressions. UDSFs can be developed in C++, Python, Java, and R. Developing UDSFs is described in Scalar Functions (UDSFs).

- User-Defined Transform Functions (UDTFs) operate on table partitions (as specified by the query's OVER() clause) and return zero or more rows of data. The data they return can be an entirely new table, unrelated to the schema of the input table, including having its own ordering and segmentation expressions. They can only be used in the SELECT list of a query. UDTFs can be developed in C++, Python, Java, and R. Developing UDTFs is described in Transform Functions (UDTFs).

To optimize query performance, you can use live aggregate projections to pre-aggregate the data that a UDTF returns. For more information, see Pre-Aggregating UDTF Results.

- User-Defined Load allows you to create custom sources, filters, and parsers to load data. These extensions are used in the COPY statement. UDLs can be developed in C++ and Java. Developing UDLs is described in Load (UDLs).

While each UDx type has a unique base class, developing them is similar in many ways. Different UDx types can also share the same library.
Handling Different Numbers and Types of Arguments

Usually, your UDxs accept a set number of arguments that are a specific data type (called its signature). You can create UDxs that handle multiple signatures, or even accept all arguments supplied to them by the user, using either of these techniques:

- Overloading your UDx by assigning the same SQL function name to multiple factory classes, each of which defines a unique function signature. When a user uses the function name in a query, Vertica tries to match the signature of the function call to the signatures declared by the factory's getPrototype method. This is the best technique to use if your UDx needs to accept a few different signatures (for example, accepting two required and one optional argument).

- Creating a polymorphic UDx by using the special "Any" argument type that tells Vertica to send all arguments that the user supplies to your function. Your UDx decides whether it can handle the arguments or not.

Overloading Your UDx

You may want your UDx to accept several different signatures (sets of arguments). For example, you might want your UDx to accept:

- One or more optional arguments.
- One or more arguments that can be one of several data types.
- Completely distinct signatures (either all INTEGER or all VARCHAR, for example).

You can create a function with this behavior by creating several factory classes, each of which accepts a different signature (the number and data types of arguments). You can then associate a single SQL function name with all of them. You can use the same SQL function name to refer to multiple factory classes as long as the signature defined by each factory is unique. When a user calls your UDx, Vertica matches the number and types of arguments supplied by the user to the arguments accepted by each of your function's factory classes. If one matches, Vertica uses it to instantiate a function class to process the data.
Multiple factory classes can instantiate the same function class, so you can re-use one function class that is able to process multiple sets of arguments and then create factory classes for each of the function signatures. You can also create multiple function classes if you want.

See the C++ Example: Overloading Your UDx and Java Example: Overloading Your UDx examples.

C++ Example: Overloading Your UDx

The following example code demonstrates creating a User-Defined Scalar Function (UDSF) that adds two or three integers together. The Add2or3ints class is prepared to handle two or three arguments. The `processBlock()` function checks the number of arguments that have been passed to it, and adds all two or three of them together. It also exits with an error message if it has been called with less than 2 or more than 3 arguments. In theory, this should never happen, since Vertica only calls the UDSF if the user's function call matches a signature on one of the factory classes you create for your function. In practice, it is a good idea to perform this sanity checking, in case your (or someone else's) factory class inaccurately reports a set of arguments your function class cannot handle.

```cpp
#include "Vertica.h"
using namespace Vertica;
using namespace std;

// a ScalarFunction that accepts two or three
// integers and adds them together.
class Add2or3ints : public Vertica::ScalarFunction
{
public:
    virtual void processBlock(Vertica::ServerInterface &srvInterface,
                                Vertica::BlockReader &arg_reader,
                                Vertica::BlockWriter &res_writer)
    {
        const size_t numCols = arg_reader.getNumCols();

        // Ensure that only two or three parameters are passed in
        if (numCols < 2 || numCols > 3)
            vt_report_error(0, "Function only accept 2 or 3 arguments, "
                            "but %zu provided", arg_reader.getNumCols());

        // Add two integers together
        do
        {
            const vint a = arg_reader.getIntRef(0);
            const vint b = arg_reader.getIntRef(1);
            vint c = 0;

            // Check for third argument, add it in if it exists.
            if (numCols == 3)
                c = arg_reader.getIntRef(2);
            res_writer.setInt(a+b+c);
            res_writer.next();
        } while (arg_reader.next());
    }
};
// This factory accepts function calls with two integer arguments.
```
class Add2intsFactory : public Vertica::ScalarFunctionFactory
{
    virtual Vertica::ScalarFunction *createScalarFunction(Vertica::ServerInterface &srvInterface)
    {
        return vt_createFuncObj(srvInterface.allocator, Add2or3ints); }
    virtual void getPrototype(Vertica::ServerInterface &srvInterface,
        Vertica::ColumnTypes &argTypes,
        Vertica::ColumnTypes &returnType)
    {
        // Accept 2 integer values
        argTypes.addInt();
        argTypes.addInt();
        returnType.addInt();
    }
};
RegisterFactory(Add2intsFactory);
// This factory defines a function that accepts 3 ints.
class Add3intsFactory : public Vertica::ScalarFunctionFactory
{
    virtual Vertica::ScalarFunction *createScalarFunction(Vertica::ServerInterface &srvInterface)
    {
        return vt_createFuncObj(srvInterface.allocator, Add2or3ints); }
    virtual void getPrototype(Vertica::ServerInterface &srvInterface,
        Vertica::ColumnTypes &argTypes,
        Vertica::ColumnTypes &returnType)
    {
        // accept 3 integer values
        argTypes.addInt();
        argTypes.addInt();
        argTypes.addInt();
        returnType.addInt();
    }
};
RegisterFactory(Add3intsFactory);

The example has two ScalarFunctionFactory classes, one for each signature that the function accepts (two integers and three integers). There is nothing unusual about these factory classes, except that their implementation of ScalarFunctionFactory::createScalarFunction() both create Add2or3ints objects.

The final step is to bind the same SQL function name to both factory classes. You can assign multiple factories to the same SQL function, as long as the signatures defined by each factory's getPrototype() implementation are different.

=> CREATE LIBRARY add2or3IntsLib AS '/home/dbadmin/Add2or3Ints.so';
CREATE LIBRARY
=> CREATE FUNCTION add2or3Ints as NAME 'Add2intsFactory' LIBRARY add2or3IntsLib FENCED;
CREATE FUNCTION
=> CREATE FUNCTION add2or3Ints as NAME 'Add3intsFactory' LIBRARY add2or3IntsLib FENCED;
CREATE FUNCTION
=> SELECT add2or3Ints(1,2);
add2or3Ints
---------
   3
(1 row)
=> SELECT add2or3Ints(1,2,4);
The error message in response to the final call to the add2or3Ints function was generated by Vertica, since it could not find a factory class associated with add2or3Ints that accepted four integer arguments. To expand add2or3Ints further, you could create another factory class that accepted this signature, and either change the Add2or3Ints ScalarFunction class or create a totally different class to handle adding more integers together. However, adding more classes to accept each variation in the arguments quickly becomes overwhelming. In that case, you should consider creating a polymorphic UDx.

Java Example: Overloading Your UDx

The following example code demonstrates creating a User-Defined Scalar Function (UDSF) that adds two or three integers together. The Add2or3Ints class is prepared to handle two or three arguments. It checks the number of arguments that have been passed to it, and adds all two or three of them together. The processBlock() method checks whether it has been called with less than 2 or more than 3 arguments. In theory, this should never happen, since Vertica only calls the UDSF if the user's function call matches a signature on one of the factory classes you create for your function. In practice, it is a good idea to perform this sanity checking, in case your (or someone else's) factory class reports that your function class accepts a set of arguments that it actually does not.

```java
// You need to specify the full package when creating functions based on
// the classes in your library.
package com.mycompany.multiparamexample;
// Import the entire Vertica SDK
import com.vertica.sdk.*;
// This ScalarFunction accepts two or three integer arguments. It tests
// the number of input columns to determine whether to read two or three
// arguments as input.
public class Add2or3Ints extends ScalarFunction
{
    @Override
    public void processBlock(ServerInterface srvInterface,
                               BlockReader argReader,
                               BlockWriter resWriter)
        throws UdfException, DestroyInvocation
    {
        // See how many arguments were passed in
        int numCols = argReader.getNumCols();
```
// Return an error if less than two or more than 3 arguments were given. This error only occurs if a Factory class that accepts the wrong number of arguments instantiates this class.
if (numCols < 2 || numCols > 3) {
    throw new UdfException(0,
        "Must supply 2 or 3 integer arguments");
}

// Process all of the rows of input.
do {
    // Get the first two integer arguments from the BlockReader
    long a = argReader.getLong(0);
    long b = argReader.getLong(1);

    // Assume no third argument.
    long c = 0;

    // Get third argument value if it exists
    if (numCols == 3) {
        c = argReader.getLong(2);
    }

    // Process the arguments and come up with a result. For this example, just add the three arguments together.
    long result = a+b+c;

    // Write the integer output value.
    resWriter.setLong(result);

    // Advance the output BlockWriter to the next row.
    resWriter.next();

    // Continue processing input rows until there are no more.
} while (argReader.next());

The main difference between the Add2ints class and the Add2or3ints class is the inclusion of a section that gets the number of arguments by calling BlockReader.getNumCols(). This class also tests the number of columns it received from Vertica to ensure it is in the range it is prepared to handle. This test will only fail if you create a ScalarFunctionFactory whose getPrototype() method defines a signature that accepts less than two or more than three arguments. This is not really necessary in this simple example, but for a more complicated class it is a good idea to test the number of columns and data types that Vertica passed your function class.

Within the do loop, Add2or3ints uses a default value of zero if Vertica sent it two input columns. Otherwise, it retrieves the third value and adds that to the other two. Your own class needs to use default values for missing input columns or alter its processing in some other way to handle the variable columns.
You must define your function class in its own source file, rather than as an inner class of one of your factory classes since Java does not allow the instantiation of an inner class from outside its containing class. You factory class has to be available for instantiation by multiple factory classes.

Once you have created a function class or classes, you create a factory class for each signature you want your function class to handle. These factory classes can call individual function classes, or they can all call the same class that is prepared to accept multiple sets of arguments.

The following example's `createScalarFunction()` method instantiates a member of the `Add2or3ints` class.

```java
// You will need to specify the full package when creating functions based on // the classes in your library.
package com.mycompany.multiparamexample;
// Import the entire Vertica SDK
import com.vertica.sdk.*;
public class Add2intsFactory extends ScalarFunctionFactory
{
    @Override
    public void getPrototype(ServerInterface srvInterface,
                                ColumnTypes argTypes,
                                ColumnTypes returnType)
    {
        // Accept two integers as input
        argTypes.addInt();
        argTypes.addInt();
        // writes one integer as output
        returnType.addInt();
    }
    @Override
    public ScalarFunction createScalarFunction(ServerInterface srvInterface)
    {
        // Instantiate the class that can handle either 2 or 3 integers.
        return new Add2or3ints();
    }
}
```

The following `ScalarFunctionFactory` subclass accepts three integers as input. It, too, instantiates a member of the `Add2or3ints` class to process the function call:

```java
// You will need to specify the full package when creating functions based on // the classes in your library.
package com.mycompany.multiparamexample;
// Import the entire Vertica SDK
import com.vertica.sdk.*;
public class Add3intsFactory extends ScalarFunctionFactory
{
    @Override
    public void getPrototype(ServerInterface srvInterface,
                                ColumnTypes argTypes,
                                ColumnTypes returnType)
    {
        // Accepts three integers as input
        argTypes.addInt();
    }
```
argTypes.addInt();
argTypes.addInt();
// Returns a single integer
returnType.addInt();
}

@Override
public ScalarFunction createScalarFunction(ServerInterface srvInterface)
{
    // Instantiates the Add2or3ints ScalarFunction class, which is able to
    // handle either 2 or 3 integers as arguments.
    return new Add2or3ints();
}

The factory classes and the function class or classes they call must be packaged into the same
JAR file (see Compiling and Packaging a Java Library for details). If a host in the database cluster
has the JDK installed on it, you could use the following commands to compile and package the example:

$ cd pathToJavaProject$ javac -classpath /opt/vertica/bin/VerticaSDK.jar \
> com/mycompany/multiparamexample/*.java
$ jar -cvf Add2or3intslib.jar com/vertica/sdk/BuildInfo.class \
> com/mycompany/multiparamexample/*.class
added manifest
adding: com/vertica/sdk/BuildInfo.class (in = 1202) (out = 689) (deflated 42%)
adding: com/mycompany/multiparamexample/Add2intsFactory.class (in = 677) (out = 601) (deflated 34%)
adding: com/mycompany/multiparamexample/Add2or3ints.class (in = 919) (out = 601) (deflated 46%)

Once you have packaged your overloaded UDx, you deploy it the same way as you do a regular
UDx, except you use multiple CREATE FUNCTION statements to define the function, once for
each factory class.

=> CREATE LIBRARY add2or3intslib as '/home/dbadmin/Add2or3intslib.jar'
-> language 'Java';
CREATE LIBRARY
=> CREATE FUNCTION add2or3ints as LANGUAGE 'Java' NAME
'com.mycompany.multiparamexample/Add2intsFactory' LIBRARY add2or3intslib;
CREATE FUNCTION
=> CREATE FUNCTION add2or3ints as LANGUAGE 'Java' NAME
'com.mycompany.multiparamexample/Add3intsFactory' LIBRARY add2or3intslib;
CREATE FUNCTION

You call the overloaded function the same way you call any other function.

=> SELECT add2or3ints(2,3);
add2or3ints
-----------
5
(1 row)
=> SELECT add2or3ints(2,3,4);
add2or3ints
-----------
9
The last error was generated by Vertica, not the UDx code. It returns an error if it cannot find a
factory class whose signature matches the function call's signature.

Creating an overloaded UDx is useful if you want your function to accept a limited set of
potential arguments. If you want to create a more flexible function, you can create a
polymorphic function.

Creating a Polymorphic UDx

Polymorphic UDxs accept any number and type of argument that the user supplies. Vertica
does not check the number or types of argument that the user passes to the UDx—it just
passes the UDx all of the arguments supplied by the user. It is up to your polymorphic UDx's
main processing function (for example, processBlock() in User-Defined Scalar Functions) to
examine the number and types of arguments it received and determine if it can handle them.

Note: UDxs have a maximum 1600 arguments.

Polymorphic UDxs are more flexible than using multiple factory classes for your function (see
Overloading Your UDx), because your function can determine at run time if it can process the
arguments rather than accepting specific sets of arguments. However, your polymorphic
function needs to perform more work to determine whether it can process the arguments that
it has been given.

Your polymorphic UDx declares that it accepts any number of arguments in its factory's
getPrototype() function by calling the addAny() function on the ColumnTypes object
that defines its arguments. This "any parameter" argument type is the only one that your
function can declare. You cannot define required arguments and then call addAny() to
declare the rest of the signature as optional. If your function has requirements for the
arguments it accepts, your process function must enforce them.

Polymorphic UDxs and Schema Search Paths

If a user does not supply a schema name as part of a UDx call, Vertica searches each schema in
the schema search path for a function whose name and signature match the function call. See
Setting Search Paths in the Administrator's Guide for more information about schema search
paths.
Since polymorphic UDxs do not have a specific signature associated with them, Vertica initially skips them when searching for a function to handle the function call. If none of the schemas in the search path contain a U Dx whose name and signature match the function call, Vertica searches the schema search path again for a polymorphic UDx whose name matches the function name in the function call.

This behavior gives precedence to UDxs whose signature exactly matches the function call. It allows you to create a "catch all" polymorphic UDx that Vertica calls only when none of the non-polymorphic UDxs with the same name have matching signatures.

This behavior may cause confusion if your users expect the first polymorphic function in the schema search path to handle a function call. To avoid confusion, you should:

- Avoid using the same name for different UDxs. You should always uniquely name UDxs unless you intend to create an overloaded UDx with multiple signatures.

- When you cannot avoid having UDxs with the same name in different schemas, always supply the schema name as part of the function call. Using the schema name prevents ambiguity and ensures that Vertica uses the correct UDx to process your function calls.

C++ Example: Polymorphic UDx

The following example shows an implementation of a ScalarFunction that adds together two or more integers.

```c++
#include "Vertica.h"
using namespace Vertica;
using namespace std;

// Adds two or more integers together.
class AddManyInts : public Vertica::ScalarFunction
{
  public:
    virtual void processBlock(Vertica::ServerInterface &srvInterface,
                               Vertica::BlockReader &arg_reader,
                               Vertica::BlockWriter &res_writer)
    {
      // Always catch exceptions to prevent causing the side process or
      // Vertica itself from crashing.
      try
      {
        // Find the number of arguments sent.
        size_t numCols = arg_reader.getNumCols();

        // Make sure at least 2 arguments were supplied
        if (numCols < 2)
          vt_report_error(0, "Function expects at least 2 integer parameters");

        // Make sure all types are ints
        const SizedColumnTypes &inTypes = arg_reader.getTypeMetaData();
```

(Rest of the code not shown)
for (int param=0; param < (int)numCols; param++) {
    const VerticaType &t = inTypes.getColumnType(param);
    if (!t.isInt()) {
        string typeDesc = t.getPrettyPrintStr();
        // Report that the user supplied a non-integer value.
        vt_report_error(0, "Function expects all arguments to be "
            "INTEGER. Argument %d was %s", param+1,
            typeDesc.c_str());
    }
} // total up the arguments and write out the total.
    vint total = 0;
    int x;
    // Loop over all params, adding them up.
    for (x=0; x<(int)numCols; x++) {
        total += arg_reader.getIntRef(x);
    }
    res_writer.setInt(total);
    res_writer.next();
} while (arg_reader.next());
}
catch(exception& e) {
    // Standard exception. Quit.
    vt_report_error(0, "Exception while processing partition: [%s]",
        e.what());
}
);
// Defines the AddMany function.
class AddManyIntsFactory : public Vertica::ScalarFunctionFactory
{
    // Return the function object to process the data.
    virtual Vertica::ScalarFunction *createScalarFunction(Vertica::ServerInterface &srvInterface) {
        return vt_createFuncObj(srvInterface.allocator, AddManyInts); }
    // Define the number and types of arguments that this function accepts
    virtual void getPrototype(Vertica::ServerInterface &srvInterface,
        Vertica::ColumnTypes &argTypes,
        Vertica::ColumnTypes &returnType) {
        argTypes.addAny(); // Must be only argument type.
        returnType.addInt();
    }
};
RegisterFactory(AddManyIntsFactory);

Most of the work in the example is done by the ScalarFunction.processBlock() function. It performs two checks on the arguments that have been passed in through the BlockReader object:

- Ensures there are at least two arguments
- Checks the data type of all arguments to ensure they are all integers

Once the checks are performed, the example processes the block of data by looping over the arguments and adding them together.
You assign a SQL name to your polymorphic UDx using the same statement you use to assign one to a non-polymorphic UDx. The following demonstration shows how you load and call the polymorphic function from the example.

```sql
=> CREATE LIBRARY addManyIntsLib AS '/home/dbadmin/AddManyInts.so';
CREATE LIBRARY
=> CREATE FUNCTION addManyInts AS NAME 'AddManyIntsFactory' LIBRARY addManyIntsLib FENCED;
CREATE FUNCTION
=> SELECT addManyInts(1,2);
addManyInts
-----------
  3
(1 row)
=> SELECT addManyInts(1,2,3,40,60,70,80,900);
addManyInts
-----------
1206
(1 row)
=> SELECT addManyInts(1); -- Too few parameters
ERROR 3412: Failure in UDx RPC call InvokeProcessBlock(): Error calling processBlock() in User-Defined Object [addManyInts] at [AddManyInts.cpp:51], error code: 0, message: Exception while processing partition: [Function expects at least 2 integer parameters]
=> SELECT addManyInts(1,2.232343);
Wrong data type
ERROR 3412: Failure in UDx RPC call InvokeProcessBlock(): Error calling processBlock() in User-Defined Object [addManyInts] at [AddManyInts.cpp:51], error code: 0, message: Exception while processing partition: [Function expects all arguments to be INTEGER. Argument 2 was Numeric(7,6)]
```

Notice that the errors returned by last two calls to the function were generated by the `processBlock()` function. It is up to your UDx to ensure that the user supplies the correct number and types of arguments to your function and exit with an error if it cannot process them.

**Java Example: Polymorphic UDx**

The following example shows an implementation of a `ScalarFunctionFactory` class with an inner `ScalarFunction` class that adds together two or more integers.

```java
// You will need to specify the full package when creating functions based on
// the classes in your library.
package com.mycompany.multiparamexample;
// Import the entire Vertica SDK
import com.vertica.sdk.*;
// Factory class to create polymorphic UDSF that adds all of the integer
// arguments it receives and returns a sum.
public class AddManyIntsFactory extends ScalarFunctionFactory
{
    @Override
    public void getPrototype(ServerInterface srvInterface,
        ColumnTypes argTypes,
        ColumnTypes returnType)
```
Accepts any number and type of arguments. The ScalarFunction class handles parsing the arguments.

```java
argTypes.addAny();
// writes one integer as output
returnType.addInt();
```

This polymorphic ScalarFunction adds all of the integer arguments passed to it. Returns an error if there are less than two arguments, or if one argument is not an integer.

```java
public class AddManyInts extends ScalarFunction {
    @Override
    public void processBlock(ServerInterface srvInterface,
                              BlockReader argReader,
                              BlockWriter resWriter)
        throws UdfException, DestroyInvocation {
        // See how many arguments were passed in
        int numCols = argReader.getNumCols();

        // Return an error if less than two arguments were given.
        if (numCols < 2) {
            throw new UdfException(0, 
                                   "Must supply at least 2 integer arguments");
        }

        // Make sure all input columns are integer.
        SizedColumnTypes inTypes = argReader.getTypeMetaData();
        for (int param = 0; param < numCols; param++) {
            VerticaType paramType = inTypes.getColumnType(param);
            if (!paramType.isInt()) {
                throw new UdfException(0, "Error: Argument "+ (param+1) + 
                                        " was not an integer. All arguments must be integer.");
            }
        }

        // Process all of the rows of input.
        do {
            long total = 0; // Hold the running total of arguments

            // Get all of the arguments and add them up
            for (int x = 0; x < numCols; x++) {
                total += argReader.getLong(x);
            }

            // Write the integer output value.
            resWriter.setLong(total);

            // Advance the output BlockWriter to the next row.
            resWriter.next();

            // Continue processing input rows until there are no more.
        } while (argReader.next());
    }
}
```

@Override
public ScalarFunction createScalarFunction(ServerInterface srvInterface) {

The ScalarFunctionFactory.getPrototype() method calls the addAny() method to declare that the UDSF is polymorphic.

Most of the work in the example is done by the ScalarFunction.processBlock() method. It performs two checks on the arguments that have been passed in through the BlockReader object:

- There are at least two arguments.
- The data type of all arguments are integers.

It is up to your polymorphic UDx to determine that all of the input passed to it is valid.

Once the processBlock() method validates its arguments, it loops over them, adding them together.

You assign a SQL name to your polymorphic UDx using the same statement you use to assign one to a non-polymorphic UDx. The following demonstration shows how you load and call the polymorphic function from the example.

```sql
=> CREATE LIBRARY addmanyintslib AS '/home/dbadmin/AddManyIntsLib.jar'
=> LANGUAGE 'Java';
CREATE LIBRARY
=> CREATE FUNCTION addmanyints AS LANGUAGE 'Java' NAME
=> 'com.mycompany.multiparamexample.AddManyIntsFactory' LIBRARY addmanyintslib;
CREATE FUNCTION
=> SELECT addmanyints(1,2,3,4,5,6,7,8,9,10);
addmanyints
-----------
55
(1 row)
=> SELECT addmanyints(1); --Too few parameters
ERROR 3399: Failure in UDx RPC call InvokeProcessBlock(): Error in User Defined Object [addmanyints], error code: 0

      (AddManyIntsFactory.java:48)
```
R Example: Polymorphic UDx

The following example shows an implementation of a Transform Function (UDTF) that performs kmeans clustering on one or more input columns.

```r
kmeansPoly <- function(v.data.frame, v.param.list) {
  # Computes clusters using the kmeans algorithm.
  # Input: A dataframe and a list of parameters.
  # Output: A dataframe with one column that tells the cluster to which each data
  # point belongs.
  # Args:
  # v.data.frame: The data from Vertica cast as an R data frame.
  # v.param.list: List of function parameters.
  # Returns:
  # The cluster associated with each data point.
  # Ensure k is not null.
  if(!is.null(v.param.list[['k']])) {
    number_of_clusters <- as.numeric(v.param.list[['k']])
  } else {
    stop("k cannot be NULL! Please use a valid value.")
  }
  # Run the kmeans algorithm.
  kmeans_clusters <- kmeans(v.data.frame, number_of_clusters)
  final.output <- data.frame(kmeans_clusters$cluster)
  return(final.output)
}

kmeansFactoryPoly <- function() {
  # This function tells Vertica the name of the R function,
  # and the polymorphic parameters.
  list(name=kmeansPoly, udxtype=c("transform"), intype=c("any"),
       outtype=c("int"), parametertypecallback=kmeansParameters)
}

kmeansParameters <- function() {
  # Callback function for the parameter types.
  function.parameters <- data.frame(datatype=rep(NA, 1), length=rep(NA, 1),
                                     scale=rep(NA, 1), name=rep(NA, 1))
  function.parameters[1,1] = "int"
  function.parameters[1,4] = "k"
  return(function.parameters)
}
```

The polymorphic R function declares it accepts any number of arguments in its factory function by specifying "any" as the argument to the intype parameter and optionally the outtype parameter. If you define "any" argument for intype or outtype, then it is the only type that your function can declare for the respective parameter. You cannot define required arguments
and then call "any" to declare the rest of the signature as optional. If your function has requirements for the arguments it accepts, your process function must enforce them.

The outtypecallback method is used to indicate the argument types and sizes it has been called with, and is expected to indicate the types and sizes that the function returns. The outtypecallback method can also be used to check for unsupported types and/or number of arguments. For example, the function may require only integers, with no more than 10 of them.

You assign a SQL name to your polymorphic UDx using the same statement you use to assign one to a non-polymorphic UDx. The following statements show how you load and call the polymorphic function from the example.

```sql
=> CREATE LIBRARY rlib2 AS '/home/dbadmin/R_UDx/poly_kmeans.R' LANGUAGE 'R';
CREATE LIBRARY
=> CREATE TRANSFORM FUNCTION kmeansPoly AS LANGUAGE 'R' name 'kmeansFactoryPoly' LIBRARY rlib2;
CREATE FUNCTION
=> SELECT spec, kmeansPoly(sl,sw,pl,pw USING PARAMETERS k = 3) OVER(PARTITION BY spec) AS Clusters
  FROM iris;
      spec | Clusters
    spec | 1
    Iris-setosa | 1
    Iris-setosa | 1
    Iris-setosa | 1
    ... 
    ... 
    (150 rows)
```
**UDx Parameters**

Parameters let you define arguments for your UDxs that remain constant across all of the rows processed by the SQL statement that calls your UDx. Typically, your UDxs accept arguments that come from columns in a SQL statement. For example, in the following SQL statement, the arguments a and b to the add2ints UDSF change value for each row processed by the SELECT statement:

```sql
=> SELECT a, b, add2ints(a, b) AS 'sum' FROM example;
```

<table>
<thead>
<tr>
<th>a</th>
<th>b</th>
<th>sum</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2</td>
<td>3</td>
</tr>
<tr>
<td>3</td>
<td>4</td>
<td>7</td>
</tr>
<tr>
<td>5</td>
<td>6</td>
<td>11</td>
</tr>
<tr>
<td>7</td>
<td>8</td>
<td>15</td>
</tr>
<tr>
<td>9</td>
<td>10</td>
<td>19</td>
</tr>
</tbody>
</table>

(5 rows)

Parameters remain constant for all the rows your UD processes. You can also make parameters optional so that if the user does not supply it, your UDx uses a default value. For example, the following example demonstrates calling a UDSF named add2intsWithConstant that has a single parameter value named constant whose value is added to each the arguments supplied in each row of input:

```sql
=> SELECT a, b, add2intsWithConstant(a, b USING PARAMETERS constant=42) AS 'a+b+42' FROM example;
```

<table>
<thead>
<tr>
<th>a</th>
<th>b</th>
<th>a+b+42</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2</td>
<td>45</td>
</tr>
<tr>
<td>3</td>
<td>4</td>
<td>49</td>
</tr>
<tr>
<td>5</td>
<td>6</td>
<td>53</td>
</tr>
<tr>
<td>7</td>
<td>8</td>
<td>57</td>
</tr>
<tr>
<td>9</td>
<td>10</td>
<td>61</td>
</tr>
</tbody>
</table>

(5 rows)

Note: When calling a UDx with parameters, there is no comma between the last argument and the USING PARAMETERS clause.

The topics in this section explain how to develop UDxs that accept parameters.

**Defining the Parameters Your UDx Accepts**

You define the parameters that your UDx accepts in its factory class (ScalarFunctionFactory, AggregateFunctionFactory, and so on) by implementing
getParameterType(). This method is similar to getReturnType(): you call data-type-specific methods on a SizedColumnTypes object that is passed in as a parameter. Each function call sets the name, data type, and width or precision (if the data type requires it) of the parameter.

Setting Parameter Properties (C++ Only)

When you add parameters to the getParameterType() function using the C++ API, you can also set properties for each parameter. For example, you can define a parameter as being required by the UDx. Doing so lets the Vertica server know that every UDx invocation must provide the specified parameter, or the query fails.

By passing an object to the SizedColumnTypes::Properties class, you can define the following four parameter properties:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>visible</td>
<td>BOOLEAN</td>
<td>If set to TRUE, the parameter appears in the USER_FUNCTION_PARAMETERS table. You may want to set this to FALSE to declare a parameter for internal use only.</td>
</tr>
<tr>
<td>required</td>
<td>BOOLEAN</td>
<td>If set to TRUE:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The parameter is required when invoking the UDx.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Invoking the UDx without supplying the parameter results in an error, and the UDx does not run.</td>
</tr>
<tr>
<td>canBeNull</td>
<td>BOOLEAN</td>
<td>If set to TRUE, the parameter can have a NULL value. If set to FALSE, make sure that the supplied parameter does not contain a NULL value when invoking the UDx. Otherwise, an error results, and the UDx does not run.</td>
</tr>
<tr>
<td>comment</td>
<td>VARCHAR (128)</td>
<td>A comment to describe the parameter.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If you exceed the 128 character limit, Vertica generates an error when you run the CREATE_FUNCTION command. Additionally, if you replace the existing function definition in the comment parameter, make sure that the new definition does not exceed 128 characters. Otherwise, you delete all existing entries in the USER_FUNCTION_PARAMETERS table related to the UDx.</td>
</tr>
</tbody>
</table>
Setting Parameter Properties (R Only)

When using parameters in your R UDx, you must specify a field in the factory function called `parametertypecallback`. This field points to the callback function that defines the parameters expected by the function. The callback function defines a four-column data frame with the following properties:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>datatype</td>
<td>VARCHAR(128)</td>
<td>The data type of the parameter.</td>
</tr>
<tr>
<td>length</td>
<td>INTEGER</td>
<td>The dimension of the parameter.</td>
</tr>
<tr>
<td>scale</td>
<td>INTEGER</td>
<td>The proportional dimensions of the parameter.</td>
</tr>
<tr>
<td>name</td>
<td>VARCHAR(128)</td>
<td>The name of the parameter.</td>
</tr>
</tbody>
</table>

If any of the columns are left blank (or the `parametertypecallback` function is omitted), then Vertica uses default values.

For more information, see `parametertypecallback` Function.

Getting Parameter Values in UDxs

Your UDx uses the parameter values it declared in its factory class (see Defining the Parameters Your UDx Accepts) in its function class's processing method (for example, `processBlock()` or `processPartition()`). It gets its parameter values from a `ParamReader` object, which is available from the `ServerInterface` object that is passed to your processing method. Reading parameters from this object is similar to reading argument values from `BlockReader` or `PartitionReader` objects: you call a data-type-specific function with the name of the parameter to retrieve its value. For example, in C++:

```cpp
// Get the parameter reader from the ServerInterface to see if there are supplied parameters.
ParamReader paramReader = srvInterface.getParamReader();
// Get the value of an int parameter named constant.
const vint constant = paramReader.getIntRef("constant");
```

Note: String data values do not have any of their escape characters processed before they are passed to your function. Therefore, your function may need to process the escape sequences itself if it needs to operate on unescaped character values.
Using Parameters in the Factory Class

In addition to using parameters in your UDx function class, you can also access the parameters in the factory class. You may want to access the parameters to let the user control the input or output values of your function in some way. For example, your UDx can have a parameter that lets the user choose to have your UDx return a single- or double-precision value. The process of accessing parameters in the factory class is the same as accessing it in the function class: get a ParamReader object from the ServerInterface's getParamReader() method, then read the parameter values.

Testing Whether the User Supplied Parameter Values

Unlike its handling of arguments, Vertica does not immediately return an error if a user's function call does not include a value for a parameter defined by your UDx's factory class. This means that your function can attempt to read a parameter value that the user did not supply. If it does so, by default Vertica returns a non-existent parameter warning to the user, and the query containing the function call continues.

If you want your parameter to be optional, you can test whether the user supplied a value for the parameter before attempting to access its value. Your function determines if a value exists for a particular parameter by calling the ParamReader's containsParameter() method with the parameter's name. If this call returns true, your function can safely retrieve the value. If this call returns false, your UDx can use a default value or change its processing in some other way to compensate for not having the parameter value. As long as your UDx does not try to access the non-existent parameter value, Vertica does not generate an error or warning about missing parameters.

Note: If the user passes your UDx a parameter that it has not defined, by default Vertica issues a warning that the parameter is not used. It still executes the SQL statement, ignoring the parameter. You can change this behavior by altering the StrictUDxParameterChecking configuration parameter.

See C++ Example: Defining Parameters for an example.
Calling UDxs with Parameters

You pass parameters to a UDx by adding a USING PARAMETERS clause in the function call after the last argument.

- Do not insert a comma between the last argument and the USING PARAMETERS clause.

- After the USING PARAMETERS clause, add one or more parameter definitions, in the following form:

  \[
  \text{<parameter name>} = \text{<parameter value>}
  \]

- Separate parameter definitions by commas.

Parameter values can be a constant expression (for example 1234 + SQRT(5678)). You cannot use volatile functions (such as \texttt{RANDOM}) in the expression, because they do not return a constant value. If you do supply a volatile expression as a parameter value, by default, Vertica returns an incorrect parameter type warning. Vertica then tries to run the UDx without the parameter value. If the UDx requires the parameter, it returns its own error, which cancels the query.

Calling a UDx with a Single Parameter

The following example demonstrates how you can call the \texttt{Add2intsWithConstant} UDSF example shown in \texttt{C++ Example: Defining Parameters}:

```sql
=> SELECT a, b, Add2intsWithConstant(a, b USING PARAMETERS constant=42) AS 'a+b+42' from example;
```

<table>
<thead>
<tr>
<th>a</th>
<th>b</th>
<th>a+b+42</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2</td>
<td>45</td>
</tr>
<tr>
<td>3</td>
<td>4</td>
<td>49</td>
</tr>
<tr>
<td>5</td>
<td>6</td>
<td>53</td>
</tr>
<tr>
<td>7</td>
<td>8</td>
<td>57</td>
</tr>
<tr>
<td>9</td>
<td>10</td>
<td>61</td>
</tr>
</tbody>
</table>

(5 rows)

To remove the first instance of the number 3, you can call the \texttt{RemoveSymbol} UDSF example:

```sql
=> SELECT '3re3mo3ve3sy3mb3ol' original_string, RemoveSymbol('3re3mo3ve3sy3mb3ol' USING PARAMETERS symbol='3');
```

<table>
<thead>
<tr>
<th>original_string</th>
<th>RemoveSymbol</th>
</tr>
</thead>
<tbody>
<tr>
<td>3re3mo3ve3sy3mb3ol</td>
<td>re3mo3ve3sy3mb3ol</td>
</tr>
</tbody>
</table>

(1 row)
Calling a UDx with Multiple Parameters

The following example shows how you can call a version of the tokenize UDTF. This UDTF includes parameters to limit the shortest allowed word and force the words to be output in uppercase. Separate multiple parameters with commas.

```sql
>= SELECT url, tokenize(description USING PARAMETERS minLength=4, uppercase=true) OVER (partition by url) FROM T;
url | words
---+-----------------------------
www.amazon.com | ONLINE
www.amazon.com | RETAIL
www.amazon.com | MERCHANT
www.amazon.com | PROVIDER
www.amazon.com | CLOUD
www.amazon.com | SERVICES
www.dell.com | LEADING
www.dell.com | PROVIDER
www.dell.com | COMPUTER
www.dell.com | HARDWARE
www.vertica.com | WORLD'S
www.vertica.com | FASTEST
www.vertica.com | ANALYTIC
www.vertica.com | DATABASE
(16 rows)
```

The following example calls the RemoveSymbol UDSF. By changing the value of the optional parameter, n, you can remove all instances of the number 3:

```sql
>= SELECT '3re3mo3ve3sy3mb3ol' original_string, RemoveSymbol('3re3mo3ve3sy3mb3ol' USING PARAMETERS symbol='3', n=6);
original_string | RemoveSymbol
----------------+------------------
3re3mo3ve3sy3mb3ol | removesymbol
(1 row)
```

Calling a UDx with Optional or Incorrect Parameters

You can optionally add the Add2intsWithConstant UDSF's constant parameter. Calling this constraint without the parameter does not return an error or warning:

```sql
>= SELECT a,b,Add2intsWithConstant(a, b) AS 'sum' FROM example;
 a | b | sum
---+---+-----
 1 | 2 |  3
 3 | 4 |  7
 5 | 6 | 11
 7 | 8 | 15
 9 |10 | 19
```
Although calling a UDx with incorrect parameters generates a warning, by default, the query still runs. For further information on setting the behavior of your UDx when you supply incorrect parameters, see **Specifying the Behavior of Passing Unregistered Parameters**.

```
=> SELECT a, b, add2intsWithConstant(a, b USING PARAMETERS wrongparam=42) AS 'result' from example;
WARNING 4332: Parameter wrongparam was not registered by the function and cannot be coerced to a definite data type
 a | b | result
--------
 1 | 2 |  3
 3 | 4 |  7
 5 | 6 | 11
 7 | 8 | 15
 9 |10 | 19
(5 rows)
```

### Specifying the Behavior of Passing Unregistered Parameters

By default, Vertica issues a warning message when you pass a UDx an unregistered parameter. An *unregistered parameter* is one that you did not declare in the `getParameterType()` method.

You can control the behavior of your UDx when you pass it an unregistered parameter by altering the `StrictUDxParameterChecking` configuration parameter.

### Unregistered Parameter Behavior Settings

You can specify the behavior of your UDx in response to one or more unregistered parameters. To do so, set the `StrictUDxParameterChecking` configuration parameter to one of the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Allows unregistered parameters to be accessible to the UDx. The <code>ParamReader</code> class's <code>getType()</code> method determines the data type of the unregistered parameter. Vertica does not display any warning or error message.</td>
</tr>
<tr>
<td>1</td>
<td>[Default Value] Ignores the unregistered parameter and allows the function to run. Vertica displays a warning message.</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>2</td>
<td>Returns an error and does not allow the function to run.</td>
</tr>
</tbody>
</table>

**Examples**

The following examples demonstrate the behavior you can specify using different values with the `StrictUDxParameterChecking` parameter.

**View the Current Value of StrictUDxParameterChecking**

To view the current value of the `StrictUDxParameterChecking` configuration parameter, run the following query:

```sql
=> \x
Expanded display is on.
=> SELECT * FROM configuration_parameters WHERE parameter_name = 'StrictUDxParameterChecking';
-[ RECORD 1 ]-----------------------------------------------
| node_name | ALL                        |
| parameter_name | StrictUDxParameterChecking          |
| current_value   | 1                          |
| restart_value   | 1                          |
| database_value  | 1                          |
| default_value   | 1                          |
| current_level   | DATABASE                   |
| restart_level   | DATABASE                   |
| is_mismatch     | f                          |
| groups          |                            |
| allowed_levels  | DATABASE                   |
| superuser_only  | f                          |
| change_under_support_guidance | f                  |
| change_requires_restart | f               |
| description     | Sets the behavior to deal with undeclared UDx function parameters |
```

**Change the Value of StrictUDxParameterChecking**

You can change the value of the `StrictUDxParameterChecking` configuration parameter at the database, node, or session level. For example, you can change the value to '0' to specify that unregistered parameters can pass to the UDx without displaying a warning or error message:

```sql
=> ALTER DATABASE mydb SET StrictUDxParameterChecking = 0;
ALTER DATABASE
```
Invalid Parameter Behavior with RemoveSymbol

The following example demonstrates how to call the RemoveSymbol UDSF example. The RemoveSymbol UDSF has a required parameter, symbol, and an optional parameter, n. In this case, you do not use the optional parameter.

If you pass both symbol and an additional parameter called wrongParam, which is not declared in the UDX, the behavior of the UDX changes corresponding to the value of StrictUDxParameterChecking.

When you set StrictUDxParameterChecking to '0', the UDX runs normally without a warning. Additionally, wrongParam becomes accessible to the UDX through the ParamReader object of the ServerInterface object:

```sql
=> ALTER DATABASE mydb SET StrictUDxParameterChecking = 0;
ALTER DATABASE
=> SELECT '3re3mo3ve3sy3mb3ol' original_string, RemoveSymbol('3re3mo3ve3sy3mb3ol' USING PARAMETERS symbol='3', wrongParam='x');
original_string | RemoveSymbol
-----------------+------------------
3re3mo3ve3sy3mb3ol | re3mo3ve3sy3mb3ol (1 row)
```

When you set StrictUDxParameterChecking to '1', the UDX ignores wrongParam and runs normally. However, it also issues a warning message:

```sql
=> ALTER DATABASE mydb SET StrictUDxParameterChecking = 1;
ALTER DATABASE
=> SELECT '3re3mo3ve3sy3mb3ol' original_string, RemoveSymbol('3re3mo3ve3sy3mb3ol' USING PARAMETERS symbol='3', wrongParam='x');
WARNING 4320: Parameter wrongParam was not registered by the function and cannot be coerced to a definite data type
original_string | RemoveSymbol
-----------------+------------------
3re3mo3ve3sy3mb3ol | re3mo3ve3sy3mb3ol (1 row)
```

When you set StrictUDxParameterChecking to '2', the UDX encounters an error when it tries to call wrongParam and does not run. Instead, it generates an error message:

```sql
=> ALTER DATABASE mydb SET StrictUDxParameterChecking = 2;
ALTER DATABASE
=> SELECT '3re3mo3ve3sy3mb3ol' original_string, RemoveSymbol('3re3mo3ve3sy3mb3ol' USING PARAMETERS symbol='3', wrongParam='x');
ERROR 0: Parameter wrongParam was not registered by the function
```

- Setting Configuration Parameter Values

User-Defined Session Parameters

User-defined session parameters allow you to write more generalized parameters than what Vertica provides. You can configure user-defined session parameters in these ways:

- From the client—for example, with `ALTER SESSION`
- Through the UDx itself

A user-defined session parameter can be passed into any type of UDx supported by Vertica. You can also set parameters for your UDx at the session level. By specifying a user-defined session parameter, you can have the state of a parameter saved continuously. Vertica saves the state of the parameter even when the UDx is invoked multiple times during a single session.

The RowCount example uses a user-defined session parameter. This parameter counts the total number of rows processed by the UDx each time it runs. RowCount then displays the aggregate number of rows processed for all executions. See C++ Example: Using Session Parameters and Java Example: Using Session Parameters for implementations.

Viewing the User-Defined Session Parameter

Enter the following command to see the value of the session parameter:

```plaintext
=> SHOW SESSION UDPARAMETER all;
schema | library | key | value
----------+----------+------+
(0 rows)
```

Now, execute the UDx:

```plaintext
=> SELECT RowCount(5,5);
RowCount
----------
10
(1 row)
```

Again, enter the command to see the value of the session parameter:
=> SHOW SESSION UDPARAMETER all;
schema | library | key | value
---------------------------------------------
public | UDSession | rowcount | 1
(1 row)

Because the UDx has processed one row, the value of RowCount is now 1. Running the UDx two more times should increase the value of RowCount by 2:

=> SELECT RowCount(10,10);
RowCount
--------
20
(1 row)
=> SELECT RowCount(15,15);
RowCount
--------
30
(1 row)

You have now executed the UDx three times, obtaining the sum of 5 + 5, 10 + 10, and 15 + 15. Now, check the value of RowCount.

=> SHOW SESSION UDPARAMETER all;
schema | library | key | value
---------------------------------------------
public | UDSession | rowcount | 3
(1 row)

Altering the User-Defined Session Parameter

You can also manually alter the value of RowCount. To do so, enter the following command:

=> ALTER SESSION SET UDPARAMETER FOR UDSession RowCount = 25;
ALTER SESSION

Check the value of RowCount:

=> SHOW SESSION UDPARAMETER all;
schema | library | key | value
---------------------------------------------
public | UDSession | rowcount | 25
(1 row)

Clearing the User-Defined Session Parameter

From the client:

To clear the current value of RowCount, enter the following command:
ALTER SESSION CLEAR UDPARAMETER FOR UDSession RowCount;
ALTER SESSION

Verify that RowCount has been cleared:

SHOW SESSION UDPARAMETER all;
schema | library | key | value
--------------+----------+-----+-------
(0 rows)

Through the UDx in C++:

You can set the session parameter to clear through the UDx itself. For example, to clear RowCount when its value reaches 10 or greater do the following:

1. Remove the following line from the destroy() method in RowCount:

   `udParams.getUDSessionParamWriter("library").getStringRef("rowCount").copy(i_as_string);`

2. Replace the removed line from the destroy() method with the following code:

   ```
   if (rowCount < 10)
   {
     udParams.getUDSessionParamWriter("library").getStringRef("rowCount").copy(i_as_string);
   }
   else
   {
     udParams.getUDSessionParamWriter("library").clearParameter("rowCount");
   }
   ```

3. To see the UDx clear the session parameter, set RowCount to a value of 9:

   ```
   ALTER SESSION SET UDPARAMETER FOR UDSession RowCount = 9;
   ALTER SESSION
   ```

4. Check the value of RowCount:

   ```
   SHOW SESSION UDPARAMETER all;
   schema | library | key | value
   -------------+----------+-----+-------
   public | UDSession | rowcount | 9
   (1 row)
   ```

5. Invoke RowCount so that its value becomes 10:

   ```
   SELECT RowCount(15,15);
   RowCount
   --------
   30
   ```
6. Check the value of RowCount. Because the value has reached 10, the threshold specified in the UDx, expect that RowCount is cleared:

```sql
=> SHOW SESSION UDPARAMETER all;
schema | library | key | value
---------------------------------------------------------------
(0 rows)
```

As expected, RowCount is cleared.

Through the UDx in Java:

1. Remove the following lines from the `destroy()` method in RowCount:

   ```java
   udParams.getUDSessionParamWriter("library").setString("rowCount", Integer.toString(rowCount));
   srvInterface.log("RowNumber processed %d records", count);
   ```

2. Replace the removed lines from the `destroy()` method with the following code:

   ```java
   if (rowCount < 10)
   { 
   udParams.getUDSessionParamWriter("library").setString("rowCount", Integer.toString(rowCount));
   srvInterface.log("RowNumber processed %d records", count);
   }
   else 
   { 
   udParams.getUDSessionParamWriter("library").clearParameter("rowCount");
   }
   ```

3. To see the UDx clear the session parameter, set RowCount to a value of 9:

   ```sql
   => ALTER SESSION SET UDPARAMETER FOR UDSession RowCount = 9;
   ALTER SESSION
   ```

4. Check the value of RowCount:

   ```sql
   => SHOW SESSION UDPARAMETER all;
   schema | library | key | value
   -----------------------------------------------
   public | UDSession | rowCount | 9 
   (1 row)
   ```

5. Invoke RowCount so that its value becomes 10:
6. Check the value of RowCount. Since the value has reached 10, the threshold specified in the UDx, expect that RowCount is cleared:

```
SHOW SESSION UDPARAMETER all;
```

As expected, RowCount is cleared.

### Read-Only and Hidden Session Parameters

If you don't want a parameter to be set anywhere except in the UDx, you can make it read-only. If, additionally, you don't want a parameter to be visible in the client, you can make it hidden.

To make a parameter read-only, meaning that it cannot be set in the client, but can be viewed, add a single underscore before the parameter's name. For example, to make rowCount read-only, change all instances in the UDx of "rowCount" to "_rowCount".

To make a parameter hidden, meaning that it cannot be viewed in the client nor set, add two underscores before the parameter's name. For example, to make rowCount hidden, change all instances in the UDx of "rowCount" to "__rowCount".

### C++ Example: Defining Parameters

The following code fragment demonstrates adding a single parameter to the C++ add2ints UDSF example. The `getParameterType()` function defines a single integer parameter that is named `constant`.

```cpp
class Add2IntsWithConstantFactory : public ScalarFunctionFactory {
```

```
// Return an instance of Add2ints to perform the actual addition.
virtual ScalarFunction *createScalarFunction(ServerInterface &interface) 
{
    // Calls the vt_createFuncObj to create the new Add2ints class instance.
    return vt_createFuncObj(interface.allocator, Add2intsWithConstant);
}
// Report the argument and return types to Vertica.
virtual void getPrototype(ServerInterface &interface,
                          ColumnTypes &argTypes,
                          ColumnTypes &returnType)
{
    // Takes two ints as inputs, so add ints to the argTypes object.
    argTypes.addInt();
    argTypes.addInt();
    // Returns a single int.
    returnType.addInt();
}
// Defines the parameters for this UDSF. Works similarly to defining arguments and return types.
virtual void getParameterType(ServerInterface &srvInterface,
                               SizedColumnTypes &parameterTypes)
{
    // One int parameter named constant.
    parameterTypes.addInt("constant");
}
};
RegisterFactory(Add2intsWithConstantFactory);

See the Vertica SDK entry for SizedColumnType for a full list of the data-type-specific
functions you can call to define parameters.

The following code fragment demonstrates using the parameter value. The
Add2intsWithConstant class defines a function that adds two integer values. If the user
supplies it, the function also adds the value of the optional integer parameter named constant.

/**
 * A UDSF that adds two numbers together with a constant value.
 *
 */
class Add2intsWithConstant : public ScalarFunction
{
public:
    // Processes a block of data sent by Vertica.
    virtual void processBlock(ServerInterface &srvInterface,
                               BlockReader &arg_reader,
                               BlockWriter &res_writer)
    {
        try
        {
            // The default value for the constant parameter is 0.
            vint constant = 0;
            // Get the parameter reader from the ServerInterface to see if there are supplied
            parameters.
            ParamReader paramReader = srvInterface.getParamReader();
            // See if the user supplied the constant parameter.
            if (paramReader.containsParameter("constant"))
                // There is a parameter, so get its value.

constant = paramReader.getIntRef("constant");
    // While we have input to process:
    do {
        // Read the two integer input parameters by calling the BlockReader.getIntRef class function.
        const vint a = arg_reader.getIntRef(0);
        const vint b = arg_reader.getIntRef(1);
        // Add arguments plus constant.
        res_writer.setInt(a+b+constant);
        // Finish writing the row, and advance to the next output row.
        res_writer.next();
        // Continue looping until there are no more input rows.
    }
    while (arg_reader.next());
}
catch (exception& e)
{
    // Standard exception. Quit.
    vt_report_error(0, "Exception while processing partition: %s",
                   e.what());
}
};

C++ Example: Using Session Parameters

The RowCount example uses a user-defined session parameter, also called RowCount. This parameter counts the total number of rows processed by the UDX each time it runs. RowCount then displays the aggregate number of rows processed for all executions.

#include <string>
#include <sstream>
#include <iostream>
#include "Vertica.h"
#include "VerticaUDx.h"

using namespace Vertica;

class RowCount : public Vertica::ScalarFunction
{
  private:
    int rowCount;
    int count;
  
  public:

    virtual void setup(Vertica::ServerInterface &srvInterface, const Vertica::SizedColumnTypes &argTypes) {
        ParamReader pSessionParams = srvInterface.getUDSessionParamReader("library");
        std::string rCount = pSessionParams.containsKeyParameter("rowCount")?
            pSessionParams.getStringRef("rowCount").str(): "0";
        rowCount=atoi(rCount.c_str());
    }
Java Example: Defining Parameters

The following code fragment demonstrates adding a single parameter to the Java add2ints UDSF example. The getParameterType() method defines a single integer parameter that is
named constant.

```java
package com.mycompany.example;
import com.vertica.sdk.*;
public class Add2IntsWithConstantFactory extends ScalarFunctionFactory {
    @Override
    public void getPrototype(ServerInterface srvInterface,
                               ColumnTypes argTypes,
                               ColumnTypes returnType)
    {
        argTypes.addInt();
        argTypes.addInt();
        returnType.addInt();
    }
    @Override
    public void getReturnType(ServerInterface srvInterface,
                               SizedColumnTypes argTypes,
                               SizedColumnTypes returnType)
    {
        returnType.addInt("sum");
    }
    // Defines the parameters for this UDSF. Works similarly to defining
    // arguments and return types.
    public void getParameterType(ServerInterface srvInterface,
                                  SizedColumnTypes argTypes,
                                  SizedColumnTypes parameterTypes)
    {
        // One INTEGER parameter named constant
        parameterTypes.addInt("constant");
    }
    @Override
    public ScalarFunction createScalarFunction(ServerInterface srvInterface)
    {
        return new Add2IntsWithConstant();
    }
}
```

See the Vertica Java SDK entry for `SizedColumnTypes` for a full list of the data-type-specific methods you can call to define parameters.

## Java Example: Using Session Parameters

The `RowCount` example uses a user-defined session parameter, also called `RowCount`. This parameter counts the total number of rows processed by the UDx each time it runs. `RowCount` then displays the aggregate number of rows processed for all executions.

```java
package com.mycompany.example;
import com.vertica.sdk.*;
public class RowCountFactory extends ScalarFunctionFactory {
    
```
@Override
public void getPrototype(ServerInterface srvInterface, ColumnTypes argTypes, ColumnTypes returnType)
{
    argTypes.addInt();
    argTypes.addInt();
    returnType.addInt();
}

generic class RowCount extends ScalarFunction {

    private Integer count;
    private Integer rowCount;

    // In the setup method, you look for the rowCount parameter. If it doesn't exist, it is created.
    // Look in the default namespace which is "library," but it could be anything else, most likely
    "public" if not "library".
    @Override
    public void setup(ServerInterface srvInterface, SizedColumnTypes argTypes) {
        count = new Integer(0);
        ParamReader pSessionParams = srvInterface.getUDSessionParamReader("library");
        String rCount = pSessionParams.containsParameter("rowCount")?
            pSessionParams.getString("rowCount"):
            "0";
        rowCount = Integer.parseInt(rCount);
    }

    @Override
    public void processBlock(ServerInterface srvInterface, BlockReader arg_reader, BlockWriter res_writer)
        throws UdfException, DestroyInvocation {
        do {
            ++count;
            long a = arg_reader.getLong(0);
            long b = arg_reader.getLong(1);
            res_writer.setLong(a+b);
            res_writer.next();
        } while (arg_reader.next());
    }

    @Override
    public void destroy(ServerInterface srvInterface, SizedColumnTypes argTypes,
        SessionParamWriterMap udParams) {
        rowCount = count;
        udParams.getUDSessionParamWriter("library").setString("rowCount", Integer.toString(rowCount));
        srvInterface.log("RowNumber processed %d records", count);
    }

    @Override
    public ScalarFunction createScalarFunction(ServerInterface srvInterface) {
        return new RowCount();
    }
}
Handling Cancel Requests

Users of your UDx might cancel the operation while it is running. How Vertica handles the cancellation of the query and your UDx depends on whether your UDx is running in fenced or unfenced mode:

- If your UDx is running in unfenced mode, Vertica either stops the function when it requests a new block of input or output, or waits until your function completes running and discards the results.

- If your UDx is running in Fenced Mode, Vertica kills the zygote process that is running your function if it continues processing past a timeout.

In addition, you can implement the cancel() method in any UDx to perform any necessary additional work. Vertica calls your function when a query is canceled. This cancellation can occur at any time during your UDx's lifetime, from setup() through destroy().

You can check for cancellation before starting an expensive operation by calling isCanceled().

Implementing the Cancel Callback

Your UDx can implement a cancel() callback function. Vertica calls this function if the query that invoked the UDx has been canceled.

You usually implement this function to perform an orderly shutdown of any additional processing that your UDx spawned. For example, you can have your cancel() function shut down threads that your UDx has spawned or signal a third-party library that it needs to stop processing and exit. Your cancel() function should leave your UDx's function class ready to be destroyed, because Vertica calls the UDx's destroy() function after the cancel() function has exited.

A UDx's default cancel() behavior is to do nothing.

The contract for cancel() is:

- Vertica will call cancel() at most once per UDx instance.

- Vertica can call cancel() concurrently with any other method of the UDx object except the constructor and destructor.
Vertica can call cancel() from another thread, so implementations should be thread-safe.

Vertica will call cancel() for either an explicit user cancellation or an error in the query.

Vertica does not guarantee that cancel() will run to completion. Long-running cancellations might be aborted.

The call to cancel() is not synchronized in any way with your UDx's other functions. If you need your processing function to exit before your cancel() function performs some action (killing threads, for example), you must have the two function synchronize their actions.

Vertica always calls destroy() if it called setup(). Cancellation does not prevent destruction.

See C++ Example: Cancelable UDSource for an example that implements cancel().

Checking for Cancellation During Execution

You can call the isCanceled() method to check for user cancellation. Typically you check for cancellation from the method that does the main processing in your UDx before beginning expensive operations. If isCanceled() returns true, the query has been canceled and your method should exit immediately to prevent it from wasting CPU time. If your UDx is not running in Fenced Mode, Vertica cannot halt your function and has to wait for it to finish. If it is running in fenced mode, Vertica eventually kills the side process running it.

See C++ Example: Cancelable UDSource for an example that uses isCanceled().

C++ Example: Cancelable UDSource

The FifoSource example, found in filelib.cpp in the SDK examples, demonstrates use of cancel() and isCanceled(). This source reads from a named pipe. Unlike reads from files, reads from pipes can block. Therefore, we need to be able to cancel a load from this source.

To manage cancellation, the UDx uses a pipe, a data channel used for inter-process communication. A process can write data to the write end of the pipe, and it remains available until another process reads it from the read end of the pipe. This example doesn't pass data through this pipe; rather, it uses the pipe to manage cancellation, as explained further below.

In addition to the pipe's two file descriptors (one for each end), the UDx creates a file descriptor for the file to read from. The setup() function creates the pipe and then opens the file.
virtual void setup(ServerInterface &srvInterface) {
    // cancelPipe is a pipe used only for checking cancellation
    if (pipe(cancelPipe)) {
        vt_report_error(0, "Error opening control structure");
    }

    // handle to the named pipe from which we read data
    namedPipeFd = open(filename.c_str(), 0_RONLY | 0_NONBLOCK);
    if (namedPipeFd < 0) {
        vt_report_error(0, "Error opening fifo [%s]", filename.c_str());
    }
}

We now have three file descriptors: namedPipeFd, cancelPipe[PIPE_READ], and cancelPipe[PIPE_WRITE]. Each of these must eventually be closed.

This UDx uses the poll() system call to wait either for data to arrive from the named pipe (namedPipeFd) or for a cancellation (cancelPipe[PIPE_READ]). The process() function polls, checks for results, checks for cancellation, writes output if needed, and returns.

virtual StreamState process(ServerInterface &srvInterface, const DataBuffer &output) {
    struct pollfd pollfds[2] = {
        { namedPipeFd, POLLIN, 0 },
        { cancelPipe[PIPE_READ], POLLIN, 0 }
    };

    if (poll(pollfds, 2, -1) < 0) {
        vt_report_error(1, "Error reading [%s]", filename.c_str());
    }

    if (pollfds[1].revents & (POLLIN | POLLHUP)) {
        /* This can only happen after cancel() has been called */
        VIAssert(isCanceled());
        return DONE;
    }

    VIAssert(pollfds[PIPE_READ].revents & (POLLIN | POLLHUP));

    const ssize_t amount = read(namedPipeFd, output.buf + output.offset, output.size - output.offset);
    if (amount < 0) {
        vt_report_error(1, "Error reading from fifo [%s]", filename.c_str());
    }

    if (amount == 0 || isCanceled()) {
        return DONE;
    } else {
        output.offset += amount;
        return OUTPUT_NEEDED;
    }
}

If the query is canceled, the cancel() function closes the write end of the pipe. The next time process() polls for input, it finds no input on the read end of the pipe and exits. Otherwise, it continues. The function also calls isCanceled() to check for cancellation before returning.
OUTPUT_NEEDED, the signal that it has filled its buffer and is waiting for it to be processed downstream.

The cancel() function does only the work needed to interrupt a call to process(). Cleanup that is always needed, not just for cancellation, is instead done in destroy() or the destructor. The cancel() function closes the write end of the pipe. (The helper function will be shown later.)

```cpp
virtual void cancel(ServerInterface &srvInterface) {
    closeIfNeeded(cancelPipe[PIPE_WRITE]);
}
```

It is not safe to close the named pipe in cancel(), because closing it could create a race condition if another process (like another query) were to reuse the file descriptor number for a new descriptor before the UDx finishes. Instead we close it, and the read end of the pipe, in destroy().

```cpp
virtual void destroy(ServerInterface &srvInterface) {
    closeIfNeeded(namedPipeFd);
    closeIfNeeded(cancelPipe[PIPE_READ]);
}
```

It is not safe to close the write end of the pipe in destroy(), because cancel() closes it and can be called concurrently with destroy(). Therefore, we close it in the destructor.

```cpp
~FifoSource() {
    closeIfNeeded(cancelPipe[PIPE_WRITE]);
}
```

The UDx uses a helper function, closeIfNeeded(), to make sure each file descriptor is closed exactly once.

```cpp
void closeIfNeeded(int &fd) {
    if (fd >= 0) {
        close(fd);
        fd = -1;
    }
}
```

### Debugging Tips

You must thoroughly debug your UDx before deploying it to a production environment. The following tips can help you get your UDx ready for deployment.
Use a Single Node For Initial Debugging

You can attach to the Vertica process using a debugger such as gdb to debug your UDx code. Doing this in a multi-node environment, however, is very difficult. Therefore, consider setting up a single-node Vertica test environment to initially debug your UDx.

Write Messages to the Vertica Log

You can write to log files using the ServerInterface.log function. Every function in your UDx receives an instance of the ServerInterface object, so you can call the log function from anywhere in your UDx. The function acts similarly to printf, taking a formatted string, and an optional set of values and writing the string to a log file. Where the message is written depends on whether your function runs in fenced mode or unfenced mode:

- Functions running in unfenced mode write their messages into the vertica.log file in the catalog directory.

- Functions running in fenced mode write their messages into a log file named UDxLogs/UDxFencedProcesses.log in the catalog directory.

To help identify your function's output, Vertica adds the SQL function name bound to your UDx function to the log message.

The following code fragment shows how you can add a call to srvInterface.log in the Add2ints example code's processBlock() function to log its input values:

```c
const vint a = arg_reader.getIntRef(0);
const vint b = arg_reader.getIntRef(1);
srvInterface.log("got a: %d and b: %d", (int) a, (int) b);
```

This code generates an entries in the log file for each row the UDx processes. For example:

```
11-05-06 14:37:20.838 nameless:0x3f3a210 [UserMessage] <UDx> Add2ints - got a: 1 and b: 2
11-05-06 14:37:20.838 nameless:0x3f3a210 [UserMessage] <UDx> Add2ints - got a: 2 and b: 2
11-05-06 14:37:20.838 nameless:0x3f3a210 [UserMessage] <UDx> Add2ints - got a: 3 and b: 2
11-05-06 14:37:20.838 nameless:0x3f3a210 [UserMessage] <UDx> Add2ints - got a: 1 and b: 4
11-05-06 14:37:20.838 nameless:0x3f3a210 [UserMessage] <UDx> Add2ints - got a: 5 and b: 2
```

See Monitoring the Log Files in the Administrator's Guide for details on viewing the Vertica log files.
Developing with the C++ SDK

The Vertica SDK supports writing both fenced and unfenced UDxs of all types in C++ 11. You can download, compile, and run the examples; see Downloading and Running UDx Example Code. Running the examples is a good way to verify that your development environment has all needed libraries.

If you do not have access to a Vertica test environment, you can install Vertica on your development machine and run a single node. Each time you rebuild your UDx library, you need to re-install it into Vertica. The following diagram illustrates the typical development cycle.

This section covers C++-specific topics that apply to all UDx types. For information that applies to all languages, see Handling Different Numbers and Types of Arguments, UDx Parameters, Handling Cancel Requests and the sections for specific Types of UDxs. For full API documentation, see the C++ SDK Documentation.

Setting Up the C++ SDK

The Vertica C++ Software Development Kit (SDK) is distributed as part of the server installation. It contains the source and header files you need to create your UDx library. For examples that you can compile and run, see Downloading and Running UDx Example Code. For requirements for your development environment, see Setting Up a Development Environment.

The SDK files are located in the sdk subdirectory under the root Vertica server directory (usually, /opt/vertica/sdk). This directory contains a subdirectory, include, which contains the headers and source files needed to compile UDx libraries.

There are two files in the include directory you need when compiling your UDxs:

- Vertica.h is the main header file for the SDK. Your UDx code needs to include this file in order to find the SDK’s definitions.
- Vertica.cpp contains support code that needs to be compiled into the UDx library.
Much of the Vertica SDK API is defined in the VerticaUDx.h header file (which is included by the Vertica.h file). If you're curious, you might want to review the contents of this file in addition to reading the API documentation.

Finding the Current SDK Version

You must develop your UDx using the same SDK version as the database in which you plan to use it. To display the SDK version currently installed on your system, run the following command in vsql:

```
=> SELECT sdk_version();
```

Running the Examples

You can download the examples from the GitHub repository (see Downloading and Running UDx Example Code). Compiling and running the examples helps you to ensure that your development environment is properly set up.

To compile all of the examples, including the Java examples, issue the following command in the Java-and-C++ directory under the examples directory:

```
$ make
```

`Note: To compile the examples, you must have a g++ development environment installed. To install a g++ development environment on Red Hat systems, run yum install gcc gcc-c++ make.`

Compiling Your C++ Library

GNU g++ is the only supported compiler for compiling UDx libraries. Always compile your UDx code on the same version of Linux that you use on your Vertica cluster.

When compiling your library, you must always:

- Pass the -shared and -fPIC flags to the linker. The simplest method is to just pass these flags to g++ when you compile and link your library.

- Use the -Wno-unused-value flag to suppress warnings when macro arguments are not used. If you do not use this flag, you may get "left-hand operand of comma has no effect" warnings.
Compile `sdk/include/Vertica.cpp` and link it into your library. This file contains support routines that help your UDx communicate with Vertica. The easiest way to do this is to include it in the `g++` command to compile your library. Vertica supplies this file as C++ source rather than a library to limit library compatibility issues.

Add the Vertica SDK include directory in the include search path using the `g++ -I` flag.

The SDK examples include a working makefile. See [Downloading and Running UDx Example Code](#).  

### Example of Compiling a UDx

The following command compiles a UDx contained in a single source file named `MyUDx.cpp` into a shared library named `MyUDx.so`:

```
g++ -I /opt/vertica/sdk/include -Wall -shared -Wno-unused-value \
   -fPIC -o MyUDx.so MyUDx.cpp /opt/vertica/sdk/include/Vertica.cpp
```

**Important:** Vertica only supports UDx development on 64-bit architectures.

After you debug your UDx, you are ready to deploy it. Recompile your UDx using the `-O3` flag to enable compiler optimization.

You can add additional source files to your library by adding them to the command line. You can also compile them separately and then link them together.

**Tip:** The examples subdirectory in the Vertica SDK directory contains a make file that you can use as starting point for your own UDx project.

### Handling External Libraries

You must link your UDx library to any supporting libraries that your UDx code relies on. These libraries might be either ones you developed or others provided by third parties. You have two options for linking:

- **Statically link the support libraries into your UDx.** The benefit of this method is that your UDx library does not rely on external files. Having a single UDx library file simplifies deployment because you just transfer a single file to your Vertica cluster. This method's main drawback is that it increases the size of your UDx library file.
Dynamically link the library to your UDx. You must sometimes use dynamic linking if a third-party library does not allow static linking. In this case, you must copy the libraries to your Vertica cluster in addition to your UDx library file.

Adding Metadata to C++ Libraries

You can add metadata, such as author name, the version of the library, a description of your library, and so on to your library. This metadata lets you track the version of your function that is deployed on a Vertica Analytic Database cluster and lets third-party users of your function know who created the function. Your library's metadata appears in the USER_LIBRARIES system table after your library has been loaded into the Vertica Analytic Database catalog.

You declare the metadata for your library by calling the RegisterLibrary() function in one of the source files for your UDx. If there is more than one function call in the source files for your UDx, whichever gets interpreted last as Vertica Analytic Database loads the library is used to determine the library's metadata.

The RegisterLibrary() function takes eight string parameters:

```
RegisterLibrary(author,
    library_build_tag,
    library_version,
    library_sdk_version,
    source_url,
    description,
    licenses_required,
    signature);
```

- author contains whatever name you want associated with the creation of the library (your own name or your company's name for example).

- library_build_tag is a string you want to use to represent the specific build of the library (for example, the SVN revision number or a timestamp of when the library was compiled). This is useful for tracking instances of your library as you are developing them.

- library_version is the version of your library. You can use whatever numbering or naming scheme you want.

- library_sdk_version is the version of the Vertica Analytic Database SDK Library for which you've compiled the library.

Note: This field isn't used to determine whether a library is compatible with a version of the Vertica Analytic Database server. The version of the Vertica Analytic Database
SDK you use to compile your library is embedded in the library when you compile it. It is this information that Vertica Analytic Database server uses to determine if your library is compatible with it.

- **source_url** is a URL where users of your function can find more information about it. This can be your company's website, the GitHub page hosting your library's source code, or whatever site you like.

- **description** is a concise description of your library.

- **licenses_required** is a placeholder for licensing information. You must pass an empty string for this value.

- **signature** is a placeholder for a signature that will authenticate your library. You must pass an empty string for this value.

For example, the following code demonstrates adding metadata to the Add2Ints example (see **C++ Example: Add2Ints**).

```c++
// Include the top-level Vertica SDK file
#include "Vertica.h"

// Using the Vertica namespace means we don’t have to prefix all
// class references with Vertica::
using namespace Vertica;

/*
* ScalarFunction implementation for a UDF that adds
* two numbers together.
*/
class Add2Ints : public ScalarFunction
{
public:
  /*
  * This function does all of the actual processing for the UDF.
  * In this case, it simply reads two integer values and returns
  * their sum.
  * The inputs are retrieved via arg_reader
  * The outputs are returned via arg_writer
  */
  virtual void processBlock(ServerInterface &srvInterface,
                            BlockReader &arg_reader,
                            BlockWriter &res_writer)
  {
    // While we have input to process
    do
      {
        // Read the two integer input parameters by calling the
        // BlockReader.getIntRef class function
        const vint a = arg_reader.getIntRef(0);
        const vint b = arg_reader.getIntRef(1);
      }
  }
};
```
// Call BlockWriter.setInt to store the output value, which is the
// two input values added together
res_writer.setInt(a+b);
// Finish writing the row, and advance to the next output row
res_writer.next();
// Continue looping until there are no more input rows
} while (arg_reader.next());
}

/*
* This class provides metadata about the ScalarFunction class, and
* also instantiates a member of that class when needed.
*/
class Add2IntsFactory : public ScalarFunctionFactory
{
    // return an instance of Add2Ints to perform the actual addition.
    virtual ScalarFunction *createScalarFunction(ServerInterface &interface)
    {
        // Calls the vt_createFuncObj to create the new Add2Ints class instance.
        return vt_createFuncObj(interface.allocator, Add2Ints);
    }

    // This function returns the description of the input and outputs of the
    // Add2Ints class's processBlock function. It stores this information in
    // two ColumnTypes objects, one for the input parameters, and one for
    // the return value.
    virtual void getPrototype(ServerInterface &interface,
                                ColumnTypes &argTypes,
                                ColumnTypes &returnType)
    {
        // Takes two ints as inputs, so add ints to the argTypes object
        argTypes.addInt();
        argTypes.addInt();
        // returns a single int, so add a single int to the returnType object.
        // Note that ScalarFunctions *always* return a single value.
        returnType.addInt();
    }
};

// Register the factory with Vertica
RegisterFactory(Add2IntsFactory);

// Register the library's metadata.
RegisterLibrary("Whizzo Analytics Ltd.",
                "1234",
                "2.0",
                "7.0.0",
                "http://www.example.com/add2ints",
                "Add 2 Integer Library",
                "",
                "");

Loading the library and querying the USER_LIBRARIES system table shows the metadata
supplied in the call to RegisterLibrary():
CREATE LIBRARY add2intslib AS '/home/dbadmin/add2ints.so';

CREATE LIBRARY add2intslib AS '/home/dbadmin/add2ints.so';

Expanded display is on.

C++ SDK Data Types

The Vertica SDK has typedefs and classes for representing Vertica data types within your UDx code. Using these typedefs ensures data type compatibility between the data your UDx processes and generates and the Vertica database. The following table describes some of the typedefs available. Consult the Vertica C++ SDK Documentation for a complete list, as well as lists of helper functions to convert and manipulate these data types.

<table>
<thead>
<tr>
<th>Type Definition</th>

</tr>
</tbody>
</table>
| VString         | String data types (such as varchar and char)  
Note: Do not use a VString object to hold an intermediate result. Use a std::string or char[] instead. |
| VNumeric        | Fixed-point data types from Vertica |

Notes

- When making some Vertica SDK API calls (such as VerticaType::getNumericLength()) on objects, make sure they have the correct data type. To minimize overhead and improve performance, most of the APIs do not check the data types of the objects on which they are called. Calling a function on an incorrect data type can result in an error.
- A NULL Vertica value string data type is converted into an empty C++ string.
- You cannot create instances of VString or VNumeric yourself. You can manipulate the values of existing objects of these classes that Vertica passes to your UDx, and extract values from them. However, only Vertica can instantiate these classes.

Handling Errors

If your UDx encounters some sort of error, it can report it back to Vertica using the vt_report_error macro. When called, this macro halts the execution of the UDx and causes the statement that called the function to fail. The macro takes two parameters: an error number and an error message string. Both the error number and message appear in the error that Vertica reports to the user. The error number is not defined by Vertica. You can use whatever value that you wish.

For example, the following ScalarFunction class divides two integers. To prevent division by zero, it tests the second parameter. If it is zero, the function reports the error back to Vertica.

```cpp
/*
 * Demonstrate reporting an error
 */
class Div2ints : public ScalarFunction
{
 public:
   virtual void processBlock(ServerInterface &srvInterface,  
                      BlockReader &arg_reader,  
```
BlockWriter &res_writer)
{
    // While we have inputs to process
    do
    {
        const vint a = arg_reader.getIntRef(0);
        const vint b = arg_reader.getIntRef(1);
        if (b == 0)
        {
            vt_report_error(1,"Attempted divide by zero");
        }
        res_writer.setInt(a/b);
        res_writer.next();
    }
    while (arg_reader.next());
}

Loading and invoking the function demonstrates how the error appears to the user.

=> CREATE LIBRARY Div2IntsLib AS '/home/dbadmin/Div2ints.so';

=> SELECT * FROM MyTable WHERE div2ints(a, b) > 2;
ERROR: Error in calling processBlock() for User Defined Scalar Function
div2ints at Div2ints.cpp:21, error code: 1, message: Attempted divide by zero

Your function must not allow an exception to be passed back to Vertica. You should use a top-level try-catch block to catch any stray exceptions that might be thrown by your code or any functions or libraries your code calls. This is especially important when running a UDx in unfenced mode. Any errors in an unfenced UDx can result in database instability or even data loss.
Resource Use for C++ UDxs

Your UDxs consume at least a small amount of memory by instantiating classes and creating local variables. This basic memory usage by UDxs is small enough that you do not need to be concerned about it.

If your UDx needs to allocate more than one or two megabytes of memory for data structures, or requires access to additional resources such as files, you must inform Vertica about its resource use. Vertica can then ensure that the resources your UDx requires are available before running a query that uses it. Even moderate memory use (10MB per invocation of a UDx, for example) can become an issue if there are many simultaneous queries that call it.

Note: If your UDx allocates its own memory, you must make absolutely sure it properly frees it. Failing to free even a single byte of allocated memory can have huge consequences if your UDx is called to operate on a multi-million-row table. Instead of having your code allocate its own memory, you should use the C++ vt_alloc macro, which uses Vertica’s own memory manager to allocate and track memory. This memory is guaranteed to be properly disposed of when your UDx completes execution. See Allocating Resources for UDxs for more information.

Allocating Resources for UDxs

You have two options for allocating memory and file handles for your User-Defined Extensions (UDxs):

- Use Vertica SDK macros to allocate resources. This is the best method, since it uses Vertica's own resource manager, and guarantees that resources used by your UDx are reclaimed. See Allocating Resources with the SDK Macros.

- Allocate resources in your UDxs yourself using standard C++ methods (instantiating objects using new, allocating memory blocks using malloc(), etc.). You must manually free these resources before your UDx exits.

Note: You must be extremely careful if you choose to allocate your own resources in your UDx. Failing to free resources properly will have significant negative impact, especially if your UDx is running in unfenced mode.
Whichever method you choose, you usually allocate resources in a function named `setup()` in your UDx class. This function is called after your UDx function object is instantiated, but before Vertica calls it to process data.

If you allocate memory on your own in the `setup()` function, you must free it in a corresponding function named `destroy()`. This function is called after your UDx has performed all of its processing. This function is also called if your UDx returns an error (see Handling Errors).

**Note:** Always use the `setup()` and `destroy()` functions to allocate and free resources instead of your own constructors and destructors. The memory for your UDx object is allocated from one of Vertica's own memory pools. Vertica always calls your UDx's `destroy()` function before it deallocates the object's memory. There is no guarantee that your UDx's destructor is will be called before the object is deallocated. Using the `destroy()` function ensures that your UDx has a chance to free its allocated resources before it is destroyed.

The following code fragment demonstrates allocating and freeing memory using a `setup()` and `destroy()` function.

```cpp
class MemoryAllocationExample : public ScalarFunction
{
public:
    uint64* myarray;
    // Called before running the UDF to allocate memory used throughout
    // the entire UDF processing.
    virtual void setup(ServerInterface &srvInterface, const SizedColumnTypes &argTypes)
    {
        try
        {
            // Allocate an array. This memory is directly allocated, rather than
            // letting Vertica do it. Remember to properly calculate the amount
            // of memory you need based on the data type you are allocating.
            // This example divides 500MB by 8, since that's the number of
            // bytes in a 64-bit unsigned integer.
            myarray = new uint64[1024 * 1024 * 500 / 8];
        }
        catch (std::bad_alloc &ba)
        {
            // Always check for exceptions caused by failed memory
            // allocations.
            vt_report_error(1, "Couldn't allocate memory :[%s]", ba.what());
        }
    }

    // Called after the UDF has processed all of its information. Use to free
    // any allocated resources.
    virtual void destroy(ServerInterface &srvInterface, const SizedColumnTypes &argTypes)
    {
        // srvInterface.log("RowNumber processed %d records", "count_ptr);
    }
};
```
try
{
    // Properly dispose of the allocated memory.
    delete[] myarray;
}
catch (std::bad_alloc &ba)
{
    // Always check for exceptions caused by failed memory
    // allocations.
    vt_report_error(1, "Couldn't free memory :[%s]", ba.what());
}

Allocating Resources with the SDK Macros

The Vertica SDK provides three macros to allocate memory:

- **vt_alloc** allocates a block of memory to fit a specific data type (vint, struct, etc.).
- **vt_allocArray** allocates a block of memory to hold an array of a specific data type.
- **vt_allocSize** allocates an arbitrarily-sized block of memory.

All of these macros allocate their memory from memory pools managed by Vertica. The main benefit of allowing Vertica to manage your UDx's memory is that the memory is automatically reclaimed after your UDx has finished. This ensures there is no memory leaks in your UDx.

Because Vertica frees this memory automatically, do not attempt to free any of the memory you allocate through any of these macros. Attempting to free this memory results in run-time errors.

Informing Vertica of Resource Requirements

When you run your UDx in fenced mode, Vertica monitors its use of memory and file handles. If your UDx uses more than a few megabytes of memory or any file handles, it should tell Vertica about its resource requirements. Knowing the resource requirements of your UDx allows Vertica to determine whether it can run the UDx immediately or needs to queue the request until enough resources become available to run it.

Determining how much memory your UDx requires can be difficult in some cases. For example, if your UDx extracts unique data elements from a data set, there is potentially no bound on the number of data items. In this case, a useful technique is to run your UDx in a test environment and monitor its memory use on a node as it handles several differently-sized queries, then extrapolate its memory use based on the worst-case scenario it may face in your production
environment. In all cases, it's usually a good idea to add a safety margin to the amount of memory you tell Vertica your UDx uses.

Note: The information on your UDx's resource needs that you pass to Vertica is used when planning the query execution. There is no way to change the amount of resources your UDx requests from Vertica while the UDx is actually running.

Your UDx informs Vertica of its resource needs by implementing the getPerInstanceResources() function in its factory class (see Vertica::UDXFactory::getPerInstanceResources() in the SDK documentation). If your UDx's factory class implements this function, Vertica calls it to determine the resources your UDx requires.

The getPerInstanceResources() function receives an instance of the Vertica::VResources struct. This struct contains fields that set the amount of memory and the number of file handles your UDx needs. By default, the Vertica server allocates zero bytes of memory and 100 file handles for each instance of your UDx.

Your implementation of the getPerInstanceResources() function sets the fields in the VResources struct based on the maximum resources your UDx may consume for each instance of the UDx function. So, if your UDx's processBlock() function creates a data structure that uses at most 100MB of memory, your UDx must set the VResources.scratchMemory field to at least 104857600 (the number of bytes in 100MB). Leave yourself a safety margin by increasing the number beyond what your UDx should normally consume. In this example, allocating 115000000 bytes (just under 110MB) is a good idea.

The following ScalarFunctionFactory class demonstrates calling getPerInstanceResources() to inform Vertica about the memory requirements of the MemoryAllocationExample class shown in Allocating Resources for UDxs. It tells Vertica that the UDSF requires 510MB of memory (which is a bit more than the UDSF actually allocates, to be on the safe size).

```cpp
class MemoryAllocationExampleFactory : public ScalarFunctionFactory
{
    virtual Vertica::ScalarFunction *createScalarFunction(Vertica::ServerInterface &srvInterface)
    {
        return vt_createFuncObj(srvInterface.allocator, MemoryAllocationExample);
    }
    virtual void getPrototype(Vertica::ServerInterface &srvInterface,
                                Vertica::ColumnTypes &argTypes,
                                Vertica::ColumnTypes &returnType)
    {
        argTypes.addInt();
        argTypes.addInt();
        returnType.addInt();
    }
};
```
Setting Memory Limits for Fenced-Mode UDxs

Vertica calls a fenced-mode UDx's implementation of Vertica::UDXFactory::getPerInstanceResources() to determine if there are enough free resources to run the query containing the UDx (see Informing Vertica of Resource Requirements). Since these reports are not generated by actual memory use, they can be inaccurate. Once started by Vertica, a UDx could allocate far more memory or file handles than it reported it needs.

The FencedUDxMemoryLimitMB configuration parameter lets you create an absolute memory limit for UDxs. Any attempt by a UDx to allocate more memory than this limit results in a bad_alloc exception. For more information on configuration parameters, see Configuration Parameters in the Administrator's Guide. For an example of setting FencedUDxMemoryLimitMB, see How Resource Limits Are Enforced.

How Resource Limits Are Enforced

Before running a query, Vertica determines how much memory it requires to run. If the query contains a fenced-mode UDx which implements the getPerInstanceResources() function in its factory class, Vertica calls it to determine the amount of memory the UDx needs and adds this to the total required for the query. Based on these requirements, Vertica decides how to handle the query:

- If the total amount of memory required (including the amount that the UDxs report that they need) is larger than the session's MEMORYCAP or resource pool's MAXMEMORYSIZE setting, Vertica rejects the query. For more information about resource pools, see Resource Pool Architecture in the Administrator's Guide.

- If the amount of memory is below the limit set by the session and resource pool limits, but there is currently not enough free memory to run the query, Vertica queues it until enough resources become available.

- If there are enough free resources to run the query, Vertica executes it.
**Note:** Vertica has no other way to determine the amount of resources a UDx requires other than the values it reports using the `getPerInstanceResources()` function. A UDx could use more resources than it claims, which could cause performance issues for other queries that are denied resources. You can set an absolute limit on the amount of memory UDxs can allocate. See Setting Memory Limits for Fenced-Mode UDxs for more information.

If the process executing your UDx attempts to allocate more memory than the limit set by the `FencedUDxMemoryLimitMB` configuration parameter, it receives a bad_alloc exception. For more information about `FencedUDxMemoryLimitMB`, see Setting Memory Limits for Fenced-Mode UDxs.

Below is the output of loading a UDSF that consumes 500MB of memory, then changing the memory settings to cause out-of-memory errors. The `MemoryAllocationExample` UDSF in the following example is just the `Add2Ints` UDSF example altered as shown in Allocating Resources for UDxs and Informing Vertica of Resource Requirements to allocate 500MB of RAM.

```sql
=> CREATE LIBRARY mylib AS '/home/dbadmin/MemoryAllocationExample.so';
CREATE LIBRARY
=> CREATE FUNCTION usemem AS NAME 'MemoryAllocationExampleFactory' LIBRARY mylib
  -> FENCED;
CREATE FUNCTION
=> SELECT usemem(1,2);
  usemem
  -------
  3
  (1 row)
```

The following statements demonstrate setting the session's `MEMORYCAP` to lower than the amount of memory that the UDSF reports it uses. This causes Vertica to return an error before it executes the UDSF.

```sql
=> SET SESSION MEMORYCAP '100M';
SET
=> SELECT usemem(1,2);
ERROR 3596: Insufficient resources to execute plan on pool sysquery
  [Request exceeds session memory cap: 520328KB > 102400KB]
=> SET SESSION MEMORYCAP = default;
SET
```

The resource pool can also prevent a UDx from running if it requires more memory than is available in the pool. The following statements demonstrate the effect of creating and using a resource pool that has too little memory for the UDSF to run. Similar to the session's `MAXMEMORYCAP` limit, the pool's `MAXMEMORYSIZE` setting prevents Vertica from executing the query containing the UDSF.

```sql
=> CREATE RESOURCE POOL small MEMORYSIZE '100M' MAXMEMORYSIZE '100M';
CREATE RESOURCE POOL
```
Finally, setting the FencedUDxMemoryLimitMB configuration parameter to lower than the UDx actually allocates results in the UDx throwing an exception. This is a different case than either of the previous two examples, since the query actually executes. The UDx's code needs to catch and handle the exception. In this example, it uses the vt_report_error macro to report the error back to Vertica and exit.

```
=> ALTER DATABASE mydb SET FencedUDxMemoryLimitMB = 300;
=> SELECT usemem(1,2);
   ERROR 3412: Failure in UDx RPC call InvokeSetup(): Error calling setup() in User Defined Object [usemem] at [MemoryAllocationExample.cpp:32], error code: 1, message: Couldn't allocate memory :[std::bad_alloc]
=> ALTER DATABASE mydb SET FencedUDxMemoryLimitMB = -1;
=> SELECT usemem(1,2);
   usemem
      --------
         3
   (1 row)
```

**Developing with the Java SDK**

The Vertica SDK supports writing Java UDxs of all types except aggregate functions. All Java UDxs are fenced.
You can download, compile, and run the examples; see Downloading and Running UDx Example Code. Running the examples is a good way to verify that your development environment has all needed libraries.

If you do not have access to a Vertica test environment, you can install Vertica on your development machine and run a single node. Each time you rebuild your UDx library, you need to re-install it into Vertica. The following diagram illustrates the typical development cycle.

This section covers Java-specific topics that apply to all UDx types. For information that applies to all languages, see Handling Different Numbers and Types of Arguments, UDx Parameters, Handling Cancel Requests and the sections for specific Types of UDxs. For full API documentation, see the Java SDK Documentation.

Setting Up the Java SDK

The Vertica Java Software Development Kit (SDK) is distributed as part of the server installation. It contains the source and JAR files you need to create your UDx library. For examples that you can compile and run, see Downloading and Running UDx Example Code. For requirements for your development environment, see Setting Up a Development Environment.

To use the SDK you need two files from the Java support package:

- `/opt/vertica/bin/VerticaSDK.jar` contains the Vertica Java SDK and other supporting files.
- `/opt/vertica/sdk/BuildInfo.java` contains version information about the SDK. You must compile this file and include it within your Java UDx JAR files.

If you are not doing your development on a database node, you can copy these two files from one of the database nodes to your development system.

The `BuildInfo.java` and `VerticaSDK.jar` files that you use to compile your UDx must be from the same SDK version. Both files must also match the version of the SDK files on your Vertica hosts. Versioning is only an issue if you are not compiling your UDxs on a Vertica host. If you are compiling on a separate development system, always refresh your copies of these two files and recompile your UDxs just before deploying them.
Finding the Current SDK Version

You must develop your UDx using the same SDK version as the database in which you plan to use it. To display the SDK version currently installed on your system, run the following command in vsql:

```sql
=> SELECT sdk_version();
```

Compiling BuildInfo.java

You need to compile the BuildInfo.java file into a class file, so you can include it in your Java UDx JAR library. If you are using a Vertica node as a development system, you can either:

- Copy the BuildInfo.java file to another location on your host.
- If you have root privileges, compile the BuildInfo.java file in place. (Only the root user has privileges to write files to the /opt/vertica/sdk directory.)

Compile the file using the following command. Replace `path` with the path to the file and `output-directory` with the directory where you will compile your UDxs.

```bash
$ javac -classpath /opt/vertica/bin/VerticaSDK.jar /path/BuildInfo.java -d output-directory
```

If you use an IDE such as Eclipse, you can include the BuildInfo.java file in your project instead of compiling it separately. You must also add the VerticaSDK.jar file to the project's build path. See your IDE's documentation for details on how to include files and libraries in your projects.

Running the Examples

You can download the examples from the GitHub repository (see Downloading and Running UDx Example Code). Compiling and running the examples helps you to ensure that your development environment is properly set up.

If you have not already done so, set the JAVA_HOME environment variable to your JDK (not JRE) directory.

To compile all of the examples, including the Java examples, issue the following command in the Java-and-C++ directory under the examples directory:
To compile only the Java examples, issue the following command in the Java-and-C++ directory under the examples directory:

```
$ make JavaFunctions
```

Note: To compile the examples, you must have make installed. To install make on Red Hat systems, run `yum install make`.

## Compiling and Packaging a Java Library

Before you can use your Java UDx, you need to compile it and package it into a JAR file.

The SDK examples include a working makefile. See Downloading and Running UDx Example Code.

### Compile Your Java UDx

You must include the SDK JAR file in the classpath when you compile your Java UDx source files so the Java compiler can resolve the Vertica API calls. If you are using the command-line Java compiler on a host in your database cluster, enter this command:

```
$ javac -classpath /opt/vertica/bin/VerticaSDK.jar factorySource.java [functionSource.java...] -d output-directory
```

If all of your source files are in the same directory, you can use `*.java` on the command line instead of listing the files individually.

If you are using an IDE, verify that a copy of the `VerticaSDK.jar` file is in the build path.

### UDx Class File Organization

After you compile your UDx, you must package its class files and the `BuildInfo.class` file into a JAR file.

Note: You can package as many UDxs as you want into the same JAR file. Bundling your UDxs together saves you from having to load multiple libraries.

To use the `jar` command packaged as part of the JDK, you must organize your UDx class files into a directory structure matching your class package structure. For example, suppose your
UDX's factory class has a fully-qualified name of com.mycompany.udfs.Add2ints. In this case, your class files must be in the directory hierarchy com/mycompany/udfs relative to your project's base directory. In addition, you must have a copy of the BuildInfo.class file in the path com/vertica/sdk so that it can be included in the JAR file. This class must appear in your JAR file to indicate the SDK version that was used to compile your Java UDX.

The JAR file for the Add2ints UDSF example explained in Java Example: Add2Ints has the following directory structure after compilation:

- com/vertica/sdk/BuildInfo.class
- com/mycompany/example/Add2intsFactory.class
- com/mycompany/example/Add2intsFactory$Add2ints.class

### Package Your UDX Into a JAR File

To create a JAR file from the command line:

1. Change to the root directory of your project.
2. Use the jar command to package the BuildInfo.class file and all of the classes in your UDX:

   ```
   # jar -cvf libname.jar com/vertica/sdk/BuildInfo.class \
   packagePath/*.class
   ```

   When you type this command, *libname* is the filename you have chosen for your JAR file (choose whatever name you like), and *packagePath* is the path to the directory containing your UDX's class files.

   - For example, to package the files from the Add2ints example, you use the command:

     ```
     # jar -cvf Add2intsLib.jar com/vertica/sdk/BuildInfo.class \
     com/mycompany/example/*.class
     ```

   - More simply, if you compiled BuildInfo.class and your class files into the same root directory, you can use the following command:

     ```
     # jar -cvf Add2intsLib.jar .
     ```

   You must include all of the class files that make up your UDX in your JAR file. Your UDX always consists of at least two classes (the factory class and the function class). Even if you defined your function class as an inner class of your factory class, Java generates a separate class file for the inner class.
After you package your UDx into a JAR file, you are ready to deploy it to your Vertica database.

Handling Java UDx Dependencies

If your Java UDx relies on one or more external libraries, you can handle the dependencies in one of three ways:

- Bundle the JAR files into your UDx JAR file using a tool such as One-JAR or Eclipse Runnable JAR Export Wizard.
- Unpack the JAR file and then repack its contents in your UDx's JAR file.
- Copy the libraries to your Vertica cluster in addition to your UDx library. Then, use the DEPENDS keyword of the CREATE LIBRARY statement to tell Vertica that the UDx library depends on the external libraries. This keyword acts as a library-specific CLASSPATH setting. Vertica distributes the support libraries to all of the nodes in the cluster and sets the class path for the UDx so it can find them.

If your UDx depends on native libraries (SO files), use the DEPENDS keyword to specify their path. When you call System.loadLibrary in your UDx (which you must do before using a native library), this function uses the DEPENDS path to find them. You do not need to also set the LD_LIBRARY_PATH environment variable.

Important: In previous versions of Vertica, the JavaClassPathForUDx configuration parameter set the locations of external libraries for all Java UDxs. In Vertica Version 7.1, this configuration parameter is deprecated. It will be removed in a future version. If you upgrade from a previous version of Vertica, switch any existing Java UDxs that rely on support libraries to use the new DEPENDS keyword. To make this switch, use the ALTER LIBRARY statement to recreate the UDx library. In this statement, supply the DEPENDS keyword to specify the directory containing the support libraries.

External Library Example

The following example demonstrates using an external library with a Java UDx.

The following sample code defines a simple class, named VowelRemover. It contains a single method, named removevowels, that removes all of the vowels (the letters a, e, i, o, u, and y) from a string.

```java
package com.mycompany.libs;
```
public class VowelRemover {
    public String removevowels(String input) {
        return input.replaceAll("(?i)\[aeiouy\]", "");
    }
};

You can compile this class and package it into a JAR file with the following commands:

$ javac -g com/mycompany/libs/VowelRemover.java
$ jar cf mycompanylibs.jar com/mycompany/libs/VowelRemover.class

The following code defines a Java UDSF, named DeleteVowels, that uses the library defined in the preceding example code. DeleteVowels accepts a single VARCHAR as input, and returns a VARCHAR.

package com.mycompany.udx;
// Import the support class created earlier
import com.mycompany.libs.VowelRemover;
// Import the Vertica SDK
import com.vertica.sdk.*;

public class DeleteVowelsFactory extends ScalarFunctionFactory {

    @Override
    public ScalarFunction createScalarFunction(ServerInterface arg0) {
        return new DeleteVowels();
    }

    @Override
    public void getPrototype(ServerInterface arg0, ColumnTypes argTypes,
        ColumnTypes returnTypes) {
        // Accept a single string and return a single string.
        argTypes.addVarchar();
        returnTypes.addVarchar();
    }

    @Override
    public void getReturnType(ServerInterface srvInterface,
        SizedColumnTypes argTypes,
        SizedColumnTypes returnType){
        returnType.addVarchar(
            // Output will be no larger than the input.
            argTypes.getColumnType(0).getStringLength(), "RemovedVowels");
    }

    public class DeleteVowels extends ScalarFunction {
        @Override
        public void processBlock(ServerInterface arg0, BlockReader argReader,
            BlockWriter resWriter) throws UdfException, DestroyInvocation {

            // Create an instance of the VowelRemover object defined in
            // the library.
            VowelRemover remover = new VowelRemover();

            do {
                resWriter
            }
        }
String instr = argReader.getString(0);
// Call the removevowels method defined in the library.
resWriter.setString(remover.removevowels(instr));
resWriter.next();
} while (argReader.next());
}

Use the following commands to build the example UDSF and package it into a JAR:

- The first javac command compiles the SDK's BuildInfo class. Vertica requires all UDx libraries to contain this class. The javac command's -d option outputs the class file in the directory structure of your UDSF's source.

- The second javac command compiles the UDSF class. It adds the previously-created mycompanylibs.jar file to the class path so compiler can find the VowelRemover class.

- The jar command packages the BuildInfo and the classes for the UDx library together.

```bash
$ javac -g -cp /opt/vertica/bin/VerticaSDK.jar
  /opt/vertica/sdk/com/vertica/sdk/BuildInfo.java -d .
$ javac -g -cp mycompanylibs.jar:/opt/vertica/bin/VerticaSDK.jar
  com/mycompany/udx/DeleteVowelsFactory.java
$ jar cf DeleteVowelsLib.jar com/mycompany/udx/*.class 
  com/vertica/sdk/*.class
```

To install the UDx library, you must copy both of the JAR files to a node in the Vertica cluster. Then, connect to the node to execute the CREATE LIBRARY statement.

The following example demonstrates how to load the UDx library after you copy the JAR files to the home directory of the dbadmin user. The DEPENDS keyword tells Vertica that the UDx library depends on the mycompanylibs.jar file.

```sql
=> CREATE LIBRARY DeleteVowelsLib AS
  '/home/dbadmin/DeleteVowelsLib.jar' DEPENDS '/home/dbadmin/mycompanylibs.jar'
  LANGUAGE 'JAVA';
CREATE LIBRARY
=> CREATE FUNCTION deleteVowels AS language 'java' NAME
  'com.mycompany.udx.DeleteVowelsFactory' LIBRARY DeleteVowelsLib;
CREATE FUNCTION
=> SELECT deleteVowels('I hate vowels!');
deleteVowels
---------------------
ht vwls!
(1 row)
```
Java and Vertica Data Types

The Vertica Java SDK converts Vertica's native data types into the appropriate Java data type. The following table lists the Vertica data types and their corresponding Java data types.

<table>
<thead>
<tr>
<th>Vertica Data Type</th>
<th>Java Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTEGER</td>
<td>long</td>
</tr>
<tr>
<td>FLOAT</td>
<td>double</td>
</tr>
<tr>
<td>NUMERIC</td>
<td>com.vertica.sdk.VNumeric</td>
</tr>
<tr>
<td>DATE</td>
<td>java.sql.Date</td>
</tr>
<tr>
<td>CHAR, VARCHAR, LONG VARCHAR</td>
<td>com.vertica.sdk.VString</td>
</tr>
<tr>
<td>BINARY, VARBINARY, LONG VARBINARY</td>
<td>com.vertica.sdk.VString</td>
</tr>
<tr>
<td>TIMESTAMP</td>
<td>java.sql.Timestamp</td>
</tr>
</tbody>
</table>

Note: Some Vertica data types are not supported.

Setting BINARY, VARBINARY, and LONG VARBINARY Values

The Vertica BINARY, VARBINARY, and LONG VARBINARY data types are converted as the Java UDx SDK's VString class. You can also set the value of a column with one of these data types with a ByteBuffer object (or a byte array wrapped in a ByteBuffer) using the PartitionWriter.setStringBytes() method. See the Java API UDx entry for PartitionWriter.setStringBytes() for more information.

Timestamps and Time Zones

When the SDK converts a Vertica timestamp into a Java timestamp, it uses the time zone of the JVM. If the JVM is running in a different time zone than the one used by Vertica, the results can be confusing.

Vertica stores timestamps in the database in UTC. (If a database time zone is set, the conversion is done at query time.) To prevent errors from the JVM time zone, add the following code to the processing method of your UDx:
Strings

The Java SDK contains a class named `StringUtils` that assists you when manipulating string data. One of its more useful features is its `getStringBytes()` method. This method extracts bytes from a `String` in a way that prevents the creation of invalid strings. If you attempt to extract a substring that would split part of a multi-byte UTF-8 character, `getStringBytes()` truncates it to the nearest whole character.

Handling NULL Values

Your UDxs must be prepared to handle NULL values. These values usually must be handled separately from regular values.

Reading NULL Values

Your U Dx reads data from instances of the the `BlockReader` or `PartitionReader` classes. If the value of a column is NULL, the methods you use to get data (such as `getLong`) return a Java `null` reference. If you attempt to use the value without checking for NULL, the Java runtime will throw a null pointer exception.

You can test for null values before reading columns by using the data-type-specific methods (such as `isLongNull`, `isDoubleNull`, and `isBooleanNull`). For example, to test whether the `INTEGER` first column of your U Dx's input is a NULL, you would use the statement:

```java
// See if the Long value in column 0 is a NULL
if (inputReader.isLongNull(0)) {
  // value is null
  ...
}
```

Writing NULL Values

You output NULL values using type-specific methods on the `BlockWriter` and `PartitionWriter` classes (such as `setLongNull` and `setStringNull`). These methods take the column number to receive the NULL value. In addition, the `PartitionWriter` class has data-type specific set value methods (such as `setLongValue` and `setStringValue`). If you pass these methods a value, they set the output column to that value. If you pass them a Java `null` reference, they set the output column to NULL.
Handling Errors

If your U Dx encounters an unrecoverable error, it should instantiate and throw a UdfException. The exception causes the transaction containing the function call to be rolled back.

The UdfException constructor takes a numeric code (which can be anything you want since it is just reported in the error message) and an error message string. If you want to report additional diagnostic information about the error, you can write messages to a log file before throwing the exception (see Writing Messages to the Log File).

The following code fragment demonstrates adding error checking to the Add2ints UDSF example (shown in Java Example: Add2Ints). If either of the arguments is NULL, the processBlock() method throws an exception.

```java
@Override
public void processBlock(ServerInterface srvInterface,
                          BlockReader argReader,
                          BlockWriter resWriter)
    throws UdfException, DestroyInvocation
{
    do {
        // Test for NULL value. Throw exception if one occurs.
        if (argReader.isLongNull(0) || argReader.isLongNull(1)) {
            // No nulls allowed. Throw exception
            throw new UdfException(1234, "Cannot add a NULL value");
        }
    }
}
```

Note: This example isn't realistic, since you would likely just replace the NULL value with a zero or return a NULL value. Your UDx should only throw an exception if there is no way to compensate for the error.

When your UDx throws an exception, the side process running your UDx reports the error back to Vertica and exits. Vertica displays the error message contained in the exception and a stack trace to the user:

```sql
=> SELECT add2ints(2, NULL);
ERROR 3399: Failure in UDx RPC call InvokeProcessBlock(): Error in User Defined Object [add2ints], error code: 1234
com.vertica.sdk.UdfException: Cannot add a NULL value
    at com.mycompany.example.Add2intsFactory$Add2ints.processBlock(Add2intsFactory.java:37)
    at com.vertica.udxfence.UDxExecContext.processBlock(UDxExecContext.java:700)
    at com.vertica.udxfence.UDxExecContext.run(UDxExecContext.java:173)
    at java.lang.Thread.run(Thread.java:662)
```
Writing Messages to the Log File

Writing messages to a log is useful when you are debugging your Java UDxs, or you want to output additional information about an error condition. You can write messages to a log file by calling the ServerInterface.log() method, passing it a printf()-style String value along with any variables referenced in the string. (See the java.util.Formatter class documentation for details of formatting this string value.) An instance of the ServerInterface class is passed to the main processing method of every SDK class you can override.

The following code fragment demonstrates how you could log the values passed into the Add2ints UDSF example.

```java
@Override
public void processBlock(ServerInterface srvInterface,
                           BlockReader argReader,
                           BlockWriter resWriter)
    throws UdfException, DestroyInvocation
{
    do {
        // Get the two integer arguments from the BlockReader
        long a = argReader.getLong(0);
        long b = argReader.getLong(1);
        // Log the input values
        srvInterface.log("Got values a=%d and b=%d", a, b);
    }
}
```

The messages are written to a log file stored in the catalog directory's UDxLog subdirectory named UDxFencedProcessesJava.log:

```
$ tail VMart/v_vmart_node0001_catalog/UDxLogs/UDxFencedProcesses.log
2012-12-12 10:23:47.649 [Java-2164] 0x01 UDx side process (Java) started
2012-12-12 10:23:47.871 [Java-2164] 0x0b [UserMessage] add2ints - Got values a=5 and b=6
2012-12-12 10:23:48.598 [Java-2164] 0x0c Exiting UDx side process
```

The SQL name of the UDx is added to the log message, along with the string [UserMessage] to mark the entry as a message added by a call to the log() method. These additions make it easier for you to filter the log to find the messages generated by your UDx.

Adding Metadata to Java UDx Libraries

You can add metadata, such as author name, the version of the library, a description of your library, and so on to your library. This metadata lets you track the version of your function that is deployed on a Vertica Analytic Database cluster and lets third-party users of your function...
know who created the function. Your library's metadata appears in the USER_LIBRARIES system table after your library has been loaded into the Vertica Analytic Database catalog.

To add metadata to your Java UDX library, you create a subclass of the UDXLibrary class that contains your library's metadata. You then include this class within your JAR file. When you load your class into the Vertica Analytic Database catalog using the CREATE LIBRARY statement, looks for a subclass of UDXLibrary for the library's metadata.

In your subclass of UDXLibrary, you need to implement eight getters that return String values containing the library's metadata. The getters in this class are:

- `getAuthor()` returns the name you want associated with the creation of the library (your own name or your company's name for example).
- `getLibraryBuildTag()` returns whatever String you want to use to represent the specific build of the library (for example, the SVN revision number or a timestamp of when the library was compiled). This is useful for tracking instances of your library as you are developing them.
- `getLibraryVersion()` returns the version of your library. You can use whatever numbering or naming scheme you want.
- `getLibrarySDKVersion()` returns the version of the Vertica Analytic Database SDK Library for which you've compiled the library.

Note: This field isn't used to determine whether a library is compatible with a version of the Vertica Analytic Database server. The version of the Vertica Analytic Database SDK you use to compile your library is embedded in the library when you compile it. It is this information that Vertica Analytic Database server uses to determine if your library is compatible with it.

- `getSourceUrl()` returns a URL where users of your function can find more information about it. This can be your company's website, the GitHub page hosting your library's source code, or whatever site you like.
- `getDescription()` returns a concise description of your library.
- `getLicensesRequired()` returns a placeholder for licensing information. You must pass an empty string for this value.
- `getSignature()` returns a placeholder for a signature that will authenticate your library. You must pass an empty string for this value.

For example, the following code demonstrates creating a UDXLibrary subclass to be included in the Add2Ints UDSF example JAR file (see Java Example: Add2Ints).
// Import the UDXLibrary class to hold the metadata
import com.vertica.sdk.UDXLibrary;

public class Add2IntsLibrary extends UDXLibrary {
    // Return values for the metadata about this library.
    @Override
    public String getAuthor() { return "Whizzo Analytics Ltd."; }
    @Override
    public String getLibraryBuildTag() { return "1234"; }
    @Override
    public String getLibraryVersion() { return "1.0"; }
    @Override
    public String getLibrarySDKVersion() { return "7.0.0"; }
    @Override
    public String getSourceUrl() {
        return "http://example.com/add2ints";
    }
    @Override
    public String getDescription() {
        return "My Awesome Add 2 Ints Library";
    }
    @Override
    public String getLicensesRequired() { return ""; }
    @Override
    public String getSignature() {
        return "";
    }
}

When the library containing the Add2IntsLibrary class loaded, the metadata appears in the USER_LIBRARIES system table:

```sql
=> CREATE LIBRARY JavaAdd2IntsLib AS :libfile LANGUAGE 'JAVA';
CREATE LIBRARY
=> CREATE FUNCTION JavaAdd2Ints as LANGUAGE 'JAVA' name 'com.mycompany.example.Add2IntsFactory'
library JavaAdd2IntsLib;
CREATE FUNCTION
=> \x
Expanded display is on.
=> SELECT * FROM USER_LIBRARIES WHERE lib_name = 'JavaAdd2IntsLib';
-[- RECORD 1 ]-+-------------------------------------+

```

### Java UDx Resource Management
